As a response to my criticism from a few days ago, Bertrand Russell might say that when he says he pities humanity he means only that he pities everyone, or he pities everyone insofar as they share in the pitiable human situation. That has some plausibility. Nevertheless, when he says "I have unbearable pity for mankind," he is implicitly making of the aggregate of humans a single collective object that suffers from the enormous collective pain of everyone combined. If such an object existed, yes, you're damn sure I'd pity it too. But it's an abstraction. Mankind *itself* does not deserve pity, or love or hate or anything else, because there is no such entity. If you don't want to be subject to the delusion of attributing existence and consciousness to a nonexistent object, you have to focus your emotions on specific people. You can pity Jane or every woman who has been raped. That's a rational act. But then why is it wrong to pity "mankind," since this arguably means only that you pity everyone (for having to deal with life's pain)? It's wrong because this "arguable" translation of the concept 'mankind' into 'every individual' is actually not valid, as is shown by the fact that you *magnify* your pity when you apply it to *mankind*. You think of your pity as

“unbearable” or “overwhelming” because you attribute unbearable and overwhelming suffering to mankind, suffering six billion times as intense as that of a single person. If you weren’t directing your pity at an abstract entity but instead at an individual, you wouldn’t call it unbearable; but, after all, mankind is composed only of a collection of *individuals*. An individual’s pain is the only pain that exists. The fact that millions or billions of individuals might be experiencing similar kinds of pain doesn’t make the pain itself any more intense than that of a single person. So, if you wouldn’t have “overwhelming” pity for *one* sufferer then you shouldn’t have it for *mankind*, because there is exactly no difference in the level or intensity of real, concrete pain experienced.

(Also, Russell would surely deny that he pities *each specific individual* on the planet. He doesn’t pity economic and political elites, etc. This means that ‘mankind’ isn’t translatable into ‘every person.’ So is it translatable into ‘most people’? No. Mankind is mankind. Everyone. Hence, it has no adequate translation, and Russell is effectively pitying an abstract entity.)

This power of abstraction or generalization in the mind is what makes possible the love of a Mother Theresa and the hate of a Hitler. It’s the generalized Other, the abstract Other instantiated in everyone and which can also be transformed into the idea of mankind or posterity or God or “Jews” or “infidels” or the proletariat or whatever you want. (The idea of God is different from the others because it *explicitly* denotes a sort of collective being with consciousness, whereas the other ideas—depending on the context of their use—can only *function, unconsciously*, as denoting such a being, because they are intended to be purely abstract notions, not to denote a particular being like God. Whether they have such an unconscious function for a particular person is often revealed in his behavior. The idea of the Jews did for Hitler because he was obsessed with killing them all, i.e. with killing this noxious Other, this devilish ‘*Conscious-Principle*’ of *Destruction* realized in every Jewish person. For normal people, the idea of ‘Jews’ is just an ordinary abstract concept like ‘Christians’ or ‘men’ or ‘animals.’ It isn’t invested with emotional, Other-directed energy.) For unusual people, or ordinary people in unusual circumstances, one of these ideas may provide an outlet into which a great deal of emotional energy is directed, which means energy whose object in some sense is the Other. Typically the “Other” is none other than a real person, a lover or a friend or some significant other; sometimes it is an abstract entity like mankind. For Nietzsche and me, it is posterity/mankind. —Needless to say, this oversimplifies. In a particular mind there are *many* such objects of emotional energy—although there are only a few “significant” ones, which are what I’m talking about now. “Restless” people like me differ from ordinary people in that we orient a lot of our emotional and productive activity toward the *ideas* of mankind and suchlike concepts—a phenomenon which, as I said, is possible because the idea unconsciously functions as a kind of collective, conscious Other in itself. Someone who pities or loves mankind is falling victim to the same error. But it’s an “error” that grows out of the human mind itself, so everyone shares in it to some degree.

Aaaaaah, this is all so difficult...

I want to reiterate the ironic truth that understanding life’s absurdity can actually *ease* your pain if you have a lot of it. Knowing that everyone is in the same metaphysical position as I, and that time steals everything, helps me tolerate somehow the emotional pain in which my sense of self is grounded. (This pain is due mainly to my rejection by women, like the Harvard girl, whose interest in me isn’t romantic.)

The problem with contemporary society is that at the same time as the shared lifeworld is shrinking, what remains of it is becoming less real. So the public space is both *small* and *false*.

People think of the loner, with his insecurities, as weak. In truth, he is extraordinarily strong: if *they* lived his life, it would kill them.

One of the advantages in being worn down by life is that you lose the vigor necessary to sustain thoughts of revenge. You come to accept everything; you reach a kind of negative equanimity. The only thought that still excites you is the thought of sleep, and nothingness.

What women are is a consolation. Every person should have the right to be consoled, the right to a woman.

When all is said and done, the thing I'll never be able to understand is how *thoughtless* and *duplicitous* people are. These two qualities go hand-in-hand. I literally cannot understand how it's *possible* to lack common courtesy in the way that most Americans do. I'm not talking about meaningless acts like opening doors for others; I'm talking about showing attention to your friends and acquaintances, showing that you appreciate them, sending spontaneous emails, *showing that you care*. People *seem* to *enjoy your company* (not *care*)—well, in fact, sometimes they do even *seem* to care—but, if they show interest in you, they never follow up later or help you out in any way; instead they completely ignore you until you meet again, when the duplicity returns. Actually, the female sex sometimes seems to be the more duplicitous one, but men are by no means innocent either. Even I'm not. But there's no question that I'm *more* innocent than most people: I *listen*, I'm *kind*, I'm *genuine* (usually). I follow up with people after meeting them once, and I don't cavalierly break appointments. Not even Meng, the Chinese girl, is genuine or thoughtful, as I've discovered. You see, I project my own genuineness onto others and get excited initially, but then I'm disappointed.

After reading about Heidegger I can see the extent to which he influenced a whole variety of thinkers, not only the existentialists, phenomenologists and poststructuralists but even theologians like Tillich and eccentrics like Buber. All the talk about “being” and “presence” and “anxiety,” and much more, it all comes from Heidegger. [No, not exclusively.] On the other hand, that doesn't mean he was wholly original. Far from it. He belongs to a large group of thinkers who were reacting against the Cartesian tradition, including Marx, Kierkegaard (sort of), James, Dewey—Heidegger took a lot from pragmatism—Nietzsche, even Hegel in some ways, Wittgenstein, and thinkers in other disciplines, e.g. psychoanalysis and anthropology. The humanities were inexorably heading away from Cartesianism, emphasizing man's embeddedness. At the same time, unsurprisingly, the individualistic perspective showed up in new ways, ‘spiritual’ and ‘existential’ ways, as social atomization intensified. (And in analytic philosophy, Cartesian-Lockean ideas inspired Russell, the logical empiricists, the early Wittgenstein, etc.) What resulted was a schizophrenic intellectual culture.

There's validity in all these approaches, from Descartes to his antipodes. Cartesianism has a lot of truth; so does the nearly opposite tradition of the 20th-century Continentals. It's all a matter of *emphasis*. You can emphasize our freedom or you can emphasize our embeddedness. You can emphasize the division between the mind and the body or you can emphasize their connection. Etc.

Reading *The Cambridge Companion to Merleau-Ponty*.

In his contribution, Charles Taylor follows Heidegger and Merleau-Ponty in arguing against representationalism, or “a mediational epistemology.” “I mean by that an understanding of the place of mind in a world such that our only knowledge of reality comes through the representations we have formed of it within ourselves.” It's a picture that presupposes the inner/outer distinction. Heidegger, you'll recall, argues that we have knowledge of things themselves, not of mere “appearances.” (Shades of Thomas Reid.) —To interject my own opinion here: from the perspective of ordinary common sense, this is true. It's even a truism. The book I see is the book itself, the thing itself. I see the thing I see, and the thing I see is a book. Moreover, one assumes unreflectively that the book as I see it is mind-independent: it ‘looks’ the same even when I'm not looking at it. But this is nonsensical: when no one is looking at it, it doesn't have any appearance at all. By definition. But then if it has no appearance in such conditions, its ‘mind-independent’ nature, or its nature ‘in itself,’ obviously differs from how it appears to us. Thus, there is a difference between the book as it is ‘in itself’ and the book as it appears to consciousness. Natural science supports this conclusion, by elucidating the mechanisms through which the brain constructs the appearance of the book. And so we're back to the representational picture, the mediational epistemology.¹ As Taylor puts it

¹ [Was I confusing here causal mediation (the brain's construction of sense-perceptions) with epistemological mediation (which has to do with how to justify one's knowledge)? Most philosophers would probably say so. But it

(without agreeing with it), “we grasp what is outside through something inner.” How this picture can be doubted, I have no idea. Taylor’s arguments are confused.

He argues against the idea that “we can understand our grasp of the world as something that is, in principle, separable from what it is a grasp of” (which he thinks is implied by any representationalism or mediational epistemology). Now, of course, the world as we experience it—which is the “world” he’s talking about—is not separable from our “grasp” of it, our experience of it. But this is a tautology. The world as I experience it is not separable from how I experience it; it is not separable from the meanings I bring to it, the way I interpret it, the “bodily know-how” that allows me to get around in it, the nonconceptual ways of being in it, the shared practices that create the spaces in which people interact. But no reasonable “mediational epistemology” would deny any of this. In fact, such an epistemology welcomes it, since this Heideggerian picture is perfectly consistent with the idea that the brain and the body construct the world as we live in it. The world as it is in itself, however, is separate from our grasp of it. Obviously. There is a certain way the world is independently of our experience of it. Before life existed, there was the world in itself. Now that life exists, there is still the world in itself. But we have no direct access to it. Only through scientific tools can we potentially gain some knowledge of it. –What is so difficult about this?

Taylor is both confused and unoriginal. The obvious existence in us of Heideggerian nonconceptual pre-understanding has no implications vis-à-vis any reasonable representationalism. (That term is misleading.) Taylor also seems to think, for some reason, that by attacking atomistic theories of experience, which postulate discrete sense-data, he’s attacking “representationalism.” “Our understanding of the world is holistic from the start... There is no such thing as the single, independent percept. Something has this status only within a wider context that is understood, taken for granted, but for the most part not focused on...” So what? This is nothing but a sound observation about how we experience the world. It has no interesting philosophical implications (although it does tell against Humean psychology). More generally, most of these Heidegger-inspired phenomenological analyses have no noteworthy philosophical ramifications. They just make explicit our prereflective experience of the world, which means that *psychologically* they’re fruitful.

So, Taylor is right that ordinarily “our grasp [or understanding] of things is not something that is in us, over against the world; it lies in the way we are in contact with the world.” (Of course, biologically it is in us, in our brains and nervous systems. But Taylor ignores biology.) He’s right that in this sense there is not a complete disconnection or “dualism” between the subject and the object, since they interact in the same meaningful world (structured by the subject—a (neo-)Kantian point that Taylor doesn’t want to admit). He’s wrong that this has implications with respect to traditional issues like realism or skepticism. The Heideggerian and Wittgensteinian recognition that doubt presupposes a background of understanding, a world which is “the all-englobing locus of my involvements,” doesn’t make Berkeleyan idealism incoherent, as Taylor thinks. Berkeley is perfectly aware of the existence of such a world. What he doubts is the existence of a different kind of world, a world of matter outside my immediate experience.

To repeat, natural science postulates a mediational epistemology. (External input makes contact with sensory nerves, which relay the information to the brain, which constructs the experience.) By denying such an epistemology, Taylor is denying science. But he’s also denying to himself that he denies science. The result is an extremely confused man.

...Again, it all depends on how you approach the question. From one perspective, to talk about “representations” is superfluous: the things I see are the things I see, not “representations” of the things I see. I see the book itself, and it’s silly or meaningless to say I see a representation of the book. On the other hand, it’s truisitic, from a different perspective, that everything I see is an appearance, i.e. a representation, in that it appears to me, I’m “being appeared to.” But these are really two ways of saying the same thing. “The book itself” that I see is obviously something that appears in (or to) consciousness, which means it is

seems to me that the two are connected. There are “unconscious inferences” going on when the brain presents something to me as a tree or a house or whatever. The brain itself is engaging in ‘epistemological activity’ by synthesizing the abundance of sensory impulses it receives into the image of a tree—for it is *inferring*, so to speak, that what is present is in fact a tree.]

an “appearance.” Thus, I perceive appearances, by definition. But the word ‘appearance,’ which implies the subject-object distinction (the object appears to the subject), also implies, in a different way, that there is an essence, an object in itself. Outside the way things look to consciousness is the way things are in themselves. Science supports this distinction, which means it supports “representationalism.”

How can Taylor even admit talk of perceptions, since ‘the other side’ of a perception is tautologously an appearance, a representation, that which is being perceived by the subject?

Davidson and Rorty oppose representationalism—or think they do. Actually, they oppose the correspondence theory of truth, favoring coherentism (about beliefs). But, as Taylor points out, beliefs are (one form of) representations. So, in a sense, D and R admit that truth has to do with representations; they simply deny that it’s a matter of correspondence between representations and reality, arguing instead that it’s a matter of coherence among the only kind of “representations” that exist, namely beliefs. Perceptions can’t rationally ground beliefs, because “nothing can count as a reason for holding a belief except another belief.” But then what is the relation between a perception and a belief? How does the first ground the second? According to Davidson, the grounding is causal, not rational. A given perception (e.g. of my roommate at the kitchen stove) causes me to have a belief (that she is cooking) but doesn’t rationally justify it, because the perception has no propositional content and only something with propositional content can justify something with propositional content (i.e., the belief). In Davidson’s language, “the relation between a sensation and a belief cannot be logical, since sensations are not beliefs or other propositional attitudes.” It can only be causal, then. This view generates absurdities, of course, and violates common sense, inasmuch as any idiot can see that my belief that my roommate is cooking is rationally justified by the sight of my roommate mixing things in a pot on the stove. But Davidson was a professional philosopher, i.e., handicapped, so don’t be too hard on him.¹ The answer to the question (about how perception can rationally justify belief even though perceptions don’t seem to have propositional content) is that perceptions do in fact have propositional content, “implicitly.” This is shown by the fact that a proposition can unproblematically articulate the ‘content’ of a perception: for instance, my sight of a dog chasing a frisbee can be “re-presented” by saying that the dog is chasing the frisbee. The proposition “unpacks” the conceptual content of the perception (as I said in the first chapter of my senior thesis). Kant recognized all this. He knew that the brain synthesizes experience conceptually, so that experience has a propositional content and structure, in fact the same structure as language (which explains why, using language, we’re able to do justice to perceptions).

John McDowell agrees with me.

How easy philosophy is. Professionals make it hard because otherwise they couldn’t write the reams of articles that allow them to get tenure.

Went to a wine-tasting event. \$60. Was supposed to meet a girl there, but she flaked out. Good wine on the roof of a building downtown with the sun shining, the park right beneath us. Boring, but it would have been fun with Aniela or some girl I liked.

....Why is it always the good person who has to justify himself? Gandhi had to justify his behavior, as did Bertrand Russell, as does Noam Chomsky, as does anyone who steps out of the mold. I guess my question answers itself.

Last night I invited to a bar a guy I barely know who’s quite boring just because he had posted on Facebook that he was feeling lonely and depressed. He wrote a note on my profile afterwards: “Thanks for getting me out of the house. You might have saved a life tonight.”

¹ He admits that “‘I saw it with my own eyes’ is a legitimate reason for believing there was an elephant in the supermarket. But [he thinks that] this reports no more than that something I saw *caused* me to believe there was an elephant in the supermarket.” Clearly this view is false. Strictly speaking, the term ‘reason’ implies *logical*, not *causal*, justification. (We’re not talking about the biological processes that *caused* me to have the belief. We’re talking about my *justification* for having the belief.) But he has denied that sensations can logically justify beliefs, which means they cannot be *reasons* for beliefs. And that’s stupid. See what I wrote during my time at UMSL on the issue of foundationalism vs. coherentism.

What is boredom? An unwilling acquiescence to a passive state of being. A desire to be active simultaneous with a desire to be passive, where the latter desire is stronger than the former. The trick is to strengthen the former desire to the point at which you force yourself to be active. The reason this can be hard is that a person doesn't have complete control over his desires. Far from it. The "body" can desire something even as the "mind" desires something else. The body may be inclined to persist in a state of passive inertia, while the mind—or rather, an aspect of one's consciousness—wants to get up and do something. (It's only an "aspect" because, after all, bodily inclinations exist in consciousness, however obscurely and implicitly.)

Attitudes and states of being can always be expressed in the language of desire. The most problematic and 'painful' are those states in which two or more desires are in conflict with each other.

Trying Match.com again because a friend, Olivia, suggested it. Very intelligent girl, by the way, articulate, self-confident, philosophy-minded, Chomsky-adoring, an avowed atheist. Pretty too. But no romantic spark between us.

Merleau-Ponty wants to overcome Cartesian dualism by denying that there are only two ways of interpreting human existence, causally (physically) and rationally (mentally). Neither of these is adequate to understanding human being. Instead, we should think of humans in terms of the lived body and motives (not causes or reasons).

Our primary way of being in the world is neither mental/conceptual/rational/logical nor physical/causal. It involves a bodily intentionality, which is sort of between the "mental" and the "physical." The body is constantly comporting itself in relation to implicit expectations about objects or events in the world. When you're about to place your fingers on the keyboard, your body "anticipates" how it will feel and acts accordingly. The keys won't be soft or gooey; they'll be hard. Etc.

The phenomenology of lived bodily experience shows that thoughts – "mental" states and events – and "physical" objects themselves actually bear on the body in ways that are meaningful but not rational. The phenomenon of motor significance makes this clear; there, we see that worldly objects speak to our body in myriad ways, drawing us into actions, while often remaining only tacitly present in our experience of things. The motivating object has "an ambiguous presence," Merleau-Ponty notes, "anterior to any express evocation... It must exist for us even though we may not be thinking of it." ...As a result of the fact that motor significations speak to our bodies, rather than through the mediation of thoughts, we cannot ever get completely clear about what moved us to act in a particular case. This is true even when we are moved to perform an intentional act like asserting.

The term 'motivation' denotes that phenomenon whereby we are moved by things of which we are often only vaguely (if at all) aware. So a motive for Merleau-Ponty does not have to be intentional, like a desire or a reason, as in the normal understanding of the word. The normal understanding is just a special case of the broader meaning. An example of a (nonthetic) motive is discussed by Merleau-Ponty here:

Only after centuries of painting did artists perceive that reflection on the eye without which the eye remains dull and sightless as in the paintings of the early masters. The reflection is not seen as such, since it was in fact able to remain unnoticed for so long, and yet it has its function in perception, since its mere absence deprives objects and faces of all life and expression. The reflection is seen only incidentally. It is not presented to our perception as an objective, but as an auxiliary or mediating element. It is not seen itself, but makes us see the rest.

The reflection on the eye is a nonthetic motive for action (or a particular judgment or experience) in ordinary life: we don't perceive it explicitly, but its presence disposes us to behave as toward a person rather than,

say, a mannequin. It isn't a reason for action, but it isn't just a physical cause either. It is implicitly significant for the agent. In short, it has an ambiguous existence. Another example is that "our ability to see objects in the world is motivated by our bodily familiarity with space."

A motive moves us to have an experience or make a judgment or act in a certain way. In treating a motive as a reason, "I crystallize an indefinite collection of motives." There are always many "motives" for any given experience etc. And we're never explicitly aware of most of them. They operate through the body.

Met the Bulgarian ambassador through a Craigslist friend, a girl I see weekly to study for the GRE—interesting girl in her own right, a 22-year-old lesbian married to a gay man who has a child by him (which lives with her parents, Russian immigrants in Connecticut). Yelena, her husband John and her parents have started a nonprofit group to facilitate West–East cultural dialogue. They took me and an Albanian friend of hers named Albana to their exhibition in Conn. of children's drawings of "the ideal house"—children from Bulgaria, Kazakhstan, Latvia, Italy, America, etc. (Not surprisingly, the poorer the country, the more imaginative and colorful were the drawings. Conventional houses from the West, incredibly imaginative ones from the East—flower-houses, rainbow-houses, fairytale-houses, nature-houses.) The ambassador, friendly, jolly guy, raconteur. Dinner with him in Yelena's parents' house, a unique place created by the father, an artist and poet—big gruff authentic peasant-like Russian who doesn't speak English. Nothing like this house, indescribable. The parents took quite a liking to me, saw me as an atypical American boy, a young philosopher and intellectual. (Conversation with the father translated through his daughter.) Invited me back this weekend. –So many great Russian customs I saw, like their giving me gifts (beer and wine) and the father downing a large shot of cognac with me before I left, probably a sign of respect or something.

July

The whole debate about such concepts as realism, representationalism, etc. is muddled. This is from the Blackwell Dictionary of Philosophy:

There are two types of perceptual realism, direct and indirect realism [often called representationalism¹]. Both claim that the physical world exists independently of perceivers and that the world is as science says it is. While direct realism believes that what we perceive is the physical world itself, indirect realism argues that what we immediately or directly perceive are sense-data, rather than the physical world itself, which can only be perceived indirectly. Thus, indirect realism sets up a field of sense-data between our perception and the physical world. But it contrasts with phenomenalism, for it denies that physical existents are composed out of sense-data. There are two main versions of indirect realism. One, called naive indirect realism, claims that sense data have all the types of properties that physical objects have. The other, called scientific indirect realism, suggests that physical objects have primary properties, while secondary properties, such as color, smell, and taste, belong only to sense-data. "The dispute between the direct realist and the indirect realist concerns the question of whether we are ever directly aware of the existence and nature of physical objects."

First of all, I should reiterate that the human mind is incapable of getting clear on this subject. The issue has been alive for millennia and will never be settled. Science has not brought us any closer to a philosophical understanding; it has, in fact, made the problems even more intractable. We know now that

¹ This word has absurdly many different meanings. Some kinds of representationalism I don't have much sympathy for; others I do.

the brain constructs experience, constructs our experience of space and time and everything else. It's natural to conclude from this that a person's experience is somehow 'in' the brain, or 'in' consciousness, and not 'out there' as it seems to be. But let's be careful: what common sense decrees is, on the level of common sense, transparently true. We do perceive physical objects in space and time, and these objects have primary and secondary properties, and everything is more or less as it appears to be. Common sense even has room for certain scientific hypotheses, such as the hypothesis that there are microscopic particles in these objects that we can't normally see. But once you start to ask questions that can't be answered by direct appeal to sensory experience (including experiences made possible by microscopes and so on), the common sense account breaks down and you get philosophical headaches.

On the philosophical level, some such notion as sense-data [or rather *perceptual appearance*, as distinguished from actual mind-independent physical objects] is unavoidable. Two kinds of arguments establish it: purely 'conceptual' ones (like the argument from illusion and other arguments I've sketched above), which make no reference to scientific theories of perception, and arguments that do make such reference. The significance of the latter is easily graspable. An example of the former is the following: if there are external objects in the world, they are (perhaps by definition) 'public,' perceivable by more than one mind. But one's *experience* of them, one's *perception*, is not public. I alone am aware of my perceptions as I experience them. So my consciousness of the objects in this room is, in a sense, private (first-personal), which is to say that the objects as they appear to me are private. Their appearances in my consciousness are private. But now we've surreptitiously snuck in so-called sense-data, i.e. the appearances of objects in consciousness (as distinct from the external objects themselves).¹ In short, it's necessary to distinguish between objects and their appearances or 'mental representations.'

But remember, for common sense there is no distinguishing between objects and their appearances. What I see is the object itself; to distinguish between it and its "appearance" is otiose. So, on this level, our "sense-data" [no; the 'structured' perceptual appearances] just *are* the external objects, and vice versa.² On

¹ [I was wrong to equate sense-data with the structured perceptual appearances we're aware of. Sense-data are a philosophical construct that's supposed to be more primitive than the perceptual manifold that appears to us as objects and so forth. Sense-data are, it seems, supposed to be things like spots of color we see *out of which* the mind constructs the image of a table. This distinction between "perceptual appearances (*as* mere appearances, not the physical objects that naïve common sense interprets them as)" and primitive "sense-data" is very subtle, and it may or may not be worth making. Sorry about the confusion. I should have said something like "perceptual appearances" rather than sense-data.]

² That's the element of truth in phenomenalism. [Written days later: Unreflective common sense, in not recognizing even the existence of mere sensory/perceptual appearance as contrasted with independent physical objects, doesn't recognize that the way objects appear to me is, in a sense, private. So the objects one perceives are ordinarily seen to be public, and one is supposed to see the same exact object that others see. Phenomenalism is more sophisticated than common sense, in that it admits sense-data. (The "public" objects are actually constructions out of sense-data.) And in doing so, it recognizes that, truitically, what consciousness has direct access to are private representations, not public objects. I.e., *mental* entities, not material ones. Where it goes wrong is in succumbing to idealism, in declaring that there *is no* matter-in-itself ("outside of experience"). There must be matter; science needs it. But consciousness doesn't have "direct" access to it, since experience is constructed by the brain. Consciousness has access only to itself and what is 'in' it, i.e. to mental representations. This is just to say that consciousness cannot experience matter in itself, which is a tautology.]

[A major source of confusion in all this is that the ordinary material objects one perceives can be thought of from two different perspectives, the 'commonsensical' one according to which they are public ("material"), and the semi-Berkeleyan one according to which they are private representations. The latter is more consistent with science, as long as you admit that matter exists in itself! But the former also has an element of truth, since, after all, the way that objects appear to me is, except in unusual or pathological circumstances, identical to the way they appear to you, which means that objects are in this sense "public," "out there," "independent of me."

[Anyway, the fact that objects can be analyzed in these two ways means that words like 'material' and 'mental' have two different meanings. There is scientific matter-in-itself, and there is matter as we experience it, i.e. as the ordinary objects we perceive all the time. Similarly, on the level of common sense there are thoughts as opposed to ordinary physical objects—this is the usual sense of 'mental'—but on the level of philosophy even these ordinary

a more sophisticated level, though, this isn't true. There's a difference between truly 'mind-external' matter and matter as we experience it. I.e., we have to distinguish between matter in itself and matter as it appears to a mind. The representation in consciousness (the appearance) is not a mere copy of some similar-looking thing in an external world that we don't perceive; it's radically different from matter as it is in itself. Matter is not colored in itself; it doesn't 'objectively' exist in those discrete forms we call "objects"; it's even possible that human time doesn't apply to it. On the other hand, this is peculiar, for our body itself is, after all, part of "matter in itself," and we can certainly say a lot of coherent things about how the body works "in itself," i.e. when the mind isn't directly perceiving its internal operations. But as I said when I was 20, it seems there are *levels* of the thing in itself (matter in itself), ontological levels distinguished by emergent causal powers. The levels that biology deals with have very different properties from the levels that quantum mechanics deals with. Somehow, space and time in some form comparable to our experience of them emerge as you proceed from the most micro of levels to progressively more macro levels. –The mysteries of philosophy merge with those of science.

Been meeting interesting people lately. Yelena, Olivia, an Israeli woman last night while waiting for the fireworks on the Esplanade who is writing a book about her spiritual experiences ("epiphanies"), and today an Indian "recovering pharmacist" named Aishwarya at the park near my house when she sat down on the bench next to me and we had an hours-long conversation about, well, everything. Very articulate and self-confident woman in her thirties, whose views on society, politics, philosophy, Chomsky, etc. are the same as mine. Seriously wants to become a high-ranking Indian politician (the prime minister, in fact) to help clean up the mess; is moving back to India in January after fifteen years in Boston, going to volunteer with a group devoted to preserving wildlife and culture. Was quite taken with me, flattered me a number of times about my mind ("wildly intelligent," "the next Chomsky," which I laughed off). Said it was the most exhilarating conversation she'd ever had! We exchanged phone numbers.

The object is public, but my perception of the object is private. This is the source of so many confusions. You can look at basically the same thing in two different ways, as a material object or as an experience (of the object). It's like one of Husserl's reductions, I forget which. A wondrously subtle shift in mental attitude changes the thing from material to mental, from public to private! The common-sense attitude, and then the philosophical attitude (sense-perception, etc.).

First: the object. Second: the object *for me*. First: public, external, material, the same thing for everyone. Second: private, semi-'internal,' semi-mental (but still 'more' material than thoughts), mine alone. First: Thomas Reid. Second: Locke, Berkeley, Hume, Russell, Ayer. Each view is correct in its own sphere. (Ultimately, though, the Lockean view seems to be the deeper truth, the basic truth of the matter—as long as it doesn't become Berkeleian or Ayerian. We have to admit the existence of some kind of matter completely external to the mind.)

If you want to picture how crude is the scientific understanding of the brain, compare the most primitive human tool—say, a stone used by Paleolithic man for killing an animal—to modern nanotechnology. And then multiply that difference by 10,000.

Hey, look at this comment of Merleau-Ponty's: "How significance and intentionality could come to dwell in molecular edifices or masses of cells is something which can never be made comprehensible, and here Cartesianism is right." Yup. So Merleau-Ponty does accept a sort of mind-body dualism after all. But the dualism I accept is 'epistemological,' not 'ontological.' It's a reflection of our lack of understanding, not of a real division in the world between mind and matter.

Much of what Merleau-Ponty has to say about bodily intentionality and subjectivity bears on my thoughts from years ago about the inexplicableness of certain desires and modes of behavior. Why do I like

objects are 'mental' inasmuch as one's experience of them is private to oneself. The foregoing discussion has probably confused the reader because of the double meaning of each of these words ('matter' and 'mental').]

looking at pretty women? Why do I desire to watch porn? How is it possible I can be ashamed in a situation without even knowing the meaning of my shame (in some sense)? How is it I'm able to just do things without thinking about them, without even representing to myself the goals of my behavior in that moment? I don't know. It's my body speaking—it's "bodily intentions" whose existence is "ambiguous," neither causal-physical nor rational-mental, somehow "implicit," possessing significance I'm not explicitly aware of (or perhaps not aware of at all). "Motives," as M-P says. I don't even have the faintest idea how it is that my hand moves when I want it to. It just does. It's all magical.

"The heart of Merleau-Ponty's philosophical inquiry is the movement by which a living being transcends its materiality and gives rise to meaningful existence and, conversely, the fact that every meaning, whatever its degree of abstraction, has its roots in corporeal life." The philosopher of the body.

Reading Gordon Wood's *The Radicalism of the American Revolution* (1991). Its argument is overstated—revisionists often go too far—but the book is exceptional anyway: a tour de force of scholarship.

...In 1760 America was only a collection of disparate colonies huddled along a narrow strip of the Atlantic coast... The less than two million monarchical subjects who lived in these colonies still took for granted that society was and ought to be a hierarchy of ranks and degrees of dependency and that most people were bound together by personal ties of one sort or another. Yet scarcely fifty years later these insignificant borderland provinces had become a giant, almost continent-wide republic of nearly ten million egalitarian-minded bustling citizens who not only had thrust themselves into the vanguard of history but had fundamentally altered their society and their social relationships. Far from remaining monarchical, hierarchy-ridden subjects on the margin of civilization, Americans had become, almost overnight, the most liberal, the most democratic, the most commercially minded, and the most modern people in the world. ...It was the Revolution that was crucial to this transformation.

...The Revolution made possible the anti-slavery and women's rights movements of the 19th century and in fact all our current egalitarian thinking. The Revolution not only radically changed the personal and social relationships of people, including the position of women, but also destroyed aristocracy as it had been understood in the Western world for at least two millennia. The Revolution brought respectability and even dominance to ordinary people long held in contempt and gave dignity to their menial labor in a manner unprecedented in history and to a degree not equaled elsewhere in the world. The Revolution did not just eliminate monarchy and create republics; it actually reconstituted what Americans meant by public or state power and brought about an entirely new kind of popular politics and a new kind of democratic officeholder. The Revolution not only changed the culture of Americans—making over their art, architecture, and iconography—but even altered their understanding of history, knowledge, and truth. Most important, it made the interests and prosperity of ordinary people—their pursuits of happiness—the goal of society and government. The Revolution did not merely create a political and legal environment conducive to economic expansion; it also released powerful popular entrepreneurial and commercial energies that few realized existed and transformed the economic landscape of the country. In short, the Revolution was the most radical and far-reaching event in American history.

But much of what he writes in part two shows that all these transformations were more gradual than you'd think from his introduction, and were already underway in the 1750s. (For instance, the eroding of a politics of personal ties, of a monarchical ethos, and the spread of an egalitarian, 'impersonal' republican culture.) By the 1770s this "social revolution" was in full swing.

In asking what matter ‘is’ in itself, what its ‘essence’ is, we’re basically, albeit implicitly, asking what its essential appearance is. We want to imagine it, imagine what it looks like—in itself. (‘What does real, mind-independent, external matter look like?’) But obviously that question contradicts itself: it tacitly presupposes a subject to which matter is appearing at the same time that it imagines away the subject, trying to get at the objective material world as it is in itself. “Essential appearance”? That’s a contradiction in terms!—at least if ‘essential’ is understood in the way it is here. So the very question is misguided (at least as it is commonly, tacitly interpreted). This shows you how hopeless is the human attempt to truly understand the world, how hopelessly in the dark we are. We can’t escape the subjective perspective. (Only formalistically, through mathematics, can we presumably escape it. Hence the truth of structural realism.)

The puzzle is that the ordinary objects we sense are both in consciousness and outside consciousness. Both mental and material. Unreflectively we think of them as wholly material and objective, but reflectively we have to think of them as at least partly mind-dependent, or mental. The word-markings on my computer screen are both *out there* and *in here*—as is shown clearly if I misread them when skimming too quickly and return an instant later to read a different word than the one I read a moment ago. Evidently what I saw the first time existed only in my consciousness, even though it had an ‘external’ phenomenological character (like all ‘external’ objects). Generalizing, it’s evident that everything I perceive exists as such only in [or *for*] consciousness, despite its seeming mind-externality. A philosopher can be classified on the basis of which aspect he emphasizes, the intuitive ‘phenomenological’ mind-independence or the logically evident mind-dependence.

Okay, I’ve been repeating myself for days now. I’ll stop.

Except, one more thing: G. E. Moore was terribly vexed by all this stuff, torn between his commitment to the idea that what we directly perceive are sense-data and hence not physical surfaces (the surfaces of objects) and his commitment to the idea that we do perceive these surfaces. “I am completely puzzled about the matter,” he said, “and only wish I could see any way of settling it.” Well, the way of settling it is the one I’ve laid out. The seemingly incompatible positions are both correct—correct on two different “levels” or in different “gestalts.” In the pre-philosophical common-sense gestalt, it’s true that we perceive the surfaces of physical objects. In the more philosophical gestalt, this is wrong; we ‘perceive’ only mental representations. But these representations are understood by us to constitute physical objects—phenomenologically they have the character of being (or of constituting in their totality) external physical objects—so the element of truth in the naïve view is preserved. We perceive what appear to us to be physical objects. And in fact they are physical objects in the sense that they—i.e., these constructions out of mental representations—have the properties of being physical, including divisibility-into-parts, public availability to other consciousnesses, etc. (properties not possessed by mental phenomena as such).

You know society is fucked up when it’s the intelligent people who are punished for the stupid ones’ stupidity.

The basic point is that value-judgments are always relative to something, not absolutely true (not just “true, period”). A person is not stupid, period. He is stupid *relative to me*.¹ Hitler was not *bad*; he was bad relative to certain standards (and, in a slightly different sense of ‘relative,’ relative to certain people).² A value-judgment not made in relation to some set of standards is not really meaningful. The desire to help people is good...not “in itself” but given other values. The problem is that when we make value-judgments, the form of the assertion is categorical or “absolute” in the way I’m criticizing, which means that the assertion lacks meaning. “It’s good to help people”: that statement seems to have meaning when you first look at it, but the more you think about it, the more elusive its meaning becomes. Insofar as

¹ Actually, ‘stupid’ may be more descriptive than evaluative. I’ll leave aside such terms for now.

² Contrast ‘This patch is yellow, period’ with ‘This painting is beautiful, period.’ The former is wholly ‘objective,’ the latter not. And they have different logical forms.

the meaning is unanalyzable, it doesn't exist. Only if you give reasons for the statement, i.e. justify it on the basis of other values, does it acquire a concrete meaning. So, why is it good to help people? Because, e.g., that reduces suffering (and I value a reduction in suffering). Thus, helping people is good inasmuch as it brings about the realization of some further end—and *this* statement is meaningful. It isn't a categorical claim ascribing "intrinsic value" to something, a notion that makes no sense.

There is no such thing as intrinsic value. Not even happiness is "intrinsically valuable," at least in the sense I'm discussing. Just consider the statement "Happiness is intrinsically good." What does that mean? Or "Beauty has intrinsic value." Huh? Every value is such in relation to a preference (i.e., an act of valuing). A masochistic person might deny that pleasure or happiness is valuable, and this is a perfectly coherent thing to do.¹ Why do I think happiness is good? Because I prefer it to unhappiness. It isn't good in itself; it's good because of (or "relative to") my set of preferences.

On another understanding, though, there are intrinsic goods. Virtue is intrinsically good: it's good by definition. Vice is intrinsically bad. But specific vices are not "intrinsically bad"—except insofar as they're classified as vices. For instance, lying is not intrinsically bad; it's just a way of behaving, like any other way. But insofar as it's a vice, it is bad, because vices are defined that way. Of course, this is really just saying that "insofar as it's (intrinsically) bad, it's (intrinsically) bad." Which begs the question.

If an intrinsic good is something that is desired or valued for its own sake, then there are intrinsic goods. Pleasure is desired for its own sake (though not always). So is happiness. So is recognition, or self-confirmation. So is—in a loose sense, perhaps—knowledge. ("I want knowledge solely for the pleasure of knowing.") These aren't goods in themselves; they're goods insofar as they're valued, and they're intrinsic goods insofar as they're valued for their own sake. But it's worth noting that specific instances of these general goods are not valued for themselves: for instance, a massage is valued not for its own sake (what would that even mean?) but for its pleasurable quality. So, a massage is extrinsically good, good on account of something else (conceptually distinct from it) which is realized through it.

Value characterizes a relation between a subject and an object. It's incoherent to say that an object is valuable in itself, i.e. with no reference to a subject (a subject's purposes, attitudes, etc.), because this contradicts the nature of value. But this is basically what one is doing when one makes a value-judgment. The statement "That painting is beautiful," by virtue of its form, ascribes value (a value-property²) to an object in itself—without reference to a subject—which is incoherent. The meaningful way of expressing the same sentiment is to say something like "That painting is such as to induce a feeling of aesthetic pleasure in me," or to list the criteria by which one judges aesthetic merit and then say that that painting fulfills the criteria.

But don't forget that all such philosophically problematic statements are unproblematic on the level of common sense. They serve their purpose in that context and are just as meaningful as they have to be given the functions of ordinary communication. (Cf. what I've written about the external world, the self, free will, linguistic meaning, the mind-body relationship, truth, etc. On the naïve level all this is unproblematic, but when you start to dig you see it all crumble beneath you until you're left with little more than illusions or contradictions or empty 'behavioral' phenomena.)

¹ The only way it would be incoherent is if happiness is *defined* (emptily) as that which a person desires. But the common definition is that it's a pleasurable, conflict-free state of mind—and it's coherent for me to prefer pain and conflict.

² This property (in the context of a statement) combines ordinary description with evaluation—a 'cognitive' stance with a 'noncognitive' one—which is incoherent. The statement posits its own truth, like any descriptive statement, but it can be neither true nor false because its real content is simply an expression of approval. So it contradicts itself. That is, its form suppresses the subjective perspective—denies its relevance, so to speak—in favor of positing an objective fact that has nothing to do with the subject's attitude—whereas its content is constituted by precisely this subjective perspective, the subject's reaction to what he is seeing.

Met a Korean girl corrupted by Harvard. Match.com girl. Harvard sucks the vitality out of people, or at least it tends to. I want a girl who isn't as intellectual as I—because intellectualism is inversely proportional to spontaneity and vitality. (I can turn off my intellectual side when I want to.)

Must escape this country. The people, the food, the culture, the politics, the city-life—it's all noxious, soul-battering. "My soul is sort of calcifying, so to speak." (From an email to Olivia.) s-s-s-s-s.

It was a surreal night with the Indian girl. Started off fine: walked to a restaurant twenty minutes away, continued our lively conversation from the other day. [...] During dinner she also gave me thoughtful advice on finding a woman. (My movements and voice should "flow" more than they do, should be slow and not "jerky" or "sharp," and I should speak in a deep and warm voice, etc. Again, it's all about exuding "strength.")

But as we talked I began to notice that, well, she can be annoying and isn't quite normal. Likes to hear herself talk, is highly theatrical, is a bit too pleased with herself...—certainly nothing unusual about that—...but then suddenly her spiritual side popped out. And that's when it got weird. This part of the conversation, which lasted an hour, was more of a monologue, since I didn't quite know how to react. For instance, in 2003 she died and was born again. It was a terrible experience, she dreamed that she was being roasted on a spit with her friends... Her death-and-rebirth was triggered one night while she was in the bathroom undressing. She was wearing two large triangle earrings, but as she pulled the sweater over her head one of them disappeared. She searched everywhere in the bathroom, but she'd had it on a moment ago and now it was gone, nowhere to be found. And then she had an epiphany: she realized that there was a triangle in her life—a love-triangle: her husband (whom she's divorcing now) was cheating on her. So she ran over to look at the phone bills and, sure enough, he had been repeatedly calling some woman. And then, I guess, Aishwarya died, at least spiritually, sometime in the next few days. But she was reborn, found peace; her personality reversed itself, from being like mine in some ways to being calm, contented, spiritual, at peace with itself. She attributes all this to God. (Professes to be a Hindu.) She also mentioned her theory that the recent Air France crash in the Atlantic Ocean was an act of God: evidently the souls in that plane had been impure. In fact, our civilization is more or less doomed: we're destroying the planet, etc., and God is getting fed up, so, for all we know, there's going to be another Flood to cleanse the world. I challenged her in the obvious ways. Like, how does all this fit with her belief that everything is predestined? Or, how could God allow all this to happen? "He trusted us with this planet but we betrayed him," etc.

So that went on for a while. Then the third act: she went to the bathroom, where a metamorphosis of some sort occurred because when she returned to the table she was virtually silent. Five minutes before, she'd been a geyser of spiritual self-analysis. We left, walked home in silence. I attempted vainly to engage her in conversation: aside from a few token sentences she would have none of it. "Why are you so quiet all of a sudden?" I asked. "I'm happy," she said. I pressed the question again later; "I'm thinking about my path," she replied. Evidently, though, she hadn't been pleased with my reactions to her spiritual revelations. "You're not in the know, are you?" she asked as we walked. "I don't know what you mean by 'in the know.'" "You haven't found your truth yet." "No, I certainly haven't," I answered; "maybe I don't have a truth."

Our parting was rather abrupt: shook hands and she said, "We'll talk later." [...]

—The world is full to the brim with bizarre people. Most of what Aishwarya says is sensible, but then she behaves erratically and preaches a flaky spiritualism. Good luck in your future life, weirdo.

In its context, the most beautiful line in Western literature may be Jesus's saying "Let he who is without sin cast the first stone." During dinner last night I related the story of the adulteress to Aishwarya, and as I did so I was so struck by its beauty that my eyes welled up. "Go, and sin no more." What a *world* of serene forgiveness and understanding is contained in those five words! (That sentence may actually be the most beautiful one.)

Merleau-Ponty on language: "The word has never been inspected, analyzed, known and constituted, but caught and taken up by a power of speech and, in the last analysis, by a motor power given to me along with the first experience I have of my body and its perceptual and practical fields. As for the meaning of a

word, I learn it as I learn to use a tool, by seeing it used in the context of a certain situation.” Wittgenstein. This view isn’t incompatible with the sort of view I defended in college in my notes on Wittgenstein: “the meaning of a sentence [writes Merleau-Ponty, and college me] is its import or intention, which once more presupposes a departure and arrival point, an aim and a point of view.”

Merleau-Ponty argues against both realism and social constructivism in science (perhaps not wholly coherently). Here’s an interesting passage:

For what precisely is meant by saying that the world existed before any human consciousness? An example of what is meant is that the earth originally issued from a primitive nebula from which the combination of conditions necessary to life was absent. But...[n]othing will ever bring home to my comprehension what a nebula that no one sees could possibly be. Laplace’s nebula is not behind us, at our remote beginnings, but in front of us in the cultural world.

Hm. Postmodernism. The fact that I can’t conceive of a nebula that no one sees, a nebula in itself, doesn’t entail the nonexistence of such a nebula, or its existence only in the cultural world.

To make language new again: to make life new again. To escape the making-empty-ness of overuse. “It’s refreshing to meet someone like you.” It’s re-freshing, makes me fresh, makes me new again and whole. It refreshes—it *freshes* me to talk to you. A new beginning.

‘Realization.’ Its duality of meaning supports a pragmatic theory of knowledge, something like Vico’s. It’s through real-izing (making, fabricating, achieving) an object that one comes to a realization about it, i.e. understands it, knows it. One realizes that something is the case—i.e., has knowledge—through an act of making-real.

The similar duality of ‘object.’ You can *achieve* an object (a goal) and you can *make* an object—or perceive it. Through perception, you’re “achieving an object,” both creating one (a physical one) and accomplishing one (a goal, an aim).

And then of course the duality of ‘subject.’ A subject that creates or is aware of an object, and a subject that—is ‘created,’ subjected to influences, processes of manipulation and transformation, of control. So on one of its meanings, ‘subject’ isn’t much different from ‘object.’ Both somewhat passive objects. What’s the significance of that?

The double meaning of ‘fabricate.’ Make and make up (lie).

Dissociation from one’s past is not always a bad thing. In fact, it can be one of life’s great mercies.

It’s a cliché but it’s true: modern loneliness comes from the attitude of treating people as means to an end, namely happiness/pleasure. If a person doesn’t entertain me or stimulate me, I’ll end my relationship with him. (Not I personally; this is just the philosophy.) Relationships have become conditional on stimulation and the achievement of satisfaction. But what’s needed is commitment. You commit to someone as an end in himself, as you commit to an end. Commitment should be conditional, if at all, only on the other’s respect for your humanity, on his treating you as an end. (No physical abuse, etc.)

Why does the modern attitude cause unhappiness? Because happiness comes from the interaction between oneself and a significant other. Happiness is relational: “happiness was born a twin” (Byron). The interaction between two equals, not between a lesser partner (a means) and a greater partner (an end). You necessarily desire recognition from someone you respect as you do yourself, because only someone fully human can fully affirm or confirm you. But we tend not to respect others as we do ourselves, i.e. as ends, which means we can’t have a significant other in our lives. —And one of the reasons for our lack of respect for others is that this is a defense against rejection. If we don’t let ourselves respect them, we won’t care if they reject us. Perhaps we interact with them in a friendly, affectionate way, but we don’t really allow them to become a part of our psyche—and for good reason. Unfortunately this is something of a self-fulfilling prophecy: if we withhold true respect for people out of an unconscious fear of rejection, our doing so will

cause them to reject us precisely because they can probably unconsciously sense our lack of engagement with them. –Well, that’s too simple. Many people show complete engagement when they’re with their acquaintances but can’t develop deeper relationships anyway. This isn’t mainly their fault; it’s because society as a whole has instilled an underlying emotional distance in people, a veritable *structure of feeling* that conditions how they relate to everyone (even the engaging ones).

Commitment is fundamentally not a hedonistic stance. It’s a moral stance: it means commitment to the person, not to his function as satisfying you in some way. Hedonism even in a less crude sense than Benthamism or (in a different way) Freudianism has very little to do with the good life, with genuine happiness. The moral stance is not only the most *moral* one; it also makes possible your greater happiness than any other stance.

You must *care for*, not *use*. Things are meant to be used; people are meant to be cared for. It’s the practical versus the affective mode of being: the first should characterize your relationship to things, the second your relationship to people (and ‘aesthetic objects,’ like nature). But modernity is the upside-down world: we care for things and use people (and nature). Is it any wonder we’re unhappy? We’re misdirecting or suppressing our emotional energies. Reification!

“In a lecture given in 1951, Merleau-Ponty rejected the notion of the unconscious. What psychoanalysts call the unconscious, he said, corresponds only to an ‘unrecognized, unformulated knowledge, that we do not wish to assume.’” There may be something to that. Actually, it fits nicely with my idea of half-conscious thoughts and perceptions, or rather of a gradual transition from explicit knowledge to lower and lower degrees of consciousness. (Also a Leibnizian idea.) The “unconscious” is latently conscious, which is precisely why it’s able to become conscious in special, ‘revelatory’ moments.

Obviously other aspects of the mind *are* truly unconscious, such as the computations it is constantly carrying out to orient the body in the world.

Reading *The Cambridge Companion to Kierkegaard*.

Why does the aesthetic seem inauthentic and frivolous now? Maybe it’s because the world has become too serious and adult-like for intelligent people to try to lose themselves in fiction or poetry or music or whatever. Doing so seems somehow childish and immature. A too-obvious distraction from reality. Reality presses on us insistently. Politics, economics, the public world presses on us. There is no longer a place in life for imagination, no longer sufficient space for it, it has been crowded out. It’s fine to read a novel now and then or go to concerts, but to seriously interest oneself in anything artistic—to take it truly *seriously*—seems almost deluded, almost comical. Solipsistic. Decidedly old-fashioned. There are more important things to do. There is no longer much of a separation between the private and the public (if there ever was); the public is the private and vice versa. The public world determines the private now—the fragmentation, the alienation, the distrust, the being-a-stranger-to-others has infected the private, so that it’s quixotic to try to escape from the public into a world of art. The public is everything (which also means that the private is everything, since in the “public” world everyone is more or less atomized and alone now). Art used to be a way of connecting people, and as long as it served that purpose it was “authentic.” But it can no longer serve that purpose. Culturally speaking, people are not really united any more by shared artistic values. Instead, art has become merely another way of escaping into a private universe, a way of evading reality, and so it is inauthentic. It’s especially inauthentic because reality cannot be avoided any more. The world’s problems are *closer* to us than ever before. By immersing oneself in art for extended periods of time one is simply, as it were, closing one’s eyes to the world’s situation, withdrawing into privacy.

Said differently, art has come to lack dignity. A Stephen King novel is explicitly frivolous, but even a Philip Roth novel is...an exercise in futility. In fact, a Roth novel is, ironically, somehow a more comical affair than a King novel, in that it suffers from a contradiction between its pretended seriousness or cultural dignity and the reality of its cultural irrelevance—its being a testament to a certain artistic solipsism.

Another way of saying it: art has always been essentially a celebration of humanity and the individual (even when it wasn’t supposed to be, as during the Middle Ages). There was a kernel of

humanism in it. This kernel started to die with postmodernism, which, at its best, was an honest attempt to artistically come to terms with the death of art. By now, humanism is effectively dead. The individual no longer has value, is no longer an end in himself. Hence, the artistic approach to life is passé.

What is still timely? Something like the ‘Protestant ethic’ approach (be it in business or politics or whatever), the hedonistic approach, and perhaps the ethical/humanitarian approach. The ‘desire for fame’ approach overlaps with all these, and I suppose the first overlaps with the third. (But there are plenty of people committed to one of the former approaches who don’t desire fame.) And then, of course, there is the average Joe’s approach, which basically consists in the lack of any distinctive approach. Being ordinary.

In the end, Hölderlin said it: “What are poets for in a barren age?” In an age of science, commodification and mass consumerism, art first adopts, perhaps, a defensive and defiant posture, then (or: along with) a despairing one, then (or: along with) an overly intellectual one, then perhaps a playful one—trying to make the best of the situation with a ‘devil may care’ attitude (postmodern irony, playfulness and frivolity)—and finally it becomes so contradictory to social reality that only a willful perverseness or stubbornness on the part of the individual can sustain a serious interest in high art. This stubbornness, I suppose, is the inauthenticity, in that it seems to signify a refusal to accept social reality. (It doesn’t necessarily signify that refusal, but, in any case, what I’m trying to explain is only the *partial appearance* of the inauthenticity of art in the contemporary period.)

So, yes, that’s the answer. Art used to be a compelling way of engaging with the world, of connecting with people and being at the cutting-edge of culture—being in touch. Now it seems to be the opposite: a way of retreating, of being out-of-touch, a turning-away from the world—an attempt that’s doomed to failure, because, as I said above, at this point there is no turning away from the world. You can pretend to, or try to, but then you’re basically lying to yourself. Arguably.

From another perspective, of course, the aesthetic approach toward life is definitely not dead, nor will it ever die. Millions of people adhere to it, and not only artists. To an extent, I do. There’s also the philosophical or scientific, truth-oriented approach, and I subscribe to this too. Finally, there’s the religious approach. Like the aesthetic—but even more so—it is somewhat out of sync with the modern age, but that doesn’t mean millions of people don’t passionately subscribe to it.

I should also say that I still have far more respect for artists, writers, and musicians, as such, than for businessmen, politicians, and lawyers, as such. The former are individuals and rebels, the latter are conformists.

Above I focused on the activity of doing art, but what I should have discussed is art itself (in a broad sense). The contradiction is between art itself and the social world, a contradiction *embedded in* the art (in its social context).

From yet another perspective, serious art is no less and no more authentic than anything else nowadays. Everything is basically alienated, atomized. Art has become private, yes, but so has life itself. Art has become self-indulgent, but so has everything else (at least in its social framework). The zeitgeist is that everything is futile, merely a way to pass the time. Even politics and business, the most “real” of occupations, function in a framework of transience and privacy, self-indulgence, futility. The “system” is everything. What happens is all a show, a farcical drama or a dramatic farce. Since no one has value and there is no justice, it’s just a bunch of idiots and pawns playing their games—be they in politics, academia, art, science, business, law, etc. It’s all “privacy” (since nothing is *shared* anymore), all posturing and self-delusion, all acting. “A play acted by its spectators.” —This is the phenomenology.

Again, though, all this is true only from a certain ‘big picture’ perspective. It seems implicit in social dynamics and the overall nature of social interactions, but it has little place in the immediacy of a happy life. Such a life can be perfectly “authentic” and deeply lived.

Kierkegaard as a classical moralist, concerned with integrity, character, intense virtue of an ethical or especially Christian sort. Inwardness, existence, subjectivity, selfhood, character, being an individual. Inwardness as contrasted with outwardness, like the inner-directed vs. other-directed personality. The modern age stresses an outwardly successful life and cares nothing about essential subjectivity.

In *Two Ages*, "character" means something like "sustained dispositional ethical enthusiasm or interest" (we might also say "commitment," though this is not a typical word for Kierkegaard). Character contrasts with the personality formation typical of the present age, which is "*devoid of passion, flaring up in superficial, short-lived enthusiasm and prudentially relaxing in indolence.*" Character is psychological continuity, stability in the face of changing circumstances. "Morality is character; character is something engraved; but the sea has no character, nor does the sand, nor abstract common sense, either, for character is inwardness." A person with character offers something "to dwell upon," something real, something stable, whereas a person without character is an "unstable emptiness" that stands only in "transitory relations" to other persons. Lacking "essential passion," he or she is "an uncomfortable lack of specific quality." These descriptions remind one of Judge William's descriptions of the personality (or rather, lack thereof) of the main aesthete of *Either/Or*, who from the judge's point of view is insubstantial, unconsolidated, lacking a definite personal identity because he never chooses himself in a decisive way, never becomes "finite" and "temporal" but drifts in realms of possibility.

Essential passion, that which consolidates the personality.

"The mature self is a proper synthesis of passion and reflection. Passion without reflection is immature, unformed, chaotic, and childish 'immediacy,' and reflection without passion is the kind of personal emptiness that is the chief target of *Two Ages* pages 68 through 112."

Parallels between Aristotle and Kierkegaard.

Marx and Kierkegaard, the first major thinkers to denigrate theory in favor of concrete living. But Kierkegaard much the more extreme of the two, the more extreme in rejecting theory. Implies that mere theorizing is even *morally* and *spiritually* wrong! Quite an original position. To merely "speculate" or "reflect" all the time is not to be a full self, not to have character or essential inwardness or subjectivity or passion. It is *dishonesty*, inauthenticity, an avoiding of the real issue (which is the question of *how* to live, not *what* is truth). The *what* doesn't matter, only the *how* matters, the how of subjectivity. Cf. Heidegger and Merleau-Ponty, who take the question of "how?" in a different, un-moralistic direction. (How Dasein or the body orients itself in the world, not "what" is represented to it. Bodily know-how, etc.)

Also, Heidegger takes his preoccupation with anxiety from Kierkegaard.

Thomas Jefferson thought that the only thing from Christianity that should be retained is the Sermon on the Mount.

How pregnant with profound implications is the fact that the pleasure of creation is infinitely greater than the pleasure of consumption! (And why is the pleasure so much greater? Because through creation, through activity, one *confirms* one's self, projects it into the world, whereas consumption (buying things, etc.) is passive. Man's essence is activity, self-positing, "creation," not consumption: it is the former that distinguishes him from the animals.¹)

Aristotle doesn't think self-mastery is a virtue. It is never a virtue to dissociate yourself from aspects of yourself. (The Greek ideal of integrating the personality.) Even if the aspects you're rejecting are vicious instead of virtuous, it isn't a *virtue* to dissociate yourself from them and try to overcome them. Instead, it is merely *better* than being complacent about them. The Christian tradition differs from Aristotle: it is decidedly "virtuous" to dissociate yourself from vices, to try to achieve self-mastery. Kierkegaard agrees with the Christian tradition.

¹ Actually, consumption, in its cultural forms, can also be a means toward recognition. "Conspicuous consumption," for example. But it doesn't partake of the *intrinsic pleasure* of creation. Its pleasure is derivative, derivative of others' seeing one's consumption and expressing appreciation or envy.

The concept of an emotion is central to Kierkegaard's thinking about subjectivity, inwardness, existence, and character. I have argued that, as in the classical conception, character is for Kierkegaard constituted in large part of dispositions to emotion -good character (virtues) being dispositions to proper emotions, and bad character (vices) dispositions to improper ones. Human emotions incorporate thought as well as interest or concern for what the thought is about, thoughts that may be right or wrong. Thus to exist well is to incorporate right thinking into a pathos-filled life. As Plutarch comments, summarizing classical moral psychology, "Ethical virtue has the passions for its material, reason for its form." Kierkegaard differs from Aristotle, however, in two suspicions: He is more attentive than Aristotle is to the fact that reflection, when separated from passion, can undermine it further and become an enemy of the virtues; and he is aware that emotions, or their simulacra, can likewise be dissociated from selfhood in such a way that the self is "volatilized." He also affirms, with the Christian tradition and against Aristotle, that it can be virtuous to dissociate oneself from aspects of one's character.

The phenomenon of dissociation wasn't something the Greeks were fully aware of, since their society was neither very individualistic nor moralistic.

Maybe the reason why people have an extra-strong desire for recognition from a charismatic person is that, in projecting greater self-certainty, he projects more of a *self*. A socially awkward little nerd doesn't have much of a self, or at least he doesn't project it; a Bill Clinton does. By 'self' here I mean 'sense of self,' i.e. self-esteem, self-confidence, self-certainty. To be insecure or self-doubting is to not fully coincide with yourself. And to not coincide with yourself is to not *be* a self, a self in the full sense. For what is a self? Fundamentally, it is self-consciousness. On the most primitive, immediate (but also 'abstract') level of self-consciousness, everyone is the same, pure self-consciousness. Empirically, though, some people are more 'self-conscious' than others—a statement that can mean different things; but here the relevant meaning is that they are more self-certain, more self-confirmed than others. Their *personality* is more certain of itself—self-recognized, self-confirmed, self-coinciding—which is to say that it is more *real*, has a higher degree of existence than another's personality. Hence, their self in its empirical fullness is more real. This is in fact essentially what it means to say that someone is charismatic or self-confident: his self has a "weighty presence," i.e. a *heavy, real* presence, unlike the wispy and weak presence of an extremely shy person.

Yay! I've answered the question that's bothered me for years ("What is it about charismatic people?")! The answer is deceptively simple, as usual. People always seek recognition from another self, so naturally they seek it most from the self that most exists. All the ordinary components of charisma, such as humor, intelligence, friendliness, "confidence," physical beauty and so on, combine to give the impression of an unusually *real*, self-certain self. Again, behold the wisdom of language: "He has a strong presence" = "His self has a high degree of presence or *existence*." This explains the unconscious judgment we make in the presence of a charismatic person that he is particularly *valuable* (which is why we bask in the glow of his attention: by being affirmed by a valuable person, we prove to ourselves that we're valuable too, i.e. that our sense of self *exists in the world*, has *reality*¹).

Self-confidence means self-presence, which is the definition of self-consciousness, which is the self.

¹ In general, that's what explains why you like a particular person's company: it validates (confirms) your existence, "makes you feel valuable." People who reject me do so because I don't validate them sufficiently, for whatever reason. With one person it might be because I'm seen as not having a strong presence, while with another person it might be because I don't give her enough attention.

The reason it's better to be an asshole than a weakling is that an asshole at least *exists*—he has “presence”—whereas a weakling doesn't. Everyone's basic desire is to have his existence, his sense of self, be confirmed. So, being an asshole isn't a particularly *good* thing either because no one wants to be disliked—his (desired) sense of self doesn't include ‘being disliked.’ Ideally you want your sense of self to be confirmed in all its aspects; and this includes ‘being a likable person, the sort of person people want to be around and be recognized by’—because in implicitly perceiving that others feel validated by your attention, you feel validated yourself (since the only entity that people want to be validated by is a *self*, a fully existing self). The interplay of mutual recognitions is a very subtle dialectic.

If I were really to launch into an in-depth analysis of all these ideas, you'd probably find it incomprehensible. The phenomena can be considered from a variety of angles. For example, while it's usually better (from your perspective) to be a slight asshole than a weakling, there's a point at which you can be so disliked that your existence is not really being even *somewhat* validated any more, simply because so much of your sense of self is denied by others.

Youth...ending. Never the bloom of fresh love... The canker and the grief... Oh to turn back the clock and be different than I was!

To have hugged a dewdrop of a girl, who could have wet my cheek with joy... Maybe there was Sangeetha, maybe, for a short time... But now that's gone, and all that's left are forgotten memories.

“If thou regret'st thy youth, *why live?*”

Devoting yourself to abstract concepts like the state, the nation, the revolution, mankind, etc. is, quite obviously, a sign that you cannot achieve in ordinary life the self-confirmation you desire. Concrete others cannot satisfy you; you need an abstract other. As I said a long time ago, in “civilized” societies (organic solidarity) everyone orients himself toward an abstract other to some extent.¹ But certain individuals are unusual, etc. The question is, phenomenologically what exactly is going on with them?

“She is lovely. She is *love-ly*. She is beauty-full.” My darling, you complete me. You *full-fill* me, fill me full with love and I love you, I love to paint you in my imagination. That's where you live, you live only in my imagination.

What explains the pleasure of buying things? Or the pleasure of getting presents?

Strictly speaking, humans are not “ends in themselves,” i.e. intrinsically valuable, because nothing is. The notion doesn't make sense. But they are, or can be, valued *for their own sake* (so to speak): my valuing someone's self is effectively synonymous with my valuing my own self-confirmation, since it is through the mediation of another self (concrete or abstract) that I confirm myself. My valuing myself is my valuing you. If I don't respect *you* then to that extent I don't respect myself, since it is through being respected (or loved) by someone whom I respect (or love) that I respect (or love) myself. Thus, if I am to fulfill myself, to attain self-confirmation, I have to value you as I value myself. Arguably, that's impossible, perhaps even incoherent. But it can be approximated.

In any case, morally speaking you should *act* as if people are intrinsically valuable. That's what morality is.

If you think about it, the idea of karma is rather offensive. Or, since I'm not offended by anything, at least it's morally and logically problematic. It amounts to the claim that everyone gets his just deserts. The real is the rational, and the rational is the real. Or, this is the best of all possible worlds. “One truth is clear,” as Pope writes in his *Essay on Man*; “whatever is, is right.” But we all know that this Leibnizian,

¹ Actually, in *all* societies there is an abstract element to the other, just to the extent that the other exists for people. Concrete and abstract are fused: a concrete other instantiates the abstract ‘phenomenological structure’ in your mind, while this abstract other is basically an internalization of the significant concrete others in your life.

Hegelian—and Spinozistic—doctrine is not only ethically dubious but downright dangerous: it can be used to justify any sort of injustice. Stalinism? Hitlerism? Pol Pot? The oppression of minorities? The real is rational! Progress works in mysterious ways! Everything is determined, everything is necessary! Inevitable, like logic itself! Quietism, conservatism, is the logical conclusion of this attitude of *amor fati*. It's a quintessentially *religious* attitude: faith in the eternal, in the beyond, in historical logic or evolution, as if it's God, with the result that you accept the world as it is. Great faith = great equanimity, great love for the natural unfolding of fate. If you vigorously throw yourself into action it's because you don't have faith that everything is as it should be: the world could be different, the world as it is is flawed, which means that people *don't* get their just deserts, we're not all wholly responsible for our destinies, karma is at best only partly true, much of reality is irrational, and God is not perfectly good or worthy of blind faith. His work has to be corrected.

In other words, there is such a thing as chance and free will. This fact is what logically justifies social activism. (Is it any wonder that power-structures throughout the world and history have propagated the same deterministic, necessitarian, consoling dogmas about the justice of fate, everyone's essential place in the hierarchical social order—"duties," as in the *Bhagavad-Gita*—and eternal rewards, compensations for present hardship? Look at any metaphysically minded regime from ancient India to the Soviet Union. Secular regimes like America's have different versions of the same 'philosophy of consolation.')

On the other hand, there is something compelling about the idea of karma. To an extent each person does create his own reality. But only to an extent.

Among the profoundest concepts is that of *repetition*. It fascinates me, and many other great thinkers. Freud made productive use of it—it led to his theory of the death instinct; Nietzsche was dazzled by it; Aristotle and the ancient Stoics (and other cultures) believed in eternal repetition; Hegel recognized the importance to spiritual development of a sort of transformed repetition; an entire philosophy of history is premised on it; Kierkegaard wrote a book called *Repetition*. Throughout the cosmos, in fact, repetition is woven. Biologically it is of the utmost importance, from the infant's *rhythms* to the very workings of DNA and RNA. Music is based on repetition, not only rhythmically but melodically and harmonically. —The concept is both the most commonplace and the most profound of all concepts.

Think of this: "Be constant in thy love." (From my *Book of Joe*.) That means be faithful in your love. Con-stant: stand with, stand firm (*constare*). Stand firm in your love, stand *with* your loved one. But how does that manifest itself? Through repetition. You *constantly*, as it were, in every moment repeat the act of loving. (The connection between the two meanings of 'constant.')

Incidentally: how do you acquire the ability to stand firm (*constare*)? By standing with (*constare*). You get strength from your *with*-ness.

Interesting: the word 'complacent' seems to come from the Latin 'com placenta.' Not asserting your independence.

Went to a concert outside at the Esplanade (on the river). Very pleasant. Haydn's cello concerto in C—I prefer the one in D—and Brahms's first symphony. The problem with Brahms is that his melodies are usually not memorable, not nearly as memorable as Beethoven's. And his serious music usually lacks a sense of humor. Also, it lacks that sense of inevitability which characterizes Beethoven's pieces, with each measure inexorably emerging from the previous one. That is to say, Brahms doesn't have Beethoven's *vigor*, his life-affirming verve. What gives Beethoven's music this quality—this universality, this *necessity*—is basically a mystery, as Leonard Bernstein said. It can't be analyzed; it's intuitive.

[....]

Despair: *de-sperare* (to *hope*). As Kierkegaard says, to despair is to not believe in *possibility* any longer, to think that alternatives have become impossible. It is to lose faith in one's freedom (i.e., the reality of possibilities)—to treat oneself as belonging to the realm of necessity, the realm of thinghood, of remaining stationary in this state forever. "A possibility and the despairer breathes again," writes Kierkegaard, "he revives; for without possibility it is as though a person cannot draw a breath." In other

words, “Hope is a good thing, maybe the best of things...” Hope, or freedom, the consciousness of possibility.

The ‘spiritual’ meanings of a lot of words are merely metaphorical extensions of the original ‘bodily’ meanings. For example: depress, repress, suppress, impress. Im-press: *press in*. Sub-press: *press under*. De-press: *press down*. Re-press: *press back, press again*. (Something presses in one direction, you press back to keep it in check. From *reprimere*, to check.) This fact is philosophically and psychologically pithy.

Kierkegaardian repetition. More profound than Nietzsche’s eternal return. I want to describe it, but I can’t do it justice. (Kierkegaard may be the profoundest thinker of the 19th century after Hegel. He was certainly not its most *realistic* or *correct*, though, nor its most *socially* profound. Those distinctions are reserved for Marx.) It doesn’t seem very metaphysical. It has more to do with self-fulfillment, with the desire to recapture a lost world of innocence, wholeness, meaning, value. Is this sort of repetition even possible? Not if you set out intentionally to achieve it. Such an attempt would probably backfire, sending you into greater despair than you were in before. Instead, repetition is *bestowed*; it just comes, it is a *gift*. Your task is simply to be open to receiving this gift.

Sometimes value lost is reacquired precisely when we stop trying to regain it. We may need a stance of receptivity, willingness, rather than the narrow focus of willed achievement. We are told in Kierkegaard’s papers that at its highest, repetition gives up the idea of self-sufficiency. Realizing that the outcome of our search for roots or love or world is not under our control may be a necessary condition of openness toward emerging roots or love or world, and hence the satisfaction of the need. Giving up on repetition as an explicit task is preparation for repetition as world-bestowal...

Remind you of someone? Yes, Heidegger. Heidegger insisted that the antidote to nihilism is decidedly not in the creation of new values, because meaning has to come from the *background*. You can’t consciously invent existential meaning, for it is precisely that relative to which we act, that fundamental “horizon of significance” which is implicit or presupposed. The very attempt to *choose* values is a symptom of the malaise. It implies relativism, after all. Instead, you need an attitude of *receptivity* to nature or “being” in order for the world to become meaningful again. You have to be open to the possibility of an “epiphany.” (My addition.) Kierkegaard says similar things about repetition—and his framing the issue in terms of that concept is illuminating, suggesting as it does an Eden-like past. Union with the mother, perhaps, or some such moment of immediacy. I’ll return to this in a second. Here’s a passage from Kierkegaard:

[We should know]...that repetition is a task for freedom, that it signifies freedom itself, consciousness raised to the second power, that it is the *interest* of metaphysics and also the interest upon which metaphysics comes to grief, the watchword in every ethical view, the *conditio sine qua non* for every issue of dogmatics, that true repetition is eternity, that repetition (by being pursued so far that it vanishes for psychology as transcendent, as a religious movement by virtue of the absurd, which commences when a person has come to the border of the wondrous) will come to mean atonement.

The book has a good discussion of these enigmatic claims.

I was going to write more, but forget it. I should read more instead.

The contrast between Platonic recollection (of the Good, True, Beautiful) and true repetition. Pagan vs. Christian—conscious vs. unconscious, reason vs. faith, active vs. passive, a self-guided act of recollecting vs. a gift from the other.

Two kinds of self-fulfillment? Active, as in Marxian philosophical anthropology, and passive, as in mystical oneness or Kierkegaardian repetition? The creative faculties as opposed to the affective faculty? “Self-fulfillment” is ultimately not a meaningful term. It’s either a truism misleadingly expressed (from one perspective) or nonsensical (from another).

The danger of religious faith is that it's supposed to be above morality. Witness the story of Abraham. Faith justifies anything: "I have faith that it's all for the best. I have faith in God and eternity." The road to hell...

The teleological suspension of the ethical. "Faith is the paradox that the single individual is higher than the universal." According to *Fear and Trembling*, the ethical has to do with the common good; faith has to do with the individual's salvation, which is so little related to ethics that it can prescribe absolutely unethical courses of action. But if this is faith, then Osama bin Laden is an exemplar of faith, like Abraham. He is the logical conclusion of Abraham's philosophy of faith. (Or, if not bin Laden, since there are differences between his situation and Abraham's, then someone who murders his family and all his friends for the sake of God and his own eternal salvation.) —Contrary to *Fear and Trembling*, I think that true faith, the good kind, does not involve a suspension of the ethical. On the contrary, it is little else but a transcendently motivated consummation of the ethical. Abraham's faith is not Jesus's (as *Fear and Trembling* seems to imply); it is a degrading, submissive, slavish faith. A philosophy not of love but of submission.

The connection between sex and death, or sex and violence. One of the reasons for it: in sex, violence, and death, humans are largely reduced to their body. An objectification takes place, an identifying of the self with the body. The self in fact recedes from explicit view: blood, bodily fluids, flesh, even bacterial smells (in the case of sex and death) come to the fore and mediate our experience of the other's self. Another way of saying it is that our ordinary ethical way of acting is suspended in the experiences of sex, death and violence. Ethics, "human dignity," respect for the other as an autonomous being or an end in himself, a spiritualized entity, more or less disappear. In short, *culture* recedes from view. After all, culture is just a mesh of norms or roles that exist for the purpose of mediating the other's perception of you in order that he confirms your sense of self in the desired way. But in the three experiences I'm talking about, in their body-centered immediacy, mediative roles are in large part cast aside. Hence our fascination. It's significant that the degrees of our respective fascinations with sex, violence and death (and surgery) are almost equal. (If the fascination is greater in the case of death, that just supports my argument. Death is the complete absence of any vestige of culture, which amounts to the complete absence of the self.)

Said differently, with these experiences there is an unusual *closeness* to people, to the real, the physical, nature of people. The mask comes off. The thick mesh of behavioral norms is cut through, so that the body, the *biological*, appears. In primitive societies of paltry "socialization," nudity and sex are not such objects of fascination as they are for us—because there is not such a contrast between the 'naked' human being and his everyday roles. It's the *contrast* that grips us.

Liszt's transcription of Schubert's song "Am Meer."¹ And "Ständchen." And "Der Müller und der Bach." And "Lebe Wohl." Pieces that have moved me. Also the song "Am Bach im Frühling," among others.

Reading the novel *The Alchemist* because everyone has recommended it.

Mark Twain: "...Reader, suppose you were an idiot. And suppose you were a member of Congress. But I repeat myself."

What's the significance of the fact that words like illusion, elude, allude and delude are variations on the Latin word for 'play'? Huizinga discusses this in *Homo Ludens*, but I forget what he says.

To understand: to stand under. That's the etymology in a nutshell. 'Finally, after years of studying it, I stand under (e.g.) Marxism!' It's also interesting that "the 'understander,' in circus slang, is the one whose shoulders carry the full weight of the acrobatic team." To understand: to bear the weight of... I used to stand outside Marxism; now I stand under it. I'm holding it up; it presses down on me. (?)² The original

¹ Another of Schubert's shockingly simple and moving melodies, in the beginning.

² Contrary to these suggestions, one website states that the Old English sense of 'under' was closer to 'between, among' than 'beneath.' Thus, to understand is to stand in the midst of, or to be close to.

concept of understanding makes reference to one's *location*, to a virtually physical (or at least behavioral) fact rather than a mental one. Think also of German: *verstehen* = stand before. (Heidegger wasn't just being a stupid cultural nationalist when he said that German is the most philosophical of languages.)

But 'That joke was *above* me' = 'I *didn't* understand it.' Maybe 'above' here means far above, so that I am not in direct contact with it, not directly under it or directly before it, not in its presence. 'General relativity is beyond me. I don't stand under it; it's beyond me.'

Perceive: *percipere: per-capere*, to take thoroughly. So, to perceive is to thoroughly take something in, which has philosophical implications. ('Take' is active. So perception is active, not passive. And the 'thoroughly' part suggests that there is a difference between perception and sensation, in that the latter is less thoroughly conscious than the former.)

Conceive: *com-capere*, to take with, to take in and hold (be together with). The pregnancy meaning was the original one; the word was extended to mean 'to take into the mind' around 1340.

Behave: be-have. Have being. To behave in a certain way is to have being in a certain way, to have (or hold) oneself in a certain way. "Behave!" Have being! Have a determinate being! Stop acting crazily, 'pull your self together,' give being to your self!

Comport: *com-portare*. Carry together, carry with.

Endure: *indurare* (harden against), *in-durare* (harden in [oneself, one's heart]). To endure something, you have to become *hard* in your self.

Enthusiasm: *entheos*, be inspired: *en-theos*, i.e. *a god in*. A god is breathing into you, so to speak.

Conspire: to breathe together.

Adjective: *ad-jacere*, to throw to. You 'throw' an adjective to its object. Again, this reinforces the model of humans as essentially active beings, not passive recipients of external data.

Object: *obicere*, "to present, oppose, cast in the way of," from *ob-jacere*, to throw against.

Subject: *subicere*, to place under, from *sub-jacere*. The original meaning is the "person under the control of another" one. The "person or thing that may be acted upon" meaning is from 1592. The connection between the meanings is obvious.

The Alchemist, the novel that has sold tens of millions of copies. "To realize one's destiny is a person's only real obligation." "When you want something, all the universe conspires in helping you to achieve it." "God has prepared a path for everyone to follow. You just have to read the omens that he left for you." "There is a force that wants you to realize your Personal Legend." "Whoever you are, or whatever it is that you do, when you really want something, it's because that desire originated in the soul of the universe. It's your mission on earth." In short, try to achieve your dreams. Where there's a will, there's a way. Life has meaning, and God cares about you. Every person has a destiny. The only thing to fear is fear itself. If you love yourself you can accomplish anything. —Cheap New Age "wisdom." There are no coincidences, everything is meaningful, everyone is special, the universe is teleological, we are all part of the One, each person is the center of the universe, blah blah. No wonder the book is so popular: it's self-help in the form of a novel. I'm reading a fucking self-help book. I won't deny that the writing is good—no characterization, of course; it's a simple allegory—but I will deny that the book deserves its fame. The author, Paulo Coelho, isn't a profound thinker; his philosophy is the superficial religious one. It's the sort of ideological, individualistic thinking that reconciles people to the social order. Requires no penetration beneath appearances—is in fact the *appearance* itself. 'Life is a matter of *will*. If you don't realize your dreams, it's your own damn fault. Pull yourself up by your bootstraps.' It's the fucking American capitalist ideology spiritualized. If people find these ideas remotely plausible, it's because they're ignorant of the millions, billions, of people who yearn passionately for their dreams but have no chance of achieving them.¹ The world is more or less just? What a fucking joke. This book implies that the world is just. No wonder the establishment loves it.

¹ I don't include myself in this group of unfortunates. Fundamentally it's all the same to me: my happiness isn't conditional on the achievement of certain "dreams." I don't even think I have real dreams anymore.

“Unfortunately, very few follow the path laid out for them—the path to their Personal Legends, and to happiness. Most people see the world as a threatening place, and, because they do, the world turns out, indeed, to be a threatening place.” Wow. The world wouldn’t be threatening if I didn’t see it as threatening? That’s one of those thoughts—the book is full of them—that sound profound but are actually asinine. In a few privileged areas of the world, for a few privileged people, it may be partly true that *esse est percipi*. Coelho’s idealist philosophy may be not completely absurd. But in most of the world, it is. And sometimes your dreams are not objectively within the realm of possibility. No one *creates* his world; he is in large part created by it. Humans are not perfectly free: Sartre’s existentialism is ultimately simple-minded, despite its profound appearance.

...Finished the book. I have to admit, it’s a wonderful story. It left me high. And I see now that the falsity of its New Age propositions is beside the point: myths are what sustain people in their quests, in life itself, and to that extent are good and necessary. By refusing to let the world’s injustice stifle you, the world indeed becomes a less threatening place (for you). Attitude is not everything, but it is a lot.

Near the end, the book’s implicit position is revealed: animism. The boy talks to the wind, the desert, the sun.

I should also remember that Elizabeth Lloyd Mayer’s book proves that “miracles” do happen.

The eighteenth-century mania for republicanism. Think of the term “republic of letters,” coined then. Republicanism was everything that was good, the opposite of corruption, self-interest, greed, and a virtual synonym for virtue.

The breathtaking utopianism of America’s revolutionary leaders. Remaking society in accordance with republican principles. Inspired by Lockean empiricism: virtue could be *learned* if education and the political system were reformed. Republicanism would create leaders animated by a spirit of “disinterestedness,” not the drive for personal gain that had operated in monarchical times. Nepotism had been almost rampant; now a republic of virtue would be created. A meritocracy. It was all about *enlightenment*. Enlightenment was fated to spread around the world, according to John Adams and others; and America was at the forefront of the movement. –Anticipations of the French Revolution.

One example of their progressivism: the reform of punishment. No more cruel and unusual punishment, fewer executions and no torture, punishments based not on public shame (which was becoming less meaningful because society was larger and less intimate than in the past) but on private penitence, solitary confinement where criminals could contemplate their wrongs. Hence the “penitentiary.”

“We shall never understand the unique character of the revolutionary leaders until we appreciate the seriousness with which they took the new republican ideas of what it was to be a gentleman. [*Not* the monarchical ideas of family connections, wealth, estates, haughty behavior. America didn’t have a conventional aristocracy.] No generation in American history has ever been so self-conscious about the moral and social values necessary for public leadership.” They were nearly obsessed with rolling back parochialism, fanaticism, and barbarism. This explains their antagonism toward religion.

In all things they took their cue from the Roman republic. Classical ideals. They wanted to be modern-day Romans, modern Ciceros. (That was John Adams’s dream.) Washington made himself a Cincinnatus by resigning as commander in chief of the American forces. He returned to his farm, wanting nothing more to do with public life. And, as he expected, the Western world sat in awe of him, this classical disinterested patriot. –Actually, Washington was supremely vain, truly obsessed with his reputation. Everything he did was for the sake of his reputation. He fervently wanted to embody classical ideals.

But there were differences between the moderns and the ancients. An important one was the changed conception of republican virtue. It wasn’t as severe, stoical, self-sacrificing as during Roman times; it was softer, based more on the ideals of benevolence, affection, love, *politeness* between men. The willingness to get along with others for the sake of peace and prosperity. “Virtue became identified with decency.” Ancient virtue was martial and masculine; modern republican virtue was soft and feminized. Since monarchical ties, such as patronage and personal loyalty, were being dissolved, it was hoped that this sort of benevolent virtue would replace them as the chief social adhesive. (As with Rousseau, political associations at a level lower than government were frowned upon, as promoting self-interest, corruption,

conspiracies, the concentration of wealth, a lack of disinterestedness. Society was supposed to be a collection of (friendly, mutually attracting) atoms—the opposite of monarchical society, with its numerous dependencies, personal ties, rankings, hierarchies. Rousseau’s atomized conception of man was a reaction to the completely un-atomized nature of the monarchical society he loathed.)

Another soaring summary of the revolutionaries:

The republican revolution was the greatest utopian movement in American history. [Debatable. What about Populism, which swept up millions of farmers and laborers?] The revolutionaries aimed at nothing less than a reconstitution of American society. They hoped to destroy the bonds holding together the older monarchical society—kinship, patriarchy, and patronage—and to put in their place new social bonds of love, respect, and consent. They sought to construct a society and governments based on virtue and disinterested public leadership and to set in motion a moral movement that would eventually be felt around the globe.

It wasn’t long before disillusionment set in. “By the early nineteenth century, America had already emerged as the most egalitarian, most materialistic, most individualistic—and most evangelical Christian—society in Western history. In many respects this new democratic society was the very opposite of the one the revolutionary leaders had envisaged.” The idea of equality, which had been let loose in the Revolution, spread like wildfire. But really the biggest problem, from the perspective of most of the revolutionaries, was that society was becoming organized into *interests*. Interest-group politics emerged in the 1780s and 1790s, and it was here to stay.

Madison, Hamilton and the other Federalists had the republican belief that politics should be the sphere of disinterested, virtuous, educated gentlemen, men not involved in market activities which could give them private motives for advocating specific policies. It was all about *disinterestedness*, pursuing the *public* good over the private goals of interest-groups (like agriculture, commerce, manufacturing, etc.). This is pure Rousseau: only a few exceptional men had the breadth of perspective to be “legislators,” to understand the general will and enact it. The Anti-Federalists, on the other hand, denied that anyone could be truly disinterested, and that the elite could understand or care about the needs and wants of the people. The elite was an interest-group like any other in society. In fact, the Anti-Federalists argued that there isn’t any such thing as “the public interest”; there is only an aggregate of private interests each fighting for itself. And that’s what politics should be: the arena in which interest-groups fight it out. “The consequences of such thinking were immense and indeed devastating for republican government,” in the sense understood by the Federalists.

The Anti-Federalist conception of politics was the more powerful, the more realistic, and in the end it carried the day. Such developments ensued as “the increased electioneering and competitive politics, the open promotion of private interests in legislation, the emergence of parties, the extension of the actual and direct representation of particular groups in government, and the eventual weakening, if not the repudiation, of the classical republic ideal that legislators were supposed to be disinterested umpires standing above the play of private interests.” But the Federalists were right in the long term, and Jefferson’s Republicans were wrong, about the size of government. Jefferson wanted a small government, the Federalists wanted a big one.

Even now we still have a version of the old Federalist ideology that only a small group of men can be trusted with the task of governance. Walter Lippman and such liberal intellectuals—as well as many conservatives and neoconservatives—argue that only the educated elite should be concerned with politics; the rest of the population should be left out of it most of the time, because the people are stupid and ignorant. And, of course, they are, to an extent, but so is the educated elite. The elite is definitely not disinterested and virtuous!

By the way, have you ever noticed that George Washington didn’t really have a face? That is, his face had no character, no distinctive features. It was bland and ugly, soft and flabby, with dull eyes. It’s like...a generic face, if that’s possible.

Kierkegaard and I share intuitions about knowledge and truth:

...Kierkegaard thus seems to combine an epistemology that rejects classical foundationalism with a traditional "realistic" account of the aim of knowing. He seems "postmodern" in his account of knowledge, yet "modern" or really "premodern" in his understanding of truth. Such a combination is puzzling to many. How can one believe in an objective, mind-independent reality and at the same time deny that human beings have final knowledge of such a reality? [Huh? On the contrary, how can one find this combination of beliefs puzzling?] Can we view our beliefs as "approximations" of an ideal truth if we never possess that truth? [Sure. Why not?] How can one say there is a thing in itself and then deny that we humans ever finally know what that is? [Easily. There is nothing incoherent about that.] At this point the antirealist argues that the thing in itself is a meaningless or perhaps useless ideal. Richard Rorty, for example, argues that realism only makes sense if one asserts that humans have some kind of direct access to reality, some mode of "givenness" such that we can compare our ideas with a reality that is known independently of those ideas. But since we have no such access to reality, Rorty asserts we must give up the ideal of truth as "contact with reality" in favor of truth as "what it is good for us to believe."

It is just at this point that Kierkegaard's view is most illuminating. For he rejects an often unnoticed premise that is common both to the classical foundationalist and the antirealist postmodernist. Both agree that *if* there is to be knowledge of objective reality, there must be some method of obtaining certain knowledge about that reality. [I don't see why Kierkegaard should be seen as rejecting this premise.] The classical foundationalist, from Descartes through Husserl, concludes that since there is objective knowledge there must be such a method. The antirealist concludes that since there is no such method there is no knowledge of objective reality. We can see lurking behind Rorty's antirealism the dashed hopes and disappointments of the classical foundationalist.

On Kierkegaard's view, though there is no "absolute given" and no "method" that can be relied upon to produce certain, objective knowledge, empirical knowledge necessarily aims at such knowledge. He never doubts that this ideal of objective knowledge is valid as an ideal or that there is a reality independent of us that we are attempting to know...

This has been my position ever since my senior thesis, or before. Even if there isn't such a reality, we necessarily assume there is.

August

I'm in love with Helene Grimaud. (Her performance of Bach-Busoni's Chaconne in D minor. A few interpretive flaws, but excellent overall.) She is everything I want in a woman. If I'd met her when she was ten or fifteen years younger, I would have been infatuated.

The great mystery of my life, the single insoluble mystery, is that I am not God. I want to *stand under*¹ myself, but I can't because I am not God. Instead, I stand under the absurd. [Obvious references to existentialism.]

¹ [Understand...]

Busoni's transcriptions of Bach are magnificent, but Gould may have been right that they also represent corruptions of the original pristine structures, the musical-logical structures. They romanticize the music, sentimentalize it, aggrandize it, *exaggerate* it, thus depriving it of its pristine classical quality. I love Grimaud's version of the Chaconne, but I almost feel as if I shouldn't love it. For what exactly do I love about it? The epicness, the emotionalness, the sublime besottedness—*intoxicating*. And the *loudness*. The dynamic contrasts; it's all about the dynamics. But that ain't Bach. Bach wasn't all about the dynamics, or thick, lush sound. The Chaconne is for solo violin! It's melodic, contrapuntal; but with Busoni, everything's harmonic. It's 'Wagner meets Bach.' Insofar as there is anguish in Bach's Chaconne, it is subtle and dignified. It's infinite anguish, which is to say it doesn't enjoy itself. (No self-reflection, no self-consciousness.) And then there's infinite forgiveness and hope, which doesn't congratulate itself on its beauty. It simply expresses pure, elevated, melodic joy. There is no need for filling out its bare-boned structure with lush sound, with chords and arpeggios and huge crescendos and diminuendos to make everything *pretty* and *embellished*—and *obvious*. Nor is there any virtuosity for its own sake. It's just a clear voice from heaven.

In his most serious compositions, Bach always wants to transcend sonority. Gould was right: Bach doesn't care about sonority, he cares about structure. He is reaching beyond, trying to communicate with God, literally. His works are about *transcendence*, transcendence of the immediate (emotions, matter, even sound-for-its-own-sake). Not so with Busoni and much romantic music. Busoni is "pianistic," as Gould would say. He is completely immersed in the piano, doesn't try to reach beyond it. Ultimately this attitude is a sort of musical *temptation* (in the sense of sin), like the temptation to wallow in sorrow of which Dante and Oscar Wilde speak. Wallow in the immediate—aestheticism, which is a kind of hedonism, which is weakness.

It's possible I'm being slightly unfair to Busoni. There are indeed otherworldly passages in his transcription(s). He was a true genius, of course. But I still get the sense that he vulgarizes Bach a little by going for the *effect*. I don't get this sense, for example, with Rachmaninoff's transcription of the third partita or with Liszt's transcriptions. But it's true that, from a Bachian or Gouldian perspective, the piano is an inherently risky instrument, since it's so easy to lose oneself in its beautiful, lush, textured sound.

...After hearing Alexander Gavrylyuk and Claudius Tanski play Busoni's version of the Toccata and Fugue in D minor, I have to say that no one could have transcribed it better. Besides, I need hardly note that the performer has a huge part of the responsibility to keep it clean and Bachian.

The assault on the American aristocracy by the laboring masses and emerging businessmen, from the 1770s to the early 1800s. Gordon Wood calls this the true American revolution, this new form of egalitarianism that swamped the North's aristocracy and put it on the defensive. Idleness became a vice, labor a virtue—an epochal change. Vicious attacks on the idle rich (mostly Federalists) by Jeffersonian Republicans—speeches, pamphlets, etc. "The rich are no better than us!" Parson Weems celebrates Franklin and Washington as industrious, as great because of their industriousness. Idleness is "the worst of crimes." This is the opposite of the old republican ideal of wealthy leisure which makes possible disinterestedness and virtue. Successful entrepreneurs are being celebrated as only great politicians were in the past. To keep up with the times, even aristocrats start insisting that man is essentially a working being, that real happiness consists not in leisure but in industriousness (even if it involves making money). Some aristocratic writers collapse the distinction between mental and manual work, arguing that lawyers and professionals have no more leisure than mechanics and are not essentially different from them.

These developments were occurring all over the Western world, but they were proceeding much more quickly in America. Foreign observers concluded that only in America was "industry an honor, and idleness a disgrace." Tocqueville was astonished that working for money was seen as honorable. And he remarked that this promoted the perception of equality: for if even government leaders had salaries, as they didn't in Europe (or only nominal ones), then no one need feel degraded by working for money.

"Perhaps nothing separated early-nineteenth-century Americans more from Europeans than their attitude toward labor and their egalitarian sense that everyone must participate in it... With everyone claiming to work and no exclusive working class, it is not surprising that the development of a socialist

movement in the United States was inhibited.” Good point. In Europe, the working class was clearly set off from the rest of the population. Obviously a socialist movement will more easily develop where the class structure is relatively rigid.

But why was America exceptional in these ways? One reason: it didn’t have much of an aristocracy to begin with. In almost all cases, “aristocrats” didn’t have anything approaching the financial security that their counterparts had in England. So they had to work on the side, practicing law or whatnot. This is also why the new American government was the first in Western history to give salaries to its leaders (in Congress and the executive branch): most men simply couldn’t afford to work without pay. The establishment of salaries was another nail in the coffin of the Ciceronian ideal of disinterested public service.

So, classical republicanism was ending and liberal democracy was beginning: Jefferson apparently said that “the public good is best promoted by the exertion of each individual seeking his own good in his own way.” I.e., liberalism. Adam Smith. Everything was reducible to the competition of private interests. “By 1823 *Niles’ Weekly Register* already defined modern politicians as ‘persons who have little, if any, regard for the welfare of the republic unless immediately connected with...their own private pursuits.’” A far cry from Cicero! And also from the early ideals of the Founders.

These changes prepared the way for modern political parties. “The Democratic-Republican parties...in some northern states...were the first modern parties in American history and perhaps in Western history. These parties were impersonal and permanent organizations of professional salaried politicians that were designed solely to recruit leaders, mobilize voters, win elections, and compete regularly and legitimately with other opposition parties. As such, they were unlike the earlier Federalist and Republican parties and indeed were unlike any party that had ever existed before.”

Martin Van Buren, the first modern professional politician to win the presidency. He built the best-organized political party in the country.

As for the increasing atomization and ‘equalization’ of society, much of it was due to the simple fact of westward expansion. “It is impossible to exaggerate the significance of this westward movement of people. It was a ‘stupendous work of human advancement...of which the history of mankind certainly affords no other example.’” That may be true. The whole country “breaking up and moving westward” in two or three generations, population-movements and constant commercial activities undermining traditional social structures (or making impossible their establishment). No wonder individualism, freedom and equality became American traits! Frederick Jackson Turner was largely, though not entirely, right. But the Revolution itself was also integral to the growth of equality and democracy. “It was ‘the general operation of the new political order of things on the mind and character of the country’ that explained the growth of democracy.” The Jacksonian revolution was responsible not so much for the democratization of America as for the legitimizing and bureaucratizing of democracy. It restrained it, controlled it, reconciled Americans to it. With Jackson came a lot of centralization and consolidation, which has been obscured to historians because of the Jacksonians’ radical democratic rhetoric. It’s true that far more ordinary people became involved in the government during those years than before. But Jacksonianism also signified the triumph of party politics and party-discipline—only Democrats were appointed to government positions, and party loyalty became the be-all and end-all—which means the relative centralization of power. (The president was called “King Andrew” by his opponents, who consequently called themselves Whigs.) And bureaucratic rationalization, regulation, impersonality increased.

...To return to commerce: it’s important to understand that America did not become materialistic and money-obsessed only with the late nineteenth or twentieth century. Since soon after the Revolution, its latent materialism and commercialism had become explicit. “The American,” foreigners said, “is always bargaining; he always has one bargain afoot, another just finished, and two or three he’s thinking of. All that he has, all that he sees, is merchandise in his eyes.” The anguished laments of American intellectuals before the War of 1812 about the crassness of their society remind one of the laments of Western intellectuals in the 1950s. In both cases, a new world, in a sense, was beginning, a new economic and political order. —And at the same time, at least in America, there was a revival of religion! Significant. (The Second Great Awakening was far more noteworthy than what happened in the 1950s.)

Saw a psychic tonight. First time in my life. Wasn't very impressed. It was at ELC: I went back there this afternoon to chaperone an activity with the students, but the incompetence of Boston's public transportation system made me late. I got there at 4:45; apologized to the receptionist, a Brit named Emily, and then asked her how late she usually stays at work. She said she was staying later than usual tonight because a psychic was coming to service the staff! (Or the few who were still there. Most of the staff leaves at 3:30.) I decided to stay, to have my future read to me. Most so-called psychics are frauds, but the director told me some astonishing stories about this woman. She had given her very specific information about, for example, her future marriage, and the nationality of her husband, and her future pregnancy—she was going to get pregnant within two months of her sister-in-law, and it turned out to be true—and so on. The psychic arrived. Started seeing each of us, fifteen minutes apiece. The people before me emerged from their sessions with impressive stories of her supernatural powers, such as her knowledge of the names of their significant others. ("Is there a William in your life?" "Yes, he's my husband." Also, "I'm sensing something about dolphins...." "Well, I'm going to a Miami Dolphins game next week.") In fact, I was amazed at their detailed descriptions of her abilities.

But then I went in. One of the first things she said was "Is there a John or a Jay in your life? I'm seeing a J, a name starting with J..." I: "Yes, my brother's name is Jay." "Okay, have you been estranged from him recently? Has there been some coldness in the relationship, some distance...?" I didn't want to be rude: "Well, I don't know, I guess so... We were never very close as children..." "It looks like the relationship is warming up, you're getting closer, things are improving." "Uh, yeah, I guess we're getting closer..." I was a bit confused; didn't think we'd be talking about him. "And it looks like he's been sick but is recovering now or has recovered. Or, someone has been sick. Has Jay been sick?" No. "I don't know, maybe," I said. Didn't want to discourage her. Then she laid out some cards and started interpreting them. Said she saw a lot of men in my life and hesitantly offered some names and letters—'Bill' is the only one I remember. I told her that Bill is my mom's brother—or rather, she asked hesitantly if that was so and I said yes—and then she made a few suggestions about Bill that didn't seem very plausible to me. "Are you gay?" she asked. Apparently all these men in my life made her think I'm gay. (Who are these men? I have very, very few men in my life.)

All in all, she gave almost no specific information. Told me to take ten cards from the pile, then she interpreted them. Mentioned the letters J and L in connection with women in my life, but that meant nothing to me. Said I was choosing or was going to choose between two women. Later I asked her if I was going to get married, and she said in two years. Then said within two to four years. And I'd have a child in two to four years. Also, she remarked multiple times that I'm good at healing people, and that I'll probably do something with my life that involves helping or healing people. Gropingly she mentioned law too, said I might do something with law. —All in all it was vague and unconvincing, though I repeatedly encouraged her so as not to be rude.

And yet the girls who met with her, and the only other guy (gay), emerged with incredible stories about the specific and accurate information she'd given them (along with inaccurate guesses). If she has psychic powers, they seem to wax and wane depending on who she's talking to. Much of what she said to me was pure guesswork; maybe there's some sort of resistance in my mind that blocks extra-sensory perception. Evidently what happens is that ideas and images flash before her mind: sometimes they're ESP-caused, other times they're random flickers from her subconscious or preconscious.

My natural inclination is to laugh at ESP stuff as being ridiculous, but I'm trying to be open-minded.

[...]

I woke up early in the morning with a splitting in my head because of the alcohol. So I drank a glass of water. Within minutes the headache eased; I could feel it easing as the water traveled through my bloodstream into my brain. And I was struck by the weirdness of it all. Water was at that very moment spreading through my head, with the direct result that my headache was being alleviated. *Water—in my*

head. The flip-side: a pleasant effect on my consciousness. The objective and the subjective: the same phenomenon from two different perspectives.

The 1954 movie *Salt of the Earth*, about a strike by Mexican miners, is very good, especially for its low budget. It was banned at the time and condemned by the U.S. House of Representatives. I've decided to resume my education: reading books about American labor history. First Daniel Guerin's *100 Years of Labor in the USA* (1976). Also articles. Jennifer Klein: "The Politics of Economic Security: Employee Benefits and the Privatization of New Deal Liberalism" (2004).

Chomsky is my intellectual conscience. I think about him every day, multiple times a day. Dozens, hundreds of times a day. It's as if he's always in my preconscious. He guides my thinking, at least on social and political questions. He has a genius for stating clear principles, premises or conclusions, which are nearly truistic but are surprisingly easy to ignore. Such as his insistence that the most elementary moral principle is that you must apply to yourself the standards you apply to others. People have a very hard time doing this, which is why nearly everyone is a hypocrite in many ways. (They condemn snobbery but are snobs themselves,¹ condemn inconsiderate behavior but are inconsiderate themselves, and so on. I'm not immune to these lapses.) Especially in politics. When *they* do it, it's a crime, whereas when *we* do it, it's justifiable or even noble. This tendency to think hypocritically is a species of unintelligence, of "abstractly-interpersonal" unintelligence, as I called it once. An inability to put oneself in the other's shoes, or to think of oneself from the position of the other. The very foundation of morality is the ability to imaginatively adopt the viewpoint, or occupy the situation, of the other—which is why morality in its explicit form is limited to the human species. (Humans are the animal most capable of internalizing the perspective of the other, i.e. of being self-conscious.) But most "civilized" people—or perhaps most people in all of history—do not have this capacity in spades. Only the ones who do ought to be in positions of authority.

Chomsky's great virtue, in other words, is simple clarity of thought. He can make explicit thoughts that are usually only implicit. For example, I've read a lot about capitalism but have never explicitly drawn the obvious conclusion that *corporations are systems of private totalitarianism*. That thought has been implicit in my mind, but Chomsky makes it explicit, thus permitting clarity of thought. You can talk about "contracts" and unions and all that, but, in the end, a corporation remains a private tyranny because one side has vastly more power than the other and issues dictates to the relatively powerless, the workers. Since this is so, and if you accept that tyrannies are unjust, you're rationally bound to oppose capitalism, or at least American capitalism. You may like that it has created great wealth and improved standards of living, but *morally* it is indefensible, since it deprives people of their autonomy.

The advantage of living in contemporary America is that I'll never be disillusioned, because I've been dis-illusioned from the very beginning.

[...]

Long weekend in Maine with family friends. Bernstein daughters: Rachel, Lindsay, Ruth. 30, 25, 22. Snob, snob, not a snob. The first two have charisma because of their looks and wit, their "positive energy," the third is similarly intelligent but a little less charismatic and pretty. Without going into details, the weekend was quite fun except for my being shoved back into memories from my youth of being ignored by the 'popular kids' even when I had things to say, memories of having nearly to shout and gesticulate in order to get people's attention momentarily focused on me during a debate or conversation or, of course, a party. I lacked the presence or the "energy" (unconscious) of certain others. But it doesn't always have to be energy in the common sense of the word. For example, after Tim arrived this weekend he was instinctively paid more attention to than I (by Rachel and Lindsay, and one or two others—at least, those were the ones who made it obvious) even though he isn't a particularly "energetic" person and typically has less to contribute to a conversation than I do, unless it's about pop music. But his body-size and

¹ Snobbery: not deigning to associate with certain people, considering oneself too good for them, because they're "nobodies." Usually it operates on an almost unconscious level.

something intangible about him apparently combine to draw people's attention, and Rachel even has a crush on him.

Another example of the phenomenon: the girls' cousins are Matt and Steve, college students, brothers. Matt, while short, is quite good-looking, somewhat witty, and has a relatively confident aura. Steve got the short end of the genetic stick: he's prematurely balding, not very attractive, and doesn't have that confident aura. He's merely friendly, kind, self-effacing, intelligent, quiet but interested in people. So Rachel and Lindsay, the snobs, tend to ignore him in comparison to Matt. They don't *overtly* ignore him (usually), and I can see that they like him in a condescending sort of way, but if I were him I'd be insulted. While the six of us (including Tim and Ruth, not including Matt) were playing Yahtzee, a stupid game that involves throwing five dice and competing for attention, I was appalled at the girls' lack of interest in Steve, especially as compared with their overt interest in the goings-on in Tim's corner of the room. When Steve threw his dice and counted them up, then threw them again, etc., and added the total and so forth, everybody ignored him, pursuing their little side-conversations. But when Tim threw his dice the two snobs were riveted, especially Rachel. Every inane little comment Tim made—"Fuck! I didn't want a six! Dammit, I just lost the game!"—elicited appreciative remarks or at least signs of sympathy; on the other hand, I was left being the only one showing interest in Steve, which I did just because I didn't want him to feel ignored. (Amazingly, he seems impervious to people's reactions to him. Doesn't give a shit if he's ignored—an amazingly noble and rare attitude.)

[...] Someone who has the 'presence' doesn't really have to work hard, doesn't have to try to be funny etc.; he or she is like a magnet—tends to attract just by virtue of the presence. Someone without the presence is at a significant disadvantage and has to work harder, especially if in the presence of someone with the presence.

This stuff is difficult to analyze, especially since most elements of human interaction depend on the specific context, on the people with whom one is interacting, even on one's clothes, the lighting, the atmosphere, etc. Nevertheless, there are "tendencies" in each person.

By the way, another way to express all this is to say, as I wrote a few weeks ago, that certain people have more of a "self" than others, or at least they project more of a self; hence their popularity. Again, consider what's being said when you say "He has a strong presence": the opposite of presence is absence, so in effect you're saying that he is more *present* than others, who are more *absent*. His self is relatively present; another's self is relatively absent. This is the meaning of charisma.

Listening on Youtube to Bach's cello suites arranged for guitar. The Prelude of the first one, played by Li Jie: so beautiful I cried at the end. Somehow the piece is more moving on the guitar, or rather it's moving in a different way than on the cello. The guitar is more intimate, private, peaceful. The cello is obviously richer, warmer, more sonorous, but with the guitar I think that the ecstasy of that piece's final lines is more poignant and *piercing* than with the cello, crystal-clear ecstasy. And I thought of Helene Grimaud's saying that art is the only worthy thing man has ever done, and looking at Li Jie effortlessly playing those final bars which are really the most eloquent thing in all music,¹ I felt pretty overwhelmed.

Reading Thomas Brooks's *Toil and Trouble: A History of American Labor* (1971).

What does it mean to treat someone as an end? Literally it means to adopt that person as a goal, as something you want to bring about. That is to say, you want to (help) bring about his sense of self, his desires, his "objective interests"—all of which, in the end, amount to his *freedom*, or his *self-confirmation* (as a free being). A person essentially is the urge or the movement toward self-confirmation, and self-confirmation is, by definition, a matter of freedom, because it's *self-confirmation* (the self's achievement of itself). So, Kant's formulations of morality in terms of both autonomy/freedom and treating others as ends do, in a sense, entail each other, as he thought. And they both entail specific and concrete commitments with respect to the organization of society.

¹ After all, they consist of mere *arpeggios* that have been invested with miraculous meaning.

How strange it is that religious/cultural conservatism and business conservatism fused into one party! I've always been struck by the strangeness of the alliance. But it makes sense if you reflect on its origins. It came into being after World War II, when both the business elite and religious conservatives waged their war against Communism—for different reasons. (Imperialism and the manufacture of domestic consent in one case. In the other, Communism symbolized the perceived erosion of tradition and authority, e.g. with the civil rights movement.) Their alliance was one of convenience, always precarious because the goals of the two factions are not identical. The Sarah Palin rednecks hate business elites, and business elites have contempt for the rednecks. Had the Cold War not happened, the alliance might not have happened. Now that the Cold War is over, the alliance seems to be falling apart. (But old habits die hard.)

Actually, it wasn't until the civil rights movement and the Vietnam War, and afterwards, that the bizarre alliance between certain sectors of business and culturally conservative sectors of the working class really came into being. (Nixon worked hard to bring it about.) But even earlier, the Democrats were starting to lose parts of the working class and the culturally conservative sections of the middle class because the Democrats, by virtue of their connection with labor, could not be as convincingly anti-Communist as the Republicans—and also because the Democrats were the party that (comparatively) supported rights for blacks, immigrants and minorities of all kinds, i.e. the threatening “Other” who would steal jobs from white workers and undermine their traditional lifestyle. When the Dems became associated with high taxes, it was over: the poor whites went Republican, thinking it was in both their economic and their cultural interest. What a spectacular coup on the part of business! Tricking workers into voting pro-business! Maybe the first time in history that had happened. And this wasn't a benign Republicanism: Reagan was among the most aggressively anti-union presidents ever.

[Later:] During the 1970s there was a migration of certain industries from the Northeast, where unions were relatively prominent, to the Sunbelt, where they were not. These industries were rabidly anti-New Deal and anti-union. Hence their (important) support of conservative politicians like Reagan. The defense industry also supported him, since he was a hawk. Needless to say, these industries didn't share the grassroots' concern with religion and traditional values; but they did share the opposition to taxes, to liberal government activism and to the New Deal, and they shared the desire to vigorously prosecute the war on Communism (because, for some of them, it meant revenues, and for all it was a bludgeon to use against their opponents, “radicals”). The parts of the working class that went conservative were hoodwinked, as they had been by the fascists in Germany and Italy; this isn't as true of the middle-class conservatives.

Why has America always been such a *fearful* country? So afraid of the Other! Far more so than other countries. Whether it's been the Indians, the British, the blacks, the Chinese, the Germans, the Communists, the Japanese, the atheists, the Mexicans, the terrorists, or whoever, Americans have always been terribly afraid of some group. It must have something to do with the unstructuredness of the social fabric, the atomization that has characterized American society from the very beginning (after the Revolution), which was so different from Europe. Paranoia is fostered in such conditions. Think of the paranoia of the 9/11 Truthers, and the conspiracy theories that have always been popular in this country. Distrust has always pervaded the society, especially distrust of authority (hence conspiracy theories) and of any 'new' group that is seen as unusually cohesive and thus threatening. Paranoia, mass distrust and fear, insecurity, xenophobia, are natural attitudes in an atomized society of few 'civil-societal' institutions or modes of association and a relatively fluid class structure, not to mention weak safeguards against unemployment and poverty (and a high crime-rate). “They'll steal our jobs!”

Obviously an equally important factor is the intentional propagation of such attitudes by the media and other power-structures. Sometimes the xenophobia is consciously whipped up, as during wars. But the fact is that this sort of indoctrination, whether conscious or not, is very useful to the ruling class for more than one reason.

What's the explanation for the unique American hatred of taxes? Whatever it is, it's essentially related to the distinctive American preoccupation with freedom (from government, from class; freedom to make money, to be an entrepreneur or adventurer, etc.). And both are a product of the social structure, privatized and atomized. Think of the Western frontier: people resented government intrusion into their

lives, preferring to work their farms privately and do as they liked. The social meaning of the fragmentation varies between regions and times, from the frontier to the Eastern city and so forth, but the basic fact of fragmentation or “individualism” or “freedom” remains. It’s a society without close ties, without a tangible class-structure along old European lines, with few social institutions except churches; the predictable result is that people want to be left to themselves (making a virtue of necessity, so to speak, or of the traditions in which they’ve been raised) and don’t want to have to pay for others’ health care or education or Social Security. An atomized society fosters the desire to be atomized (“free”); a tradition of solidarity fosters a love of solidarity. Traditions in general tend to propagate themselves through the generations, because people, having been raised in them, naturally continue to behave in accordance with them and in fact valorize them, as they valorize their sense of self.

But of course the hatred of taxes also has *a lot* to do with the power of business in America, with indoctrination, with propaganda. A broadly anti-union culture, created largely through relentless violent suppression of unions and workers’ rights, specific *policies* pursued by business and government. A very disciplined propaganda-system exalting the free market, individual initiative, distrust of the government and anything hinting of semi-collectivism.

“Why should I help that old widow across the street? Why should I help pay for her meals? Why should I help fund public education if I have no children in school?” You can see from these questions—which exemplify the anti-tax attitude—that it all comes down to the fragmentation of the social structure. “These people are strangers to me! Why should I care about them?” In a more solidaristic social structure, questions about why you should help widows and children would seem totally absurd, symptomatic of a dysfunctional mind. Selfishness might even be considered not *immoral* but *senseless*.

...Moreover, Americans have always been uniquely obsessed with *making money*. (In the 20th century, the rest of the world started catching up to us.) Saving and spending money, that’s been the purpose of life. Read Gordon Wood’s book. It’s understandable, then, why Americans would have a unique hatred of taxes. You’re *losing money!*

Robert Paul Wolff says that the fundamental problem of political philosophy is “how the moral autonomy of the individual can be made compatible with the legitimate authority of the state.” And he writes a book (*In Defense of Anarchism*) arguing that the problem is insoluble. Individual autonomy cannot be reconciled with the state’s authority. It seems to me that this conclusion is common sense. States, or governments, are violent, repressive institutions. There has never been a state that hasn’t *compelled* its citizens in some way and hasn’t used the threat of force to command obedience. And this is, transparently, to deny the individual his autonomy. The only “state” that could, perhaps, be morally legitimate is a small, decentralized direct democracy that legislated and enforced its decisions through discussion and persuasion, not violence and the threat of violence. Even with murderers, the moment you lock them up in a prison, you’re depriving them of their autonomy and are thus committing an immoral act, strictly speaking. You can justify your act through utilitarian considerations of the greater good, and realistically it’s advisable to shield the population from murderers, but it is never *morally right* to deprive someone of his freedom. It can only be *socially good*. Maybe you could call it *indirectly* moral, in that you hope to prevent the murderer from depriving someone else of his freedom (indeed, his life), but *directly* it isn’t moral, in the same way that it’s always *directly* immoral to lie, even if by doing so you hope to save a person’s life. (See Kant’s essay.)—Morality is, admittedly, an extension of humanitarianism (respect and compassion for others), but it’s different from humanitarianism in that it’s *absolute*, it permits of no exceptions. It isn’t a feeling, it’s a law. So, yes, the dictates of morality in a particular situation can conceivably violate the dictates of humanitarianism—and in this case we should ignore morality and go with humanitarianism, since the latter is, after all, the “cash value” of morality.

If you want, you can say that there are two kinds of morality: the absolute, deontological one, and the relative, humanitarian or “utilitarian” one. The former is morality in its strictest sense, as consisting of semi-divine laws by which we must regulate our behavior, but the latter is the only “morality” that isn’t a delusion (the flip-side of the delusion that humans have absolute value). If we’re assuming morality in its strict sense, then coercion or deception is always immoral. But if we’re taking the more realistic position

of “humanitarianism,” then it is indeed sometimes justifiable to coerce or deceive people. –Still, even on this level, governments as they have always existed cannot be wholly justified because they have never been exclusively, solely humanitarian, concerned literally with nothing but the welfare and freedom of their citizens. The world is too messy for that; power-structures are too committed to consolidating their power.

Actually, even in theory all this stuff is messy. For example, in real situations you constantly have to adjudicate between the claims of deontological morality and humanitarianism/utilitarianism. Deontologically, so to speak, it’s immoral to abort a fetus (because a fetus is a budding human and hence has absolute value), but humanitarily it may be justified. ‘Deontologically’ it would have been wrong to kill Hitler in 1938, but humanitarily, or “indirectly-morally,” it wouldn’t have. You have to ask which consideration is more important to you.

I wonder what Kant would say: is it moral to shove a person out of the way of an oncoming bus? You’re coercing him. Considered solely in itself, your act is a violation of his autonomy. But the “maxim” of your act, I suppose, isn’t, since by violating his freedom you’re trying to prevent a worse destruction of his freedom, in fact of his life. This example just shows how problematic even deontological morality is (quite apart from its having to be tempered by utilitarian considerations)—which itself supports my belief that morality is imaginary, unreal.

To return to the question about the state and bureaucracy in general. Wolff expresses it well when he says, “Men are no better than children if they not only accept the rule of others from force of necessity, but embrace it willingly and forfeit their duty unceasingly to weigh the merits of the actions which they perform. When I place myself in the hands of another, and permit him to determine the principles by which I shall guide my behavior, I repudiate the freedom and reason which give me dignity.” Bureaucrats who follow orders unquestioningly are immoral not only in relation to others but in relation to themselves, since they’re willfully violating their own autonomy.

[There are confusions in that discussion.]

When you have no energy to do anything, it’s hard to muster the energy to do anything.

Historically, a major hindrance to the success of the U.S. labor movement has been “the ethnicization of the unions.” More broadly: too many separate groups of immigrants, too many languages not spoken by other groups, too much ethnic pride and prejudice, too much discrimination by the skilled workers against the masses of newly arrived unskilled immigrants who threatened to steal the jobs of the established workers. “To protect their jobs, their craft and skills, skilled workmen frequently formed unions based on exclusion of recent immigrants, or of other ethnic groups.” For decades, craft unionism won out over industrial unionism; i.e., exclusion won out over inclusion. But strength has always been in numbers—“one for all and all for one.” This is how the CIO achieved its spectacular successes. But in the time of the AFL, businesses would pit groups of workers against each other and the media would propagate xenophobic attitudes. “Divide and conquer” is the motto of every savvy power-system, because it knows that if the oppressed come together they can accomplish anything.

Another problem, obviously, has been the ‘blacks vs. whites’ thing. Again, it’s the lack of unity. European labor movements were lucky enough not to have this problem to such a degree as the American movement did. –In short, the failures of the labor movement (in any country) can, necessarily, always be attributed largely to that one overarching cause, a lack of solidarity. (It is this which, in large part, makes possible the excessive concentration of power in the business class—but this concentration of power, of course, also leads through various means to the fragmentation of labor.) This consideration should be the guiding light of any explanation of labor’s weakness in America.

As Harry Bridges said, “The most important word in the language of the working class is ‘solidarity.’”

I may be the only intellectual alive who’s content to skip over the next fifty or a hundred years and speak directly to his third-generation descendants. I see that the current world order is doomed, that global warming and population growth will smash it into smithereens. So what is there to do for one who wants immortality? Only to leap over the rubble and talk to people on the other side, and tell them “Don’t give up hope! Read what I’ve written; remember the past, remember that there are good things in life [...]” As I’ve

said before, I am a concentrated reflection of many the tendencies of my age; and so in remembering me, you are paying homage to an entire era. The era constitutes a tragedy, but I represent the element of life-affirmation in that tragedy. So, in a sense, I'm trying to redeem my age, to rescue it from the unmitigated contempt in which its descendants will be tempted to hold it.

—Observe, reader, the lengths to which we go to give ourselves a purpose and convince ourselves of our worth!

Met a sort of friend today, Raj, who convinced me to take up sailing. He just started it himself; sails at a club on the Esplanade. So I went there directly after talking to him, paid the \$240 for the year, and had my first class (on rigging). Tomorrow I'll go back and practice, then I'll take the test. I should have done this years ago.

Later I met a new Italian friend, Elena, beautiful 30-year-old full of intellect and personality. And her Brazilian friend. I could probably fall in love with Elena if I let myself, but she's married, so there goes that idea. If she were a little younger she'd be everything I want in a girl. The first time we met we spent an hour talking about David Foster Wallace! And what a sense of humor she has! Playful, self-deprecating, open and friendly. And her genuineness, it's the kind of genuineness that seems so rare in American girls but relatively common among the Latins.

She re-freshes me.

Oh my Lord...Beethoven's Choral Fantasy. I discovered that piece earlier this year. I thought it was a little strange at first, unstructured and meandering, but...you know, it's quintessential Beethoven, the affirmation of everything in spite of everything, the redemption of the universe. I always get tears in my eyes when watching great music performed by...*people*, people who have devoted their lives to art and you can see it when they're singing, the hours and years of practice and passion as they belt out their notes, their devotion to music. That beautiful soprano with the blond hair coiffed perfectly and the makeup and earrings on—the most beautiful thing about her is that she's a woman, just an ordinary woman who wants to look pretty like all women and has a family and sees her friends every day and has to do maintenance on her house every year—and yet here she is standing between an orchestra and a chorus, belting out Beethoven, *singing*—humans can *sing!* (how superfluous!)—singing about how “graceful, charming and sweet is the sound of life's harmonies!” The three men and the three women singing about God's grace being bestowed on humanity when love and strength are united, and peace and joy advancing in perfect concord, and then the chorus trumpeting that we must “accept the gifts of high art!”, and the orchestra and piano and the conductor swinging his arms wildly singing along with the chorus (you can only see his lips moving but you know he's shouting as loud as the singers)—can you picture these men and women sitting and standing beside each other in front of a rapt audience, not fighting or arguing or talking of money or politics or responsibilities but *singing about art?* “Within these hallowed halls...” It's a miracle, the only real miracle in life.

A community, timeless and universal because they're performing music scribbled two hundred years ago by a deaf man who lived alone in his cluttered and filthy apartment—scratched-in ideas transported from one man's brain to a concert hall where worshipers pay homage to the only thing worth paying homage to, art. It'll all be over soon (two hours), but its very transience augments its beauty.

“The developments [throughout the world] of the past twenty years have proven wrong the assumption that economic liberalization leads to political liberalization.” True. The one doesn't necessarily follow the other, at least not in the short term (several decades). But the former does create *pressures* toward the latter, *tendencies* that have to be suppressed by the state. The Chinese government, for example, is particularly enormous and powerful, so it has successfully suppressed them. But the point is that there is a contradiction between the relative freedom of its economy and the unfreedom of its politics, and in the long run this contradiction will tend to be resolved so as to increase political freedom. The economy conditions politics more than vice versa.

Apologists for capitalism, like Milton Friedman, have always argued that capitalism leads to freedom and democracy, but, again, this is bullshit. All you can talk about is *tendencies*, not *necessary*

outcomes. Besides, insofar as capitalism does create tendencies toward democracy, it isn't because of the "democratic" nature of capitalism! Look at history: democracy and civil liberties have resulted from decades-long struggles of workers and radicals *against* capitalist *exploitation* and *suppression* of their rights. So, if anything, the positive tendencies of capitalism are flagrantly undemocratic.

Played soccer for the first time in I-don't-know-how-many-years. The pleasures of physical exertion (exhaustion).

The curious thing about major wars is that they have simultaneously a democratizing and a repressive influence. War is the health of the State, but it can also lead to greater rights for workers and oppressed minorities—partly because the State wants to head off domestic disputes and so is temporarily inclined to give workers (in particular) some of what they've been asking for. During both world wars, the American government forced employers to recognize unions and even gave labor a voice on governmental committees and such. Of course, labor was a junior partner. And, in general, repression is the order of the day (repression of strikes, of boycotts, of protests, of free speech, etc.), more than usual. But then after the war, the masses who have been mobilized and relatively empowered through full employment and 'national participation' demand democratic reforms. Thus, e.g., the 19th Amendment in 1920, and the emerging civil rights movement and feminism after World War II. All in all, war usually leads to terrible repression but has democratizing potential at the same time.

Sent an email to Chomsky after a conversation I had with Rich Pollak:

Professor Chomsky,

I recently had a conversation about you with a fellow activist, and he said something I hadn't considered: he suggested that your talks and many of your writings are altogether too pessimistic. Apparently his mother had recently gone to one of your talks and had left feeling very discouraged and depressed. I defended you in the predictable ways (you're just stating facts; you're informing the public; it's hard not to be pessimistic if one is acquainted with history; and in some ways you aren't cynical at all), but he argued that, even so, a person in your position should give very specific advice to activists rather than simply advising them to make connections with each other and prepare for the long-haul and so on. For example, you must be in touch with or be aware of many liberal organizations and politicians; perhaps in your talks you could make your listeners aware of such resources, discuss the work that particular organizations have done and their past achievements, and even give your listeners strategic and 'tactical' advice for their battles against political conservatism. Maybe you could more often talk about recent examples of successful activism from various countries and the ways in which certain goals were achieved, instead of focusing so much on the crimes of the establishment.

In the end, I came to agree with this friend of mine (more or less). I think it would be advisable for you to adopt a more positive tone. Maybe talk more about Porto Alegre in the 90s, for example -- but, in general, focus on spreading knowledge about activist efforts around the globe (especially in "Western" countries), making people aware of good things that organizers are doing in Europe, etc. Perhaps try not to come across as quite so cynical. -I realize you'd disagree with that characterization, but, justified or not, it seems to be a widespread interpretation of you. I suspect that a lot of people would like you to change your tone from predominantly negative to inspirational.

With great respect,
Chris

Thanks for your thoughts. It's certainly wrong to leave people depressed, and if that's the effect of my talks, it's my fault. I'm aware of the problem, and try to deal with it, in talks and in writing, by emphasizing the achievements that have been won by dedicated persistent educational and organizational efforts, and appropriate actions, often direct action, including in recent years. But it's true that I don't give specific advice, and strategic and tactical advice. A lifetime of activism keeps reinforcing my feeling that it can't be done. Too much depends on specific circumstances, goals, interests. And that aside, it sends the wrong message. It's easy to say "join Move-on and do what they tell about how to support 'brand Obama,'" or some other specific goal. Or some other specific suggestion. Maybe that's sometimes right, but the principle is wrong. One shouldn't be a cog in anyone's machine: rather, one should be thinking for oneself and deciding which of the myriad of choices should be made. It may be easier to follow instructions, but those are the tendencies that should be combatted, I think.

Insofar as I have any talent to be inspirational, I suppress it. Fortunately, that's quite easy. I cringe when I hear inspirational oratory. And for good reason, I think. The goal should be to help and encourage people to think for themselves, not to lead or instruct them, and not to mislead them -- as inspirational oratory almost invariably does.

Others feel differently, I know, and maybe they're right, but I can only do what I think is right.

S. H. Rigby's article "Historical Materialism, Social Structure, and Social Change in the Middle Ages" (2004). It seems to me—I said this a long time ago—that the concept of a mode of production has two applications, on the micro- and the macro-level. (1) A productive unit in society, and (2) the predominant form of production in society. A modern factory is capitalist in that the property is owned by people who extract surplus-value from the workers, who don't own any property. But this *society* is capitalist in that the capitalist form of production predominates. (There are other forms of "production" in modern society. See Wright's book *Classes*.) Medieval society was feudal in that the lord-serf relation was its fundamental basis, the most important social relation. Every society after prehistory is organized in this way around two opposing classes, two fundamental classes opposed in the production-relation (and whose opposition makes possible and defines the specific production-relation). There are all sorts of social categories and occupations and even other "classes" in the strict Marxian sense, but one class-relation in particular props up the society (creates most of the wealth, etc.). This sort of statement is hard to verify but seems plausible.

The theory of surplus-value seems plausible too. It's obviously true, first of all, that ultimately the laborer's wages are paid out of the value of the commodities he produces, since these commodities are what give the capitalist the revenue out of which he pays his workers. But his *profit* comes from the sale of these commodities too. So the workers produce the equivalent of their wages plus the capitalist's profit. This profit is surplus-value, value they've created but which doesn't go to support them and their families (which is why it's called "surplus"). —Stated in this simple way, the theory seems almost truistic.

Rigby claims that "Of all of Marx and Engels's claims, the least acceptable aspect of their social theory now is probably their 'Primacy Thesis,' in which society's relations of production correspond to the level of development of its productive forces, and so are cast aside as they become fetters on the growth of the productive forces." One reason this claim is problematic is that "a given level of the productive forces can be compatible with a variety of different relations of production." I'm inclined to agree with Rigby. The same level of productive forces could surely give you either slavery or serfdom, or some Asian version of serfdom. *Some* technologies do rule out certain production relations; for example, with computers and so on it's going to be extremely difficult to sustain a mode of production based on slavery, for a number of reasons. In any case, it seems that the Primacy Thesis is either truistic (on a weak interpretation) or false (on a strong one). But there's also a middle interpretation according to which the productive forces are

constraints on the production relations—or some such hypothesis—and this seems both plausible and rather substantive. The nature of the productive forces has *some* value in explaining why a particular set of production relations has been ‘selected’ by society.

Many recent Marxists reject G. A. Cohen’s “technologicistic” interpretation according to which the productive forces have an “autonomous” tendency to develop throughout history and instead argue that it’s actually the specific production relations of capitalism which cause modern productive forces to develop at such a rapid pace. But these two claims aren’t mutually exclusive. I think Cohen’s word “autonomous” is unnecessary and misleading; the point is that there is a slight pressure (as E. O. Wright says) on the productive forces to develop through history, from the simplest tools of Paleolithic man to the machines of the Romans, and as this development occurs there will periodically take place social revolutions—most of them have been very slow—adjusting social and production relations to the new conditions of production. One revolution accompanied the emergence of a social surplus product: classes were born, masters and slaves came into existence because the hunter-gatherer relations weren’t appropriate anymore (being suited to subsistence conditions in which there was no surplus to sustain an unproductive class). Actually, to speak more realistically, there were, for example, the Mycenaean production relations, then the Classical Greek relations (appropriate to a higher stage of production than Mycenae), then the Roman—and then there was a regression in Europe, etc. But perhaps all these modes of production were more similar to each other than different, involving slavery and/or serfdom. With capitalism came a true revolution: for the first time, the production relations were not *conservative* (as they had been in the past) but inherently progressive, so that now it isn’t a matter of waiting eons for the productive forces to develop to such a point that they change the relations; instead, the relations constantly revolutionize the forces. –In short, the Primacy Thesis is not incompatible with Cohen’s critics’ position, if the two are understood correctly.

Valid criticisms:

If, as Marx and Engels claimed, society’s relations of production correspond to and change with the level of development of its productive forces, then we would expect that, as they themselves concluded, “serfdom cannot be abolished without improved agriculture.” Yet, in his specific historical analysis of the transition to capitalism, Marx actually claims the opposite: at first, “agriculture remains the same although the day labourer has replaced the serf.” For Marx, England underwent an “agricultural revolution” from the “last third of the fifteenth century” until the final decade of the sixteenth century. Yet, while this revolution in the productive forces took place in the sixteenth century, serfdom had, in fact, “practically disappeared” in England as early as the “last part of the fourteenth century” so that the “immense majority of the population consisted then, and to a still larger extent in the fifteenth century, of free peasant proprietors.” Again, Marx’s own historical analysis concentrates on change in society’s social relations as the prelude to change in its productive forces, the opposite approach to that set out in his and Engels’s general theory.

On the other hand, the social relations can’t change until the productive forces have reached a certain level of development. Serfdom in England couldn’t have been abolished in the 1000s (as it supposedly was in the 1300s) because the material conditions weren’t ripe for the abolition of serfdom then. But once it was abolished, the new social relations facilitated a revolution in productive forces. So you see that a very complicated dialectic characterizes the interaction between the social relations and the productive forces, each pushing the other towards change. Once the material conditions of production had evolved to a certain point, it was possible to abolish serfdom; once serfdom was abolished, the new social relations propelled a revolution in the material conditions of production.

Still, insofar as the Primacy Thesis suggests that “dynamic productive forces call forth new social relations,” it’s false. Productive forces are never “dynamic” or “revolutionary” or “inherently progressive” in and of themselves. Only social relations are.

In fact, it’s better to say that insofar as productive forces ever advance, it’s because social relations have caused them to. So maybe it’s better to reject Wright’s abovementioned suggestion altogether (even

though it may be true). What causes the forces to develop isn't their "autonomous tendency"; it's the social framework in which they find themselves. But then once they have advanced to a certain point, the old social framework becomes obsolete and new relations are born. So in this sense, the productive forces and material conditions are primary.

Recall, though, the revision I made to historical materialism years ago: it isn't that *relations* become fetters on the *forces' development* (as Marx said); instead, the *obsolete* relations become fetters on the *new, emerging relations that propel the forces' development*. Marx's original statement is misleading. Two sets of social relations are involved, not one.

More criticisms:

While historical materialism provides an extremely useful analysis of society's class divisions, it tends to neglect other, nonclass social inequalities and conflicts, such as those based on racial or religious divisions (as in the case of the position of the Jews within medieval society) or on other forms of personal status. A classic example of such a nonclass social inequality which is central to the stratification of all societies is that of gender. While Engels rightly emphasized that the nature and extent of the inequality between the sexes is socially specific and historically changing rather than being biological and inevitable in nature, his explanation of patriarchy in terms of its links with the transhistorical category of "private property" meant that, like Marx, he provided no real account of how gender inequalities were related to specific forms of class relation. Modern Marxists' attempts to fill this gap in Marx and Engels's analysis have tended to result either in reductionism, as when medieval gender inequalities are (rather unconvincingly) explained in terms of their functional benefits for feudal relations of production, or, alternatively, in an attractive but seemingly non-Marxist sociological pluralism in which society is seen in terms of a multiplicity of separate axes of social inequality.

Surely there is some truth to the functional explanations. And don't forget that functional explanations can, at least theoretically, be reduced to causal explanations.

Or consider this objection: "Many critics of historical materialism have focused on the problem that while Marx presents society's "economic foundation" as determining the nature of its political and ideological "superstructure," in reality it is impossible to distinguish or separate social and economic relations from political, legal, and ideological factors, since the latter are actually constitutive elements in the former. But if base and superstructure interpenetrate, and so cannot be separated, it would be illegitimate to derive one from the other or to claim a primacy of one over the other, a conclusion which would undermine the whole thrust of Marx and Engels's social theory." This objection is one of those superficially plausible ones that dissolves if you take a *historical* approach to the subject-matter. Theoretically it's possible (though empirically difficult) to 'observe' new relations of production emerging in the interstices of the old society. At first, these new relations have no legal expression, no ideological justification, etc. But as they gradually colonize the society there comes a point at which they're finally explicitly recognized in law and ideology, and they start to influence politics and science, etc. Then you can see that our current ideologies, laws and political practices have evolved on their basis. Thus, from a historical or 'developmental' perspective it *is* possible to distinguish the relations of production from political, legal and ideological factors.

Rigby asks if it's possible for one causal factor to be "more important" than another in historical matters. He answers in the negative. Economic factors aren't more important than others; instead, a whole jumble of factors come together to create an event or a situation, and each factor is as "important" as the others (because they're all necessary in order for the situation to come about). I disagree, or I think there's a confusion involved here. It's usually possible to rank things roughly in order of their importance. DNA can be called more important than RNA even though both are essential, because RNA is created from DNA. The heart is more important than the spleen because you can live without the latter but not without the former—and yet both play significant roles in biological processes. Similarly, you can say that, in general,

economic factors are more important than ideological ones, for many reasons (one of which I sketched above).

Reading Mike Davis's *Prisoners of the American Dream: Politics and Economy in the History of the U.S. Working Class* (1986).

Why is the U.S. working class different? Why has it failed where European workers have succeeded (at least relatively)? Many reasons. Originally, for example, there was the "safety valve" of the frontier. And what I wrote above about ethnic and religious divisions. "Stratifications rooted in differential positions in the social labor process have been reinforced by deep-seated ethnic, religious, racial and sexual antagonisms within the working class... The political power of the working class has always been greatly diluted by the effective disenfranchisement of large sectors of labor: blacks, immigrants, women, migrant workers, among others." The European labor movement didn't have to deal with quite the same ethnic, religious, racial, or 'immigrant' problems. This doesn't explain everything, though. Part of the problem, surely, is that once the capitalist class had been allowed to 'get ahead' of the workers through all these divisions, its dominance 'snowballed,' fed off itself, and thus it was able to keep down the workers even after they had finally achieved some measure of national and industrial unity.

Nor should you forget the incompetence and timidity of labor's leadership, with the likes of Samuel Gompers, William Green, John L. Lewis in his early days (or, rather, his whole life), Philip Murray, Sidney Hillman, George Meany, and all the corrupt bureaucrats.

Also, ironically, the very size of the country and of the laboring classes surely hindered the formation of a labor party. Too many regional divisions, too many linguistic divisions, too much diversity, too many industries, too many interests—millions of workers and hundreds of sectors with their own interests and jealousies—just *too much* for a unified labor party to come into being, to pull all these factors together. By contrast, the size of the country and wealth of its resources has only helped the capitalist class, by making possible giant conglomerates and vast accumulations of wealth and power. And capital has exploited and exacerbated the already atomized, fragmented nature of the social structure (which itself has been due to the country's size, the relative paucity of its population, the presence of the frontier, the absence of old feudal social ties and class solidarity, the constant flood of new immigrants—"strangers in a strange land," alienation, fragmentation between ethnic-groups—etc.). In fact, these circumstances help explain why throughout most of America's history there has been far more craft-solidarity than class-solidarity (which has been tremendously detrimental to the labor movement).

Between 1892 and 1896 a Farmer-Labor alliance started to develop which, for a time, looked like it might create a viable third party, comparable to the labor parties then being created in Australia, England and other European countries. But it was sabotaged by the forces of reaction (including Gompers and the AFL). Davis has a good discussion of it. On a broad scale, he attributes the radicals' failure to two factors:

First, the united rebellion of the Southern yeoman and farm tenants—the cutting edge of agrarian radicalism—was broken up by a violent counter-attack of the regional ruling class which counterposed "Jim Crow" and redneck demagogism to the Farmers' Alliance and interracial cooperation. A vicious panoply of Black disfranchisement, racial segregation, and lynch terror was installed in the nineties to suppress Black tenants, to keep them tied to the land, and to prevent their future collaboration with poor whites...

Secondly, this Southern counterrevolution was paralleled north of the Mason-Dixon line by a resurgence of nativism and ethno-religious conflict within the industrial working class. In the bleak depression days of the mid-nineties, many native as well as 'old' immigrant workers came to believe that burgeoning immigration was creating a grave competitive threat... Fatally for the hopes of labor radicals, anti-immigrant and anti-Catholic prejudice rent the unity of even those industrial unions, the miners and the railway workers, which were ostensibly the bedrock of Labor-Populism...

...Although the Republicans [in 1896] temporarily captured an important segment of the alienated Catholic working-class vote, an even larger part retreated from electoral participation altogether. The election of 1896 thus marks a profound mutation in American

political culture. At a time when the European proletariat was becoming more politically engaged than ever before, the American working class was undergoing a striking electoral *demobilization* as a result of the nativist backlash (particularly the agrarian capture of the Democratic Party) and of new restrictions on the popular suffrage (Black disfranchisement, poll taxes, and residency requirements). This combined process of exclusion/abstention dispersed the working-class vote...

September

Here's a simple way to think about the spectrum between conservative and anarchist: on the far right, you have people who support authority. It's the "authoritarian personality." ("A personality pattern reflecting a desire for security, order, power, and status, with a desire for structured lines of authority, a conventional set of values or outlook, a demand for unquestioning obedience, and a tendency to be hostile toward or use as scapegoats individuals of minority or nontraditional groups." Conventionalism, authoritarian submission, authoritarian aggression, destructiveness, cynicism, excessive concern with sexuality, and so forth. I'll have to read Adorno's book.) These people tend not to value freedom, human rights, democracy, intellectual curiosity, etc.; they want *sameness*, universal agreement (with them), a rigid social order where they clearly belong and can see their place, can see themselves reflected in the uniformity of society. They can't tolerate dissent.

In the center you have "liberals" (e.g., Kennedy liberals), who value freedom and human rights but not enough. They still have an attachment to "order," to "legitimate authority"; they're frightened of radical democracy. The 1960s made them nervous. They accept capitalism, usually think it's "natural," don't adopt a very critical stance toward their society, accept a lot of conventional pieties about progress and their country's goodness; in short, they have the typical educated/indoctrinated middle-class outlook. Basically they want things to be "normal" so they can feel comfortable and secure. They're relatively open-minded but also a little small-minded.

The far left is reserved for those who are truly committed to freedom, democracy, diversity, a multiform equality. They always question authority: in fact, their basic assumption is that power over others is automatically illegitimate unless it can prove itself justified (which it rarely can). As Chomsky says, the burden of proof is on power, not on those who oppose it. Liberals and conservatives accept authority, to varying degrees; anarchists and left-Marxists don't.

...Another way to conceptualize the spectrum is to look at the *descriptions*, not the *prescriptions*, offered. Conservatives sometimes accept the class struggle in a qualified form, or at least they accept that society is composed of irreconcilable interests. Fascists, for example, are not committed to rejecting the reality of struggle. William Buckley or Phyllis Schlafly has no reason to deny that society is locked in a war between the lovers of authority and the haters of authority. But it's true that conservatives do tend to reject the Marxist interpretation of struggle as essentially economic; they often even deny that capitalists and workers are necessarily opposed. Regardless, they believe, at least implicitly, that justice is usually on the side of power, not the oppressed. (This shows that bureaucracies are essentially "conservative," since they consist in (the belief that) the exercise of power (is justified and is not to be resisted by the relatively powerless). They're also conservative in that they're resistant to change.)

Liberals, again, have been successfully indoctrinated: they accept the hegemonic ideology that society is composed, more or less, of a harmony of interests, with a few radicals and nay-sayers at the margins. There is no class struggle, there are no essential struggles at all. It's only necessary to smooth out the rough edges, to get rid of the troublemakers in the corporate ranks and the radical ranks, to rewrite a few governmental rules and regulations, etc.

The left, properly so-called, agrees with conservatives that society is locked in struggle, but it diagnoses the struggle differently: rather than mainly cultural, the struggle is economic. It revolves around the nature of economic power in capitalism, which affects everything from the environment to women's rights. And justice—and the future—is on the side of the oppressed.

...I should be clearer about conservatism. Thinkers like Hayek, Friedman and Henry C. Simons have very different allegiances than fascists or authoritarian-types. They genuinely want small government and individual freedom. They can be considered liberals, or even anarchists, by inclination—*absolute freedom, no bureaucratic authority trampling on rights!*—but they’re anarchists who have been confused by neoclassical economics and ideology. They can’t see the truth, as plain as day, that corporations rather than government bureaucracies have become the real threat to individual liberty, nor that an unregulated, unsubsidized economy wouldn’t last a week. (It would either collapse immediately or a tiny minority would soon collect most of the economic power and proceed to govern the country according to their own interests. Adam Smith’s ideal economy of small producers is inherently unstable.) In short, these “honorable,” intellectually consistent conservatives end up, in spite of themselves, as mere ideologues and propagandists on behalf of business—although, admittedly, they do sometimes express dismay at the degree of cartelism, cronyism and corporate welfarism that permeates the economy.

Strictly speaking, then, I should distinguish between the mindless mass “conservatism” that led to fascism and is usually behind people’s opposition to civil rights—i.e., the so-called conservatism of Rush Limbaugh and Pat Robertson—and the more ‘intellectual’ conservatism of Hayek, which is much closer to old liberalism than to fascism. [*Um, except for Hayek’s love of Pinochet and other authoritarians!*] Chomsky considers it absurd to call the former current “conservative,” but insofar as it is traditionalist (religious, patriarchal, authoritarian, law-and-order-ish) the label does make some sense. Is it right to call Dick Cheney a conservative? Not if you mean Hayekian; *somewhat* if you mean the other kind. But really he is neither. What he believes in is strong state power, strong executive power, and strong American power around the world. He isn’t very committed to quasi-religious social conservatism, except insofar as it’s useful in maintaining “law and order.” He cares for one thing only, and that’s *power*. He’s a fascist without the principles (the fanaticism). A truly authoritarian personality. Which he has in common with Limbaughian conservatives.

Why didn’t the CIO’s alliance with the Democratic party before, during and after World War II result in something more satisfactory to the labor movement than FDR’s lack of sympathy, a Republican Congress, the Taft-Hartley Act, Truman’s broken promises, etc.? What went wrong? Many things.

“As we have seen, the ‘civil wars’ between the AFL and CIO, and later within the CIO itself [over the issue of Communism], undermined every attempt to establish a liberal bloc in American politics or to develop the basis for independent political action by labor. Without minimizing the purely political or inter-bureaucratic aspects of the schism between the AFL and CIO, the underlying determinant was still the persistence of those divisions between the craft and mass-production workforces that had polarized the American proletariat since the turn of the century. As we have seen, the surprising resurgence of the AFL in the late thirties behind the banners of labor-patriotism and anti-communism exploited the residual prejudices of the native and old-immigrant stock workers against the second-generation ethnic laborers in the mines and factories. Working-class disunity was further augmented by the pervasive white racism which all too frequently subverted wartime industrial militancy into ‘hate strikes’ against Black newcomers. Finally, the Cold War dramatically strengthened the hegemony of Catholicism and right-wing ethnic nationalism in broad sectors of the industrial working class.

“...[Additionally,] the anti-communist inquisition within the CIO produced a staggering series of losses: the ‘deunionization’ of the electrical and textile industries, the destruction of promising beachheads in the tertiary, professional and agricultural sectors, and the collapse of ‘Operation Dixie.’...” Davis’s analysis is long and insightful. In fact, the book is a masterpiece.

It occurs to me that the U.S. must be among the most violent countries or empires in history. First of all, it’s one of the few countries founded on genocide—possibly the most effective genocide ever. It has fought dozens of wars in only two hundred years. Its military is the most lethal killing-machine ever devised. Apparently during Nixon’s campaign in Cambodia, more firepower was involved than the sum of all the conventional bombs used in World War II. It’s the only country ever to have used nuclear weapons. In general, the government pursues an unusually militaristic foreign policy and has few scruples about throwing its military might around the world (if only as a threat sometimes). It’s complicit, moreover, in

the crimes of the regimes it has supported, including Suharto's, Saddam Hussein's, Saudi Arabia's, Israel's, Egypt's, Turkey's, a number of Latin American states, etc. *Domestically*, the history of labor has been uniquely repressive and violent (on the part of the ruling class). Don't forget slavery and the subsequent century of black repression. In fact, the rule of business is founded on a constant, daily reign of unreported violence, the suppression of rights in the workplace, the persecution of anyone who steps a little out of line, the segregation of tens of millions in ghettos, slums, etc. The U.S. crime-rate is unusually high, and people have remarkable freedom to own guns. Images of violence pervade pop culture. Immigration and detention policies are appallingly arbitrary, despotic, bureaucratic. The prison system, partly privatized, is a monument to inefficiency, bloatedness and discrimination. The "war on drugs" is absurdly unjust and violent (though ineffective), little more than a continuation of imperialism by other means, especially in Colombia. Since the 19th century there have been seething undercurrents in the South and Midwest (and everywhere else) of semi-fascist discontent, violence, prejudice. Nativism and xenophobia have always been unusually strong. The list goes on.

The Roman Empire was *nothing* compared to us. Its coercive forces were less intensive and less extensive than ours. Ours spread around the globe and penetrate to the level of every individual, forcing on us a degree of atomization unprecedented in history.

To maintain, despite all this, the prevailing ideology of liberalism, peace, democracy, moral superiority, broad-based consent—"Americanism"—is an impressive feat of ideological distortion. So is, incidentally, the widespread perception that America is not a class-polarized society, and the general acceptance of free-market myths.

What rational people often forget is that most people are not rational. Last night I attended a Bible study with my friend Ivy, an intelligent girl who wants to study at Stanford; at one point in the evening she denied that the Earth revolves around the Sun. She said it depends on your "frame of reference": if you're on the Earth, the Sun revolves around the Earth, while the reverse is true from the perspective of the Sun. I couldn't dislodge her from her opinion. —Postmodernism, you see. It all depends on "frames of reference."

In the same way, it's hard for me to take 'businesspeople' seriously: when I have a discussion with them, I hear indoctrination being regurgitated. Today I had a mini-debate with that intellectual abortion Raj, a business analyst.

But let's get back to stupidity. I just watched an interview with Chomsky in which the interviewer asked if he agreed that the terrorist attack on 9/11 was "*impolite*" and "*bad manners*"! The guy actually compared it to Ali G's irreverent interview of Chomsky! Poor Chomsky had to sit through a whole interview with this dipshit. He was like, "I don't see any analogy between 9/11 and Ali G's interview of me. 'Bad manners' is the wrong category. Would you say that the Holocaust was 'bad manners'?" And the interviewer went off on an incoherent spiel about language. How is this sort of stupidity possible?

It's the same with many people who oppose healthcare reform. Watch the videos of the town hall debates. The people cannot be reasoned with. That's scary. Comparing Obama to Hitler because he wants to extend health coverage. What planet do these people live on? All you can do is what Barney Frank did: refuse to have a conversation with them. "Talking to you, ma'am," he said, "would be like trying to have a conversation with a dining room table. I have no interest in doing it."

In the 1960s, the AFL-CIO apparently devoted *two to three percent* of its total income to recruitment campaigns, while 25% was devoted to "international affairs," i.e. to supporting the government's imperialist adventures. Moreover, "as the 1980s would again show with a new eruption of inter-union rivalries, it was often more 'profitable' for large established unions to raid other unions for new members rather than invest in costly organizing campaigns whose fruits might accrue to other unions."

In the 1950s, about a third of private-sector workers were unionized. Now, 7% are. Hopefully Richard Trumka, the new president of the AFL-CIO, will help turn things around. He seems to have fire in his belly.

Ralph Nader, quoting his father, referring to the government's repeated rescues of the economy and large corporations: "Why will capitalism always survive? Because it'll always make socialism save it."

Or, as Chomsky says, “*really existing* free market theory,” as opposed to the fantasies espoused by economists, is: “free markets are fine for *you* but not for *me*.” Market discipline for you, but subsidies and bailouts for me.

Things started getting worse for the labor movement in the late '70s. Deindustrialization, deregulation, and the opening of the economy to foreign imports were some of the causes. But also, “in retrospect it can be seen that the postwar defeat of Southern labor organization (and, correlatively, the failure of the labor movement to become a civil rights movement) was the Achilles heel of American unionism. The right-to-work states have allowed American capital a unique internal mobility, leaving a vast economic space for the evolution of ‘Southern strategies’ and the crystallization of new non-union sectors.” A whole region of the country was and is mostly non-union, more so even than the rest of the country.

I’m going to start regularly reading articles on the web about labor developments, from *The Nation*’s and *Monthly Review*’s archived articles (and *Z Magazine*’s, etc.) to those in daily newspapers. The unfortunate thing about immersing myself in current events is that I can’t engage with the information as I do with philosophy and psychology (in my journal); I can only stuff my head with data. I can’t be creative. But it’s important data nonetheless, and it’s true I’m learning how the world works.

Not only labor. Also Latin America, Africa, the Middle East, etc. Online magazines are full of information I should take advantage of.

John Bellamy Foster has a good article on dependency theory (“the development of underdevelopment”). He notes that classical Marxism tended to assume that the rest of the world would follow, more or less, the capitalist path traversed by Western Europe, but then he observes that “Marx himself in other historical contexts was to point to divergent paths of development. In *Capital* he wrote that ‘a new and international division of labor springs up [under industrial capitalism], and it converts one part of the globe into a chiefly agricultural field of production for supplying the other part, which remains a pre-eminently industrial field.’ In his writings of the 1860s and after he discussed what we would now call conditions of dependency imposed on nations such as Ireland and India.”

According to the Argentine economist Raúl Prebisch, writing in the 1950s, “Underdeveloped countries were bound to an international division of labor where they exported low-value primary commodities and imported high-value manufactured goods, placing them at a structural disadvantage. Underdevelopment, it was argued, was not the same as original underdevelopment, i.e., the mere absence of development.” Prebisch’s view is substantially the same as Marx’s, according to which India, for example, exported the raw material of cotton to England, thus stimulating the latter’s industrial revolution, and then imported the finished goods at prices so cheap that Indian producers couldn’t compete.

Paul Baran was one of the founders of dependency theory. Contrary to bourgeois ideology, which explained underdevelopment as due to a lack of capital and know-how and an excess of population, Baran invoked the concept of economic surplus, i.e. the difference between output and consumption in a given economy. He distinguished between actual and potential economic surplus. “The actual economic surplus was ‘the difference between society’s actual current output and its actual current consumption.’ This was the surplus or savings as usually treated in economic theory. In underdeveloped countries the actual realized surplus in this sense was typically quite small, leading to notions of a shortage of capital, or a chronic lack of surplus (or savings) for investment.”

In contrast, potential economic surplus is “the difference between the output that *could* be produced in a given natural and technological environment with the help of employable productive resources and what might be regarded as essential consumption.” The potential surplus in underdeveloped economies is much higher than the actual surplus.

The entire distorted class structure that emerged [in underdeveloped societies] was prone to waste: luxury consumption by the wealthy coupled with loss of output and misallocation of surplus due to the irrational and wasteful organization of production and chronic unemployment. The state apparatus was often distorted by these developments, reflecting the parasitical class relations. “What results,” Baran stated, “is a political and social coalition of wealthy compradors, powerful monopolists and large landowners dedicated to

the defense of the existing feudal-mercantile order.” The ruling elements in the underdeveloped countries tended to invest large parts of the surplus at their disposal abroad “as hedges against the depreciation of the domestic currency or as nest eggs assuring their owners of suitable retreats in the case of social and political upheavals at home.” The mobilization of the surplus for new investment was thus typically blocked at every turn, leading to dismal economic performance and the expansion of poverty in a vicious circle. “Just as investment,” Baran wrote, “tends to become self-propelling, so lack of investment tends to become self-perpetuating.”

But even when foreign capitalists reinvested profits in the country, the investments were usually not very helpful, being organized around the export of primary commodities. This “tended to weaken rather than strengthen the internal development linkages of the underdeveloped country, thus impeding any possible ‘investment snowball effect.’” These countries, therefore, had very undeveloped internal markets.

Sometimes the oppressed people tried to take matters into their own hands, by elevating governments that endeavored to divert the potential surplus to social and economic development. But in these cases, the U.S. covertly or overtly intervened to restore a regime friendly to the needs of foreign capital. Moreover, U.S.-supported regimes wasted huge surpluses on military expenditure.

Foster claims, plausibly, that the gap between the center and the periphery has actually increased since Baran’s day (with some notable exceptions, a few countries that haven’t followed the neoliberal model of development).

Women’s greatest strength is their weak-ness. It naturally gives them power over men.

Reading James Joll’s *The Origins of the First World War* for a class. Also, Carl Kaestle’s *Pillars of the Republic: Common Schools and American Society, 1780–1860*.

A. J. Muste, “revolutionary pacifist” from World War I to Vietnam. I read this on Wikipedia: “At the end of his life, Muste took a leadership role in the movement against the Vietnam War. Fellow peace activist Andrea Ayvazian tells of Muste standing outside the White House every night during the Viet Nam War, holding a candle, regardless of whether it was raining or not. One evening, a reporter approached him and asked if he really thought that by standing outside the White House holding a candle night after night, he would change the policies of the country, to which Muste replied: ‘Oh, you’ve got it all wrong. I’m not doing this to change the country. I do it so the country won’t change me.’” Now *that’s* a human being. [Well, maybe Chomsky’s perspective is better: Muste’s action there was entirely self-serving and not especially admirable. “The Vietnamese didn’t give a damn if he saved his soul,” as Chomsky later said in an email to me.]

What I wrote weeks ago was right: people identify with or sympathize with or hate or ‘invest emotional energy in’ fictive concepts like nations or races or religious groups, and this makes possible the noblest and the basest behavior. A nation is an imaginary entity. So is a race. It’s a kind of infantilism to treat these things as real existents (as patriots do, anti-Semites do, etc.). It’s misleading to say, “The United States went to war against Vietnam.” This is an unscientific way of talking. Neither entity exists. What happened was that certain elites in one part of the world sent a mass of men to kill other men who were blocking the elite’s goals...and so on. Less unreal than talk about countries is talk about classes, since at least the people in one class share material conditions and interests opposed to those in another class. The citizens of a “country,” by contrast, have little in common besides their language (and not always even that)—and other such meaningless similarities as having to follow the same set of laws, etc. Merely a series of *formal* similarities, as opposed to real commonalities of interests.

But because humans have the capacity to intellectually subsume themselves under a concept which is supposed to denote a community—thus treating themselves as part of this (usually very ‘forced’ or abstract and unreal) community which functions as confirming an aspect of their sense of self—they treat

the community as a real thing with real interests, sort of an extension of themselves. What often results is behavior that would look totally irrational to an observer from another planet.

Speaking of which:

In 1906 there occurred a famous episode that seemed to demonstrate in farcical terms the position of the military in German society. An elderly ex-convict dressed up in a uniform of a captain of the 1st Foot Guards, ordered some soldiers coming out of the military swimming baths “by command of the All-highest” to follow him and arrested the mayor and the treasurer of a small town on the outskirts of Berlin, making off with the petty cash and leaving the bewildered soldiers in occupation of the town hall for several hours.

Classic. He was wearing a uniform.

As for World War I, if you want to sum up its origins in one word it's *nationalism*. European culture was thick with it, a virulent nationalism. Germany, Austria-Hungary, Serbia, Russia, France, even Britain suffered from this neurosis, this obsession with national honor and greatness and destiny. The leaders didn't all want a war, certainly not a general European war, and *definitely* not the war they got. But they were influenced by the cultural atmosphere: they felt that to renege on their treaty obligations would sully their country's honor in the eyes of the world, and in any case they had known for years that a war of some sort was inevitable. Too many clashing national “destinies,” too many imperialistic schemes of world-domination. Too many arms races, too much militarism, too many imperialistic quarrels that could erupt any day into a full-scale war, and *would* erupt eventually. Everyone knew it. It was only a matter of when and where. It didn't have to happen when it did, but the odds were overwhelming that it would happen sometime soon. Culture and politics were just so *tense* back then, with politicians worried about socialists, worried about revolution, worried about the designs of neighboring countries, doing everything they could to foster national unity. Why? So that the elites could remain in power and increase their power. The continent was saturated with nationalistic propaganda, most of it from the initiative of the ruling classes. Anything to draw people's attention away from *class*! It's all about manufacturing consent: patriotic or nationalistic indoctrination is an excellent means toward that end. The same tricks are still being used today, and have always been used. It's true that Marxism in itself doesn't account for the emotional power of the appeal to the nation, but it does explain why power-structures constantly propagate national myths, and why patriotic wars etc. are enormously useful to the elite.

In addition, though, there was the organic nationalism among the oppressed ethnicities, in particular the South Slavs in Austria-Hungary (Serbs, Croats, etc.), who were creating unrest. It was they who assassinated Franz Ferdinand. The Austrians thought this was a good opportunity to suppress the Serbian troubles once and for all, which were threatening the stability of the empire, so they declared war on Serbia (whose government they accused of aiding the assassins). If they could crush Serbia, hopefully they could put an end to the agitation of the Serbs, Croats and others in the south of Hungary. So you see that nationalism wasn't only a tool of the Great Powers; it was also one of the immediate ‘problems’ that led to the war. It was in fact Serbian nationalism that was the direct cause of the war (through the killing of the Archduke). In short, nationalism created the culture that led to war, was itself the direct cause of war, and was propagandistically used by the Great Powers as a means of settling the imperial conflicts that had made inevitable a general European war. And so it was reflected in the anti-German provisions of the Treaty of Versailles. But this is precisely why the Treaty was bound to fail: far from addressing the main problem, viz. the prevalence of nationalist sentiment, it presupposed it and indeed intensified it. Hence the need for a second war to eradicate the disease once and for all—as was achieved in the late 1940s, when Europe finally set aside its past prejudices and worked together to rebuild itself on a peaceful, cosmopolitan, liberal-democratic basis. Not until nationalism had led to a truly apocalyptic catastrophe could it be transcended, i.e. understood as suicidal. Evidently World War I wasn't apocalyptic enough; another war was needed to drive home the point. In the '20s and '30s capitalism was still immature, too tied to the nation-state, not yet sufficiently (intensively and extensively) globalized. Now that countries' economies are much more interlinked, such a huge nationalistic war is almost inconceivable.

[...]

Nevertheless, it is capitalism that led to imperialism and nationalism. Industry and finance exerted considerable pressure on their governments to expand the country's sphere of influence in the world, so as to realize greater profits. Imperialism grew directly out of the expansionist tendencies of capitalism; and nationalism was a corollary of imperialism. For the latter was 'justified' to the population through nationalist propaganda, and besides, the idea of world empire and national greatness was very exciting to broad sectors of the population. Conversely, the imperialism of the Great Powers gave birth to organic nationalist movements among exploited and oppressed ethnicities, like the Slavs in the Balkans, who thus fought back against imperialism, creating extra conflicts. So, in some ways, imperialism had causal and logical priority over nationalism—and imperialism was a capitalist phenomenon. Thus, despite appearances, capitalism gave birth to nationalism. But, again, it was a somewhat immature capitalism, in which capital was not as globalized or integrated as it would become much later. It still relied on national boundaries; it relied on governments to conquer foreign territories for it and administer them to its advantage.

So I guess I was wrong, or it was superficial, to attribute the war to nationalism. Rather, it should be attributed to imperialism, hence capitalism. Lenin was right. Marxism can explain nationalism after all.

No doubt this is all very complicated, and economic considerations were not necessarily the primary motives for the leaders' decision to go to war. But the dynamism and expansionism of capitalism in combination with the partial, or more than partial, reliance of capital on the patronage of its government led to an expansionist nationalism, i.e. imperialism,¹ which colored the whole cultural atmosphere and made it seem an end in itself to colonize foreign territories and acquire spheres of influence—or, to be precise, not an end in itself but something to be pursued for the sake of national prestige (and of course wealth)—which in turn, directly and indirectly, made a confrontation between the Great Powers inevitable. In a continent as dense with countries as Europe, the ideology and practice of political and economic expansionism was going to cause a collision sooner or later. A collective collision.

"The Marxist theorists who insisted that war was inherent in the nature of capitalism and that the growing crisis of capitalism would lead to war envisaged that this war would result from the imperial rivalries caused by the capitalists' need to maintain their profits by constantly finding new fields for investment, new sources of raw materials and cheap labor and new markets." Non-Marxist historians often deny that the politicians had economic motives in mind when they declared war. But what their conscious motives were is an uninteresting and perhaps unanswerable question. Maybe Nicholas II had personal insecurities of some sort, or he wanted to erase the terrible memory of the Russo-Japanese war... Who cares? Maybe some policymakers thought they were defending democracy. The important point is that the aforementioned political-economic structures and imperatives led to the situation that made war possible, in fact inevitable (given the political conditions of fin-de-siècle Europe—which were themselves, of course, influenced by the economic conditions).

Most European politicians in 1914 thought the war would last a few months at most, or a few weeks. Here's Friedrich Engels in 1887, referring to the future war:

Eight to ten million soldiers will swallow each other up and in so doing eat all Europe more bare than any swarm of locusts. The devastation of the Thirty Years War compressed into the space of three or four years and extending over the whole continent; famine, sickness, want, brutalizing the army and the mass of the population; irrevocable confusion of our artificial structure of trade, industry and credit, ending in general bankruptcy; collapse of the old states and their traditional statecraft, so that crowns will roll by dozens in the gutter and no one will be found to pick them up; it is absolutely impossible to predict where it will all end and who will emerge from the struggle as victor. Only one result is absolutely

¹ Actually, those two factors don't entirely explain the brutal nationalistic form that imperialism took back then, since the two factors exist even now whereas virulent nationalism doesn't (in the West). But a kind of imperialism remains, in a somewhat different form than before.

certain: general exhaustion and the establishment of the conditions for the final victory of the working class.

He may have been right: the conditions were established. Unfortunately the workers failed to take advantage of them.

By the way, Engels was even right about the number of deaths: 9.7 million soldiers were killed.

The funny thing about time-travel is that even if, for the sake of argument, it's possible, or even if it *happens* some time in the future, so that someone goes back to change the past, what has happened has already happened and isn't going to be changed. It's not as if we can hope that a future time-traveler will return to the 1930s and kill Hitler, because the past is finished. It's logically impossible for the past to change. By definition, and not only by definition, it can't be altered. Can it be *observed*, or *returned to* in some way? Logical considerations would seem to make this, too, impossible. On the other hand, I've heard that some physicists think they're on the verge of time-travel on a subatomic level (to an instant immediately prior to the present). But they're probably kidding themselves.

Actually, in a way it's almost a truism to say that the war was ultimately due to capitalist imperialism and colonialism, because such imperialism is simply the specific form that economic and political expansionism took at that moment in history—and expansionism, or the desire to maintain and augment economic/geopolitical power, is essentially the cause of nearly all wars, at least indirectly. The conquests of the Hittites, the Persian wars against Greece, the Peloponnesian wars, the Chinese wars in the age before the Han dynasty, all the wars in the aftermath of Alexander's conquests, the innumerable Roman wars against Asia and the barbarians, most of the wars of medieval Europe, the Spanish conquests of Latin America, the American wars against the Indians, most of the imperial conflicts of early modern Europe, the American Civil War (especially from the perspective of the Confederacy), etc.—all these conflicts had to do with the pressure to increase or at least maintain economic power, the control over resources and “national interests.” The main relevant difference between capitalism and prior modes of production is the *increased* expansionism, dynamism, competitiveness, imperialism, i.e. the greater opportunities and pressures and incentives toward war (be it in “colonies” or wherever). Mature, liberal-democratic capitalism has evolved means of maintaining a degree of stability and at least nominal peace—but you have only to look at the two Iraq wars, indeed the foreign policy of the U.S. all through the 20th century, to see that powerful imperialistic pressures (toward the control of resources and markets) remain. Capital is still tied to the nation-state: governments are still agents of the capital that has its home in their country, as they were a hundred years ago, and so they're still prone to violence and war.

I read the UN Charter. Among the noblest documents in history. Also perused the Geneva Conventions, thus confirming to myself that the U.S. has committed innumerable war crimes over the years.

When people argue that the interests of capital are essentially peaceful (so that it can continue its quest for profit unhindered by war), and draw un-Marxist conclusions from this supposed fact, they misunderstand the nature of capital. Yes, it has an interest in peace, but it also has an interest in violence, because violence is useful for extracting surplus-value and profit, for suppressing dissent, for spreading the dominion of capital around the world. And while in an ideal world capital would operate in peace on the basis of the total suppression of workers' rights, in practice violence is necessary to sustain the rule of capital. So the usefulness of violence trumps the usefulness of peace.

What happened after World War II was in fact the reorganization and reconsolidation of the forces of violence into a more effective and efficient system, a system of *multinational military integration* (as Mike Davis says)—through NATO, etc.—which would ensure that military violence was never again suicidally directed at “enemy” imperialist governments but instead at recalcitrant Third World nations or rebellions against imperialism, including countries that looked like they might succumb to Communism. After World War I, Western capitalism was not yet ‘bourgeoisified’ enough to permit the eradication of

ultra-nationalism in the West; after World War II it was, or was in a condition to become so.¹ Reactionary nationalism had been utterly discredited, along with the aristocracy and everything remotely pre-capitalist. The evolution of capitalism, therefore, had finally reached the point at which the most important issue was seen to be the purely economic one of *the maintenance of capitalism*—not extra-economic goals like national glory or racial domination—a goal which, it was finally understood, could be achieved only in a liberal-democratic order [in the advanced capitalist core].

So, as I wrote years ago, the two world wars can be interpreted as stages, or symptoms, of Europe's laborious transition from pre-capitalism to capitalism. They resulted from the 'fusion' of an emerging capitalism and imperialism with a declining absolutist and aristocratic order, one of the effects of which fusion was the making of nationalism into a *reactionary* force,² which was intermingled with the counter-revolutionary obsession with race.

Thus, the orthodox Marxist explanation of World War I is only partly right. Ironically, it commits the quintessentially 'bourgeois' sin of abstracting from social structures, namely the structures of pre-capitalism that still existed in 1914—the structures that helped engender the (from the perspective of capital) highly irresponsible sin of engaging fellow capitalist elites in a massive suicidal war. Capital itself is most interested in waging violence only against exploitable workers or revolutionary movements, etc., less so against other capitalist nations—because what advantage can thereby accrue to capital?³

Davis makes a good point (unrelated to the foregoing):

[After World War II], the Yankee legions on the Elbe and along the DMZ, together with the nuclear umbrellas that protect them, made it possible for the European and Japanese economies to provide, respectively, high social-welfare overheads to integrate labor, and vast trade and agricultural subsidies to preserve international competitiveness... In other words, the major allies, with the signal exception of Britain and its high per capita military outlays, have reaped the social-conformist fruits of militarism without having to pay the real market price.

When the government doesn't have to spend exorbitant sums of money on the military, workers and the underprivileged are, not surprisingly, much better off than they would be otherwise.

Interesting: "The old Gordian knot of capitalism and democracy in continental Europe was finally cut [after World War II] by the creation of a new, U.S.-sponsored political current: Christian Democracy. The contribution of Christian Democracy to the consolidation of an Atlantic capitalist order cannot be exaggerated." Equally important, though, was the U.S.-led campaign against not only Communists but "all really broad and inclusive forms of working-class unity." In Germany, Communists and left-Social Democrats were purged from elected positions and strikes were forbidden. The AFL and later the CIO assisted the U.S. government in its subversion of European trade union solidarity.

Another part of the postwar equation is that American institutions guided Europe's economic development away from cartelism and colonialism to a Fordist, consumerist, Americanized capitalism within an integrated European domestic market. The old protectionism- and heavy-industry-centered European order was cast aside, along with traditional 'Closed Door' colonialism. (And nationalism!)

¹ That is to say, around the time of World War I Europe still had plenty of pre-capitalist elements, including a backward peasantry, a militaristic and race-besotted aristocracy, and, in places, a monarchical-absolutist ethos. After World War II these had been effectively destroyed. What remained was capital and labor.

² In itself, nationalism is neither revolutionary nor counter-revolutionary. During the French Revolution and the events of 1848 it was revolutionary; in the 1920s and '30s it was counter-revolutionary, an obstacle to progress.

³ [The obvious rejoinder is that particular sectors of capital gain from investing in technologies of destruction, whatever countries they end up being used against. Also, I was forgetting or unaware of Bukharin's point that *intrinsic to capitalism is the nationalization of capital*, not only the internationalization of capital. Nationalizing and centralizing dynamics engender tendencies of inter-imperialist conflict, which can either break out into war or can be contained by contrary "internationalizing" tendencies, as in the last 80 years. The world wars were products of both the essential tendencies of capitalism and "the persistence of the old regime" in that era—as Arno Mayer argued.]

The old problem of underconsumption (and overproduction), i.e. of insufficient aggregate demand (due to meager wages), which played a role in bringing on the Great Depression, was solved by the successes of the labor movements in the 1930s and subsequently, in particular, the successes of postwar collective bargaining, which ensured a relatively high level of real wages, in fact a more or less continuous increase in wages until the 1970s. Wrote one author in 1978, “The growth of the real wage has for more than a decade ceased to be the principal motor of private consumption, which has instead come to depend upon demographic growth and, for each family, on indirect and secondary sources of income, including part-time work and the black market.” Suggestive observation.

Reading Gar Alperovitz’s *America Beyond Capitalism: Reclaiming Our Wealth, Our Liberty, and Our Democracy* (2005). I heard Chomsky mention it in an interview. It’s given me an idea for my Masters thesis: researching workers’ ownership of firms.

I want to clarify the nature of American conservatism once and for all. All the different kinds. There’s the libertarian version: the Chicago school of economics, Robert Nozick, etc. In its purest form, this is the opposite of fascism; in fact, it’s but an [incoherent] capitalistic form of anarchism or left-Marxist utopianism. No state (or a minimal one), no interference with the individual, no coercion at all. It emphasizes the supposed economic and moral virtues of private enterprise. Secondly, there’s traditionalism. Family values, patriarchy, religion, “morality,” law and order. It intersects with a bastardized kind of libertarianism (as I wrote months ago), because many Americans have come to associate government with an undermining of tradition, an intrusion into the family, an activist liberalism, taxation and a redistribution of income to blacks, immigrants and the poor—i.e., the heathens, the enemies of patriarchal and religious authority, the destroyers of social order, the corrupting Other. These conservatives, despite their supposed semi-libertarianism, are not far removed from fascism: they would welcome a state that imposed their values on the population, that rolled back progress.

Thirdly, there are the neocons. These people are neither libertarians nor traditionalists, although they share the latter’s nationalism, obsession with Americanism. They are in fact merely latter-day nationalists, statist and imperialists, advocating imperialism in the name of “democracy.” They’re not implacably opposed to government interference in the economy, especially when it benefits big business. Nor are they committed to small government. Cheney is the perfect example.

And then there are the shallow, selfish people who just want low taxes, who don’t care about helping others, who don’t really have an ideology but just want to be left alone. They’re pale reflections of both the traditionalists and the libertarians. There are also the businessmen whose only ideology is that government shouldn’t be involved in the economy except when it benefits them, and who agree with the apologists for private enterprise that social welfare is bad because it encourages laziness and is uncapitalistic. Government itself is a necessary evil—an evil because it’s inefficient, bureaucratic, uncapitalistic. These people are intellectually diluted versions of the first category above. They believe that anything capitalist is more or less an end in itself.

Despite all these variations, I was right to put conservatism on the side of authority, since in practice, all these ideologies support and defend authority in one way or another. While they claim to be opposed to governmental authority, their opposition is actually in the name (or to the advantage) of a more insidious and destructive sort of authority: either *capital* or “*tradition*” (or, confusedly, both). But it’s wrong to equate the “authoritarian personality” with the whole spectrum of American conservatism. It mainly applies to the semi-fascist traditionalists and some neocons. Doubtless some people on the left exemplify it also, but to the extent that they do, they’re betraying leftist ideals.

In yet another sense, I am actually one of the truest conservatives around. I am an arch-traditionalist: I love old classical music, old literature, old art, old Enlightenment ideals of truth, rationality, freedom, community, all-encompassing knowledge. The ideal of the well-rounded person, the universal genius, but most importantly old values like compassion, simple morality, human dignity, humanism, philosophical wonder. I resent modern technology for its anti-humanist implications. Chomsky, by the way, has said the same thing about himself: he’s exceptionally traditional.

Reading a lot of journal articles on workers' ownership and cooperatives. (And economics in general.) For example, Karen Ann Faulk's "*If They Touch One of Us, They Touch All of Us: Cooperativism as a Counterlogic to Neoliberal Capitalism*" (2008), about the experience of some hotel-workers in Argentina. Hoyt N. Wheeler's "Producers of the World Unite! A Return of Reformist Unionism?" (2004). Cecile G. Betit's "Carris Companies' Practice of Employee Governance" (2002). Rousseu and Shperling's "Pieces of the Action: Ownership and the Changing Employment Relationship" (2003). Elizabeth A. Hoffmann's "Confrontations and Compromise: Dispute Resolution at a Worker Cooperative Coal Mine" (2001). Takis Fotopoulos's "The myths about the economic crisis, the reformist Left and economic democracy" (2008).

From Shperling's article, a respectable non-Marxist formulation of the idea of surplus-value: "The traditional source of entrepreneurial wealth is the premium employees willingly pay for a guaranteed wage. This wealth premium is the difference between the worker's actual economic contribution to the firm and the compensation he or she receives." But later we have this statement: "To successfully start new firms or enhance growth in existing ones, workers must generate value greater than their current compensation." The emphasis here on *starting* and *growth* suggests that Shperling doesn't understand the general applicability of the theory of surplus-value.

Associative Democracy: New Forms of Economic and Social Governance (1994), by Paul Hirst. Much of *Making Mondragon: The Growth and Dynamics of the Worker Cooperative Complex* (1988), by William Foote Whyte. Most of *Governing the Firm: Workers' Control in Theory and Practice* (2003), by Gregory K. Dow. *The Cooperative Movement: Globalization from Below* (2007), by Richard C. Williams. Parts of *Fundamentals of the Stock Market* (2000), by B. O'Neill Wyss. Also reading internet articles on finance. I'm tired of ignorance. The subject-matter is dry, but learning about it is exciting.

This sentence (from the *Monthly Review*) basically sums it up: "When economic stagnation struck most of the world's advanced capitalist economies, beginning in the mid-1970s, capital went on the offensive, quickly understanding that the best way to maintain and increase profit margins in a period of slow and sporadic economic growth was to cut labor costs." As a result, "governments and global lending agencies such as the World Bank and International Monetary Fund began to implement policies that made workers increasingly insecure." That's the last thirty years right there. And the culmination was the Great Recession we're experiencing. *Finally* neoliberalism is on its way out.¹

Simplifying somewhat, true statements about humans are (directly or indirectly) a function either of their biology or of the social structures, conventions, ideologies and so on that have molded individuals. But so-called moral truths can be justified by neither. Consider biology: no researcher has ever learned by studying DNA that it's wrong to murder. Likewise, it's ridiculous to say that given our biological constitution, or our patterns of behavior, humans have an inalienable right to freedom. So moral truths are not biological or "natural." But they can't be conventional either—their truth can't result from the fact that society is organized in a particular way. Why? Because that's as absurd as arguing for them on the basis of biology. Moreover, it actually contradicts the essence of moral truths: it means they can't be "absolute" or anything like natural laws, but are relative, changeable, like society itself. —Thus, to talk about moral truths is to not know what one is talking about, since they can be neither 'biological' nor (by definition) merely conventional—but these are the only two options.

In another sense, though, a non-normative sense, moral truths are a function of *both* biology and social organization: our genetic endowment predisposes us to (valorize) compassion, cooperation, respect for others, and the organization of our society results in our belief that particular rules are moral absolutes.

So the proper way to conceptualize ethics is to think of its practitioners as simply trying to find the best way to frame the normative dimension of human relations. Not as trying to find the "truth."

I should say, however, as I've said repeatedly, that, given certain basic values and assumptions, there *are* moral absolutes. If you reject the former, or somehow qualify your commitment to them, it's perfectly rational to reject the latter.

¹ [Wow. Naïveté.]

I'm studying for the GRE again; taking the test at the end of October.

John Aubrey Douglass's *The California Idea and American Higher Education: 1850 to the 1960 Master Plan* (2000). Parts of Fritz Fischer's massive *Germany's Aims in the First World War* (1966), which gives the very strong impression that Germany was mainly responsible for the war.

Irony #973.— It's perverse that selling yourself as a killing-machine to certain capitalist power-structures that send you across the world to slaughter people you don't know for the sake of the profits of people you don't know—whose minions indoctrinate you into complete ignorance of what exactly it is you're doing—is considered praiseworthy, in fact heroic.

What do [some] women want? Vicarious confidence. They want a man in whose confidence they can bask.

Karl Marx once said, "After all, we can forgive Christianity much because it taught us to love children." Almost unbelievably, the factual part of that statement is right. Christianity did have such an effect on the Western world. Throughout antiquity, children had had little or no value. In Rome, fathers had absolute authority over their children: they were legally permitted to kill them for any reason, even on a whim. Infanticides, as you know, were rife all over the Mediterranean (and, I suspect, all over the world). Children were regularly sold into slavery. I can't think of any references in classical literature to the value of children. That's far from true, though, of Buddhist literature. And of Christian literature. From the Gospels on, Christians held children up as an earthly ideal. This attitude has been revealed in Christians' charitable endeavors throughout the centuries.

If all we knew about antiquity was that it didn't respect children, we'd know that it was a horrible, inhuman era. Aside from art and nature, the world contains nothing more valuable than children.

Concentration of power and resources has, from the very beginning, been the overwhelming source of the world's ills. (Not religion, as Dawkins et al. would have you believe.) Abolishing it is the sine qua non for establishing a humane society. —Yes, it *is* that simple. All the sophisticated analyses of scholars and economists and philosophers boil down to the fact that it's imperative to abolish the concentration of wealth, and therewith the centralization of power.

Jackson, good ol' Jackson, asked me on Facebook what I thought about Habermas and his "cognitive interests." I haven't addressed Habermas much in this journal, so I'll put my answer here: "I don't know much about Habermas, but I've always found him to be a more challenging and sophisticated thinker than his postmodernist competitors, like Foucault. The Marxist romantic in me likes his 'systematic' ambitions. But regarding his tripartite division of cognitive interests, it strikes me as a little simplistic, artificial. Any such classification of mental activity is bound to fail, I think, just because it's 'forced' and 'false' to draw boundaries between different kinds of activities of the intellect. You know, I'm always suspicious of tidy little schemas like Kant's twelve categories or Habermas's "technical, practical and emancipatory." They can be useful and illuminating and may lead to fruitful research, but ultimately they gloss over inconvenient details, they make everything too tidy—they're merely symptoms of the human desire to systematize everything (and to systematize usually means to simplify)."

Durkheim's conception of democracy as communication. (Similar to Habermas', by the way.) De-emphasizing the 'representation' aspect, emphasizing the 'communication between state and society' aspect. Coordination, constant communication. "The state is an organ for social coordination, not a mere medium for registration of the wills of social majorities." Closer to corporatism than to the atomism of classical representative democracy. Associative democracy rejects the elitist corporatism but accepts the centrality of *communication* (and also the necessity of political representatives).

Some obvious points from Hirst's book:

The idea of a market society is a virtual impossibility. Social relations cannot be sustained by buying and selling alone, even if we assume an elementary non-commercial solidarity in the natural affinity between the members of the family. ...The morality can only work in a context of social institutions that supply it with a distinctive morality for its participants. Even if we assume near-perfect competition and reasonably available market information, we find that the market requires, even with public regulation, strongly moral and self-denying individuals if it is to be equitable. Honesty, fair-dealing and a respect for law are essential to an efficient and impersonal market, but they are not supplied by it and cannot be bought at any price. They are a gift from society and its moral order... The market relies on the non-market motivations, beliefs and behaviors of individuals.

...A market economy can function well if it is embedded in a society that is complementary to the market principle, but, in being complementary, uses non-market calculations and forms of resource allocation. In particular, such a society is cohesive enough and collaborative enough to judge market performance substantively, that is, the market system will be expected to produce acceptable levels of employment, investment and a suitable composition of output. If it does not, social actors will intervene to correct it, and provide the appropriate means of regulation and inputs to achieve the substantive outcome desired. The market system is thus a viable economic mechanism in the right kind of social context.

Fotopoulos notes that the market is efficient *given a particular distribution of income*. That's what economists always say: given a distribution of income (and perfect competition), the market allocates resources Pareto-efficiently. But the whole point is that income is never distributed equally. So a few people get everything they want and much, much more, while the majority can't even get what they need because their incomes aren't high enough. Therefore, resources aren't distributed rationally, if by 'rationally' you mean that everyone gets what he needs first and only then starts to acquire luxuries.

Market failures in fact occur constantly. They're *everywhere*, from pollution to the existence of widespread poverty to a lack of choice in various aspects of life. As Chomsky says, the market can give you the option to buy a Ford or a Toyota, but it can't provide you with a subway or any kind of public transportation system—which people overwhelmingly desire. Only a government can provide you with that. Democratic governments are more efficient, more responsive to the public's desires, than markets, because (ideally) they aren't attuned to the accident of income.

October

Part of an email from my beloved Aniela:

So, shortly about my last trip. It was my first time when I was in Israel and I have to admit that it's amazing place but a little scary at the same time. When I was entering Israel I felt like I'm in Europe. Ok, almost like in Europe because the first what I saw was guns! A lot of guns and a lot of soldiers (very young people) everywhere! Do you know that the army is obligatory to everyone (boys and girls) who is 16 years old? It's frightening! In a crowded restaurant I had to ask a man to move his gun and after it I could sit in the seat beside him.

I visited Jerusalem during the Jewish New Year. Of course I was impressed by the Wailing Wall. It must be very interesting when you see small groups of Jewish men with long braids and black yarmulkes read prayers in a rapid, muttering rhythm. The crevices were stuffed with bits of folded paper, all prayers, some possibly decades old. But I was given no peace. When I was watching Jewish people walking into Arab quarter I felt something like high

tension. They observe each other like boxers before a boxing match. First time in my life I saw the destructive power of religion! Any form of dialogue will be never possible! People need bombs because of religion! Such a strange world!

I visited Bethlehem and Jericho too. The situation here is far more tense and dramatic than I expected! The Israeli - Palestinian conflict will be forever! No doubt! And the word 'conflict' it's not strong enough to describe this situation. Fear and hate sit on every corner! They live in a climate of unrelenting fear, ever-increasing anti-Semitism and mutual suspicion. But on the other hand I'm attracted to some kind of apocalyptic culture. I want to go back to Israel this year!

I went to Jordan to visit Petra. Absolutely amazing place! Petra itself is gorgeous, awe-inspiring, and well worth the visit. Unfortunately I didn't make any pictures because I left the camera in my apartment in Egypt but I want to see it again!

[...]

When the world has ten billion people, what is economic activity going to look like?? This is the question that drives me. I sit in my room trying to imagine what the global economy will look like. Much of the world, no doubt, will be in utter chaos, with famines, starvation, refugee-movements, depleted resources. Other parts of the world will be relatively prosperous, though overpopulated. Will capitalism still be hegemonic, or will cooperativism, or some other form of socialism, predominate? There will surely be a number of little wars going on in impoverished areas (e.g. much of Africa), which will kill off a significant proportion of the population.

Richard Williams's book is informative. The enormous success of cooperatives is the world's best-kept secret. I had no idea of their extent and influence until reading this book.

Prima facie, the arguments of economic liberals make sense. For example, liberalizing trade, eliminating tariffs, sounds like a good idea because of comparative advantage. Initially the liberalization of trade might result in hardship for many people, but eventually the capital of the two countries will shift to those sectors in which it is most profitable—i.e., in which production is most efficient—thus resulting in benefits for both countries, and for everyone in them. Prices will decrease through competition, real incomes will rise. Labor will shift to those sectors in which it is most in demand. Et cetera. You can finesse the argument however you want.

Unfortunately, the real world is messy. Such assumptions as perfect competition, perfect access to information, perfect flexibility in labor-markets, a fairly equal distribution of capital, equal access to political power (so that no one can cheat)—are invalid. In practice, the mega-corporations undersell the small local enterprises and drive them out of business. Local industry has no chance. (This is why virtually every industrialized country started off with high tariffs and a degree of state sponsorship, to protect its infant industries.) American corporations, moreover, have inordinate political power, so that they can retain government subsidies while forcing their competitors not to have them. This is what happened with NAFTA: corporate corn farms continued to be subsidized by the U.S. government, while Mexico wasn't allowed to subsidize its own corn growers, who consequently went out of business and had to become unskilled laborers, often emigrating to the U.S. Additionally, whatever income gains do occur for Mexicans go disproportionately to wealthy investors (who tend to siphon their profits off to the already-developed economies), unless a strong labor movement exists. Instead of the nation's becoming wealthier as a whole, it might well become immiserized. Hence the increased disparity between rich and poor countries over the last two decades.

Besides, the very concept of comparative advantage has lost most of its applicability in today's world. It's outdated (with the exception of a few sectors).

When adjudicating between models of the economy, for example the neoclassical vs. the Marxist, the final test has to be how closely they mirror the real world. How well can they explain things that are

really happening? The neoclassical model has great logical force, it is mathematically elegant, but ultimately it is less adequate than the Marxist because it does a worse job of explaining reality. Its very starting-point is wrong: it starts from the market, from an abstractly idealized market, when it should start from what happens in the sphere of production, which is the real heart of capitalism. Even its *definition* of capitalism differs from Marx's, emphasizing the "free market" etc. rather than "wage-labor vs. ownership of capital." Which assumption seems more realistic to you?

Reading John Keegan's *The First World War*, a detailed military history. Other books too.

To sum up.— The problem with people is that we tend to judge someone's worth on the basis of his intelligence and confidence, not on the basis of his thoughtfulness and how he treats people. That makes sense from an evolutionary perspective but not an ethical one.

Upside-down.— People love the servants of power, the policemen and soldiers, for supposedly giving us our freedoms and protecting them, while they hate the radicals, the socialists, the workers, the feminists, who are the real reason we have any freedom at all. What confusion! Worshiping authority for ensuring *freedom*, the one thing it violently opposes! The confusion is predictable, though: indoctrination works wonders, reason-defying miracles.

Faith, not evidence.— The fact that I'm well-disposed towards people has nothing to do with people. It has to do with me.

A little thing I had to write:

Socialization in American Schools

The selections we read from *Whose America? Culture Wars in the Public Schools*, by Jonathan Zimmerman, and *Learning from the Past: What History Teaches Us about School Reform*, edited by Diane Ravitch and Maris Vinovskis, were stimulating and well-written. Taken together, they provide a coherent narrative of how the socializing functions of the public school system have evolved from the beginning of the twentieth century to its end. A picture emerges of a society preoccupied initially (around the turn of the century and afterwards) with instilling its diverse population with patriotic and nationalistic sentiments, to "Americanize" the many immigrant-groups and tie the country together. In this era, especially in the 1920s and 1930s, textbooks deemed "unpatriotic" for whatever reason—whether because, influenced by Charles Beard and other "new historians," they impugned the ostensibly noble, selfless motives of the Founding Fathers, or because they suggested that, in light of the Great Depression, laissez-faire capitalism is a flawed system—were attacked by groups ranging from the American Legion and Ku Klux Klan to immigrant organizations committed to the sacredness of the American Revolution (partly as a standard by which to criticize contemporary racist and anti-immigrant currents). This focus on assimilation was complemented by an emphasis on successful adjustment to the modern world, in which men could meet the demands of a complex economic order and women could be effective homemakers. According to Patricia Albjerg Graham, academic achievement in itself was not the primary concern of educators during the first half of the century;¹ assimilation and adjustment were.

During and after the civil rights era, educators concentrated on giving minorities and the poor increased access to education. "Equal educational opportunity" was the mantra during this period. In a sense, then, it constituted an extension of the prior concern with unifying the country, with ensuring that it truly become a "melting pot." From the 1970s on, however, multiculturalism has become the dominant and somewhat paradoxical means through which children are to be socialized—"paradoxical" because, as Reed Ueda notes, it apparently serves to fragment the populace rather than unify it. People are encouraged to

¹ In fact, it only became so during the 1980s and '90s, when people started to think that American educational achievement was lagging behind that of other countries.

identify with their ethnic group, their specific “cultural heritage,” rather than simply with their country. Prima facie, this policy appears to be the opposite of that favored during the initial decades of the century.

Needless to say, this brief outline of the readings does not do them justice. A particular strength of Zimmerman’s book is his appreciation and illustration of the complexity of the politics of education. It is not a simple matter of ‘minorities and progressives vs. conservative nationalists’; instead, the agenda of the latter has periodically overlapped with that of immigrants, while progressives have been opposed by both. For example, during the first two or three decades of the twentieth century, conservatives and immigrants were both eager to promote patriotism and the worship of national heroes, in particular the Founding Fathers. They campaigned against so-called liberal textbooks that emphasized socioeconomic forces and class-based analyses, claiming that these ideas would dilute the patriotic fervor of impressionable children, who should instead be taught that the Revolution, for instance, was indeed a cut-and-dried matter of ‘heroic Americans vs. evil British oppressors.’ In this case, the main difference between immigrant groups and white Protestant conservatives was that the former tried to insert their own ethnic heroes into the historical narrative of America: the Irish claimed that they had been instrumental in the nation’s founding, the Germans that *they* had been so, the Poles that *they* had been so, etc. But they all embraced the national mythology.

It is intriguing in this connection to note that, in a sense, the history of education has come full circle: whereas a hundred years ago ethnic groups insisted on including their own special contributions to America in schools’ textbooks for the sake of basking in the nation’s glory (thus derivatively illustrating the glory of their own cultural heritage), now multiculturalism pursues the same end—of appreciation for every culture and ethnicity—but effectively at the *expense* of an emphasis on national unity and glory, the “melting pot” ideology. That is to say, a century ago immigrants’ pride in their heritage (as manifested in their education campaigns) was mediated by the idea of America; now, an insistence on the primacy of the nation is no longer necessary to achieve the same result of ‘pride in one’s heritage,’ presumably because the idea and ideology of the nation-state is past its prime.

In fact, upon reading Ueda’s article on multiculturalism, I was initially surprised that such an apparently divisive ideology was embraced so enthusiastically by educators across the country. Of course I had already been aware of the phenomenon of multiculturalism, but Ueda’s focus on its cultural divisiveness brought home the point that it is in obvious tension with the ideology of the nation-state. From the time of Horace Mann (or earlier), however, a major concern of educators, as stated above, has been to foster a cohesive national society, to socialize children into love-of-country, to minimize differences between class, culture, and ethnicity (with the exception—until the 1960s—of blacks and occasionally Asians). So what is the significance of the recent apparent reversal in their practice?

Actually, it is easy to overstate the significance of multiculturalism in schools, and Ueda does so. Even in multiculturalism’s heyday, most textbooks and educators did not denigrate the ideology of Americanism, or even necessarily discard the “melting pot” metaphor. (I remember its being repeatedly invoked in my Social Studies classes.) Perhaps from an ideal, abstract perspective, Ueda is right that “multicultural schooling intensifie[s] ethnic divisions by stressing group pride and exclusive identities” (p. 128). Nevertheless, realistically, one or two hours a day in a class that teaches one to take pride in one’s race or ethnicity is probably not going to have a huge effect—and certainly not a very negative effect (as Ueda argues)—on one’s way of viewing the world. Academic learning is not what usually determines a young person’s behavior and worldview; rather, it is determined by the way he interacts with his family, his peers, his society inside and outside school. Besides, multicultural schooling is but a reflection of broader societal trends. These trends are the really important things—trends toward increased immigration from Latin America, toward the fragmentation of the country into ethnic, racial and working-class communities, toward regionalism, toward greater rights for minorities, toward an expanding population with a greater proportion of minorities. Ueda does not address these trends, instead treating multicultural schooling virtually as an independent variable, or at least as an extremely important conditioning factor in people’s behavior, which it probably is not. It is more an effect than a cause.

Nevertheless, the readings were thoughtful and thought-provoking. They constituted an informative survey of policymakers’ thinking (since 1900) on the purposes of American education.

Similar paper:

Timothy Hacsí's book *Children as Pawns: The Politics of Educational Reform* is a well-researched, illuminating discussion of five questions that get to the heart of proposals for educational reform. (Briefly, the questions are the following: "How successful is the program 'Head Start'?", "Is bilingual education a good idea?", "Does class size matter?", "How big a problem is social promotion?", and "Does more money make schools better?") It systematically examines the research that bears on each issue, eschewing the bias and partisanship that characterizes most discussions in favor of an evenhandedness that reflects the true complexity of the issues. This is in fact its main strength, this scholarly rigor (combined with a readability that comes from its attempt to appeal to a popular readership).

A reader with liberal sympathies might take it for granted, e.g., that Head Start has been proven to be an extremely successful program, bilingual education is obviously advisable in the case of children who do not speak English, small class-sizes are virtually a prerequisite for effective learning, and so on. Hacsí's book will disabuse him of these illusions, at least to an extent: research undertaken on each issue since the 1960s has often led to ambiguous results. It has been shown, for instance, that while total submersion in English-speaking classes has a negative impact on the education of children who cannot understand English—a conclusion that is not too surprising—nevertheless, the relative advantages of different implementations of bilingual education are unclear. There is, for example, "structured immersion," in which classes are taught in English but the teacher can (in theory) speak the students' native language and does so in moments when it is considered necessary. There is the model in which certain classes, such as art and music, are taught in English, while others, such as math and science, are taught in the native language. Then there are the "two-way bilingual" classes in which, say, Hispanic immigrants and native English-speakers are taught in *both* languages, so that ideally they become fluent in two languages. (These programs appear to have been particularly successful.) And of course there is also the option of having regular ESL classes taught alongside English-submersion classes. —The list goes on. The point is that the most difficult part of the issue is not the broad question of "Bilingual education?" but the matter of *implementation*. Pundits and politicians tend to take a stance on the question of principle and leave it at that, but the ambiguous and difficult part of the debate is how to implement any given principle. Even to discover the strengths of one model over another is enormously difficult, given methodological problems and the messiness of the real world.

Head Start is almost as problematic as bilingual education. In principle, of course, it is an excellent idea. Preschool for disadvantaged urban children, combined with health care and various kinds of family assistance—what could be more commonsensical than that?! Hacsí shows, however, that when you start to dig a little the subject gets murky. First of all, as the *New York Times* pointed out in 1990, a "one-year program with little follow-up 'cannot combat the ills of poverty'" (p. 47). In many cases, merely attending Head Start for one year and then returning to the 'status quo ante,' which involves broken families, broken schools and broken neighborhoods, is not going to have a long-term impact on a child's life. Moreover, it has been shown that standardized test scores, especially several years down the line, tend not to be improved by one's having participated in Head Start. Many local programs are of very low quality (partly because Head Start as a whole is underfunded). On the other hand, certain studies have indicated that children who attend the program are less likely to need special education classes later on, less likely to be held back a grade, and less likely to drop out of high school (p. 35). So it is far from true that Head Start is totally ineffective. (And its health-care benefits, including immunizations and dental work, are obvious.)

In fact, if competently run, preschool education can be astonishingly beneficial. I was impressed to learn that a particular evaluation, of unimpeachable methodology, demonstrated that even *decades* after having graduated from a uniquely well-run program called Perry Preschool, former students were reaping the benefits of their early education. As nineteen-year-olds they had relatively high grades (compared to the control group), better-paying jobs, a greater sense of social responsibility—fewer had been arrested or gone to juvenile court—and a higher proportion had entered college. By the age of twenty-seven, they were earning significantly more than the control group, were more likely to own their own home, and had fewer

arrests (p. 52). These data prove, in short, that a couple years of preschool education can potentially have a huge influence on one's entire life. Perhaps this is not so surprising, given that early childhood is one of the decisive stages of life. At any rate, it shows that Head Start, if administered competently and funded sufficiently, has significant promise.

If Hacsí's book has a weakness, it may be that he does not do enough to explicate the statistical techniques he employs, or rather which were employed by the evaluations he discusses. The entire purpose of his book is to evaluate and develop the implications of scores of studies undertaken since the 1950s, so this lack of attention to clarifying such techniques as meta-analysis can be considered a flaw. He does discuss meta-analysis briefly in the introduction, but not in any detail. In light of the fact that meta-analytic techniques have led to diametrically opposed conclusions to those based on more 'primitive' techniques, I was left wondering exactly how such differences are possible. What *is* meta-analysis, ultimately? How is it done? A detailed example or two would have been illuminating. In Hacsí's defense, his book is not targeted specifically to scholars but to educated laymen.

The impression with which the reader is left is negative in a twofold sense: solving the problems of American public education is most likely impossible, due to their complexity and controversial political implications, and politicians do not have the will to solve them anyway. They don't even have the will to let evidence determine the policies they will promote. Other factors are more important, such as what is politically popular, what will get the politician reelected, what will please his donors, and so on. A massive infusion of money—tens of billions of dollars—into the education system would have a positive effect if the money were allocated wisely, but the pressures of interest-group politics make such allocation unlikely. If most of the money were used to reduce the average class size by eight to ten students and to hire better teachers, education might be significantly improved. But, again, even if the political will for these changes existed, the difficulties of *specific* allocation, administration and oversight would probably ensure that the results would be less magnificent than anticipated. Still, Hacsí's book makes the convincing case that it would be worth trying.

Much of Robert Oakeshott's *The Case for Workers' Co-ops* (1978), Johnston Birchall's *The International Co-operative Movement* (1997), and Reed and McMurtry's (eds.) *Co-operatives in a Global Economy: The Challenges of Co-operation Across Borders* (2009). Online resources may be even more useful than books and academic articles. Certain websites also have online books available for free, including the excellent *Cooperatives: Principles and Practices in the 21st Century*.

Every public school, public transportation system, publicly funded highway, cooperative, non-profit firm, state-funded social program, public park, and everything else the government does is evidence of a market failure. Rather than conceptualizing our society as basically market-run, we should describe it as basically 'cooperative' and state-run with a significant role for markets.

Christopher Read's *From Tsar to Soviets: The Russian People and Their Revolution, 1917–21* (1996). Want to write a paper on the Revolution.

Kissed someone for the first time since Aniela: Natalie, a girl I worked with at GEOS. Went to a bar with her and friends, walked her home, then "made out." Seems to like me. Nice girl, intelligent and fairly pretty. Has an unpleasant laugh. "Huhhuhhuhhuhhuh."

The tragedy of the 19th- and early 20th-century evolution of capitalism, or rather of Marxist and socialist movements, is that consciousness outran objective conditions. When capitalist industrialization was just starting, workers and intellectuals were already fighting for a post-capitalist society. Industrialization was so brutal and so conducive to working-class organization and radicalization that visions of, and struggles for, a socialist or cooperative society were inevitable everywhere. And, in retrospect, they were inevitably going to be defeated, either in the short run or the long run, because economic conditions were not ripe for a cooperative, democratic society. An economic framework of competition was still more efficient and productive than a framework of cooperation, because scarcity was still too prevalent. (Cooperation may be more efficient than competition in individual units like firms, but the competitive macroeconomic framework, which creates the necessity to produce cheaply, is what compels firms to be efficient.)

The absurdity of it is that, *necessarily*, socialist utopianism would be most widespread at the earliest, the most brutal, stages (because of their absolute brutality: one extreme tends to foster the opposite extreme)—precisely when true socialism was *least* possible. But as it slowly becomes more and more possible (because of the gradual overcoming of scarcity and emergence of a cooperative economy), revolutionary desires and hopes fade, because the masses' lot in life has become relatively tolerable. On the other hand, the fading of revolutionary dreams itself facilitates the slow emergence of socialism (worker cooperativism) because it means that there will be no more Leninist, Maoist misadventures, no more attempts to establish socialism *consciously*, by decree, which was never going to work. It has to be an unconscious, organic evolution out of capitalist conditions, as Marx understood in his less voluntaristic moments. What he didn't understand was that this condition was incompatible with an upsurge of the masses, a rupture, a clean break from the past, a "dictatorship of the proletariat." In (almost) the same unconscious way that capitalism originally emerged from feudalism, socialism will emerge from capitalism. [It'll be in pockets at first, decentralized.]

It's an absurd tragedy. Think of it: millions of people laboring to establish a social order that they were fated from the very beginning not to establish, just because it wasn't yet time! "Communism" in Russia and China didn't have to happen; it depended largely on specific, contingent conjunctures. It could have happened in Germany but didn't because the authorities were strong and social structures relatively stable; it happened in Russia and China because the authorities were weak and society unstable. Everywhere, it was power-structures against workers and poor farmers/peasants—and the power-structures were historically, more or less, in the right (as shown by the failures of "Communism")! How absurd is that! The oppressed were getting ahead of themselves. That was history's horribly inadequate answer to them. [Of course this is simplistic and overly deterministic, but there's *some* truth to it, at least as regards the utopian goals of the revolutionaries.]

On the other hand, it's probably true that decades-long revolutions and civil wars were inevitable in such countries as Russia and China, simply because the aristocracy and the peasantry had to be destroyed in order for capitalism and modernization to happen. What wasn't inevitable was the form that these revolutions would take. The *outcome* was more-or-less predetermined, namely the destruction of feudal classes. But the path to this result didn't have to be "Communist"—although perhaps some such thing was probable after all, given the numerical force of the peasantry. I.e., it was likely that the peasantry would start out as the base for the new political elite, the elite that would crush the *ancien regime*, even if this very peasantry would necessarily itself be crushed sooner or later because it too was pre-capitalist (uncompetitive, unindustrial, unprofitable, conservative, all qualities that would have to be overcome if their society was to survive in a capitalist world—which, again, is why the feudal classes were doomed). Still, what strikes the historical observer is that most of the participants in these struggles completely misinterpreted the significance of their actions. Including Lenin, Trotsky, Mao, Stalin, all the leaders. They thought they were clearing the way for socialism, when, of necessity, they could do little more than clear the way (however circuitously) for modernization, i.e., in the final analysis, capitalism. That was their historical task—which, in fact, they failed at in the short term, since they misunderstood their task.

Sad irony! Marxists falling victim to Marx's insight that historical actors are usually mistaken about the significance of their actions. Ah, Reason, you cunning thing.

In any case, Marx was right that the "contradictions" of capitalism are what make inevitable, eventually, a more cooperative society (and what necessitate cooperative, democratic elements in current society). Many of these contradictions are what we call, in contemporary jargon, market failures or market inefficiencies.¹ What they all amount to is that the functioning of capitalism necessitates non-capitalist institutions and forces, which will someday overwhelm it.

¹ These are "contradictions" because they are direct results of capitalist activity and yet tend to undermine it. Bourgeois economists are wrong, therefore, in implying that market failures are mere "accidents." They are intrinsic to capitalist production and the laws of supply and demand. For example, why are agricultural co-ops so common? Because capitalist firms didn't think that potential profits justified the expense of getting involved in these sectors. Whenever

By the way, you may wonder how “consciousness getting ahead of what is economically feasible” squares with Marxian epistemology (social being first, then consciousness). The truth is that it doesn’t literally contradict Marxism, since this aspect of Marxism cannot in fact *be* contradicted. It isn’t a scientific hypothesis that can be tested; it’s more like a premise for psychology and sociology, a premise based on semi-philosophical, semi-psychological or -physiological considerations. It isn’t empty, but its content isn’t on the level of science. This is partly because consciousness, while molded by physical and social conditions, is not bounded by them. Humans have imagination: they can see beyond what is immediately given. They can plan and hope and imagine. In fact, if you take the Marxian dictum in its strictest possible sense, human agency is inexplicable. But anyway, in an ideal science it would be possible to translate the dictum into a contentful hypothesis that could be tested (because the dictum is, after all, empirical); only in our messy world is that extremely difficult to do.

As for Marx’s statement that mankind only sets itself such tasks as it can achieve—which is partly based on the idea that consciousness is derivative of social being—this is problematic. First of all, it would seem to have been disproven by the failure of all mass efforts to achieve socialism. On the other hand, it almost seems meaningless. And if it’s not meaningless, why would it be true? Intuitively, for some reason, it strikes me as vaguely compelling, but I can find no logical justification for that.

To return to the thing above. Tsarism, for example, was doomed eventually. Why? Because capitalism and industrialization give rise everywhere to the “awakening of the masses,” i.e. movements for equality and freedom. It happened in the West, it’s happening in Latin America, it’s happening in the Middle East and China. When millions of people are thrown together in cities, they’re bound sooner or later to get some power, and more power as the decades pass. The question is, how was Tsarism going to fall? The process could have been gradual, if the rulers had been less hidebound. Liberal reforms could have proceeded step by step, the bourgeoisie could have been progressively brought into the institutions of governance, the workers and peasants could have been permitted a political party, as happened in Germany. In fact, for a while Germany and Russia *could* have traveled parallel paths. Nevertheless, some sort of violent revolution was likely sooner or later in both countries, since it’s highly improbable that the aristocracy would have relinquished power peacefully. But the revolution could have been more like a liberal, bourgeois one than that of October 1917. There could have been a more successful “Provisional Government” than the one of 1917, and then a liberal constitutional convention, etc. Communism (in whatever form) was not inevitable. That is to say, the specific circumstances of World War I were not inevitable, partly because Russia *could* have liberalized to a greater degree than it had by then. But it didn’t: it didn’t ameliorate the conditions of the proletariat or the peasantry, it didn’t moderate its imperialism, it chose to fight the war, and its generals didn’t do so well. (Had Russia won, the revolution in whatever form would have been postponed a decade or two. It might have happened during the Great Depression.) So the Bolsheviks came and conquered because they told the masses, especially the soldiers, what they wanted to hear—“All power to the Soviets!” and “Peace, land, bread!” Unfortunately, democracy was impossible in the conditions that obtained then. The party was determined to maintain power, determined to establish socialism by whatever means necessary, and a civil war had to be fought for two years. And so it went. By 1921, Bolshevism had already served the historical purpose of destroying all reactionary aristocratic remnants of Tsarism; now it had to resume the industrialization that had begun under the Tsar but was now in tatters. In retrospect, though, we can see that industrialization, or modernization, in un-capitalistic conditions cannot be genuine, thorough modernization, i.e. cannot really compete with capitalist modernization. The case of China confirms that. Hence the ultimate necessity of introducing some kind of capitalism.

In short, the revolution in Russia, the event that would catapult it into the modern era, *should* have been something like the French—should have merely cleared away the detritus of feudalism and absolutism. [Actually, from this perspective the French Revolution was really decades long, still not finished by 1848.]

all relevant firms make such a calculation, these is a market failure, a “contradiction of capitalism.” There’s demand but no supply. (Other contradictions involve an excess of supply over demand.)

That would have been the shortest, most efficient and effective way to get to the predetermined endpoint, viz. political and economic modernization. But World War I got in the way—millions of soldiers, and peasants, radicalized by years of misery—and the Provisional Government was inept, and Lenin was brilliant, and everything got fucked up.

Still, I shouldn't forget what I wrote yesterday: Russia and China were unique in the sheer numbers of their peasantry. Sooner or later some adventurer or party was bound to ride the peasants' wave into power, be it Mao or Lenin or whoever. (Actually, Napoleon III did the same thing, if you believe Marx's account in *The Eighteenth Brumaire*. And he too, if I remember right, was none too loyal towards them, like Mao and Lenin. None of them *could* be loyal, in light of the imperative to modernize.) But his inevitable betrayal of them didn't have to take the form of collectivization; it could have consisted in enforced 'capitalization,' as happened in other, smaller countries around the world. Including France.

The GRE has gotten harder since I last took it. John Nash would have had difficulty with some of those math problems. I got a 1320. Yup. Think I did fairly well on the writing section, though.

It's wonderful to be able to kiss and caress a woman again. The beauty of women... [...] I need women; they're all I need. And *touch*, how I've missed touch! –Natalie and I are officially dating, though I have two or three other prospects also. A girl I met last weekend at a party (Dana) seems to have been smitten by my having discussed Russian literature and labor history with her: she sent me an email days later, having sought and found my address.

...Saw Dana tonight at a party she'd invited me to. She was nice enough to drive me home. We kissed for a while in her car until a cop interrupted us. I'll see her tomorrow night. She's a wonderful girl, intelligent and beautiful.

November

29 years old. "You're an old man," Natalie said tonight as we lay naked in her bed after sex, or something like it. (She's 25.) The alcohol and the condom somewhat reduced Mr. Johnson's enthusiasm for the task to which he has devoted his life. Useless little fucker. He's demanding, but when he gets what he wants he doesn't want it. Anyway, Natalie cooked dinner for me, a delicious Italian pasta. As I was in bed with her, Dana called me: wants to meet this weekend.

Peter Irons' *Jim Crow's Children: The Broken Promise of the Brown Decision* (2002).

In the library today I happened to pass Harry Truman's memoirs. Picked the book up and flipped to the pages on the atomic bomb. "...General Bloodlust [or whatever his name was] wanted to drop the bomb on Kyoto, but Secretary Stimson argued that Kyoto was an important cultural and religious shrine." Stimson had spent his honeymoon there and had fond memories of it; hence, it was saved. Because of a honeymoon. A treasure-trove of history and culture saved because one guy said "No" because of his honeymoon. And then you tell me there's a God! Idiots.

Upon receiving the telegram reporting that the bomb had been dropped on Hiroshima, Truman "was deeply moved. I turned to the sailors I was having lunch with [on some battleship somewhere] and said, 'This is the greatest thing in history. We're going home.'" Yes, he said it was the greatest thing in history. And—the next page is on a different subject. No reflections on the meaning of Hiroshima or the decision to use the bomb; just...it was the greatest thing ever, and then on to his negotiations with Stalin. The man was amoral. An arch-bureaucrat, an amoral machine, like Roosevelt, Churchill, Stalin, and most heads of state in history.

How that level of unreflectiveness is possible, I don't know. Years afterwards, as he's writing his memoirs, he doesn't stop to reflect on his decision to kill more than 200,000 (with the after-effects) civilians. He takes it for granted that American lives are more valuable than Japanese lives, and that it's better to kill hundreds of thousands of Japanese civilians (women, children) than to let *much fewer* American soldiers die. Had the Japanese not surrendered, he and his generals would have gone on dropping as many bombs as necessary. They would have been happy to obliterate every city. A million deaths, two

million deaths, priceless cultural artifacts destroyed...it would have been okay, because it would have ensured that they won the war.

Being a “man of action” is not a positive thing. It means that you’re *not* a man of reflection. It signifies only the proportionate absence of reflection.

Irony #1048: cooperativism and quasi-“state socialism,” which help rectify the myriad market failures of capitalism, are what sustain the capitalist world-system (by stabilizing it).

By the way, what China is doing in Chongqing and other areas is amazing. State socialism administered intelligently, if amorally.

Ronald Formisano’s *Boston Against Busing: Race, Class, and Ethnicity in the 1960s and 1970s*.

Hegel: “History teaches us only that people have never learned from history.”

From an article on the Russian Revolution: “...In the highly competitive world of nation states, none could hope to survive without the employment of all its human resources. As World War I showed, these would not be forthcoming if large segments of the population felt excluded from the benefits of full citizenship and if economic hardship intensified the sense of exclusion which led in some cases to open rebellion. In the half century after 1914, almost every European regime, whatever its political coloration—socialist, fascist or liberal—tried in some way to assure itself of the loyalty of its citizens, tried by means honest or specious to create for them a sense of belonging and participation. Corporatism, communism or welfare state were the different names given to what was fundamentally the same search for national solidarity, national power and national survival, for ways of reconciling deeply divided societies and of concentrating national energies. At the opposite pole from the Bolsheviks, Italian nationalists and fascists indicted their ruling clique (they shunned the word class) for ineptness and greed and preached national solidarity as a necessary prerequisite for the struggle between Italy, a nation of proletarians (or a proletarian nation), and the plutocracies. ‘Workers of all classes unite!’ was the slogan of Belgian fascism, and the choice of name for Hitler’s National Socialist German Workers’ Party was not accidental.

“Here then is another meaning of the Russian Revolution and of Bolshevism that shows them to be anything but provincial, local or peculiar and reveals them as partaking of certain central features of recent history. Here too, the one-party state, first developed in Soviet Russia and widely copied elsewhere, was but one tool for overcoming the atomization and disintegration of society caused by liberalism, war or economic crisis, just as communism, like fascism, was but one of the challenges to the selfishness of individuals and of interests that opposed themselves to the general will. Fascism is often seen as a reaction to communism, or as one of its distorting mirrors. It is equally true to say that while both were nourished in the matrix of modern history, they were separate and distinct (yet in some ways similar) responses to problems posed by that history. Both aspired to be total creeds; both proclaimed their hostility to the bourgeoisie, to individualism, to liberalism; both were collectivistic, messianic and authoritarian. They were alike in promising a new world and in invoking the general will, in their activism and their appeals to youth, in their opportunism and their combination of populist tendencies and elitist practices.”

Welfarism, corporatism, communism, fascism, nationalism—these 20th-century phenomena all amounted to ways by which power-structures sought and/or were enabled to shore up the unity of their society and overcome the divisive tendencies of capitalism (especially liberal capitalism), thus maintaining power. Or, to speak more accurately, if these movements attained power it was because of their usefulness to power-structures in controlling the population. Each of them exploited a different tendency growing out of capitalist dynamics, which was almost *logically implicit* in them. Communism exploited workers’ opposition to capital; fascism and some kinds of nationalism exploited capital’s (or private property’s) fear of working-class revolution; welfarism was an expression of capital’s desire for societal stability and labor’s “reformist” or “trade-union” desire for material well-being and the ownership of property (a desire in tension with its sometimes-revolutionary tendencies);¹ corporatism reflected a similar ‘desire’ or ‘demand’

¹ The two working-class tendencies, of a trade union consciousness and of a revolutionary consciousness, are logical outgrowths of two different aspects of the labor–capital relation. (Roughly, (1) the antagonists’ ‘desire’ for harmony,

for compromise between labor and capital. (I put those words in scare-quotes because I don't want to personalize fundamentally impersonal dynamics.) Liberalism, too, and individualism, human rights, etc., grow out of capitalist dynamics, for example the necessity of economic competition, of separation between owners of capital, of individual initiative, and so on, which leads to the bourgeois demand for a level playing-field, a doctrine of political liberty and equality as well as a framework of laws to adjudicate frequent disputes of an economic character. (But the working-class demand for rights and recognition is also a tremendous impetus towards human rights and democracy.) Anyway, every mode of production has a dynamic that can be considered from various aspects, each of which expresses itself in a particular form of social and political activity.¹

—I just thought of that. Cool! Though it's largely an extrapolation from Marxism, I can't remember reading any author who articulated it.

I've forgotten most of Barrington Moore's book. But it seems to me that the way it works is this:² the rise of the bourgeoisie and birth of the proletariat puts pressure on the state in a number of ways, which responds by placing more burdens on the peasantry (for example, increased taxation, greater exploitation, more pressure to produce a food surplus), which seethes in discontent for decades and finally boils over in revolutionary energy when an outside shock of some sort occurs, e.g. a war or political crisis. The inchoate bourgeoisie, petty-bourgeoisie and urban workers play perhaps the leadership role in the revolution but derive much of their power from the peasantry's opposition to the aristocracy. The urban leaders of the revolution will retain the support of the peasants if they denounce the landowners. So, the peasants rise up against the landowners as the bourgeoisie seizes political power, helped also, "objectively" if not subjectively, by the urban underclass. But the peasantry is not a progressive force: it wants only to own the land it works on, not to advance to a higher, more efficient mode of production. The bourgeoisie, however, wants (eventually) efficiency and profit, and wage-laborers to boot (drawn from the ranks of the peasants), so in the end its 'alliance' with the peasantry is doomed. The latter is the tool of progress, an essential tool in toppling the old regime but doomed to disappear after it has served its final historical function (of rising up against the autocrats and landowners in effective support of their bourgeois successors). —Or such is the most logical and 'direct' way for the transition to happen. In reality, in Russia and China it ended up being not the bourgeoisie but the Communists who successfully manipulated peasant discontent, largely because this discontent was directed in part against new capitalist policies (or the capitalists were somewhat in league with the landowners). But the Communists, being a group that aimed at power in a competitive international arena, had ultimately the same goal as the capitalists, namely economic efficiency and modernization, which meant that they too would inevitably scorn the conservative desires of the peasant. And the end-result is the same: downfall of the old regime by riding the wave of peasant resentment, only to turn on the peasants later (in an economic evolution lasting decades, during which the peasants cannot rebel successfully because their new masters have more power than their old ones did). Poor Mr. Peasant: the dupe of history.

... You should remember that the peasantry in a given society revolts periodically throughout the centuries. It isn't only with the onset of capitalism that things become unbearable for the peasant. But it *is* only with the onset of capitalism that the peasant revolt can finally lead to bigger and better things. The peasant wants to smash the state machinery that is exploiting him ruthlessly, so that he can return to the legendary days when he was in charge of his land. But *this* time there is also another class that shares his desire to smash the ancien régime, an emerging class centered in the cities, which can therefore take charge of the revolution and guide it by harnessing the power of the peasantry for its own ends. In countries,

stability or a *modus vivendi*, vs. (2) their 'desire' to *crush* the other, to attain complete power. Depending on social conditions, one or the other tendency will come to the fore.) The first is exploited by welfarism, the second by Communism.

¹ I'm not saying that *all* social and political activity is an expression of tendencies implicit in the dominant mode of production.

² I'm thinking mostly of France and Russia. And I'm simplifying egregiously, for instance by using such terms as "bourgeoisie." But a term like that does have some meaning, a cultural and an economic meaning.

however, that have capitalism thrust on them instead of growing organically out of the society, capitalists make alliances with the landowners and the authoritarian regime, which means that only a group that sets itself in opposition to both “feudalism” and capitalism will gain the support of the peasantry. Relative to the latter, the capitalists are still a very small group that can be overwhelmed in a rebellion. So, given that (1) the fledgling bourgeoisie have allied themselves with a permutation of the ancien régime, which has itself begun adopting capitalist policies, and (2) the peasants hate this regime, a titanic struggle is inevitable, and it will take the character of a rebellion against feudalism and capitalism *at the same time*.¹ Socialists or Communists are the group that leads the rebellion because of their education and urbanism. So the peasant uprising occurs, with the assistance of the nascent urban proletariat and the Communist intellectuals. The latter interpret the whole affair as heralding post-capitalism, but what they do once they’ve achieved power belies their Marxist faith: they smash *feudalism* (or ‘capitalist feudalism’), just what the bourgeoisie did (slowly) in the original capitalist countries, but they do so, of necessity, by other than bourgeois means. By allying themselves, if uneasily/temporarily, with reactionary exploitative landowners, the bourgeoisie in these countries (such as China and Russia) had ensured that the path to modernization would be anti-bourgeois, once the peasantry revolted en masse against ‘capitalist feudalism.’ Only decades later, after the power of the peasantry had been broken by Communist violence, would it be possible for capitalism to emerge again, in a new form, and finish the process of modernization (as is happening now in China).²

I haven’t yet lost the ability to feel. There’s a certain pleasure even in my fundamental aloneness. A pleasure in myself, an enjoyment of myself fused with Schubert—holding myself aloof from the (pre)occupations of society. On a deep Schopenhauerian level not being concerned even with questions about the future of humanity or culture. The short article in the newspaper today written by a classical composer wondering if music has died, speculating on the future of music and culture. It’s all external to me. I am the noble, un-absurd element in existence.

Chomsky makes a good point: the Japanese attack on Pearl Harbor was *far* more justified from a “pre-emptive war” perspective than our attack of Iraq was, since the Japanese had clear evidence we were planning to roll back their imperialistic advances, while we had no evidence of anything Saddam was planning. Even if we’d had such evidence, the legality and morality of an invasion would have been questionable at best.

Paper on the Russian revolution:

The Causes of the Russian Revolution

The Russian Revolution is the sphinx of the twentieth century. Its historical meaning is unclear. Lenin and Trotsky interpreted the events of October 1917 and subsequent weeks as constituting an authentic proletarian revolution, a socialist revolution. The main source of confusion for them was why this socialist revolution had occurred in so backward a country as Russia, when Marxist theory predicted that it would occur first in an advanced capitalist society like England. In retrospect, though, it seems that they were wrong: the October revolution was not socialist in the proper sense, because it did not lead to a post-capitalist order. Rather, in the (very) long run the society it made possible succumbed to capitalism, in the 1990s. Moreover, it did not even lead to workers’ control over production (which is one way of defining

¹ What isn’t inevitable is the outcome of the struggle. In China for a long time the Communists were losing. It was only after an imperialist war had weakened the national power-structures that the Communists finally triumphed. The same thing happened in Russia, during World War I. So, in the sense that massive imperialist wars were inevitable, and these weak autocratic industrializing states were bound to falter and lose the ability to control their population, perhaps it was incredibly likely after all that the peasantry and workers would in the long run triumph over the landowners and capitalists—even if their victory was to be a hollow one.

² [The empirical statements in that account are not all correct. See my Russia paper below.]

socialism): the Communist party, particularly under Stalin, controlled production, not the workers who slaved in the factories. Even under Lenin, workers' experiments in controlling their factories were discouraged in favor of centralized, bureaucratic control.¹ But if the October revolution was not socialist or Marxist in the classic sense of "workers' democracy," what was it? Was it simply an "accident," as some historians have argued? Was its success truly a "miracle," so that it had no real historical significance but depended only on luck and Lenin's political skills?

Scholars who argue along these lines have to account for the awkward fact that Communism has had an authentic popular appeal among numerous peoples on every inhabited continent. Nor was Russia the only country that—in the conventional understanding—had a successful "Communist" revolution. China and Cuba did too, among others, which suggests that Russian Communism was not totally improbable after all but resulted from causes that to some extent functioned internationally. Thus, I'll argue in this paper that the Bolshevik revolution was not exactly an accident or a miracle, nor even *nothing but* a "coup," but rather had genuine popular support and could not have succeeded without it. Most importantly, the industrial workers and many soldiers supported Bolshevism; but the peasants did as well, to an extent, since the Bolsheviks promised to expropriate land from the rich landowners and distribute it among the peasantry. World War I in particular is what laid the foundations for the Bolshevik victory—as World War II (specifically the struggle against the Japanese invaders) laid the foundations for Mao's victory in China. Nor can it be argued that these wars themselves were "accidental" (with the implication that the revolutions they made possible were based on a very lucky, historically improbable conjuncture); quite obviously, they grew out of the imperialist dynamics of the international capitalist order.²

But what are the broader implications of my argument? I haven't answered the question of the "meaning" of the Bolshevik revolution. Why did "bourgeois" revolutions occur in England and France, while so-called Communist revolutions occurred in Russia and China? In brief, it is because in England and France during the seventeenth and late eighteenth centuries respectively, the oppressors were not industrial capitalists but mainly the autocracy and the feudal lords (especially in France); hence, the peasants, the urban underclass and the nascent bourgeoisie fought together against the autocratic state and many of the large landowners, effectively paving the way for a bourgeois democratic order. On the other hand, in those countries where capitalism does not emerge indigenously and organically, so to speak, but is consciously imposed by the state and/or by colonial powers' imperialist policies, industrial capitalists *are* among the major oppressors, who also include the still-existing landowning aristocracy and the autocratic state. Russia in the early twentieth century was one of these countries. As in all modernizing "late-feudal" countries, the Russian peasants were more concerned to throw off the yoke of the landowners (and high taxation) than of the bourgeoisie; the urban proletariat, however, understood that its enemy was capital and the repressive state. So, what effectively tends to happen in "peripheral" countries that have capitalism imperialistically foisted on them (instead of growing organically and very slowly over centuries, as in England and France) is that the peasantry's anti-feudal, anti-landowners' rebellion partly allies with the proletariat's anti-capitalist rebellion, in a hybrid anti-feudal *and* anti-capitalist revolution.³ But since the urban areas are the

¹ See Christopher Read, *From Tsar to Soviets: The Russian People and Their Revolution, 1917–21* (New York: Oxford University Press, 1996), pp. 247–255.

² The First World War, for example, which acute observers had foreseen for years, was a product largely of the armaments race and the political and economic pressures for world-domination. After all, when numerous states are packed together in an area as small as Europe, each industrializing at a frenetic pace, expanding economically, seeking new markets abroad and new opportunities for capital investment at each other's expense, building up their militaries out of mutual suspicion and the political influence of the armaments industry, pursuing secret diplomatic alliances, actively fostering nationalist sentiments in their populations, a conflagration is inevitable.

³ Needless to say, the rebellions don't always succeed. More often than not, capitalists and landowners, who form an uneasy alliance, remain in power for a long time, frequently with the help of a military dictatorship. Latin America provides many examples of this outcome. Christopher Read remarks that Russia itself, in the years before the First World War, "was moving towards military dictatorship based on authoritarianism and Russian nationalism," much like what would happen later in innumerable colonized countries whose states wanted to maintain the power of both capital and the (semi-capitalist) landowning aristocracy. Read, *op. cit.*, p. 34.

power-centers, dynamic and conflict-ridden, pulsating with historical initiative, the revolution typically starts there and uses a primarily anti-capitalist instead of an anti-feudal ideology. Indeed, initially it may not really know what to make of the peasantry, treating it as sort of an afterthought. Soon, however, it becomes clear that peasant support is essential if the landowners and capitalists (who together control the state) are to be defeated.

Its leaders invariably interpret the revolution as socialist or post-capitalist. In reality, it functions as a way of smashing relics of pre-modernity, including feudal property-relations and undemocratic ideologies. It signifies the country's entrance onto the modern stage, its embrace of mass politics (with democratic ideologies), nationalism, and the "patriotically inclusive" drive for national power,¹ to be achieved through economic modernization. It's significant that the Communist regime that seizes power soon fuses Marxist propaganda with nationalist propaganda—thereby revealing its true, nationalist nature.² In order to maintain power the new government pursues the same goal that was being pursued by the *ancien régime* in the final years before its collapse, namely of playing catch-up with the advanced capitalist countries by industrializing and modernizing its economy. It turns out, however, that "Communism," i.e., a hybrid state-capitalist state-socialism, is not up to the task, being less dynamic and more inefficiently authoritarian than liberal-democratic capitalism, and so in the end it in turn succumbs to a kind of capitalism, as has happened in China and Russia.

No stage in this long process is "accidental," per se. Neither is it inevitable. It is, rather, a product of deep economic and social tendencies, for example the tendency of capitalism in societies where it doesn't emerge indigenously to become associated—before having the chance to become entrenched (a chance it *does* have in such countries as England and France³)—with the autocratic state and the pre-modern social structures that stifle the peasantry. Because of this association, the potential arises for capitalism to be overthrown—in its infancy—with the state and the landowners. But it is still only a *potential*. Even though the peasantry and the newly born proletariat constitute the vast majority of the population, the power-structures, having a virtual monopoly on violence, can usually maintain their hold on power. Only in the context of a war that is going badly for the state does the state's overthrow become likely, because in this case the *soldiers* turn against the government as well. Such is what happened in Russia in 1917. And, given this fact of soldiers' opposition—to be established below—a radical-left, people's or "Communist" revolution against the Russian government became likely. Had there been no Lenin, such a revolution might have been delayed, or conceivably might not have happened, but the pressures towards it would have remained.

The foregoing constitutes the theoretical framework within which this paper will argue that there was popular support for Bolshevism, that the masses were clamoring for a revolution, and that the war was

¹ I use the enigmatic term "patriotically inclusive" to contrast the new state's drive for national power with that of the old, the *ancien régime*. In a sense, the protracted transition from the old order to the new coincides with the creation of the nation-state, the "imagined political community" whose members identify with each other on that account. This nationalistic ideology is fundamentally democratic and inclusive, which is why it (1) can't properly exist in a feudal autocratic state and (2) is compatible, ironically, with the egalitarian, collectivistic Communist ideology. The spread of Communism can almost be regarded as the spread of a type of nationalism: it signifies the expulsion of the outsiders, the exploiters, the parasitic capitalists, so that only *the people, the nation*, remains. This creed is revealingly similar to Fascism. Indeed, as it functions ideologically, Communism is little more than an intellectually rigorous Fascism for the proletariat, just as Fascism is a more philosophically malleable and *explicitly* nationalist "Communism" for a capitalist society. (Expulsion of the outsiders, who are defined this time racially or ethnically, not fundamentally by reference to class. This ethnic, rather than economic, definition is what makes Fascism compatible with capitalism and thus a possible tool in the hands of business.)

² In other words, the Communist regime uses its embrace of Marxist ideology as a way of differentiating itself from other nation-states, of proclaiming the country's uniqueness and justice—a source of national pride, and thus a means of shoring up the regime's own power (by motivating its populace to serve the state, in manifold capacities). All this is precisely the opposite of Marxism, which is an internationalist creed.

³ The reason, again, is that in these countries it is born very slowly, from the ground up, consolidating its power at every step.

what allowed the revolution to come to pass. In fact, the war played a central role at every stage of the sequence of events from February to October 1917.

Conditions in Russia prior to the First World War

The last few tsars pursued a policy that combined the blinkered absolutism of the French kings Louis XV and Louis XVI with Bismarck's promotion of industrialization from above. They understood that economic modernization was both desirable and inevitable, but they wanted it undertaken in such a way that they would retain absolute power. Hence their (suicidal) rejection of the German path of political compromise with representative democracy, which would have stabilized the regime and given it more popular support. Equally importantly, their incompetence extended into matters of economic policy: they bungled both emancipation of the serfs and industrialization.

First of all, emancipation, in the 1860s and subsequent decades, occurred on terms injurious to the peasants, spreading political and economic discontent throughout the country. Emancipation meant that peasants would be given a plot of land and be freed of their legal obligations to the landowner. But before they were granted ownership of the land, they were required to pay, over a period of decades, exorbitant sums of money to the government and landowners. In many cases the land they were given was barely sufficient to live on, since private landowners often retained huge expanses of their former holdings. The extreme inequality that resulted fueled resentment. In addition, the population was rising tremendously, to crisis-levels. In the Black Earth zone of Russia, between 1880 and 1917 the population rose from 100 million to 182 million, causing famines because agricultural techniques remained primitive and inefficient.¹ The expanding population had to be fed, but the size of the peasants' plots was too small to achieve that purpose, especially since the population growth meant that already-meager strips of land had to be divided up further and distributed to millions of new households. Peasant land-hunger was potentially explosive by 1905, when the first revolutionary upsurge occurred.²

All this time, millions of peasants were trying to escape horrendous conditions by seeking industrial employment in the cities, where conditions were even worse. "Wages were low, hours long, factories dangerous, living conditions squalid, discipline brutal, employment insecure and insurance non-existent."³ Many of the industrial companies in St. Petersburg were state-owned, but the state showed no interest in alleviating discontent by treating its workers humanely. The main reason that worker protest was limited before 1900 is that government repression was effective and organization was impossible.

The Russo-Japanese War of 1904–1905 set the stage for a revolution that the autocracy barely managed to survive. In January of 1905 industrial workers held a peaceful demonstration to publicize their economic grievances, to which the government responded with brutal repression. Strikes, terrorist attacks, and demonstrations resulted; across the country, too, peasant uprisings against landowners occurred. Finally in October 1905 the tsar reluctantly made liberal concessions, e.g., by granting a parliament.⁴ Worker and peasant unrest continued, however, and after the Russo-Japanese war had ended, military repression spread through the country. What in fact was happening between 1905 and 1907 was a minor civil war: thousands of government officials were killed and thousands of summary executions of peasants and workers took place. At length the repression accomplished its purpose: the tsar felt confident enough to reimpose arbitrary authority, and the liberal concessions he had made were hollowed out.

Astoundingly, the autocracy learned no lessons from the 1905–1907 revolts. It remained mired in its old political traditions, while paying lip-service to a few new liberal ideas. An explosion, therefore, was inevitable sooner or later. There would be no step-by-step liberalization of politics. Even the liberalization of the agrarian economy undertaken by Stolypin after 1905, intended to mitigate the problems that had led

¹ Christopher Read, *op. cit.*, p. 13.

³ Read, *op. cit.*, p. 21.

⁴ Sheila Fitzpatrick, *The Russian Revolution* (New York: Oxford University Press, 1994), pp. 32–34.

to peasant insurrections, proved not wholly successful.¹ The society and state had not overcome the legacy of serfdom, including, with regard to the peasants, the centrality of the inefficient and primitive village commune and communal norms, and with regard to the state, a reliance on brute force to keep the population in check (which reliance had evolved under conditions of serfdom). “The Russian state,” writes Christopher Read, “remained, until 1917, essentially a serfowners’ state with corresponding powers and attitudes.”²

Nevertheless, the events of 1905 show that a kind of bourgeois revolution, similar to that which had occurred in England and France, was not out of the question in Russia. For months liberals were at the head of the opposition movement; Nicholas then issued his October Manifesto, granting civil liberties, a parliament, universal male suffrage, and the principle of a constitution; in 1906 a quasi-liberal constitution was adopted, the first Russian constitution ever, and the Duma (parliament) was elected (although subsequently dissolved by the tsar due to its radical politics). As had been the case earlier in other European countries, for example during the liberal revolutions of 1848, the bourgeoisie and the socialist workers resisted the government together, pressuring it to liberalize. Nicholas’s concessions to liberalism were half-hearted, but, even so, an independent legal system was beginning in these years, an active civil society was emerging, political parties and trade unions were legalized (though still partly suppressed), censorship was becoming less draconian, and “commercial and professional organizations began to give Russia’s main cities a more Westernized and liberal flavor.”³ Moreover, in the years before the Great War the government enacted a program of educational expansion: “enrollments in institutions of higher learning more than tripled and those in secondary schools more than quadrupled... The official goal... was the achievement of universal, compulsory primary school education.”⁴ George Kennan estimates that, had war not intervened, the goal might have been achieved by the mid-1920s.

It seems, therefore, that a Communist, or proletarian- and peasant-based, revolution was not inevitable in the long run or even overwhelmingly probable. In the absence of a disastrous war, other historical trajectories were possible, even given the government’s hidebound conservatism. And yet the prospects for liberal revolution in Russia suffered from a tragic paradox: given the autocracy’s hold on power, revolution was most likely to happen in wartime conditions (if, that is, the war was going badly), as during the Russo-Japanese War and World War I—while, on the other hand, the myriad instabilities of such wartime conditions meant that a liberal government would have difficulty maintaining the support of the peasants, workers and, most importantly, the soldiers, all of whom would be tempted to join the camp of the leftist radicals and overthrow the new liberal government. Such is what happened in 1917.

After 1910, prospects for liberal reform grew ever more remote, as the proletariat became increasingly radicalized in response to the old state repression and atrocious living conditions. Large-scale strikes became more frequent. In 1912, for example, government troops massacred 200 striking miners,⁵ an event that belatedly symbolized the state’s abandonment of its flirtations with liberalism. Since 1905, workers and peasants had been joining the radical Socialist Revolutionaries and Social Democrats⁶ (who split into the Mensheviks and Bolsheviks); they had little interest in liberalism. The stage was being set for their strong suspicion of, and swift disillusionment with, the liberal Provisional Government in 1917.

¹ Gill, op. cit., pp. 11–15. Stolypin’s legislation was meant to weaken the power of the peasant commune by making it easier for individual peasants to consolidate their land-holdings, i.e., separate them from the jurisdiction of the commune. However, by the time of the tsar’s fall, it seems that less than 20% of households had separated from the commune in this manner. Furthermore, the commune was actually strengthened insofar as peasants resentful of the rearrangement of their plots “fell back on the commune as their chief support,” their main protection against the enclosure movement. Nevertheless, Stolypin’s reforms did have some effect, and, given time, might have led to substantial liberalization.

World War I and the Russian Revolution

The Great War is what finally led to the collapse of tsardom. By 1916, virtually every sector of Russian society was disgusted with the government's handling of the war, from its incompetent military endeavors to its clumsy handling of proletarian discontent. With the growth of the army from a pre-war size of 1,400,000 to 16 million by 1917, the peasantry lost 40–50% of its able-bodied male population, which led to a severe shortage of labor.¹ Certain circumstances ensured that the peasantry's situation in the early parts of the war was not dire, including high grain prices and a prohibition of liquor (which traditionally had consumed a large amount of the peasant's budget). But by 1917, rapid inflation and "increased exactions for the war effort"² had renewed and intensified the old desire to expropriate land owned by non-peasants. With the collapse of the autocracy, the peasants set about achieving their goal through initially peaceful and subsequently violent means.

Christopher Hill reports that nominal wages in industry trebled between 1913 and 1917; however, price-inflation was such that these wages bought less than 45% of the goods they would have bought in 1913.³ Tsarist inefficiency was stupendous, denounced vituperatively even by conservative politicians in the Duma. By 1916, strikes and street-demonstrations were frequent. Finally, in February of 1917 thousands of people flooded the streets of Petrograd to protest the food shortages. A general strike began. At first, soldiers and police tried to suppress the demonstrations, occasionally with violence. After several days, though, a number of soldiers switched sides: they joined the crowds and mutinied against their officers. Many of the officers had in fact already fled the city; military discipline was collapsing everywhere. On March 2 the tsar abdicated, pressured to do so even by his closest advisors. A "Provisional Government" took over and a republic was proclaimed.⁴

It is evident that the soldiers' mutiny was decisive for the success of the revolution. This was only the first example of the essential role that the soldiers' radicalism would play in the unfolding of events over the next year. Industrial workers had started the rebellion—infuriated by low wages, a lack of food, the poor progress of the war, brutal conditions in the factories, and tsarist repression—but soldiers had completed it. Of course, workers and ordinary soldiers saw themselves as belonging to the same class and having the same interests. They were both victims of exploitation.

The new republic began governing with a surge of goodwill from the populace, but already the seeds of future conflict had been sowed: an ambiguous situation existed of dual power between the Provisional Government and the Petrograd Soviet. The soviets were novel institutions of grassroots democracy that had sprung up during the 1905 revolution and reappeared in 1917. They consisted mainly of delegates from factories and working-class organizations, though the army and navy would also apply the soviet principle. Petrograd's soviet was the most powerful in the country, but Moscow and many provincial towns developed soviets in the months to come. In some ways they were analogous to the village communes and the workers' factory committees that would be established later, since their function was to legislate and even to administer laws by direct and indirect democracy. While the Provisional Government was predominantly liberal and bourgeois, consisting of professionals and politicians, the Petrograd Soviet was susceptible to revolutionary ideas of class struggle, workers' control over industry, distribution of land to the peasants, and military democracy as opposed to hierarchy. Its first order in 1917, which was obeyed all over the country, "authorized all military units to elect committees with rights almost equal to those of the officers" and even stated that no governmental order to the army was valid without the signature of the Soviet.⁵ In fact, the Petrograd Soviet commanded more allegiance among the masses than the Provisional Government did, and it had more power. As the War Minister Guchkov complained,

⁴ William Chamberlin, "The March Revolution Was Spontaneous," in Adams ed., *op. cit.*, pp. 46–52.

⁵ Hill, *op. cit.*, p. 89.

The Provisional Government does not possess any real power; and its directives are carried out only to the extent that it is permitted by the Soviet of Workers' and Soldiers' Deputies, which enjoys all the essential elements of real power, since the troops, the railroads, the post and telegraph are all in its hands. One can say flatly that the Provisional Government exists only so long as it is permitted by the Soviet.¹

[Incidentally, the duality between the Petrograd Soviet and the Provisional Government points up the tension in every anti-*'ancien régime'* revolution between, on the one hand, the impoverished and semi-impoverished masses, including (certain sections of) the peasantry, the petty-bourgeoisie and the workers, and, on the other hand, the bourgeoisie or the 'respectable classes' who are striving for representation in the autocratic government. The latter groups tend to desire only political and legal reforms in the mold of liberalism, while the former desire something like a social revolution, including universal suffrage, radical democratization, and social equality. For example, in *The World Turned Upside Down* (1984), Christopher Hill notes with regard to the English civil wars of the mid-seventeenth century that *two* revolutions occurred: 'The one which succeeded established the sacred rights of property (abolition of feudal tenures, no arbitrary taxation), gave political power to the propertied (sovereignty of Parliament and common law, abolition of prerogative courts), and removed all impediments to the triumph of the ideology of the men of property—the protestant ethic. There was, however, another revolution which never happened, though from time to time it threatened. This might have established communal property, a far wider democracy in political and legal institutions, might have disestablished the state church and rejected the protestant ethic.' The Levellers, the Seekers, the Ranters, the Diggers, and other such radical groups represented the revolution that might have happened. Similarly, in revolutionary France a tension continually displayed itself between radical democracy and 'responsible' representative government. The same conflict flared up in 1848, when the French workers and bourgeoisie fought together against the monarchy—although, more accurately, it's always the workers (and petty-bourgeois) who do the actual fighting—only to part months later, when the bourgeoisie allied itself with the aristocracy in crushing a threatened popular revolution. A similar phenomenon was evident in Russia in 1905, with the workers fighting alongside the bourgeoisie though each distrusted the other. And in 1917, first the bourgeois revolution—exemplified by the establishment of the Provisional Government—triumphed, and then the popular revolution did, exemplified by the events of Red October, which were supposed by millions to have finally established the principle of soviet democracy. Generalizing, it's evident that in some cases the popular revolution fails, which may result in a narrow parliamentary government, limited suffrage, and a liberal social order conducive to the development of capitalism, while in other cases (e.g., Russia in October 1917, China in 1949, and perhaps certain Latin American countries for a few years before the return of capital-based authoritarianism), the popular revolution 'succeeds'—at least it appears to, temporarily—resulting in the suppression of landowners and capitalists. In 1917, the masses had the resources, the numbers, the circumstances, and the leaders to succeed, whereas in France in the 1790s they didn't (because industrialization had not yet begun, modern urbanization was in its infancy, etc.).]

For a while the masses of workers and soldiers who had been radicalized into semi-Marxist revolutionaries by years of misery and struggle did not overtly resist the "bourgeois" Provisional Government. They accepted that the socialist revolution would occur later; for now, they were content to let the liberals govern. The Executive Committee of the Petrograd Soviet, less radical than its rank and file, actively cooperated with the government. Some members of the Committee—Mensheviks and Socialist Revolutionaries—even entered the government in May, which turned it into a coalition of liberals and socialists. However, continued economic grievances and dissatisfaction with the war effort led to open revolts against the government in June and July.

Lenin had returned to Russia from exile in April 1917. The Bolshevik party so far had been willing to cooperate with the government, at least for the time being, but Lenin's arrival changed that. He published his "April Theses," proclaiming that the government had to be resolutely opposed, that power should pass

¹ Fitzpatrick, *op. cit.*, p. 47.

into the hands of the soviets, that the bourgeois revolution was already over and it was time for the proletarian revolution to begin, that landed estates should be confiscated and distributed to the peasants, and that the war should be ended unless it could be turned into a truly *revolutionary* war against the foreign imperialist powers.¹ These statements shocked even Lenin's Bolshevik followers, but in time he was able to bring the party around to his position. From then on, the Bolsheviks, alone among all parties, represented revolutionary opposition to the government and refusal to participate in it. In April this seemed like a dangerous gamble, and indeed it periodically threatened the political and personal safety of Bolshevik leaders, but in the long run it paid off. For it was only a matter of time before the masses would lose patience with their government, and when that happened they would turn to the Bolsheviks.

During April and May, militancy on all fronts increased. The factory committees in Petrograd and Moscow, which had been established by workers in order to supervise foremen and managers, actually began to take over managerial functions. Slowly they were wresting control of factories away from the owners and managers. In the Petrograd committees, Bolsheviks quickly became the dominant influence. In the countryside, similarly, land-seizures by the peasantry were becoming more frequent. This was not due to Bolshevik propaganda; in fact, most of the peasants hadn't even heard of the Bolsheviks. Their party of choice was the Socialist-Revolutionary. But that mattered little: the Provisional Government was procrastinating on the issue of land reform, and this in itself bred frustration and impatience.²

However, more immediately significant than these developments was the soldiers' war-weariness, which led to an uprising in early July. The government had initiated a major offensive in June, which began promisingly but soon fell apart. Two hundred thousand casualties were sustained, even as hundreds of thousands of soldiers were deserting the army in the months between February and August. Insubordination and lack of discipline were rampant, encouraged by the democratic mentality that revolutionary leaders were propagating everywhere. On July 2, sailors from Kronstadt, a particularly radical area, stormed into Petrograd with the intention of overthrowing the government, having been galvanized by rumors that they were to be transferred to the front.³ Workers and other soldiers joined them, to the point at which the armed demonstration was said to have reached half a million people. They proceeded to the Bolshevik party's headquarters, where Lenin refused to lead them in an assault and advised them to disperse. It seems that he and other leaders were taken off guard by the attempted uprising. Soviet leaders, too, who were far less militant than Lenin, dissuaded the demonstrators from violent action. So the group broke up in confusion and disappointment.

The significance of this event is that it shows how far revolutionary sentiments had permeated the populace. The demonstration had not been organized by Bolsheviks, who indeed were utterly surprised by it. The Provisional Government had lost its legitimacy in the eyes of many soldiers and sailors, a sizable proportion of the army and navy. The economic crisis, the intractable problems of the war, the land question, and constant revolutionary agitation had produced the first popular rebellion against the government, which probably could have succeeded had it had effective leadership. The second would be in October—triggered, ironically, by a failed *conservative* rebellion in August.

The attempted conservative coup was centered around General Kornilov, the commander of the Petrograd military district. Officers and "men of property" had been wary of the Provisional Government all along: it was too leftist for them, and too tolerant of continual insubordination in the army. They were concerned above all with winning the war and ensuring that the rights of property were not eroded. Finally at the end of August they acted: Kornilov sent some of his troops to Petrograd on the pretext of suppressing disorders. Apparently he wanted to establish himself as military dictator. The coup failed due to the efforts of the Petrograd workers, who diverted and obstructed troop-trains, shut down newspapers that supported Kornilov, and in general pressured the troops to abandon their mission, assuring them that there were no disorders in Petrograd that had to be put down. Kornilov was arrested. The significance of his failed coup is that it pushed the radicalization of workers and soldiers to its logical conclusion: within weeks, the

² Fitzpatrick, op. cit., pp. 54–56.

³ Read, op. cit., p. 50.

Bolshevik party had a majority in the Petrograd and Moscow Soviets and was acquiring greater influence in soldiers' committees all along the front, many of which passed resolutions that all power ought to be transferred to the soviets. The Provisional Government lost much of whatever legitimacy it had still had in the eyes of the masses, largely because its prime minister, Alexander Kerensky, was thought to have tacitly supported Kornilov's move so as to neutralize the troublesome Petrograd Soviet. The Bolsheviks, by contrast, gained new prestige, since they had been warning of a counterrevolutionary attempt from the very beginning. Their main advantage, though, was that "they were the only party uncompromised by association with the bourgeoisie and the February regime, and the party most firmly identified with ideas of workers' power and armed uprising."¹

The immediate result of Kornilov's coup was a power-vacuum at the political center: the army officers and the right now hated Kerensky because they thought he had betrayed them by first supporting Kornilov and then withdrawing his support at the critical moment; the left didn't trust him for the analogous reason mentioned above. For months Kerensky had struggled mightily to maintain the coalition between socialists, liberals and conservatives; it had finally unraveled due to the coup (although it had been falling apart prior to that). The Provisional Government was polarized and ineffective, having lost every semblance of unity as well as the confidence of the masses. The latter were clamoring for the same thing that Lenin had advocated in his April Theses: "All power to the soviets!" Being the only party that expressed unreserved commitment to that idea, the Bolsheviks had the loyalty of the soldiers and workers, at least temporarily and conditionally.

In the final analysis, though, it is true that what happened at the end of October was more like a coup than a revolution. It was not a "spontaneous" upsurge of the masses, even if many sectors of the latter did embrace it afterwards and would have supported it beforehand. (And certainly in the aftermath, during the civil war between the Whites and the Reds, the majority of people supported the Reds at least passively.)² It was a coup secretly planned by Lenin, Trotsky and the Military Revolutionary Committee of the Petrograd Soviet. In fact, had Lenin not been vehemently insisting on the need for a coup since September to his skeptical colleagues, it surely would not have happened. In the end he convinced them, however, and so on October 24, soldiers loyal to the Military Revolutionary Committee occupied the telegraph offices, the railway stations, nearby bridges, etc. A couple days later forces occupied the Winter Palace, where the Provisional Government was meeting. Very little fighting actually took place. The government didn't put up much resistance, because it couldn't: the Petrograd garrison was no longer loyal to it. Many soldiers were convinced that the government favored reestablishing the power of the officers and rolling back the army's democratization. The soldiers who were sent out by Kerensky to defend particular locations were simply "talked out of" their loyalty to the government by their comrades loyal to the Soviet who showed up at the same locations later. The busy life of the city continued more or less as normal despite the political crisis occurring.

Again, it is evident that the essential factor was the behavior of the soldiers. Had they supported the government, the coup would have failed. Any coup or revolution, in fact, can be thought of on one level simply as a struggle for who will control the means of violence: will control-over-violence remain in the hands of the current power-elite, or will it pass to a new elite? If a hopeful elite can gain the hearts and minds of the soldiers—or at least the soldiers closest to the power-centers—then all that is necessary to initiate a successful coup is a few clever tactical maneuvers. By October the Bolsheviks had accomplished the first task; they then accomplished the second, through the determination of Trotsky and Lenin. It was the war, however, that had created the conditions for revolution—because the war is ultimately what caused first the tsarist autocracy and then the Provisional Government to lose the support of the "enforcers," i.e., the soldiers. The Bolsheviks, too, once they had had power for a number of months, began to lose the

¹ Fitzpatrick, p. 61.

² Read, p. 198. The author remarks that the Whites' main weakness was their inability to gain a popular base of support. Of course, the situation varied between regions: in some regions, such as Siberia, the majority of peasants did oppose the Bolsheviks.

people's support,¹ but by then—and especially in the thick of the civil war—only two serious options presented themselves: either a Red government that claimed to speak for the workers, the poorest peasants, the soldiers, and democracy, or a White government that (it was commonly known) would have acted, and did act in the regions where it seized power, terroristically on behalf of capitalists, landowners, and the forces of reaction. For most people, especially the workers and the majority of peasants, it was not a difficult decision to make.

I have argued that most industrial workers and many soldiers had joined the Bolshevik camp by October 1917 because it was the Bolsheviks who had been agitating vociferously since April for soviet control, workers' democracy, "Peace, bread, land," the democratization of the military, and opposition to the government. N. N. Sukhanov, a Menshevik, later wrote that after the Kornilov revolt, "the mass lived and breathed together with the Bolsheviks. It was in the hands of the party of Lenin and Trotsky."² Christopher Read goes so far as to suggest that something like the October revolution might have happened even without the Bolsheviks, given the universal desire for soviet power and the ineffectual character of the government.³ Immediately after the October coup, an All-Russian Congress of Soviets, which had been scheduled months before, convened in Petrograd. Three hundred of the 670 delegates were Bolsheviks. A group of Mensheviks and SRs violently criticized the coup and quit the Congress in protest, but even so, soviet power was triumphantly proclaimed at the first session of the Congress, suggesting that a great majority of the populace did favor the outcome of the coup, if not, perhaps, the illegal means.⁴

The peasantry, however, was not as supportive of the Bolshevik party as the workers and many soldiers were. On the other hand, there was really no reason for it not to be, given that Lenin and his party had since the spring supported the principle of parceling out the landowners' land to the peasants. Most peasants favored the Socialist Revolutionaries simply because they had been around longer than the Bolsheviks, had made more inroads into the countryside, and people were more familiar with them. In any case, politics was not a major concern of the peasantry, which in 1917 only wanted to have control over the land and be left alone by government agents. Throughout the summer it had been confiscating land in non-peasant hands and revolting against government authority, which had not only failed to address the peasants' traditional grievances but was frantically using every means at its disposal, including grain requisition, to alleviate the chronic food shortage in Petrograd and other cities. Graeme Gill observes that the link between the villages and cities was breaking down. This breakdown had revolutionary potential for the simple reason that without an effective administrative apparatus to transport food from the villages to the cities, mass starvation would result, and starvation would fuel revolutionary sentiment. "Combined with the war-weariness of the soldiers, the disillusionment of rural and urban dwellers left the government defenseless."⁵ So the behavior of the peasantry played a role in preparing the ground for the Bolsheviks' success.

Immediately after the coup, however, the Bolshevik party moved towards a dictatorial form of government. Lenin had never been completely comfortable with the democratic idea of soviet power; he supported it only if the soviets could be used as organs of the party. His success was due to the fact that people took the Bolsheviks at their word when they advocated democracy. But during the Congress of Soviets in October, the true nature of the new regime was hinted at. It was announced that instead of the government's being headed by the Central Executive Committee of the soviets, elected by the Congress and including representatives from several political parties, it would be headed by a new Council of

¹ See Roy Medvedev, *The October Revolution* (New York: Columbia University Press, 1979), chapters 12 and 13. In the spring of 1918 much of the petty-bourgeoisie, traditionally the most patriotic class, began to turn away from the Bolsheviks because of the humiliating Brest-Litovsk treaty. But the relatively well-off of the peasantry did so too because of forced grain requisitions in response to starvation in the cities. Even industrial workers in some regions started to prefer the Mensheviks and left-SRs to the Bolsheviks.

People's Commissars whose members would be exclusively Bolshevik. Later, party members argued that a broader socialist coalition should govern, but Lenin refused.¹

The story of the regime's consolidation lies outside the scope of this paper. Suffice it to say that, despite the erosion of popular support in the spring and summer of 1918 in the face of continued economic deterioration and the terrorization of certain parts of the peasantry, during the civil war much of the population fought alongside the Bolsheviks against what they saw as a threat incomparably greater than Lenin's dictatorship, namely the restoration of conservative rule. After the war, and even during it, the Red Army brutally suppressed a number of anarchist uprisings against the Bolsheviks, for example Nestor Makhno's peasant insurrection in the Ukraine and the Kronstadt sailors' revolt in 1920.² But even before the civil war, the evils of bureaucratization, centralization, terror, and dogmatic thinking on the part of the government had shown themselves. For the remainder of its existence, Communism would rely largely on brute force to maintain its rule, just as the tsarist autocracy had.

However, the differences between tsarism and Communism reveal the meaning of the revolution. Tsarism was analogous to French absolutism before the Great Revolution: exclusion of the masses from politics, blatant suppression of civil liberties without attempting to justify it by reference to principles of "long-term" democracy and so forth (as Communism did), and generally an *ideological* (rather than only political and social) hierarchization of society, an explicit foundation in feudal hierarchies. The point is that capitalism and industrialization made inevitable, sooner or later, the masses' eruption into politics, in France, England, Russia, China, Germany, and every other country. The question was only how this would come about. Would it occur through a step-by-step liberalization, as in England and the United States? Or would it involve a sudden, violent social revolution, as in France? In Russia it took the path of the latter because of, first, the tsars' blind allegiance to reactionary dogmas, and second, the catastrophic nature of World War I. In retrospect, what seems most incredible is not that Red October happened but that the regime survived until 1991. After all, Chinese Communism felt compelled to liberalize after only about thirty years in power (1949–1979)—and even thirty years is impressive, thirty years of a monolithic, terrorizing, inefficient, blundering state structure. The lesson is that power is tenacious.

*

Discarded paragraph from the first draft of my paper, before I'd decided to change the angle:

"...In this paper I'll argue that the real historical meaning of the revolutionary events from February to October 1917 *should* have been simply the overthrow of Tsarism, the casting-off of feudal and autocratic structures inappropriate to a country entering the modern age. That is to say, by rights the revolution should have been comparable to the French Revolution of 1789 and the English civil wars of the 1640s followed by the Glorious Revolution of 1688, all of which events served largely to clear away the political and bureaucratic detritus of feudalism and absolutism in what amounted to preparation for the rule of the bourgeoisie, and ultimately for the age of mass politics and democracy. They partially accomplished the modernization of the political order, which itself facilitated the continued modernization of the economy (which had already begun by the time of these revolutions). According to the logic of history, the revolutionary events of 1917 in Russia should have served essentially the same purpose (of partial political and social modernization in the framework of an emerging capitalism). The reason these events *didn't*, I'll argue, and instead went beyond their historical mandate and established something like a hybrid, monstrous state socialism—or a state-capitalist state socialism—which falsely claimed to act in the name of the workers, is that World War I got in the way. World War I is what made possible the derailing of the *legitimate* revolution, the revolution that would not have fallen victim seventy years later to the encroachment of capitalism because it would have been fully consistent with capitalism. It is Russia's tragedy that its inevitable anti-autocratic revolution happened to coincide with a world war that had already decimated Russia's social fabric."

¹ Fitzpatrick, pp. 65 and 66.

² Read, chapter 11.

Same goes for China, more or less. In war, things become possible that would have been nearly impossible in peacetime. The army can turn against the regime, and a new regime can take advantage of the chaos of things to build up a new state system based on a military mentality and structure, a repressive apparatus that can last decades. It necessarily originates in a popular revolution [or, at least, revolutionary impulses]—that’s how it comes to power—but then...well, the rest is history. One long record of folly and brutality.

...Nationalism and Socialism/Communism are the two powerful ideologies that can seize a people awakening from centuries of torpor. (Fascism is a variant of nationalism.) Both incorporate profound democratic yearnings. And both were born in the French Revolution. At times the people leaned towards nationalism, at times they leaned towards (nascent) socialism—and there are many historical examples of a people leaning towards both. The two are theoretically compatible, after all, though what I wrote in my fascism paper is true: in practice, the emphasis tends to be on one or the other. Typically nationalism gets the best of socialism during a revolution (e.g. a colonial uprising) and afterwards, because nationalism is far less dangerous to power-structures.¹ But not always: not during major wars, for instance, as happened in Russia and China. *After* the revolution, though, even in these cases nationalism comes to supersede socialism or “industrial democracy” because the myth of the nation is enormously useful for the regime’s consolidation of power.

Liberalism is a bourgeois ideology, not an ideology with mass power, that can *inspire masses to revolt*. The peasantry, petty-bourgeoisie and proletariat never rise up as one to institute—liberalism. What tends to happen is that some version of liberalism is the compromise reached between the bourgeoisie and the old monarchy, a sop thrown to the people but a gift to the bourgeoisie. During times with revolutionary potential, what the masses follow is always either nationalism or socialism—or some sort of economic egalitarianism²—or, confusedly, both (with the emphasis, in these cases, probably on nationalism, the expulsion of the imperialists). The late-nineteenth and twentieth centuries were the age of nationalism and socialism precisely because they were revolutionary: whole peoples were exploding into politics for the first time ever. Their inspiration, naturally, would be democratic egalitarianism in its two major manifestations, nationalism³ and socialism.

It’s true that a third mass ideology is possible: religious fundamentalism. Historically this has been less potent than the other two, and even now it usually isn’t whole populations who support it but only fringe groups. It’s different from those cases in which Muslims wanted to throw out the Christian rulers; the dynamic of these rebellions was basically nationalist, with a surrogate ideology for nationalism. Religious fundamentalism properly so-called also can have a quasi-nationalist dynamic (in its Muslim and Hindu manifestations), which is however fused with a distinctively fascist rejection of modern values, a desire to return to the good old days of strong authority, unity, hierarchy, simplicity, certainty. The reason why fascism can become a mass ideology is that, despite the hierarchical and authoritarian nature of its ‘reality,’ the *ideology*, and the movement itself, is strangely democratic and egalitarian, in that it’s supposed to express the general will and signifies the submersion of the individual in the mass, so that everyone is equal and essential. Everyone has his special function; he belongs. (These things are less true of “Islamofascism,” but not wholly false. Think of Khomeini’s popular revolution, which fused Islam, semi-fascism and democratic overtones.)

Nationalism and socialism get their power from their positing of an oppressor or parasite or ‘evil Other’ of some sort, from which the people have to assert their independence (by coming together and

¹ In fact, the socialist ideology has often been used as a mere tool by revolutionary leaders who fundamentally wanted only to get the imperialists out of their country so they could rule it themselves. Castro, for example, while he did want to improve the social condition of his people, had no *a priori* commitment to socialism or Marxism. He was partly *forced* into the lap of the Soviet Union.

² I insert that clause because the peasantry isn’t always socialist or Communist. Sometimes they just want land for themselves, that’s all. But the party that promises to institute this program is either nationalist or socialist, or both.

³ Of course nationalism often leads to the opposite of democracy. But as a social movement, even in its fascist versions, its dynamic is democratic and egalitarian.

rebellious). Each ideology expresses the popular urge to be *free* and *whole, united*. Each exists most powerfully in opposition to oppression or as a reaction to genuine hardship. The difference between them is that nationalism disregards material conditions, focusing on “culture” or “spirit” or “race” or “blood” or “heritage,” while socialism takes material conditions to be of primary importance. Socialism is liberalism taken to its extreme of *economic freedom, economic rights*, while nationalism is (as an ideal-type) a negation of liberalism, being holistic and cultural. But both movements are realized by people coming together and battling a perceived menace.

When I refer to “socialism” I mean the ideology. The *reality*—which is cooperativism—has not yet had its day.

Social life. I don’t care for Dana; she has no personality. Won’t see her again. I’ve been seeing Natalie once or twice a week, sex etc. She spent the night here recently. Seems to like me quite a lot, but, as I think I said before, she isn’t vivacious or talkative enough for me. So it’s only a matter of time.

Reading David Fromkin’s magisterial *A Peace to End All Peace: Creating the Modern Middle East, 1914–1922* (1989). Brilliantly researched and a ripping good yarn.

December

Eponine still hasn’t lost her power over me. ‘Eponine, a girl of the streets.’ The most beautiful, the most affecting, the sweetest character in all literature. Or, at least, there can be no character *more* beautiful than her. Listening to the song “On my own,” with the tears—such innocence and love suppressed by fate. “The rose that grows from concrete.”

To repeat: we have to separate the dogmatic in Marxism from the scientific. The dogmatic is what’s directly connected to the so-called Marxist revolutions, for example the theory that the proletariat is the necessary agent of capitalism’s downfall, and most of the other ideas on the socialist revolution. The scientific is what can be established on the basis of evidence, not revolutionary prophecy. Capitalism does tend to undermine itself; that can be demonstrated through both logic and evidence. The working class does in many ways represent a challenge to capitalism and may periodically stage mass revolts against it. But in the light of the past century, only inverted Hegelian idealism—cheap philosophy, not social science—can lead one to the conclusion that these revolts will necessarily or even probably someday lead to the overthrow of the system. Far more likely is the possibility that gradual, decentralized experiments in cooperativism, as well as large-scale economic coordination undertaken by governments, etc., will lead to a largely post-capitalist society. (Remember, every society will surely retain elements of capitalism.) Perhaps at a late stage of this evolution, things like political revolutions will occur in many countries, discrete, violent or non-violent events that will transfer political power to—not a particular *class* but the majority of the population as a whole. A combination of classes and occupations. [...]

The popular uprisings that have occurred during depressions or crises of various kinds have never signified something like ‘a potential transition to post-capitalism.’ It’s easy to think so because of one’s revolutionary hopes, but no *evidence* establishes it. What they signify, rather, is the simple truth that capitalism does undermine itself, does contain contradictions, and that one of these contradictions is the tendency for impoverished masses to revolt against their oppressors so as to gain more rights or institute new leadership. This is a tendency that has existed since the ancient world, and in that sense every form of society has been contradictory in a sense. People involved in the struggles certainly become convinced that the new world is at hand and develop impressive theories to prove so, but ultimately it’s all just an expression of discontent and the desire to improve one’s lot in life. Insofar as an overcoming of capitalism is inevitable, arising from profound social dynamics, it will take place very gradually and doesn’t have to coincide with a violent political revolution. [*Um, at one or many stages, insurrections and political violence will be inevitable. But I was right about the **gradual** nature of any far-reaching change in economic systems.*]

It's easy to be bewitched by the vast logical constructions of Leninism and Maoism and so on, many of which have a seductive theoretical aesthetic and seem to follow from the scientific aspects of Marxism, but in most cases the revolutionary prescriptions and theories are logically separate from Marxism's defensible constructs. The best parts of Marxism are the diagnoses of how class societies, in particular capitalist ones, function, not the prognoses that are supposed to be logically based on them.

It's easy to invent plausible-sounding theories or excuses meant to justify one's values and desires.

...Marxism has to be shorn of its teleological aspects. Social-scientific thinking itself does. Every hint of teleology has to be rejected. [*No! I was wrong about rejecting even **hints** of teleology. When we look back at history, it's not hard to discern a loose kind of 'developmental' logic.*] Thinking of sectors of society in terms of their "historical function." What exist are systems, structures, tendencies conflicting with each other, leading in all sorts of possible directions depending on how they interact and an infinite number of contingencies. [...] There is nothing like a map to socialism. Some such society can be achieved in more than one way; nor, probably, is it inevitable, even in the very long run. No class has a "historic task."

Another problem is that classical Marxism doesn't recognize the extensive array of powerful countervailing tendencies in modern society, the many structures of consciousness and institutions. It's not all economics, nor is the economics all polarizing. Society really is of an astounding complexity. The conflicts and structures that Marx pointed to are indeed of exceptional importance, but things get messy when you have as many variables as we've had for several centuries.

It's my childlikeness that keeps me healthy—though it's also my childlikeness that keeps me alone.

Fascism and Communism. Both are founded on hatred of an oppressor or outsider. In Communism, it's the capitalist class and state; in fascism, it's the parasitic financial and political elites and parts of the broader population deemed parasitic, foreign, untraditional, subversive, divisive. In both cases, the "workers," the productive ones, are the good class; the "parasites," e.g. intellectuals and financiers, or (with fascism) immigrants and racial outsiders, are the bad class. This mass celebration of productive work already shows how new these two ideologies are, how distinctively modern. In its essence, Communism is economic; fascism comprises a fusion of economic and cultural concerns. The focus on the *economic structure* is what makes Communism revolutionary; the disregarding of the economic structure and the tendency, as it gets closer to power, to downplay economic problems in general and focus on culture is what makes fascism compatible with capitalism. Communism appeals primarily to industrial workers and the peasantry; fascism appeals primarily to the petty-bourgeoisie, the lower middle class, certain parts of the peasantry, some patriotic, culturally conservative workers, and the upper class insofar as it thinks it has to rely on extremism in order to prevent a social revolution. The existence of the two ideologies shows that two kinds of threats can (be perceived to) face the masses: either *economic/political* or *cultural/political*, or a confused blend of both (as in classical fascism). With Communism, it's the large majority of the population against the ruling elites, whereas with fascism, it's a huge part of the population against, probably, a somewhat smaller part as well as certain sectors of the ruling elite (although, ironically, it's the political elite that finally allows the fascist leaders to take power, since they're the lesser evil). In both cases, the regime that comes to power violently suppresses certain groups, reflecting both its ideological origins and political expediency.

Japan in the 1930s had something like a fascist society, but it was top-down and thus quite different from the European variety. Still, the militaristic etc. outcome was similar. Fascist *movements* are what I was talking about above; fascist *regimes* don't have to originate in a popular fascist movement, though usually they do.

Reading various chapters of Chomsky's *For Reasons of State*. Also Michael Albert's *What Is To Be Undone: A Modern Revolutionary Discussion of Classical Left Ideologies* (1974).

Sometimes a sentence or two can light up reality, even if what it says is obvious: "European emigrants to the New World left behind most of the old-world trappings of crown, state, aristocracy, and established church. In their place they constructed a political language that glorified individualism, hard

work, economic self-sufficiency, self-reliance, localism, and minimalist government.” American liberalism. Still exists, though now it’s sustained by different factors than in the beginning. There was no real bourgeois revolution in America [except for the Civil War] because there didn’t have to be: there was nothing to revolt against. No oppressive state or church or feudal aristocracy. The thin institutional atmosphere was naturally conducive to liberalism.

...Liberalism in the deepest sense isn’t about minimal government, self-reliance, self-sufficiency, as people think. It’s about the individual’s freedom from coercive institutions. At times or in certain respects the government may be one of these institutions, but at other times or in other respects it may be a means to *protect* people from such institutions, in particular from private corporations. Similarly, true liberalism isn’t opposed to labor unions or community groups of various sorts, nor is it absolutely committed to “self-reliance.” It’s committed to whatever enhances freedom and autonomy. Insofar as labor unions protect their members from a threat to their autonomy, they are “liberal” institutions. It’s private corporations that are illiberal and undemocratic, in fact totalitarian.

In certain social conditions, private property can be a force for good, for liberalism. In other conditions it can be authoritarian or the basis of something approaching totalitarianism. That is, it can constitute either a defense against authoritarianism or a tool of it.

Short paper:

The selections we read this week in *Learning from the Past* address a variety of contemporary educational problems. Gary Nash continues in Reed Ueda’s footsteps of emphasizing the dangers inherent in multicultural education, specifically when it takes the form of “Afrocentrism,” which he criticizes partly because he sees it as black chauvinism and partly because its focus on the grand cultural heritage of blacks does not solve, or even address, the real problems that inner-city black students confront in their daily lives. Diane Ravitch provides a history of attempts to erect “standards” for American education; the context of her article is the political effort in the early 1990s to impose sweeping national standards by the year 2000. David Tyack provides a similar history, in a similar political context, of attempts to “reinvent schooling” by, e.g., using new technologies for instruction, by contracting out education to private corporations, by “emulating management and budgeting techniques in business or government” (p. 193), and by reforming the teaching profession on the basis of an “ideology of competition and hierarchy and a practice of unequal rewards borrowed from other organizations” (p. 194). His history demonstrates that most of these ambitious endeavors have ended in ignominious failure, largely because they ignored the complex institutional realities of American education. Paul Peterson’s article is an intriguing discussion of the dialectic between liberalism and statism that has characterized the history of American schooling, with statism predominant especially before the 1960s (Horace Mann, John Dewey and others promoting ideologies quite compatible with Hegelianism), and liberalism, or a “politics of choice” in the form of magnet schools, alternative schools, and vouchers, making inroads since then. Lastly, Joseph Kett considers the issue of “school leaving,” i.e. dropping out of school, from a historical perspective, describing how educators from 1900 on have responded to the problem.

The best article—best-organized, best-written, and most informative—is probably David Tyack’s. He shows how utopian, uninformed, and, not surprisingly, *capitalistic* most “break-the-mold” reform attempts in the 20th century have been. Looking at the history of it all, one sees how right Hegel was that what we learn from history is that people never learn from history. Also, one is struck by the truth of Ed Hunt’s remark in class last week that teachers in America are treated with overt or subtle contempt because they are *workers*, i.e., part of the problem and not the solution, being intrinsically prone to laziness, inertia, a lack of creativity, benighted self-interest, bureaucratic routinism. Like the working class as a whole, they are merely raw material to be shaped at will; and if the resultant shapes do not prove as fine as the artist had hoped, it’s because the clay is not pliable enough. The possibility of the design’s being flawed in its essence is discounted. Innovators have been enamored of models from business and technology, despite the consistent failure of these models. In the early 20th century, Ellwood Cubberley, who thought of schools as “factories in which the raw materials (children) are to be shaped and fashioned into products to meet the

various demands of life” (p. 195), proposed that school administrators act more like business managers in order to make schools more efficient and cost-effective. Following in the tracks of this failed idea, “the cult of efficiency in education during the 1960s and 1970s” engendered the technocratic, McNamara fads of “management by objectives,” “zero-based budgeting,” and other such educational applications of corporate concepts, which usually only increased inefficiency by adding new bureaucracies and new excuses to waste reams of paper.

The myriad attempts since the birth of radio and television to use newfangled technology in the service of learning (and thus, incidentally, make profits for the businesses selling these technologies) have met a fate similar to that of technocratic models, having been rejected by teachers who thought the technologies were of poor quality or didn’t fit the curriculum or were simply not worth the trouble of setting up and maintaining. Most of these outside entrepreneurial innovators have never requested the input of teachers; they have often even advertised their technologies as promising someday the elimination of teachers as necessary ingredients in education—which has hardly endeared them to the people whose jobs were to be lost. Similarly, the many schemes of merit pay and teacher-hierarchy proposed over the decades have not been successful, largely because teachers prefer an egalitarian culture in which they have incentives to share ideas and help each other over a competitive culture that incentivizes selfishness and is in any case irrelevant to the main reward that teachers crave, which is seeing their students grow.

Another strength of Tyack’s article is that he draws concrete lessons from the failures of the past, for example to “enlist and honor teachers as the key people in reforming schooling.” Too often, innovators have shown contempt for educators, which is a peculiar attitude to have on the part of one who wants to improve education. It’s encouraging that Barack Obama seems to have more respect for teachers than his predecessors did.

I liked Peterson’s article too. Its first half, at least, was intellectually stimulating in that it made surprising connections between institutions and ideas. It seems fruitful to conceptualize American educational history, as he does, in the framework of a tension between liberalism and statism, or Kantianism and Hegelianism. Initially, with Benjamin Rush, Thomas Paine and others, it was thought that government should stay out of education as much as possible, except to provide subsidies to parents so that they could educate their children however they wanted. Kant’s liberalism may have inspired these thinkers, since Kant argued that governments “are simply interested in such training as will make their subjects better tools for their own intentions” (p. 221). Education should be freed from the “artificial restraints of church and state.” Later, however, Horace Mann, and especially John Dewey, argued that state education did not necessarily have to be “restricted, constrained, and corrupted” by the interests of the state, since ideally they were synonymous with the interests of society and of the individual.¹ “Following Hegel, Dewey portrayed the school as the transmitter of the knowledge and culture that historical processes had created” (ibid.)—and the state, like society and the individual, had an interest in transmitting such knowledge and culture. He thus discarded the liberal distinction between the three entities (society, state, and individual). He should have known better: writing in the midst of World War I, he ought to have recognized that the state is not always a benign institution.

I won’t summarize the rest of the article. Peterson goes on to argue that the courts, not the educators or policy-makers, have effectively been the carriers of the liberal tradition, typically asserting the rights of the individual against the encroachments of state-controlled education. He also has a multifaceted discussion of the ways in which statism and liberalism have influenced and intersected with Republican and Democratic policies and the civil rights movement. The history is complicated, but Peterson’s conceptual “binary opposition” proves to be an illuminating prism through which to view it.

All the articles we read, in fact, were informative. One of the few weaknesses I can think of is in Gary Nash’s: it seems to me that the position he is arguing against, the danger he is warning us of, does not

¹ Mann’s arguments, at least implicitly, had much to do with his opposition to “papist superstition” and his desire to inculcate sound Protestant morals. The means to do so, he thought, was free public schooling, state-administered education, which won him the charge that he wanted to “Prussianize” American education. This was in the days before it had become possible to bandy about accusations of socialism or communism, a tactic that might have worked better.

merit all the attention he gives it. In this respect my criticism echoes the one I made of Reed Ueda's article: Ueda is overly worried about multiculturalism, while Nash is overly concerned about Afrocentrism. Each points to a number of logical flaws in his opponent's position, a number of ways in which the "progressive" strategy can theoretically go awry, but the fact remains that multiculturalism in education is probably incapable of leading to the sort of mass divisiveness and extremism the prospect of which Ueda and Nash bemoan. If anything will have this effect, it is economic and social conditions in society as a whole, not the curricula in a few classes at some public schools.

That isn't to say, however, that education is unimportant. The book *Learning from the Past* makes the case persuasively that it is not only important but interesting to study on a scholarly level.

*

The Marxist and existentialist claim that *you are what you do*, that there is *nothing else* to you, isn't true, or is meaningless. It's like behaviorism: it denies the interior, denies *potentiality*, and certainly denies the existence of a human nature in some deep sense. It says that there is no 'unconscious' structure of the mind; the only component of me is self-expression. Inasmuch as the self is consciousness (which is self-expression), that's true; but consciousness, even in its latently conscious or unconscious forms, is merely the surface. There's a deep structure of biology underneath it.

Anyway, I've always thought that Marxism isn't particularly committed to these existentialist ideas. In fact, they're not readily compatible with theories of alienation, since the latter implies that there is something that is alienated. But if *all there is* to me is how I express myself, surely I can't experience alienation, i.e. the suppression of my *potential*. –There may be ways around this criticism, but no matter. There's no point in making categorical, misleading statements like "You are how you act." Only in a limited, perhaps truistic sense is that true. (And what about *thoughts*? Do they count as acts?) There are possibilities in my character that haven't been realized and will never be realized. I have the potential to kill someone, but I probably never will. The inner is not the outer; it is broader than the outer. It encompasses an infinite range of 'outers,' an infinite set of possibilities. The outer does reveal the inner, but not the *whole* inner.

It's true that we are changed by our actions and environment, that even as we change our environment we are changed by it. But *human nature* stays the same, in the sense that humans have a different nature than birds. Only on a more superficial level can the environment change us. It can (to an extent) change how we act or are inclined to act, what sort of thoughts and emotions we have, but it doesn't change the broad human potential within us, nor the specific genetic potential in each individual.

I heard Chomsky say in an interview that "If you're a CEO you have to be an immoral monster. [The system forces you to be.]" In a way that's obviously true: your priorities necessarily have so little to do with human well-being that it would actually be better for you (your investors) if you could lower the pay of your employees as much as possible, give them as few benefits as possible, and in general focus all your attention solely on the pursue of profit, with whatever human or environmental costs that might have. If you fail in your duty to be nothing but a money-making machine, you'll be fired. It's the reverse categorical imperative: treat humans only as means to an end or you're dead.

Michael Albert's book is pretty good, though very repetitive. Useful little summary of dialectics (which Marx called "the science of the general laws of motion, both of the external world and of human thought"):

The science of dialectics is essentially the assertion that significant historical changes are not matters of straight-line, progressive alteration but of rupture, not matters of evolution but of revolution, not matters of continuations of flows but of resolutions of spiraling contradictions.

It is the assertion that real changes are due not to factors outside reality and imposed upon it, but to factors within reality from the start and only slightly affected by conditions imposing from without. It is the assertion that history does not change by the

effects of some absolute, or in pursuit of some absolute, but rather in accord with its own internal contradictions and their continuously evolving resolutions.

At least in its Classical pre-Maoist formulations, the science of dialectics is a very general, loose *methodological* assertion. That is, to understand historical situations one must understand those contradictions whose eventual resolutions entail overthrow of the original situation's defining characteristics. That is, one must understand situations insofar as they, by their very natures, toss up against themselves the forces of their own *dissolutions*.

For Classical Marxists, systems necessarily undergo fundamental changes whenever they embody the contradiction of trying to *perpetuate* themselves while at the same time *undermining* themselves. Thus Classical Marxists interested in understanding and affecting historical situations have a clear methodological imperative: they must constantly uncover how systems simultaneously foster their own continuations and their own demises; *they must study motions of conflicting tendencies and forces precisely in regard to those critical contradictions and precisely so as to find ways to most beneficially help along the factors favoring their revolutionary resolutions.*

Actually, these ideas seem somewhat illuminating and useful. I was wrong when I wrote long ago that dialectics is an empty theory. It's both a methodology and a grand, general conception of society. It might even have some applicability in the realm of nature and psychology. In fact, it surely does. Systems perpetuating and undermining themselves at the same time. That all these ideas are imprecise and hard to conceptualize is not a decisive argument against them: remember that the concept of downward causation suffers from the same weaknesses but obviously applies to reality. Human cognition is deficient.

Needless to say, the theory of dialectics has weaknesses, for example (as Albert notes) its emphasis on forces that cause change over those that reinforce stability, and its overly 'general' character. [Also, insofar as it has content, it's kind of obvious. It's a fancy word for something that amounts to common sense.]

Rudolf Rocker:

Power operates only destructively, bent on forcing every manifestation of life into the straitjacket of its laws. Its intellectual form of expression is dead dogma, its physical form brute force. And this unintelligence of its objectives sets its stamp on its supporters also and renders them stupid and brutal, even when they were originally endowed with the best of talents. One who is constantly striving to force everything into a mechanical order at last becomes a machine himself and loses all human feeling.

In a more general sense, though, Foucault is right that relations of power saturate society at every level. Psychological power (over others), bureaucratic power, institutional power, etc., subtle or overt. The broader the scale, the cruder, more brutal are the forms that power takes. Also, in politics and the economy power tends to be expressed more crudely than in love-relationships, etc. (With regard to the latter, see my thoughts on self-confidence, self-consciousness, charisma, the desire for approval, and so on.)

Joy Behar: "Monogamy is monotonous." True.

It became clear to me a moment ago, while reading pages from the novel *Snow*, that perhaps the main reason I don't like to read fiction is that it brings me painfully close to myself. I become one with my longings, my regrets, my loneliness. My heart starts aching with the old fantasies I daily repress, because I'm being carried along in someone else's fantasies. And I'm brought face to face with my past, repressed. It's much less painful to read nonfiction relating to impersonal entities than to read fiction or biographical nonfiction. For most people, reading such stories is an escape; for me, reading the non-biographical nonfiction is the escape. From my self-preoccupation.

The really great social revolutions occur when new, expansive production relations and forces come into conflict with old, conservative ones. I don't mean the actual violent events that we call a "revolution"; I mean the prolonged, sometimes centuries-long evolution that involves periodic political upheavals. In this context, such political upheavals are indeed pregnant with historical significance and constitute a phase in the classic Marxist type of a revolution. But historically, in most cases of a social group's rising up against the elite, it has had nothing to do with this sort of revolution. Not the slave revolts of the ancient world, not the peasant revolts of the Middle Ages. These were just reactions against oppression, pure and simple. There was no "cunning of reason" working through them, no tremendous historical potential. In all of history, probably the only revolutions in the classic Marxist sense occurred during the transition from feudalism or some other type of agrarian economy to capitalism, revolutions that have occurred (and are still occurring) all over the world. The Communist revolutions that did away with private property, such as the one in Russia from 1917 to 1934 and afterwards, were not of the type that Marx described in his famous Preface—although from another perspective the events of 1917 *could* have signified one phase in such a revolution, but the one from feudalism to capitalism, not from capitalism to socialism. Actually those events *did* have that significance, but then the (ongoing) feudalism-to-capitalism revolution was hijacked and gave birth to a monstrous historical abortion [Stalinism] that ended up, in retrospect, signifying yet one more phase in the *very* prolonged transition from feudalism to mass capitalism. I.e., the "Communist revolutions" were essentially mere phases in the transition from feudalism to 'mass,' 'consumerist,' 'relatively stabilized' or 'mature' capitalism in the countries where they occurred. (Such capitalism hasn't yet been realized in Russia or China, but it's the logical end-point of the process.¹ Whether it will ever be achieved is another question.)

The² conflict between new and old production relations is manifested in the 'lower' classes' (including the bourgeoisie's) struggle for greater freedoms. The bourgeoisie's struggle is explicitly on behalf of the new economic relations, since it wants laws that favor capitalist property and capitalist trade. It wants more opportunities for, and fewer feudal obstructions to, making profit—and the capitalist thirst for profit is what drives the new production relations. Thus, in the case of the bourgeoisie, the 'mechanism' by which the 'impersonal' struggle between new and old production relations becomes translated into people's desire for more freedom is unproblematic. They want freedom to make profit, i.e. to intensify and extend the new economic relations. The peasantry's role in bourgeois political revolutions is not similarly on behalf of capitalist relations; it rises up simply under the burdens of increased taxation etc. and is used by the bourgeoisie in the latter's fight against the autocracy. But the peasantry's uprising is indirectly related to the conflict between new production relations (and forces) against the old, in that this conflict in the towns and cities has repercussions in the countryside which exacerbate the peasantry's grievances against landowners.

The industrial workers' revolts against the autocracy, which are in uneasy alliance with the bourgeoisie's and sometimes break out into full revolt against capitalism, are, like the peasantry's, not explicitly on behalf of capitalist property-relations. The workers only want more humane conditions and more freedoms. But again, their struggles are made possible by the new production relations—not insofar as they conflict with the old feudal ones, but insofar as they conflict with *themselves*. In this sense, the proletariat's struggle is in advance of the peasantry's and bourgeoisie's, because the latter struggles have to do with the conflict between old and new production relations, not conflicts engendered by capitalist relations in themselves. Marx was therefore right that the proletariat's battles were historically more progressive than the bourgeoisie's. They had to do with capitalism's undermining of itself, not with the struggle between capitalism and feudalism. He was even partly right that they had something to do with

¹ I don't mean the final stage of history. I mean only that the myriad tendencies operative in capitalism seem to lead, in the long run, to this relatively stable, liberal democratic, consumerist capitalism, after which it's hard to say what historical stage will come (next).

² (Note for the reader: one of the purposes of this discussion is to reduce the functional explanation in Marx's theory of revolution to a causal explanation.)

capitalism's fettering of productive possibilities, for instance as manifested in the business cycles and crises that happened repeatedly during the nineteenth century, crises that (1) interrupted and slowed production and (2) thereby encouraged working-class revolts, since employment dropped and workers were thrown out of work. However, he was wrong that working-class revolts had some connection to "new productive forces (or relations) slumbering in the lap of social labor," since back then labor wasn't yet "socialized" enough for such possibilities *genuinely* to exist. It's doubtful that, had the working class gained political power in the late 1800s, economic activity would have become greatly more efficient and more productive. Nowadays, though, cooperative production *is* often more efficient and productive than capitalism. In other words, it's doubtful that those old working-class revolts were full of historical potential in the sense that the bourgeoisie's revolt against the aristocracy was. In the latter case, new property-relations were steamrolling old ones, and capitalism's victory was virtually inevitable; in the former case, it wasn't as if socialist property-relations (almost nonexistent) were steamrolling capitalist ones, and certainly the victory of socialism was not remotely inevitable back then.

However, it's true that in conflicts between more productive and less productive economic relations, there's a certain pressure for the new relations to win—although there's also a pressure for the old relations to hold out against change. It's also true that the older capitalism gets, the more significant becomes the conflict between emerging cooperative relations, relatively efficient, and old capitalist ones.

Spent the night with Natalie. When it comes to women and sex, it all depends on your attitude. I wrote above that I tend to be a little disconcerted by the realities of the female body. But that's not entirely true—at all. [...] My point is that you can choose to love the smells, sights, tastes and sounds of the female body. It's a whole other side of life, a whole world of earthy pleasure.

Later in the morning she got all in control of the situation with making breakfast, then confidently talking to her friend on the phone, not acting lovey-dovey with me at all; and this afternoon she went to a cookie-swap with her friends. The sensual and the practical sides of the female personality.

Final paper of the semester:

The Functions of Education in the United States

A question that tends to be ignored in policy debates about education, answers to which question are nonetheless implicit in many political proposals, is what purpose(s) education serves or should serve in a modern society. On one level, the proper answers are virtually truisms: education should increase students' knowledge, facilitate their cognitive growth and self-knowledge, prepare them for an economically productive adulthood, socialize them in such a way that they become citizens "mindful of the common weal," and in general make both the individual's and the community's life richer, more enlightened and moral, than it would be otherwise. These are humanistic answers that come naturally to us, since we live in a liberal society. In illiberal societies the emphasis might be less individualistic and more explicitly nationalistic: for example, in Stalin's Russia people might have thought that whether education contributed to an individual's "growth" was far less relevant than whether it prepared people to subordinate themselves to the interests of the state, to fulfill their economic roles faithfully and productively for the sake of realizing socialism. The commonly accepted functions of education vary between social contexts. So do, in fact—to a limited extent—the morally proper goals (as opposed to the goals that people in fact think education should accomplish, or the functions it actually serves). In a society in crisis, the ideal role of education surely differs from its role during normal times.

I'll take it for granted in this paper that, apart from times of extraordinary crisis, the correct functions of education are humanistic and liberal. Illiberal goals are always wrong, since they violate principles of the freedom, dignity and equal worth of all human beings. However, this still leaves open more specific questions, including "Should we try to use education to heal societal problems, such as class divisions and racism?" and "Should schools focus on inculcating patriotism, or should respect for the sordid truth guide the curriculum in history and civics classes?" Questions about higher education are pertinent

also, for example whether it is more properly characterized as a “community of scholarship” or as a democratizing force that should serve societal needs. In the following, I will first summarize the history of American attempts to define the functions and missions of education; in the second section, I will set forth my own conception of what education ought to accomplish.

The Past

The republican sentiments that prevailed during and after the American Revolution influenced political theorists and policymakers in their advocacy of education as playing “an important role in reconciling freedom and order.”¹ Proper education would civilize the unwashed masses, train them to be good republican citizens who would elect wise leaders. It was through education that a descent into anarchy was to be avoided and that the enormous country would be tied together into one entity. Thus, the moral or civic aspect of education was considered at least as important as the intellectual aspect. And since education was supposed to train men from nearly all classes to be intelligent citizens, many political leaders argued that schools should be organized and financed by state governments. Education should be free, or nearly so. In 1779, for example, Thomas Jefferson put forth a plan (subsequently defeated) for free schools in Virginia. In 1786, Benjamin Rush introduced a plan for Pennsylvania that called for a state-supported university, several colleges around the state, and a free school in every town.² These proposals, being ahead of their time, had little impact. State legislatures were unwilling to institute taxes for education.

During the early decades of the republic, most rural children, who greatly outnumbered urban children, attended local schools a couple months in the winter and a couple in the summer to learn reading, writing and arithmetic. For these children and their parents, the primary purpose of education was simply to acquire enough rudimentary cognitive skills to function in the countryside. Urban education was more complex: there were “independent pay schools,” which were somewhat like inexpensive private schools; there were apprenticeship opportunities for boys, which required the masters to furnish a rudimentary education; and there were church charity schools for orphans and the poor. As social problems increased through the decades, charity schooling became more widespread and secular (although the traditional denominational schools persisted). Reformers argued that increased schooling would mitigate problems of poverty and crime. “Both English and American advocates emphasized collective goals—such as the reduction of crime and disruption—rather than individualistic goals—such as intellectual growth or personal advancement. ...One central goal...was to rescue children from an allegedly harmful family environment.”³ Charity schools were funded by philanthropists and voluntary associations.

During the mid-nineteenth century, as capitalism and industrialization tore up the old society and left relative chaos in its wake, the emphasis on education as a facilitator of social stability increased. “In cities the prevention of crime and poverty became the leading moral mission of public schools.”⁴ It was during these decades before the Civil War that the common-school movement began. Carl Kaestle defines a common school as “an elementary school intended to serve all the children in an area.”⁵ Such schools were not quite an extension of charity schools, since they were not solely for the poor and sometimes cost families a small amount of money. They were usually state-supported and state-regulated, though minimally. Reformers like Horace Mann and Henry Barnard advocated common schooling as a way to foster social harmony by bringing (white) children from all classes together, and by indoctrinating the youth with republican, Protestant and capitalist ideas. The socializing functions of education were emphasized more than ever before: these schools were to be a force for egalitarianism. The Whig Party, but many

Democrats as well, came to think that government intervention was essential to instill morals and mold the diverse population into a cohesive whole, a project that intimately involved education.

“Generally speaking,” said John Pierce, Michigan’s first superintendent of public schools, “the child uneducated in knowledge and virtue is educated in the school of depravity. And what is true of the individual is true of communities.” The reverend Elia Cornelius echoed that opinion: “the moral and religious improvement of the poor is the surest and best means of relieving their wants.”¹ As Kaestle summarizes, “Intellectual education did not receive as high a priority as moral education in discussions of the purposes of common schools. Far more emphasis was placed on character, discipline, virtue, [Americanization,] and good habits than on literacy, arithmetic skills, analytical ability, or knowledge of the world.”² Throughout the middle decades of the nineteenth century, epic debates took place over tuition-free schooling, centralization, government involvement in education, taxation for schools, and other issues, but eventually the “progressive” viewpoint emerged victorious. It became accepted that a major goal of education—and an important reason why government should be involved in it—was to alleviate social problems and to play some role, limited or otherwise, in integrating immigrants into the broader society.

Paul Peterson characterizes the view that was emerging as Hegelian; he takes John Dewey to have been its most influential exponent.³ The ideology was more nationalistic or collectivistic than liberal: the emphasis (to repeat) was on transmission of the country’s culture and mores, assimilation of immigrants into the society, and use of public schooling to remake society in a more harmonious, homogeneous image. Liberal values were considered compatible with this vision, but they were subordinate to the value of social harmony. After all, the turn of the twentieth century was the age of Progressivism, which sought to rectify social ills by governmental means—government intervention, centralization, but also the deepening of democracy.

Consistent with these circumstances is the unabashed triumphalism that was taught in social studies courses, the narrative of America’s glorious and noble history. The American Revolution, for example, in the early twentieth century was often portrayed as something approximating good against evil, revolutionary “demi-gods” against the “deep-dyed scoundrels” who constituted Britain’s leadership.⁴ Likewise, the evils of slavery received short shrift in textbooks, due to the influence of the South on publishers. W. E. B. Du Bois complained that “our histories tend to discuss American slavery so impartially that in the end nobody seems to have done wrong and everybody was right.”⁵ This “impartiality” fit nicely into the narrative of America as a country unparalleled in history for its magnificence.

Inculcation of a patriotic ideology seemed especially important in the United States, as opposed to other countries, because hordes of immigrants had to assimilate into the culture. This was an enormous problem, and schools had an essential role to play with respect to it. Indeed, Patricia Albjerg Graham argues that it was probably education’s most important function during the first quarter of the twentieth century.⁶ The need to Americanize immigrants and their children “pushed the country to develop comprehensive schools through high school before they were common elsewhere.”⁷ Instilling enthusiasm for learning in children was at best an incidental goal, if that; the real goal was to create a “melting pot” of ethnicities, races and religions. How little academic learning was valued is shown by the *Report of the Commission on the Reorganization of Secondary Education of the National Educational Association*, published in 1918, which declared that the principal aims of education were as follows: health; command of fundamental processes; worthy home membership; vocation; civic education; worthy use of leisure time; and ethical

character.¹ Of these seven aims, only “command of fundamental processes” hints at academic learning; the rest have to do with socialization, in particular with immigrant assimilation and an easing of citizens’ painful process of adjustment to a vast industrial economy.

“Americans,” according to Graham, “have traditionally considered their schools mechanisms for social improvement.”² We have already seen examples of this. Around the beginning of the last third of the twentieth century, the mission was expanded yet again to include giving minorities and the poor increased access to education and thus to social advancement. This is not surprising, considering that schools and universities were at the forefront of the civil rights movement and many of its battles were fought on their turf. The Elementary and Secondary Education Act, passed in 1965, “established the principle that children from low-income homes required more educational services than children from affluent homes did.”³ Francis Keppel, commissioner of the U.S. Office of Education during these crucial years, was ambitious: he not only wanted to expand access but to emphasize socialization less and academic learning more. To this end he arranged for the federal government to give additional funds to schools to help them educate impoverished children, and he established the first national testing program.

Keppel’s concern with the academic curriculum was ahead of its time. It wasn’t until the 1980s that the nation became fixated on the “learning” aspect of education, with the publication of *A Nation at Risk* in 1983 by the National Commission on Excellence in Education. This report warned of “a rising tide of mediocrity that threatens our very existence as a Nation and a people.”⁴ Low educational achievement was rampant. The report recommended that state and local high school graduation requirements be strengthened so that they included, at a minimum, four years of English and three years of mathematics, science and social studies each. America was galvanized by this report into establishing commissions and task forces to study ways of improving learning. States rewrote curriculum frameworks, which resulted in the rewriting of textbooks. State testing was revised; many governors became converts to outcome-based education, which led to the unending search for better tests and assessments to measure student achievement. When George H. W. Bush became president he initiated the America 2000 plan to reach a wildly ambitious set of goals by the year 2000, including that the high school graduation rate would rise to 90 percent, U.S. students would be first in the world in science and mathematics achievement, every adult American would be literate, and every school would be free of drugs and violence.⁵ Bill Clinton continued Bush’s crusade to improve educational standards (at least according to these politicians’ rhetoric), as did the second Bush.

At the same time, with the rise of multiculturalism the emphasis on America’s unique moral greatness, as well as on the “melting pot” ideology, declined. In the early 1960s it was still possible to see in fourth-grade textbooks such passages as the following, which describes the massacre of the Pequots by Captain John Mason:

His little army attacked in the morning before it was light and took the Pequots by surprise. The soldiers broke down the stockade with their axes, rushed inside, and set fire to the wigwams. They killed nearly all the braves, squaws, and children, and burned their corn and other food. There were no Pequots left to make more trouble. When the other Indian tribes saw what good fighters white men were, they kept the peace for many years.

“I wish I were a man and had been there,” thought Robert.⁶

The socializing functions of such a textbook are transparent. But by the 1980s and ’90s, textbooks had become more sophisticated. The narrative tended to be more ambiguous, less insistent of America’s

righteousness. The socialization purposes of school were no less important, but they had become oriented toward instilling respect for all people and cultures rather than focusing solely on how magnificent America and Western civilization were. This seems to be the stage we're at now.

In the foregoing brief survey I haven't discussed colleges and universities. Until the late nineteenth century and especially the advent of mass higher education in the early twentieth century, the institutions that existed were mostly private and catered to future lawyers, professors, diplomats and so on. There were also teachers' colleges, so-called "normal schools" (from the French, *écoles normales*). In the middle and late nineteenth century, however, public state universities began to be created in a number of states as a result of the passage of the Morrill Act in 1862, which gave federal land grants to states for this purpose. The growth of mass higher education was slow, but it came to maturity in the Progressive era, largely through the efforts of California and Wisconsin Progressives. The result was what John Aubrey Douglass has called the California Idea: "a cohesive and popular vision of public higher education as an ameliorative and pro-active agent of state and local government, which would set the stage for a modern and scientifically advanced society."¹ The industrial economy was expanding rapidly in California and all around the country, which necessitated "better-trained labor, a new class of professionals, and greater access to education." Public universities, in other words, were to become an essential agent of social and economic change, in particular the democratization of science and the economy. The first states in which they realized this purpose were California and Wisconsin.

The California system became a model for other states. Junior colleges emerged to supplement teachers' colleges and the prestigious University of California as a way to democratize higher education. The University of California itself grew from an original campus at Berkeley to a campus at Los Angeles, and from there on to other cities around the state as the demand for education kept pace with the rising population. The Berkeley campus symbolized the fusion of the old humanist, elitist conception of higher education with the new utilitarian, democratizing conception, in that it excelled both in the humanities and in scientific research for the benefit of agriculture, engineering, physics, etc.² The role of California's higher education system as a facilitator of economic and social progress became evident to the entire world, which for many decades would look to California as a symbol of the potential of democratic higher education if empowered to serve the needs of the state.

Later in the century, the university's mission became less clear. The institution experienced a kind of identity-crisis, which, if anything, has become more acute in recent years as government funding has dried up even as student populations have increased. Arguably the ambiguity in the university's mission was implicit even in the Progressive age; it became explicit, however, in the 1960s, with the disruptions caused by the Vietnam War, the anti-war movement, and the student movements. For many decades there have been three major functions that the university has fulfilled: the first is expressed in Willhelm von Humboldt's humanistic definition of the university as "nothing other than the spiritual life of those human beings who are moved by external leisure or internal pressures toward learning and research";³ the second is to facilitate the democratizing and 'civilizing' of society and the economy; the third is to be an enabler of power-structures in business and the government, for instance to be a branch of the defense industry and a manifold source of profit for corporations and investors. The first two purposes are each partly realized in the 1960s-ish understanding of the university as ideally a locus of subversion, of the questioning of authority, of the radical democratization and de-bureaucratization of society, a place where shibboleths are attacked and discredited. But the third purpose is directly opposed to this noble ideal of intellectual freedom, and is even in tension with the university's role as advancing the democratization of professional, economic and scientific life. In recent years, the third purpose has been gaining at the expense of the other two.

The Future

¹ John Aubrey Douglass, *The California Idea and American Higher Education* (Stanford: Stanford University Press, 2002), 82.

² *Ibid.*, 104, 105.

³ Quoted in Chomsky, *op. cit.*, 299.

Having considered the history of American education, we'll consider now the question of what purposes education *should* serve. I stipulated in the beginning that, whatever they are, they have to be at least *compatible* with humanism and liberalism, i.e., respect for the individual's freedom and creativity. We can expect that "schooling" and "higher education" will not have exactly the same functions.

The first question to ask is whether education should be devoted solely to (1) disinterested learning, unconcerned with social implications, and (2) realization of the individual student's creative personality, or whether it should also aim to fulfill certain socializing functions, such as indoctrinating children with patriotism or egalitarian ideas. Surely the answer is that it is neither possible nor desirable for the socialization aspect to be eradicated. Every generation of reformers has correctly assumed that socialization is not only an incidental but an integral function of schooling. Children have to learn how to relate to others, and one cannot simply assume that they will learn proper behavior from their parents. But the behavior and beliefs they are taught at school should consist in an elaboration of liberal humanism—that is, respect for others, the belief in human equality and freedom, a broad humanitarianism, a commitment to reason and truth, etc., all of which components preclude aggressive patriotism or nationalism, exclusivist theology, racialism, and the like. In fact, children should not even be taught that the United States is a better country than others, and certainly not that it has a "great" history, since the first idea can lead to an emotional kind of patriotism singularly compatible with both willful ignorance and an irrational respect for one's compatriots over other people, while the second idea is contradicted by the facts. If patriotism is to be inculcated at all, it should be of the tepid sort that encourages you to help your fellow citizens in such a way that citizens of other countries are not hurt.

It's true that in social studies classes, a narrative of American history has to be presupposed by the textbooks one uses and the teacher's approach to them. But the narrative should not consist in the triumphalism that has been taught for much of American history. Rather, it should be organized around the simple but fundamental truth that *through popular struggle, people(s) have won freedom—and freedom has never been won without popular struggle*. Students ought to be taught that American history is "great" only insofar as it has been shaped by progressive popular struggles. The government's history should not be celebrated. The major crimes of political and economic power-structures ought to be discussed, but not at the expense of stories of progress.

The objection that the foregoing revisions in educational indoctrination would lead to a disintegration of America's social fabric due to a lack of commitment to the nation is unconvincing. What keeps the social fabric intact is not having been taught a narrative of American greatness in one's childhood and youth, but instead "the dull compulsion of economic relations," to quote Karl Marx. I.e., the daily subordination to economic and social relations that are difficult to revolt against. Whether the hegemony of any ideology at all is important in sustaining the structure of American society is in fact an open question.

On the other hand, the objection that my ideas are unrealistic, that they could never be actualized given the interest of the elite in maintaining the status quo, may have some truth but is irrelevant. I am proposing only an ideal we should try to approximate, because it would benefit both society and individuals and, moreover, is a consistent elaboration of our deepest shared values.

With regard to "indoctrination," then, students should be taught to think for themselves, to accept nothing on the basis of authority, to value truth and evidence above everything except freedom and compassion, and to develop themselves creatively in all directions as long as their creativity does not interfere with others'. The seven "principle aims of education" listed above (from 1918) are a good starting-point, but more emphasis should be placed on academic learning and spontaneous creativity. All academic learning should be consistent with the best scholarship (though simplified for children).

Horace Mann was right that we should use education, from the lowest to the highest, partly as a way to remedy social inequalities and divisions. Thus, it is advisable to mix children from different races and from the lower and upper classes together. Through busing, (some) suburban children should be sent to inner-city schools and inner-city children should be sent to suburban schools. If implemented—which it wouldn't be—this idea would have the added advantage of focusing attention on the inadequacies of city schools and causing suburban money and power to be used for their improvement (since middle- and upper-

class parents would presumably insist on better city schools for their children). Similarly, affirmative action programs should be widely implemented in higher education. However, education should not be considered the primary means of rectifying social problems like crime and poverty. Far more effective would be massive, government-funded reconstruction of urban areas (with the participation, and in the interest, of the communities involved).

The new concern in recent decades with the quality of academic learning in schools is a positive development. However, the way to approach the issue is not through financial rewards based on standardized testing but through the infusion of massive aid into urban schools for the sake of reducing class sizes and hiring better teachers, i.e., raising teachers' salaries to attract the most qualified candidates. New schools ought to be built, and old schools renovated. Curricula in all states ought to be redesigned along the lines I outlined above. Such measures would have a perceptible impact on both academic learning and socialization. They would simultaneously help the individual and the community.

Reforms in higher education should be as radical as those in primary and secondary education. To repeat, the major purposes of higher education are to give the masses access to the 'higher' spheres of economic, scientific and professional life, and in so doing to stimulate the country's economy while encouraging upward mobility amongst the populace. Wilhelm von Humboldt's humanistic conception of the university is valuable too but arguably secondary to the "democratization" conception. Given the university's tremendous potential to benefit society, as evidenced in its contribution to California's development during the twentieth century, federal and state governments should pour tens of billions of dollars into public universities and colleges across the country. High tuitions are a barrier to fulfillment of the university's democratizing potential; indeed, education should be free.

The least valuable purpose of the university is its being a handmaiden of corporate profits and the Department of Defense's high-tech research. Insofar as such research may be of use to society—as the development of the computer and subsequently the internet was—it is to be encouraged; but research on "weapons of mass destruction" such as napalm or missile systems (during the Vietnam War) contradicts the university's humanistic, democratic mission and is thus wrong. Likewise, for obvious reasons it is dangerous to think of universities as businesses whose funds should be invested in stocks and so forth, as is increasingly done.

Broadly speaking, there seems to be no contradiction between the humanistic and the democratic missions of education. Each is compatible with an ideological foundation in liberalism and an emphasis on the worth of the individual personality. These values should be the standards by which we judge how well any given aspect of education is fulfilling its goals.

We can learn a lot from the history of education, as an extended essay would demonstrate. The purpose of this paper has been merely to sketch the history of how reformers in the United States have conceptualized the functions of education and to propose on the basis of this knowledge a bare outline of an ideal educational system in the future. The chances of its being realized are slim, but nothing great has ever been accomplished without an unrealistic ideal in mind.

*

Reading Takis Fotopoulos's *Towards an Inclusive Democracy: The Crisis of the Growth Economy and the Need for a New Liberatory Project* (1997). Very thought-provoking. Takes a market-oriented rather than capitalism-oriented approach. A whole different way of conceptualizing things. But I suspect it isn't as different as it seems at first: capitalism and the market are very closely related, the first presupposing the second and the second not *systemically* existing except in capitalism.

Thoughts on World War I, half-opposed to Lenin's:

"Protectionism [beginning in the 1870s]...undermined the market economy that had been established in the 19th century and, in fact, led to its near collapse in the 20th... It undermined...the world market economy by leading to colonial rivalry and competition for markets still unprotected. As a result of protectionist policies, the world economy, on which the 19th century balance-of-power system had rested, started disintegrating. This inevitably led to the near collapse of the system itself because...the '100 years

peace' (1815–1914) crucially depended on two freedoms: the freedom of trade and the freedom of capital. Therefore, once colonial rivalry started having its effect on both freedoms, World War I became inevitable.”

TF loves Karl Polanyi.

To my mind, Polanyi's significant contribution was that he expressed the fundamental contradiction of the market economy system not in terms of an *economic* conflict between productive relations and productive forces, as Marx assumed, but in terms of a broader social conflict between the requirements of the market economy and those of society; in particular, in terms of the conflict created by the fact that in a market economy land and labor have to be treated as genuine commodities, with their free and fully developed markets, whereas in fact they are only fictitious commodities.

Thus, as soon as a market economy was established, a ceaseless social struggle started. Schematically, this is the struggle between those controlling the market economy, i.e. the capitalist elite controlling production and distribution, and the rest of society. Those controlling the market economy aimed at marketizing land and labor as much as possible, that is, at minimizing—at best eliminating—all social controls on them [such as social security and trade union activity], so that their free flow, at a minimum cost, could be secured. On the other hand, those at the other end, particularly the growing working class, aimed at maximizing social controls on labor and land, that is, at maximizing society's self-protection against the perils of the market economy, especially unemployment and poverty.

At the theoretical and political level, this conflict was expressed by the clash between *economic liberalism* and *socialism* (in a broad sense)... [Liberalism: self-regulating market. Socialism: conserving humans and productive organization.] This struggle constituted the central element of European history, from the Industrial Revolution to date.

The economic conflict [between forces and relations] Marx discusses is so hard to evaluate empirically that it may not be worth keeping. But I can't help thinking there's some truth to it. Still, even if there is, it's less explanatorily useful with regard to social dynamics in capitalism than is Polanyi's hypothesis above (which is really just common sense). [See '*' below.]

The self-confidence of revolutionaries has been wrong from the beginning. Genuine socialist revolution has never been more than a distant possibility growing out of the contradiction between the demands of the capitalist elite and the demands of the broader society. Even in the 21st century, cooperativism will not usurp capitalism, though it will continue making inroads. Things are just going to become a big mess around the middle of the century, with the relative decline of the nation-state, the rise of semi-localism and semi-globalism, the interpenetration of various modes of production, and everything else.

The temptation to see things teleologically—and over-simplified—is almost irresistible. Hence revolutionaries' confidence. Even now, for example, leftists are excitedly proclaiming that Latin America's moves toward independence have some deep world-historical significance, on the level of the rise of socialism. But nothing like that can be said. These developments are just stages in the aforementioned conflict. At times, one side gets the upper hand; at other times the population gets the upper hand. But it's mainly wishful thinking to argue that any given stage represents the beginning of the end. These struggles will go on forever.

I like the “sweep” of TF's interpretation of capitalism's history. In the 19th century there was the initial attempt at international marketization, liberalization, which failed (succumbing to protectionism, colonialism, imperialism, world wars) because “the objective [economic, technological] conditions for completion of this process [of the marketization of society] had not as yet been created.” Then there was the interlude of statism, from the 1930s to the 1970s, during which marketization was rolled back, social controls instituted to protect society from the market, and the national domestic market rather than the

international market drove economic growth. The statist or “social-democratic” phase fell victim in the 1970s to internationalization, liberalization, and the globalizing potential of information technology. The neoliberal phase is essentially a continuation of the liberal phase: “a historic opportunity has been created for the marketization process to be completed.” Needless to say, the price of marketization is a drastic increase in inequality.

“In concluding, it is obvious that the rise of neoliberalism is not a conjunctural phenomenon, as social democrats present it, but that it represents the completion of the marketization process that was interrupted by the rise of statism.” Radical *structural* changes have been brought about by the internationalized market economy, changes that can’t simply be legislated out of existence by neo-Keynesian economic policies or a mild improvement of the social safety net. In the light of the global recession, neoliberalism will be tightened up a bit and monitored more effectively, but it won’t go away.

I think TF underestimates the extent of the “social controls” that still exist in the neoliberal age, such as social security, health insurance and unemployment insurance, and overestimates the extent of social controls during the “statist” or “social democratic” phase. I.e., he exaggerates the differences between that era and this one. But that’s a relatively minor criticism.

*It occurs to me that Polanyi’s hypothesis above, as elaborated by TF, is basically a reformulation of Marx’s hypothesis that the story of capitalism is the story of class struggle. The struggle between the interests of capital (although TF would say the market economy—but “in the last instance” that resolves into primarily the interests of capital, i.e. profit and expansion) and the human interests of the rest of society, which Marx mistakenly thought would come to be dominated by the impoverished working class.¹ He also formulated this theory in terms of the conflict between productive forces and production relations, probably because he wanted his system to be “scientific” and “economistic.” He was right, by the way, that the interest of the working class lay in the expansion of the productive forces, whereas the interest of the capitalist class was not in their expansion *simpliciter* but only in their expansion to the extent that it results in profit. Actually, on this level, the capitalist class as a whole has no collective interest at all; each capitalist merely wants to develop productive forces *faster than his competitors*, an interest which, in the aggregate, is perfectly compatible with recessions, depressions, the colossal waste of resources, etc. By contrast, the working class *does* have collective interests because the latter are *human* interests, e.g. the need for food, shelter, self-realization, and solidarity. And these interests can be realized in part by unimpeded development (and efficient, environmentally kind use) of the productive forces.

TF in fact regresses from Marx in that the class struggle (though not the conflict between forces and relations, which exclusively characterizes capitalism and the transition from feudalism to capitalism) has been a major causal factor throughout history, providing huge pressures on the political elite, even determining people’s perceptions of the world (depending on their location in the class structure), etc., whereas TF expresses it as though social struggle didn’t fully exist before the “market economy.”

Anyway, this is all silly. The point is that *obviously* power-structures, and not only economic ones, conflict with the demands of the majority of the population. They always have and always will.

Incidentally, we shouldn’t be too quick to say that the working class is no longer “relevant” or is merely a small minority of the population. The opposite is the case, especially on the global scale.

Likewise, the conflict between productive forces and production/exchange relations is still relevant. Perhaps more so than ever, on a global scale. In Latin America, Africa and much of Asia—as well as, for that matter, Europe and North America—capitalist relations prevent the unfolding of the productive potential of modern industry and agriculture. In many cases, cooperativism has become necessary in order to give people a livelihood, indeed to allow them to survive, and certainly to make full use of productive potentialities that exist (such as abandoned factories in Argentina). From the beginning of industrial capitalism, cooperatives have sprung up as a result of market failures, which generally can be expressed as emerging from a contradiction between productive (or consumption) potential and capitalist economic relations.

¹ Actually, it theoretically *could* have been. But he was wrong that that was inevitable. It was merely one of the tendencies operative in a capitalist society.

The reason that full-scale revolutions require changes in production relations is that the latter are the foundation of a society. And what's the logical reason that a revolution would cause a change in such relations? Because the old relations are hindering the development of productive potential—the realization of which is linked both to the satisfaction of human wants and the fulfillment of economic freedom—requiring the institution of new relations (which have in fact already been developing in the womb of the old society; the political revolution simply sweeps aside restrictions on their development). By the way, capitalism's ecological destruction, which results from the dynamic of its production and exchange relations, is yet another manifestation of its fettering of productive potential (since the environment is closely linked to production and the satisfaction of human needs). TF implies that Marxism's fetish of productive growth *logically* leads to ecological destruction, but that's stupid, since such destruction hinders productive growth. TF's opposition to Marxism in general is extremely stupid.

Dialectics: *structures*, self-propagating and self-undermining. The original version of 'structuralism.' Not fully conceptualizable or explicable, but that's an indictment of human cognition rather than dialectics. —Actually, it's inexact to say that social structures undermine themselves. You should remember, first of all, that the dialectical and structural way of talking is just an approximation, or rather a kind of metaphorical abstraction. What exist are only human beings, each adhering to a variety of roles governed by rules. The roles and rules that are defined in terms of each other constitute a "structure." But the structure doesn't undermine *itself*. Rather, it is undermined (1) by clashing with other sets of roles and rules, or structures, and (2) by conflicting in various ways with the nature(s) of the people who together instantiate it. The human needs and desires of these people are separate from the rule-governed roles adopted, which are in constant tension both with other roles and with the *vivified* nature of their bearers. Rules can conflict with human needs. Speaking in the broadest way, urges of freedom and self-assertion will constantly undermine social structures (founded on power-relations, mutually interlocking duties, etc.). Sometimes these urges in one person will take a similar form to those in another, because the two people have the same location in a structure and thus have similar grievances—and if enough people come together, a social movement may start that aims at changing the repressive structure. This movement in turn will generate structures, i.e. relations of power, which might themselves come into tension with the vivified (i.e. free) character of the role-bearers, and so another movement might break away from the original. The process can be endless. In any case, what result from all these structures and counter-structures and structures within structures realized in a temporal world of freedom (and the unceasing urge for freedom, from repressive rules) and functioning in a matrix of *material conditions* are societal tendencies, counter-tendencies, contradictory tendencies, an impossibly intricate web of mutually complementary and mutually contradictory activities, with the 'unstructured' fact of *freedom* there at every instant and every point to provide continuous *rupture* (in tension with structural continuity). This stuff can't possibly be conceptualized in detail; only schematically and metaphorically can you inject some conceptual order into it.

January, 2010

Spent New Year's Eve watching the documentary *Ghosts of Rwanda*. Rwanda, the naked essence of power. Power vs. humanity, the struggle. Acts of heroism by an individual Rwandan soldier or a Belgian doctor juxtaposed with the evasions of Washington and New York bureaucrats, laughable if they weren't so despicable. Anthony Lake, Madeleine Albright, Warren Christopher, Bill Clinton, UN deputies and secretaries of state. Even trying to justify themselves after the fact. The moral cowardice is stupefying. And the tortured debates over the legal meaning of "genocide," because if the government admits it's genocide then it's bound to take action. The whole world withdrew from Rwanda. Left it to its fate. The UN, despite its mission never to let another Holocaust-similar event happen. White faces were evacuated, black faces left on the ground.

The fettering of productive potential by the Soviet system played a huge role in the demise of the system and its replacement by a capitalist economy. To an extent, this fettering even played a role in the revolutionary events of 1917, since it was *capitalist* (imperialist) forces that had resulted in World War I and thus indirectly in mass unnecessary starvation, which caused the workers to overthrow capitalism. In this sense, though, Marx's hypothesis says only that when economic relations result in massive poverty and "relative deprivation,"¹ (given certain other conditions) the oppressed will revolt against the economic relations. From this perspective, the hypothesis isn't terribly interesting.

It is further emptied of content and made obviously true when you take into account that "fettering of productive forces" refers not only to their *development* but to their rational and efficient use, which obviously doesn't exist in capitalism. This fact has of course fueled many revolutionary social movements, a circumstance that both confirms and makes less interesting Marx's hypothesis. But the hypothesis is false insofar as it states that in any revolutionary conjuncture, the progressive movement will inevitably or very probably win. Only in the very long term is that *possibly* true.

Skimming Gar Alperovitz's *The Decision to Use the Atomic Bomb, and the Architecture of an American Myth*. Truman calling the bomb "merely another powerful weapon in the arsenal of righteousness." Absolutely jubilant upon hearing news of Hiroshima. As for Nagasaki, even G. A.'s scholarly excavations unearth no rational reason for its bombing so soon after Hiroshima, before giving the Japanese significant time to respond. It seems to have been only a result of the determination to end the war before the Russians, who had just declared war, had a chance to enter Manchuria. (Obviously the Americans wanted to keep them out of the east.) The decision to use the bomb at all was militarily unnecessary, as high-level generals and advisers stated years later and argued in private at the time. In fact, the war could have ended weeks earlier if the Americans had simply assured the Japanese, who were desperate for peace, that the emperor could remain on the throne (a request that was later granted). But Truman and Byrnes, the secretary of state, wouldn't make this concession. Why? Probably because their knowledge of the bomb gave them an "ace in the hole" at Potsdam, and they wanted a chance to demonstrate it to the Russians. So, from this perspective, far from shortening the war, the bomb may have lengthened it by a few weeks, by motivating Truman to reject Japan's overtures for peace. (Yes, he rejected them, in July!) But of course once the Russians declared war on Japan, the Americans wanted peace immediately. At any rate, the evidence is conclusive that the bomb didn't save American lives, since alternatives to invasion of Japan existed.² It was a maneuver undertaken for the sake of the Great Game with Russia that America had inherited from England. And Truman, along with Byrnes, Groves, LeMay and the rest, is among the great villains of history. (Actually, much like G. W. Bush, he lacks the grandeur to be a "villain." But objectively he is.)

By the way, neither Hiroshima nor Nagasaki was a military target, despite Truman's self-justifying lies to the contrary.

A journalist close to military thinking expressed it well:

We were twice guilty. We dropped the bomb at a time when Japan already was negotiating for an end of the war but before those negotiations could come to fruition. We demanded unconditional surrender, then dropped the bomb and accepted conditional surrender, a sequence which indicates pretty clearly that the Japanese would have surrendered, even if the bomb had not been dropped, had the Potsdam Declaration [in July] included our promise to permit the Emperor to remain on his imperial throne.

¹ The connection between this concept and Marx's analysis is that relative deprivation shows the underprivileged what *could* be theirs given a more socially efficient use of society's productive capacity.

² For instance, given that Japan was on the verge of collapse anyway, a weeks-long wait, combined with the shattering blow of Russia's declaration of war, might have resulted in victory.

What if Stalin had been the one to drop the bomb and had justified it by saying it probably saved Russian lives? Would we be defending the decision? No. We'd be saying, rightly, that the use of the bomb was horrifying, that in itself it enshrined Stalin as one of the arch-villains of history.

...Another note on Marx's theory of revolution: included in the "productive forces" is labor itself, productive activity, not to mention economic employment. And obviously insofar as these things are prevented from being realized, as they generally are to a greater or lesser degree in capitalism, tendencies toward revolt against the mode of production will build up. Whether they'll come to fruition is another question entirely, which Marx was wrong to gloss over. (I.e., he was wrong to take it for granted that the proletariat's revolutionary tendencies—and it has other tendencies too—would triumph.)

After skimming through G. A.'s dispiriting book, it's a liberation to read Chomsky's "Notes on Anarchism" and "Language and Freedom."

Power-relations are inevitable in any society. Between family-members, friends, and lovers; in institutions of all sorts. They can be informal or formal, implicit or explicit. In a particular situation the social dynamic may vary from moment to moment, with one person and then another, or no one, or several, having a relative monopoly (or 'duopoly,' etc.) of power. Nature has even placed tendencies in humans regarding who will have relative power, e.g. male over female, large over small, strong over weak, adult over child. Certain power-relations, therefore, are natural; others are unnatural, or societally manufactured. The best that can be hoped for is to moderate the natural ones—since they foster emotional and physical conflict—and get rid of the artificial ones, which are the greatest source of social misery.

The wonderfulness of sex with "no strings attached." Seeing Natalie just to make out, have sex, lounge languidly afterwards, and...that's all. We talk, cuddle, all that stuff, but there are no romantic complications. I'm her boy-toy, her screamingly fun boy-toy, and she's my—exercise mat. But I want more girls, and most of all I want love.

Happiness means more to those who lack it than to those who have it; unhappiness means more to those in pain than to others.

Pleasures appear magnified the farther away one is from them.

On David Foster Wallace's prose.— Genius is rare, but rarer is genius that is not sickly.

It requires a special kind of cruelty, albeit a common one, to ignore a person.

He whose mind is purely disinterested is going to have a hard time in life.

Given the nature of modern society, failure is a point in one's favor.

A typically effective cure for boredom is to step outside.

The anarchist morality of not accepting subordination to power is essentially masculine. The feminine categorical imperative, in fact, is precisely the opposite.

On the other hand, the anarchist morality of democracy, community, cooperation, resolution of conflict through *talk*, is stereotypically feminine.

I suspect that every kind of behavior can be considered either "masculine" or "feminine" in this way, depending on how it's described. It can also be considered either "adult" or "childlike," and "bad" or "good," and "free" or "unfree," and so on. It all depends on how you choose to describe it. —This is like perspectivism, relativism, the lack of "objective truth." And yet it doesn't mean there aren't *better* descriptions, *truer* descriptions than others. So in some way there has to be a "truth of the matter" after all. Only with regard to these so-called binary oppositions, or at least some of them some of the time, is there

perhaps not. (For instance, often the label “masculine” or “feminine” is virtually meaningless, as in the example above.)

Ressentiment, or resentment of a person for his perceived superiority, is a quintessentially feminine illness, and a modern one. Self-consciousness, self-criticism, a distant cousin of “compulsive awareness of oneself as an object of someone else’s observation,” to quote Laing’s definition of self-consciousness. Indeed, schizophrenia is probably at least sometimes related to *ressentiment*, an extreme version of it. Perhaps generalized so as to be directed at all people. Acute insecurity, acute lack of self-confidence and self-identity, resentment towards reality as a whole (precisely because it is ‘whole’). Like schizophrenia, *ressentiment* is caused by a lack of (self-)confirmation from the other, from the world, from oneself. It can be analyzed in terms of recognition. And there are many ways to deal with it, for example the Christian way that Nietzsche talks about, or Sarah Palinian conservatism: “We rednecks are the true America, not those liberal elites in New York, and we’re damned proud of our simplicity, our traditions, our guns.” There’s *ressentiment* involved in that: turning one’s perceived inferiority (how the Other views one) into a strength, one’s greatest source of pride. “You think I’m ignorant? Well, fine, I’m *proud* of my ignorance!” Defining oneself in relation to the dominant other: *he is bad, so I, being different, am good*, rather than *I am good (obviously), so he, being different, is bad*.

Kropotkin’s essay “The State: Its Historic Role.” *L’état, c’est la guerre*. One of its historic roles, of course, has been to transplant the peasantry from the countryside to the cities so as to facilitate industrialization (Marx’s “reserve army of labor”) and make possible the exploitation of land for profit. This is one of the ways in which the nation-state and capitalist industrialization go hand-in-hand. China is doing it now, moving hundreds of millions of peasants to cities—the greatest urban-planning project in history. European states did it from the 1500s to the 1900s, in England with the enclosure acts, in France with the laborious destruction of the village communes, in Russia with Stolypin’s legislation and then Stalin’s Five-Year Plans, etc. There are other ways too. Chomsky discusses in one of his articles the historic function of the Vietnam War in destroying on a colossal scale the peasant villages and sending former inhabitants to the cities, where they’d become cheap labor for capital to exploit. This massive removal of the peasantry from the countryside is a prerequisite for capitalist development, indeed for industrialization of whatever kind. And it isn’t “automatic,” proceeding from purely market-driven causes, as bourgeois ideologists proclaim. It’s intentional, political, brutal, the forced uprooting of hundreds of millions.

Kropotkin was always right that the regeneration of society, the social revolution, couldn’t be carried out by the state but only by grassroots movements. The state is an institution for domination, destruction, and “law and order”; it is not *socially creative*, except in marginal ways. (Funding initiatives like the Peace Corps, etc.) Anarcho-syndicalism was right that present economic structures will inevitably leave their mark on institutions built after the political revolution—and therefore that the *social* (economic) revolution must substantially take place *before* the conquest of political power, not after it. In the latter case it will fail, since capitalist holdovers of domination will influence the “new society.” But this truth is also implicit in Marx’s dictum that politics follows in the wake of economics. A revolution can’t be politically imposed, because in that case economic relations are not ripe for it. The new relations have to have already “matured,” at least somewhat, under the old political regime, as happened during the transition from feudalism to capitalism. Rightly understood, then, Marx was an anarcho-syndicalist with qualifications.¹

¹ Anarcho-syndicalists believed that workers had to create in the womb of the old society the institutions of the new. Socialism, they thought, would be structured around workers’ councils and unions that had developed in capitalism. They also rejected the idea of a “workers’ state,” proclaiming it to be impossible, and believed that the general strike was the most effective tool of revolution—two respects in which Marx would have disagreed with them. But he shouldn’t have. From his perspective there’s no good reason to disavow the use of the general strike. Even his support for the idea of a workers’ political party, which anarcho-syndicalists rejected (because they rejected all politics), is not particularly “Marxist,” since political parties are forced to work within the confines of the parliamentary system and thus make compromises that blur the antagonism between labor and capital, in the end leading to the co-optation

(Or at least he should have been, logically speaking.) From his premises, the proletarian dictatorship's task could only be to *finish* the job, not to *start* it, as Lenin tried. Workers' groups had to do much of the societal restructuring beforehand; their subsequent political decrees would formalize and 'organize' the institutions that the workers had already created. Otherwise, given the foundation of the political in the economic, the new government's acts would inevitably have the taint of capitalist, bureaucratic structures that still survived. More than the "taint," in fact. Despite himself, Marx knew that the attempt to politically will new liberatory institutions into existence wouldn't succeed (as Lenin, Stalin and Mao tried). They have to emerge slowly, through popular struggle; otherwise they're artificial, 'inorganic,' bureaucratic and coercive, since economic conditions aren't ripe for them.

Polanyi's *The Great Transformation: The Political and Economic Origins of Our Time*. One of the salient differences, I think, between the era that led to the world wars and the era that followed them is that politics was more independent of the interests of capital in the first than in the second. The great wars were, by and large, not in the interest of European financial or industrial capital. **[Wrong! In many respects they were.]** As I said earlier, then, the wars were symptomatic of capital's immaturity, of its not yet having definitively conquered the summits of political power. **[It's true that the bourgeoisie wasn't in unequivocal control of the European state system by the time of World War I. But national capitalist classes were firmly behind their respective states in both wars. Would the wars have occurred had Germany's aristocratic Junker class not existed or had so much power? I don't know. Possibly not.]** Again, the great influence of nationalist and racist ideologies all through the 19th century and well into the 20th testifies to that—but only to an extent, since capital itself orchestrated innumerable colonial wars and fanned the flames of nationalism. (And such ideological forces also simply emerged 'naturally' from the social-dislocating dynamics of the international economic regime.) Racism and nationalism are perfectly compatible with capitalism up to a point; but they're dangerous in that they can breed social conflicts destructive to capital, and also in that as motivating forces they can interfere with the profit incentive. So, mature capitalism tends to discard them, or rather breeds (directly and indirectly) popular and elite efforts to discredit them for the sake of social stability, etc. **[But reactionary sectors of capital continue to propagate and subsidize them.]**

[...]

Mitt Romney is coming out with a book called *No Apology: The Case for American Greatness*. Since we're accustomed to politicians talking obsessively about "American greatness," the title of his book doesn't strike anyone as laughable. But think of it in a different way. What if a French politician came out with a book called *No Apology: The Case for French Greatness*? Or a Chinese with *No Apology: The Case for Chinese Greatness*? It would be a joke. Like, why the hell are they even worrying about stupid stuff like that? Reassuring themselves that they're great? It's worse than childish, since even children don't have to reassure themselves about the greatness of their country; it's infantile. But in America it's politically savvy.

A good way to conceptualize the failure of Marx's predictions is to say that he assumed incorrectly, like market liberals, that the only two alternatives are free market capitalism and socialism. This is just another way of formulating the common criticism that Marx underestimated the actual (in his day) and the potential role of the state in regulating the capitalist economy. Polanyi is right that without continuous massive state intervention, the free market would quickly lead to complete social disintegration, in which case something like a revolution might happen. And actually, the horrors of the first half of the twentieth

of the labor movement as a prop for the stability of the system. This was a danger that Marx and Engels were aware of, but they didn't take it seriously enough. Marx also should have made more explicit his support of direct action, which anarcho-syndicalists of course advocated. Nothing is more "Marxist" than direct action (which, like Marxist theory, privileges economics over politics). [On the other hand, I have to admit that Marx's advocacy of political action was in some ways more realistic and less 'utopian' than the anarcho-syndicalist position. But it was either Scylla or Charybdis for him, and for the working class: either the syndicalist route, which didn't work so well in any country for a variety of reasons, or a workers' party that would attempt to seize control of the state but in the process would inevitably make compromises and finally succumb to a moderate reformism and bureaucratism, as happened everywhere.]

century were largely a result of insufficient social controls on economic activity, or rather of the liberal framework around which the global economy was structured and to which nations tried to adapt in various ways (some fascist). The gold standard itself was a product of the liberal vision of a governmentally unregulated, self-adjusting global economy, and (according to Polanyi) it led to the opposite of what liberals predicted, namely enormous social dislocation, imperialism, protectionism to offset the social dislocation, depressions, and wars.

Fred Block's introduction to the book is very good. Excerpts:

The gold standard was intended to create an integrated global marketplace that reduced the role of national units and national governments, but its consequences were exactly the opposite. Polanyi shows that when it was widely adopted in the 1870s, it had the ironic effect of intensifying the importance of the nation as a unified entity...

The reality is that the simple rules of the gold standard imposed on people economic costs that were literally unbearable. When a nation's internal price structure diverged from international price levels, the *only* legitimate means for that country to adjust to the drain of gold reserves was by deflation. This meant allowing its economy to contract until declining wages reduced consumption enough to restore external balance. This implied dramatic declines in wages and farm income, increases in unemployment, and a sharp rise in business and bank failures.

...Hence, almost as soon as the gold standard mechanism was in place, entire societies began to collude in trying to offset its impact. A first recourse was for countries to increase their use of protective tariffs for both agricultural and manufactured goods. By making trade flows less sensitive to price changes, countries could gain some degree of greater predictability in their international transactions and be less vulnerable to sudden and unanticipated gold outflows.

A further expedient was the rush by the major European powers, the United States, and Japan to establish formal colonies in the last quarter of the nineteenth century. The logic of free trade had been strongly anticolonial, because the costs of empire would not be offset by corresponding benefits if all traders had access to the same markets and investment opportunities. But with the rise of protectionism in international trade [which itself grew out of the exigencies of free trade, and the necessity to reduce its social impact!], this calculation was reversed. Newly acquired colonies would be protected by the imperial powers' tariffs, and the colonizers' traders would have privileged access to the colonies' markets and raw materials. The "rush to empire" of this period intensified the political, military, and economic rivalry between England and Germany that culminated in the First World War.

For Polanyi the imperialist impulse...materializes as nations struggle to find some way to protect themselves from the relentless pressures of the gold standard system. The flow of resources from a lucrative colony might save the nation from a wrenching crisis caused by a sudden outflow of gold, and the exploitation of the overseas populations might help keep domestic class relations from becoming even more explosive.

Polanyi argues that the utopianism of the market liberals led them to invent the gold standard as a mechanism that would bring a borderless world of growing prosperity. Instead, the relentless shocks of the gold standard forced nations to consolidate themselves around heightened national and then imperial boundaries. The gold standard continued to exert disciplinary pressure on nations, but its functioning was effectively undermined by the rise of various forms of protectionism, from tariff barriers to empires. And yet even when this entire system came crashing down with the First World War, the gold standard was so taken for granted that statesmen mobilized to restore it. The whole drama was tragically played out again in the 1920s and 1930s, as nations were forced to choose between protecting the exchange rate and protecting their citizens. It was out of this

stalemate that fascism emerged. In Polanyi's view the fascist impulse—to protect society from the market by sacrificing human freedom—was universal, but local contingencies determined where fascist regimes were successful in taking power.

...Polanyi's arguments are so important for contemporary debates about globalization because neoliberals embrace the same utopian vision that inspired the gold standard... The neoliberal utopia of a borderless and peaceful globe requires that millions of ordinary people throughout the world have the flexibility to tolerate—perhaps as often as every five or ten years—a prolonged spell in which they must survive on half or less of what they previously earned.

Polanyi: “When the significance of poverty was realized [around 1780], the stage was set for the nineteenth century.” Truer words were never spoken. If the eighteenth century was the age of the political revolution (republicanism and so on), the nineteenth was the age of the social revolution, at least the attempted one. In the 1700s it was republicanism, in the 1800s it was socialism.

Above I said that social structures don't undermine themselves, properly speaking. And in many cases that's true. The patriarchal family doesn't undermine *itself*; it is undermined by conflicting with human desires and with other social structures, and the desires/values that they propagate. However, at least one structure does undermine itself: the capitalist free-market economy, taken as a single vast structure. Or you can abstract out the essential elements from the empirical reality and take those as the structure. Either way, as a whole it conflicts with itself—the functioning of its rules and roles generates problems with their functioning—and, given enough time, will run itself into the ground. The difficult thing is to understand in detail the ways in which it accomplishes this feat. Marx spent a lifetime trying to do so.

Had Europe in the nineteenth century not taken measures to “protect society from the functioning of the economic (market) system,” society and the economy would have collapsed. But, ironically, the measures it took—protectionism, imperialism—led to much the same outcome. Actually, it's too early for me to say whether I accept Polanyi's arguments about the gold standard and about imperialism being, in effect, a way of sheltering a nation from the ravages of the free market. I'm not even sure I like his way of conceptualizing things in terms of the conflict between the pressures towards a free market and the pressures towards society's “self-protection” against it. Why not interpret the world along strictly Marxian lines, according to which the various sectors of capital try to do whatever is in their interest, which usually amounts to “free market discipline for *you*, but subsidies, bailouts and protectionism (and imperialism, colonial wars, etc.) for *me*,” while workers and all other groups disadvantaged by the rule of capital—which incorporates not only the free market but also state-sanctioned violence, union-busting, private armies and other non-market means of discipline—fight for their own interests? Isn't Polanyi's conceptual framework somewhat superfluous, i.e. not as explanatorily powerful as Marx's? Prima facie, in Polanyi's scheme *agency* is an after-thought, whereas it is essential to Marx's (even if its structural location is what matters most). On the other hand, Polanyi's perspective provides insights, is at least a half-useful way of viewing things, and can probably be seen as supplementary to Marx's if formulated in the right way. In fact, the reason for capital's insistence on subsidies and protections for its benefit is precisely that it recognizes the hazards of the free market and wants to be shielded from them. You can follow Polanyi in calling this an element in the “self-protection of society,” but that seems explanatorily counterproductive. Ideological even, in that it suggests that capital's acts are socially necessary and beneficial, which is usually far from true.

...What I was trying to say above is that it may be better to talk only about the capitalist mode of production (wage-labor, capital, surplus-value, profit) rather than about the movement towards a free market vs. the “countermovement” towards “social controls.” Doesn't Polanyi introduce illusory distinctions, artificial ways of picking out social tendencies? Doesn't he fixate too exclusively on the mode of distribution at the expense of the mode of production? He says that “Robert Owen's was a true insight: market economy if left to evolve according to its own laws would create great and permanent evils.” Isn't it more fruitful to talk about the opposition between capital and labor than the opposition—derivative of more basic forces—between the free market and “societal self-protection” from the market? I guess the best

way to answer such a question is by deciding which scheme bears greater theoretical fruit. “By their fruits ye shall know them.”

Maybe this is all sort of a red herring. Polanyi’s basic point is that nature, humans, and businesses have to be protected from the “devastating effects of a self-regulating market,” because land, labor-power, and money are “fictitious” commodities that obey different laws than ordinary commodities. His point is valid. In fact, it makes up for the deficiency in Marxism that led Marx to concentrate on purely economic laws at the expense of their possible, or necessary, alteration and softening by the state. Polanyi helps explain the state’s interference in the economy, which helps explain, among other things, why a Western socialist revolution never happened.

On the other hand, if Marx succeeds in demonstrating the contradictions of capitalism, which are of course intimately connected even in his system with the functioning of the market, then surely he too inadvertently explains why the state is forced to intervene in the economy.

But what exactly is the relationship between capitalist production and distribution? Doesn’t each imply the other? Isn’t each *involved in* the other? And yet at the same time production is more fundamental? What does that mean? Analytically, how do you separate production from distribution? In a sense, the whole process is “production.”

Maybe a better way of expressing Polanyi’s criticism of the unregulated market is to criticize unregulated *capitalism*, i.e. capital’s unregulated pursuit of profits. It is this that is the real danger, since capital also uses other means than the free market to squeeze profit from workers. Moreover, surely this criticism is more historically specific than Polanyi’s. It’s conceivable, after all, that unregulated markets need not always be socially catastrophic, for instance if they’re on a small scale. The danger isn’t markets per se but capital’s use of them. Especially because (Polanyi points out in the beginning of his book that) markets in themselves don’t have a tendency to expand or to destroy everything in their path; only the capitalist market does.

But I’m forgetting that Polanyi’s criticisms are directed at the market *economy*, which he defines as the complete extension of markets so that they comprise even the organization of labor, land and money. In this sense, capitalism means the market principle taken to its extreme. “Market economy” is, for Polanyi—(obviously)—synonymous with “capitalism,” more or less; it is this he is criticizing, not markets per se. But, again, his reluctance to frame the issue in terms of capital, class, surplus-value, the drive for profit, the sphere of *production*, and the opposition between capital and labor, reduces the explanatory power of his ideas. Marx’s framework allows us to understand why there is constantly pressure for an expansion of the free market (though rarely at the expense of big business), namely because it is in the interests of capital in its war against wage-labor. Polanyi, remarkably, doesn’t really try to explain why markets in a “market economy” are prone to global expansion; he mainly invokes “economic liberals” and mistaken liberal thinking as responsible for the extension and prolongation of the free market (during the 1920s, for example)—a wildly inadequate explanation, but virtually the only possible one within the confines of a theory that tries to minimize structural agency, class, and class conflict.¹

(To repeat, the notion of surplus-value, which I invoked a minute ago, is, on the most basic level, merely common sense. It’s practically a synonym for ‘profit.’ If the employee didn’t create extra value (on top of the value of his wages) for the employer, there would be no point in employing him.)

Polanyi, the bourgeois socialist.

He dislikes the theoretical framework that sees society as composed of a number of competing interests, preferring to think in terms of “societal self-protection” (from the market economy) as a whole. He constantly talks about vague “social interests” as if everyone can agree on what these are, and refers deprecatingly to the typically Marxist “obsession that only sectional [e.g. class], never general, interests can become effective,” i.e. can force themselves on society in such a way that reforms are made. But what

¹ Takis Fotopoulos, Polanyi’s disciple, doesn’t do much better: if I remember, he periodically alludes to the competitive advantage of expanding one’s economic operations and doesn’t probe further, perhaps because he’s unconsciously afraid of the Marxian conclusions he might be led to. (The relative importance of the sphere of production, the role of structural conflict in capitalism, etc.)

are these general interests that become effective? There aren't many. Most pieces of social legislation have to be fought for by specific interest groups, which are usually directly or indirectly related to class locations and class-determined experiences.

The Andante from Schubert's Piano Trio in B-flat, D. 898. (I'm trusting the YouTube title.) The two components that make Schubert Schubert: the melodic hauntingness and the experimentation with key-changes.¹ Listening to each measure wondering where he's going to go next. The inventiveness. Brendel remarks in an essay that, whereas Haydn's excursions into foreign keys seem consciously planned and controlled, Schubert's seem to take him by a surprise comparable to the listener's. They're spontaneous. In his late music, if he isn't actually changing the key he's inserting a note or two to *hint* at a key-change, only to draw back from the edge. The effect in this piece is an impression of *suspension*, levitation. But that also has to do with the classical restraint, simplicity and quietness of the melody. Unusually exquisite, even for Schubert.

How do you create a labor market where there isn't one, for example in traditional societies? You destroy the prevailing social structures and means of subsistence so that people are forced into the factories and the mines to make a living. Particularly effective is the expedient of starving them; they're bound to obey you then.

Polanyi's functionalism isn't necessarily mistaken. He's right that interests that serve a useful function for society tend to have some influence. For example, his explanation of the continued influence of the Continental landed aristocracy through the nineteenth and early twentieth centuries seems plausible: namely, that "feudalism and landed conservatism retained their strength as long as they served a purpose that happened to be that of restricting the disastrous effects of the mobilization [i.e., marketization] of land." In other words, the survival of feudal forms of life in Central and Eastern Europe was due to their function in "retarding the marketization of land," which had the potential to be socially catastrophic if undertaken too hastily. In general, Polanyi likes to explain the influence of a particular class by how well it serves the interests of society as a whole (presumably as stabilizing it and allowing it to compete with other societies). This reminds me of Darwin's functionalism: those adaptations that improve a species' chances of survival tend to be the ones that live on; the rest die out. But just as a *mechanism* is necessary in the case of Darwinism, so it is in the case of Polanyism. Real explanations are causal, not functional.

Under the circumstances, a group able to represent the endangered rural interests could gain an influence out of proportion to their numbers. The protectionist countermovement actually succeeded in stabilizing the European countryside and in weakening that drift toward the towns which was the scourge of the time. Reaction was the beneficiary of a socially useful function which it happened to perform. The identical function which allowed reactionary classes in Europe to make play with traditional sentiments in their fight for agrarian tariffs was responsible in America about a half-century later for the success of the TVA and other progressive social techniques. The same needs of society which benefited democracy in the New World strengthened the influence of the aristocracy in the Old.

Very interesting thoughts. One way around the functionalism is to suggest that at first liberal policies were tried (in Germany, for example), and they led to social problems, such as the Great Depression of 1873–86; then protectionist, aristocratic, feudal interests were allowed to have a say, and the policies that resulted stabilized the society. (Legislation was enacted in the 1880s and later to protect labor also, and other interests.) So groups opposing them lost political influence, and the protectionist policies prevailed. In the meantime, by the way, the aristocracy's appeal to the soil, the race, the nation, and old martial, chivalric values—all of which struck a chord in the peasantry and petty-bourgeoisie, who were resistant to capitalist

¹ On a more general level, of course, the third Schubertian trait is a unique fusion of classicism and romanticism.

change¹—played a great role in exacerbating national antagonisms and imperial rivalries, thereby contributing to the onset of World War I. Only when these conservative rural interests were destroyed in the Second World War was a European peace made possible.

In the broadest of strokes, here's a way to explain the world wars [and later developments]: Free trade in the nineteenth century, if unchecked, would have resulted in society's transformation into a "heap of ruins"; so protectionism, with its corollary imperialism, made great strides after the 1870s. National and imperial rivalries emerged, and in the long run the outcome was the Great War. Then in the 1920s there was a return to an orgy of economic liberalism. The consequence was the Great Depression. Once again, "protectionism" [of many types] on a huge scale resulted, with the New Deal in America and fascist policies in Europe. There were even pressures towards autarky, since international trade plummeted and nations decided it was more prudent to rely on themselves and avoid the risks of having to import essential resources from other countries. (Think of Hitler's *Lebensraum*, his policy of expanding Germany to such an extent that it could rely entirely on its own economy.) Combined with cultural resentments felt all across Europe, World War II was the product of this retreat into national self-sufficiency and elimination of free trade. Afterwards, international regulatory institutions were put in place to prevent a third war. Regulated free trade resumed, but in a framework of strong statist welfare measures and societal self-protection from the vagaries of the market. Decades of relative prosperity resulted, until the 1970s when deindustrialization began in the West as corporations outsourced aspects of the production process to countries where labor was cheaper. Protectionism, welfare, and regulation were partially dismantled for the sake of corporate profits; the consequence was great hardship for the mass of people everywhere. Similar to the 1920s, but worse and spread all over the world. Then in 2008 there was a semi-repeat of 1929, caused again by liberalization and the financialization of the economy. With the resulting mass hardship, protectionist and semi-fascist pressures are again making themselves felt (Sarah Palin, Glenn Beck), although this time the dangers are less real than they were in the 1930s because of our irreversible global economic integration and a somewhat more sophisticated approach to recessions, as well as the far more entrenched nature now than in the '30s of the non-fascist elite. What does the future hold? Probably a continuation of the status quo for a long time, with greater regulation of the global economy and relative loss-of-power of the nation-state. Trends toward global cooperation and regional decentralization will continue, as people learn that they can no longer rely on the national government and the broader economy to protect them. Developments like those that Gar Alperovitz describes in *America Beyond Capitalism*.

Polanyi is right: "The degenerative character of the fascist solution was evident. It offered an escape from an institutional deadlock which was essentially alike in a large number of countries, and yet, if the remedy were tried, it would everywhere produce sickness unto death. That is the manner in which civilizations perish." And in a manner of speaking, a civilization did perish in World War II. The degenerative character of fascism bears resemblance to the less extreme degeneration signified by Louis Bonaparte's rise to power in the late 1840s and early '50s. There was institutional deadlock: as Marx said, the bourgeoisie had become incapable of ruling society and the proletariat was not yet capable. (In fact, it never would be capable, or at least it would never have the opportunity to prove itself.) But the deadlock was much greater in the early 1930s. There wasn't a real risk of a communist revolution in Central Europe, but even so, capital wanted to stop labor's frightening agitation for social reform. Labor, for its part, was not strong enough to push through its policies, just as capital was not strong enough to push through its own. So a band of thugs was, in effect, called in to end the stalemate. This sort of scenario, this institutional breakdown, is a permanent possibility (though rarely a reality) in capitalism given the foundational antagonism between capital and labor.

My idea of happiness would be to play duets with a girl, like Schubert's Two Trios and Two Ländler, D. 618. Or those delightful duets by Mozart. Anything classical in spirit, since classicism is harmony and happiness.

¹ "The nation" etc. signified for them their old secure way of life, their self-respect, their traditional culture, and their property, as Daniel Guerin notes in his book *Fascism and Big Business*.

Against Nietzsche.— More “strength” is required to overcome *ressentiment*, or any other attitude of mean-spiritedness, than to be immune to it from the beginning.

The amount of free time I have is really obscene. Almost sickening. That’s in the nature of January, but it won’t change because I’m not taking any classes this semester, only writing my thesis. So I’m getting involved in more activities. Book clubs and so on. Heard about a meeting tonight to address homelessness in Boston; the people there, twenty-somethings, were just the sort of *special* people you’d expect, special in the true sense. The girl directing the meeting—Emilia—was beautiful, charismatic, eloquent, friendly, brilliantly articulate. She’s an opera singer too. Afterwards she walked over and thanked me for my comments, which completely hadn’t been “thank you”-worthy; we had a brief conversation. She probably has a boyfriend, though.

What a great documentary we saw. Short, but among the best. Produced in the ’80s. It followed four homeless Bostonians around for weeks, four unique and very human characters who made me see homelessness in a different light. Marx remarks somewhere that the criminal classes tend to include the population’s best elements, the intentional nonconformists.

Emilia and the movie and discussion had put me in a deliciously mellow mood, but now that I’m home in front of my computer and have just watched clips on YouTube, I again, as usual, feel nothing(ness). Doing nothing, feeling nothing.

All these new girls I meet through Craigslist and Meetup. Elena remarked in an email that my “untiring energy to go meeting new girls is remarkable.” I suppose it is, isn’t it? Hope springs eternal.

One problem with the average political “conservative” (or neoconservative; the distinction is evaporating in the broader culture) in the U.S. is that he has an emotional attachment to the idea of America, its greatness, so that if anything is said that might be interpreted as critical of the country he feels the need to disagree with it and defend America. He is more committed to his belief in the greatness of his country, a nonexistent abstract entity, than to action on behalf of people’s well-being (action that he often thinks takes “anti-American” forms). He is vigilantly on the lookout for “anti-Americanism,” his antennae hyper-attuned to the faintest whiff of it. He won’t accept criticisms, for example, of American foreign policy unless they’re premised on the belief that America is great, noble, a force for democracy and freedom in the world. His outlook, hyper-patriotic, is basically totalitarian. So he can’t think clearly about the world: the fog of patriotism is always obscuring his vision and putting blinders on him, like on a horse. It’s a mental pathology, not unlike the pathology of fundamentalist Christianity (which is probably why the two pathologies are often seen in the same person). A profound emotional commitment to an abstract entity is always pathological, which is to say unnatural, contrary to nature, arising out of societal alienation.

My little pseudo-debates with Ryan Williams on Facebook—Williams, the very exemplar of intellectual laziness and, yes, just plain stupidity—enlighten me as to how the conservative mind works. It revolves around an ideological core immune to argument. You could amass all the evidence in the world, but this douchebag is never going to change his opinion on issues like “big government” (bad) or “law and order” (good). The best thing you can do with such people is to push them aside and get on with productive work.

Here’s a better way of saying it: once a person like the douchebag places you in a certain mental category that he considers beyond the pale, such as “radical” or “socialist” or “anti-American,” his mind is more or less shut off to your arguments. You can say as much as you want, point to any number of facts or empirical studies or anything like that, but because you’ve been locked away in this box, none of it has to be taken seriously. The box is a defense-mechanism by which the douchebag prevents your arguments from undermining his own convictions too radically. The fact, then, that conservatives are very prone to name-calling is significant: by labeling their opponents “liberals” they give themselves permission to disregard their arguments, which is the best possible reaction because if they actually tried to engage with arguments on their merits they’d fail miserably. Liberals/leftists don’t need the name-calling so much because they can beat their opponents through logic.

Reading John Curl's excellent book *For All The People: Uncovering the Hidden History of Cooperation, Cooperative Movements, and Communalism in America* (2009). Very comprehensive.

Lincoln, just before his death: "I see in the near future a crisis approaching that unnerves me and causes me to tremble for the safety of my country... Corporations have been enthroned, an era of corruption in high places will follow, and the money power of the country will endeavor to prolong its reign by working upon the prejudices of the people until the wealth is aggregated in a few hands and the Republic is destroyed." This crisis has been going on for about 150 years.

...The next time someone tells you that cooperativism doesn't work in practice, point out that in fact it works much better than capitalism, i.e. the system characterized by constant pressures toward war (two world wars), economic instability, high levels of unemployment, labor-capital conflicts, famine and ecological destruction, disincentives toward adequate social welfare, oligarchic politics, and everyday alienation.

Herbert Gutman's "Work, Culture, and Society in Industrializing America, 1815–1919." What a rich world we lost with the standardization and atomization of society. Such diversity and humanness, artisanal craftsmanship and pride, free-wheeling festivals of life outside the factory. Actually, already in the mid-1800s the dehumanization was apparent, according to Mike Walsh: "A 'gloomy, churlish, money-worshipping spirit' had 'swept nearly all the poetry out of the poor man's sphere,' said the editor-politician. 'Ballad-singing, street dancing, tumbling, public games, all are either prohibited or discountenanced, so that Fourth of July and election sports alone remain.'" Local and national power-structures pressing the masses into dull rectangular shapes. The nascent nation-state suppressing local variety, spontaneity being dangerous to centralized power.

At heart I remain a philosopher and a phenomenological psychologist. These are the subjects most congenial to the structure of my mind. Doing historical research is a very, very slow process, and painful. Every ten minutes I distract myself with music or YouTube or emailing.

I want to suck a slut's slick slit. Suck the slick slit of a slut. Slip the spit-soaked skin of my sucked stick into a slut's slobber-slick slit.

February

Reading *A Heartbreaking Work of Staggering Genius* for a book club with a bunch of chicks. After a hundred pages and a little skipping around, one of my impressions is that this dude doesn't achieve the connoisseurship of suffering that I knew for too many years, although he thinks he does (or did) and prides himself on it (while mocking his pride, while mocking his mocking, while proud of his self-mocking self-mocking). Tragedy, yes; drama, no doubt; but extended, distended, intended, subtended pain tending toward suicide year after year after year, no. Parents dead within five weeks when he's 21—tragic, dramatic, the stuff of memoirs; but two older siblings and a girlfriend he sort of loves and close friends and a younger brother to whom he's passionately devoted and off to San Francisco (San Francisco!), and a fair amount of sex and dating. None of the cavernous loneliness and ambivalent self-esteem of mine for far too long, or the burning sexual frustration. (Maddening, the unconsummated love of women.) This insidious undramatic suffering is the worst kind. My having emerged cheerful as ever on the other side is—impressive.

On the other hand, Eggers did grow up with an alcoholic father. There's that too.

...The desire to meet a good woman is the motivation behind my socializing. ("A good woman is a hidden treasure: the finder is well advised not to boast about it.") The book clubs. The homelessness campaign, which I agreed to join the leadership committee of because it's a connection to good people. The MIT conference tonight and tomorrow on "Building an Ethical Economy" (utopian), subtitled "Theology and the Marketplace"—tonight a lecture by some Cambridge economist well-versed in the art of talking without saying anything. Grand words and sentences spoken with gravitas about why natural resources are underpriced in the market and so forth, and then the panel with a bishop, a theologian from UChicago, the

Archbishop of Canterbury, and some other guy, followed by questions from the audience, and the same puffed-up lexical legerdemain with the big words and long sentences spoken in paragraphs that leave you wondering at the end “What was just said?” And if you figure it out, the next thought is “I could have said all that in two sentences.” (And when it comes to intellectuals, the customer is indeed always right.) Afterwards the splitting into small groups to pore over the copious...doodles we had made. In the vacuum of power and intelligence that was my group, I emerged as the de facto leader, trying to steer the discussion towards something, *anything*, concrete. These conferences, like most meetings of whatever sort, tend to be masturbatory—although really it’s an insult to masturbation to call them masturbatory. But I met some girls and will go back tomorrow to meet others.

Second day: again with the verbal virtuosity but relative emptiness of thought, excessive abstractness. The focus of the conference is theory, not practice—and not even *productive* theory, but *moralizing*. Ways of moralizing about the economy and economics. You know, it’s thinned-out theology, watered down into pseudo-humanism. Zippidy-doo, let’s all go celebrate how good we feel now. But I liked most of the young people I met. Had a heated little debate during our “group discussion” with an elderly douchebag of a management consultant blindly loyal to capitalism; trounced him, of course. It’s diverting to school a businessman in the ways of the world, talking calmly in my somewhat resonant voice, watching him get twisted in the coils of his illogic. These diluted humanist-religious people were allergic to what limited tension there was and tried to defuse it.

...Reading this book by an unconscious literary semi-Hegelian obsessed with self-obsession and fame and self-confirmation or the (imaginary) *real-izing* of one’s self, the voice of a culture that has no higher goal than to overcome anonymity through whatever means necessary (*The Real World* or starting an ill-fated literary magazine or whatever)¹ because that’s how you validate your existence even though it’s quixotic for nearly everyone (and in a deeper sense, for *everyone*), brings home to me how ingenious is my own solution to the problem. You know what it is. The not caring about *present* fame, the being born posthumously. It’s an illusion perfectly symmetrical to the illusion of imprinting oneself immortally on the world, which is what is sought by the author and his culture in the *present*, self-defeatingly (because the present is gone the next moment, but for other reasons too). My illusion is perfectly calibrated to achieve my goal, in fact makes its lack of achievement impossible—because if posthumously I’m not celebrated by millions it won’t matter, since I’ll be dead. So I go through life not being disturbed by my anonymity (at least on one level). Millions of others not so intensely aware of Absurdity as I am suicidal, suicides, while I “do my thing” quietly and patiently, guided by faith. In myself.

Twenty-nine years old.— Nothing impresses me anymore, least of all the fact that nothing impresses me anymore—so there’s nothing to do but sit back and enjoy this good-humored life-weariness and listen to the song “Beast of Burden,” with a cold beer in my hand.

Useless book club. Few people showed up, and only the stupid ones. Funny how two people can read a book and have totally opposite impressions—one person understanding it and the other completely missing the point. :-P Idiots moralizing about Eggers, his “selfishness,” need for attention, manipulation of relationships for the sake of art. (Poor John, poor Beth, poor everyone being exploited by Eggers for his novel. So inconsiderate! So immoral! And oh his pathetic need to be in the spotlight!) Jesus God what morons. Personalizing it all. What the fuck is wrong with people. As usual, I played the philosopher to everyone else’s—Tartuffe. The sympathizer with genius vs. the enforcers of convention. Seriously, what occurs in the mind of the average person? Condemning Eggers for “telling me how to interpret the book,”

¹ Irony: validating yourself, making yourself “real,” by means of reality shows that are in fact less real than anything else in the world (although they are also *more* real insofar as they’re at the center of culture, i.e. the public reality). And the public recognition that comes from them, or from any media-centered activity, is similarly unreal, meaningless. The only “real” things in life (i.e., the things that make you real) are your family, your friends, your lover, and so on, although these are also (perceived as) unreal in that they’re not the center of the public world, which is seen as the only real world—though it is in fact, as I just said, the fakest.

and for being self-obsessed—as if that isn't the whole point. I went out of my way to antagonize these fools. “I loved the book, and as for his being self-obsessed, I have to agree with him that in general it's hard to be intelligent or interesting without being self-obsessed on some level. Anyway, it's the culture, not him. It's a narcissistic culture; that's his point. He recognizes the absurdities of his own stance, even the perhaps morally ambiguous implications, but you can't avoid his self-absorption nowadays if you're intelligent. [That sounded mean, so:] It's the environment.” Stony stares, glares. And then the harsh moral criticisms for explicitly exploiting his relationships with friends. So I: “All artists exploit their relationships, their experience, especially all literary artists. At least he has the honesty to admit it, and to struggle with it. And that's the whole point, that self-consciousness. Besides, the only alternative is to not write at all. It's supposed to be a memoir, portraying the inhumanity of modern America, the using each other for our own purposes, and the self-doubts, the moral doubts, that go along with that. He's full of angst, you know, and what more do you want?” Vacant stares, so I stop. Then my praising the scene near the end in the church thinking about his mother's death and the world's ingratitude for her sacrifices, my saying that was one of the best parts because it was totally authentic and not “corrupted” by self-consciousness, and somebody observing that in fact he thought Eggers was worrying in that scene about his *own* death, about people potentially not acknowledging *his* future achievements, and it required discipline for me not to say “That's fucking stupid.” So I said, “No way. The point of that scene was to rise above any self-awareness or self-doubt, to just pour out his anguish, his genuine anger at the world for its treatment of his mother and for the absurdity of her death totally unsymmetrical with the value of her life—that's why the angels carried her up and the dome came off the church and the golden light. There was no self-referring. It would have corrupted it, like [earlier] when he was throwing her ashes into the water and wondering about his motives, about how he would look to an outsider and so on, which ruined the moment for him.” But you can't change people's minds, so the other guy concluded that we simply had a disagreement. “Yeah, but I'm right and you're wrong,” I wanted to say, as I'd said to the douchebag businessman at the other thing. (To be more exact, he had said that a certain group of people I was criticizing—mainstream media executives, etc.—would “make the same criticisms of you [i.e., me],” so I retorted, “Sure, but they're wrong and I'm right,” which is the only sensible retort, aside from “So fucking what?” When he went on defending them, I shut him down.)

Yuja Li, 30-year-old attractive tall Chinese biologist-pianist with a new Yamaha in her beautiful apartment that I've been to twice to play for and with her (Mozart duet), a girl I met at a concert during a moment of taking-initiative on my part, and now it seems we're dating, very nice and intelligent though somewhat reserved girl. Mature.

Feminism ends in the bedroom. (Unless it's French feminism, in which case it begins in the bedroom.)

It's possible to be too good for your own good.

Interesting explanation: “Historically, ‘fragmentation’ has always been a problem for the political left because the left, unlike the right, cannot in principle coalesce around private property.” The abstract leftist ideals of human dignity and freedom can be made concrete in more ways than the idea of a society organized around private property can.

March

Got high last night with Elena at her place. Drank and smoked A LOT. Higher than I've ever been. Exceedingly enjoyable; giggling maniacally at how surreal everything seemed. Disrupted, interrupted thought-processes; couldn't carry on a coherent conversation. Constantly forgetting what we were talking

about. A bit of paranoia at how stupid I must have looked, since she hadn't smoked as much as I had. Was sorely tempted to kiss her as we sat on the couch but restrained myself.

...How is it possible to look so similar to people and yet be so different? The world's insipidness is suffocating, breath-taking. Imagine the inhumanity, the depth of the instinct to conform, required in order to ignore unrecognized value *because* it's unrecognized while heaping praise on disgustingly over-recognized semi-value *because* it's so celebrated. That's the human species right there. It's a good thing the "abstract Other" exists in my consciousness, because I certainly don't care if I'm recognized by these concrete imbeciles. –Only in the abstract can I find my equal.

This thesis is one of the most painful things I've ever had to do. It's torture. Horribly boring. I hate doing research and collecting data; I want to be doing something like examine the operations and implications of *ressentiment* and how it intersects with social structures, or whatever. There's no place for *originality* in this thesis. But the only time I feel like myself is when I'm being original. (Or, more accurately: the only time I *don't* feel like myself is when I'm being unoriginal.)

Got into UIC, thank God. Was quite happy to hear it. So the next four or more years will be in Chicago.

Yuja and I are dating. She seems to like me a lot, misses me when I'm away. Sleeping at her place a couple times a week. [...] She's affectionate when we're in private, which I love. How lucky that I introduced myself to her that night! Otherwise I'd still be forlorn.

...Sex with Yuja. Then lying in bed and talking, mostly about me because she's very curious. Says I'm complicated, have "hidden depths" and all that. The first time we met she thought I was just a simple, happy guy. But now I'm an enigma, she wants to know what goes on "behind [my] face," is always looking at me cutely and intently without saying anything. Did so in bed for a few minutes until I asked her what she was thinking; she replied, "I didn't know it was possible to be so close to someone's body but so far from his heart." Wow. But I said she's much closer to my heart than most people are. Said I might even be able to fall in love with her. [...]

...During a pause in a bout of sex, as I caught my breath while poised above her, she said, "I love your power..." "Uh, I'm actually not that powerful," I chuckled. "I like to be controlled," she responded, and "I like to be submissive." And yet she's not a particularly submissive person. (You see the implications.)

In *The Cambridge Companion to Hegel*: for Marxists, "dialectic treats the world as a complex of processes rather than things, reveals everything to be shot through with tensions and contradictions demanding resolution and hence to be transitory, and involved in an inevitably progressive process of developments. This point sometimes carries in its train a number of other general ideas or philosophical theses. For example, it is often combined with the use of organic metaphors for societies and social change, usually implying a commitment to methodological holism and a willingness to employ functional or teleological forms of explanation. 'Dialectic' connotes reciprocity or mutual interaction between opposed or contrasting aspects of something..." The tension between thinking of it in terms of *structures* and in terms of *processes*. Both ways of conceptualizing it seem necessary. Social structures are in a state of continuous 'process' in relation to each other and on the basis of human freedom. Continuously evolving. Structures are always in flux, due to freedom and interstructural 'conflict,' even as they continue to exert enormous influence over our behavior.

Reading Nelson Lichtenstein's *State of the Union: A Century of American Labor* (2002). "By the onset of the depression decade, most reformers and radicals thought that a great contradiction lay at the heart of American capitalism. Outside the walls of the private enterprise, American political culture celebrated a Jeffersonian world of free speech, democratic participation, and masterless autonomy. But within the corporate world, and the nearby industrial municipalities, autocracy, obedience, and social deference were the order of the day..." Black holes of totalitarianism teeming in a society supposed to be structured around democracy. Lichtenstein points out, though, that many of the gains made by reformers over the last century which are now accepted as unquestionably valid, such as antidiscrimination law, are

actually quite radical: they entail that employers can't do with their property as they wish. They're subject to laws restricting who they can fire and for what reasons, how they can treat the people who work on *their* premises, their property, and so on. The totalitarianism of these black holes has thus been moderated.

Important passage:

Roosevelt's Court-packing plan of 1937 represented the decisive moment in the crystallization of an aggressive brand of anti-union, anti-New Deal sentiment. For more than half a century the Supreme Court had been the conservative defender of property against government regulation from above and labor upheaval from below. When FDR offered the nation his plan to expand, and thereby pack the Court with New Dealers, he opened the door to a world of anti-government invective. Indeed, FDR's Court-packing plan may be taken as the occasion at which modern conservatism achieves both a mass base and its ideological coherence. Until 1937 small producers, farmers, middle-class shop owners, as well as workers and consumers, saw the large, national business corporation as their enemy and nemesis. They hated the railroads, banks, mining companies, chain stores, and agricultural equipment makers. The government loomed far smaller in their social imagination, and when it did, it symbolized the agricultural extension service, internal improvements, and the maintenance of social order.

But Roosevelt's Court-packing plan, proffered in the very midst of the sit-down strikes, worked a symbolic revolution, for it seemed to embody all that was threatening in the social and political upheavals of the New Deal. There was the assault on property, the overreach of executive power, the subversion of a hallowed institution of American government, and the New Deal alliance with a radical social movement that threatened the status and power of the old middle class.

More trouble was to follow. Almost a third of a million small business firms folded during World War II, more than 10 percent of all those existing at the end of the 1930s. Manufacturing companies with fewer than one hundred workers saw their proportion of total output drop from more than a quarter to less than a fifth. The loss of autonomy particularly threatened small-town bankers, merchants, manufacturers, and others in the "old" middle class. For these citizens and others, an intrusive government symbolized the daily threat to individual and traditional values. Big business, on the other hand, emerged from the war with enormous sophistication and self-confidence...

It seems as though Obama's presidency is finally starting to kick into gear. He's been flailing around for a year, but now healthcare reform has passed, an arms-reduction deal with Russia is imminent, and financial regulatory reform is closer to reality. Of course, it's the same old shenanigans in Latin America and the Middle East, and the efforts to address unemployment have been pathetic, and environmental and energy legislation seems to be going nowhere, but at least the administration isn't as feckless as it was six months ago. The problem with Obama is that he's an idealist where he should be a realist and a realist where he should be an idealist. He's idealistic with regard to *process* but "realistic" regarding *substance*. Anyone with his head screwed on can see it's pointless to try to compromise with Republicans on issues like healthcare, as the Lawyer-in-Chief has been trying to do for over a year; it's also immoral, since it hurts society. The idiots in the administration think it's good politics, since the public likes the word "bipartisan," but what the public likes even more is getting things done. You think the healthcare law will *hurt* Dems in November? You agree with the pundits? Well then you've been debrained, like them. People want strong leaders, not timid compromisers—partly because compromise doesn't change anything, and what people want is change, epic change.

It amazes me that such an intelligent man as Obama can be so imbecilic sometimes. Why waste time and risk coming across as a weak leader by desperately trying to find common ground with people who you know have decided to obstruct every important thing you do? Just look at Boehner and McConnell, for God's sake. You think you're gonna get through to them?? Nancy Pelosi has balls; Barack is a pussy. I

suspect it was Pelosi, in fact, who steered him for the healthcare fight in January, who persuaded him not to follow Rahm's pusillanimous advice and gut the bill.

For such an ambitious idealist—"End the Age of Reagan!"—Obama sure loves to sell out. Here's a paper I just discovered from my days at UMSL:

The Rigidity Thesis

In his paper "Rigidity and Content", Jason Stanley argues against what he calls the Rigidity Thesis, which is a principle that Saul Kripke uses in his arguments against the description theory of names in *Naming and Necessity*. The thesis is that "if a term *t* is modally rigid, and another term *t'* is not modally rigid, then *t* and *t'* do not have the same content" (Stanley, 131). In other words, a rigid designator and a non-rigid designator cannot have the same content. Since names are rigid designators, as Kripke showed in his book—and if the Rigidity Thesis is true—the description theory of names must be false, for it states that a proper name has the same content as an appropriate definite description. For instance, the content of the name 'Aristotle' may be something like 'the last great philosopher of antiquity' (according to the description theory). But that description is modally non-rigid, and so, given the Rigidity Thesis, it must not specify the content of the rigid designator 'Aristotle'. Stanley contests RT, thereby defending the description theory from Kripkean criticisms. In this paper I shall argue that Stanley's objections against RT have little force.

First we should ask what it means to say that a rigid designator and a non-rigid designator do not have the same content. What is 'content'? Stanley notes that, given Frege's context principle, which states that the content of a term depends on the content of utterances in which it occurs, RT is basically a thesis about the content of assertions of sentences. So, restated accordingly, it is: "if one utters a sentence containing a rigid term, then one has *asserted something different* from what one would have asserted had one uttered, on that very same occasion, any sentence differing from the original one only in the substitution of a non-rigid term for the rigid one" (Stanley, 135). Stanley calls the content of an assertion the *assertoric content* (as opposed to semantic content, in a narrow sense).

He proceeds to offer two arguments against RT. The first is that there seem to be counterexamples. His example of a counterexample is as follows. Suppose Bill Clinton stops by my house for a visit. I can then say either "The President of the United States came by for a visit" or "The actual President of the United States came by for a visit". Now, these utterances don't seem to differ in assertoric content. They differ only in 'tone': by including the word 'actual' in the second one, I'm simply emphasizing my surprise at Clinton's visit. "The *actual U.S. President* came by for a visit! Imagine that!" The proposition being expressed by the two utterances, in other words, is the same. However, the second utterance contains the rigid term 'actual', unlike the first utterance. Therefore, if RT is true, the assertoric contents of the utterances should be different. Since they aren't, RT must be false.

Stanley's example, though, is not convincing. It seems to me to rest on an equivocation. The word 'actual' has two relevant meanings: it can be used either for emphasis—for 'stress' or 'tone'—or it can be used in a modal context. In the first case, its use is comparable to unphilosophical usage of the word 'absolute' in '*absolute truth*' (like, "It's the *absolute truth* that I saw him yesterday!"). It doesn't have a philosophical meaning in this case; including it in the quoted utterance is equivalent to saying "The *President of the United States* came by!" That is, the utterance has the same content whether or not the word 'actual' is used. On the other hand, the word can be used to differentiate between modalities: this world is actual for me, since I live in it, while other worlds are merely possible. On this understanding of the term, if I say "The actual President came by for a visit", I am really saying "The President in this world, as opposed to other possible worlds, came by for a visit". However, *this* assertion is clearly different from merely saying that the President came by for a visit. In short, Stanley has exploited the ambiguity of the word 'actual': the two utterances *do* differ in content if 'the actual President' is used as a rigid designator. So, in fact, Stanley's example *supports* the Rigidity Thesis.

Stanley's second argument fares no better. He imagines himself wanting to talk about a world in which the inventor of the zip, whoever he was, went into advertising instead of computer programming,

with the result that the zip was not invented. He calls the man ‘Julius’—a proper name, i.e., a rigid designator. The reference-fixing stipulation he uses is: “Let ‘Julius’ denote the inventor of the zip”—that is, the man who ended up inventing the zip in *this* world but *didn’t* in another world. ‘Julius’ is rigid, while ‘the inventor of the zip’ is non-rigid. This causes problems for the Rigidity Theorist: suppose, for example, that one says “Julius was born in New York” and then “The inventor of the zip was born in New York”. Since ‘Julius’ and ‘the inventor of the zip’ are not modally equivalent, the Rigidity Theorist is committed to thinking that the two utterances have different assertoric contents. This is counterintuitive, though: it seems as if, given that both terms denote the same individual, the utterances assert the same thing, namely that this individual was born in New York. Therefore, unless one is willing to accept the counterintuitive conclusion, RT must be false.

Once again, however, Stanley is mistaken. While he is right that ‘Julius’ is a rigid designator, since it serves as a proper name, he is wrong that ‘the inventor of the zip’ is non-rigid in this context. For he is using it as synonymous with ‘the inventor of the zip *in only this world*’. After all, he has said that ‘Julius’ will denote the man who invented the zip in this world but fails to invent the zip in another world. It looks as if ‘the inventor of the zip’ is non-rigid only because, when Stanley formulates his stipulation of the denotation of ‘Julius’ (on p. 138), he neglects to add the qualification ‘in this world’ after the description ‘the inventor of the zip’—a fact that is easily passed over because in the preceding paragraph Stanley has already effectively added the qualification (so that it’s now tacitly assumed by the reader). So, while ‘the inventor of the zip’ has the form of a non-rigid designator, it functions as a rigid designator in the context of the example. In short, it is *not* counterintuitive that the two assertions about the individual’s being born in New York have the same content, for they both include rigid designators.

In section three, Stanley puts forward other arguments against the Rigidity Thesis. In one of these, he criticizes Kripke’s use of intuition to establish the rigidity of names. “We have a direct intuition of the rigidity of names,” writes Kripke, “exhibited in our understanding of the truth-conditions of particular sentences.” The reason why this appeal to intuition is relevant to Stanley’s paper is that, as Stanley says, “it would be difficult to account for this intuition unless we suppose that the rigidity of a term affects *what* we understand (i.e., the assertoric content)” (p. 150). In other words, we probably would not have the intuition unless RT is true. Therefore, Stanley has to argue against either the cogency or the relevance of the intuition.

He accepts that there is such an intuition, i.e., that people can intuitively see that rigidity characterizes at least *some* uses of proper names. He denies, though, that one of these uses involves the speech act of assertion. I disagree. Consider the following sentences:

- (1) Aristotle was fond of dogs.
- (2) The last great philosopher of antiquity was fond of dogs.

Kripke claims that we have a direct intuition that ‘Aristotle’ is modally rigid. Now, personally, I do have this intuition. It seems obvious to me that, even though I ‘fix’ the referent by means of some such description as “the last great philosopher of antiquity, who wrote the *Nicomachean Ethics* and tutored Alexander”, (1) could be true even in a world in which Aristotle was not the greatest philosopher of antiquity. The name ‘hooks onto’ the *man*, not the *description*. What this means is that (1) and (2) have different truth-conditions. For Aristotle might have liked dogs even had he not been the last great philosopher of antiquity. The truth-conditions of (1) are simply that the man named ‘Aristotle’ liked dogs; the truth-conditions of (2) are that whoever turned out to be the last great philosopher of antiquity, whether Plato or Aristotle or Epicurus, was fond of dogs. So it’s metaphysically possible that (1) is true while (2) is false, and vice versa. This means they have different assertoric contents, which upholds RT.

In general, I find Stanley’s rejection of RT implausible. Why shouldn’t modal rigidity affect the content of an utterance? If rigidity is irrelevant in this way, then so are all modal properties. None of them bears on the content of an utterance. But what does that mean? How could it be true? What notion of ‘content’ is this that bypasses modality altogether? Certainly a very strange one. For, as I just argued, the presence of a rigid designator in (1) affects its truth-conditions, and thus its content.

In any case, there would be momentous implications for the philosophy of language if modality were unrelated to assertoric content. In light of this fact, as well as the foregoing arguments, Stanley has his work cut out for him.

*

Reading Steven Leikin's *The Practical Utopians: American Workers and the Cooperative Movement in the Gilded Age* (2005).

A note on the mass hysteria surrounding healthcare reform. As Frank Rich writes in his column today, it isn't really about healthcare per se. That issue is just an excuse. I'll quote some of Rich's article:

...The real source of the over-the-top rage of 2010 is the same kind of national existential reordering that roiled America in 1964 [with the passage of the Civil Rights Act].

In fact, the current surge of anger — and the accompanying rise in right-wing extremism — predates the entire health care debate. The first signs were the shrieks of “traitor” and “off with his head” at Palin rallies as Obama's election became more likely in October 2008. Those passions have spiraled ever since — from Gov. Rick Perry's kowtowing to secessionists at a Tea Party rally in Texas to the gratuitous brandishing of assault weapons at Obama health care rallies last summer to “You lie!” piercing the president's address to Congress last fall like an ominous shot.

If Obama's first legislative priority had been immigration or financial reform or climate change, we would have seen the same trajectory. The conjunction of a black president and a female speaker of the House — topped off by a wise Latina on the Supreme Court and a powerful gay Congressional committee chairman — would sow fears of disenfranchisement among a dwindling and threatened minority in the country no matter what policies were in play. It's not happenstance that Frank, Lewis and Cleaver — none of them major Democratic players in the health care push — received a major share of last weekend's abuse. When you hear demonstrators chant the slogan “Take our country back!,” these are the people they want to take the country back from.

They can't. Demographics are avatars of a change bigger than any bill contemplated by Obama or Congress. The week before the health care vote, The Times reported that births to Asian, black and Hispanic women accounted for 48 percent of all births in America in the 12 months ending in July 2008. By 2012, the next presidential election year, non-Hispanic white births will be in the minority. The Tea Party movement is virtually all white. The Republicans haven't had a single African-American in the Senate or the House since 2003 and have had only three in total since 1935. Their anxieties about a rapidly changing America are well-grounded...

This is just a continuation of the fascist undercurrent that has ebbed and flowed in American society since the late nineteenth century. Since the progressive advances of the 1960s, it has been fighting a rearguard action against democracy and minority-rights. Nixon, Reagan and Bush Jr. rode the wave to power. These semi-fascist masses have always felt as if they were under siege, even when they were securely in the seat of power. But now that they really are in a state of terminal decline, for instance demographically, they're bound to lash out ferociously. I wonder how many thousands of Americans are plotting to assassinate Obama...

On the other hand, some of these Tea Party folk are simply well-intentioned people who want to fight big business and Wall Street but, due to their ignorance, are going about it in absolutely the wrong way, by attacking “big government,” which is the only thing that can effectively fight against business. Poor dupes. Doing the bidding of corporate executives even as they burn them in effigy.

One of the problems is that, like classical fascists, they conflate the fight against Wall Street “parasites” with the fight against immigrant “parasites,” minority-rights-obsessed “parasites,” welfare “parasites,” and so on. They feel like they're being persecuted not only by big business but also by ordinary *cultural* outsiders, and they think that government is in cahoots with business *and* immigrants, gays, blacks,

welfare-recipients, not knowing that the interests of business are totally opposed to those of the latter group of people. The Tea-Partiers are torn, unknowingly, between their instinctive knowledge that corporate elites are bad and their 'business-propaganda'-fueled prejudice against government and minorities clamoring for rights. Again, this is the formula for classical fascism and the KKK.

Some of them could potentially be educated into the truth, but, as usual, the left is impotent.

Reading *A People's History of the United States* again. For real this time.

A fundamental truth from Zinn's book: essential to the stable domination of an upper class over society is this class's capturing the loyalty of the middle class. Sometimes this involves concessions to the middle class, and always it involves the use of appealing rhetoric. The upper class has to foster divisions between the lower and middle classes—and ideally between sections of the lower class, as well as sections of the middle class. But it has truly done its job marvelously when, through a group of demagogues, it seduces and confuses not only the middle class but even much of the lower class. To the extent that this happens—i.e., that the mass of the people has been duped into effectively following the leadership of the upper class, thereby allowing it or even encouraging it (unknowingly) to pursue its own economic interests unhindered by the masses' noisy complaints (which, inasmuch as they continue to exist, are suppressed)—fascist tendencies have become predominant. Usually it's accomplished by appeals to the nation, the race, the "good old days," or religion. Insofar as all this is operative in a particular historical event, such as the American Revolution or the Civil War (which benefited Northern businessmen) or Reaganism, there are traces of fascism.

My existence. Here, now, at this moment in history. The *facticity* of it. Billions of years of my nonexistence...then *me*...then billions more years of my nonexistence... It's totally arbitrary that I was born when and where I was, yet at the same time it's absolutely necessary, because *I*, after all, could not have been anyone else but had to be myself, this self at this point in time. By 'definition,' so to speak. This body had to be this body; for it to be any other is...meaningless.

The problem is that it's "absurd" to accept that one is simply an object in the world like all others, an object in history no different from those that one reads about. One tends, necessarily, to assume a position outside of history, the endless flux of unfortunate creatures determined by larger forces of which they're unaware. I am a subject. I am the absolute *contemplating* history, not an object embedded in time, like any of those objects we read about from the 1800s or the 1500s or the 400s...

Historian Kim Voss: "American industrial relations and labor politics are exceptional [compared to Europe's] because in 1886 and 1887 employers won the class struggle." There's some truth to that.

Lesley Stahl (in 1996) on U.S. sanctions against Iraq: "We have heard that a half-million children have died. I mean, that's more children than died in Hiroshima. And, you know, is the price worth it?" Secretary of State Madeleine Albright: "I think this is a very hard choice, but the price—we think the price is worth it." That statement in itself enshrines Albright as one of the villains of history.

Looked at a chapter from *The Cambridge Companion to Bertrand Russell*, got amused, wrote this email:

Professor Chomsky,

I've always been intrigued by the controversy that has reigned for centuries over the ontological status of such "abstract objects" as propositions, numbers, concepts, relations, and so on. It has seemed obvious to me that the myriad debates and the positions adopted, such as realism and nominalism, bespeak a great deal of confusion, in that they revolve around trivialities. For instance, is the concept 'whiteness' 'real'? Realists say it is, it exists, while nominalists deny that. Charles Peirce, the realist, says, "It is perfectly true that all white things have whiteness in them, for that is only saying, in another form of words, that all white things are white; but since it is true that real things possess whiteness, whiteness is real." Quine, on the other hand, denies the existence of whiteness. But is this debate not

the height of triviality and confusion? Whiteness tautologically exists insofar as certain things are white; it tautologically doesn't exist insofar as, surely, for something to 'exist' it has to have a location in spacetime -- it has to be a "particular" -- and since abstract objects have no location in spacetime, they don't exist. Any notion of existence besides this 'concrete,' 'spatiotemporal' one seems obscure; and yet analytic philosophers, who pride themselves on their insistence on conceptual precision, endlessly debate about something as obscure, indeed as meaningless, as whether abstract objects "exist." What would it *mean* for them to exist?? What would their existence "look like"?

Admittedly, my denial of abstract objects (as being a meaningless notion) might seem to pose certain paradoxes in the philosophy of mathematics and language, but surely the way to resolve these paradoxes isn't to introduce a virtually meaningless term that itself poses problems but to explain how they arise out of a mistaken use and understanding of language. The late Wittgenstein was on the right track, I think, when he tried to show that such debates -- i.e., debates that an ordinary non-philosopher would consider silly -- are based on semi-illusory confusions that philosophers get themselves into when thinking about how we use language.

Like, Russell's position that propositions referring to external objects in the world somehow literally include within them those external objects.¹ Etc. The ontological question "What is a proposition?" itself seems misguided. All these confusions, I think, result from conceptual "reification" -- taking too seriously the 'representational' nature of language. Language is just a tool for survival, a way of behaving and, at the same time, a set of structures in the mind. We shouldn't introduce all these 'metaphysical' notions into it.

What do you think? Do you agree that ontological questions of this sort are misguided and, ultimately, rather silly?

Thanks.

Chomsky:

It becomes non-trivial when you try to work out how you can paraphrase what we want to say about properties in terms of individuals. There's a considerable and often subtle literature on these topics.

Hm. I wish he'd said more.

Intellectually, one of Chomsky's inadequacies is that he's too firmly located in the analytic framework. I doubt he has much patience for phenomenology (loosely understood), which is an essential philosophical method and program. The analysis of consciousness, etc. His mind is too 'mathematical' and 'logical,' 'Russellian.' Nor, probably, does he have patience for philosophical experimentation à la Nietzsche or Wittgenstein.

When I read about these interminable ontological debates, I hear Bergson in the back of my head: "The essence of philosophy is the spirit of simplicity."

I mean, look at this passage below, about Russell. I choose it because it's comprehensible, unlike most of the others.

¹ In a sense, that doctrine is true. But in a sense it can't be, since a proposition is, necessarily, a (mythical) abstract thing.

Propositions were certainly problematic in their Principles [of Mathematics] form. They came in two varieties, true and false, and both alike were equally real. It is possible to make too much of the oddness of Russell's claim that the world is made up of propositions: propositions, after all, were just complex, unified terms. But, by the same token, on this account it is hard to make sense of the claim that there are both true and false ones and to give some appropriate account of the distinction between them. Yet false propositions, as well as true, were needed as the objects of belief. In particular, the theory makes it hard to understand why we should prefer to believe only the true ones. One might be tempted to suggest that the actual world is made up of true ones, while the false ones occur in some non-actual (though, since necessary falsehoods may be believed, not always possible) world, but there is no hint of this account in Russell. Instead, he suggested at one point that we might have a fundamental moral obligation to believe only true ones, pointing out, with too much cleverness for his own good, that while we might hope that this principle was true, if it was not, there was no ground for thinking we did harm in believing it. Evidently, this state of affairs could not remain satisfying for long...

Non-actual worlds, possible worlds, non-actual but impossible worlds, "real" but false propositions vs. real and true ones, etc. etc. Something has gone terribly wrong. –But all this is nothing compared to what's common in contemporary literature.

And yet once you enter into the world of analytic philosophy, these discussions start to seem reasonable, even unavoidable, in some perverse way. This kind of analytic philosophy consists in analysis of myths, myths that are, in a way, necessary, or somehow presupposed in the way we talk and think.

Like the phenomenologists, Russell tried to demonstrate the existence of material objects by constructing them logically from sense-data, which were the only things he thought we had direct acquaintance with. But

It is important to realize that, for Russell, sense-data were physical objects [?] (since they existed in physical space) but not material ones. [What the hell does that mean?] His construction of material objects was therefore not, as many have supposed, a form of phenomenism. Nor was it, since physical objects were constructed from sense-data, a form of representational realism. Moreover, because sense-data were physical, there were more of them than were actually given in acquaintance. (In fact Russell used 'sensible' as the inclusive term, and 'sense-data' for those sensibilia with which someone was acquainted.) Admitting unsensed sensibilia certainly proved useful in the construction of enduring material objects, for it supplied the resources needed for their existence when no one was looking...

Weirdness.

Are particulars "bundles of universals," as Russell thought at one time? Sure, in a sense. Obviously. They're bundles of properties. You list all the properties, and voilà, you have the particular. But in another sense, that's absurd. Properties are abstract; a particular is concrete. There has to be something the properties inhere in. Hence Locke's "substratum" or "substance in general." But that idea has problems too. (Substance is a "something I know not what.") In the end you're led to Kant's position, the categories and the inability to say anything very substantive about the world as it is in itself, because if you do you get tangled in paradoxes. Or rather, you have to leave investigation of the world-in-itself to science, or mathematics. On a "conceptual," rigorously philosophical level, using what Kant called "reason"—the level of metaphysics—we're never going to understand any of these things.

But as I said last summer, it seems there are three different kinds of things: consciousness (private); the matter in our world, the world we perceive (public); and matter as it is in itself, which is investigated

by physics.¹ Matter “in itself” is surely very different from the matter we perceive. Even when you perceptually access a normally unperceived piece of matter, like a DNA molecule through a microscope, the image you see is partly constructed by the brain, is in fact the result of an indefinite number of ‘invasive,’ ‘constructive’ physical and biological processes. By definition it’s impossible to view the world as it “really” is—i.e., to perceive it as it exists in an unperceived state!

...It’s true: by temperament, I’m an amateur. It’s the restlessness of my mind. But amateurs, if they have discipline, can make great contributions. Just look at Nietzsche’s psychological discoveries. I’d even go so far as to say that genius is inherently closer to the spirit of the amateur than the spirit of the specialist. It’s the spirit of the child.

April

Asked Chomsky about metaphysics again. He wrote, “I don’t really think the questions can be formulated properly this way. Take the concept ‘intuitively understand.’² That disappeared with Newton, and was a major issue in the 18th century—never resolved, just forgotten. I’ve written on it, if you’re interested.” He’s probably referring to the article of his I discussed a year or two ago. (We can’t “intuitively understand” the notion of matter in the Newtonian system, involving as it does the idea of action-at-a-distance.) But I don’t agree with him on this topic. In fact, surely his point about Newtonian matter only supports my own distinction between the “matter” we perceive and “matter” as it really is, this “occult” thing that supposedly acts at a distance. In any case, the real, “in-itself” essence of matter is energy, as Einstein showed, and that certainly contradicts our own experience or “intuitive understanding” of it. Hence, I’m right. We do have a vague intuitive understanding of what matter is, but our understanding, if supposed to apply to the essence of matter-in-itself, is wrong.

I attended my first Episcopalian service last night, at the church patronized by the Hope in Action campaigners. It was Maundy Thursday, so we did the whole foot-washing thing and then the Eucharist, etc. Endless singing and antiphonal rituals, responses, prayers. A certain pungent beauty in the foot-washing, beautiful symbolism. But how foreign it all is to the spirit of the times! A relic of antiquity, as Nietzsche said. The Greek chorus, for instance. Submersing ourselves in ritual, in self-forgetfulness and community. Love, the incredible and constantly repeated emphasis on love. Admirable. But it seems that in order so to escape ourselves in love we have to fall back on the expedient of inventing a God who loves us and enjoins us to love each other, and pray to him, direct our love first to him and thereby to each other. It is through the mediating idea of a God that people are best able to achieve love of mankind. Nor is this surprising. Mankind is just an abstraction, the most abstract of abstractions, and as such is not easy to love passionately. God is a kind of abstraction too, but, paradoxically, a concrete and self-conscious one. He is something like the “concrete universal.” A sublimation of the idea of mankind, or rather of all its noble aspects (love, power, goodness, omniscient self-consciousness) as personified in a self, which is the sort of thing that can most readily be loved (as opposed to “mankind”). God is the bridge between the concrete self and the abstraction of humanity: he is a concrete abstraction, or an abstract concreteness. And the idea of him provides people with a half-conscious sense of being-respected or being-recognized/confirmed for loving everyone. It inspires them to make the effort to “love thy neighbor,” since if they do, they know they’ll in turn be loved by the Absolute Self, and thus be objectively confirmed as (objectively) valuable. Certainly this motivation isn’t conscious, but it’s there all the same.

¹ That is, *for us* [i.e., from the perspective of the human mind informed by science and philosophy] there are three different kinds of things. The world in itself, though, is monistic. It’s the difference between the epistemological and the metaphysical perspectives.

² I had written, “...Modern physics seems to confirm the Kantian viewpoint, given our inability to intuitively understand or ‘conceptualize’ the doctrines that quantum mechanics and general relativity lead to (about space, time, causation, gravity, etc.).”

As I've said repeatedly, God is something like the "objective correlative" of the abstract other in consciousness. By securing his recognition you're securing the recognition of the abstract other, and so, effectively, of your self. Putting to rest your self-doubt.

—If neuroscience ever catches up with me, it should be able to confirm the essentials of all my phenomenological analyses. (The meaning of self-consciousness, the element of otherness in consciousness, the phenomenological sources of self-dissatisfaction, the urge toward self-confirmation, etc.) Maybe "mirror neurons" will have something to do with it. Internalizing the perspective of the other. G. H. Mead and so on.

One of the advantages of Marx's equation of progress with the expansion of productive capacity is that it provides a clear criterion for determining what is "progressive" (i.e., probably representative of the future, in light of powerful tendencies) and what is "reactionary."¹ Another criterion is the development of social and economic equality, but this one is probably less reliable than the first, partly because powerful interests always oppose equality whereas, in capitalism, they don't oppose the expansion of productive forces (and neither do most other interests). So in capitalism there is a very clear tendency for productive forces to develop and a somewhat less clear tendency for social equality to spread.

Consider "the Reformation peasants of Germany in the 1520s who rose up to defend their common lands and village autonomy in the name of an authentic folk version of Christianity." (From Murray Bookchin's essay "The Ghost of Anarcho-Syndicalism" (1992).) As Bookchin says, their movement manifested a kind of anarchism. But surely it wasn't progressive: although it was "egalitarian," it was opposed to the development of the productive forces, which by then was virtually inevitable. The future lay in capitalism, and hence the nation-state, the destruction of village autonomy. It's similar with the Knights of Labor. Insofar as they upheld the rights of the artisan against the encroachments of industry and mechanization, they weren't progressive. But insofar as they advocated egalitarian causes, unity of the black worker with the white, industrial unionism, etc., they were. (In the case of industrial unionism, which anticipated the IWW but especially the CIO, their project derived its 'Marxist' progressiveness from the fact that an expansion of nationwide industry would lead to its achievement fifty years later.) Economic cooperation, or reorganization of the economy along socialist lines, in the 1880s and 1890s probably wouldn't have resulted in an expansion of the productive forces competitive with that under capitalism, and so capitalists elsewhere—perhaps in Europe or England—would have continued to spread their operations around the world, and in the end socialism in America would have succumbed to capitalism, as it (or "state socialism") would do in China, Russia, and other places.

The real is definitely not "the rational," but, nevertheless, there is an overarching "rationality" or "probability" (perhaps a near-inevitability) in the real, if only in its most general structures.

...Bookchin takes issue with Marx's emphasis on the workers' economic interest as the probable motive-force of the revolution, preferring to emphasize the moral force of anarchism as a necessary motivator if people are to overcome present authoritarian arrangements. He quotes Malatesta approvingly:

The real and immediate interests of organised workers, which is the Unions' role to defend, are very often in *conflict* with their [i.e., revolutionaries'] ideals and forward-looking objectives; and the Union can only act in a revolutionary way if permeated by a spirit of sacrifice and *to the extent that the ideal is given precedence over interest*, that is, only if, and to the extent that, it ceases to be an economic Union and becomes a political and idealistic group.

There may be some truth in those views. Think of Lenin's critique of "pure and simple trade-unionism." On the other hand, Marx was right that moral ideals will never be enough to motivate millions to overthrow fundamental power-relations. Only immediate and practical interest can impel the masses toward a revolutionary or quasi-revolutionary project. (Think of the oppression and starvation that led workers,

¹ I use those words not in a moral sense but in a factual one.

peasants and soldiers to overthrow the state in Russia and China.) If, in the end, it seems that industrial workers usually did not identify their immediate and practical interests with the overthrow of capitalism, that fact simply shows that Marx's identification of the industrial proletariat as the agent of revolution was wrong—because, as Malatesta said, their economic interests turned out to be better satisfied by simple trade-unionism, reformism. But Malatesta and Bookchin are still wrong in appealing to the “morality” of anarchism, or rather it's pointless to make such an appeal, since the masses will never “give precedence to the ideal over interest.” (If they do occasionally become frenzied in their support for a moral ideal, it's because they identify the ideal with their interest. Think of the black struggle for civil rights.) So we're back to Marx's claim: something like socialism will never happen unless people decide it's in their *practical interest*. Numberless groups of people will have to decide, and act on the decision, that arranging production democratically is in their immediate interest.

When the state of the economy reaches such a point that, *finally*, most people's immediate practical interests will coincide with the (semi-gradual) supersession of capitalism—in such a way that cooperativism becomes not only an ideal but an apparently feasible goal—it'll happen. Marx's mistake was simply that he thought such “coinciding” would take place at an earlier stage of evolution (and amongst a more narrowly defined sector of the population) than it in fact will. Economic conditions are ripe for socialism only when the socialist project doesn't face overwhelming odds, with all of society's power-structures arrayed against it. Capitalist production relations, too, started to emerge from feudalism only when the feudal aristocracy was obviously in the throes of decline, with the legitimate means of violence already not always being used in its interest.

...Here Bookchin agrees with what I wrote a couple months ago about Marxist illusions, what he calls the illusion of “proletarian hegemony” (revolutionary hegemony, i.e. the proletariat as the agent of revolution):

...The industrial working class, for all the oppression and exploitation to which it is subjected, may certainly engage in class struggles and exhibit considerable social militancy. But rarely does class struggle escalate into class *war* or social militancy explode into social *revolution*. The deadening tendency of Marxists and anarcho-syndicalists to mistake struggle for war and militancy for revolution has plagued radical theory and practice for over a century but most especially during the era of “proletarian socialism” par excellence, from 1848 to 1939, that gave rise to the myth of “proletarian hegemony.” As Franz Borkenau contends, it is easier to arouse nationalist feeling in the working class than feelings of international class solidarity, especially in periods of warfare, as the two world wars of this century so vividly reveal. Given the steady diet of “betrayals” to which Marxists and anarcho-syndicalists attribute the failure of the proletariat to establish a new society, one may well ask if these “betrayals” are really evidence of a systemic factor that renders meaningless and obscure the *kind* of “proletariat” that Marxists and anarcho-syndicalists adduce as the basis for privileging the working class as a whole in the name of “proletarian hegemony.”

Often lacking in explications of the notion of “proletarian hegemony” is a historically nuanced account of the workers who did raise barricades in Paris in June 1848, in Petrograd in 1905 and 1917, and in Spain between 1870 and 1936. These “proletarians” were most often craftspeople for whom the factory system was a culturally new phenomenon. Many others had an immediate peasant background and were only a generation or two removed from a rural way of life. Among these “proletarians,” industrial discipline as well as confinement in factory buildings produced very unsettling cultural and psychological tensions. They lived in a force-field between a preindustrial, seasonally determined, largely relaxed craft or agrarian way of life on the one hand, and the factory or workshop system that stressed the maximum, highly rationalized exploitation, the inhuman rhythms of machinery, the barracks-like world of congested cities, and exceptionally brutal working conditions, on the other. Hence it is not at all surprising that

this kind of working class was extremely incendiary, and that its riots could easily explode into near-insurrections.

...To the extent that wage-labor and capital do confront each other economically, their struggle—a very real one indeed—normally occurs within a thoroughly bourgeois framework, as Malatesta foresaw generations ago. The struggle of workers with capitalists is essentially a conflict between two interlocking interests that is nourished by the very capitalist nexus of contractual relationships in which both classes participate. It normally counterposes higher wages to higher profits, less exploitation to greater exploitation, and better working conditions to poorer working conditions. These patently negotiable conflicts turn around differences in degree, not in kind. They are fundamentally contractual differences, not social differences.

Precisely because the industrial proletariat is "disciplined, united, organized by the very mechanism of capitalist production itself," as Marx put it, it is also more amenable to rationalized systems of control and hierarchical systems of organization than were the precapitalist strata that historically became the proletariat. Before this proletariat became integrated into the factory system, it mounted uprisings in France, Spain, Russia, Italy, and other relatively unindustrialized countries that are now so legendary in radical history books. Factory hierarchies, with their elaborate structures of managerial supervision, were often carried over into trade unions, even professedly anarcho-syndicalist ones, where workers were unusually vulnerable to "labor bosses" of all kinds—a problem that still plagues the labor movement of our own day...

“The radicalism of tradition.”

Reading Leon Fink's *In Search of the Working Class: Essays in American Labor History and Political Culture* (1994). In one essay he criticizes the argument that a major reason why the Knights of Labor failed to transform society is that the bourgeoisie was culturally hegemonic, that the working class partially identified with the dominant culture and so undermined its own struggles against it. "T. J. Lears [his opponent] cites entrepreneurial ambition, evangelical religion, and electoral politics as a kind of devil's brew of individualism eroding the communal fiber of movement culture." The Knights had a "divided consciousness," partly accepting and partly rejecting the "symbolic universe" of the dominant culture. And so their struggles against the society were ineffective and incomplete because of this partial consent they gave to the culture.

Obviously this Gramscian explanation is inadequate, for many reasons. Just look at the concrete history of the Knights and you'll see how simplistic is the invoking of "cultural hegemony" as an explanation of their failures. More broadly, with regard to Gramscianism itself, I'm tempted to agree with Thomas Haskell: Gramscianism is to Marxism as Unitarianism is to Christianity—"a 'feather pillow' to catch those falling from the true faith." It's like the liberal notion of consensus as adapted for Marxists. It can lead one to put the blame on the oppressed for their oppression, for buying into the "general direction imposed on social life by the dominant fundamental group." Hence the conservative bias implicit in appeals to culture as an explanatory tool (in this context): the current social order can be seen as legitimate, since it's based on the consent of the masses. The elite's worldview is hegemonic because the masses let it be.

Needless to say, though, there is some truth to this aspect of Gramscianism. A great deal of societal consent is involved in the elite's economic and political domination. Sometimes the consent is active and overt, as with supposedly patriotic wars, while often it's passive, resigned, apathetic. (Patriotism is a particularly effective tool for manufacturing consent.) The mainstream media's job, after all, is essentially to manufacture consent. But cultural hegemony is probably not as potent a force (nor as substantive a notion) as Gramscians think. In any case, you have to temper, *greatly* temper, this doctrine with "vulgar Marxism" (economism, etc.). The reality of economic power-structures, brute economic power and control over the means of violence. In a middle-class society people simply act the way they have to in order to make money and not go to prison; what ideology they subscribe to, if they even have one, is of small importance for their behavior. In industrializing societies, on the other hand, continual coercion is necessary

in order to suppress working-class subcultures and revolts. In general, “ideologies” are important only for the intellectuals who guide movements. The masses live as they do on the basis of what they perceive as their economic interests, their interest in associating with others (family, friends), and their interest in being entertained (whether by socializing, watching TV, reading novels, going to concerts, etc.). Social being—mundane realities of social life, the normal roles we adopt, the rules we’re socialized into obeying—is far more important than cultural and political consciousness (insofar as ordinary people even *have* that consciousness).

It’s true that ideas propagated by the media or whomever have tremendous power to motivate—but usually in times of social crisis, disruptions in the “social being,” the matrix of economic structures, patterns of behavior, the stability of habitual daily expectations. When these things are disrupted, identity-crises ensue, or the masses flare up in anger and seize on the nearest (and simplest) ideas, ideas that are typically in circulation precisely because they serve capitalist economic interests. (Think of the Tea-Partiers’ Reaganism.) Or, in the case of progressives, it’s usually when relations of absolute domination, like slavery or Jim Crow or patriarchy, start to break down that social movements—inspired by ideas, of course—have a chance to form. But the ideas that inspire them are simply an expression of the desire for new social relations, the desire for economic security, economic and political freedom, a stable and democratic communal life. Conservative movements incorporate ideas upholding old authoritarian rules and relations, and an economic security that is being threatened. (Certainly people’s self-identity is being threatened too, but, again, that’s because the social relations on which their self-identity was based are no longer stable.¹) Whatever the kind of movement, then, its existence is almost entirely a function of how social relations are evolving, and the ideas that inspire it are merely more-or-less distorted ideological expressions of the desire for a particular set of social relations, which is to say a particular vision of how they want to interact with people and the world.

Writes Lears: “Like other labor historians in the [E. P.] Thompsonian mold, Fink sometimes still seems to assume that class consciousness provided the firmest basis for radical politics, even when his own evidence may suggest that local sources of solidarity [such as ethnicity, religious association, or craft unions] were more important than the abstract notion of class.” Well, why is class supposedly such a firm basis to begin with? Many reasons. For instance, to paraphrase E. O. Wright, the best way to eliminate oppression and exploitation in capitalist societies is by systematically transforming class relations, given the fundamental origins of this oppression and exploitation in the relation between wage-labor and capital. In other words, to arrive at an effective solution, you have to solve the problem—the *main* problem for centuries. Secondly, essential to the success of radicalism of whatever kind is mass solidarity. Strength in numbers. And how better to amass numbers than to unite all industrial laborers and egregiously exploited people in what would effectively be a class struggle? Smaller, local groups have less chance of making a difference than millions united by their common economic grievances. And so on.

But of course class has disadvantages too. E.g. its abstractness, at least on a national or international scale. It’s hard, though, for an analytical thinker not to assume that, due to the structures of the capitalist economy, class will inevitably be the fulcrum of a future successful revolution. That prediction is just too beautiful, too rational, too elegant, to be wrong. Unfortunately it is. (Probably.) Marx’s method of abstraction is powerful and elegant but overlooks the complexity of society. Orthodox Marxists made a fetish of theoretical elegance—that’s the final truth, the ultimate reason for their faith in the revolution.

¹ I admit that ideologies *can* be of great importance to self-identities. People can become extraordinarily attached to a particular ideology or religion. I suspect, though, that this isn’t as common as it’s thought to be. Or it may be common on the understanding that the ideologies in question are often merely implicit in behavior rather than explicitly objects of consciousness. But then this is in danger of becoming truistic. One can ‘read into’ any pattern of behavior a particular ‘ideology’ or set of beliefs and ideals that the behavior seems to presuppose. But almost always, people are just socialized into the behavior, on the basis of rules, roles, structural locations they’ve come to occupy, habitual accommodation to social expectations. The ideologies to which they may be consciously or unconsciously committed are, to a great extent, merely (“distorted”) crystallizations-in-consciousness of the social relations—and, correspondingly, *interpersonal exchanges, reactions, internalizations*—that have molded them in their formative years.

I suspect the *potential* wasn't even there, realistically. Far from being inevitable, a cooperativist revolution wasn't possible. As Lears notes, "The discovery that radical protest has often had conservative sources is one of the major historiographical advances of the last two decades." The labor movement was most radical in its early stages—a fact that directly contradicts orthodox Marxism—when the "collective memory" of an agrarian and artisanal world destroyed was still fresh and poignant, and the situation of workers was most wretched. But a cooperative economy could surely never have evolved in those times of early industrial capitalism, even in the 1930s, for a dozen reasons. —If only Marxism didn't have such damned seductive elegance!

...Or maybe that's being simplistic, not to mention fatalistic. While a socialist *society* was not and probably never will be anything remotely close to inevitable, maybe not even possible, *sections* of it in certain countries seem to have had the potential to become cooperatively organized and remain that way. Think of Catalonia during the Spanish civil war. The feats of cooperation there were astounding. But they were crushed once Franco seized power. Such semi-isolated regions have a greater chance of becoming cooperative than the mainstream does. (Mondragon.) But since they eventually have to face competition with capitalist sectors, with the wage pressures, business cycles and so on that market competition entails, true socialism or anarchism is not possible even there. A fully socialist or cooperative economy has to be self-sufficient, isolated from capitalist pressures.

In any case, my point is that strict economic determinism, as well as Marx's "all or nothing" perspective regarding socialism, is wrong. Degrees of cooperativism are possible between pure capitalism and pure socialism, just as *pockets* of cooperativism are possible in a broadly capitalist society. Similarly, while the state of productive forces and production relations may somehow determine what is objectively possible, human initiative determines whether certain possibilities, such as a cooperative transformation of production relations, are actualized. These truths provide the theoretical foundation for radical struggle, and restore to individuals their dignity as a potential force for structural economic change (of which dignity historical materialism threatened to deprive them).

An excellent observation from Lears: "I think we should try to distinguish between genuinely popular culture and the corporate-sponsored mass culture that is so often mistaken for it." Genuine popular culture is the kind of thing you saw amongst the farmers in the Populist movement, the Italian anarchists in the early 20th century, the working-class communities of the 19th century, etc. Popular culture is necessarily bottom-up, not top-down. Mass culture, by contrast, is founded on the co-optation and mutilation of a few popular impulses into means of making profit, tools of the upper class.

Reading Rudolf Rocker's *Anarcho-Syndicalism: Theory and Practice* (1938).

...To return to Gramsci: ideological hegemony is obviously of great importance even now, contrary to what critics of the "dominant ideology thesis" think. Many in the lower and lower-middle classes do subscribe to what's called Reaganism, and this influences their political allegiances. Reaganites are given power. Public-relations firms, private corporations, politicians, newspapers and magazines, think tanks, all spend billions of dollars propagating ideologies that serve to legitimate business interests. So evidently they think hegemony matters. And they're right. If the lower and middle classes could be indoctrinated with more progressive ideologies, changes might ensue. A counter-hegemony might accomplish great things. So yes, ideas do have power. That's so obvious it's not worth pointing out. But how does one mass-propagate ideas opposed to the dominant power-structures? The latter have almost all the resources. The nature of social relations almost entirely determines *which* ideas are kept in circulation. The only solution for the leftist is to keep working, keep trying to get through to people.

Chomsky observes that leftists are wrong to ridicule Tea-Partiers and such people. The right reaction isn't to criticize *them* but to criticize *oneself* for failing to educate them. If they're influenced by Rush Limbaugh it's because leftists aren't doing their job. —On the other hand, millions of these conservatives are absolutely immune to having their minds changed. I know that from personal experience. They were, so to speak, "socialized" into conservatism a long time ago, and nothing you can say will convince them to vote Democratic, much less Socialist. Even on local levels they often refuse to change their priorities or revise their understanding of, say, government and taxes. Maybe only on the level of

direct action, such as taking over a factory, is there hope—contexts in which there is *no chance* of their mistaking what their interest is.

Reading Sharryn Kasmir's *The Myth of Mondragon: Cooperatives, Politics, and Working-Class Life in a Basque Town* (1996).

Arizmendiarieta, the Catholic priest who started the Mondragon cooperatives in the 1950s, was, in some ways, a typical priest:

The emancipation of a class or of a people [he said] must begin with the training of those who make it up. [So far, I agree with him.] We have said many times that we must struggle against social injustices, against the exploitation of the wage laborer, against the excessive accumulation of wealth, etc., but have we understood that the central servitude, that the first and greatest poverty is intellectual poverty? We consider that the saddest inheritance of the world is the lack of educational opportunities and not economic inequality.

Except that you'll never remedy the lack of educational opportunities for the masses unless you first remedy economic inequality. It's precisely in the poorest areas that people lack educational opportunities. Maybe some individuals are lucky enough or smart enough to get a good education and escape from poverty, but without a sustained assault on economic power-structures, you won't fix the general disparity in levels of education.

I'm starting to wonder if worker cooperatives are so great after all. I've had suspicions for months, but this book has brought them into focus with its observations on how co-ops sidestep the class struggle, on how cooperators tend not to identify with unionists, on how Franco and Mussolini liked cooperativism because of its similarities with corporativism ("nonconflictual relations between labor and management, the withering away of class identifications"). Cooperativism is collective entrepreneurship. Encourages workers to identify as small businessmen. ("Cooperativism [in Mondragon] was founded as an entrepreneurial alternative to working-class activism and socialism.") So it fits into the framework of capitalism—but not entirely. In principle it's also somewhat opposed, of course. It has an ambiguous position. I suppose I'm in favor of it if cooperators commit to establishing connections with each other, if they commit to building a social movement, a political movement, and don't forswear the class struggle. Cooperativism can be one of the pillars of a counter-hegemony, which if it eventually claims the adherence of millions can be the foundation of a direct attack on capitalist power-structures.

By the way, "hegemony" doesn't have to signify something explicitly ideological or "cultural" in the narrow sense. Obviously. I was wrong to imply that earlier. Authors who criticize the "dominant ideology thesis" are partly missing the point: you can get the same effect with an "un-ideological," "unconscious" but consensual socialization into the dominant economic structures, which is surely all that "Gramscianism" requires. An acquiescence to a middle-class existence that isn't based on submission to explicit threats of violence is a form of consent, and it has substantially the same effects or "functions"—but in a more powerful way—as does indoctrinating people with a particular ideology. Even in such a socialized-bourgeois society, revolutionaries have the task of developing a counter-hegemony, whether through explicit ideological indoctrination or, preferably and more realistically, through struggle and the construction of new social relations that people "get used to," i.e. become socialized into.

As for cooperativism, its value in a capitalist society depends on its immediate institutional context and the ideological commitments of its participants. It can be a force for conservatism or a force for socialism. It can lead to working-class fragmentation and identification with the middle class, or it can help build an oppositional movement. Hence Mussolini's demand that the Italian cooperative movement purge its Communists and Socialists before he gave it legal protection.

...Parts of *An Antonio Gramsci Reader: Selected Writings, 1916–1935*, edited by David Forgacs.

Maybe the best way to think about it nowadays isn't to say we need a "counter-hegemony" (because there is no hegemony per se, no "dominant culture"); rather, we need to combat the fragmentedness of civil

society.¹ We have to bring people together in a common project (or multiple projects on local/regional levels)—no small task in our atomized society. But effectively there’s no huge difference between now and earlier times: always, the twin imperatives are *education* and *organization*. It’s just that the system periodically finds new ways to perpetuate itself, which require new strategies from the opposition. Earlier, there was radical and overt violence; later, an increasing measure of hegemony, consent, the stabilization of capitalism (involving reformism, concessions from the ruling class); and now, even more corporate dominance, mass culture, fragmentation, consumerism on an unprecedented scale. But it goes without saying that “fragmentation” is possible largely on the basis of continued violence against unions, all kinds of political, economic and physical coercion against the poor, the dispossessed.

[...]

It’s obvious that an enormous number of societal ‘circumstances’ are possible on the basis of the productive forces we have now. Tendencies toward one or the other set of circumstances are particularly powerful, but collective movements could accomplish a lot and potentially even overcome some such tendency as the continued massive political dominance of certain sectors of business. And on the basis of this success, other possibilities would present themselves. There’s no reason to think that radical democratic movements can’t emerge and have more success than any such movement in history—if only the right leaders and organizational arrangements come to the fore. The proletariat has lost the historical initiative, but cross-class alliances on behalf of economic aims are not out of the question. In a sense, of course, they’re occurring everywhere even at this moment. We just have to build them up.

Still, there *are* major reasons—grounded in the dominant production relations—why things are as they are. Ultimately, to enact real change (for instance, to reduce the power of the banks, or to revitalize urban schooling) you have to make war on production- or property-relations, and that ain’t easy. There were *some* advances in that direction in America in the late 1930s, with the Wagner Act, industrial unionism and so on, but they petered out. The civil rights movement accomplished less: minor changes in the political, ‘educational’ and cultural superstructure in certain regions (partial desegregation—less successful than the popular narrative tells us)—and cosmetic changes in economic relations—but even these minor reforms, which didn’t prevent the horrifying current plight of minorities in cities, wouldn’t have been possible without prior mini-revolutions (during the 1930s, ’40s and ’50s) in Southern economic relations or the active support of Northern economic elites during the ’60s. So, in short, it isn’t an accident that things are as bad as they are. It isn’t just a failure of leftist leadership.

All the Sixties movements essentially failed, or had limited success, precisely because none of them amounted to a sustained and broad-based attack on economic power-relations. And the movement that tried to make such an attack, Black Power, was singled out and crushed by the FBI. —Every person in a position of economic or political power is unconsciously a vulgar Marxist with a loyalty to capitalism.

...Gramsci on the French Revolution: “In fact, it was only in 1870-71, with the attempt of the Commune, that all the germs of 1789 were finally historically exhausted. It was then that the new bourgeois class struggling for power defeated not only the representatives of the old society unwilling to admit it had been definitively superseded, but also the still newer groups [i.e., the workers] who maintained that the new structure created by the 1789 revolution was itself already outdated; by this victory the bourgeoisie demonstrated its vitality vis-à-vis both the old and the very new.” (203)

“In studying a structure, it is necessary to distinguish organic movements (relatively permanent) from movements which may be termed ‘conjunctural’ (and which appear as occasional, immediate, almost accidental).” (201) The essential vs. the inessential. For instance, Franco’s victory in the Spanish civil war was in large part accidental—it could have been otherwise—but the evolution of the welfare state in the

¹ Or maybe you could say that the “hegemony” now is precisely this ‘social fragmentedness of a consumerist, mass-cultural, corporate-capitalist character, incorporating a structurally determined apathy and sense of the individual’s powerlessness in the face of omnipotent entrenched elites.’ So the “counter-hegemony” wouldn’t necessarily be a specific ideology but just the overcoming of structural fragmentation, the reinvigoration of civic commitment and of a movement or movements to build participatory democracy.

West was basically inevitable, systemically determined. Likewise with neoliberalism (financialization, economic liberalization, etc.), and thus the contemporary decline of the welfare state.

Actually, Franco's victory was relatively "organic" compared to most political events, since it was closely related to such "systemic" international economic and political dynamics as the inevitable greater commitment of Germany and Italy to supplying the war-needs of a power-elite that would uphold conservative property-relations than of England, France and the U.S. to supplying the needs of a somewhat radical democracy (the Second Republic in 1936) that would redistribute economic resources to benefit the lower classes. The U.S. oil industry even supported Franco in the civil war, which was crucial to his victory.

The section "Americanism and Fordism." Gramsci is right that fascism partly amounted to an attempt to transplant Fordism to European conditions without substantially altering the old anachronistic social structure (landowners, peasants, petty-bourgeois, the whole archaic structure of Europe even in the 1920s and '30s). Ford himself supported the fascists, who learned a lot from him, and the system he symbolized was simply industrial fascism. Creation of the new man, the new worker, the new order, etc. Taylorism, totalitarian company towns, regulation of the worker's private life, prohibition (of alcohol), and so forth. European fascism even had some success in combining the new with the old, modernizing society without modernizing it—"a revolution without a revolution," a "passive revolution," a "revolution-restoration." (Gramsci's incisive remark that fascism serves approximately the function for the 20th century that conservative liberalism served for the 19th—a revolution without a revolution, economic progress without social progressivism. In a diluted form, fascism would persist throughout the 20th century. Technocratic modernization and social conservatism, mass propaganda, the military-industrial complex, government planning, a degree of social welfare to limit discontent, diluted nationalism, colonial wars in defense of capitalism and to stimulate the domestic economy (including Cheney's Iraq war). True of the USSR too. Classical fascism was just an early and too-extreme-to-last manifestation of the statist (and monopoly-capitalist) phase of history.) The Second World War was in large part a result of fascism's success at reconciling the existence of the traditional conservative nationalistic strata (tied figuratively and 'literally' to the soil—"Blood and soil!", racialism) with modern methods of production that vastly increased the destructive power of technology. After the war had essentially destroyed all vestiges of the *ancien régime*, statism could continue without the threats to Western civilization it had posed in the first half of the 20th century. The boundary-dissolving tendencies of capitalism could operate less hindered by the traditional classes and social structure, which at the same time militated against nationalistic ideologies and conflicts.

Someday I want to buy posters of Marx, Chomsky, Nietzsche, Kant, and Sartre, and put them on the walls of my office. Each of these figures symbolizes one aspect or more of my personality and my mind. (With Sartre, it's the phenomenology and the "existential anguish.")

I'm reworking the thesis, since writing it was sheer torture. Now it has more emphasis on revolution and less on the day-to-day bullshit of running a co-op.

Sviatoslav Richter playing Bach's Fantasia and Fugue in A minor, BWV 944. Listening to it makes you feel like a tortured genius.

The rotten society.— "Average U.S. taxpayers subsidize excessive executive compensation—by more than \$20 billion per year—via a variety of tax and accounting loopholes. That \$20 billion for America's most powerful is more than double what the federal government spent last year on educating America's most vulnerable—children with disabilities."

Serious conversation with Yuja about our relationship. She said I don't care about her, in fact don't have an attachment to anyone; wants a long-term relationship, potentially marriage, but only if I change, etc. It'll never come to marriage, surely. But we talked and I tried to reassure her. I care about her, etc. Slowly I got a little sentimental, actually *wanting* to care about her and even thinking I did. —And there is, after all, truth to that. She is meaningful to me.— So finally, after she had cried a bit and I was feeling ordinary again, we hugged and suddenly I started crying. You know, that old thing, with the tears quietly

streaming down as I lament the emptiness of life and my emotional scars. But then we were happy again, and the next time I saw her I brought flowers which she loved, and next week we'll go to the zoo, etc.

Last week of May

I read an article by Edward Herman, Chomsky's former collaborator, in the *Monthly Review* that argues, with extensive documentation, that the narrative we've been fed about the Rwandan genocide of 1994 is totally untrue. He claims that most of the victims weren't Tutsi but Hutu! Paul Kagame's Rwandan Patriotic Front supposedly killed hundreds of thousands of Hutus as it swept through the country to take power after the Hutu president's assassination in April—which, according to Herman, was itself an RPF doing. His reasoning certainly makes sense. And there are a lot of holes in the official story. But I don't know... Herman says the U.S. wanted the RPF to control Rwanda for various reasons of its own, and *this* is why it didn't oppose the massacres going on—most of which were, apparently, against *Hutus*. The reason the U.S. pulled out most U.N. forces was to let the RPF take control of the country, which it wanted! But doesn't that seem too Machiavellian even for Bill Clinton?

I can accept that it was the RPF that killed the Hutu president and that it intended from the very beginning to seize power after his death—indicated by its incredibly efficient deployment of 50,000 troops against the Rwandan government two hours after the president's death—and perhaps even that Kagame anticipated the genocide of his own people as a result of the Hutu president's murder (and the RPF's subsequent movements) and that he was willing to use the genocide as a pretext to take power, but I'm still convinced that most of the killing was at the hands of Hutus, and that Tutsis were the most numerous victims. This has surely been sufficiently established by independent international observers. Nevertheless, Herman is probably right that the U.S. has been responsible for the lack of any serious investigation of Kagame and the RPF's doings during the genocide. Even the Hutu president's murder, which triggered the Tutsi genocide, hasn't been investigated! That's a sure sign that the U.S. government thinks or knows it was committed by the RPF, a U.S. client. Similarly, the U.S. has surely protected Kagame from being indicted for his role in the Second Congo War, which has caused the deaths of over 6 million people.

I'm reading Raymond Carr's *The Spanish Tragedy: The Civil War in Perspective* (1977). I've always been curious about that war.

It's not even June yet and I'm writing the fourth and final chapter of the thesis. The first two chapters were much more tolerable to write after I'd changed the focus, and the third chapter, on revolution, was a joy.

...Joseph Marzah's testimony in the Truth and Reconciliation Commission for Charles Taylor of Liberia, Marzah a military guy. Describing matter-of-factly how at the orders of Taylor he and his colleagues slit open hundreds of pregnant women's bellies, smashed babies' heads against the wall to kill them, drowned old men, buried a pregnant woman alive, amputated thousands of limbs, burned people, pulled out intestines and stretched them across the road to scare passersby, stuck heads on spikes and car bumpers, carved out the heart of an enemy and ate it, cooked and ate many people (flavoring them with salt and pepper)—he was ordered to—raped thousands of women, etc. He denied having regrets. He had to do as he was told, otherwise he and his family (24 children) would have been executed. He saw a pregnant woman once, radioed his superiors to ask if he should cut out the fetus because "it's an enemy." In his testimony Marzah seems strangely like a child, totally naïve about moral issues—a partial result of his tribal upbringing, perhaps? Are most "primitive" men potentially like that, moral children? Certainly not individuated. He followed instructions more implicitly even than the Nazis. Did everything he had to, taking it all for granted. And yet I don't get the impression that he enjoyed it, although he may have. He's just an amoral machine.

[Stuff about Yuja.]

Reading Fred Magdoff and Michael D. Yates's *The ABCs of the Economic Crisis: What Working People Need to Know* (2009). Note to self:

Under typical circumstances, a nation with a large trade deficit [which means that it is taking in more imports than selling exports] will find its currency depreciated, that is, exchanging for less and less foreign currency. As with anything else, when supply greatly exceeds demand, prices fall. In this case, the price is the exchange rate of the dollar with foreign monies... If the exchange value of the dollar were to fall dramatically, this would make imports to the United States more expensive (for example, more dollars would have to be paid for a certain number of yen than before), and by raising the price of consumer goods that would increase inflation in the United States. If the foreign goods and services did not have acceptable substitutes, U.S. consumers might continue buying them at the higher prices and cut back on things produced here, leading to unemployment. A weaker dollar would also encourage foreigners to buy U.S. exports, but this might not be enough to stop the devaluation of the dollar. If the decline in the dollar's exchange value fell enough to whet the appetite of speculators who believed it might fall further, they would begin to speculate against the dollar and this would devalue it further. To stop the harmful consequences of this, the government, through the Federal Reserve, might have to push interest rates up to raise the demand for U.S. government bonds and thereby also raise the demand by foreigners for dollars. High interest rates would, however, reduce demand for houses, cars, and construction, causing more unemployment.

The U.S., however, isn't a typical country. The dollar is the leading global currency. So every nation's central bank has reserves of dollars with which, in the case of a depreciation in its own currency's value, it can buy that currency (for instance, Japan would use its reserves of dollars to buy yen) and keep the exchange rate stable, thereby preventing foreign goods from being more expensive and so preventing domestic inflation. As a result, the dollar has been in high demand around the world—also because U.S. government bonds are safe, so that foreign countries and businesses buy them in high volume. The result is that “the United States can run up large international deficits without causing its currency to depreciate in value as much as it should, which means that interest rates in the United States can be lower than they would otherwise be. Therefore, foreigners in effect helped subsidize the housing boom and all other spending that relied on borrowing.” This has helped the U.S. economy, i.e. helped counteract trends toward stagnation.

Another note: supply-side economics tends to assume that by decreasing taxes on the rich, the rich will invest more in the real economy and thus create jobs for ordinary people. But the assumption is wrong. Because of the financialization of the economy, lower taxes simply cause the rich to invest more in stock-market gambling, which creates few jobs. —In his critiques of Reaganism, Paul Krugman never mentions this one (as far as I know).

“There was so much money in the hands of the wealthy that they had no productive way to use it. If a greater share had been in the hands of workers, this money would have been spent on commodities of all kinds, generating output and employment without such a massive accumulation of household debt” as we've seen in recent decades. This point harks to underconsumptionism and Keynesianism. But capitalism has powerful tendencies toward polarization of income—“underconsumption” for the masses, or “too much money being in the hands of the wealthy for it to be used productively”—and this contributes to its tendencies toward stagnation.

Moreover, given the existence of all this wealth without productive outlets, it was inevitable that financialization would occur, i.e. that the wealthy would find some way to use their wealth to make profits. But financialization, the massive system-wide accumulation of debt, in the long run was inevitably going to come untethered from the real economy, which means that people and institutions were someday going to lose their ability to service their enormous debt (because of their insufficient income), which means that a virtual collapse of the system was going to occur. And these tendencies will persist as long as there is a

paucity of investment opportunities in the real economy, partly as a result of the relatively little wealth possessed by the multitudes.

Frankly, I'm not impressed by Obama's vaunted political skills. With opponents like Mitch McConnell, John Boehner, Eric Cantor and Newt Gingrich, not to mention Glenn Beck, Rush Limbaugh and the rest, it shouldn't be hard to seem like the voice of sanity. All he has to do is be honest, hammer home the point that Republican policies would benefit Wall Street. Tell the population that Wall Street hates him, which it does. Follow in the mold of FDR in 1936, as Paul Krugman suggests in his column today. Stop gingerly hinting at criticisms of corporate greed; be a fighter, at least in rhetoric (since it isn't in Obama's genes to fight in *action*). Treat the public like grownups; tell them, for instance, we need a certain amount of "big government" to fight big business. And repeat that until you're nauseated by it. And give concrete examples. These tactics are common sense. Say unorthodox things like, oh I don't know, the truth. That'll impress people. Go to Tea Party country and give them a dose of common sense, which even they'll understand if you say it simply enough. Choose soundbites from Republican leaders and make mincemeat of them. Explain that you're raising taxes only on the wealthy. Etc. Go directly to the people, bypass their Fox News filter. –What on earth is wrong with this guy?? Corporations are already donating far more to Republicans than Democrats, so it isn't as though a change in his strategy would suddenly antagonize them and have disastrous consequences for the midterm elections. The opposite would happen. [Dude, be realistic. He's beholden to Wall Street and the corporate sector; he can't antagonize them.]

Speaking of Obama...it really is amazing, but predictable, how incompetent and/or inhuman his economic advisors are. I don't have to tell you about Lawrence Summers. But you probably didn't know this, although you could have guessed it: "The advice he gave as a highly paid consultant to Lithuania and Russia was that they should speed up their transition from socialism to capitalism by embracing neoliberalism as fast as possible. The results were catastrophic [as everyone knows by now]. Mass economic hardship caused the suicide rate in Lithuania to double, and Russia became the first advanced industrial nation in history to endure a sharp decline in life expectancies." The last two decades of Summers' career are a record of crimes, follies, and stories of what an obnoxious shithole he is.

Reading a few chapters of Chomsky's *Powers and Prospects: Reflections on Human Nature and the Social Order* (1996). I'm pleased to learn that Chomsky shares my contempt for the "Turing Test" beloved by a certain behavioristic breed of philosopher, which is supposed to provide a criterion for determining whether a given thing can think or understand or "manifests intelligence." I've always found it to be a pointless intellectual game played by thinkers uninterested in serious questions (or unable to tell a serious from a trivial question).¹ Apparently Turing himself thought as I do: "the question whether machines think 'may be too meaningless to deserve discussion.'" Yes. Or, even better: it depends what you mean by "think" or "understand" or "manifest intelligence." If you mean "think" in the sense that a human being consciously thinks, introspects, is self-conscious, I find it hard to believe that any possible machine could qualify. The Cartesian criterion was better than the Turing test: a being that can creatively use language as humans do has a mind. But I don't agree with this criterion either. I think cats have "minds" in some sense even though they can't use language.

Chomsky on the Turing test (and other such functionalist-inspired, behavioristic "criteria" for whether to apply a particular concept): "a confused attempt to answer a question that has no meaning."

Erik Olin Wright, "The Structuralist Marxist and Parsonsian Theories of the State" (1973). "Recent Developments in Marxist Theories of the Capitalist State" (1975). "The Continuing Relevance of Class Analysis" (1996). An encyclopedia article he wrote on class (2006).

I love the anger, the outrage, the impassioned sarcasm of Chomsky's writings on neoliberalism:

What is being reported blandly on the front pages would elicit ridicule and horror in a society with a genuinely free and democratic intellectual culture. Take just one

¹ The search for a "criterion" is probably not frivolous, but the way they go about it is. I obliquely addressed the issue in my paper on the analytic/synthetic distinction, as well as in this journal.

example. Consider the economic capital of the richest country in the world: New York City. Its mayor, Rudolph Giuliani, finally came clean about his fiscal policies, including the radically regressive shift in the tax burden: reduction in taxes on the rich (“all of the Mayor’s tax cuts benefit business,” the *New York Times* noted in the small print) and increase in taxes on the poor (concealed as rise in transit fares for school children and working people, higher tuition at city schools, etc.). Coupled with severe cutbacks in public funds that serve public needs, these policies should help the poor go somewhere else, the Mayor explained. These measures would “enable them to move freely around the country,” the report in the *Times* elaborated, under the headline: “Giuliani Sees Welfare Cuts Providing a Chance to Move.”

In short, those who were bound by the welfare system and public services are at last liberated from their chains, much as the founders of the doctrines of classical liberalism advised in their rigorously demonstrated theorems. And it is all for their benefit, the newly reconstituted science proves. As we admire the imposing edifice of rationality incarnated, the compassion for the poor brings tears to the eyes.

Where will the liberated masses go? Perhaps to *favelas* on the outskirts, so they can be “free” to find their way back somehow to do the dirty work for those who are entitled to enjoy the richest city in the world, with inequality greater than Guatemala and 40 per cent of children already below the poverty line before these new measures of “tough love” are instituted.

And on and on.

June

Yuja and I ended it last night. Tears on both sides. I completely broke down at one point, having drunk too much wine. Then to bed, maybe the last time I’ll sleep in her bed. We’re going to be friends, and we still plan to go strawberry-picking soon, etc. What pains me most is her pain—both her emotional attachment to me and her increasingly urgent quest for a husband. Hopefully she’ll get over the former quickly.

I spend almost all my time alone, reading and writing.

Since reading that passage from Michael Albert’s book, which I quote in my thesis, I’ve come around to the dialectic. I now finally appreciate its full significance. But it remains, after all this time, an under-emphasized and little-understood concept. Even I don’t have a full grasp of it yet in all its permutations. I’d like to write an essay on it, the theory and the reality in particular historical events.

As Hegel and Marx said, a given period of history can’t be well-understood until it has evolved into something else. One’s understanding will become even more thorough after the succeeding period has in turn been superseded, and so on. Ordinary undialectical thinkers would say this is simply because one gains “perspective” on the period after it has passed, but that’s a superficial explanation. The real reason is that the internal tendencies, the structural contradictions that constitute the real essence of a society and propel its development reveal themselves only in the new or modified structures engendered by their evolving and contradictory “resolutions.” Until then, societal tendencies are extraordinarily difficult to detect or understand. Even the most acute thinker can be totally wrong about developments in his society, as Marx was wrong about the significance of working-class radicalism in his day. It certainly isn’t *impossible* to make accurate predictions on the basis of thoughtful analyses, but the predictions are always provisional (unlike in the natural sciences, where there is no dialectic to worry about, because no consciousness or freedom).

Reading Chomsky’s *Problems of Knowledge and Freedom* (1971). Part One is an able defense of common sense in the form of “rationalism.” Part Two is a defense of common sense in the realm of politics and the economy.

Douglas Blackmon's *Slavery By Another Name: The Re-enslavement of Black People in America from the Civil War to World War II* (2008). To quote Chomsky, "one of the most horrifying books I've ever read." But beautifully written, and a tour de force of investigative journalism. It enlightens you as to the human misery potentially embedded in the ground you walk on, the bricks in city buildings, stretches of de-forested land, seemingly placid rural hamlets. America truly was built on the backs of slaves, chattel-slaves and wage-slaves, convict-slaves, immigrant-slaves—centuries of persecution, torture, forced labor, debt-slavery, human trafficking, genocide, imperial conquests, every horror imaginable.

Here's an astonishing fact: according to Gallup polls, a majority of Americans has approved of labor unions in every single year from the 1930s to the present, except last year, when only 48% approved of them. This is despite *massive* business propaganda against unions. Even in the 1980s, most Americans consistently favored unions. It's miraculous. What a disinformation campaign we've been subjected to by the media!

On the other hand, for a long time people have feared big government more than big business. An example of propaganda stultifying rational faculties.

Erik Olin Wright's *Class, Crisis and the State* (1978).

Society, of course, isn't just "structures," unless that term is meant loosely. Children playing, adults foreplaying, friends hanging out together, ways of acting in the home, in fact interactions themselves are not "structures," although they presuppose some more or less defined structure(s). What you have are loose structures and norms associated with the roles in those structures. Some structures, particularly in the economy, are quite defined, relatively invariant, with strict and strictly enforced norms governing behavior, hierarchies, etc.; "cultural" structures and roles, on the other hand, as in the household and among friends, are more flexible, somewhat variable within a society, less "constraining" than economic roles, more like "norms" in the ordinary sense. It actually doesn't make a lot of sense even to call some of these cultural phenomena "structures," or defined by structures (role-differentiations), except in the most abstract, virtually empty way. They're just norms, common ways of behaving. Behavior among casual friends is the best example. No clear "structures" there.

The question is, why exactly are economic structures different in this way? Not too hard to answer. The reasons why they have to be strictly enforced are obvious. (Extraction of the surplus, survival of the society, etc.) Historically, hierarchies have gotten the job done—extracted the surplus—better than democratic cooperation. Or at least they get the job done, and the higher-ups don't want to change the structure. Coercion, strict enforcement, is necessary because nobody wants to be in the lower position.

Here's the thesis. Strange to say, I'm somewhat pleased with it, on the whole. (I could have done more with chapter 5, but by the end I just wanted to get it over with. The whole purpose of the essay, and the only reason I could tolerate writing it, is chapter 4.) [*I've substituted for the thesis the book that I turned it into a few years later. Or rather a nearly final draft of it. I had rewritten chapters 4, 5, and 6, and edited the first three chapters.*]

WORKER COOPERATIVES AND REVOLUTION: HISTORY AND POSSIBILITIES IN THE UNITED STATES

CHAPTER ONE INTRODUCTION

The capitalist mode of production does not permit a socially efficient allocation of resources. Resource-allocation is determined by the twin structural imperatives of having purchasing power (on the demand side) and of chasing profit (on the supply side). If one has a need but lacks the money to back up that need, as for example the billion children worldwide living in poverty do, one's need will not be met by the market. Conversely, investors will pursue only those projects that have the potential to make a profit. For instance, many areas of rural America were still without electricity in the early 1930s because investors had judged that the meager profits to be made did not justify the costs of supplying electricity to these

regions; hence the New Deal's Rural Electrification Administration and the cooperatives that sprang up to supply electricity.¹

Broadly speaking, the dynamic between capital and wage-labor, as well as that between millions of atomized units of capital each seeking profit at the expense of every other, makes for a very unstable and crisis-prone economy. Capital's interests lie in paying the worker as little as possible and in preventing him from exercising control over the process of production, while the worker wants to be paid as much as possible and to exercise greater control over production. This simple structural antagonism is the basis for the whole history of the labor movement, the continual confrontations, the unions and union-busting, the private armies deployed to break up strikes, the government suppression of labor parties, the revolutionary social movements, the constant and pervasive stream of business propaganda, and the periodic bursts of cooperative economic activity among the ranks of labor. At the same time, the vicissitudes of the capitalist economy leave many people unemployed at any given time, unable to find work because their skills and needs are not valued or because of insufficient investment in their geographical or professional area, or because of outsourcing to countries where labor is cheaper, or for other reasons. In recent decades, the liberalization and financialization of the international economy has entailed a tendency for corporations to seek profits not through investment in industry and infrastructure development but through financial speculation. This sort of investment, undertaken on the principle of "*Après moi le déluge*," is not only risky but essentially adds no jobs and no real wealth to the economy, which tends to stagnate—or to contract, after it finally becomes evident that all these financial transactions have been grounded in "the baseless fabric of a vision" (to quote Shakespeare). So, millions more people are thrown out of work as capital withdraws itself from further investments, and government initiatives are required to set the economy on track again—for more financial speculation and more stagnation, as opposed to contraction.²

However, even before the orgies of neoliberalism it was obvious that capitalism is not socially efficient. Market failures are everywhere, from environmental calamities to the necessity of the *state's* funding much socially useful science to the existence of public education and public transportation (not supplied through the market) to the outrageous incidence of poverty and famine in countries that have had capitalism foisted on them.³ All this testifies to a "market failure," or rather a failure of the capitalist, competitive, profit-driven mode of production, which, far from satisfying social needs, multiplies and aggravates them. This should not be surprising. An economic system premised on two irreconcilable antagonisms—that between worker and supplier-of-capital and that between every supplier-of-capital and every other⁴—and which is propelled by the structural necessity of exploiting and undermining both one's employees and one's competitors in order that ever-greater profits may be squeezed out of the population, is not going to lead to socially harmonious outcomes. Only in the unreal world of standard neoclassical economics, which makes such assumptions as perfect knowledge, perfect capital and labor flexibility, the absence of firms with "market power," the absence of government, and in general the myth of *homo economicus*—the person susceptible of no other considerations than those of pure "economic rationality"—is societal harmony going to result.

From the very beginning of its history, the manifold social evils of capitalism have given rise to oppositional movements. The one I am concerned with in this work is cooperativism, specifically worker cooperativism. There are many other kinds of cooperatives, including those in the credit, agriculture, housing, insurance, health, and retail sectors of the economy. But worker cooperativism is potentially the

¹ Deward Clayton Brown, *Electricity for Rural America: The Fight for the REA* (Westport, CT: Greenwood Press, 1980).

² See John Bellamy Foster and Robert McChesney, "Monopoly-Finance Capital and the Paradox of Accumulation," *Monthly Review* 61, no. 5 (October, 2009): 1–20; and John Bellamy Foster and Robert McChesney, *The Endless Crisis: How Monopoly-Finance Capital Produces Stagnation and Upheaval from the U.S.A. to China* (New York: Monthly Review Press, 2012).

³ Naomi Klein describes recent examples in *The Shock Doctrine: The Rise of Disaster Capitalism* (New York: Henry Holt and Company, 2007).

⁴ Capitalists may indeed reach a modus vivendi to alleviate the mutually harmful consequences of competition, for instance by fixing prices, but the potential always remains for the antagonism of interests to reassert itself.

most “oppositional” form, the most anti-capitalist, since it organizes *production* in anti-capitalist ways. Indeed, the relations of production that constitute worker cooperativism also define socialism in its most general sense: workers’ democratic control over production and, in some varieties, ownership of the means of production (whether such ownership is organized individually, by owning shares of equity, or collectively). As one common formulation states, in the worker co-op, labor has power over capital, or “labor hires capital.” In the conventional business, by contrast, capital has power over labor, i.e., “capital hires labor.” None of the other kinds of cooperativism directly rejects these capitalist power-relations, although some may signify an implicit undermining of capitalism insofar as the co-op exists not primarily for the sake of maximizing profit but for satisfying some social need.

It must be understood that a society’s dominant mode of material production, i.e., the “hegemonic” method of organizing the relations of material production (such as manufacturing and food production), conditions the overall character of the society more than any other of its features does. This is because the society is erected on the basis of material production; the first task for a society is to reproduce itself in its specific form, which presupposes the reproduction of a set of production relations. Social relations will tend to evolve that make possible the reproducing of the relations of production. In the spheres of economic distribution, of politics, of sexual relations, of intellectual production, and so on, social structures and ideologies will tend to predominate that are beneficial, “functionally selected” with respect to the dominant mode of production.¹ Therefore, a movement that aims for fundamental transformations in society should not limit itself to the sphere of distribution, as do consumer co-ops, credit unions, and housing co-ops, nor the sphere of gender relations, as does the feminist movement, but should concentrate on changing the mode of production (with its correlative property-relations, the criteria for allocating resources), as does worker cooperativism.

Such cooperativism on a societal scale, involving “a federation of free communities which shall be bound to one another by their common economic and social interests and shall arrange their affairs by mutual agreement and free contract,”² is not only a more socially rational way of organizing production than capitalism but also a more intrinsically ethical way (even apart from its potential allocative efficiencies). First of all, the very premises of capitalism are absurd, as Michael Albert makes clear:

Rewards for [owning] property are called profit...wherein individuals who own the means of production pocket profits based on the amount of those means of production. You own some machines. The machines have high output that can be sold for revenues that exceed the cost of maintaining them. You pocket the difference, or profit. You needn’t do anything other than keep track of your deed to your property, while sipping mint juleps or dry martinis.³

More pertinent, however, is that capitalism tends to stultify the worker’s creativity, his human urge for self-expression, freedom, mutually respectful interaction with others, recognition of his self-determined sense of self, recognition of himself *as* a self rather than an object, a means to an end. Karl Marx called it “alienation.” Capitalism alienates the worker—and the capitalist—from his “fundamental human need” for

¹ Philosophers have debated interminably the validity or invalidity of “functional explanation” and the notion of “functional selection,” but in fact functional explanations are simply shorthand versions of causal explanations—as in Darwinism, whose talk of the “functions” of particular biological adaptations is a way of rephrasing the *causal* doctrine of natural selection by means of random variation. To say, as G. A. Cohen does in *Karl Marx’s Theory of History: A Defence* (1978), that Marxism (more specifically, historical materialism) is committed to functional explanation is misleading. It is “committed” only to causal explanations, but Marxists often use the idiom of functionalism because to tease apart all the causal mechanisms through which particular structures, patterns of behavior, and ideologies have developed and persisted is no easy task. I’ll return to this issue in the final chapter.

² Rudolf Rocker, *Anarcho-Syndicalism: Theory and Practice* (Oakland: AK Press, 2004), 1.

³ Michael Albert, *Moving Forward: Program for a Participatory Economy* (San Francisco: AK Press, 2000), 17. That many owners of capital do productive work (managerial, technical) is not essential to their ownership of capital considered in itself. It is this from whence they derive their profits.

“self-fulfilling and creative work,” “the exercise of skill and craftsmanship,”¹ in addition to his fundamental desire to *determine himself* (whence comes the desire to dismantle oppressive power-relations and replace them with democracy). Alternative visions of social organization thus arise, including Robert Owen’s communitarian socialism, Charles Fourier’s associationist communalism, Proudhon’s mutualism (a kind of anarchism), Marx’s communism, Bakunin’s collectivist anarchism, Kropotkin’s anarchist communism, Anton Pannekoek’s council communism, and more recently, Murray Bookchin’s libertarian municipalism, Michael Albert’s participatory economics, Takis Fotopoulos’s inclusive democracy, Paul Hirst’s associationalism, and so on. Each of these schools of thought differs from the others in more or less defined ways, but they all have in common the privileging of economic and social cooperation and egalitarianism.

I take these visions to be essentially similar to “worker cooperativism,” which in some form is at least an *element* in all of them. If it were generalized so as to be the dominant mode of production, a society approximating classical utopias would be achieved. In this book, however, my primary focus is not on cooperativism’s value as the ideal we strive for, but on its value as a possible path towards that ideal. That is, I want first of all to evaluate the potential of worker co-ops for undermining capitalism and moving us towards something like “socialism.” What should be their strategic role? What systemic effects have they had in the past? What mistakes have been made? How have co-ops fared as a form of business? Do they indeed tend to entail workplace disalienation and democracy, or is that just a theoretical construct that doesn’t obtain in reality? Can their potentially revolutionary function be reconciled with their need to survive in a capitalist economy? What sort of political consciousness has their membership tended to possess? How have co-ops interacted with the labor movement? What challenges do they face as businesses? Why are they so rare?

Opponents of capitalism have by no means always looked favorably on worker co-ops as tools of revolution. We’ll have to consider their arguments in the following chapters. Marx had an ambivalent attitude toward co-ops: he considered them to “represent within the old form [i.e., the capitalist economy] the first sprouts of the new” but thought that “they naturally reproduce, and must reproduce, everywhere in their actual organization all the shortcomings of the prevailing system.”² Not until the working class had seized political power and imposed cooperative principles on the economy could co-ops be anything more than aberrations. Lenin and other Marxists agreed with this judgment. Nikolai Bukharin accused “pre-revolutionary” cooperators of being “purveyors of a ‘miserable reformist utopia’ because they imagined a socialist evolution of cooperatives within the capitalist system...cooperatives ‘inescapably fall under the influence of capitalist economics’...and ‘are transformed into capitalist enterprises.’”³

Edward Greenberg observes that members of worker cooperatives occupy what Erik Olin Wright has called “contradictory class locations.”⁴ “In producer cooperatives, democratic participation is joined to actual ownership of the enterprise so that shareholders are, at one and the same time, workers and capitalists.”⁵ Because of their contradictory structural locations they have contradictory interests and incentives, desiring both the maximization of profit and workplace democracy and equality. They might also, in their capacity as workers, identify with employees of conventional companies in their struggles against management, perhaps going so far as to join a union, to strike or boycott sympathetically in solidarity with their oppressed brethren, to participate in radical social movements—or they might forswear unions and the class struggle altogether and act solely as entrepreneurs. We’ll look at examples of this behavior later.

In chapters two and four I’ll consider arguments for and against co-ops in depth. We’ll see that the issues are not quite as simple as Marxist opponents and anarchist proponents have sometimes thought. Cooperatives can behave in different ways, and much depends on their institutional context. Some

cooperators rhapsodize about their experiences while others profess disillusionment. What factors explain these differences? I also want to consider two additional questions: first, can co-ops have a viable role in alleviating on a broad scale, *within* the capitalist economy, the worst defects of capitalism? Secondly, is such a role in tension with the goal of eventually transcending capitalism, in that it tends to stabilize the economy and contain discontent, postponing the necessary *direct attack* on capitalist institutions? Or, on the contrary, can the propagation of co-ops in the interstices of capitalism be an element in the long-term formation of a counter-hegemony? That these questions are imperative is revealed by the fact that not only leftists but even conservatives and fascists have at times favored worker co-ops. Mussolini granted official recognition to the Italian cooperative movement once it had purged Socialists and Communists, and he pointed to cooperatives as embodying “worker participation, nonconflictual relations between labor and management, and the withering away of class identifications.”¹ In the famous Spanish town of Mondragon, worker cooperativism was founded (in the 1950s) “as an entrepreneurial alternative to working-class activism and socialism.”² There is a danger, therefore, that cooperatives can become tools of reaction rather than progress.

In chapter two I’ll discuss cooperatives from a non-revolutionary perspective, culling the scholarly literature for insights into organizational structure, methods of capitalization, labor productivity, worker satisfaction, wage levels, profitability, effects on employment, company survival-rates and longevity, challenges the movement faces, etc. Chapter three is devoted to the history of worker cooperativism in the United States. I will show, among other things, that in an overall framework of powerful institutional obstacles, worker cooperativism has periodically surged forward and then receded in a cyclical pattern. After its advances, conservative political and economic forces have pushed back to virtually eradicate it. For example, under the sponsorship of the Knights of Labor it made great headway in the 1870s and 1880s; in the late 1880s and the 1890s it succumbed to the attacks of big business on industrial unionism, which also decimated the Knights of Labor. Cooperativism made strides in the 1930s, partly with the help of New Deal legislation, but in the 1940s and ’50s receded again. The 1960s and ’70s saw further advances under the influence of such progressive movements as the civil rights, youth, anti-war, and feminist movements, while the 1980s saw massive counterattacks by conservative sectors of business. This whole history arises from the violent and cyclically prone conflict between capital and labor (in occasional conjunction with other progressive interests like the black struggle against segregation and poverty).

I’ll apply the lessons from chapter three in the following chapter, where I discuss the question of what co-ops and the growing “alternative economy” can contribute to a long-term struggle against capitalism. This discussion will be more theoretical and speculative than that in the second chapter—inevitably so, since one can only speculate about the future, not analyze it. But since people study the past precisely to glean lessons for the future, a semi-theoretical, semi-empirical analysis of possibilities seems appropriate.

To anticipate briefly: I expound and revise the Marxist theory of revolution so as to provide a theoretical framework to interpret the alternative economy (of cooperatives, municipal enterprise, public banking, urban agriculture, the solidarity economy). Marxists and “cooperators” have tended to be mutually hostile, but, as I’ll explain, the logic of Marxism is in fact committed to the sorts of “interstitial” movements that are emerging now, which represent a new society within the shell of the old. Marx himself misunderstood his own system when he adopted a statist perspective and predicted a dictatorship of the proletariat—two things that are very un-Marxian, as we’ll see. His followers persisted in his mistakes, such that up to the present day virtually no one has understood the elementary truth that statism and Marxism are in conflict (in two ways, actually: morally and strategically). So, I purify Marxism, returning it to its logical essence. The reason for doing this isn’t only to make some academic points about doctrine; instead, I think that if the theory of revolution is purified and updated it sheds light on the historical moment we’re living in.

¹ Sharryn Kasmir, *The Myth of Mondragon: Cooperatives, Politics, and Working-Class Life in a Basque Town* (Albany: State University of New York Press, 1996), 75.

² *Ibid.*, 195.

To illuminate that moment, I retrace the logic of the West’s historical development in the last few centuries. The notion of a “logic of history” isn’t fashionable nowadays, probably because it implies that capitalism is merely a temporary phase that, like all social systems, is bound to evolve into something different. Nevertheless, I resurrect the idea and use it to explain why *only now* are we finally entering the revolutionary era Marx and Engels looked forward to—and why it couldn’t have been any other way. They got the timeline wrong; “socialism” on a broad scale was not possible earlier. But the coming revolution will not look like what they predicted, namely a seizing of the state and a unitary reconstruction of the economy. Rather, it will take place over generations and will sprout from the grassroots, locally, regionally, and transnationally—again, as Marxism (despite Marx) entails. Given a true revolutionary situation, cooperatives are by no means antithetical to the class struggle; they are an essential tool of it.

Chapter five returns to the narrow focus on worker cooperatives, this time looking at their formation. In particular, I recount the experience of a business that was recently formed and has frequently been in the press, the New Era Windows cooperative in Chicago. Its worker-owners are the same workforce that occupied the Republic Windows and Doors factory in 2008, just as it was closing, to demand the back pay, severance, and temporary healthcare benefits to which they were entitled. It was one of the very few factory occupations since the 1930s, and it became a national *cause célèbre* that even President-elect Obama spoke positively about.¹ A couple months after the workers’ victory the factory was partially reopened under a new owner, Serious Materials—which three years later, in February 2012, announced that it was closing the factory again and consolidating operations elsewhere. So, once again, the workers staged a sit-in to protest the closing, which ended after the owners agreed to keep the factory open for ninety days. Fed up with capitalist caprice, the workers decided to buy the factory themselves and run it as a cooperative. Again they encountered resistance from the business class, but with determination and community support they overcame it. I tell their story in some detail in chapter five.

The point of this case-study isn’t only to tell an inspiring story of David triumphing over Goliath. I’m also interested in how and why these workers have succeeded where others have failed or not even tried. Why were they apparently the only workforce in the U.S. to occupy their factory in the dismal months of late 2008 and early 2009, when the economy was imploding? What ingredients were present that were missing elsewhere? Why and how did they decide to start a cooperative? How did they force the owners, who were initially reluctant, to let them buy the factory? What steps were required to establish the cooperative? Has the experience been successful so far? What challenges have had to be overcome along the way? In general, I try to glean lessons that can be applied in similar cases, which I hope and expect will become more common in the coming decades.

In the final chapter I return to the topic of Marxism and revolution, to discuss some implications of the ideas in chapter four. I argue, for example, that the old mutual hostility of Marxism and anarchism is seen to be unfounded upon a deeper understanding of Marxism, and that leftists should therefore move beyond the sectarianism that has interfered with radical movements for at least 150 years. On the other hand, if my revision of Marxism succeeds in returning it to its “essence,” it becomes even clearer than it was to Rosa Luxemburg that Leninism is a deviation from Marxism. According to the latter, and to any sensible revolutionary strategy, the transition to a new society will take place over many generations and will involve every conceivable tactic, including radical political parties, frequent mass demonstrations, violent confrontations with armed personifications of authority, transnational federations of peasant and worker solidarity, pressures from the environmental movement to end destructive capitalist practices, and, crucially, the construction of new cooperative modes of production and distribution in the womb of the old regime. Activists should have a clear understanding that this is what we’re in for; this broad-based “movement of movements” is what we should expect and embrace.

Thus, an essential element in this movement of movements is the worldwide spread of co-ops (of every kind) that is happening now. Indeed, we are living in the most exciting time for cooperativism since capitalism began its conquest of the world. Cooperatives proliferate from Canada to Argentina, across Europe and Russia, to India and over to Indonesia, throughout Africa and the Middle East. Almost 800

¹ Monica Davey, “In Factory Sit-In, an Anger Spread Wide,” *New York Times*, December 7, 2008.

million people are members of cooperatives, and three billion depend on them for their livelihood.¹ The developing world has made excellent use of the cooperative principle, in the form, for example, of microcredit, which is—or can be—a kind of cooperative banking. Neoliberal institutions like the IMF and World Bank, far from facilitating sustainable economic development, have typically amounted to imperialism and colonialism by other means, functioning so as to permit the transfer of wealth from the poor to the rich and from poor countries to rich countries. As a result, regions such as South Asia have, in some respects, begun to reject the neoliberal model in favor of such strategies as establishing institutions that grant small loans with little or no interest to villagers, usually women—which, incidentally, empowers them vis-à-vis men—for the purpose of starting businesses or buying houses for their families.² In Bangladesh, such institutions have helped well over 10 million people escape from dire poverty.² In recognition of the fact that cooperatives “are becoming a major factor of economic and social development”—as the General Assembly of the UN declared in 2002³—the UN named 2012 the International Year of the Cooperative.

Cooperatives have had success in the developed world too, as the following random statistics show. In France, farmers borrow up to 90 percent of their loans from credit cooperatives, cooperative banks handle 60 percent of the total deposits, and 28 percent of all retailers are cooperatives.⁴ Ninety-one percent of Japanese farmers belong to agricultural co-ops. In the United States, a number of well-known corporations are technically cooperatives, including Land O’Lakes, Sunkist, Ocean Spray, Welch’s, Sunmaid, REI, the Associated Press, and True Value Company. Credit unions in the U.S. had 95 million members in 2012, or 45 percent of the economically active population.⁵ Electric utility co-ops provide electricity to more than 42 million rural Americans; 1.2 million families live in homes owned or operated by cooperative associations; and over 11,000 social and public service cooperatives exist—e.g., cooperative daycare centers, which serve more than 50,000 families.⁶ Altogether there are about 30,000 cooperatives in the U.S., providing two million jobs and generating more than 600 billion dollars in revenue.⁷

Of all forms of cooperative economic activity, worker cooperativism has had the most troubled history. And yet it too has had notable successes. Consider Europe again. Confining our attention to recent times, the European Confederation of Worker Cooperatives reports that the 50,000 enterprises affiliated with it employ about 1.4 million people.⁸ Italy has a particularly high proportion of worker co-ops—the highest per capita in the world—due in part to legal advantages.⁹ The Mondragon cooperative complex in Spain has had well-publicized success since it was established in the 1950s, eventually diversifying its

operations from industry to retail, agriculture, education, housing, and research and development. Currently it comprises about 250 companies that together employ 80,000 people and have annual sales of 13 billion euros, elevating Mondragon into the class of major multinational corporations.¹

Worker cooperativism has recently been spreading in Latin America, as societies try to piece themselves together in the wake of neoliberal economic destruction. For example, factory takeovers by former employees were quite common in Argentina after the collapse of 2001; the new worker-owners have organized their companies on a cooperative basis.² Some of these firms have won important legal battles that have affirmed their right to expropriate the property of the old failed business.³ After ten or more years—a long time even for conventional firms—many of these “recovered companies” are still in business. The same phenomenon has occurred in Brazil, perhaps on an even broader scale, as its solidarity economy has grown.⁴

The United States has often lagged with respect to progressive movements, and worker cooperativism is no exception. Currently there are only about 300 or 350 such co-ops in the country, and most of them are small to medium-sized.⁵ (Employee stock-ownership plans (ESOPs), by contrast, are quite common, with 11,000 of them operating today.)⁶ Nevertheless, the movement is growing. For example, the U.S. Federation of Worker Cooperatives was founded in 2004; smaller such federations and support organizations proliferate across the country, for instance the Network of Bay Area Worker Cooperatives in the San Francisco area (founded in 1994), the Valley Alliance of Worker Cooperatives in Massachusetts (founded in 2005), the Eastern Conference for Workplace Democracy, the Federation of Workplace Democracies in Minnesota (formed in 2004), CooperationWorks!, the New York City Network of Worker Cooperatives, the Ohio Employee Ownership Center (from 1987), the ICA Group, the Cooperative Fund of New England, Green Worker Cooperatives (based in the Bronx), the California Center for Cooperative Development, the Working World, the Cooperative Development Institute, the National Cooperative Business Association (founded in 1916), and many more. Even the organizations not exclusively devoted to supporting worker co-ops have recently been getting more involved with them, as public awareness and interest have increased.

The worldwide growth of economic cooperation unreported by the corporate media suggests that we are witnessing the beginning of a social movement the likes of which have never been seen in history. It is quietly sweeping the earth, altering life for millions, but it has barely yet emerged from its infancy. For two centuries its scouts have forged ahead, so to speak, effectively building interstitial redoubts from which in part to wage the future war. And it *will* be waged, in the coming decades. Compared to this underlying economic evolution, the political headlines of today are little more than epiphenomena. Worker and consumer cooperativism, the social economy, the solidarity economy, local participatory democracy, public banking, regional economic coordination—all this represents the future. The following will establish this claim in broad outline, by taking worker cooperatives as emblematic of larger trends.

THE SOCIOLOGY AND ECONOMICS OF WORKER COOPERATIVES

The first question we have to answer is how to define a worker cooperative. Numerous definitions have been offered, all of which share the same intuitions about democratic ownership and control. Here is Derek Jones's definition:

...an autonomous enterprise in which (a) many workers (or members) own stock, (b) ownership is widely distributed among the workers, who own much of the voting stock, (c) working-members participate in the enterprise's management and control, and (d) they share in the distribution of the surplus, usually on the basis of work [rather than stock ownership].¹

Like most commentators, he distinguishes cooperatives from mere employee-owned firms, for instance those that have ESOPs, which do not require employee participation in their management.

As stated in the Introduction, the conceptual starting-point of the worker co-op is that labor has power over capital, whereas it is the reverse in a conventional business. That is, in a capitalist enterprise both ownership and control (and the right to a share in profits) ultimately belong to investors, and voting rights are proportionate to the number of shares of equity held. The more capital one owns, the more control one is supposed to have over the operations of the firm. In the co-op, control is not directly related to ownership: the principle is "one worker, one vote," not "one share, one vote." Moreover, all or the majority of shares—if stock exists at all—are owned by workers, not outsiders. Otherwise there would be the danger that investors could acquire all the power, which would lead to the business's degeneration into a capitalist firm.

In a traditional business, the only consideration that really matters is the accumulation of profit. All else is subordinated to this goal. In a co-op, the dominant consideration is whatever the workforce wants it to be, for example the maintenance of steady employment, service to the community, or the accumulation of profit (to be allocated as the members decide). We'll see below that, as a rule, workers prefer the continued employment of as much of the workforce as possible to the retention of high revenues, which in hard times means that they accept pay cuts in order to avoid layoffs.

The typical governance structure of a cooperative follows from what has been said. In large cooperatives, a board of directors, drawn from the ranks of the worker-members themselves, is elected by the workforce and managers are appointed by the directors (or sometimes elected directly by workers). Both directors and managers, therefore, have an incentive to treat "employees" well and respect at least some of their priorities, since if they don't, they might be voted out of their position. Small co-ops, on the other hand, have little "governance structure" at all: they tend to operate by (near-)consensus and have no need of managers or directors. Occasionally there is a nominal "board of directors" for minor decisions or for administrative matters with which other members do not want to concern themselves.

Already, a major reason for the rarity of worker co-ops is evident: investors have a greater incentive to invest in firms that give capital control over labor rather than vice versa. Hence, it will frequently be the case that people cannot raise enough capital to get a cooperative started or to keep it functioning. Investors' interest is in the extraction of maximum profit regardless of the will of the workers; indeed, the interest of the latter, as employees, is directly opposed to the interest of capital, since profit is inversely proportional to wages. Investors will therefore be reluctant to deposit their funds in a firm that gives control to its workers, who do not value the maximization of profit above all else.

At the same time, cooperatives are motivated, as I said, *not* to seek large amounts of outside investment, since then it might be difficult to prevent control from effectively falling into the hands of these investors, an eventuality that could lead to the erosion of the firm's commitment to democratic ideals. The

¹ Derek Jones, "American Producer Cooperatives and Employee-Owned Firms: A Historical Perspective," in *Worker Cooperatives in America*, eds. Robert Jackall and Henry M. Levin (Berkeley: University of California Press, 1984), 37.

usual practice among co-ops is to rely primarily on initial investments in the firm by its worker-members (who thereby gain a share in ownership),¹ in conjunction with loans from cooperative banks or other institutions ideologically committed to cooperativism. But it remains true, for the reasons mentioned and others to be examined below, that raising sufficient capital is one of the biggest obstacles to the spread of worker cooperatives—and, as a corollary, that cooperatives have preponderated in non-capital-intensive industries.

However, let's consider these questions and others in more detail, drawing upon the scholarly literature. I will discuss small cooperatives, sometimes called “collectives,” first, since they are the most numerous.

Collectives

Organizational structure

Collectives approach most closely the participatory democratic ideal of cooperation. Being of fewer than, say, 40 people, often as few as 15 or less, there is a minimum of bureaucracy and a maximum of collective decision-making. The values of decentralization, spontaneity rather than bureaucracy, freedom and self-initiative rather than external imposition of rules, are the guiding lights. In a sense, the structure of collectives can be seen as the ideal that larger cooperatives try to approximate insofar as they are committed to cooperativism.

As already noted, the collectivist form of governance is directly democratic and usually consensual. Major decisions, and often minor ones, are approved of in meetings attended by all the members; the goal is to hammer out a policy on which everyone agrees. What makes this consensual decision-making possible, of course, is the small size of the collective. As one author states, “The face-to-face relationships and directly democratic forms that characterize the collectivist organization *probably cannot be maintained if the organization grows beyond a certain size.*”² There is no absolute optimal size of cooperatives, though, since the proper size varies with the nature of the work and the technology available. Perhaps Jean-Jacques Rousseau's criterion, suggested in *The Social Contract*, is best: “each citizen [must] with ease know all the rest.” One writer states bluntly that “democracy is inversely proportional to the size of the cooperative,” and he advises that co-ops not exceed a size compatible with a general meeting of the members.³

For example, in the 1980s the small size (around 25 members) of the Cheese Board, a collective in San Francisco that was and is the leading cheese store in the area, made possible a largely consensual approach to decision-making, with no formally acknowledged “leaders.” Any leadership is informal, based on personality and perceived commitment to the co-op. As Robert Jackall noted in a 1983 case-study, when major matters have to be decided upon, “such as the long-term disposal of the growing surplus funds,” a consensus is required at one of the monthly meetings. For minor matters, though, a simple majority vote sufficed—or decisions could be made by the shift at the time that an issue arises. Achieving consensus is difficult and time-consuming, sometimes requiring many meetings over many months, as when the business decided to post a sign publicly proclaiming its status as a collective.⁴ This is one of the reasons why a constant practicing of direct democracy, especially of the consensual sort, is not feasible in large organizations; it would take too long to reach and implement decisions on even minor issues. Representative democracy and a degree of bureaucracy, i.e., of the centralization of power, become essential to getting things done in a timely manner.

¹ Actually, legal structures exist according to which worker-members do not “own” a “share” in equity but receive a portion of the profits anyway. See the final section of this chapter. For now, the differences between legal forms are unimportant.

² Joyce Rothschild and J. Allen Whitt, *Potentials and Dilemmas of Organizational Democracy and Participation* (New York: Cambridge University Press, 1986), 91. Italics in the original.

³ Tadeusz Kowalak, quoted in *ibid.*, 92.

⁴ Jackall, “Paradoxes of Collective Work,” in *Worker Cooperatives in America*, 122.

(In fact, now that the Cheese Board has expanded to 50 members who also run a bakery and a pizza business, the old requirement of consensus has been partially abandoned. The new rule is that a kind of “modified consensus” is necessary for important decisions: members try to reach agreement, but if they can’t, a near-consensus suffices.)

So, the first constraint on democracy is size—of the business and of its market. Equal Exchange, a workers’ co-op in Massachusetts with over 100 members that did \$51,046,000 worth of business in 2012, necessarily has more bureaucracy, more specialized jobs (including customer service, media outreach, etc.), and less democracy than Collective Copies, a copying center with 12 members in Western Massachusetts.¹ The second constraint, mentioned already, is time. “Quite simply, a boss can hand down a bureaucratic order in a fraction of the time it would take a group to decide the issue democratically.”² On the other hand, in the latter case the policy might be implemented more effectively, since workers presumably would be more committed to it. Indeed, ironically, the much-maligned inefficiency of bureaucracies is due in large part to their *undemocratic* nature, their inflexible, impersonal, atomized, uncommunicative, unaccountable, uncreative, unresponsive-to-unforeseen-contingencies structure. As Michael Crozier says, “A bureaucratic organization is an organization that cannot correct its behavior by learning from its errors.”³ This is because in centralized organizations, change can come only from the top—but at the top are people who usually do not learn of “errors” at the bottom at all. Information does not flow efficiently: bureaucrats are isolated from the consequences of their actions and cannot see the broader picture, due to the atomized and diffuse nature of the organization, with each official performing a specialized function and no other, always waiting for dictates from on high in lieu of taking initiative.⁴ These failures, and others, of bureaucracy do not apply to democracy.

A third constraint on democracy in worker co-ops is environmental: larger structures in the society have inculcated behavior patterns of submission to authority, competition in the workplace, conformism, and passive atomization rather than active participation in decision-making. One finds in the scholarship descriptions of cooperators who simply do not have the desire to participate in the governance of the firm, who want only to get their paycheck and not deal with the challenges of deciding policy. This is one origin of the old elitist accusation that “the masses” *want* to be subordinate, that they have neither the capacity nor the inclination to exercise democratic self-control. However, as one sociologist concludes, “We learn to participate by participating... The experience of a participatory authority structure might be effective in diminishing tendencies toward non-democratic attitudes in the individual.”⁵ To say it in a different way:

If one accepts the assumption [that certain people “are not ripe for freedom”], freedom will never be achieved; for one cannot arrive at the maturity for freedom without having already acquired it; one must be free to learn how to make use of one’s powers freely and usefully...⁶

As Kant goes on to say, the first gropings toward freedom and democracy by a people not used to it may be clumsy or ineffectual—especially if the experiments in freedom (such as worker cooperatives) are situated in a still-unfree society. Actually, a lack of involvement by some worker-owners in the affairs of governance is less a problem in collectives than in larger cooperatives. But the point holds: the cooperative’s structure and the expectations or pressures that go along with it are in tension with those of the broader society, and this fact can undermine the co-op’s smooth democratic functioning inasmuch, for example, as

⁴ To take a random example, Lawrence Wright’s *The Looming Tower: Al-Qaeda and the Road to 9/11* (New York: Knopf, 2006) explains how the CIA’s and FBI’s bureaucratic overspecialization resulted in the 9/11 attacks.

⁵ Carole Pateman, quoted in Rothschild and Whitt, *Potentials and Dilemmas*, 67.

⁶ Immanuel Kant, quoted in Noam Chomsky, *For Reasons of State* (New York: Vintage Books, 1973), 393.

lazy and undemocratic attitudes have to be overcome, and individuals with competitive or authoritarian personalities have to be persuaded to soften their behavior.

One way to avoid these sorts of problems is to be selective in admitting new members. And collectives often are very selective indeed. The Arizmendi Bakery in Oakland, California is an example:

We watch how [prospective members] work and how they take feedback. We bring people in for twelve hours over several weeks. They shadow someone and try out different tasks and we evaluate them. Then we bring them in for a group interview. If we really connect with them, then we bring them on for a six-month trial candidacy. We train them on specific shifts, and they go to meetings related to the history and other ideas that are important for understanding the collective.

By the end of six months, there will have been three different evaluations, which are pretty intense. We give them constructive feedback, time for them to voice their concerns, feedback from their sponsor, who has been working alongside them. Then it goes to a full vote and the candidate has to get a 75 percent positive vote to be invited in.¹

Joyce Rothschild and J. Whitt go so far as to say that “*consensus, an essential component of collectivist decision-making, may require from the outset substantial homogeneity among members*. Participants must bring to the process similar life experiences, outlooks and values if they are to arrive at agreements.”² To an extent this is obviously true, and the rigorous screening process at Arizmendi testifies to it. But the criterion of homogeneity can surely be overemphasized. For example, Red Sun Press, a printing-and-design cooperative in south Boston with ten worker-owners, has had a very heterogeneous workforce since its founding in 1973: young and middle-aged, highly educated and less educated, countercultural and mainstream, middle-class and working-class, whites and Hispanics. This fact has not prevented the business from lasting forty years and being financially successful.

Another factor that can interfere with participatory structures is the sheer exhaustion and stress that can accompany the fusion of “employer” and “employee” roles. This is exacerbated by the fact that cooperators, especially collectivists, sometimes receive less pay than their counterparts in conventional businesses. “Burnout” can set in: “the experience of feeling constantly overworked, of having too much responsibility and not enough organizational support to carry it out, of never having enough free time for personal pursuits, of constantly being hassled, of, in one worker’s phrase, ‘losing your soul.’”³ Similarly, in a directly democratic environment, where consensus may be required, interpersonal tensions are prone to flaring up. Disagreements can become personal, and general meetings can be quite stressful. Bureaucracy, therefore, is in some ways *easier* than democracy: the impersonal environment, the not-having-to-treat-people-as-people, can reduce the potential for emotional conflicts.

Again, though, qualifications are necessary. A member of Red Sun Press, in Boston, observed in an interview with the author that, contrary to what one reads in much of the scholarly literature, working in a co-op is not significantly more stressful than working at a traditional business. “In a conventional workplace,” she says, “some of the stress comes from having little power over your working conditions and business decisions. In a co-op, some of the stress comes from *having* the power—then you *are* responsible for what happens! Ultimately, having the power is the option I would choose.”⁴ Most cooperators, and probably most people, would agree with her.

Studies in the 1980s and earlier emphasized another manifestation of the collectivist commitment to egalitarianism: “deprofessionalization,” or the avoidance of professional specialization due to its

⁴ Interview with Nancy Nichols, June 10, 2010.

bureaucratic, stratifying implications. “In the smaller worker cooperatives,” writes one author, “work roles are holistic, specialized knowledge is demystified, and there is frequent task sharing and job rotation.”¹ The practice of job rotation (or, in a less extreme form, simply having the option to change one’s job) was in part a legacy of the radical origins of the 1960s’ and ’70s’ wave of collectives, but it also arose, and continues to arise, from the very nature of small-scale cooperative work. People working in a business often get bored with their routine and want to learn something new. This diversification of their skill-set, in fact, may be intimately connected to their sense of self-worth: the more routinized, bureaucratized, bored and detached from one’s activities one is, the less self-esteem one has. Humans crave new challenges periodically, and a life or a job bereft of challenges or opportunities for growth is a terrible thing. In capitalist businesses, where most employees have far less input than management in the firm’s operations, the desire for stimulating novelty is subordinated to the bottom-line. In collectives, by contrast, workers often give themselves the opportunity to change their roles, to learn new tasks.

For example, Robert Jackall notes that at the Cheese Board it was possible during the 1980s to switch jobs occasionally if one had enough initiative. Certain tasks were considered attractive, such as baking bread in the morning, and one could “win” these jobs at least temporarily if his coworkers respected his contributions to the store—in other words, if he “deserved” the job.² In fact, a similar tradition continues today.³ It requires self-initiative, but the opportunity is there.

However, such deprofessionalization is not possible in all industries. Sometimes expertise is essential for efficiency, as in the printing-and-design and other high-tech industries. In these cases, job rotation is rare. What does happen, though, is that workers change their jobs if they so desire: e.g., at Red Sun Press, Nancy Nichols was the salesperson for seven years, then became the production manager, then did customer service, and now is the business manager. Still, to the extent that expertise in specialized tasks has become increasingly important in recent decades, deprofessionalization has declined. Similarly, the larger a cooperative is, the more difficult it is to organize job rotations, just as it is more difficult to institutionalize democracy.

Wages and employment

One of the ways in which cooperatives rectify the injustices of capitalism is by instituting a relatively equal compensation-scheme for their members. While in the U.S. the average ratio of CEO compensation in the Fortune 500 companies to the ordinary worker’s has recently been reported as 344:1,⁴ in co-ops the pay-differential between management and the average worker rarely exceeds 4:1. In collectives, like the Cheese Board, everyone is usually paid the same amount.

For example, a British study from the 1980s reports that all of the dozens of small co-ops it researched had lower pay-differentials than conventional businesses, and most had little or no differential at all.⁵ At Arizmendi Bakery everyone currently receives about 20 dollars an hour plus a percentage of the year’s profits. The worker-owners of Mondragon Bookstore and Coffeehouse in Canada earn the same rate of pay. At Equal Exchange, a relatively large co-op, there is a 4:1 pay ratio.

On the other hand, collectivists sometimes earn less than their counterparts in private enterprises. One study reports that at a cooperatively run newspaper called the *Community News*, which had a full-time staff of about 15 people, staffers made between 18 and 25 percent of what they could have made at comparable but “established” journalism jobs. Some workers in fact were paid nothing at certain times, while working a 40- to 60-hour week. At another co-op studied, a medical clinic, some staffers made about 50 percent of what they could have earned at other nursing or counseling jobs for which they were qualified.

⁵ Chris Cornforth et al., *Developing Successful Worker Co-operatives* (London: SAGE Publications, 1988), 123, 124.

Volunteers also made up a significant portion of the staff. On the other hand, because of the substantial equality in salaries, such workers as secretaries often earned as much as their ‘capitalist’ counterparts.¹

Against examples of low pay must be set small co-ops like Home Green Home Natural Cleaning in San Francisco, which was established in 2009 to give employment and decent wages to low-income Latinas. In addition to the 50 to 100 percent higher earnings the women make at their new job than earlier, they have health insurance now and work in healthier environments, where the cleaning chemicals are not as toxic as in many conventional cleaning companies. A study reports that the worker-owners of another such co-op in California, called Natural Home Cleaning (started in 2003), have tripled their personal income and enjoyed an increase of 70 percent in their household income since they joined the cooperative.² In some cooperatives wages might be low but because workers are owners they receive a share of annual profits, which, combined with benefits, often raises their income to above the level at comparable private firms. [more?]

The reason for the sometimes-low pay-levels of collectives is not too obscure: it is due to undercapitalization, which means that small cooperatives “sometimes generate little surplus to distribute among their members.”³ Especially in the early days of a cooperative, the lack of external capital might mean that wage-levels have to be kept low in order to capitalize the business.⁴ And in times of recession, cooperators usually choose to lower their wages if the alternative is to lay off members, which they are always extraordinarily reluctant to do. In conventional firms, by contrast, wages are “sticky,” hard to change; management typically chooses to lay off employees and let the remaining ones keep an income that is perhaps higher than that of the cooperators who have voted to cut their own wages.⁵ Thus, as one recent study sums up, cooperatives of whatever size tend to have more volatile wages than conventional businesses and less volatile employment.⁶

These facts, of course, merely confirm what common sense would suggest. First of all, members of cooperatives tend to see themselves as part of a community of worker-owners, and they respect each other as belonging to this community. It is reported universally in the literature that the prospect of laying off or firing fellow workers is extremely painful. This is especially so in collectives, where the communities are tightly knit and people develop bonds of friendship with each other. Even in situations where close friendships do not develop, there usually remains mutual respect and a sense of obligation to each other—a sense of “we’re in this thing together.” In fact, historically one of the most important goals and functions of cooperatives has been “to provide employment security or to expand the employment base for the local population.” This was a key reason for the establishment of both the famous plywood co-ops discussed below and Mondragon,⁷ as well as the green cleaning cooperatives in San Francisco and the Evergreen cooperatives in Ohio (see the next chapter). Therefore, to lay off workers, even the least productive ones,

⁴ Cornforth, *Developing Successful Worker Co-operatives*, 123.

⁵ In recent years, of course, it has become increasingly common during recessions for capitalist businesses not only to lay off employees but to hire new ones at a much lower rate of compensation. For instance, this is what the Hyatt Hotels and Resorts chain did in Boston in 2009: it laid off a hundred housekeepers who were earning \$15 or more per hour and outsourced their jobs to others whom it paid \$8 an hour (even though, because the staff had shrunk, these new housekeepers had to do far more work than the old ones had). Megan Woolhouse, “Firing Housekeepers Creates PR Mess for Hyatt,” *The Boston Globe*, September 25, 2009. Incidentally, as is usually the case in such situations, the broader recession was simply an excuse that Hyatt used to justify its action; in fact, the company was by no means in desperate financial straits. See “Hyatt Hotels posts narrower Q4 new loss” in *The Guardian*, <http://www.guardian.co.uk/business/feedarticle/8962714> (accessed March 15, 2010).

during hard times would flagrantly violate not only the democratic, humanistic spirit of cooperativism but also one of its main economic functions in a society of employment insecurity.

In short, there is no question that cooperatives, even collectives, have potential for alleviating unemployment, and that this function is typically seen to take precedence over that of securing high wages—although the two are by no means always mutually exclusive.

Incentives, job satisfaction, productivity, and “the political effects of participation”

It should be obvious by now that a different set of incentives tends to operate in small cooperatives than in conventional businesses. Whereas the latter are typically structured primarily around the desire to make more money and get promotions faster than one’s coworkers, the internal dynamics of the former have more to do with interpersonal relationships, the desire to feel good about one’s work, the goal of maintaining a democratic workplace, and so on. Workers tend to have different expectations and want different kinds of rewards than they would hope for in a capitalist firm.

This is particularly true of collectives. As already stated, these are both the most numerous co-ops and, in general, the least remunerative: sometimes workers are egregiously underpaid compared to their counterparts in capitalist firms. But, as with all things cooperative, this is partly by choice. People *choose* to remain in a collective, they accept low pay in part because they value other things more than money. Study after study demonstrates that collectivists want most of all to be in control of their work, and that they find nothing more miserable than working in a bureaucratic setting with a boss who orders them around. The following statements are illustrative:

“You get a different feeling, working for yourself...” “You’re working more hours but you get more enjoyment...it’s your own.” “There must be many people who, like us, have been driven half-insane by the dehumanizing straitjacket of the orthodox working world and yearned to be part of something better, more fulfilling.” “There’s some scope for personal creativity.” “Not having someone who does not know the job telling you what to do...” “I believe now in my capability of being something. I’ve always felt impotent before about getting things done in the world. I believe I could start a business of my own if I wanted to. I’ve gotten practical knowledge and a sense of self as well that I couldn’t conceive of before.” “Every year I become a little more confident of myself as someone who counts.”¹

Having control over work is not the only benefit. Closely related to it is the satisfaction of *believing* in one’s work and lifestyle, being convinced of its moral worth. This is especially the case if the co-op exists in part to serve a broader social movement, whether it be through printing leftist literature, as Red Sun Press does, or through promoting knowledge of whole foods, as some food cooperatives do. Such ‘moral’ orientations may serve the same function of raising self-esteem as does the opportunity to control the actual work process.

Collectivists are usually, though not always, liberal, educated, young, middle-class, and white. There are many exceptions, but on the whole this seems, for now, to be the demographic most attracted to the collectivist experience. “The [potentially] low salaries and erratic uncertain career paths [of collectivists] exclude, by self-selection, most minorities and all but a handful of those from working-class origins.”² Many of these young cooperators move on to more conventional jobs after a few years in a collective, desiring more money, new outlets for their ambition, and perhaps less labor-intensive, time-consuming work. But it is not uncommon to find middle-aged workers in collectives.

It is true that the sometimes-low pay can be considered a substantial cost, one of the most negative aspects of the collective experience. Tiredness due to long hours is also a common complaint, especially

¹ Quoted in *ibid.*, 124, and Cornforth, *Developing Successful Worker Cooperatives*, 100, 101.

² Robert Jackall and Joyce Crain, “The Shape of the Small Worker Cooperative Movement,” in *Worker Cooperatives in America*, 94.

from workers who are very active in the business and feel that they are taking on an undue share of the burden. Resentment can arise toward less active members who are perceived as “free-riding.” On the other hand, the more active one is, the more influence one has and respect one commands—as long as other workers do not perceive one as domineering or undemocratic. As mentioned above, collectives tend to be more susceptible to interpersonal conflict than conventional businesses are, due to their open, democratic, personalized structure.

None of these costs, however, is irremediable. Wages usually get higher, sometimes to union levels or above, after the co-op has been in business for a while and has accumulated experience and expertise; it is in the early stages or during difficult times that wages are lowest. The other problems can be mitigated simply by communicating with other members, airing grievances during meetings and strategizing about how to deal with them. Most cooperators report that meetings can be confrontational, stressful, sometimes traumatic, intensely personal, excessively long; but in principle it is through the mechanism of periodic general meetings that the pitfalls of cooperation can be overcome, or at least mitigated so that the benefits of cooperation decidedly outweigh the costs (as almost all cooperators report that they do). It must also be emphasized, again, that strong bonds frequently develop between cooperators, indeed partly because of the relatively intense and sometimes difficult nature of the work. Apologists for capitalism point to this existence of conflict as a flaw, but in fact it ought to be considered a strength. For one thing, it indicates that workers are personally committed to their work, unlike in many private enterprises. Overt conflict (when it exists) is also more psychologically healthy than suppressed conflict, and it is more ethical, in that it results from adults’ treating each other as adults, with dignity. They confront their problems and try to solve them, which means they act as human beings rather than bureaucratic automatons who treat each other impersonally.

One source of “alienation” in conventional enterprises that cannot always be rectified in cooperatives is the intrinsically unpleasant nature of certain kinds of work. No matter what the social relations are, whether cooperative or competitive, sewing, for example, is not particularly fun. “It’s hard work...you have to concentrate, you can’t just gossip away and it can be boring,” reports one worker. Printing may involve “toxic chemicals, noise, oil vapor, carcinogens.”¹ The industrial work of the old plywood co-ops is inherently monotonous: “It’s like being a zombie... You’re doing something that’s basically unpleasant. Most jobs are monotony and repetition. It can drive you nuts... I go through times when I get so depressed.”² Even Karl Marx conceded that some kinds of work are inherently antithetical to freedom, the spontaneous creative expression of the human spirit:

...In fact, the realm of freedom actually begins only where labour which is determined by necessity and mundane considerations ceases; thus in the very nature of things it lies beyond the sphere of actual material production... [The realm of material production] remains a realm of necessity. Beyond it begins that development of human energy which is an end in itself, the true realm of freedom, which, however, can blossom forth only with this realm of necessity as its basis. The shortening of the working-day is its basic prerequisite.³

Marx may even have exaggerated here the intrinsically alienating features of material work. But his broader point is correct: some activities will never, no matter how they’re organized, be the sort of thing one chooses to do for their own sake. This is one of the reasons why some collectives practice job rotation.

A problem that may afflict collectives, and to an extent larger co-ops, but does not affect private enterprises is conflict over goals. Workers have to decide whether their main objective is to have high wages, to provide employment to as many people as possible, to provide a cheap service to political and community groups, to grow as a business and spawn new co-ops, or any other objective to which some

¹ Cornforth, *Developing Successful Worker Cooperatives*, 104.

² Quoted in Greenberg, *Workplace Democracy*, 82.

³ Marx, *Capital*, Vol. 3, Part VII, Ch. 48.

members may be committed. The potential for strife here is great. Moreover, even if the members reach a consensus on how to prioritize objectives, there remain external constraints on cooperative goals and values, such as the need to be efficient and competitive against conventional businesses that may not have the same problems with capitalization as co-ops do. This necessity is less constraining the more “marginal” a cooperative is—for example if it serves a niche market where there is not much competition from other firms—but co-ops will always have to act like a capitalist business to some extent, just to stay afloat.

Actually, labor productivity is usually higher in cooperatives than in conventional enterprises, for obvious reasons. I will return to this issue in the section on larger cooperatives; suffice it to say for now that cooperators have greater incentives to be productive than typical employees do. For one thing, worker-owners can directly appropriate, or do as they want with, profits, whereas in capitalist firms profits usually go to outside investors. Thus, the connection between the success of the capitalist business and the employee’s personal gain is not as direct as it is in a co-op. Cooperators will also exert peer pressure on one another to perform well, and the relatively high camaraderie present in the work process will have a productivity-boosting effect. The work itself, as stated above, is more intrinsically rewarding and self-actualizing, especially in collectives, and the democratic environment, which allows access to information that would be withheld from conventional employees, is empowering. Cooperators are not always more productive than regular employees, but the *incentives* for high productivity are great.

Another argument sometimes made by leftists in favor of cooperativism is that it encourages class-consciousness, participation in politics and social movements, and in general fosters a “proactive” transformation of individual character. The hope is that cooperators will carry over their work practices (insofar as they involve participation and engagement) into the outside world, and that the co-op itself might join and support progressive movements. Unfortunately, the data are mixed. With regard to collectives, few generalizations can safely be made. It is true that most collectivists report that their experiences have raised their self-esteem—especially if they used to work at a traditional company—and they certainly enjoy work more than most employees do. It has not been conclusively established, however, that membership in a collective inherently raises political consciousness or encourages political activity. While it is likely that collectivists have had a higher rate of political participation than the population as a whole, that is partly because the sort of people who join small co-ops are more likely to have a liberal activist’s temperament and values. Also, many such co-ops are explicitly political, such as radical printing presses and bookstores. Even food cooperatives are relatively political, since the distribution of food is a political issue. But cooperatives are also businesses, and as such might choose not to join a movement or even act contrary to progressive interests, for instance by negotiating deals with employers that are injurious to the latter’s employees. American history is replete with examples of cooperatives alienating the local labor movement. Co-ops also might be loath to offend their customers by taking overt political stances.

So, individually and collectively cooperators as such *might* be prone to progressive activism (see below) but are not so in any stunning way. It seems as though they should be because their workplaces are relatively egalitarian and empowering, but one must remember the lesson of Marxism: social dynamics are holistic, such that individuals and institutions are molded by pressures emanating from *everywhere* in the society. The social structure as a whole conditions entities to behave in certain ways, and in a sense it reproduces itself.¹ Thus, the facts that co-ops have to survive in a capitalist context and that cooperators themselves have been shaped by broader patterns in the society tend to undermine whatever anti-capitalist and politically participatory implications there are in cooperative production relations. On the other hand,

¹ Louis Althusser called this “structural causation,” different from other kinds of causality. It is an obscure notion but a necessary one, which is operative not only in society but in nature (albeit in a different way, a more deterministic way). Althusser thought that Spinoza was the first Western thinker to grasp the importance of structural causation, the first to pose the question of how the elements of a whole can be conditioned or determined by the whole itself (which, in Spinoza’s pantheistic system, was the entire universe, which he called God). See Althusser and Étienne Balibar, *Reading Capital* (London: New Left Books, 1970), especially 182–193, and Alison Assiter, “Althusser and Structuralism,” *The British Journal of Sociology* 35, no. 2 (June, 1984): 272–296. Structural causation is closely related to the difficult ideas in contemporary philosophy of “downward causation” and “emergence.”

the latter's political potential becomes more potent the more cooperatives colonize a given area, building up their own culture, and the more they network with each other—the more they establish federations, etc. For then they might develop political agendas, lobby together for favorable legislation, link up with other movements in similar structural locations and with similar interests and ideals. Such networking is arguably the most important element in any attempt to make society a more humane place.

Medium-sized and larger cooperatives

Organizational structure

In general, the larger an organization is, the more complex and less directly-democratic its structure is. Indeed, it almost necessarily becomes more bureaucratic and hierarchical, because in order to function smoothly some specialization of roles is required. A business with a hundred employees has to have a more differentiated structure than a business with fifteen employees; for example, it has to process much more information, of different kinds. With specialization and bureaucratization, however limited it may be, comes an element of hierarchy. There has to be a central organ that collects all the information and uses it to make decisions about the organization's future and its relations with the outside world. Theoretically the entire body of workers could make these decisions collectively—perhaps everyone could receive a packet of information about the firm's operations, study it for a week or two, and then congregate in a general meeting—but certain constraints make this unrealistic. As stated above, the time constraints may be prohibitive. Even in a collective, weekly meetings can last for several hours and it may take weeks or months for a single issue to be resolved. Also, the information that has to be digested may be so technical that most workers are unable or unwilling to absorb it, preferring to leave it to specialists who have been trained in the particular topic. Or they may simply be apathetic and too exhausted at the end of the day to devote hours to administrative matters.¹

For many reasons, therefore, some of which are not necessarily related to the nature of capitalist social structures, it may be necessary to have specialized professionals advising a board of directors. In a large cooperative, direct democracy will be the exception, representative democracy the rule. The board of directors will have to appoint managers—or they can be directly elected by the workforce, as the board of directors is—to ensure the smooth daily coordination of the business. Workers do monitor each other in many large co-ops, but it is not hard to imagine situations in which at least a few designated “superintendents” of some sort are necessary (and perhaps would be so even in a more egalitarian economy than the present).

The now-defunct plywood cooperatives of the Pacific Northwest, whose history will be discussed in the next chapter, illustrate these points. In the early 1980s there were eleven such co-ops in Washington and Oregon, each owned by between 100 and 300 workers. Christopher Gunn summarizes their governance structure as follows:

Owner-members elect their board of directors, and the firm's general manager is appointed by that board. The board and the manager administer the routine operations of the co-op; policy decisions are made on a one-person, one-vote basis by all owner-members in semiannual or quarterly general meetings [where “there are discussions about everything from the manager's performance to capital-investment decisions”]. Major decisions are discussed extensively by owner-members, who have full access to information concerning the co-op's operation. The core of production workers in these co-ops essentially hires and fires its manager.²

¹ See, e.g., Kasmir, *The Myth of Mondragon*, 136–138.

² Christopher Eaton Gunn, *Workers' Self-Management in the United States* (Ithaca, NY: Cornell University Press, 1984), 100, 109.

There is an element of hierarchy in production and decision-making on the shop-floor, but much less so than in comparable capitalist firms. The word “hierarchy” in fact is a bit misleading: plywood worker-owners take their “supervisor” much less seriously than in conventional mills because his continued employment depends on their goodwill, and it is very rare that he will try to fire one of them. (Sometimes he is an outsider who has been hired, sometimes a worker-owner himself.) There are also few supervisors in plywood co-ops, maybe one or two per shift, whereas in a private enterprise there have to be six or seven because the workers have less of an incentive to work efficiently. The co-op supervisor tends not to bother the workers but concentrates on “broader, plant-wide issues having to do with the flow of materials and machine-usage.”¹

Plywood cooperators, who often have semiskilled jobs that can easily be rotated, frequently organize informal job rotations to alleviate monotony or for some other reason. This is not done in conventional mills, where “jobs are assigned through precise and formal agreements made between management and the union.”² Cooperators also initiate innovations in work procedures and have more flexibility in their tasks than at conventional mills.

Thus, while considerations of efficiency dictate that the consensual, spontaneous, “self-actualizing” form of collectives be limited in larger co-ops, it can still exist to a much greater degree than at private enterprises. One should not think, incidentally, that this presence of democracy constrains efficiency, that it signifies a compromise between freedom and productivity. Quite the contrary. The above description should already have helped dispel that impression; moreover, as I mentioned earlier, bureaucracy not tempered by democracy can be extremely inefficient, whether it’s in a government or a business. Therefore, to compromise between participation and hierarchy in a large organization is in fact to establish the greatest possible efficiency. I’ll return to this point below.

Companies in the Mondragon Cooperative Corporation, which have hundreds or thousands of workers, have a more complex governance structure than the plywood co-ops. The general assembly of all worker-members in each company meets at least annually to elect a governing council (similar to a board of directors) and to approve company plans and policies. Members of the governing council, who themselves are worker-members, have four-year terms; they are not paid for their council responsibilities but receive their regular salaries. The council appoints and can remove the CEO and must approve his choices for senior executives; it meets once or twice a month to monitor the management team’s and the company’s performance. There is also a “Social Council” that meets monthly, composed of representatives elected annually; its role is vaguely similar to that of a union, though it is supposed to be more cooperative than confrontational vis-à-vis the governing council and the management team. It serves as the voice of all the workers, communicating with management on such issues as working conditions, wages, and health and safety. This structure has worked for decades.³

Each cooperative in Mondragon has its own workplace structure, though there are similarities and tendencies that most of them share. The firm called Irizar, which manufactures products for transportation, from luxury coaches to city buses, exemplifies these tendencies. To encourage innovation and the diffusion of knowledge, there are no bosses or departments in Irizar. Rather, it has a flat organizational structure based on work teams with a high degree of autonomy. (One study remarks that they “set their own targets, establish their own work schedules, organize the work process as they see fit, and so on.”) The teams also work with each other, so that knowledge is transmitted efficiently. Participation occurs also in the general assembly, which meets three times a year rather than the single annual meeting common in other Mondragon firms. Its subsidiaries in other countries have at least two general assemblies a year, where they

approve the company's strategic plan, investments, etc. These participatory structures have enabled Irizar to surpass its competitors in profitability and market share.¹

The cooperative in south India called Kerala Dinesh Beedi (KDB), which has had great success since its inception in the late 1960s, is worth describing because of its unusual characteristics. First of all, it is very large: at times having had over 35,000 worker-members, it currently has about 9000. It grew out of a conflict between the employees and owners of a private company, when the owners laid off 12,000 beedi workers in the state of Kerala.² A left government had come to power in Kerala in 1967 and was committed to implementing recent national legislation that would regulate and improve the deplorable conditions of the beedi industry. Beedi employers were not happy with these developments; they wanted to continue using child labor and also institute a domestic "putting-out" system to fragment the workers, whose unions had been active in radical social movements for decades and were troublesome to the employers. One of the latter essentially declared war on the unions and the new leftist government: not only did it threaten to relocate to a different state if the government enforced the law, but it laid off 12,000 employees.³

A months-long crisis ensued, until the government and the unions decided to create a new cooperative to employ the 12,000 laid-off workers. Cooperatives had been created before in Kerala, but not nearly on this scale. The workers could not afford to put up much capital, so the government lent them millions of rupees, in addition to helping the trade unions accomplish the monumental organizational tasks. Government officials even joined the board of directors. What is amazing is that despite all this political involvement, the government soon "withdrew from any active role in the running of the cooperative."⁴ Even the endemic Indian problems of corruption did not arise, since the government was desperate for the cooperative to succeed.

One study summarizes the structure of KDB:

KDB is a federation of twenty-two "primary cooperatives." Each of the primary cooperatives has six to fourteen shop floors. At each, there are generally between 75 and 125 beedi-rollers. Production takes place at the shop floor. Every worker directly participates, informally and continually, in the decisions about work arrangements at his or her shop floor. Each shop floor has a formal, general body meeting only about once every six months. At the general body meeting of each group of shop-floor workers (seventy-five to one hundred twenty-five people) everyone participates. These meetings are the fora for discussing complaints about conditions of work, disputes with supervisors, and problems with the behavior or productivity of individual workers. Every shop floor also has a "factory committee" that does the day-to-day supervision and management of the floor. This involves deciding on matters such as ventilation, entertainment, and break times.⁵

Each primary cooperative has a board of directors elected by the members, which supervises the purchase of raw materials from, and the sale of finished beedis to, the "central cooperative," which is the point of contact between KDB and the outside world. Its decisions are a function of market demand; it is in charge of quality control, pricing, marketing strategy, diversification, the overall structure of wages and benefits, etc. The central board of directors is elected by the primary cooperatives' boards of directors. Workers

participate regularly in meetings with their unions, which then negotiate wages and benefits with the central cooperative. There are annual meetings of representatives of all the primary cooperatives.

Shop-floor supervisors cannot hire, fire, transfer, or fine their worker-bosses, but they have power nonetheless. They are usually senior workers themselves; they're promoted to their new position by the primary cooperative's board of directors. The supervisors are supervised, in turn, by foremen who have been hired by the central cooperative. The main function of a supervisor is to help train workers whose productivity is low or whose beedis are of low quality, but he is also responsible for enforcing workplace discipline and, of course, for monitoring individuals' productivity. Various positive incentives have been devised to encourage productivity, and as we'll see, they have been quite effective.

In short, every worker cooperative has its own distinctive structure, but the egalitarian and participatory tendencies I have described characterize all of them to some degree. These are the most important features distinguishing them from capitalist enterprises.

Wages and employment

The pay scales at large cooperatives are either identical to those at collectives or somewhat more unequal due to competitive pressures. The plywood co-ops paid all their members equally, the major exception being the general manager, who was usually a hired outsider and received a higher salary than members.¹ In the conventional plywood mills, by contrast, the wages of the highest-paid workers and the lowest-paid differed by a factor of about 2.5.²

At Mondragon, until the 1980s the differential between the highest- and lowest-paid workers was fixed at 3:1. In recent years, with the pressures of globalization and the need to attract skilled managers who could receive much more money in private enterprises, some positions have been raised to a 6:1 ratio, while the CEO of the entire Mondragon corporation earns nine times more than the lowest-paid worker.³

The fact that cooperative pay-scales are always relatively egalitarian is intuitive and uncontested. Less clear is whether ordinary workers in co-ops tend to be paid more or less than their counterparts in capitalist firms. It is known that, generally speaking, management is paid less than in capitalist businesses: this can be inferred from the smaller pay scale in co-ops. But the data on the wages of the average worker are less clear-cut. As we saw above, some collectives give their members higher pay and better benefits than in comparable private enterprises, while other collectives are unable to do so, especially if their capitalist competitors are unionized. Larger co-ops more regularly offer higher compensation, in many cases much higher than at comparable capitalist businesses—but, again, only for low-level or, sometimes, mid-level workers. David Herrera reports that “wages at Mondragon, as compared to similar jobs at local industries, are 30 percent or less at the management levels and equivalent at the middle management, technical and professional levels. As a result, Mondragon worker-owners at the lower wage-levels earn an average of 13 percent higher wages than workers in similar businesses.”⁴

Kerala Dinesh Beedi is an even better example of high wages: workers earn over three times as much as those in other firms (including health benefits, maternity benefits, pensions, and paid holidays). While most beedi workers slave away in “small and dingy work sites that lack proper bathroom facilities and pose health hazards because of the way the tobacco is kept,” KDB members have work sites that are spacious, clean, well-ventilated, and even “have entertainment in the form of someone who reads stories or news articles to the workers as they are rolling beedis.” Managers, on the other hand, earn only about as much as the beedi workers themselves, whereas in a capitalist firm of comparable size they would probably

make thirty or forty times that level, in addition to having luxurious perquisites not offered KDB's managers.¹

Cooperative Care in Wisconsin, which provides care to the elderly, was able to give its 81 members in 2004 relatively high pay, workers' compensation, ten days' paid vacation, and 50 to 75 percent health insurance coverage, all only three years after beginning operations.² Cooperative Home Care Associates in the Bronx, New York, founded in 1985, offers its 1700 members "significantly better pay and working conditions than most home health aides."³

How are cooperatives able to maintain high wages while competing successfully against conventional enterprises? The answer lies partly in their high productivity, which we'll discuss below. Also, greater size leads to greater capital accumulation than in collectives, which leads to more revenue in a self-reinforcing cycle. Collectives often just don't have enough capital to get the cycle started in a meaningful way—although, to repeat, when the annual distribution of profits and benefits is taken into account (in addition to wages), many collectivists do have a higher income than their conventional competitors.

As regards the trade-off in hard times between wages and employment, medium-sized and large cooperatives have the same priorities as collectives: they adjust pay rather than employment. The plywood mills, again, illustrate the point. A 1992 study compares the responses of three types of firms in the plywood sector—unionized, non-unionized, and co-ops—to adverse economic circumstances in 1980, as contrasted with the expansionary year of 1972. It finds that

employment in the union mills and in the classical [non-union] mills in 1980 averaged 83.6 percent and 51.3 percent of the 1972 values, respectively, whereas employment in the co-ops was 115.9 percent of the 1972 level; with respect to nominal average hourly earnings, earnings in the union mills more than doubled between 1972 and 1980, whereas earnings in the co-ops in 1980 were 183.8 percent of their 1972 levels.⁴

Thus, employment shrank significantly in the conventional firms but actually grew in the co-op, while the earnings of the cooperative workers did not grow as fast as those of the union workers. This supports my earlier contention that cooperatives have even more potential for alleviating unemployment than for providing high incomes.

Incentives, job satisfaction, productivity, and the political effects of participation

Because sizable co-ops are usually less economically marginal, more "mainstream," than collectives, and the people who work in them are more ordinary demographically and have more conventional expectations for their jobs, competitive success and high compensation are relatively important incentives. High profit-margins are valued so that members can earn more and (perhaps) the business can expand and invest in new technology. After all, most of these co-ops are founded solely to provide employment; the element of idealism or passion for a particular cause is rarely as significant as it is to many collectivists.

Owner-members of the plywood co-ops indicated in interviews that the reasons they joined the cooperatives were the potential for good income and job security. They have "individualistic, property-

holding motivations” that do not change as they experience the cooperative relations of production.¹ This is in marked contrast to most collectivists, who have precisely the opposite motivations—the inherently political desire to “escape the rat race” and do something they believe in. One obvious reason for the difference is that the plywood cooperators have a working-class origin and have known long periods of unemployment.² They think of their participation in a co-op as a financial investment: buy a share and get a secure job.

However, they quickly come to appreciate the control they have over their work. While they remain less idealistic and enthusiastic than the average collectivist, their attitude certainly differs from that of the workforce in a conventional plant, which tends to suffer from a relative “deadening of the spirit, a sense of defeat, hopelessness, and abjectness.” The participatory environment of the cooperative “fosters an extremely strong sense of collective responsibility and mutuality,” which is antithetical to the structure of work in a conventional factory. As mentioned above, this sense of mutuality is manifested, e.g., in collective and self-supervision and the rather low number of designated supervisors. “Everybody pitches in and helps,” remarks one worker; “the people stick together, that’s the reason we’ve gone so far and production is so high, ’cause everybody works together.” Some workers even profess to enjoy their work, despite its repetitive and mechanical nature: “There is a certain feeling to know that you own part of what you’re working for... I’ve always gone to all the stockholders’ meetings and...I enjoy it. I’ve never had so much fun! Hell, we run this operation all by ourselves.”³

One obvious supposed benefit of cooperatives is that there is less conflict between workers and managers than at conventional, hierarchical enterprises. Nearly all the data indicate that this is indeed the case. Consider, for example, a study published in 2001 that examines dispute resolution at a cooperative coal mine in Wales as compared to how it functioned when the mine was owned and operated by the British government, as it had been for years. In the early 1990s, with British Coal threatening to close it, 200 employees bought it and converted it into a worker cooperative. By law the company was required to have managers in charge of safety, finance, engineering and so on, but it hired only a third of the managers that had been employed by the government even though there was approximately the same number of miners. These managers retained significant power over the workers, but now their decisions could be overruled by the board of directors elected annually by the workforce.

When the mine was government-owned it was severely hierarchical and dispute resolution was confrontational: grievances, which cropped up continually, were resolved according to a rigid set of formal rules, and work stoppages instigated by either management or the union occurred frequently. Under cooperative ownership this all changed. Worker-owners were more flexible in upholding work rules, so that disputes were far less frequent. “Many current issues and conditions would have been formally contested under British Coal, warranting a grievance or other union action. Today, these potential disputes do not develop into grievances. Furthermore, these potential disputes are not...simply tolerated; instead, they are no longer seen as injurious experiences.”⁴ Miners were now not unwilling to work overtime without extra pay, or, for example, they would work at an undermanned site, whereas in the past that would have resulted in a grievance (because it entails extra work). In general, they were more willing to compromise, since their status as owners made them disinclined to stop work. Managers too were more easygoing and respectful, because power was more dispersed than in the past. One worker offers eloquent testimony:

Today, the manager will come out and talk to you. He very rarely goes through the pit without saying, you know, stopping and talking to everyone. Whereas before, the manager used to come down and he wouldn’t talk to you. He’d probably tell somebody

else who would tell you to do something. They felt they were some super-human! You know, we were down there and they were up at the top like. And it was all, “Do this!” They *tell* you rather than ask you.

Today, now, the manager comes down and he’ll ask you, “Any chance you could?” You know? “Can you do me a favor?” Before it was, “Oh you get and do that!” And obviously the respect had gone from the men for the management under British Coal.

Now at the colliery the men have got a lot of respect for the manager, because, at the end of the day, he owns as much of the colliery as we do. We all have equal-share basis and he’s in it for the same reason we are: to get the best out of the colliery.¹

Admittedly, some research indicates worker discontent at some large cooperatives, including conflict between management and the workforce. Mondragon, considered an exemplar of large-scale worker cooperation, has not been immune to this. For instance, in 1989, at a typical co-op with 250 worker-owners, members reported to a researcher that they most definitely did not think the firm was democratic. They referred to themselves as “working stiffs” and called the managers “bosses.” “We are not different,” they said, “from other businesses in any way.” “It doesn’t matter how equal we are in theory, in practice we are not.” “What good does it do me that they call me a collaborator when they treat me like a subordinate... At least in a regular firm you can call the boss a son of a bitch.”² Managers at this company considered relations between themselves and the workforce to be cooperative, respectful, and democratic; the workers, however, disagreed.

A study in the mid-1980s reported that Mondragon’s supervisory structures were virtually identical to those at nearby conventional firms, and observed that “the necessity to compete in national and international markets leaves insufficient space to implement alternative manners of work organization on a large scale.”³ Moreover, in recent years there have been major organizational changes considered necessary to maintain international competitiveness, so that now pay-scales are less flat, management councils have more power, and non-cooperative subsidiaries are being acquired in China, Brazil, and other countries.

There is no question that the need to compete in a capitalist world forces large co-ops to compromise with their principles. This has always been a criticism leveled at them by Marxists and other radicals. Nevertheless, it does not appear that they necessarily have to degenerate into semi-capitalist corporations, nor that they ever have the same adversarial relations between management and the workforce as conventional firms do. Even in the example mentioned above from Mondragon, the author of the study notes that relations are more harmonious in the co-op than in a comparable capitalist company. As long as most of the workers own the firm and participate in governance, and especially if efforts are made to instill a culture of cooperation at both the shop-floor level and the enterprise level, there will be meaningful differences between cooperative and conventional firms. These differences may even be strictly economic: the co-op will quite possibly be more productive than its capitalist counterparts, because of incentives and the diverting of resources away from unproductive supervision and the need to contain conflict (which is a constant imperative in the average capitalist business).

For example, I noted above that fewer supervisors were needed in the plywood cooperatives, and the worker-owners were unusually committed to the success of the enterprise. (The same was true of the cooperative mine just discussed.) This resulted in higher productivity-rates—measured by the physical volume of output per hour, the quality of the product, and economy of material input use—than in privately owned mills, as much as 50 percent higher. A relatively low amount of capital per worker was required, and the hourly return to workers was often 50 percent higher than union averages.⁴

The case of Kerala Dinesh Beedi is even more impressive. Despite its competitors’ significantly lower labor costs, it has been able to compete successfully for decades. How is this possible? One area of

¹ Ibid., 573.

² Kasmir, *The Myth of Mondragon*, 152.

³ See Dow, *Governing the Firm*, 62.

⁴ Gunn, *Workers’ Self-Management*, 103.

advantage is its far fewer managers and their relatively low compensation. But KDB's labor costs remain high even so. Another advantage is that there have been no major labor disputes in its history—a fact that is stunning in itself, since disputes are common and costly in the region as a whole. Also, as noted earlier, shop-floor conditions are very efficient, with workers monitoring each other and sharing information willingly. A particularly decisive strength is the uniformly high quality of KDB's beedis, which customers appreciate. Workers at other companies have an incentive to be hasty and careless in their beedi-rolling because they are paid on a piecework basis, and monitoring is difficult. KDB workers, who are happier, healthier, and better-paid, are more careful.¹

Examples of such productivity could be multiplied. But that would merely provide further illustrations of the intuitively reasonable point that labor will tend to be more productive in co-ops than in conventional businesses. One author concludes, on the basis of a meta-analysis of 43 previous studies, that (1) worker participation in decision-making in co-ops has a “small, positive, and statistically significant association with productivity, rejecting the traditional view that democratic management of the firm is associated with *reduced* efficiency”; (2) profit-sharing in cooperatives is very strongly associated with increased productivity, while the association is less pronounced in capitalist enterprises; (3) worker-ownership in co-ops has a small but statistically significant association with productivity, whereas in capitalist firms there is virtually no correlation (probably because employees typically own only a small proportion of assets).² A study in 1994 found that “employee involvement programs are invariably positively associated with desirable outcomes (such as greater work effort and higher productivity), whereas measures of performance pay are less robustly associated with these outcomes.”³ More recent studies have concluded that there is often a gain in productivity with employee stock-ownership plans—again, a result compatible with the hypothesis that worker cooperatives will tend to have high labor productivity.⁴

A number of reasons can be thought of to explain these results, most of which have already been mentioned. Cooperatives have lower absentee rates and less worker turnover than their conventional competitors. (For instance, the annual rate of turnover in the Mondragon cooperatives in 1974 was two percent, while in comparable capitalist firms it was 14 percent.)⁵ Members show relatively high individual work effort, tending to act as their own supervisors, at least to a greater degree than employees do elsewhere. Job rotation, where it happens, enhances the attractiveness of the work. And there are greater incentives to help one another than in a competitive environment.

Does all this have implications for political consciousness and participation? It seems to, but less so than one might hope. I noted above that collectivists tend to be relatively politically conscious and active but that the reasons for this are not entirely clear. The situation is even more ambiguous with regard to larger cooperatives. Edward Greenberg's conclusions about the plywood industry are illustrative. He addresses four claims made by leftists: “workplace democracy encourages participation in other social institutions outside of the workplace; helps create citizens who are endowed with a sense of their own political efficacy; increases participation in normal political life; and creates a sense of community and cooperation as well as a commitment to the public interest.”⁶ Few of his findings are encouraging.

For example, worker-owners were actually a little *less* likely to participate in organizations outside the workplace than conventional employees. This could be due to the fact that many of the latter belong to unions, unlike the former, which may foster political consciousness and activism. On the other hand, Greenberg finds that over time the cooperators did increase their participation in social institutions, though not to above the level of ordinary employees. They also didn't have any greater sense of political efficacy

than regular workers. More encouragingly, members were significantly more politically involved than conventional workers and were more likely to increase their participation over time—but at the same time they were more likely to think that “Society is best off when each individual looks out for his own well-being and not the well-being of others,” and in fact to agree with this statement more the longer they worked in a co-op. So their political participation was not necessarily a sign of public-spiritedness. Nor were they class-conscious in a good way: they were relatively likely to call themselves middle-class rather than working-class, and a relatively high proportion identified themselves as Republican. (This was during the Reagan years.)¹ Greenberg concludes:

Clearly...without powerful countervailing forces to the market mechanism, democratic, self-managed enterprises drift inexorably toward enterprise egoism and membership behavior as collective capitalists. Without a working-class party, a cooperative or egalitarian culture, a socialist ideology, a revolutionary movement, or a government committed to economic democracy, the logic of the market is determinative and blocks the larger promise of self-management...²

Especially in a large cooperative, whose members are typically more concerned with having money and a secure job than collectivists are, the market mentality can prove stronger than the democratic, egalitarian, workers’ social-movement mentality.

As always, there are many counterexamples. Equal Exchange, with about a hundred members, is politically progressive, committed to such causes as Fair Trade (with Latin American coffee-growers). Inspired by Mondragon and the cooperatives of northern Italy, it has also begun donating a portion of its earnings to a fund for the development of new co-ops.³ Rainbow Grocery in San Francisco, owned by about 150 workers, likewise functions as a center of progressivism, in the tradition of many natural-food stores. Kerala Dinesh Beedi has a long history of radical political activism going back to even before its formation. The region of Kerala has bred left social movements since early in the twentieth century; KDB’s labor unions are militantly Marxist.

Such examples support Greenberg’s point that progressive political activism, while not guaranteed by a cooperative workplace, is not only compatible with it but potentially encouraged by it as long as the business either maintains ties with cooperative institutions or is run by workers committed to radical ideologies. Unionization of employees in conventional companies likewise fosters political consciousness and action; there is no particular reason, therefore, why cooperatives cannot affiliate with unions and assist them politically, and vice versa. This has been common practice in Europe for a long time, was so in the United States for much of the nineteenth century, and, as we’ll see later, is starting to become so again.

Other issues

I have yet to address a number of important matters in relation to cooperatives of all sizes. First, in what sectors is it most common to find them? All the research indicates that it is the labor-intensive, service areas of the economy. Food stores, bookstores, print shops, restaurants, repair services—all risky areas for small business. Historically, U.S. cooperatives have had “a strong craft orientation, with fields of activity including metal foundries, barrel-making, shingle-making, and plywood.”⁴ Many Western European

⁴ Dow, *Governing the Firm*, 49.

cooperatives operate in construction and certain labor-intensive branches of manufacturing. Some Mondragon and Italian cooperatives, however, are very capital-intensive, which is possible because of the networks they have established with each other. Also, cooperatives are relatively common in the somewhat capital-intensive industry of transportation—a number of taxi companies have been cooperatives—which is probably because the physical assets needed (such as vehicles) can easily be resold at close to their purchase price if the business fails, so that there is relatively little risk in lending money to the co-op.¹

The main problem, then, is that most cooperators or would-be cooperators have limited access to financial capital. Why is that? Sometimes they decide to seek capital only from their members; in this case, the reason for undercapitalization is self-evident. One reason they might shun bank loans is if banks charge high interest-rates. Sometimes banks will require that each member provide collateral to guarantee the loan, a risk that some workers might not be willing to undertake.² Two reasons why traditional lenders might be reluctant to lend to worker-run enterprises are

because of heightened levels of (a) moral hazard and (b) transactions costs. The moral hazard argument is that lenders bear most of the risk of failure in situations in which workers can easily move to new jobs in the event of the firm's failure. As for the higher transactions costs, the argument is simply that it is easier and quicker to deal with a single borrower (or the borrower's delegate who has authority) than to deal with a group that has to use a democratic process to make decisions.³

Overseeing the activities of an enterprise with a small number of decision-makers is easier than if every worker is a director and owner. Even the initial loan is then relatively difficult to arrange: the bank has to deal with the elected board of directors, drawn from the ranks of the workers, who have often had no experience arranging bank loans. Sometimes “the bank must ultimately go to a shareholders' meeting and explain the terms of a loan to them, an unfamiliar experience for the lending officer and not always a pleasant one.” Apart from this, “the bank's worst fears are that the co-op will distribute the loan among its workers and then declare bankruptcy.” It is not surprising, therefore, that banks might attach onerous conditions to loans.⁴

An additional advantage, from the perspective of lenders, of undemocratic firms is that it is easier for the lender to influence the policies of such firms, for instance by preventing them from undertaking excessively risky or excessively conservative projects. One author remarks that with cooperatives “there is no guarantee of a single owner or officer who always represents the workers, given the democratic management. As a result, the financial community cannot obtain the leverage over cooperatives seeking to borrow that they can over capitalist firms.”⁵

Equity financing, on the other hand, is unappealing to cooperators because it may mean relinquishing control to outside investors, which is a distinctly capitalist practice. Investors are not likely to buy non-voting shares; they will probably require representation on the board of directors because otherwise their money could potentially be expropriated. “For example, if the directors of the firm were workers, they might embezzle equity funds, refrain from paying dividends in order to raise wages, or dissipate resources on projects of dubious value.”⁶ In any case, the very idea of even partial outside ownership is contrary to the cooperative ethos.

⁶ *Ibid.*, 188.

A general reason for traditional institutions' reluctance to lend to cooperatives, and indeed for the rarity of cooperatives whether related to the difficulty of securing capital or not, is simply that a society's history, culture and ideologies might be hostile to the "co-op" idea. Needless to say, this is the case in most industrialized countries, especially the United States. The very notion of a workers' cooperative might be viscerally unappealing and mysterious to bank officials, as it is to people of many walks of life. Stereotypes about inefficiency, unprofitability, inexperience, incompetence, idealism, and anti-capitalism might dispose officials to reject out of hand appeals for financial assistance from co-ops. Similarly, such cultural preconceptions may be an element in the widespread reluctance on the part of working people to try to start a cooperative. They simply have a "visceral aversion" to, and unfamiliarity with, the idea—which is also surely a function of the rarity of co-ops itself. Their rarity reinforces itself, in that it fosters a general ignorance of co-ops and the perception that they're risky endeavors. Additionally, insofar as an anti-democratic passivity, a civic fragmentedness, a half-conscious sense of collective disempowerment, a diffuse interpersonal alienation and mistrust saturate society, this militates against initiating cooperative projects. It is simply taken for granted among many people that such things cannot be done. And they are assumed to require sophisticated entrepreneurial instincts. In most places, arguably, the cooperative idea is not even in the public consciousness; it has barely been heard of.

Business propaganda has done its job well.¹ But propaganda can be fought with propaganda. In fact, this is one of the most important things that activists can do, this elevation of cooperativism into the public consciousness. The more that people hear about it, know about it, learn of its successes and potentials, the more they'll be open to it rather than instinctively thinking it's "foreign," "socialist," "idealistic," "hippyish." If successful cooperatives advertise their business form, that in itself performs a useful service for the movement. It cannot be overemphasized that the most important thing is to create a climate in which it is considered normal to *try* to form a co-op, in which that is seen as a perfectly legitimate and predictable option for a group of intelligent and capable unemployed workers. Lenders themselves will become less skeptical of the business form as it seeps into the culture's consciousness.

It's true that people sharing a common culture or ethnicity, especially if they have emigrated to or live together in a diverse society, are more likely to start cooperatives. It was the Basques of northern Spain who started Mondragon, at a time when they were fiercely antagonistic toward Spanish (Francoist) society. The plywood co-ops were organized by Scandinavians in a community that benefited from high levels of trust. This theme of "cultural homogeneity" supports the hypothesis mentioned earlier that heterogeneity is not conducive to the formation and success of worker cooperatives. A heterogeneous co-op may succeed, but insofar as its heterogeneity undermines levels of trust, it threatens the co-op's survival. Ultimately, though, the most important precondition, particularly in small cooperatives, seems to be that individuals have a democratic attitude, commitment to the project, and some degree of interpersonal skills.

One obstacle to forming a co-op is the challenge of gathering a group of interested, capable, and like-minded people, people interested in starting the same kind of business, who can work well together and have enough information and initiative to do the difficult preliminary work. A single entrepreneur is unlikely to want his business to be a cooperative, since that would reduce his revenue and control. Hopeful cooperators will probably be workers who place a high value on job-security or people committed to cooperation for ideological reasons. But such people are not likely to have a great deal of money to invest in a business, and they will be wary of putting thousands of dollars into one venture. Regular investors, of course, diversify their wealth for precisely this reason, this aversion to risk. It would seem, then, that risk-tolerant people would be most interested in forming a co-op—and such people are relatively rare.²

Employee buyouts of capitalist enterprises are not very common either. They usually happen, if at all, only when a company is in financial straits and workers want to save their jobs. One possible reason they are somewhat rare even in the case of failing firms is that they are more likely to occur if the employees are unionized, and unionization rates are low in the United States. Buyouts require a lot of work from a few

leaders. Also, workers might not be able to agree among themselves on the many decisions that have to be made, some preferring a cooperative and others control by outside investors. When takeovers do occur, often the company is in such bad shape that even in a restructured form it fails within a few years.¹

All these considerations are reasons why the formation rate of worker cooperatives is low. And this is the biggest problem for cooperatives, this low rate of formation. But once they do form, other problems can arise. A commonly cited one is that cooperators may lack business experience and know-how. Many of the co-ops formed in the 1960s and 1970s failed because they were started by youthful idealists who cared little about the technical details of running a business.² They ignored accounting problems until it was too late. Even if the workers are competent, it might be difficult to attract managers or specialists if they are needed, since the pay is likely to be low. Another pitfall is that the stress and the personal intensity of work in cooperatives, especially collectives, might prove too much. People might find that they cannot work together or prefer an ordinary, less stressful job, and the collective may dissolve.

The severity of these problems is debatable—for example, Beatrice Webb was wrong to think that cooperatives will inevitably suffer from poor management because of an inability to attract skilled professionals³—but other commonly cited hazards are in practice even less problematic. It does not appear to be widely true that democratic decision-making leads to great inefficiencies; on the contrary, I have argued that it can promote high productivity and work-discipline, and in those cases when direct democracy is impracticable it is easy to substitute representative democracy. Nor is it true that worker-owners tend to shirk or that monitoring is difficult; more often, the opposite is the case.⁴

On the other hand, the possibility of degeneration into a capitalist enterprise is real. Ironically, this can result from the co-op's success. If the business wants to expand it might choose to *hire* labor rather than admit new members, because, under certain legal structures, if it adds new shares (each of which is to be bought by a new member) that reduces the value of the current members' shares. Ultimately, then, the co-op might end up having more wage-laborers than members. As we'll see in the next chapter, some of the plywood cooperatives degenerated in this way. Others, and many co-ops in the nineteenth century, degenerated by being sold to outside investors. That is, as "members approach[ed] retirement age and [became] more interested in wealth maximization than working conditions or other consumption benefits derived from firm membership,"⁵ each member would sometimes sell his valuable share to an investor (because it was too expensive for less wealthy prospective workers to buy). Or, in some cases, the members collectively sold the whole business to investors.

The possibility of degeneration diminishes if the co-op uses the proper legal structure. The best structure is that of the Mondragon companies, which do not allow workers to own a tradable share of equity. Instead, in addition to their wages they each have an internal capital account the value of which depends on the business's performance and on the number of hours the member works. A new member has to pay a large entrance fee, most of which is credited to his internal account. He receives interest at the end of every fiscal year, but he cannot withdraw the annually accumulating principal from his account until retirement. Almost all profits are divided between these individual accounts and a collective account that helps ensure the company's survival. No buying or selling of shares takes place in this scheme, so that it is difficult for the firm to lose its worker-controlled status. Not until 1982, however, did the internal-capital-accounts legal structure exist in the United States (and then only in Massachusetts); prior to that, worker cooperatives had to make convoluted use of other categories, which sometimes made them vulnerable to degeneration.⁶

⁶ David Ellerman, "Workers' Cooperatives: The Question of Legal Structure," in *Worker Cooperatives in America*, 268–273. Even now, most states do not have worker-cooperative statutes. From early in the twentieth century

In any case, the survival rates of contemporary cooperatives put the lie to traditional theories of cooperatives' unsustainability, for they appear to have *higher* rates of survival than conventional firms. During the 1970s and early 1980s, the death rate for co-ops in France (due either to dissolution or to conversion into a capitalist firm) was 6.9 percent; the comparable rate for capitalist competitors was 10 percent. A study in 1989 found much higher failure rates for capitalist companies than cooperatives in North America.¹ A study conducted by Quebec's Ministry of Industry and Commerce in 1999 concluded that "Co-op startups are twice as likely to celebrate their 10th birthday as conventionally owned private businesses."² A later study by the same organization found that "More than 6 out of 10 cooperatives survive more than five years, as compared to almost 4 businesses out of 10 for the private sector in Québec and in Canada in general. More than 4 out of 10 cooperatives survive more than 10 years, compared to 2 businesses out of 10 for the private sector."³ These data sufficiently demonstrate the viability of cooperatives.

Indeed, their viability tends to be proportional to their cooperativeness:

Broadly speaking, it is those clusters of producer cooperatives with the *most cooperative* features...that have the longest life, the best economic performance, and the best record of maintaining a cooperative structure over time... A great number of cooperatives succumb to the demands for efficiency by progressively negating their cooperative character. The historical record suggests that in the end these firms will end up with neither cooperation nor efficiency. The key to successful, long-lived cooperatives seems to be precisely greater cooperation and a concomitant responsiveness to the economic and labor conditions of the marketplace.⁴

The reasons for cooperatives' success should be obvious by now, but they are worth reiterating: "The major basis for cooperative success...has been superior labor productivity. Studies comparing square-foot output have repeatedly shown higher physical volume of output per hour, and others...show higher quality of product and also economy of material use."⁵ Hendrik Thomas concludes from an analysis of Mondragon that "Productivity and profitability are higher for cooperatives than for capitalist firms. It makes little difference whether the Mondragon group is compared with the largest 500 companies, or with small- or medium-scale industries; in both comparisons the Mondragon group is more productive and more profitable."⁶ As we have seen, recent research has arrived at the same conclusions. It is a truism by now that worker participation tends to increase productivity and profitability.

Research undertaken by Henk Thomas and Chris Logan corroborates these conclusions. "A frequent but unfounded criticism," they observe, "of self-managed firms is that workers prefer to enjoy a high take-home pay rather than to invest in their own enterprises. This has been proven invalid...in the Mondragon case... A comparison of gross investment figures shows that the cooperatives invest on average

cooperative corporation statutes have existed, but these were usually designed for farmer cooperatives and are "poorly drafted and out-dated," so it was and is not particularly advantageous for worker co-ops to incorporate under them. four times as much as private enterprises.” After a detailed analysis they also conclude that “there can be no doubt that the [Mondragon] cooperatives have been more profitable than capitalist enterprises.”¹ Recent data indicate the same thing.² One particularly successful company, Irizar, which was mentioned earlier, has been awarded prizes for being the most efficient company in its sector; in Spain it competes against ten private enterprises, but its market share is 40 percent. The same level of achievement is true of its subsidiaries, for instance in Mexico, where it had a 45 percent market share in 2005, six years after entering the market. An author comments that “the basis for this increased efficiency appears to be linked directly to the organization’s unique participatory and democratic management structure.”³ A major reason for all these successes is Mondragon’s federated structure: the group of cooperatives has its own supply of banking, education, and technical support services. The enormous funds of the central credit union, the Caja Laboral Popular, have likewise been crucial to Mondragon’s expansion. It proves that if cooperatives have access to credit they are perfectly capable of being far more successful than private enterprises.

It is worth noting, incidentally, that most private corporations are fantastically inefficient, although their inefficiency is disguised by collusion with the government:

Contrary to their claims of efficiency, most large corporations...spend an inordinate portion of society’s resources on advertising, executive perks and salaries, transportation and communications to far-flung corporate empires, and lobbying expenses. Most depend for their profits and survival on a complex regime of public subsidies, exemptions, and externalized costs, including the indirect subsidies they gain when allowed to pay less than a living wage, maintain substandard working conditions, market hazardous products, dump untreated wastes into the environment, and extract natural resources from public lands at below-market prices. Ralph Estes...estimates that in 1994 corporations extracted more than \$2.6 trillion a year in such subsidies in the United States alone—roughly five times their reported profits... It is one of the basic principles of efficient market function that the full costs of a product or service be borne by the seller and passed on to the buyer. Yet many corporations would be forced to close their doors or restructure if they had to bear the true full costs of their operations.⁴

Americans sometimes think of large size almost as an end in itself, or at least as necessary for economic efficiency. But this is not always the case. In some industries, economies of scale do exist. But large size tends to entail bureaucratic inefficiencies, environmental destruction, allocative inequalities, political corruption, in general significant negative externalities.⁵ Consider, by contrast, the Emilia-Romagna region of northern Italy, “widely recognized as one of the world’s leading examples of a successful cooperative economy, with [40 percent] of the region’s GDP deriving from cooperative

⁵ William Greider points out also that “Above a certain size, getting bigger and bigger does not deliver new economies of scale; it simply walls off the threat of innovative competition. Companies use their size to guard their turf against intruders and, because they have greater financial resources and technological and marketing skills, they can literally smother the new guys who come along with a better idea.” Therefore, the “success” of gigantic corporations like ExxonMobil and Microsoft does not necessarily indicate “efficiency.” Greider, *The Soul of Capitalism: Opening Paths to a Moral Economy* (New York: Simon & Schuster, 2003), 241.

enterprises.”¹ The region of four million people, one of the richest and most developed areas in Europe despite its poverty only a few decades ago, has between 10,000 and 20,000 cooperatives (accounts vary) and 400,000 enterprises, making for a dense network of small and medium-sized firms. The major sectors are retail, manufacturing, and construction.² Emilia-Romagna’s success is due to the unique structure of its economy, sometimes called the Emilian Model: cooperative principles govern “the joint production and distribution of goods and services by private firms,” most of which are not themselves cooperatives. Highly specialized small firms cooperate to produce a given product; most of the firms are subcontractors for the one that produces the finished good.³ At the same time, Mondragon’s system of “secondary cooperatives,” such as the Caja Laboral, that provide support to primary cooperatives has been replicated, so that small businesses share “service centers” for “research & development, education & training, marketing & distribution, financing, technology transfer, workplace safety, environmental regulation, and a host of other services that help small and medium-sized firms to compete in a global marketplace. ...What all these centres have in common is that they replicate the advantages of large corporate structures for the collection and application of global knowledge for production, while maintaining the strengths which are unique to small enterprise.”⁴ Long-term support from the historically leftist regional government has been essential to the development of the Emilian Model.

In short, there are many ways in which cooperatives can be made to work. Even isolated co-ops can be successful if they have access to capital. As we have seen, cooperatives typically fare as well as or better than capitalist enterprises in relation to longevity, productivity, wages (sometimes), working conditions, democratic organizational structures, the potential for ensuring long-term employment, and even profitability (if they have enough capital). Their rarity is due to their low rate of formation, which is due in large part to difficulties in securing capital, but also to a lack of will or knowledge among the populace. People have to be educated on the possibilities open to them, shown where to look for resources, how to start a business together. Starting a business is hard work; it requires initiative, resourcefulness, and intelligence. But it is done all the time, though usually by capitalist-minded entrepreneurs; there is no reason to think that a small group of cooperators cannot do the same thing, especially if assisted by any of the dozens of organizations in the U.S. that exist for this purpose. Policy changes would help too—and have been forthcoming recently, as when the Small Business Administration started providing loans to worker cooperatives.⁵ There is still a long way to go, though, especially considering that the hostility of the American government (on federal and state levels) as compared to the governments of Italy and France has historically been a major impediment to the formation of worker cooperatives in the U.S. Even today, the federally chartered National Cooperative Bank tends not to lend to worker co-ops. A priority of activists should be (and is) to change such policies. In fact, governments committed to the reduction of current high rates of unemployment would be well-advised to facilitate proactively the formation of cooperatives of all kinds.

I could go into more detail on certain matters, for instance the issues involved in employee buyouts of traditional companies, but the purpose of this chapter has been only to give an overview of the nature of the worker cooperative. Hopefully I have at least convinced skeptical readers that co-ops have great potential, and that if they are rare now it is not because of inherent flaws in the model. With education, technical support, policy changes, and capital—all of which, it is worth remembering, have been crucial to the global success of capitalist businesses—cooperativism could be the next great movement of American history, indeed of world history.

CHAPTER THREE WORKER COOPERATIVES IN AMERICAN HISTORY

Despite its reputation for individualism and unbridled capitalism, the United States has a history rich in cooperation and communalism. From the colonial era to the present—and among the indigenous population for millennia—local communities have engaged in self-help, democracy, and cooperation. Indeed, the “individualistic” tradition might more accurately be called the “self-help” tradition, where “self” is defined not only in terms of the individual but in terms of the community (be it family, township, religious community, etc.). Americans are traditionally hostile to overarching authorities separate from the community with which they identify, a hostility expressed in the age-old resentment towards both government and big business. The stereotype, based on fact, is that Americans would rather solve problems on their own than rely on political and economic power-structures to do so. The following brief survey of the history substantiates this claim. While my focus is on worker cooperatives, I will not ignore the many and varied experiments in other forms of cooperation and communalism.

Certain themes and lessons can be gleaned from the history. The most obvious is that a profound tension has existed, constantly erupting into conflict, between the democratic, anti-authoritarian impulses of ordinary Americans and the tendency of economic and political power-structures to grow extensively and intensively, to concentrate themselves in ever-larger and more centralized units that reach as far down into society as possible. Power inherently seeks to control as much as it can: it has an intrinsic tendency toward totalitarianism, ideally letting nothing, even the most trivial social interactions, escape its oversight. Bentham’s Panopticon is the perfect emblem of the logic of power. Other social forces, notably people’s strivings for freedom and democracy, typically keep this totalitarian tendency in check.

In fact, the history of cooperation and communalism is a case-study in the profound truth that people are *instinctively* averse to the modes of cutthroat competition, crass greed, authoritarianism, hierarchy, and dehumanization that characterize modern capitalism. Far from capitalism’s being a straightforward expression of human nature, as apologists often proclaim, it is more like the very antithesis of human nature, which is evidently drawn to such things as free self-expression, spontaneous “play,”¹ cooperation and friendly competition, compassion, love. The work of Marxist historians like E. P. Thompson shows how people have had to be *disciplined*, their desires repressed, in order for the capitalist system to seem even remotely natural: centuries of indoctrination, state violence, incarceration of “undesirables,” the bureaucratization of everyday life, have been necessary to *partially* accustom people to the mechanical rhythms of industrial capitalism and the commodification of the human personality.² And of course resistance continues constantly, from the early nineteenth century to the present day. “Wage-slavery,” as workers in the nineteenth century called it, is a monstrous assault on human dignity, which is why even today, after so much indoctrination, people still hate being subordinated to a “boss” and rebel against it whenever they can. The history of worker cooperatives in particular shows that commitment to

¹ See Johan Huizinga, *Homo Ludens* (Boston: Beacon Press, 1955).

² See E. P. Thompson, *The Making of the English Working Class* (New York: Vintage Books, 1966), as well as the enormous literature Thompson helped spawn on Victorian cultural repression, welfare capitalism, Fordism, the regulatory obsessions of Progressivism, and in general the history of labor movements everywhere in the world.

the ideals of workplace democracy, indeed worker ownership and control, is just below the surface of mass consciousness. A spark could light a fire.

From this history one can draw another lesson, more limited in scope: most cooperatives have been formed during economic contractions or waves of political and social movements. On the other hand, many cooperatives, like all kinds of businesses, have succumbed to economic contractions. The best way to prevent that is by building up a thick mesh of institutional networks, cooperative federations, and ideologically friendly banks. Fortunately, this is happening now. As it continues, moreover, society will no longer have to wait for recessions to stimulate the creation of new co-ops; they will be born continually around the world, as organizers spread the gospel and help provide the capital. Effectively there will be a continuous social movement.

This also suggests that another pitfall of earlier movements has finally been overcome: each generation of past cooperators often had to begin anew, relearning the lessons of their forebears, because most cooperative institutions did not extend sufficiently in time or in space. Even if knowledge and capital could be accumulated over many years—which they usually could not—the means of coordinating a continent-wide movement did not exist. Now they do, increasingly so every year.

More generally, a lesson of the history of radical social movements is that advances in freedom or against power-structures do not occur as quickly as activists would like or expect them to. Radicals in the 1880s, 1910s, 1930s, 1960s, and so on, thought that society was on the cusp of a social revolution. Strictly speaking, though, society is never on the “cusp” of a social revolution, because these things take an inordinate amount of time. I’ll return to this subject in the next chapter; suffice it to say that the history of cooperativism is an excellent illustration of the *slowness* of systemic change, the necessity for revolutionists to be dedicated to decades of slow, patient organizing as opposed to sweeping assaults on the fortress of capitalism. To use Antonio Gramsci’s terms, the “war of position” is more important than the “war of maneuver”¹—precisely because, with regard to a *social* revolution, the war of maneuver should be seen not as separate from and subsequent to the war of position, as Gramsci saw it, but as a component in the latter. Radicals should always be testing the strength of reactionary power-structures, pushing against them directly through political “maneuvering” to enact reforms that erode their power and conservatism, while at the same time educating and organizing the multitudes partly as a basis for these political actions. This is the process through which most genuine, long-term progressive achievements have been won, as opposed to abortive “revolutions” like Lenin’s in 1917 (which led to Stalinism). In the long run, Leninist impatience does not work.

Anti-capitalist movements were fitful and sporadic prior to the Civil War, although horror at the excesses of early industrialism was widespread even among the privileged, and the miseries of the lower classes in urban and rural areas fostered a seething discontent that exploded in events like the Flour Riot of 1837, Dorr’s Rebellion in the 1840s, the Anti-Renter movement in the Hudson Valley around the same time, innumerable strikes by factory workers, and the formation of the world’s first Workingmen’s Parties in New York and other states.² The frequently wretched work conditions of the first half of the nineteenth century are well known.³ Less well known are the early, tentative experiments in alternative social and economic arrangements. In the very early nineteenth century workers occasionally formed cooperatives while on strike, or after a strike had failed. In Baltimore, a cooperative shoemakers’ manufactory was organized in 1794; in 1806, Philadelphia shoemakers organized another cooperative manufactory. Such actions became increasingly common in the early labor movement, especially among artisans and

³ See Peter Way, *Common Labor: Workers and the Digging of North American Canals, 1780–1860* (Baltimore: Johns Hopkins University Press, 1997) and Seth Rockman, *Scraping By: Wage Labor, Slavery, and Survival in Early Baltimore* (Baltimore: Johns Hopkins University Press, 2008).

craftsmen.¹ A less oppositional sort of cooperativism was practiced by immigrants from Europe, as it would be in later waves of immigration as well: they formed communities in cities on the east coast in which mutual-aid structures were essential to survival.

At the same time, communalism of both secular and religious varieties was trying to gain a foothold in the U.S. Communalism has been a recurring phenomenon in American history, from the early seventeenth century to the 1970s and beyond: a group of like-minded people get together and establish a community on the fringes of American society, away from the capitalist rat-race. Quakers, Shakers, Mormons, Rappites, Christian Socialists and other religious groups founded cooperative communities in the late eighteenth century and early to mid-nineteenth century, usually with at most a few hundred members. Some of them were quite successful, lasting decades; others ended after a few years because of personality clashes or organizational problems.²

Secular communalism was not wildly successful either. Robert Owen came to the U.S. in 1825 to spread his new socialist ideas and start experimental communities at New Harmony, Indiana and other locations. With 900 people, New Harmony did impressively well for a while—so well, in fact, that Owen prematurely changed its status and structure into that of a commune, with means of survival held in common and remuneration based on need rather than work. This enterprise failed miserably: the township was too diverse, consisting, as Owen’s son said later, of “a heterogeneous collection of radicals, enthusiastic devotees to principle, honest latitudinarians, and lazy theorists, with a sprinkling of unprincipled sharpers thrown in,” and infighting spelled its doom. The whole Owenite movement effectively collapsed in 1828.³

A second wave of communalism began in the 1840s, when Charles Fourier’s ideas were put to the test. Horace Greeley, a disciple of Fourier, summarized these ideas eloquently:

Not through hatred, collision, and depressing competition; not through war, whether of nation against nation, class against class, or capital against labor; but through union, harmony, and the reconciling of all interests, the giving scope to all noble sentiments and aspirations, is the renovation of the world, the elevation of the degraded and suffering masses of mankind, to be sought and effected.⁴

Associationists, as they were called, hoped that “phalanxes,” Fourier’s ideal communities, would eventually sprout all over the country and transform it from a competitive to a harmonious, cooperative society. Owen’s followers had focused on cooperative agriculture, but Fourier’s emphasized industry, since times had changed since the 1820s. Dozens of phalanxes with at least a hundred members each were founded in the eastern half of the country. But after a few years the old problems with Owen’s movement returned: most poor people couldn’t afford to found phalanxes, even after combining their resources, and the phalanxes they did form usually remained poor, “strangled by debts they had undertaken.”⁵ Participants expected the new communities to magically solve their economic problems; when they didn’t, and in fact added such new stress to life that many people “burned out,” the movement lost its vitality and collapsed (after ten years or so).

Concomitant with Associationism was a renewed union worker cooperative movement. After the case *Commonwealth v. Hunt*, decided by the Massachusetts Supreme Court in 1842, established that labor unions had the right to exist, unions grew quickly throughout the east. Strikes erupted in the late 1840s in

response to wage cuts brought on by a depression, and cooperatives were formed in the wake of these strikes. For instance, the iron molders of Cincinnati struck in 1847, lost, and then organized a successful cooperative foundry: the 47 members collected \$2100 with which to buy land, and philanthropists from Cincinnati erected buildings for the new business.¹ Unions established cooperatives in many states—often as a response to failed strikes—and among such diverse groups as glassblowers, cabinetmakers, barrel-makers, seamstresses, tailors, and hat-finishers.² Europeans who had emigrated after the failed revolutions of 1848 also started many cooperatives in eastern cities. On the whole, however, this wave of cooperativism was over by the mid-1850s, having succumbed to a lack of resources and fierce capitalist competition. The depression of the mid-1850s also wreaked havoc on cooperatives, and the Civil War eliminated most of the few that still remained.

But before that final catastrophe happened, consumer cooperatives made their first major appearance in the U.S., between 1845 and 1860. In a consumer cooperative, as opposed to a worker cooperative, “the customers are the voting members who band together to acquire consumer goods directly from producers and eliminate the profits of middlemen [i.e., retailers]. The workers in the cooperative may or may not be members.”³ Consumer co-ops are more capitalistic than worker co-ops in that, while the property is collectively owned by consumer-members, managers exist (appointed by a board of directors elected by the membership) who hire and fire workers as in a capitalist enterprise. Nevertheless, the co-op has definite advantages over the private enterprise, not the least of which is that it can sell goods more cheaply, at close to cost, by eliminating the middleman. This is what the Working Men’s Protective Unions did, approximately 800 of which were established in New England and Canada between 1845 and 1860, servicing 30,000 to 40,000 members and tens of thousands of non-members.⁴ The movement was stimulated by the harsh economic climate for working people of the 1840s, and also by the energy of radical European immigrants who carried the frustrated hopes of 1848 to America. The hundreds of stores provided cooperative employment, cheap goods, and devoted much of their financial surplus to insurance for the aged and the sick. And yet the movement lasted only a few years because of the aforementioned problems of debt, lack of resources, and economic depressions in the 1850s. It also fatally incurred the wrath of capitalists for selling goods too cheaply: private enterprises used the tactics of price-slashing and blacklisting to drive the co-ops out of business, after which prices were raised again.⁵

The Rochdale consumer-cooperative movement in England, which began around the same time as the Protective Unions in the United States, avoided some of the latter’s mistakes, particularly the mistake of selling goods much more cheaply than conventional businesses did. Instead, the Rochdale cooperators pioneered a device that has been used to great effect ever since: rather than every customer’s paying a low price, regular prices were charged but rebates periodically given to members (greater rebates going to those who purchased goods more frequently).⁶ This mollified capitalist competitors. At the same time, the Rochdale group was better able to secure financing for its operations by relying not merely on small membership fees, as in the Protective Unions, but also on shares of equity sold to members, who thereby could earn a fixed dividend of no more than 5 percent.⁷ Another important contribution of Rochdale was to formulate concrete principles of cooperation that have been embraced by cooperators for 150 years. Among them are the following: voluntary and open membership; democratic member control; member economic participation, such that capital is equitably contributed to the business; autonomy and independence; education and training (of members and the general public, to spread the ideology of cooperation);

cooperation among cooperatives; and concern for community. Hundreds more cooperative stores opened in America after the Civil War, most of them modeled on the Rochdale system rather than the failed Protective Unions.

It is after the Civil War, during the “second industrial revolution,” that the history of cooperativism becomes really exciting, full of promise and tragedy. Organizations like the National Labor Union, the Sovereigns of Industry, the Knights of St. Crispin, and the Knights of Labor enthusiastically supported cooperation and proselytized for it. Around the time of labor’s Great Upheaval (the late 1870s and 1880s), thousands of cooperative stores and workshops were born around the country, especially in the east. Hundreds of thousands of laborers and artisans had faith in cooperation—at least in the long run—as an escape from industrial misery, low wages, and periodic unemployment, hoping to mold society anew in the image of a “republic of labor,” which would be a continuation and fulfillment of the Founding Fathers’ republican *political* vision. Labor reformers thought that in order for liberty, equal rights, and the pursuit of happiness to flourish, social conditions would have to be revolutionized: cooperation would have to supersede “wage-slavery,” so that economic reality could be made consistent with America’s democratic form of government. “The principles of Co-operation,” wrote a reformer in the late 1860s, “are more in harmony with the principles of our form of government than our present social system.”¹ The dream of this cooperative utopia inspired reformers for decades.

For example, in the late 1860s the newly formed National Labor Union, a loose federation that had over 300,000 members before it collapsed in 1873, endorsed cooperation and sponsored the creation of many cooperatives. William Sylvis, its president, declared that “Of all the questions now before us, not one is of so great importance, or should command so large a portion of our consideration, as co-operation... Co-operation is the only true remedy for low wages, strikes, lock-outs, and a thousand other impositions and annoyances to which workingmen are subjected.”² The NLU even petitioned Congress to spend \$25 million on establishing cooperatives. Many local unions in New England organized co-ops to support strikes or in the case of a lockout, but continued to operate them after the strike or lockout had ended. For instance, between 1866 and 1876, iron molders established at least 36 foundries and shoemakers at least 40 workshops, most of which were responses to failed strikes or lockouts. In fact, nearly all the important trades assayed cooperation in the years after the Civil War, including bakers, coach-makers, coal miners, shipwrights, machinists, blacksmiths, plumbers, tailors, printers, and many others.³

The Knights of St. Crispin, a shoemakers’ union (excluding unskilled labor) that was founded in 1867, were equally zealous in their propagandizing for cooperative work. They were among the most powerful unions in the world: with over 50,000 members, by December, 1870 they had scores of lodges in Massachusetts, New York, New Hampshire, Ohio, Michigan, Pennsylvania, Indiana, Wisconsin, New Jersey, even California. Like other national unions of the period they were decentralized, and so they mostly left it to the initiative of local branches to found co-ops. But it was recommended that every lodge consider starting a cooperative workshop and a store. In Massachusetts, by 1869 the Crispins had organized between 30 and 40 cooperative stores; in the following years they organized workshops in New England, New York, New Jersey, and other states.⁴ The Crispins disappeared in the late 1870s, but the Knights of Labor would go on to form cooperative shoe shops in the 1880s.⁵

The methods of financing and organizing all these workshops and stores varied. Since the labor movement was highly decentralized at the time, the initiative usually lay with the local branches of unions. These comprised mostly skilled workers and craftsmen hostile to unskilled labor and the development of

industry because it threatened to deprive them of their livelihood and the pride they took in their work. (Mass unionization of “unskilled” workers did not come into its own until the late 1930s, with the founding of the CIO. Craft unions, organized by occupation rather than industry, were the norm at the end of the nineteenth century.)

So how did these craftworkers start all their co-ops? The main obstacle was and is the need for capital. One common tactic was to require workers to purchase shares of stock, which would earn a small dividend. Perhaps after a failed strike at a capitalist business, a dozen carpenters in a union would get together and decide to form a co-op. Often they wrote letters for advice to labor leaders like William Sylvis, John Samuel, and Thomas Phillips, inquiring, for example, as to whether it was better to distribute profits on the basis of shares owned or of labor performed. They might start a retail store as a way to accumulate capital for production. In the 1880s, local and district assemblies of the Knights of Labor oversaw the creation of cooperative businesses, and it became common practice to open a store first. Victor Drury, a French immigrant influential in the labor movement, recommended that products be sold in the store at slightly above cost, only until

we could sell at *cost* those commodities which we should produce ourselves as soon as we begin to manufacture. So soon as we could find sale for sufficient of the products of any of the industries we have mentioned to employ a few producers, we should establish a workshop or *centre of production*. For instance, if we sold sufficient bread and pastry to employ four or five bakers, we should immediately establish a bakery... We should then call upon the Trades' Unions to furnish us with the most skilled and capable men in their special industries to direct these *centres of production*.¹

Drury was a member of the Knights of Labor's District Assembly 49 in New York, which organized many cooperatives that were managed by a designated committee. It sold shares in an organization called the Solidarity Co-operative Association, which invested over \$6000 in various enterprises. No interest was paid to the shareholders, nor did they have any control over the management of the firms; instead, the association would buy back the shares later and reinvest 50 percent of its profits in cooperation. By 1887, the Solidarity Association was running eight businesses, one of which had capital of \$67,000 and employed over 100 workers.²

Most of the cooperative businesses of the 1860s and 1870s—like many private enterprises—succumbed to one of the several depressions that rocked the nation in those decades, such as the severe slump of 1873. But the Knights of Labor picked up where the National Labor Union and the Sovereigns of Industry (among other groups) had left off, and it was in the 1880s that cooperativism had its greatest successes.

The Knights of Labor originated in the late 1860s and early 1870s in Philadelphia but slowly expanded into the rest of Pennsylvania and finally became a national organization with 750,000 members. It encompassed many trade unions and was organized geographically rather than by occupation. “The Knights attempted to organize all American productive workers into ‘one big union’ regardless of skill, trade, industry, race or sex and were divided into local, district and national assemblies, with a centralized structure”³—although substantial autonomy was granted to local assemblies, which took the initiative in establishing hundreds of cooperative stores and factories. The national leadership was less energetic on this score than local leadership. The overarching purpose of the organization was, as its longtime leader Terence Powderly said, “to associate our own labors; to establish co-operative institutions such as will tend to supersede the wage-system, by the introduction of a co-operative industrial system.”⁴ To this end, the Knights lobbied politically, engaged in numerous strikes, lent their support to other radical social

movements, and, of course, organized co-ops. Masses of workers genuinely believed that they could rise from being “rented slaves” to become cooperators in control of their work and wages, living in revitalized and stabilized communities, no longer subject to periods of unemployment. Cooperation was a religion for some of them.

In 1880 the delegates to the General Assembly earmarked 60 percent of regular dues for cooperatives; in the following years they also levied a compulsory monthly tax on members and subsequently a voluntary one. But in 1884 the Cooperative Fund was still only \$974.52.¹ On the other hand, the national leadership was willing to spend \$20,000 over several years to support a coal mine that had been started by eight miners in 1883 after they leased a forty-acre plot. They ran into financial troubles and appealed to the Knights’ Executive Board, with the result that this Indiana mine became the first major production cooperative to be run directly by the central organization. As John Curl states, “the Knights intended the mine to be the first link in the economic backbone of the new society they planned to build.”² However, after buying the land, equipping the mine, and laying railroad tracks to it, the Knights discovered that the railroad company would not connect their switch to the main track for nine months. Later they found out that they would have to provide their own switch engine, which they could not afford. Such problems accumulated, and in the end the Knights leased the mine and finally sold it.

As already noted, more successful than these centralized efforts were the hundreds of projects initiated by local assemblies or unions. Minneapolis in the 1880s was a particularly exciting place for cooperators, who were running 35 or 40 businesses.³ There were eight cooperative barrel factories, eight building-and-loan associations, two print shops, and one grocery store, shirt factory, house construction company, library, cigar factory, dry-goods store, laundry, and a 250-acre cooperative colony miles from the city. Most of these businesses were started between 1882 and 1886, when the Knights had a strong presence in the city, though some of the barrel-making factories dated from the ’70s. These came to dominate the city’s barrel industry; in 1887 they grossed over a million dollars’ worth of business and employed 368 journeymen-owners out of 593 coopers in the city. Evidently their methods of capitalization served them well: each of the sixteen original members of the first factory (in 1874) bought a \$15-share initially and paid \$5 to the business every week thereafter, which eventually allowed them to buy a shop near the railroad. New members had to buy shares, which they could purchase from departing members (if there were any). Through these simple means, and the high demand for barrels among millers, the business was able to expand and spawn others, until a veritable cooperative community developed which maintained admirable cohesiveness despite the mixture of ethnicities—German, Swedish, Norwegian, Irish, Italian, and American.

Incidentally, it’s worth quoting Albert Shaw, a nineteenth-century historian, on the salutary effects of cooperation among the Minneapolis coopers:

Coöperation has developed business capacity in the men which they were not aware of possessing because they had never tested it. The conduct of the shops from the governmental point of view may well encourage one’s belief in democracy. Sound judgment almost invariably prevails.... Dissension is almost unknown. Differences of opinion are not infrequent, but the will of the majority is acquiesced in without strain.... The coopers themselves are emphatic in saying that the moral effects of their coöperative movement constitute its highest success. It has unquestionably wrought a transformation in the character of these craftsmen. They are no longer a drunken, disreputable guild, figuring in the police courts and deserving the disfavor of the community. They have become a responsible and respectable class of citizens....⁴

⁴ Albert Shaw, “Coöperation in the Northwest,” in *History of Cooperation in the United States*, 236, 238.

The key to their economic success, of course, was institutional support. This is always essential to the success of any oppositional movement. A rich network of mutually supporting institutions is necessary, helping each other with finances, publicity, organizational and recruiting work, “moral support,” etc. It is necessary to build a genuine community outside the mainstream. The Minneapolis coopers had this community, as testified by Shaw:

In Minneapolis there are men who are earning their living in a cooperative cooper shop, paying for their home through a cooperative building and loan association, buying their groceries at a cooperative store, and having their washing done in a cooperative laundry. Some of them perchance enjoy the advantages of membership in a cooperative neighborhood improvement association, obtain books and magazines from a cooperative reading club or library association, and so on. Many of them belong to societies and orders which have as their most practical feature a system of cooperative life and accident insurance.¹

However, the experience of the cooperative coopers is illuminating also with regard to the challenges they faced. For example, they had an ambivalent relationship with the labor movement and the Knights of Labor. On the one hand, the Knights provided institutional support and leadership. Indeed, the main reason cooperation failed in Minneapolis after 1887 was the organizational decline of the Knights.² On the other hand, the cooperators were running a business and so did not always have the same interests as the journeymen coopers, the wage-laborers, who were employed in conventional workshops with bosses. At times they acted in solidarity with their fellow workers, while at other times their business interests put them at odds with the labor movement. Some of the cooperators even hired journeymen and machine operators in their shops and so became employers themselves. The Knights actually expelled the members of one co-op from the local Assembly for acting too independently vis-à-vis ordinary workers. Such conflicts are, as we saw in the last chapter, always a possibility given the ambiguous nature of the worker cooperative.³

As the Knights expanded over the continent—especially after 1885, when they won a major nationwide strike against Jay Gould’s railroad company—worker cooperatives followed in their wake, at least 334 of them between 1880 and 1888 (according to one study),⁴ in 35 of the 38 states. Many were a response to the depression of 1883–85, when wages were cut on average 15 percent, causing workers to look to other sources for income.⁵ The businesses they started were not “factories” as we understand the term, with its connotations of mass production and assembly-line workers, but rather workshops in which skilled craftsmen or semi-skilled workers supervised themselves and each other, sometimes with an almost obsessive concern for democratic procedures. The minutes of general meetings attest to this preoccupation with democracy, given the insistence on having formal votes on almost every conceivable matter.⁶ Workers were always very reluctant to fire a fellow worker, and it seems to have happened in only the most exceptional cases.

Indeed, aside from their predictable sexism and racism, the attitudes and behavior of cooperators in the Gilded Age seem not to have differed substantially from those of cooperators eighty or a hundred years later, at least with respect to relationships in the workplace itself. There was the same emphasis on freedom and democracy, on realizing the inherent dignity of work, and the same struggle to reconcile cooperative ideals with the pressures of the market and hostility of conventional businesses. There was also a progressive desire to organize women, or for women to organize themselves: in Chicago, for example,

¹ Quoted in Leikin, *The Practical Utopians*, 129.

women in the Knights of Labor organized twenty cooperatives in the clothing industry. Forty women established one such co-op after being locked out by their employer; they bought shares of stock for \$10 each, distributed the profits equally among the workforce, and worked only eight hours a day.¹

There were, however, major differences between the respective upsurges of cooperativism in the 1880s and the 1960s, revolving around the fact that the earlier one was part of a broad-based *labor* movement, unlike the later. Thus, the skilled and semi-skilled cooperators during the 1870s and 1880s explicitly used cooperatives as a way to guarantee employment, and arguably they were more ambitious, with their revolutionary hopes for a cooperative commonwealth. Their ideology, of course, was not the educated middle-class countercultural and anti-authoritarian one of the 1960s' youth movements but "laborist," "producerist," devoted to the Jeffersonian ideal of a republic of free laborers, mostly artisans and craftsmen. Some scholars have argued that this fact proves the Knights of Labor were "backward-looking" rather than truly revolutionary—that the future lay in mass production, not skilled labor or artisanry²—but this criticism seems partly off the mark. It is true that the Knights were hostile to mechanization, just as workers were in the era of the AFL-CIO, because in both cases it threatened to put them out of a job or to result in the lowering of wages and the deskilling of work. If this aversion to the degradation and mechanization of work is reactionary, so be it. But it is also a source of such revolutionary demands as democratization of production-relations, cooperative organization of the economy, public ownership of industry, destruction of the capitalist class and its frequent tool the state, and other hopes cherished by hundreds of thousands of workers in the late nineteenth century.

In reality, the Knights of Labor were radical and conservative at the same time. They were genuinely progressive in their political positions, such as abolition of child labor, support for the eight-hour day, advocacy of public ownership of the railroads, water systems and utilities, support for the women's movement and "equal pay for equal work," attempt to organize *all* workers into "one big union," and so forth. They were conservative insofar as they still exalted the ethos of artisanry and rejected, in their prescriptions for a future economic system, nationwide socialist institution-building, something like the plan put forward by Henry Sharpe when he was president of the Knights of Labor's Cooperative Board in the mid-1880s. He saw that large-scale and long-term cooperativism could not work as long as co-ops remained isolated units in a market economy. Dependence on wages could not be superseded that way; competition would always remain a fact of life, as would, therefore, the downward pressures on wages, the necessity to mechanize and expand, the subjection to the business cycle, etc. Instead, the Knights of Labor had to create their own self-sufficient world of cooperation—"a great industrial union, self-employing, self-sustaining, self-governing." The members, he said,

should be taught to look upon themselves as a "people," or, so to speak, as a nation, and the legislative, the executive, the judiciary, the industrial, the police, the insurance, the educational and the charities departments should all be well defined, properly officered and actively employed. It is high time that members be found whose special aptitudes incline them toward one or the other of the departments, and who, finding therein a field for their activities, develop their aptitudes still further and become specialists.

In effect, he was advocating state socialism. While his vision was impracticable and arguably morally objectionable, it had at least one virtue: as Steven Leikin says, it accepted "the organizational realities of the new industrial economy."³ It anticipated the elaborate bureaucratic structures of the twentieth-century state, and hence was in no sense "conservative" or "reactionary." But the Knights refused to take cooperation to these limits. They would not consent even to compulsory taxes, much less to Sharpe's vision

¹ James Green, *Death in the Haymarket* (New York: Pantheon Books, 2006), 152.

² Needless to say, it is a caricature of the Knights' position to say they wanted an economy entirely of small artisanal workshops and small producers. Rather, they desired public control of transportation and communication systems and cooperative administration of mines and other massive industrial facilities.

³ Leikin, *The Practical Utopians*, 65. See pages 60–66.

of centralized authority. Insofar, therefore, as they desired a cooperative society but would not make an all-out assault on capitalism or commit to building a network of alternative economic institutions, they can perhaps be called unrealistic and conservative. Similarly, inasmuch as bureaucracy, statism, and mass production represented “progress,” the Knights, like anarchists and left-Marxists, were indeed ambivalent towards progress.

As it turned out, Sharpe was right. Cooperation succumbed to market forces, but even more to the war waged on it by the business classes. By 1887 the latter were determined to destroy the Knights, with their incessant boycotts, their strikes (sometimes involving hundreds of thousands), their revolutionary agitation, and their labor parties organized across the country. In the two years after the famous Haymarket bombing in Chicago and the Great Upheaval of 1886, in which 200,000 trade unionists across the country went on a four-day-long strike for the eight-hour day but in most cases failed—partly because Terence Powderly, the leader of the Knights, who had always disliked strikes, refused to endorse the action and encouraged the Knights not to participate—capitalist repression swept the nation. Joseph Rayback summarizes:

The first of the Knights’ ventures to feel the full effect of the post-Haymarket reaction were their cooperative enterprises. In part the very nature of such enterprises worked against them. The successful ventures became joint-stock corporations, the wage-earning shareholders and managers hiring labor like any other industrial unit. In part the cooperatives were destroyed by inefficient managers, squabbles among shareholders, lack of capital, and injudicious borrowing of money at high rates of interest. Just as important was the attitude of competitors. Railroads delayed the building of tracks, refused to furnish cars, or refused to haul them. Manufacturers of machinery and producers of raw materials, pressed by private business, refused to sell their products to the cooperative workshops and paralyzed operations. By 1888 none of the Order’s cooperatives were in existence.¹

Thus, by 1888 it had become evident that a national cooperative movement could not succeed in America, at least not in the absence of sustained, massive and violent attack on the wage-system, far more massive and well-organized than the Knights’ movement had been. As Henry Sharpe said, what they were doing was not realistic. Small workshops with little capital and obsolete machinery in an age of rapid industrialization; insufficient institution-building to give financial and material support to co-ops; enslavement to the market at a time when competitors would stop at nothing to suppress working-class moves toward independence. Especially with the weak leadership of Terence Powderly and the mass desertion of former Knights after 1886, as they lost strike after strike, the great dream of building a national cooperative economy was effectively over.

Farmers in the South, West, and Midwest, however, were still building a major movement to escape from the control of banks and merchants lending them supplies at usurious rates; agricultural cooperatives—cooperative buying of supplies and machinery and marketing of produce—as well as cooperative stores, were the remedy to these conditions of virtual serfdom. While the movement was not dedicated to the formation of worker co-ops, it is worth mentioning anyway because of its vast historical importance. In the late 1880s and early 1890s it swept through southern and western states like a brushfire, even, in some places, bringing black and white farmers together in a unity of interest. Eventually this Farmers’ Alliance decided it had to enter politics in order to break the power of the banks; it formed a third party, the People’s Party, in 1892. The great depression of 1893 only spurred the movement on, and it won governorships in Kansas and Colorado. But in 1896 its leaders made an enormous strategic blunder in allying themselves with William Jennings Bryan of the Democratic party in his campaign for president. Bryan lost the election, and Populism lost its independent identity. The party fell apart; the Farmers’

¹ Rayback, *A History of American Labor*, 174.

Alliance collapsed; the movement died, and many of its cooperative associations disappeared. Thus, once again, the capitalists had managed to stomp out a threat to their rule.¹

They were unable to get rid of all agricultural cooperatives, however, even with the help of the Sherman “Anti-Trust” Act of 1890.² Nor, in fact, did big business desire to combat many of them, for instance the independent co-ops that coordinated buying and selling. Small farmers needed cooperatives in order to survive, whether their co-ops were independent or were affiliated with a movement like the Farmers’ Alliance or the Grange. The independent co-ops, moreover, were not necessarily opposed to the capitalist system, fitting into it quite well by cooperatively buying and selling, marketing, and reducing production costs. By 1921 there were 7374 agricultural co-ops, most of them in regional federations. According to the census of 1919, over 600,000 farmers were engaged in cooperative marketing or purchasing—and these figures did not include the many farmers who obtained insurance, irrigation, telephone, or other business services from cooperatives.³

From the 1890s to the 1920s, cooperation had its home mainly in the agricultural sector. The sheer number of regional and national organizations devoted to cooperation in agriculture testifies to this. There was the National Farmers Union, the American Society of Equity, the Non-Partisan League in North Dakota, the Farmer-Labor Exchange, the Farmers’ Equity Union, the National Grange, Farm Bureaus all over the country—which in 1920 led to the American Farm Bureau Federation—to educate farmers on business methods and cooperation, many regional associations such as the California Fruit Growers Exchange (which became Sunkist), the California Associated Raisin Growers (now called Sunmaid), and the Missouri Farmers Association, and in the 1920s there emerged a variety of Communist farm organizations. Many of these associations had the financial and political support of the federal government, state governments, and business groups, who recognized that the atomistic, competitive model of classical capitalism was inappropriate to agriculture.⁴ The passage of the Capper-Volstead Act in 1922 was of great importance for marketing co-ops, since it determined that they did not violate the Sherman Act’s prohibition of organizations in restraint of trade. Because of this exemption, marketing co-ops no longer had to worry about the sort of legal harassment they had endured for years.⁵

Consumer cooperativism, however—not to mention worker cooperativism—was not having much success around the turn of the century. In 1896 the American Federation of Labor decided to support consumer co-ops, but they did not become a priority of the labor movement. Many immigrant groups ran co-ops in the East and Midwest, and in the West there were several thriving associations, such as the Pacific Cooperative League, the Pacific Coast Cooperative Union, and the California Rochdale Company; but aside from these Western movements, and some Midwestern federations, there was little coordination or communication between co-ops.⁶ The Cooperative League of America was founded in 1916 with the mission of coordinating consumer cooperativism (although eventually it expanded its activities to apply to *all* co-ops). It joined the International Cooperative Alliance in 1917, and it exists today as the National Cooperative Business Association.

From the 1890s to the 1930s, worker cooperatives were almost entirely ignored by the labor movement. Neither the AFL nor the IWW had much interest in them; nor did the Socialist or the Communist Parties, nor even the Cooperative League. Labor activists seem to have learned their lesson from the fate of

¹ See, e.g., Lawrence Goodwyn, *The Populist Moment: A Short History of the Agrarian Revolt in America* (New York: Oxford University Press, 1978); John D. Hicks, *The Populist Revolt: A History of the Farmers’ Alliance and the People’s Party* (Nebraska: University of Nebraska Press, 1961/31); and Charles Postel, *The Populist Vision* (New York: Oxford University Press, 2007).

² One of the innumerable ironies of history is that the Sherman Act was mostly used not against big business but against unions and cooperatives, even though its chief proponents had been workers, farmers, and small businessmen hoping to break the power of monopolies. Zinn, 260, and Curl, 118, 119.

the 1880s' co-ops. Not until the Great Depression and the self-help movement would there be a resurgence of a type of producer cooperativism, and this time the movement would be even more spontaneous and decentralized than it had been under the Knights of Labor. Consumer co-ops, too, would make a comeback; they had not fared well during the 1920s.

The self-help cooperative movement, which flourished between 1931 and 1935 but lasted in some form until 1938, originated not in production but barter. It involved the exchange of goods and services, with cooperators sometimes performing labor services on farms in exchange for meals. Productive associations, vaguely similar to worker co-ops, arose after 1934, oriented around such activities as butchering, plumbing, flour milling, logging and sawmilling, carpentry, dentistry, printing, furniture-making, coal mining, laundering, shoe-repairing, etc. Over the course of the movement, more than half a million families were affiliated with 600 self-help organizations in 37 states; about 250 of these were productive associations.¹ The cooperatives thrived particularly around Los Angeles, San Francisco, Seattle, Salt Lake City, Denver, and Minneapolis.²

The production cooperatives differed in at least one crucial respect from ordinary worker co-ops: they relied heavily on government funding and government assistance—\$4,730,000 worth of funding. In 1933 a Division of Self-Help Cooperatives was set up in the Federal Emergency Relief Administration to administer the grants and set the rules that cooperatives receiving money would have to follow. One significant rule stated that no cooperatively produced goods could be sold on the open market. “In effect, a self-help economy was created which functioned separately from the open-market economy. These rules reflected the government’s desire to allow the cooperative sector to operate as long as the free market was not disturbed.”³ Evidently the government was comfortable with cooperatives insofar as they had a stabilizing influence on society and would provide a safe outlet for discontent.

The economic performance of the co-ops was not quite stellar, but it was not shabby either. Many or most of the workers were in their fifties or older—people who had particular difficulty finding employment—and so were less productive than the average employee in a comparable capitalist business. The cooperatives tended to be relatively small too, and grew but slowly. They were, however, a very cost-effective way for the government to provide relief to the unemployed, because it seems that, had these co-ops not existed, the government would have spent far more on relief than it did. (Families who were eligible for relief did not apply for it, instead relying on their cooperative income.) In addition, they provided a useful service as “rehabilitation” for the unemployed, who derived psychological benefits from working when otherwise they would have been idle and discouraged. Therefore, whatever one thinks of the government’s motives in supporting the co-ops, and their systemically stabilizing effects, it can hardly be denied that they performed a valuable function for the families affected.

In the end, the main lesson of the self-help co-ops may be that government assistance can be of great use to cooperators and societal innovators—as it was in Kerala, India—but they should be careful not to become too dependent on it. For then they are subject to the whims of bureaucrats, policymakers, and politicians, who may withdraw legislative and financial assistance if the political winds change. Government funding of self-help was not guaranteed and policies changed erratically, not always to the benefit of the co-ops. In any case, the movement lost much of its momentum after the Works Progress Administration was set up in 1935, providing employment for millions and thus obviating the need for the cooperatives.

The government also promoted cooperatives under the aegis of the Tennessee Valley Authority, in the mid- to late 1930s. As is well known, the TVA was conceived as a grand experiment in social reconstruction. It turned out to be quite successful, in no small part because of the fertilizer and electric

³ Jones and Schneider, “Self-Help Production Cooperatives,” 59.

cooperatives that the government helped set up. Indeed, the TVA served as the “incubator of the federally promoted and financed rural electrification program” that began in 1935, when only ten percent of the country’s farms were electrified. Dozens of electrical power cooperatives had already been set up in the Midwest between 1914 and 1930, but it was only with the Rural Electrification Administration that the problem was tackled on a large scale. In December 1935, 789,000 farms were being served by public and private utility systems; five years later, largely as a result of the REA, the number was 1,871,942. By 1940 more than half of rural America was still not electrified, but in the coming decades the job was completed.¹

Agricultural cooperation thrived during the 1930s, again due to New Deal initiatives. In 1933 the Farm Credit Administration set up Banks for Cooperatives, a program that created a central bank and twelve district banks; it “became a member-controlled system of financing farmer cooperatives, as well as telephone and electric cooperatives.”² For the rest of the century, Banks for Cooperatives would prove an invaluable resource. Already by 1939 its financial assistance made it possible for half the farmers in the United States to belong to cooperatives.

With World War II and the end of the New Deal, and especially in conservative postwar America, cooperation in all spheres but agriculture plummeted. The political left went off to fight Hitler as the right gained control of the government and many unions. After the war the CIO was purged of Communists, dealing a huge blow to the labor movement. Through reactionary legislation like the Taft-Hartley Act, military and police violence against unions, imperialist foreign policy, McCarthyite fear-mongering, and other such devices that created a center-right consensus in the 1950s, the labor and cooperative movements were severely damaged. It was essentially a war of big business and conservative Republicans against the social and political legacy of New Deal America, a war in which centrist politicians and even liberal Democrats were complicit, due in large part to the supposed exigencies of the Cold War.

Nevertheless, all was not quiet on the worker-cooperative front. In Washington and Oregon a number of large cooperatives had been and were still being organized; these were the plywood co-ops discussed in the last chapter. They would go on to become the longest-lived cluster of cooperatives in the United States, lasting from the 1920s to the early 2000s (although dwindling in later years). The first one was called Olympia Veneer, organized in 1921: a bank loan of \$25,000 was secured, and 125 shares of equity were sold at \$1000 each to loggers, carpenters, and mechanics, in order to finance construction. The business did well, and shares were sold at a high price to outsiders. Soon the worker-owners were earning one-and-a-half times the pay of employees in conventional enterprises, due to their higher labor-productivity. Over time the co-op degenerated into something like a capitalist corporation, since non-member employees were hired and non-workers could buy shares. By 1952, 1000 non-owners were employed and the original plant had been sold to a conventional lumber company; in 1954 Olympia was sold to U.S. Plywood Corporation.³

More plywood co-ops were formed just before World War II, and 21 were organized between 1949 and 1956. Over the course of their lifetime, the size of their workforces would be between 60 and 500. In the 1940s and ’50s the cooperatives accounted for 20 to 25 percent of total production capacity in the industry; in later decades their relative share declined as many more conventional firms were created and almost no new co-ops. On the whole, though, they continued to perform very well, as well as or better than their conventional competitors even during severe slumps in the industry. Their decline in the 1990s did not reflect problems with their cooperative organization but rather the overall decline of the regional industry. Conventional mills succumbed too.⁴

Why were the plywood co-ops so successful? One reason is that they were formed in the growth period of a major new industry.⁵ As stated above, the cultural origins of the cooperators surely played a role too: the Scandinavian people have traditionally sought cooperative solutions to problems. Also, the

Northwest had had a lot of experience with consumers' and producers' co-ops. These last two reasons point to the importance of a "collective memory," a cultural memory, to the resilience of an oppositional culture.¹ Examples are legion: the Knights of Labor was defending an artisanal, pre-industrial, Jeffersonian-republican ethos; the Italian working-class anarchists in Northeast urban communities at the turn of the twentieth century had recently emigrated from rural areas in Italy with rich communal traditions they carried over to the New World, and which served as a foundation for radical opposition to industrial capitalism;² in the 1960s, SNCC had success organizing a civil rights movement in the South because it tapped into local traditions of participatory democracy, religion, empowerment through music and ritual, and small-town mutual respect and dialogue.³ Even in the 1990s, Mayans in North Carolina who had recently emigrated from Guatemala waged a long battle against their employer Case Farms, nourished and encouraged by their collective memories of rural community, mutualism, agricultural cooperation, and immersion in the Catholic church.⁴ All these dissidents derived their strength from the "radicalism of tradition" as it came into conflict with industrial society.⁵

That fact would seem to have a discouraging implication with respect to the viability of contemporary and future struggles against capitalism, namely that they will not be very "resilient" because, in many parts of the world, the possibility no longer exists of grounding them in "tradition," a "collective memory," "precipitates of past historical experience."⁶ These precipitates, after all, have largely been erased by late capitalism. However, I think the conclusion is unwarranted. As will be evident from the following chapter, I think a good way to conceptualize radical movements is by dividing them into those that proceed in large part from the "radicalism of tradition" and those that do not obviously draw sustenance from past historical experience but instead grow out of mature capitalism itself. These two categories are of course merely ideal-types, and actual social movements might not always fall clearly under one or the other. But examples of the "non-traditional" kind of movement would be the anti-war, the feminist, the environmental, and the Black Power movements of the late 1960s. Currently, the vast global movement symbolized by the World Social Forum is, on the whole, a clear case of the "mature" sort of anti-capitalist radicalism, the unequivocally progressive sort (as opposed, for instance, to the Knights of Labor, which was in some respects reactionary). These latter-day movements have been quite resilient, some lasting decades and instigating major changes in culture and politics.

Karl Marx had little to say about the traditional, "primitive" sort of radicalism,⁷ and in fact the utilitarian, Enlightenment-derived, "progress"-fixated, rationalistic and economic bias of Marxism makes this theory not a wholly adequate framework for understanding them. Historical materialism as a sweeping theory, at least, tends to downplay the significance of "culture" and cultural residues, just as it has little interest in the psychological motivations that actually guide actors, emphasizing instead the latter's structural locations in the economy and the utilitarian *interests* that these locations dispose them to pursue.⁸

⁶ Lears, "Power, Culture, and Memory," 117.

⁷ Eric Hobsbawm, *Primitive Rebels: Studies in Archaic Forms of Social Movement in the 19th and 20th Centuries* (Manchester, England: The University Press, 1959).

⁸ Cf. Axel Honneth, *The Struggle for Recognition: The Moral Grammar of Social Conflicts* (Cambridge, MA: The MIT Press, 1995), 145–151. On another level, though, Marxism as a set of research programs is perfectly compatible with—indeed, tends to encourage—an emphasis on the *concrete experiences* of collective actors, as evidenced by, e.g., E. P. Thompson's *The Making of the English Working Class*, David Montgomery's *The Fall of the House of Labor: The Workplace, the State, and American Labor Activism, 1865-1925* (New York: Cambridge University Press, 1987), and Barrington Moore's *The Social Origins of Dictatorship and Democracy: Lord and Peasant in the Making*

This framework has its deficiencies, but it is more appropriate to the analysis of “modern” radical movements than “archaic” ones. In particular, it is a powerful tool for interpreting, first, “modern” struggles between capital and labor, with regard to which considerations of culture and tradition are decidedly subordinate to the objective facts of structural location,¹ and secondly, the future evolutionary transition to a post-capitalist society. (See chapter four.) It is precisely the latter that Marx intended his theory to explain. Archaic cultural residues will be less relevant to this evolution, which, if it happens, will be propelled overwhelmingly by the economic conditions of late capitalism.

In another sense, however, “collective memory” has always been and will always be essential to every oppositional movement, inasmuch as the movement has to educate itself, remember its past experiences and learn from them, maintain and expand on its institutional innovations, build up economic, social, and cultural bases of resistance. The plywood cooperators came from a subculture that had already experimented with consumers’ and producers’ co-ops, which made their new venture that much easier. Another reason for their success is that the first few co-ops provided a “template” that later organizers could use. This, too, is an important lesson for contemporary cooperators.

Another lesson lies in the fate of many of these cooperatives: due in large part to their success, they degenerated into semi-capitalist corporations. Some of them were actually sold to conventional enterprises, but apparently all of them used hired, non-member labor much of the time. As stated in chapter two, they did not want to increase the number of worker-owners by creating new shares, because that would have entailed a loss of income for the current members. So the firms that wanted to expand simply hired employees who were not allowed to participate in decision-making and had vulnerable, often temporary jobs. They were effectively second-class citizens in the plants—and they sometimes constituted almost 50 percent of the workforce. This clearly interfered with a culture of cooperation. In fact, what sometimes happened was that when a member retired, his share was not sold to a new worker but instead bought back by the firm, so that each member would have a somewhat higher annual income. The result was that the membership, i.e., the class of owners, gradually shrank as the class of hired labor expanded. For example, during the first five years of Olympia’s operation (1923 to 1928), 100 non-members were hired, as the number of worker-owners dropped from 118 to 92.²

This capitalist mentality was evidenced also in the fact that these co-ops did not participate in cooperative social movements and were founded purely for the sake of providing employment to members. They had no strong ideological commitment to cooperation; they rarely even linked up with one another for political, economic or ideological reasons. Each enterprise was simply “one big family” (with the exception of the hired labor) united against a hostile outside world.³ As mentioned earlier, therefore, it is essential that co-ops maintain a connection with social movements if their cooperative identity is not to erode. No great social change will happen if cooperatives simply speckle the economic landscape atomistically, even if there are quite a few of them; they have to actively spread their ideology, spawn new co-ops, maintain ties with the labor movement, fundraise continually, agitate politically for grants and favorable legislation, look to progressive social experiments being undertaken in other parts of the world and learn from them or contribute to them. Besides, it is likely that the more connections they have with each other, the smaller is the possibility that they will fail economically.

The next great wave of cooperatives after the 1930s adhered to some of these principles, and was in any case the very antithesis of what the plywood mills represented. I’m referring to the movements of the 1960s and ’70s. The perennial question arises: what caused these movements? At first glance they seem to have appeared out of nowhere. That is not true, of course; rumblings in the 1950s and earlier anticipated

of the Modern World (Boston: Beacon Press, 1966), not to mention Marx’s own *Eighteenth Brumaire of Louis Bonaparte* and *The Civil War in France*.

¹ We should not forget, though, as some revisionist historians are wont to do, that class structures have always been of central importance even to the old “tradition-derived” struggles. It is precisely the industrial capitalist class structure that artisans, petty bourgeoisie, peasants and others have fought against, while drawing on their cultural heritage.

them. In the South, black activists in the 1940s and '50s were establishing connections with each other, testing the limits of repression, registering voters (voter registration increased fourfold, eightfold, tenfold even by the early 1950s);¹ the NAACP became increasingly active prior to and after *Brown v. Board of Education*, and its membership expanded. Conflicts escalated between whites and blacks as the latter grew in collective confidence. At the same time, urban centers in the North were incubating the counterculture, notably Greenwich Village and San Francisco, where artists, students, intellectuals, and dissidents of all sorts came together in loose communities. In the late 1950s and early 1960s, these movements reached a critical mass and exploded into the national spotlight.

Ultimately, the explanation for what was happening lies mainly in the advance of the productive forces and their bursting the shackles of certain conservative production relations.² In the South, for example, tractors appeared during the First World War; later, flame cultivators cleared land more cheaply than laborers did; a cotton harvester came into use during the 1940s, which did the work of forty cotton-pickers. In short, cotton production was being mechanized. At the same time, “competition from synthetics and cheap foreign cotton made cotton a less valuable crop.” Plantations needed fewer and fewer laborers, and so there was less economic need to control blacks, “either through the near-peonage of sharecropping or through violence.” Millions of them migrated to Northern cities, while the rest tended to become more socially assertive—not least because the rise of radio and television, as well as the mass mobilization for the Second World War, lessened their isolation from the rest of the world, encouraging activism to enact freedom and equality. Northern cities became more populous and diverse, which fostered creativity and dissent, as Southern cities became more overtly conflict-ridden.³

The movements that sprouted from this soil, including the civil rights, anti-war, women’s, students’, environmental, and anti-nuclear movements, translated their concern with freedom and democracy into organizational arrangements that revolved around the “collective.” In a broad sense, a collective is just a small group that embodies participatory democracy; it is a form that can be adapted to many uses, from education and childcare to art or law. It was nearly ubiquitous in the 1960s—Freedom Schools, informal leadership committees, law collectives, communes, underground newspapers, cooperative housing, “food conspiracies,” free medical clinics in Chicago and Oakland administered by the Black Panthers, the latter’s Liberation Schools, free breakfast and clothing programs, free stores in San Francisco, music and art groups, “free universities” offering unorthodox courses, etc. And there were hundreds of worker collectives, and even more consumer co-ops.

John Curl summarizes the evolution of 1960s’ worker collectives:

The earliest collective businesses were mostly connected with radical communication media: presses, bookstores and film. This reflected the explicitly political movement from which they emerged. They were followed by food-related cooperatives in the late 1960s, and artisan/industrial collectives and cooperatives beginning around 1970 both in urban and rural areas. These differed from earlier American industrial cooperatives and co-op stores mainly in that they chose worker control through the collective consensus decision-making system, rather than the majority-rule managerial system predominant since the early 19th century.⁴

I cannot discuss the sixties and seventies in great detail here. Much of the history is common knowledge or is easily accessible. The rise and partial fall of food co-ops is illustrative and perhaps most worth looking at: “Of all the countercultural organizations, they became the most interconnected, the most

developed ideologically and...had the most far-reaching effects.”¹ Between five and ten thousand of them were organized in the late sixties and seventies, at the end of which decade they had an annual volume of about \$500 million.² Some were controlled by their workers, others by their workers and customer-members. Many began on college campuses but spread to working-class and middle-class neighborhoods as food prices skyrocketed in the 1970s, rising almost 50 percent between 1972 and 1976. The cooperatives’ goal was, first, to provide healthier, less expensive food to their communities, and second, to create a radical alternative to the dominant system. The movement developed dozens of cooperative warehouses around the country to help supply the stores, since most co-ops could not buy in sufficient bulk for established wholesalers to do business with them. Trucking collectives helped connect the system of alternative wholesalers, co-ops, and regional federations on both coasts and in the Midwest.

When one considers the forces against them, it is remarkable how much the cooperatives accomplished. As always, the main obstacle was lack of money. Sometimes organizers had to knock on doors in their communities to fundraise before creating a store, or hold benefits such as dances. When the co-op got started it was often able to sell some food (not all) more cheaply than supermarkets because its members were not concerned with making a profit, and their business had little overhead. Some customers would be recruited for volunteer labor, but most importantly, workers paid themselves very low wages. Without this extreme “self-exploitation,” most co-ops could not have lasted long or offered food at such low prices.

The food co-op movement, insofar as it can be called a movement, declined in the late 1970s. Co-ops could not compete with corporate supermarkets at selling processed foods or meat, or having a high volume of products. They became specialty stores that customers would patronize to buy natural and wholesome foods before skipping over to the local supermarket to buy everything else. Cooperators found that in order to remain in business they had to expand—which meant compromising their principles and led to bitter ideological fights. Even if they were able to expand, which they usually weren’t, they were often still too small to remain financially viable for long, and with the low wages, workers “burned out” after a few years. There was also a chronic shortage of business experience. Financial problems were sometimes not taken seriously until it was too late. Some of these failures could have been mitigated had more cooperative networks been established across the country, but participants in the movement had too many different ideologies and goals to work together in a sustained way. Some had political agendas, others were committed only to running a store. “The co-ops in Minneapolis,” said one participant, “are very isolationist.” This was true almost everywhere.

Surveying the terrain of New Left movements in the sixties and seventies, one is led to several conclusions. Most of these movements seem to have gone wrong in similar ways, due to similar causes. State violence and repression were instrumental in some cases, especially regarding those few movements, such as Black Power, that explicitly challenged the class structure. More widespread in its counterproductiveness was ideological sectarianism. The bitter factional infighting that erupted in the late sixties and early seventies drained energy from networking and coordinating dissent. Often participants could not agree on their overall aims, or even their immediate aims. Even more importantly, the movements that attempted to create such alternative institutions as cooperatives and communes suffered from an inevitable lack of capital; in the end, the organizations that survived, whether in the media—like the *Village Voice* and *Rolling Stone*—or in the food industry, had to follow the rules of the dominant system. Idealism and inexperience lost out to pragmatism and business acumen.

On a deeper level, the fatal flaw in the New Left was that it did not set out to change the dominant mode of production in any comprehensive or competent way. One cannot have a true “social revolution” without radically transforming the class structure, which is the foundation of society’s institutional structures in general. The sixties’ movements, by and large, focused on culture and politics while neglecting the economy, thus vitiating their long-term goals. They were more interested in “sexy” things like culture,

¹ Ibid., 212.

² Daniel Zwerdling, “The Uncertain Revival of Food Cooperatives,” 90. The following information comes from Zwerdling’s article and Curl, 212–218.

ideology, and politics than the hard work, the decades-long work, of building up a new economy. Of course, this could not have been done anyway; structurally it was impossible at that time, and even now it will be decades before the transition from capitalism to a more cooperative mode of production, if it takes place at all, will reach a very visible level. Nevertheless, the absence in the 1960s of an alliance between the labor movement and the New Left—indeed, the outright mutual hostility¹—suggests the latter’s “superstructural” nature, as it suggests the former’s bureaucratic ossification and conservatism under George Meany and the old guard.

The fate of the New Left shows that the way to a new society does not lie with sectarian ideologizing. It lies with protracted economic evolution, coordination of sustained economic and political struggles, the slow accumulation of financial and human resources—nothing so culturally fixated and impatient as the movements of the 1960s. They were a product not of the impending demise or decrepit nature of capitalism, as many hoped, but of transformations in production relations and technologies (most obviously in the South), population movements, the complex of federal, state, and local housing and tax policies that fostered “white flight” to the suburbs and left inner cities to rot,² the spread of media that connected distant regions to an unprecedented degree, the partly resultant elevation of the problem of poverty into the national consciousness, the U.S.’s waging of an unpopular war in Vietnam, and many other circumstances.

All this time, mainstream cooperatives were making quiet progress. Credit unions, for example, which had been given legal foundations in the early decades of the century, spread after World War II. By 1969 there were nearly 24,000 credit unions, and a decade later they had 43 million members. Housing co-ops, which date to the beginning of the century, expanded in cities during the 1960s, many of them partly financed by the Department of Housing and Urban Development. Agricultural cooperatives (in marketing, buying and selling, etc.) continued to thrive and merge into ever-larger units, even as the number of farmers shrank. In 1955 there were 8100 farmer cooperatives with 7.6 million members; in 1979 there were 7500 cooperatives with fewer than 6 million members. Most rural inhabitants were no longer independent farmers but wage-earners for agribusinesses, part of the rural proletariat. As for worker co-ops, John Curl estimates that their U.S. membership reached its peak in 1979 with about 17,000 people. There were 750 to 1000 small co-ops and a number of larger ones, including 18 plywood co-ops and a reforestation cooperative called Hoedads with 300 members.³

The Reagan years were not kind to cooperatives, as they were unkind to the whole labor movement and in fact to oppressed people everywhere in the world. It was a terrible decade, the first full decade of neoliberal attacks on the global population. Still under the influence of conservative Meanyite traditions, the U.S. labor movement remained ambivalent to worker-ownership as manifested in employee buyouts, ESOPs, and cooperatives, opposing the blurring of the line between employees and management. Ever since the AFL had endorsed collective bargaining and rejected worker cooperatives in the late nineteenth century, this had been the standard line. It began to change in the late 1970s as union officials and local communities experimented with employee buyouts as ways of preventing plant shutdowns and saving jobs.⁴ But in most cases the traditional adversarial relations between workers and bosses remained despite majority employee-ownership, and often buyouts could not prevent the failure of a plant anyway. Stock ownership plans have become increasingly popular since the 1980s, but usually they have little in common with worker cooperatives, since employees typically do not control the firm even if they own most of its stock. Arguably

¹ See Nelson Lichtenstein, *State of the Union: A Century of American Labor* (Princeton: Princeton University Press, 2002), chapters four and five.

² See, e.g., Robert O. Self, *American Babylon: Race and the Struggle for Postwar Oakland* (Princeton: Princeton University Press, 2003) and *Marxism and the Metropolis: New Perspectives in Urban Political Economy*, eds. William Tabb and Larry Sawers (New York: Oxford University Press, 1984).

³ Curl, *For All The People*, 235–241.

⁴ The most famous case is that of the 1977 steel mill closing in Youngstown, Ohio, which led to the employees’ (failed—or foiled) attempt to buy the factory and turn it into a worker cooperative. See Staughton Lynd, *Fight Against Shutdowns: Youngstown’s Steel Mill Closings* (San Pedro, California: Singlejack Press, 1982).

they are of more use to management than to ordinary workers, being ways of raising capital and of giving employees a direct stake in the company's success (which is supposed to motivate them to be productive).¹ Gar Alperovitz may be right, however, that in the long run ESOPs have great transformative potential, as employees demand more control over the companies they own.²

Recessions and a hostile political environment led to the relative decline of consumer and worker co-ops in the 1980s and, to a lesser extent, the 1990s, but in some areas in the latter decade co-ops began to come together in federations or sponsored the creation of supporting institutions. San Francisco's Network of Bay Area Worker Cooperatives, founded in 1994 to connect dozens of co-ops, is an exemplar of that trend, and it continues to spawn new businesses and affiliate with others. The National Cooperative Bank, chartered by Congress in 1978, provided assistance to cooperatives throughout these years; its total assets as of December 31, 2012 were \$1.7 billion.³ Unfortunately it does not often provide loans to worker cooperatives, focusing instead on consumer co-ops, housing, ESOPs, community development corporations, and sometimes even fast-food chains like Dunkin' Donuts (which qualifies as a business cooperative under NCB's definition).

Recently the prospects for cooperatives in all spheres, all over the world, have become brighter than ever. The United Nations and affiliated institutions have repeatedly proclaimed that cooperatives are a crucial component of the plan to meet the Millennium Development Goals by 2015. From dairy cooperatives in Bangladesh, water cooperatives in Bolivia (to give people access to safe drinking water), and a revitalized consumer cooperative sector in Russia, to tenant takeovers of abandoned housing in New York City⁴ and cooperative care of the elderly and disabled in Wisconsin and New York, the movement is making life livable for millions and spreading an anti-capitalist ethos. Indeed, as stated in this book's Introduction, we seem to be in the early stages of a renaissance unlike any in the history of cooperativism.

As will be clear from the following chapter, this renaissance is not some accidental or inexplicable thing. Forty years of savage neoliberal assaults on workers' rights have decimated civil society and discredited conventional approaches to fighting capitalist power. The old paradigm of bureaucratic business unionism, a narrow focus on wages and collective bargaining, and reluctance to fight for broader issues of social justice has failed catastrophically. New strategies are desperately needed and have begun to be pursued, even by such former strongholds of conservatism as the AFL-CIO. Unions that used to follow the motto "We'll get it done ourselves" are now allying with women's groups, immigrant organizations, environmental groups, and community groups of all kinds to fight for mutually beneficial goals like environmental protection, immigrant rights, a higher minimum wage, and improved public education.⁵ The innovative strategy of "minority unionism" is spreading: rather than organizing a majority of workers at one business and then holding a vote for union recognition, a minority of workers at multiple businesses are organized to engage in militant, public actions that dramatize grievances, galvanize political action, and hopefully force employers to make concessions while attracting more workers to unionism.⁶ Recent strikes at Walmart, in the fast-food industry, and for a 15-dollar federal minimum wage have followed this model. Progressive unions are reaching across national borders to create transnational alliances—a long-delayed necessity in this age of globalization. New models are emerging of "regional power-building," the construction of durable coalitions between unions, local labor councils, progressive business groups, and

other civil society organizations.¹ In this context of free-wheeling experimentation to address labor's woes, the spread of cooperativism and worker ownership is one of the most exciting developments. The sophistication of current projects is striking: in particular, institutions have learned the lesson that nothing is more important than to make connections with each other to birth new co-ops.²

For instance, the United Steelworkers union and Mondragon announced in October 2009 that they were collaborating to establish manufacturing cooperatives in the U.S. and Canada, an agreement that USW president Leo Gerard called "a historic first step towards making union co-ops a viable business model."³ In March 2012, the USW, Mondragon, and the Ohio Employee Ownership Center jointly announced the publication of their detailed template for union co-ops, which sets out an organizational structure that can be replicated by other unions interested in starting co-ops as a way to save jobs and communities. The template is based on Mondragon's structure but with the key innovation that a Union Council (in place of Mondragon's Social Council) is empowered to collectively bargain with the management team on such matters as compensation and working conditions. That is, worker-owners elect a Board of Directors that appoints a management team to oversee the business's day-to-day operations and to engage with the Union Council on matters pertaining to employee rights and welfare. All the members of these bodies are required to be worker-owners themselves. The template, which also includes guidelines on ownership structures, financing, education, training, etc., is flexible enough to be appropriate for businesses of from ten workers to thousands of workers.⁴

The USW, along with SEIU and other unions, is already involved in a number of cooperative initiatives. For instance, it is helping to launch the Pittsburgh Clean and Green Laundry Cooperative, a new industrial laundry that will employ a hundred people. "Under the union-cooperative model," Amy Dean writes, "the laundry's employees would be able to join the union of their choice, and the jobs offered at the plant would provide a living wage, benefits, and a collective bargaining agreement. As worker-owners, the employees would also gain equity in the business."⁵ Pennsylvania's Steel Valley Authority, which has been integral to the project, describes its ambitions as follows:

It would be our intent to create worker ownership initiatives across the Pittsburgh region and examine the potential for expanding this initiative state and region-wide, and over time, explore opportunities for national replication. In order to accomplish this, the SVA is exploring the development of a dedicated center that provides technical assistance, a revolving loan fund that provides early stage capital for new co-op businesses, and a training program that provides specialized training for company leadership....⁶

All these ideas are taken, in part, from Mondragon, which is collaborating with the SVA.

¹ Amy Dean and David Reynolds, *A New New Deal: How Regional Activism Will Reshape the American Labor Movement* (Ithaca: ILR Press, 2009). There is a growing literature on the new progressivism of U.S. unions and the necessity for it. See, e.g., Tamara Kay, *NAFTA and the Politics of Labor Transnationalism* (New York: Cambridge University Press, 2011), which traces this progressivism to the shock of NAFTA. Bill Fletcher Jr. and Fernando Gapasin, *Solidarity Divided: The Crisis in Organized Labor and a New Path Toward Social Justice* (Berkeley: University of California Press, 2008) is a thoughtful analysis of the crisis in the labor movement and possible solutions to it.

⁶ Steel Valley Authority, "Pittsburgh Clean and Green Project," <http://www.steelvalley.org/building-sustainable-communities/pittsburgh-cleangreen-project> (accessed May 20, 2013).

Another example of the USW's activism is its support of the Cincinnati Union Cooperative Initiative, which is developing a railway manufacturing co-op, a co-op for retrofitting buildings for energy efficiency, and a "food hub" called Our Harvest that allows institutions "to buy produce that is grown, harvested, and packaged by worker-owners." Our Harvest, which is in partnership with the United Food and Commercial Workers union, is already in operation: food is grown on a 30-acre farm in an urban neighborhood, though plans are underway to get a thousand acres' worth of production going.¹

As Rob Witherell of the USW notes, union-affiliated projects like these are springing up all over the country, from Seattle to New York. "One of the nice problems we have," he says, "is trying to keep track of it all."² This "problem" is a happy indication that the U.S. labor movement, in the footsteps of Latin America's, Canada's, and Europe's, is finally starting to take seriously the enormous potential that cooperatives have as both job-saving devices and means of pushing society in a progressive direction. Not since the 1880s, in fact, have mainstream American unions been so actively involved in either worker cooperativism or what has come to be called "social justice unionism" (or "social movement unionism").³

One of the success stories that has inspired this recent flurry of activism is the Evergreen Cooperative Initiative in Cleveland, Ohio. So successful has it been that in 2010 it was featured on NBC Nightly News, which glowingly reviewed its efforts to revitalize an impoverished community on the east side of the city; it has also been the subject of articles in the *Economist*, *Business Week*, the *Nation*, *Time*, and dozens of less prominent media outlets. The reason for all this hype is that it has provided a new and ambitious model for reversing economic decline in a blighted area of the Rust Belt. The project came to fruition in 2008 when several local institutions (including the Cleveland Foundation, University Hospitals, Case Western Reserve University, and the municipal government) teamed up with the Ohio Employee Ownership Center and the Democracy Collaborative at the University of Maryland to establish a network of worker-owned businesses modeled on Mondragon's federated structure. The goal was, and is, to create ten co-ops and five hundred living-wage jobs for local residents. With the help of millions of dollars in grants, three businesses had been created as of 2013: Evergreen Cooperative Laundry, Evergreen Energy Solutions, and Green City Growers Cooperative (supposedly the largest urban food-producing greenhouse in the country). Technologically these are cutting-edge enterprises, committed to being the greenest firms within their sectors. They are also very profitable, in part because they've attracted the business of hospitals and other local "anchor institutions" that are trying to reduce their carbon footprint (and keep their money within the community). To help start new co-ops, each of the businesses is required to pay ten percent of its pre-tax profits into a Cooperative Development Fund—a practice that is modeled, again, on Mondragon.⁴

Another striking fact about cooperatives in the twenty-first century is that they are faring comparatively well in our stagnant economy, on average better than capitalist businesses. An ILO report in 2009 concluded that "Financial cooperatives remain financially sound; consumer cooperatives are reporting increased turnover; worker cooperatives are seeing growth as people choose the cooperative form of enterprise to respond to new economic realities."⁵ Cooperative banks, not being driven purely by the profit-motive, had little incentive to give risky loans; 2008 was in fact a record year in many respects for credit unions, some of which are among the largest banks in the world. Regarding other types of cooperatives,

⁵ Birchall and Kettison, "Resilience of the Cooperative Business Model in Times of Crisis," 2.

there has lately been an increase in their formation rates, and, as noted earlier, they have tended to last longer than conventional businesses.¹

A 2012 study by the (cumbersomely named) European Confederation of Worker Cooperatives, Social Cooperatives and Social and Participative Enterprises reaches similar conclusions. The record has not been uniformly positive across Europe, but in general cooperatives have been more resilient than conventional enterprises. Their members mostly attribute this fact to the “participation of members in the management of the cooperative, the build-up of reserve funds, the connection with territorial needs and the participation of the community, the capacity to organise and follow-up business transfers to employees, mutual aid and horizontal groups and consortia among cooperatives. In particular, the establishment of horizontal groups and consortia is considered by members as being an important instrument to support innovation and competitiveness for small and medium sized worker and social cooperatives.”² The number of worker cooperatives in the UK actually increased during the crisis, from 373 in 2007 to 541 in 2011. In March 2013 the *Financial Times* had an article titled “Economic crisis spawns co-op revival,” which observed that the total number of cooperatives had risen by 23 percent since 2008, about the same rate as their growth of revenue.³

One of the lessons of such developments is that as oppressed people and their advocates find traditional avenues of reform closed to them, they will be forced to invent revolutionary new solutions such as worker cooperatives. This is what the Latina immigrants in Natural Home Cleaning and Home Green Home Natural Cleaning have done, as well as those involved in the emerging New York City Co-op Network,⁴ and the Evergreen cooperators and many others. They have all been stymied in their attempts to seek help through conventional channels. Economic outcasts like these will continue for decades to network with each other outside the mainstream, accumulating resources on behalf of cooperativism, building up an alternative civil society alongside a decaying capitalist order. The system itself will drive them to these extremes; it will produce its own gravediggers as it collapses in old age. And the long, tragic history of cooperatives will finally be consummated: it will be rescued and celebrated as a glorious harbinger.

CHAPTER FOUR MARXISM AND THE ALTERNATIVE ECONOMY

The death of Marxism has been announced so many times that it might seem anachronistic to reconsider Marx’s ideas yet again. In the early twenty-first century haven’t we moved beyond Marxism? The answer, it seems, is no. For one thing, in recent years even the mainstream media has suggested that the ghost of Marx is haunting the world. Articles are published with headlines like “Why Marx was Right”⁵ and “Marx’s Revenge: How Class Struggle Is Shaping the World,”⁶ and mainstream economists like Paul Krugman and Nouriel Roubini invoke Marxism to explain capitalism’s current crisis. Radical thinkers such as David Harvey and Richard Wolff have become academic celebrities, and magazines like *Monthly Review* and *Jacobin* are becoming more popular. In fact, the Pew Research Center reported in 2011 that among Americans aged 18 to 29, 49 percent have a positive view of socialism whereas 46 percent have a positive view of capitalism.⁷ It seems, then, that reports of Marx’s death have been greatly exaggerated.

It is worth asking why Marxism is so resilient. On the most basic level, the answer is that class struggle is indeed of central and perennial importance to human life. Since the emergence of social classes thousands of years ago, individuals' and groups' access to resources has been determined primarily by their positions in particular relations of production (or a "mode of production")—and of course access to resources is of unique importance to life, since it essentially determines one's ability to survive and to influence what happens in society. The way that economic production has worked since class structures emerged is that certain classes of people have, through various methods of "hard" and "soft" power, forced others to work for them, or rather to produce a surplus that can be appropriated by the privileged or those with power. Whether people have been *aware* of "forcing" others to work—or of being forced to work—is irrelevant; the point is that the system has functioned in such a way that some people have had to be slaves, serfs, wage-laborers, etc., while others have been slaveowners, landed aristocrats, capitalists, etc.—i.e., have profited off others' labor (due to asymmetrical power relations). Exploiters and exploited have thus confronted each other in a perpetual struggle, sometimes implicit and sometimes explicit, to have more power and resources. The profound explanatory power of this analytic framework explains why academic Marxism has for decades been relatively prominent even in a capitalist society.

Incidentally, a corollary of this emphasis on class struggle and class interests is equally valid: at least if *explanation* is one's goal, it is more fruitful to analyze "social being" than "consciousness." The former is more fundamental than the latter, in part because consciousness tends to be a sublimation of social being. That is to say, ideologies, "discourses," subjective identities, thoughts and conceptions of all kinds are conditioned by such non-discursive things as economic realities, institutional imperatives (the need to follow the rules of given social structures), physical environments, and the basic necessities of biological survival to a far greater degree than the latter are conditioned by the former. This is true of both individuals and collectivities. For example, people in a particular social category will tend to have beliefs that legitimate their economic interests and institutional roles. Slaveowners may well believe that slavery is moral or divinely ordained; intellectuals will probably think that ideas or "discourses" are of tremendous importance;¹ capitalists will be prone to thinking that capitalism and greed are natural and good. But even if some people manage to be more mentally independent than the majority, that doesn't matter much, because there are still overwhelming pressures for their *behavior* to conform to social structures and institutional norms. And these are situated in a material and economic context that is, on a broad scale, structured around the power and interests of a "ruling class" (consisting of those who occupy the dominant positions in a society's dominant mode of production).

Thus, on the societal level too, consciousness and ideas are secondary to the configuration of production relations, the resultant distribution of resources, and institutional structures in general. Ideologies will tend to predominate that either legitimate or are compatible with the interests of those people who have the most control over the most resources, i.e., the ruling class. As Marx said, "the ideas of the ruling class are in every epoch the ruling ideas."² True understanding of social dynamics, therefore, necessarily exists on a materialist foundation.³

Aside from these general considerations, the obvious reason why Marxism keeps reappearing in the broader culture is that Marx was basically right in his analysis of capitalism: the economy is prone to crisis, class polarization has a pronounced tendency to increase (unless held in check by other forces), the working class tends to be relatively or absolutely immiserated, people in general are commodified and dehumanized in capitalist society, commodities are "fetishized," and so forth. In fact, all it takes is an

¹ For critiques of postmodern idealism, see my *Notes of an Underground Humanist* (Booklocker, 2013).

² Needless to say, this pat formula is of less use with regard to eras in which two or more classes are contending for supremacy, such as during the eighteenth century in Western Europe.

³ For a study that shows the power of such a materialist analysis, see Thomas Ferguson and Joel Rogers, *Right Turn: The Decline of the Democrats and the Future of American Politics* (New York: Hill and Wang, 1986). Charles Beard, *An Economic Interpretation of the Constitution of the United States* (New York: The Macmillan Company, 1913) is a still-compelling classic. The political writings and interview collections of Noam Chomsky (*Understanding Power* is an easy-to-read example) likewise demonstrate the persuasiveness, indeed the commonsensicalness, of materialism.

unbiased mind to see that Marxian perspectives on all facets of capitalism are extraordinarily penetrating: the writings of E. P. Thompson, Raymond Williams, Paul Sweezy, Paul Baran, Ernest Mandel, Harry Braverman, David Montgomery, Robert Brenner, David Noble, Erik Olin Wright, Göran Therborn, Thomas Ferguson, David Harvey, John Bellamy Foster, and numerous other academic Marxists of the last sixty years are sufficient to prove this. And of course there are the writings of Marx and Engels themselves to consider, as well as of the second generation of Marxists (roughly Lenin's generation). In short, there is no question that Marxism is here to stay.

Given the unique power of this intellectual system, it is wholly justified to reconsider what is perhaps its weakest aspect, its theory of revolution. Marxists have traditionally been hostile to cooperatives as a tool of revolution, but as we'll see, a properly understood Marxism is in fact strategically *committed* to cooperatives. Even more importantly, a reconsideration and modification of Marx's theory of revolution will enable us to understand how a transition to socialism, or something like it, can happen, and what role cooperatives and other "alternative economy" institutions will play in that transition.

These are big topics, and the discussion in this chapter will necessarily be both wide-ranging and schematic. There isn't space to go into the detail I'd like. Still, lest the reader lose the thread of the argument in the thicket of ideas, I'll outline it here. The main point that ties it all together is that I reject Marx's statism, and I do so for reasons that I think are more faithful to Marxism than his own statist conception of the "dictatorship of the proletariat" is. I find it astonishing, in fact, that, as far as I know, no one has ever appreciated the radically *un-Marxian* character of that conception, the fact that it doesn't follow logically from the basic premises of Marxism. Quite the contrary: as I'll argue in chapter six—though it is also implicit in this chapter—the spirit of anarcho-syndicalism is much closer to the essence of Marx's thought than Leninism and statism are. This isn't just an academic debate, by the way. For one thing, Marxists should know what they are logically committed to, and in what respects Marx got his own ideas wrong. It's also important to cleanse and update the theoretical system in order to keep it a *living force*, to salvage its insights and put them to use in our own urgent struggles. It seems to me that intellectual integrity is a virtue, and ideas can have powerful practical repercussions.

My rejection of Marx's statism, i.e., his adherence (despite his internationalism) to the framework of the nation-state, leads to my argument that only in the twenty-first century are we finally entering the revolutionary period Marx and Engels looked forward to. That is, they got the timeline wrong: international socialist revolution never could have happened in the nineteenth or twentieth centuries, for reasons I explain later. Their impatience got the best of them. Only now is the nation-state system *beginning* to deteriorate—and global revolution could never have happened before this deterioration started. In part to explain why this is the case, and what it is about our contemporary world that makes it so much more pregnant with transnational revolutionary potential than the world of, say, a hundred years ago was, I briefly review the "historical logic" of the evolution of capitalism and the nation-state into the neoliberal present. On the most abstract level, one can view the last 150 years or so in the West as consisting of, first, a relatively "pure" and "unregulated" capitalism that, through the conflicts it engendered between labor and capital (and the resultant economic crises of "underconsumption" and "overproduction"), necessitated the birth of the regulated Keynesian welfare state, in the heyday of the nation-state era between the 1930s and 1960s. This period was the interregnum, so to speak, between the first era of semi-"pure" capitalism and the second, which began in the mid-1970s and has continued to the present. As before, the relative lack of government economic regulation and the disempowerment of organized labor are leading to extreme social discontent and economic crisis/stagnation. This time, however, the old nationalist Keynesian "compromise" is not a possible solution, because the nation-state system is succumbing to the disintegrating effects of transnational capital.

So, the current decline of the nation is the world-historic development that, together with the emerging period of global economic stagnation, will make possible a (very protracted) social revolution—centered not around national states but around grassroots movements, municipal democratic experiments, regional networking, and transnational coordination of anti-capitalist resistance. It was always inevitable that *this* was how the revolution would happen, as opposed to un-Marxist fantasies of the working class

taking over national states and directing economic reconstruction from above. Such a proletarian dictatorship has never happened and never can happen, as follows from the premises of Marxism itself.

After setting out this theoretical framework, I consider its implications in practice. My focus this time isn't on worker cooperatives, since I discuss those in other chapters, but on things like municipal enterprise and participatory budgeting. I argue that these are the seeds of the new economy, the post-capitalist society that will germinate in the next century or two. After reviewing a few of these initiatives, I conclude the chapter by considering why states and ruling classes will allow—indeed, are allowing—the “revolution” to happen despite its anti-capitalist character. Throughout the discussion, I try to draw parallels with the earlier transition in Western Europe from feudalism to capitalism. I think that if we examine that earlier revolution carefully, we'll find clues as to how the future will unfold.

This chapter is necessarily dense; it could itself be expanded into a book or two. Its main purpose, again, is just to sketch a framework by which we can interpret the recent and future growth of alternative economic arrangements in the interstices of a decaying civilization. I'll leave it to a future book to fill in the details.

Theory

Marx has, in effect, two theories of revolution, one that applies only to the transition from capitalism to socialism and another that is more transhistorical, applying, for instance, also to the earlier transition between feudalism and capitalism. I will consider, and revise, each of these in turn. Both see the working class as the agent of transition to a post-capitalist economy. Whatever Marx meant by “working class,” in the following discussion I will interpret the term broadly, as denoting the majority of wage-earners—except those whose high income, high managerial positions, ownership of stocks, and so on effectively align them with the capitalist rather than the working class. It has long been known that many people in modern society, especially those in the “middle class,” have contradictory class locations, sharing some interests with capitalists and others with low-wage workers. This is what makes it possible for the middle class sometimes to act in radical ways and other times in reactionary ways.¹ Typically, in fact, the middle class has been the conservative bastion of social order; nevertheless, the wage-earning status of most of its members always holds out the possibility that someday they will act in radical opposition to those who own capital. If they lose their middle-class status, whether through economic crisis or some other cause, this possibility becomes more likely.

Among the people who will or can serve as the agents of transition to a new society are, for example, industrial workers, clerical workers, low-wage service workers, a majority of teachers, the unemployed, and in general those people who are relatively disempowered by corporate capitalism or have grievances that can be remedied by a dismantling of capitalism. This category of people in fact also includes others whom Marx would probably not consider working-class: most students, peasants, dispossessed indigenous peoples, even environmental activists (for such activism is really part of the class struggle, the struggle against the predatory capitalist class). All these people and more, the totality of whom amounts to the large majority of humanity, have interests opposed to the profit-making, environmentally destructive, humanly exploitative, universally commodifying, undemocratic imperatives of corporate capital, and therefore are effectively the “workers of the world” whom Marx called to “unite.” This is how we should interpret his call in the twenty-first century.

Let's consider, then, the basics of his theory of how capitalism will give way to socialism. The pivot of the theory is capital's unquenchable thirst for profit, for surplus-value. It seeks always to squeeze more surplus-value out of the worker, which is to say value for which the worker does not receive an

¹ See, e.g., Robert Johnston, *The Radical Middle Class: Populist Democracy and the Question of Capitalism in Progressive-era Portland, Oregon* (Princeton: Princeton University Press, 2003); Christopher Lasch, *The True and Only Heaven: Progress and Its Critics* (New York: Norton, 1991); and Lewis Corey, *The Crisis of the Middle Class* (New York: Covici Friede, 1935).

equivalent in wages.¹ This entails the reduction of wages to as low a level as possible (given societal conditions, workers' power, the skill-level of the job, etc.) and the intensification of work to as high a level as possible. Capital invests its earnings in labor-saving, money-saving schemes like mechanization, ever-increasing mechanization so as to employ fewer workers, especially fewer skilled ones, control them more effectively, and generate more profit. At the same time, it expands its operations and puts less profitable competitors out of business. These failed competitors—who historically have included artisans, craftsmen, much of the petty-bourgeoisie, and many capitalists themselves—are forced to become wage-earners as the relatively few surviving capitalists acquire more money and power. Most of the peasantry, too, is eventually forced off the land through myriad pressures of “push” and “pull,” swelling the ranks of the working class. The “reserve army of the unemployed” also tends to grow, in part because periodic economic crises throw people out of work and shutter unprofitable businesses. Without delving into Marxian economics, we can say that these are typically crises of overproduction and/or underconsumption, the latter a product of the endemic drive to lower wages and employ as few workers as possible. That is, low effective demand leads to disincentives for business to invest and incentives to cut costs, which means laying off workers and paying them less, thus aggravating the macroeconomic problem.² The end-result of all these tendencies, at least according to Marx's ideal model, is that the working class and the unemployed population become larger and poorer, while the capitalist class gets smaller (at least relatively) and wealthier. Society becomes increasingly divided into two polarized classes. Workers' self-interest and collective grievances impel them to fight together for their power and dignity: they form unions and other associations, some of them political, that train them in struggle and radicalize them. Because their demands can ultimately not be met in the framework of capitalism, at length they seek to take over the state so as to remake the economy along democratic, i.e. socialist, lines. Marx thinks that eventually they are destined to succeed, if only because of their overwhelming numbers and their decades of organizing themselves.

To repeat, this is an ideal model and therefore, like all models, a simplification. The question is how closely it resembles reality. The answer appears to be: in some respects very much so, in others not. In particular, the analysis of how capitalism works seems clearly to be an accurate, if idealized, model of definite tendencies in the real world. On the other hand, the prediction of radicalization of the masses—their increasing class-consciousness—and eventual overthrow of the bourgeois state seems not to have been fulfilled. Before considering these matters in greater depth, however, I'll describe Marx's “second” theory of revolution, the transhistorical theory.

Its *locus classicus* is the last four sentences of the following paragraph from Marx's Preface to *A Contribution to the Critique of Political Economy*:

In the social production of their existence, men inevitably enter into definite relations, which are independent of their will, namely relations of production appropriate to a given stage in the development of their material forces of production. The totality of these relations of production constitutes the economic structure of society, the real foundation, on which arises a legal and political superstructure and to which correspond definite forms of social consciousness. The mode of production of material life conditions the general process of social, political and intellectual life. It is not the consciousness of men that determines their existence, but their social existence that determines their

¹ This controversial theory of surplus-value is really nothing but common sense, like most of Marxism. If workers were compensated for all the value they produce (which then goes on the market), the capitalist couldn't make any profit. On Marxian economics, see, among innumerable others, Ernest Mandel, *Marxist Economic Theory* (London: The Merlin Press, 1968); Paul Sweezy, *The Theory of Capitalist Development: Principles of Marxian Political Economy* (New York: Monthly Review Press, 1942); David Harvey, *The Limits to Capital*

² See, e.g., David Harvey, *The Enigma of Capital* (New York: Oxford University Press, 2011) and Richard Du Boff, *Accumulation and Power: An Economic History of the United States* (New York: M. E. Sharpe, Inc., 1989). On the concept of overproduction, see Robert Brenner, *The Economics of Global Turbulence* (New York: Verso, 2006). He departs from orthodox Marxian economics, though.

consciousness. At a certain stage of development, the material productive forces of society come into conflict with the existing relations of production or—this merely expresses the same thing in legal terms—with the property relations within the framework of which they have operated hitherto. From forms of development of the productive forces these relations turn into their fetters. Then begins an era of social revolution. The changes in the economic foundation lead sooner or later to the transformation of the whole immense superstructure.

There are several problems with this theory as expressed here. First of all, it is clearly the barest of outlines, desperately in need of elaboration. Unfortunately, nowhere in Marx's writings does he elaborate it in a rigorous way. Second, it is stated in functionalist terms. Revolution happens supposedly because the productive forces—i.e., technology, scientific knowledge, the state of education, and so forth—have evolved to such a point that production relations are no longer compatible with their socially efficient use and development. But what are the *causal mechanisms* that connect this functionalist concept of “fettering of the productive forces” to social revolution? As far as I know, nowhere does Marx express his theory in causal, as opposed to functionalist, terms.

Perhaps the biggest problem is that, as it's stated above, the theory borders on meaninglessness. How does one determine when production relations have started to impede the use and development of productive forces? It would seem that to some extent they are *always* doing so. In capitalism, for example, one could point to the following facts: (1) recurring recessions and depressions periodically make useless much of society's productive capacity; (2) enormous amounts of resources are wasted on socially useless advertising and marketing campaigns; (3) there is a lack of incentives for capital to invest in public goods like mass transit, the provision of free education, and public parks; (4) the recent financialization of the Western economy has entailed investment not in the improvement of infrastructure but in glorified gambling that doesn't benefit society; (5) artificial obstacles such as intellectual copyright laws hinder the development and diffusion of knowledge and technology; (6) a colossal level of expenditures is devoted to war and destructive military technology; (7) in general, capitalism distributes resources in a profoundly irrational way, such that, for example, hundreds of millions of people starve while a few become multi-billionaires. Despite all this, however, no revolution has happened.

Indeed, in other respects capitalism continues to develop productive forces in a striking way, as shown by recent momentous advances in information technology. It's true that—contrary to the fantasies of “free market” fanatics—this technology was originally developed in the state sector; nevertheless, the broader economic and social context was and is that of capitalism. It is therefore clear that a mode of production can “fetter” and “develop” productive forces *at the same time*, a fact Marx didn't acknowledge.

In order to salvage his hypothesis quoted above, and in fact to make it quite useful, a subtle revision is necessary. We have to replace his idea of a conflict between productive forces and production relations with that of a conflict between two sets of production relations, one of which uses productive forces in a more rational and “un-fettering” way than the other. This change, slight as it might seem, has major consequences for the Marxist theory of revolution. It is no exaggeration to say that, in addition to making the theory logically and empirically cogent, it changes its entire orientation, from advocating a “dictatorship of the proletariat” that directs social and economic reconstruction to advocating a more grassroots-centered long-term evolution of social movements that remake the economy and society from the ground up. I will also argue that my revision makes the theory more compatible with the basic premises of Marxism itself, and that a statist version of Marxism, such as Leninism, is both un-Marxist and unrealistic.

My revision to the theory, then, is simply that at certain moments in history, new forces and relations of production evolve in an older economic and social framework, undermining it from within. For different reasons in different cases, the new production relations spread throughout the society, gradually overturning the traditional economic, social, political, and cultural relations, until a more or less new society has evolved. This happened, for example, with the Neolithic Revolution (or Agricultural Revolution), which started around 12,000 years ago. As knowledge and techniques of agriculture developed that made possible sedentary populations, the hunter-gatherer mode of production withered away, as did the ways of life appropriate to it.

Likewise, starting around the twelfth and thirteenth centuries in parts of Europe, an economy and society organized around manorialism and feudalism began to succumb to an economy centered around the accumulation of capital. Several factors contributed to this process, among them (1) the revival of long-distance trade (after centuries of Europe's relative isolation from the rest of the world), which stimulated the growth of merchant capitalism in the urban interstices of the feudal order; (2) mercantile support for the growth of the nation-state with a strong central authority that could dismantle feudal restrictions to trade and integrated markets; (3) the rise, particularly in England, of a class of agrarian capitalists who took advantage of new national and international markets (e.g., for wool) by investing in improved cultivation methods and enclosing formerly communal lands to use them for pasturage; (4) the partly resultant migration of masses of the peasantry to cities, where, during the centuries from the sixteenth to the nineteenth, they added greatly to the class of laborers who could be used in manufacturing; (5) the discovery of the Americas, which further stimulated commerce and the accumulation of wealth. In short, from the thirteenth to the nineteenth centuries, capitalist classes—agrarian, mercantile, financial, and industrial—emerged in Europe, aided by technological innovations such as the printing press and then, later on, by all the technologies that were made possible by the Scientific Revolution of the seventeenth century. All this is just to say that in the womb of the old society, new productive forces and production relations evolved that were more dynamic and wealth-generating than earlier ones. Moreover, on the foundation of these new technologies, economic relations, and scientific discourses arose new social, political, and cultural relations and ideologies that were propagated by the most dynamic groups with the most resources, i.e., the bourgeoisie and its intellectual hangers-on.¹

It's true that numerous political clashes had to occur before the rising bourgeoisie could achieve hegemony over Europe. Both the feudal aristocracy and absolutist monarchies opposed the bourgeois doctrines of economic and political liberalism, such that a series of revolutions was necessary before the bourgeoisie could accede to political power. The point relevant to the following discussion is that once capitalist economic relations had reached a relatively mature and widespread level, the ultimate political victories of the capitalist class were nearly inevitable, if only because of this class's continuing growth and access to more resources than its opponents had. Furthermore, it was *only* when capitalist relations had already made significant progress that bourgeois political revolutions were possible.

We should apply the lessons of the transition from feudalism to capitalism to the future transition from capitalism to some other system. This, too, will have to happen in a very gradual way, as new production relations sprout in the "interstices" of a decaying order. Briefly stated, one can expect that capitalism's descent into long-term crisis (or stagnation) will generate—or rather, is generating—movements of resistance across the world, many of which will be devoted to establishing new cooperative modes of production and distribution that will assist millions of the unemployed and the cast-off in their tasks of survival. Explicitly political anti-capitalist resistance will spread too, but it cannot possibly attain the summits of political power without having command over tremendous resources, sufficient resources to compete against the ruling class. An important way of acquiring such resources is by accumulating capital through business activities, such as cooperatives and other "alternative economy" institutions do. Thus, just as the bourgeoisie could not achieve power before the capitalist economy had conquered much of Europe, so the working class cannot take over political power (on a broad scale) before its own economic institutions, its "socialist" institutions, have partially remade the world economy. Sooner or later, durable alliances will have to be made between the alternative economy and political movements if the latter are to

¹ Among many others, see Phyllis Deane, *The First Industrial Revolution* (New York: Cambridge University Press, 1979); Robert Brenner, "The Origins of Capitalist Development: A Critique of Neo-Smithian Marxism," *New Left Review* I/104, July-August 1977, 25-92; Rodney Hilton, ed., *The Transition from Feudalism to Capitalism* (London: New Left Books, 1976); T. S. Ashton, *The Industrial Revolution, 1760-1830* (Westport, CT: Greenwood Press, 1986); Giovanni Arrighi, *The Long Twentieth Century: Money, Power, and the Origins of Our Times* (New York: Verso, 1994); and Robert Allen, *The British Industrial Revolution in Global Perspective* (New York: Cambridge University Press, 2009).

succeed in their ultimate objectives. On a global level this process can be expected to take at least a century or two.

Before examining these ideas in more detail, it's worth reviewing the advantages of the revision I've made to Marx's theory of revolution. Again, my argument is just that social revolution happens when an old set of production relations fetters—or irrationally uses—productive forces *in relation to a new set of widely emerging production relations*. The “in relation to....” that I have added saves the theory from meaninglessness, for it indicates a definite point at which the “old” society really begins to yield to the “new” one, namely when an emergent economy has evolved to the point that it commands substantial resources and is clearly more “rational” in some sense than the old economy. Whether this hypothesis applies to *all* social revolutions is a question I won't consider here; the point is that it does apply to some, and it will surely apply to any transition between capitalism and cooperativism. (See below.)

Another advantage of my revision is that it supplies a causal mechanism by which a particular mode of production's “fettering of the productive forces” leads to revolution—indeed, to *successful* revolution. The mechanism is that the emergent mode of production, in being less dysfunctional and/or more “efficient” than the dominant mode, eventually (after reaching a certain visibility in the society) attracts vast numbers of adherents who participate in it and propagandize for it—especially if the social context is one of general economic stagnation and class polarization, due to the dominant mode of production's dysfunctionality. Moreover, this latter fact means that, after a long evolution, the emergent economic relations and their institutional partisans will have access to so many resources that they will be able to triumph economically and politically over the reactionary partisans of the old, deteriorating economy. Again, this is what ultimately ensured the political success of the bourgeoisie in its confrontations with the feudal aristocracy. Similarly, if capitalism continues to stagnate and experience manifold crises, this will ensure the global victory of a cooperative mode of production that will have developed over generations in the interstices of capitalist society.

So, in short, my revision provides a necessary condition for the success of an anti-capitalist revolution, and thus, as we'll see in a moment, helps explain why no anti-capitalist revolution so far has been successful in the long term (namely because the condition has been absent). Another way of seeing the implications and advantages of the revision is by contrasting it with the views of orthodox Marxists. A single sentence from Friedrich Engels sums up these views: “The proletariat seizes state power, and then transforms the means of production into state property.”¹ This statement, approved by Lenin and apparently also by Marx, encapsulates the mistaken statist perspective of the orthodox Marxist conception of proletarian revolution. This perspective is briefly described in the *Communist Manifesto*, where Marx writes “The proletariat will use its political supremacy to wrest, by degree, all capital from the bourgeoisie, to centralise all instruments of production in the hands of the State, i.e., of the proletariat organised as the ruling class,” and then lays out a ten-point plan of social reconstruction by means of state decrees. It's true that orthodox Marxists expect the state, “as a state,” to wither away eventually, but they do have a statist point of view in relation to the early stages of revolution.

This statist vision emerges naturally from both of Marx's theories of revolution discussed above: from the first one, because Marx simply assumes that the main task of the working class is to take over the national state (i.e., all national states), and that in the long run its efforts will be devoted to this task; from the second, because the idea of a conflict between the rational use and development of productive forces and the fettering nature of current production relations suggests that at some point a social “explosion” will occur whereby the productive forces are finally liberated from the chains of the irrational mode of production. Pressure builds up, so to speak, over many years, as the mode of production keeps fettering the socially rational use of technology and scientific knowledge; through the agency of the working class, the productive forces struggle against the shackles of economic relations; at length they burst free, when the working class takes over the state and reorganizes the economy. These are the metaphors naturally conjured by the paragraph quoted above from the Preface to *A Contribution to the Critique of Political Economy*.

¹ Quoted in Lenin, *State and Revolution* (New York: International Publishers, 1969), 15.

But there are logical and empirical problems with the statist view, the view according to which the substance of social revolution occurs *after* the seizure of state power. First of all, it is in tension with the Marxian conception of social dynamics. Briefly stated, Marx sees the economy—rightly, I think—as the relative foundation of the rest of society, including politics, which suggests that a post-capitalist social revolution cannot be politically willed and imposed. This would seem to reverse the order of “dominant causality,” from politics to the economy rather than vice versa. Moreover, such extreme statism exalts *will* as determining human affairs, a notion that is quite incompatible with the dialectical spirit of Marxism. History really happens “behind the backs” of actors: it evolves “unconsciously,” so to speak, as Hegel understood. Social and institutional conflicts work themselves out, slowly, through the actions of large numbers of people who generally have little idea of the true historical significance of their acts. As Marx said, we should never trust the self-interpretations of historical actors. And yet apparently he suspends this injunction, and his whole dialectical method, when it comes to the so-called proletarian revolution. *These* historical actors are somehow supposed to have perfect understanding of themselves and their place in history, and their historical designs are supposed to work out perfectly and straightforwardly—despite the massive complexity and “dialectical contradictions” of society.

The reality is that if “the working class” or its ostensible representatives seize control of the state in a predominantly capitalist society—and if, miraculously, they aren’t crushed by the forces of reaction—they can expect to face overwhelming obstacles to the realization of their revolutionary plans. Some of these obstacles are straightforward: for example, divisions among the new ruling elite, divisions within the working class itself (which is not a unitary entity), popular resistance to plans to remake the economy, the necessity for brutal authoritarian methods of rule in order to force people to accept the new government’s plans, the inevitable creation of a large bureaucracy to carry out so-called reconstruction, etc. Fundamental to all these obstacles is the fact that the revolutionaries have to contend with the institutional legacies of capitalism: relations of coercion and domination condition everything the government does, and there is no way to break free of them. They cannot be magically transcended through political will. In particular, it is impossible through top-down directives to transform production relations from authoritarian to democratic; Marxism itself suggests that the state is not socially creative in this way. The hope to reorganize exploitative relations of production into liberatory, democratic relations by means of bureaucracy and the exercise of a unitary political will is utterly utopian and un-Marxist.

The record of so-called Communist revolutions in the twentieth century is instructive. While one can expect some Marxists to deny that lessons should be drawn from these revolutions, since they happened in relatively primitive rather than advanced capitalist countries, the experiences are at least suggestive. For what they created in their respective societies was not socialism (workers’ democratic control of production) or communism (a classless, stateless, moneyless society of anarchistic democracy) but a kind of ultra-statist state capitalism. To quote Richard Wolff, “the internal organization of the vast majority of industrial enterprises [in Communist countries] remained capitalist. The productive workers continued in all cases to produce surpluses: they added more in value by their labor than what they received in return for that labor. Their surpluses were in all cases appropriated and distributed by others.”¹ Workers continued to be viciously exploited and oppressed, as in capitalism; the accumulation of capital continued to be the overriding systemic imperative, to which human needs were subordinated. While there are specific historical reasons for the way these economies developed, the general underlying condition was that it was and is impossible to transcend the capitalist framework if the political revolution takes place in a capitalist world, ultimately because the economy dominates politics more than political will can dominate the economy.

In any case, it was and is breathtakingly utopian to think that an attempted seizing of the state in an advanced and still overwhelmingly capitalist country, however crisis-ridden its economy, could ever succeed, because the ruling class has a virtual monopoly over the most sophisticated and destructive means of violence available in the world. Even rebellions in relatively primitive countries have almost always been crushed, first because the ruling classes *there* had disproportionate access to means of violence, and second

¹ Richard Wolff, *Democracy at Work: A Cure for Capitalism* (Chicago: Haymarket Books, 2012), 109.

because the ruling classes in more advanced countries could send their even more sophisticated instruments of warfare to these countries in order to put down the revolution. But if a massive rebellion happened in one of the core capitalist nations, as opposed to a peripheral one, the reaction of ruling classes worldwide would be nearly apocalyptic. They would prefer the nuclear destruction of civilization to permitting the working class or some subsection of it to take over a central capitalist state.

My revision of Marx's theory of revolution avoids all these problems while still retaining key insights about the inevitable causes of revolution. It's obvious that any transition to a new society, if carried out largely through the agency of the oppressed masses (which it will have to be), will be a consequence of capitalism's socially irrational distribution of resources and fettering of the productive and democratic potential of current "forces of production." If used sensibly, there is no question that modern wealth, technology, and scientific know-how could make possible adequate shelter, sustenance, and security for billions more people than currently enjoy them. An anti-capitalist revolution will be motivated by the imperative to redress these (and other) inequalities and injustices, and it will necessarily take the form of instituting new, more democratic property and production relations. Whether such a revolution is "inevitable," as Marx and Engels arguably believed, is a question I will consider later. I will also consider the reasons why the state and the ruling class will allow a revolution of the "gradual" sort I have described to happen. The point is that the only possible way—and the only *Marxist* way—for a transition out of capitalism to occur is that it be grounded in, and organized on the basis of, the new, gradually and widely emerging production relations themselves. This is the condition that has been absent in all attempts at revolution so far, and it explains why, aside from a few isolated pockets of momentary socialism (such as Catalonia in 1936), they never managed to transcend a kind of state capitalism. They existed in a capitalist world, so they were constrained by the institutional limits of that world.

Ironically, Marx understood that this would be the case unless the revolution was international. He understood that "socialism in one country" is impossible. He knew that unless a revolution in Russia triggered or coincided with revolutions elsewhere, which on an international scale worked together, so to speak, to build a socialist mode of production, it was doomed to failure. What he didn't understand was that the only way a revolution can be international is that it happen in a similar way to the centuries-long "bourgeois revolution" in Europe and North America, namely by sprouting first on the local level, the municipal level, the regional level, and expanding on that "grassroots" basis. The hope that the states and ruling classes of many nations can fall at approximately the same time to a succession of national uprisings of workers—which is the only way that Marx's conception of revolution can come to pass—is wildly unrealistic, again because of the nature of capitalist power dynamics that Marxism itself clarifies.

Indeed, only recently has capitalism attained the truly globalized condition that Marx assumed was a necessary prerequisite for revolution. While there are good reasons to say that the USSR and Communist China before the 1980s or 1990s were in some respects state capitalist, their "capitalism" was very different from the competitive, market-driven system that is impelled by economic logic to expand and spread its dominion over the planet. *This* capitalism, which Wolff calls "private [as opposed to state] capitalism," has only in the last thirty-five years spread to huge areas of the world that had for a long time managed to hold it at bay. In addition to China, the USSR, and Eastern Europe, much of Latin America and Africa until the 1990s remained outside the domain of classical capitalist relations of production, defined by the presence of a mass of people who own nothing but their labor-power and are consequently forced to seek employment with those who own the means of production. The absence of these production relations was the result of many factors, for instance popular and elite reactions (such as, in some respects, the Mexican Revolution of 1910-1920 and its aftermath) against the predatory liberal capitalism and imperialism of the late nineteenth and early twentieth centuries.¹ In other cases, such as parts of Central America, it was the result of international capitalism's *shoring up* domestic semi-serfdom, by means of the peculiar incentive

¹ See Alan Knight, "The Mexican Revolution: Bourgeois? Nationalist? Or just a 'Great Rebellion?'" *Bulletin of Latin American Research* 4 (1985): 1-37; Friedrich Katz, *The Secret War in Mexico: Europe, the United States, and the Mexican Revolution* (Chicago: University of Chicago Press, 1981); and Leslie Bethell, ed., *Mexico Since Independence* (Cambridge: Cambridge University Press, 1991).

structures created by “merchant capitalism” and the international division of labor (whereby some countries export raw materials, others export finished products).¹ Finally by the 1980s and 1990s, all this semi-capitalism, semi-feudalism, peasant resistance to proletarianization, state ownership of industries, and so on gave way to neoliberal offensives of privatization and marketization, such that the capitalist mode of production and its corresponding property relations have by now virtually conquered the world and are creating a truly global “proletariat” (or “precariat”).² As they do so, resistance spreads and intensifies.

In order to understand what is likely to happen in the next fifty or a hundred years, it’s useful to contextualize the historical moment we’re living in. And to properly understand its context, it helps to resurrect an old, currently unfashionable idea, viz. that there is a kind of *logic* to history. That is, we should return to Marx’s Hegelian notion that history, on the broadest scale, unfolds according to a certain “necessity,” which is always evident in retrospect. This idea is commonly rejected nowadays, even by some Marxists, for two main reasons: first, it seems to deny that individuals have the power to shape history, that they are active agents in the historical process, instead treating them as mere tools of an impersonal historical “Reason”; second, it seems to valorize this Reason as being synonymous with “Progress” in some quasi-moral sense, implying (supposedly) that, e.g., the rise of Europe in modern times was both inevitable and good, and that people—artisans, workers, peasants—who resisted such things as industrial capitalism were benighted and backward, the enemies of progress. The result of these misinterpretations is that few writers now are interested in excavating the structural tendencies, the dialectical self-undermining, the logic of “the emergence of the new within the shell of the old” by which historical phases have yielded to their successors. Radical authors like Richard Wolff, David Schweickart, and Michael Albert have largely abandoned Marx’s quasi-“scientific” conception of socialism, according to which socialism not only *should* but *will* happen (by means of class struggle); their approaches to the subject are not so much *historical* as *ethical*. We should resurrect Marx’s historical approach—which follows Hegel’s in seeing the “truth,” the “meaning,” of the past as revealed by the present and future—in the process correcting his mistakes.

Consider Marx’s predictions that the impoverished working class would continue to expand until it constituted the majority of society, and that as it did so its class consciousness and radicalism would mature—internationally—to the point that world revolution would occur. In retrospect, we can see that he was wrong; he misunderstood capitalist society. While there are indeed tendencies toward class polarization, impoverishment of workers, international class solidarity, and economic crisis, there are also tendencies toward assimilation of the working class into the dominant order, toward “pure and simple trade-unionism,” toward the state’s stabilizing management of the economy, and toward workers’ identification not only with the abstract notion of a social class that spans continents but also with the more concrete facts of ethnicity, race, trade, immediate community, and nation. These identifications make possible the working class’s fragmentation, which diminishes the likelihood of socialist revolution in the classical sense. Similarly, the historical successes of trade unionism obviated the necessity (from the proletariat’s perspective) of revolution; reform was sufficient, at least in the short run, to improve the life situations of a large proportion of workers. Thus was born twentieth-century social democracy, the welfare state, and collective bargaining.

Marx was right that the capitalist class is averse to progressive initiatives like these, and that it has inordinate influence over the state; what he didn’t appreciate was the historic potential of divisions within the class. The research of Thomas Ferguson, for example, has shown that the “second New Deal” (in 1935) in the United States, which led to the welfare state and federal protection of collective bargaining, was made possible by divisions in capitalist ranks between labor-intensive, domestically oriented, protectionist businesses, such as those in the textile industry, and capital-intensive, internationally oriented businesses, such as Standard Oil and General Electric. The former were viciously opposed to labor-empowering measures like the 1935 Wagner Act, while the latter, who valued social stability more than savage

repression of workers, in fact helped *write* the Wagner and Social Security Acts.¹ Their support for Franklin Delano Roosevelt and the New Deal order made the U.S. welfare state possible (as did, in another sense, the struggles of millions of workers). The welfare state—and the institutionalization of collective bargaining—in turn contributed to postwar economic and political stability, which for a while seemed to invalidate Marx’s pessimistic analysis of capitalism. Trade unions became part of the “establishment”; much of the white working class became increasingly conservative, alienated from movements for radical social change, and intellectuals decided that Marx had been totally wrong all along.

In reality, though, what he was wrong about was the *timeline*, as I said earlier. It was impossible for capitalism to succumb to socialism in the nineteenth or twentieth centuries. Suppose, for instance, that by some unimaginable miracle Friedrich Engels’ eager prophecies (in the 1880s) with regard to the Knights of Labor had been borne out. Aware of its experiments in cooperativism, its attempts at industrial unionism, and its radical rhetoric, Engels predicted that it would serve as midwife of a revolutionary class consciousness and class organization that would lead the workers to victory over capitalism. This couldn’t have happened, of course, for obvious reasons. (The ruling class had a monopoly over the means of violence; divisions in the laboring classes, between black and white, skilled and unskilled, Catholic and Protestant, precluded the necessary continent-wide unity; most leaders of the labor movement were basically conservative, as they almost always have been.) But suppose capitalism had been overthrown in the United States in the late 1880s or 1890s and a semi-cooperative “republic of labor” had been founded, with artisans in their small workshops connected through cooperative networks, public control of industry, Rochdale-type consumer cooperatives proliferating around the nation. What would have happened then? Capitalists in Europe would have continued amassing profit, investing in mechanization, building up industry and technology, and the artisans, craftsmen, and self-governing industrial workers in the U.S. would have been, in the long run, unable to compete with them. In the end, the U.S.’s proto-socialism would have eroded due to competition from Europe, and a degeneration to capitalism would have taken place, much as it did later in the Soviet Union. What this would have proven is that America’s proto-socialist adventure, like the USSR’s so-called “state socialism,” was a historical detour, a dead end, a kind of accident.²

Economic conditions—and productive forces—simply were not “ripe” then, or in the twentieth century, for socialism. It certainly is appalling to contemplate the irony of this fact. It’s an absurd, senseless tragedy: millions of people in the Americas, in Russia and Asia, in Germany, in France, in Spain and Italy spending decades fighting and dying for a dream that would never have come to fruition anyway because, supposing they had achieved something like it in a particular region, such as Catalonia, and it had not been crushed by the forces of reaction, it would have slowly degenerated under market pressures from the broader capitalist society, pressures on wages—downward for the lower workers, upward for the higher—pressures to mechanize, and the business cycles that inevitably would have seeped in to these havens of cooperation and disturbed the order of things, and of course after the revolutionary fervor had subsided the usual daily problems of running factories would have cropped up, “alienation” would have returned because industrial work is inherently unpleasant, battles between management and the average worker would have spoiled the revolution. Mondragon’s recent evolution confirms these counterfactual claims. So, the irony is shockingly cruel: it is when capitalist industrialization was *starting*, precisely when socialism was least possible, that workers, artisans, peasants, and intellectuals fought with greatest heroism and determination for socialism. Industrialization was so brutal and so conducive to the lower classes’ radicalization that visions of, and struggles for, a cooperative society were inevitable everywhere. But they didn’t have the significance their participants thought they did. They were, so to speak, symptoms of the birth-pangs of industrial capitalism, not of its death-throes. Or, to view the matter from a different perspective, they were—in the long run—symptoms of the maturation and consolidation of the nation-state, not of the imminent overcoming of

¹ Thomas Ferguson, *Golden Rule: The Investment Theory of Party Competition and the Logic of Money-Driven Political Systems* (Chicago: University of Chicago Press, 1995).

² On Leninism and the Soviet Union, see chapter six.

capitalism. A global system structured around state-capitalist nation-states was always the inevitable outcome, despite the utopian hopes of millions of oppressed people.

This, indeed, is another way of expressing Marx's mistake: *political* conditions were not ripe for international socialist revolution. Marx didn't foresee the "mature nation-state" period of history, which is to say the twentieth century. He profoundly underestimated the power of the "nationality" principle, and of the state. In many ways he was right that the class principle is more important than the nation principle, but not in the way he wanted: *business* tended to be more loyal to class than to the nation, and it used the idea of nationality to divide the working class and maintain social control. (For example, big business subsidized and continues to subsidize fascist or semi-fascist movements because they distract from the class struggle and serve business's political agendas; and its frequent support for "patriotic" wars is a function not only of their profit-making potential but also of their usefulness in stifling domestic social discontent and progressive political movements.¹) For other reasons too, though, the nation-state's central authority was *bound* to get stronger, more bureaucratic, more extensive, more "society-regulating," more effective at manufacturing consent, than it was in, say, the 1870s. In retrospect we can see this. From the Middle Ages on, capitalism and the nation-state have grown up together in a symbiotic relationship (at least until very recently); it was inevitable that as capitalism continued to grow in power and extent in the early and middle twentieth century, the nation-state would do so as well.²

There isn't space here to discuss all the reasons for the necessary failure of Marx's prophecies in the historical short term, or for the inevitability of the "high modernist" period of the nation-state.³ I could, for instance, draw from the Marxian tradition itself and argue that an era of "monopoly capital" necessarily followed the nineteenth-century era of competitive capitalism, and that monopoly capitalism necessarily engendered certain varieties of state capitalism, corporatism, fascism, state welfarism, etc.⁴ Instead I'll invoke Karl Polanyi's arguments in *The Great Transformation*, while adding my own perspective, which brings the story up to the neoliberalism of the present day. Permit me to quote from my *Notes of an Underground Humanist*:

It's always dangerous to construct abstract schemas, but there appear to have been two, or rather one-and-a-half, "cycles" in capitalist history. Abstractly you can think of it in this way: first, a lot of ancient [feudal] communal practices and public goods [such as the peasant commons] were dismantled before, during, and after the Industrial Revolution. You can call this the first wave of privatization. (It has continued unceasingly all over the world, but let's just call it the first wave.) As it was going on, the victims of capitalism sought to maintain their old rights and/or acquire new, governmentally protected ones. At length they succeeded to some extent, and new public goods were consolidated under the 20th-century Keynesian welfare state. This was probably a nearly inevitable development, because, as Karl Polanyi said in *The Great Transformation*, marketization and privatization will, if unchecked, eventually cause the total destruction of society. So popular resistance, aided by sane elements of the upper classes, succeeded in regulating further depredations and temporarily saving society after the Great Depression. But technology kept progressing, capital mobility increased, global integration continued, populations kept growing, and the "public" and politicized nature of the Keynesian state started encroaching

¹ See J. A. Hobson, *Imperialism: A Study* (New York: J. Pott & Co., 1902).

⁴ See Rudolph Hilferding, *Finance Capital: A Study in the Latest Phase of Capitalist Development* (London: Routledge & Kegan Paul, 1981 (1910)); Paul Baran and Paul Sweezy, *Monopoly Capital: An Essay on the American Economic and Social Order* (New York: Monthly Review Press, 1966); and Robert A. Brady, *Business as a System of Power* (New York: Columbia University Press, 1943).

too much on capitalist class power. Finally the masses got out of hand, got too politicized, too powerful—all those crazy ideas of democracy in the 1960s!—and there was a capitalist backlash, made possible by (and making possible) ever-more-globally-integrated markets, elite institutional networks, and extreme capital mobility worldwide. The inflationary consequences of relative popular empowerment in a context of economic stagnation (the 1970s) were tamed, namely by destroying popular empowerment. That is, the second wave of privatization occurred, after the 1970s: public goods were again dismantled and “capital accumulation by dispossession” began anew (though, in truth, it had never really stopped). This time, the old nationalist Keynesian solution to the horrors of privatization wasn’t available, since the world had become too integrated and nations themselves were deteriorating, due to the post-1970s capitalist onslaught. So transnational social movements were necessary....¹

Or, even more schematically:

With respect to the very long run, Marx was always right that capitalism is not sustainable. There are many reasons for this, including the contradiction between a system that requires infinite growth and a natural environment that is finite, but the reason most relevant to Marxism is that ultimately capital can *never stop* accumulating power at the expense of every other force in society. It is insatiable; its [competition-driven] lust for ever more profit and power condemns it to a life of Faustian discontent. It can never rest. Any accommodations, therefore, between the wage-earning class and capital—such accommodations as the welfare state and the legitimization of collective bargaining—are bound to be temporary. Sooner or later capital’s aggressiveness will overpower contrary trends and consume everything, like a societal black hole (to change the metaphor). Everything is sucked into the vortex, including social welfare, the nation-state, even nature itself. The logic is that nothing will remain but The Corporation [in the plural], and government protections of the people will be dismantled because such protections are not in the interest of capital. This absurd, totalitarian logic can never reach its theoretical culmination, but it will, it *must*, proceed far enough, eventually, that an apocalyptic struggle between the masses and capital ensues. A relatively mild version of this happened once before, in the 1930s and ’40s, and a compromise [in the West]—the mature welfare state—was the result. But then, as I said, capital repudiated the compromise (or is doing so as I write these words), and the old trends Marx diagnosed returned with a vengeance, and so humanity could look forward, this time, to a final reckoning. A final settling of accounts will occur in the coming century or two.²

Those two paragraphs sum up my argument as to the context in which the “new economy” of cooperatives and other anti-capitalist institutions is arising. The rise of neoliberalism (from the mid-1970s on) was nearly inevitable, given the distribution of power in the West and the heightening of international economic competition after the 1960s.³ In other words, a resurgence of global privatization and capitalist empowerment—after the consummation of the nation-state era between the 1930s and 1960s—was bound to happen, which means that social disintegration and atomization was bound to reach the pathological extremes of the present. This would inevitably, sooner or later, trigger massive resistance and creative efforts to reconstruct civil society and the economy on a new basis. These efforts are still in their infancy.

² *Ibid.*, 173.

³ See Robert Brenner, *The Economics of Global Turbulence: The Advanced Capitalist Economies from Long Boom to Long Downturn, 1945-2005* (New York: Verso, 2006).

To elaborate in a little more detail: As David Harvey and others have argued, the corporate capitalist class in the U.S. and Britain faced two major problems in the mid-1970s. First, it had to rein in the 1960s' "excess of democracy" that was threatening its political power;¹ second, it had to restore its profits that were eroding from the combination of intense international competition and "excessively generous" social welfare programs. Moreover, these programs, and in general all the pressures resulting from the population's relative political empowerment, were causing high inflation, which was bound to become intolerable to much of the ruling class sooner or later. In the end, the most effective way to curb inflation and to protect profits from the demands of organized labor was, first, to adopt a restrictive monetary policy (which Paul Volcker, chairman of the Federal Reserve, did in 1979) and, second, to dismantle the welfare, regulatory, and labor-accommodating regime that had been constructed between the 1930s and early 1970s.² The Reagan and Thatcher administrations proceeded to do this with gusto in the 1980s, and their successor administrations in the 1990s and 2000s continued their work. In the U.S., for example, union density in the private sector sank from 35 percent in 1954, and 20 percent in 1980, to less than 7 percent today. Various "free trade" acts, such as NAFTA, have been negotiated that have contributed to the decimation of organized labor in the affected countries. Daily newspaper headlines remind us of the devastation of the social safety net. Numerous studies have described how government regulation of the economy has been gutted since the 1970s, making possible the financial collapse and recession of 2008 and 2009. All this grows out of the dynamics of a corporate capitalism that is throwing off the shackles imposed on it by the nation-state-centric "compromise" (between labor and capital) of the postwar period.³

Moreover, by now the political economy of neoliberalism has spread from the U.S. and U.K. to the whole world. Libraries could be filled with the scholarship and popular writings on this subject. Naomi Klein provides a good popular overview in *The Shock Doctrine* (2007), which recounts the sordid tale of neoliberalism's conquest of Latin America, Eastern Europe and Russia, Southeast Asia, and the Middle East (leaving out Europe, Africa, China, and India). Through IMF structural adjustment programs, trade agreements, collaboration with authoritarian governments, and other means, the U.S. has imposed its model of a liberalized economy on the entire globe. Recently even Europe, long known for its generous social welfare provisions and healthy trade-union presence, has been shredding its former social contract. This process was underway long before the 2008 recession, but since then ruling elites have adopted the motto "Never let a crisis go to waste" and dramatically accelerated their dismantling of unions and the welfare state. The pretext, as always, is the restoration of fiscal health and national economic competitiveness. The consequences are that far fewer workers are covered by collective bargaining agreements, workplace protections are being rolled back, income inequality is rising, healthcare and education are being partly privatized, poverty is increasing, and, in general, the social fabric is being re-cut to fit the pattern of the U.S.⁴

¹ For the liberal wing of the ruling class's perspective on the 1960s, see Michel Crozier, Samuel Huntington, and Joji Watanuki, *The Crisis of Democracy: Report on the Governability of Democracies to the Trilateral Commission* (New York: New York University Press, 1975).

² A not incidental advantage of Volcker's tight money policies was that they facilitated the taming of organized labor, by raising unemployment to its highest levels since the Great Depression.

³ On neoliberalism, see David Harvey, *A Brief History of Neoliberalism* (New York: Oxford University Press, 2005); Noam Chomsky, *Profit Over People: Neoliberalism and Global Order* (Toronto, Ontario: Seven Stories Press, 1999); Robert Pollin, *Contours of Descent: U.S. Economic Fractures and the Landscape of Global Austerity* (New York: Verso, 2003); Greta Krippner, *Capitalizing on Crisis: The Political Origins of the Rise of Finance* (Cambridge: Harvard University Press, 2011); David McNally, *Global Slump: The Economics and Politics of Crisis and Resistance* (Oakland, CA: PM Press, 2010); and Gérard Duménil and Dominique Lévy, *Capital Resurgent: The Roots of the Neoliberal Revolution* (Cambridge: Harvard University Press, 2004).

⁴ Eduardo Porter, "Americanized Labor Policy Is Spreading in Europe," *New York Times*, December 3, 2013; Sotiria Theodoropoulou, "European Welfare States in the Era of Pervasive Austerity," European Trade Union Institute, Brussels (draft version, August 2012); International Federation of Red Cross and Red Crescent Societies, "Think Differently: Humanitarian Impacts of the Economic Crisis in Europe" (Geneva, 2013),

The most important points about this worldwide hegemony of neoliberalism (and its associated productive forces, in particular information technology¹) are that it is causing a resurgence of economic crisis and stagnation, and it is hollowing out the nation-state as an entity. Let's consider each of these phenomena in turn, starting with the first (which contributes to the second).

Any thoughtful observer of the neoliberal political economy has to be struck by the parallels between it and the era that culminated in the Great Depression. There is similar class polarization and vicious subjection of labor to capital, similar 'thinness' of government economic regulation, similar extreme subordination of government to corporate capital, similar proneness to periodic economic crisis, similar empowerment of financial capital, and so on.² It's true that there are differences. For example, since the 1960s or 1970s, "deindustrialization" has occurred in the West, most notably in the United States. There, employment in the manufacturing sector declined as a share of total non-farm employment from 31 percent in 1950 to 20.7 percent in 1980, 13.1 percent in 2000, and 9.1 percent in 2009.³ As Robert Brenner argues, this trend results in large part from heightened international competition since the late 1960s and consequent declines in the growth-rates of manufacturing profitability and investment.⁴ That is, intense international (and intra-national) competition and the resultant diminished growth of profitability have necessitated firms' feverish cost-cutting, which has meant more automation, employee layoffs, wage cuts, and outsourcing of production. The former industrial infrastructure of the West has been dismantled as firms have downsized and relocated their operations to regions with cheaper labor. In the process, industrial unionism has been destroyed, the high wages and stable jobs of what was once the core of the economy have become low wages and unstable (or nonexistent) jobs—in part because automation is making human labor superfluous⁵—and a massive restructuring of the West's economy has happened.

The existence of deindustrialization only supports the broader point I want to make, that (to quote David Harvey) an "underlying problem [of] excessive capitalist empowerment vis-à-vis labour and consequent wage repression, leading to problems of effective demand,"⁶ characterizes both the dynamics of neoliberalism and of the political economy that eventuated in the Great Depression, which is commonly interpreted along Keynesian lines, as a product of (among other things) low effective demand. Deindustrialization has recently been a major contributor to this dynamic, and thus to the stagnation that afflicts the West and with it the world. For the loss of jobs and high wages in the manufacturing sector has not been compensated by high wages or a sufficient quantity of stable jobs in the service sector; hence, in part, the higher income inequality in the West now than fifty years ago, and the resultant lowering of effective demand.⁷

Moreover, with deindustrialization, increased capital mobility since the 1960s, the demise of the Bretton Woods international regulatory framework in the 1970s, and in general the neoliberal restoration of capitalist class power has come a financialization of the U.S. economy even more striking than that of the 1920s. It isn't necessary to dwell on this point, since it has been thoroughly analyzed by scores of

⁷ The business press sometimes has good coverage of these "underconsumptionist" trends. See, for example, Steve Johnson, "Capital gobbles labour's share, but victory is empty," *Financial Times*, October 13, 2013.

commentators.¹ I will only note that the financial sector's share of corporate profits in the early 2000s was around 40 percent, though since then it has declined to 30 percent.² Likewise, its share of GDP was 8.4 percent in 2011, compared to 2.8 percent in 1950.³ As investment has shifted from the "real" economy to the more profitable financial sector since the 1970s—a sector that employs far fewer people than manufacturing once did—wealth and income inequality have skyrocketed, growth has stagnated, economic instability driven by speculative bubbles has increased, physical and social infrastructure has deteriorated, and unemployment has grown. Neoliberalism has meant, in short, a partial "de-development" of the United States (which in this respect is not alone among advanced industrial countries).

Processes that were in some ways similarly disempowering to the majority of wage-earners helped lead to the Great Depression, from which, as we know, ultimately emerged the Keynesian compromise between capital and labor. The national state stepped in to boost effective demand and empower labor, so keeping the system running. At the same time, nationalism, or rather the "imagined community" of the nation, continued its earlier function as a kind of ideological glue to cohere societies and ensure order: "we," both capitalists and workers, were "Americans" (or "British," or "French," or whatever) sharing a common language, a culture, a history, etc.⁴ "We" were supposed to maintain allegiance to the nation and the state, i.e., to overarching power-structures, no matter how much we might disagree with one another or want a bigger slice of the economic pie than we had. To be "disloyal" was the supreme crime, and invoking that concept proved effective as a way to tar and feather "radicals." To call them Communists, for example, was to call them foreigners and subversives, which marginalized them and helped keep the capitalist order relatively stable. Thus the nation-statist compromise, which functioned ideologically as a kind of *distraction* (from immediate issues of economic, social, and political empowerment), reached its classical, high modernist phase.

Since the 1970s, however, the nation-state, after many centuries of growing in power, importance, and global extent, has finally begun its long, tortured descent into crisis and collapse. The elegant irony of history is again on display: while the evolution of capitalism hitherto had contributed to the consolidation of the nation-state, at this point capital outgrew and started to shake off its old friend and enabler, who clung to it in ever more servile fashion. The state now does whatever it has to to stay in the good graces of the most mobile and wealthy sector of capital, finance; but other sectors, too, have found that they have a freer hand than they once did.

Again, the essential condition of this shift in the balance of power has been the spectacular increase in capital mobility since the 1960s, made possible by the rise of new productive forces, in particular electronic technology. Actually, even apart from its enabling the ascendancy of transnational corporations and global finance, this technology is playing an important role in the downfall of the nation. Just as "print-capitalism" after the fifteenth century contributed to the rise of the nation-state (as Benedict Anderson argues), what one might call "electronic capitalism" is contributing to its fall. To be sure, the imagined community of the nation is declining faster than the national state itself. The community is fragmented by electronic media, which, at least in the context of capitalism, tend to substitute isolation and self-involvement for direct interaction with others, as well as to degrade communication into instantaneous visual and auditory stimuli whose effect is to undermine identities (be they personal, national, or whatever). To quote myself again:

⁴ See Benedict Anderson, *Imagined Communities: Reflections on the Origin and Spread of Nationalism* (New York: Verso, 2006).

These trends [of national disintegration] are evident when one considers the impact of television, video games, cell-phones, computers, the internet, and such “social media” outlets as Twitter and Facebook. A society in which most people spend an inordinate amount of their time sitting in front of TVs, playing video games, shopping online, searching for soulmates through internet dating, imbibing bits of information in short bursts from an endless variety of global news and entertainment sources, and electronically “chatting” with acquaintances or strangers located anywhere from the next room to the other side of the world—such a society does not have much of a tangible national culture, and its “imagined community” is indeed *imaginary*, a mere abstraction with little basis in concrete reality. In short, the individualistic, passive, and *consumerist* nature of a capitalist society saturated by electronic media¹ is interpersonally alienating and destructive of civil society, hence destructive of a shared national consciousness.²

Moreover, the fact that electronic technology makes possible nearly instantaneous communication across the world means that the kind of community it fosters is global rather than national. One may start to feel more affinity for people ten thousand miles away than for one’s compatriots. Global social movements become easier to coordinate; things like the Arab Spring and Occupy Wall Street can emerge to break down national barriers and birth a *global* consciousness.

The worldwide hegemony of finance and the transnational corporation is similarly destructive of traditional civil society, and thus of the nation. For it has contributed to deindustrialization in advanced countries, the virtual destruction of organized labor, the rise of a “precariat” of insecure workers living on society’s margins, the erosion of the welfare state, the privatization of such public resources as education and the natural environment, the decline of Keynesian stimulation of demand (largely because investors fear its inflationary consequences), the hollowing out of state regulation of the economy, the onset of economic crisis and stagnation, degradation of the natural environment, etc. All these circumstances tend to bring about a relative equality of conditions between countries, as a creeping Third-Worldization of the West occurs. The very idea of “America” or “Britain” or “France”—a substantive national community that differs from others—becomes threadbare, a transparent fig leaf for the naked pursuit of power by moneyed elites.

The state, too, is in decline, though perhaps less obviously than the idea of the national community. The reason is simply that the global community of capitalists will not let the Western state reverse its post-1970s policies of retrenchment, which is the only way for it to adequately address all the crises that are currently ripping society apart. If any state—unimaginably—made truly substantive moves to restore and expand programs of social welfare, or to vastly expand and improve public education, or to initiate programs like Roosevelt’s Works Progress Administration or Tennessee Valley Authority (but on a necessarily broader scale than in the 1930s), or to restore organized labor to its power in the 1960s and thereby raise effective demand, or to promulgate any other such anti-capitalist measure, investors would flee it and its sources of funds would dry up. It couldn’t carry out such policies anyway, given the massive resistance they would provoke among all sectors and levels of the business community. Fiscal austerity is, on the whole, good for profits (in the short term), since it squeezes the population and diverts money to the ruling class. In large part because of capital’s high mobility and consequent wealth and power over both states and populations, the West’s contemporary political paradigm of austerity and government retrenchment is effectively irreversible for the foreseeable future.

This raises an obvious question: how is the state to deal with social discontent? In the 1930s and 1940s, states adapted to discontent mainly by becoming more inclusive and increasing their control over

¹ And by “print versions” of such media, for example magazines devoted to celebrity gossip and instant gratification of whatever sort.

² Wright, *Notes of an Underground Humanist*, 168.

capital.¹ But since that is no longer an option, what's the solution? Evidently the most immediate and urgent response is *repression*. This is the natural instinct of every power-structure when confronted by resistance: destroy it, stamp it out, for instance by imprisoning people, demonizing dissidents as “extremists” or “terrorists,” and deploying police forces to smash popular movements. So far this has been, and will probably continue to be, the predominant political response to the contemporary crisis. A quasi-police state is taking the place of the welfare state, as can be seen from governments' investment in “national security,” greater powers of surveillance, the expansion and privatization of the prison system, the militarizing of police forces,² the ever-more-frequent suspension of civil liberties, etc. These measures do not signify the health of the state; they are its desperate response to a terminal illness. National governments are being hamstrung and privatized by capital even as their subject populations are rising up in revolt. The only recourse, it seems, is to militarize society—i.e., to expand one of the few government powers capital doesn't object to, the power to suppress democratic resistance.

In short, durable “compromises” between labor and capital are no longer possible. Only the nation-state could be a framework for such a compromise, because only national governments (not local or regional) potentially have the power to stand up to corporate capital and regulate it. But they have lost this power (on the scale necessary) since the 1970s. So what will ensue in the coming years and decades is a global conflict between the capitalist hyper-elite—together with its political minions—and the majority of the species, a conflict that *this* time will not be resolved by the principle of nationality, because it is dying. Almost two hundred years after the *Communist Manifesto*, Marx's time has arrived. The time for *true* internationalism, which is to say *transnationalism*, in anti-capitalist (and anti-statist) movements has arrived, at long last.³ A hundred years ago there was no such internationalism in labor movements, as the two nationalist world wars—largely supported by organized labor—showed. Nor was there in the context of the Cold War, as the reactionary and imperialistic stances of the U.S.'s AFL-CIO showed. Only since NAFTA, and especially since the Seattle demonstrations against the WTO in 1999, have labor unions and social movements in general really begun to realize their internationalist potential.⁴ I'll discuss this more in the next section.

A leader of Brazil's Landless Workers' Movement says it well: “It is very striking that it is only now that farmers are starting to achieve a degree of worldwide coordination, after five hundred years of capitalist development.... The new phase of capitalism has itself created the conditions for farmers to unite against the neoliberal model.”⁵ And the neoliberal model, to repeat, is not some drastic new departure but only the logical conclusion of tendencies that have operated in capitalism for many centuries, namely privatization, marketization, the commodification of everything, suppression of workers' power, class polarization, integration of the world under the aegis of capitalist relations of production, and ever-increasing capital mobility. These tendencies have finally reached the point that they are consuming nation-states and making both possible and necessary globally coordinated resistance in the form of transnational social movements. This *global* confrontation of capital, in fact, is really what Marxism was all about to begin with. The slogan “Workers of the World, Unite!”, far from being outdated, has become more timely and necessary than ever before.

There is much more to be said about the decline of the nation-state, but I'll skip to the main point: what the retrenchment of government's public functions is making possible, for the first time ever, is the paradigm of revolution that I described above when critiquing Marx's theory. Given the state's growing

¹ In many cases, of course, they tried the fascist route first, hoping to crush the left. After that led to near-armageddon they had to go the more democratic route, to some extent incorporating the left and the working class into the state.

² See, e.g., Arthur Rizer and Joseph Hartmann, “How the War on Terror Has Militarized the Police,” *The Atlantic*, November 7, 2011.

³ “Trans” means *through*; “inter” means *between*. We need social movements that operate through and around nation-states, not only between them or on the basis of them. We need movements organized globally.

⁴ Tamara Kay, *NAFTA and the Politics of Labor Transnationalism*.

⁵ Quoted in Annette Desmarais, “La Via Campesina,” in *Rural Social Movements in Latin America: Organizing for Sustainable Livelihoods*, eds. Carmen Diana Deere and Frederick S. Royce (Gainesville, FL: University Press of Florida, 2009), 37, 38.

incapacity to assuage discontent, movements of a decentralized, semi-interstitial, regional, democratic character are emerging to fill the vacuum. In the long run they, or the institutions they spawn, will probably take over many of the functions of the national state, such as the provision of social welfare. Even more importantly, they will enable the construction of new production relations in the shell of a corporate capitalist economy that cannot provide billions of people with a livelihood. These relations will spread all over the world, in an agonizingly slow process that will surely take over a hundred years—because social transitions on the scale of capitalism-to-“cooperativism” do not happen quickly.

But *how* will such a transition happen? I’ll address this question empirically in the following section, but here I can at least outline the historical logic. Marxists and other radicals often object that the sorts of developments I’ll describe shortly are merely interstitial and unpolitical, can be co-opted by the ruling class, can function as *stabilizing* forces for society, are compelled to compromise with capitalism, and therefore do not represent viable paths to a post-capitalist future. I’ll argue that there is much truth to these objections when the social context is one of basic systemic stability, i.e., when society isn’t in a “revolutionary situation” anyway. But when it is—when the social fabric is disintegrating, economic crisis is throwing millions out of work, class polarization is growing—these “interstitial” developments can have revolutionary significance. The logic is that as political resistance spreads and the ruling class grows ever more fearful, some of its more progressive members and institutions split off from the rest and throw their support to un-capitalist or semi-capitalist initiatives as a desperate way to keep the masses content and society under control. Again, this is how the New Deal state was born in the U.S. But since such a state is not an option anymore, the ruling class’s hopes for stabilizing society will, by and large, lie in more localized and decentralized democratic experiments (in addition, as I said, to political repression). The combination of mass agitation and ruling-class support will ensure that these experiments spread, especially because in all likelihood there will be no foreseeable end to the economic crisis. In the long run, the result will be capitalism’s self-undermining by means of its forced support for a proliferation of people-empowering measures. Their popularity and success, moreover, will generate a dynamic by which they spread of their own momentum, so to speak. The success of the new “bottom-up” economy will make the old top-down one increasingly obsolete, though of course innumerable political clashes will have to occur before it can be unseated from the summits of power.

In short, the state and ruling class will, whether consciously or not, adopt two overarching strategies to maintain their power: try to repress dissidents, and assist progressive initiatives that seem comparatively unthreatening. In “liberal” societies such a dual approach is always necessary, because repression alone is unsustainable and does not address the underlying causes of protest. On local, regional, and national scales, the ruling class will try to smash radical movements even as it (or a section of it) tentatively supports such things as public banking, municipal enterprise, cooperatives, and communal self-help institutions of various kinds. But political dissidence will, if anything, only spread, not go away. One can expect that, in a world of multiform crisis, alliances will naturally emerge between different movements on the left some of which are less explicitly challenging to the capitalist state than others. The progress of so-called “unpolitical” initiatives, therefore, will aid the progress of the more political movements, and vice versa, such that corporate capitalism will be slowly hollowed out even as it loses ideological hegemony. Its opponents will command more and more resources, which itself will make possible their command over even *more* resources, in a self-reinforcing cycle somewhat comparable to the early-modern bourgeoisie’s gradual erosion of feudalism’s (and later absolutism’s) economic, political, and ideological hegemony. The more economic success one has, the more resources one has, which means the more propaganda one can churn out and so attract people to one’s agenda.

As for the question whether alternative economic institutions can indeed be more “successful” than capitalist ones, that is to say more productive and socially equitable: one of the purposes of this book is to show that they can. Cooperatives, as we’ve seen, can be more effective than conventional businesses even by the narrow standards of capitalism. We shouldn’t necessarily condemn co-ops for having to work within the confines of capitalism, for if they become common and network with each other and other progressive organizations they might prove to be of great use to left-wing political movements, by providing them with resources and spreading an anti-capitalist ethos. Furthermore, as greater numbers of co-ops mutually

support one another, each will be less shackled to the logic of capitalism. The economic success of these and other alternative-economy institutions—in part a result of their support for each other—will then serve as its own public-relations campaign, so to speak, attracting people to new models and thus contributing to the spread of alternative modes of production beside the old dysfunctional capitalist mode.

Another way to conceptualize the coming social transformations is to return to the idea that the main problem the economy is facing is low effective demand. The question, then, is how to raise demand. We know that the old Keynesian solution was high government spending and high wages for workers, but both those options are off the table in an era of austerity, government privatization, and neoliberal globalization. Keynesianism on the colossal and international scale necessary is simply out of the question. The only other solution, and the only appropriate one in an age of decaying nation-states, is to construct new, non-statist social relations that economically empower people, i.e., raise demand. To repeat, what many of these will ultimately amount to are new production relations, on the basis of which will, necessarily, arise new social and political structures. Thus, virtually by analytical necessity it is evident that profound social revolution offers the only way out of the contemporary economic crisis. The *slowness* of the revolution is what will allow members of the ruling class to support it, for it will appear that all they are doing is defusing mass unrest by means of piecemeal reforms. But these reforms will be of a very different character from those of the earlier welfare state. Rather than being essentially corporatist, i.e., giving greater power to a national state that is integrated into corporate capitalism, they will consist of a democratic transformation of social relations “from the ground up.”

Practice

In the tradition of Marxism, we’ll follow our theoretical discussion with a focus on practice, which is, if anything, even more important than theory. The point is to change the world, not just to interpret it. This whole book pertains mainly to practice, but in this section I’ll disregard worker co-ops in the U.S. and describe other initiatives springing up around the world. Needless to say, there are many to choose from. People and governments everywhere are experimenting with alternative economic, social, and political arrangements. Some of these will not last long or will prove to be of limited importance; others may end up serving as models for a future society. In the following I’ll focus on some initiatives that strike me as particularly promising and interesting.

A reasonable starting point is Quebec’s social economy, which is a sophisticated set of interlocking institutions that has matured since the 1980s. The term “social economy” just refers to the third sector in economies, between the private and the public sector. It is composed of such things as housing associations, civic societies, nonprofits, charities, cooperatives, and credit unions—institutions that are at least in part run by community members and exist not to pay profits to shareholders but to benefit communities, the environment, and marginalized groups. The social economy has ethical aims, but, as we have seen with cooperatives, the seemingly opposed imperatives of ethics and “efficiency” are by no means mutually exclusive. Very often one finds that the more ethical an institution is, the more profitable, productive, and efficient it is. Likewise, bureaucracy, gigantic size, and slavishness to the interests of big capital not only are immoral (inhumane and undemocratic) but have costs even by the narrow standards of efficiency and effectiveness. Being run by people whose goals are ethical, the social economy contributes to job creation, the provision of services, the production of goods, community revitalization, and in general sustainable development.¹

Quebec’s social economy is famous, and has been intensively studied, because of its sophistication and effectiveness. I won’t describe it in great detail here, but it comprises over 7000 organizations that provide an array of services to the population. A watershed moment for it occurred in 1996, when the state invited representatives of all these actors—among which are “citizen’s committees, food banks, community centers, family economy cooperative associations, community health clinics, legal clinics, not-for-profit

¹ Social Economy Lisburn, “What is Social Economy?” <http://www.socialeconomylisburn.org/?tabid=696&tabindex=7> (accessed May 20, 2013).

childcare centers,”¹ housing co-ops, women’s centers, workers’ co-ops, community economic development corporations, labor unions, and environmental associations—to participate in a conference on the future of Quebec in light of its problems with unemployment and economic development. The result was the subsequent institutionalized collaboration between the state at all levels and these diverse organizations, a collaboration that “involve[s], among other things, making it much easier for non-profit associations engaged in social economy activities to acquire the necessary financial resources, through government grants, indirect subsidies, or access to credit; the creation of a social economy office within the provincial government; and the consolidation of an umbrella organization in civil society, the *Chantier de l’économie sociale*, to coordinate strategies for enlarging and deepening the role of the social economy.”² Few social economies in the world have achieved this degree of institutional coherence and coordination, which explains why activists and policymakers have been so intrigued by the Quebec model.

In general, the global social economy can be expected to grow in the next fifty years, as national governments prove less capable of fulfilling their welfare and regulatory functions. Quebec’s social economy, for example, continues to grow in extent and access to capital. A recent innovation was the creation in 2007 of the *Fiducie du Chantier de l’économie sociale*, “a \$53.8 million patient capital or quasi-equity fund to enable collective enterprises to embark on long-term planning, invest in real estate, and move out of a vicious cycle of debt.”³ A couple years later, a financial network called CAP Finance was established to connect microcredit organizations, local development funds, large “labor solidarity” funds, and so on. The mainstream economy’s recent travails have not hindered any of this activity; on the contrary, “amidst the debris of speculative financial markets” it has become easier to interest investors in the *Fiducie*’s stable rates of return.⁴

Europe’s social economy is just as vital as Quebec’s. As reported in 2012 by the European Economic and Social Committee (EESC), the social economy accounts for over 14.5 million jobs and about 6.5 percent of total paid employment in Europe.⁵ Since the last quarter of the twentieth century the social economy has grown considerably, so that it is increasingly taking the place of the state in creating employment and correcting economic and social imbalances. It is also achieving greater recognition as an important actor in European affairs, as reports on it are published by the EESC, the UN declares the social economy to be crucial for global development, Europe-wide statutes for cooperatives are adopted, conferences on cooperatives and the social economy are organized, new legal forms are created to accommodate social enterprises, university courses on the social economy appear, and, in 2012, a social economy minister is appointed in France’s government. As in Quebec, this sector of the economy is faring relatively well in conditions of economic stagnation; for instance, it has been able to deploy “its own alternative forms of solidarity funding, such as ethical banking, social currencies or the credit unions, which are not only providing credit but are also generating trust in its financial services.”⁶ Similarly, employment levels are proving more stable than those of the private sector. It’s true that recent cutbacks in public spending have had a damaging effect, but they have been far from devastating.

A few random figures indicate the sector’s vitality. In France, the social economy (which accounts for 10 percent of salaried employment) created 18 percent of all new jobs between 2006 and 2008. Its employment level increased by 2.9 percent (70,000 new jobs) between 2008 and 2009, while in the private

sector it sank by 1.6 percent and in the public sector by 4.2 percent. Similarly, in Italy, employment in cooperatives increased by 8 percent between 2007 and 2011, while in the conventional private sector it decreased by 2.3 percent. In Spain, too, employment in worker cooperatives grew by 4.7 percent in 2011, as it dropped in the rest of the private sector for the fourth consecutive year.¹

Related to the social economy, and often considered a part of it, is the solidarity economy, which tends to be a little more political and anti-capitalist than the social economy as a whole. The values that inspire its participants are the opposite of capitalist: community, egalitarianism, and democracy. Like its more well-known cousin, the solidarity economy started growing exponentially in the last quarter of the twentieth century, as neoliberalism ravaged Latin America and other parts of the world. The solidarity economy's chief impetus came from social movements in Latin America, which has a long history of peasant- and indigenous-based resistance to Western imperialism. In the past, this resistance helped bring about things like the Mexican and Cuban revolutions, the "developmentalist" period of South American history between the 1930s and 1960s, Chile's dalliance with a kind of democratic socialism in the early 1970s (until it was crushed by the U.S. and Pinochet), and attempts at revolution in Central America in the 1980s. Since the 1990s, it has birthed Latin America's turn to the left (for example with the elections of Hugo Chavez, Lula da Silva, Evo Morales, Rafael Correa, and Daniel Ortega) and helped birth such global movements as fair trade, solidarity lending, the expansion of cooperativism and credit unions, the World Social Forum and its offshoots, and La Via Campesina. Among the practices that are often mentioned in the context of the solidarity economy are community-supported agriculture, urban gardening, alternative currencies, collective kitchens, and community land trusts, not to mention all the more familiar forms of cooperativism (producer, consumer, housing, agricultural, etc.).

Before going into more detail about some of these phenomena, it will be worthwhile to consider just how significant the solidarity economy and its conceptual relatives are becoming. In a sense, after all, the term is nothing but a name for the ideal that all "radicals" are fighting for: it is socialism, anti-capitalism, cooperativism, economic democracy, whatever your preferred name is. The post-capitalist economy will have to incorporate the "solidarity" structures that are emerging, and in fact it will be grounded in them. Especially if you broaden the concept of solidarity economy so that it encompasses public banking, municipal enterprise, benefit corporations, and participatory budgeting (all to be discussed below), its contemporary significance is undeniable. It is, in short, the terrain of the "movement of movements" against privatization and profit-mongering, aimed at the resurrection of *public space*, whether embodied in the World Social Forum, Occupy Wall Street, or any of the countless dissident movements rocking the globe.

A clear indication of the growing importance of the solidarity economy is its ever-greater institutionalization. A rather primitive gauge of this is the proliferation of relevant websites, such as yesmagazine.org, geo.coop, shareable.net, aloe.socioeco.org, ripess.org, community-wealth.org, en.soleclopedia.org, uwcc.wisc.edu, and american.coop. More substantively, dozens of international networks have been formed recently to facilitate organizing and education, including Alliance for a Responsible, Plural and Solidarity Economy (ALOE), the Intercontinental Network for the Promotion of the Social Solidarity Economy (RIPESS), the U.S. Solidarity Economy Network (SEN), the Asian Alliance for Solidarity Economy, the European Institute for Solidarity Economy (INESS), and many organizations in Latin America. One must include all the social forums that exist even in the conservative U.S.: the U.S. Social Forum, the Midwest Social Forum, the Social Forum of the Americas, the European Social Forum, etc. Like their progenitor the World Social Forum, which began in 2001 and has met annually, these are essentially periodic conferences where activists and organizations involved in the alter-globalization movement can come together to share ideas, strategies, and experiences, attend workshops and lectures,

¹ European Commission, Directorate-General for Employment, Social Affairs and Inclusion, "Social Economy and Social Entrepreneurship" (Luxembourg: Publications Office of the European Union), 53.

network and seed new institutions. The WSF regularly draws more than 60,000 participants from around the world.¹

Perhaps even more striking than the proliferation of all these networks, organizations, and conferences is the recognition that the solidarity economy is receiving from governments. I already mentioned the creation of the new post of Minister for the Social Solidarity Economy in the French government. Compared to Latin America, though, France is behind the times. For example, in 2003 Brazil's president Lula established a National Secretariat of the Solidarity Economy, and cooperatives receive financial support from the ministries of Agricultural and Social Development. The Brazilian government also funds university programs that provide local groups with training and support to set up cooperatives or social enterprises, "similar to business incubators in the U.S."² (Cooperative business programs are starting to appear in North American universities too.) Ecuador went a step further in 2008: it adopted a constitution that draws from the social and solidarity economy (SSE) model for development, in that it formalizes commitments to food sovereignty, the use of land for social and environmental functions (forbidding large estate farming, land concentration, and the privatization of water), a "decentralized national system of participatory planning" for development, and numerous other progressive principles that are fleshed out in very concrete ways. Bolivia's 2009 constitution is similarly progressive. Public policy initiatives on the SSE have been flowering in Venezuela, Mexico, Argentina, Chile, Peru, and elsewhere, under the pressure of growing social movements.

Governments in Africa and Asia are likewise facilitating the growth of the SSE, though I can't review all the relevant policies here. The South African government, for example, has passed legislation to boost cooperatives, and, as of 2012, further legislation to establish a cooperative council, academy, and development agency has been proposed.³ Africa's tenth ministerial conference on the theme of cooperatives was held in Rwanda in 2012; 27 countries committed to passing laws to support the SSE, expanding education regarding the creation and sustainability of co-ops, increasing regional cooperation and trade among co-ops, and possibly creating integrated financial cooperatives at country and regional levels.⁴ Prime Minister Erdogan of Turkey launched in 2012 a national cooperative strategy and plan of action to fundamentally restructure the cooperative sector so as to make it more effective, competitive, and sustainable.⁵ India and Indonesia have recently reformed their laws regarding co-ops. Since the early 2000s, the Russian government—at all levels—has actively supported the cooperative movement.⁶ Indeed, on the whole it seems there are few governments in the world that do not provide notable support, and are not increasing their support year by year, for the social and solidarity economy.

The UN and its specialized agency the ILO have been taking action too; in fact, they have facilitated many of the policy initiatives just mentioned. I noted in the Introduction that the UN declared 2012 the Year of the Cooperative. What this designation concretely meant was a year of intense advocacy and organizational support for co-ops, so as to publicize their worldwide impact on poverty reduction, social integration, and socioeconomic development. (The website social.un.org/coopsyear showcases the UN's work in this area.) As the UN sponsors international summits, forums, ministerial conferences, film

festivals, and other events to spread the ideology of cooperativism, the ILO publishes in-depth reports, sponsors cooperative projects, aids in the formation of policy, and helps organize conferences like the SSE Academy, which began in 2010. The SSE Academy is “an inter-regional training event bringing together more than 100 [in fact as many as 300] practitioners and policy-makers from around the world, to share their experiences and meet leading SSE specialists.”¹ Among other achievements, the 2013 conference helped further the ILO’s initiative to establish an Interagency Task Force in the United Nations that would bring “relevant UN agencies together for regular exchanges on their programming and policy making in the field of SSE.”²

As for the actual practices of the solidarity economy “on the ground,” I can at best hope merely to gesture at a few examples in the limited space here. The classic example is Brazil’s Landless Workers’ Movement (MST), which began in 1984 and now has a membership of almost two million people. Its main political goal is to bring about national agrarian reform that eliminates the extreme inequality in ownership of land; much of its activity consists of occupying unused land and establishing encampments on it, which become permanent settlements if the occupiers gain legal ownership. The encampments and settlements can be organized on the basis either of family ownership or of collective ownership, depending on the decisions of local assemblies. Each settlement is structured as a mini-society (with extensive ties to other settlements and to state, regional, and national leaders), which collectively decides how the settlers’ income is to be spent—how much will go to production, health care, schooling, and so forth. The MST as a whole has established hundreds of agricultural cooperatives that take in more than 50 million dollars a year, some of which goes to the 20 million dollar budget for social services and infrastructure, the rest of which goes directly to member families. The movement also has founded teacher-training programs in national universities, hundreds of daycare centers, an agricultural college, almost two thousand primary and secondary schools, several credit cooperatives, 96 food processing plants, a clothing factory, etc.—all of which is ancillary to its main achievements of organizing over 250,000 occupations and winning land for over 350,000 families in two thousand settlements (as of 2009), in addition to the 200,000 families that are currently occupying land but do not yet legally own it. As a result of all this success, the MST has won international recognition, receiving grants from UNESCO and UNICEF and awards from the UN.³

The MST clearly parallels the solidarity economy in general: it is both a model of a future democratic, socialist society and a means of bringing it about. More specifically, as activist Ethan Miller says, the means to the end is that “building relationships between solidarity-based enterprises and larger social movements builds increased support for the solidarity economy while allowing the movements to meet some of the basic needs of their participants, demonstrate viable alternatives, and thus increase the power and scope of their transformative work.”⁴ That’s my argument in a nutshell. It’s worth noting, incidentally, that the MST belongs to the Brazilian Solidarity Economy Forum, which “works on an even broader scale [than the MST], incorporating [as of 2006] twelve national networks and membership organizations with twenty-one regional Solidarity Forums and thousands of cooperative enterprises to build mutual support systems, facilitate exchanges, create cooperative incubator programs, and shape public policy.”⁵ This is the revolution in action.

A broad category, and a particularly well-known one, of the solidarity economy is the movement known as Fair Trade, which has expanded significantly in recent years. As defined by the World Fair Trade

⁵ *Ibid.*

Organization (in association with Fairtrade International, the Network of European Worldshops, and the European Fair Trade Association), Fair Trade is a “trading partnership, based on dialogue, transparency and respect, that seeks greater equity in international trade. It contributes to sustainable development by offering better trading conditions to, and securing the rights of, marginalized producers and workers—especially in the South.”¹ More specifically, it “promotes standards for production practices and delivery procedures, working conditions and labour remuneration, environmental care and social policies in supply chains of certified goods.”² The Fair Trade Labeling Organization (FLO) was established in 1997 to set standards worldwide and certify that particular products embody these standards. Among the growing range of goods that the certification system can cover are coffee, bananas, sugar, oranges, tea, chocolate, wine, rice, honey, nuts, flowers, cosmetics, and clothing. As the Fair Trade movement has gone mainstream, with large retailers selling certified products, the worldwide volume of sales has increased; in 2011, for example, sales were up to 6.6 billion dollars, 12 percent higher than the previous year.³

The way Fair Trade works is quite complex, but the main point is that for a product to be Fairtrade-certified it has to have been produced and traded under conditions characterized by, for instance, the absence of child labor and forced labor, workers’ freedom to unionize, compliance with ILO conventions on working conditions, respect for the environment, commitment to gender equity and poverty reduction, and the importer’s payment to the producing organization (e.g., an agricultural cooperative) of both a specified minimum price and a premium. The minimum price helps shield farmers from the volatility of world markets, while the premium goes into a fund that farmers and workers can use for community purposes, as they see fit. Producers and traders who want to sell Fairtrade-labeled products have to pay a fee to FLO, which inspects them to certify that they adhere to the requisite standards.

Studies have shown that, so far, Fair Trade (FT) has had mixed results in terms of improving local conditions and empowering farmers and workers. On the one hand, “guaranteed Fair Trade market outlets and stable prices provide incentives to producers to realise on-farm investments, intensify input applications and enhance labour use.”⁴ FT associations and cooperatives can provide farmers with technical assistance and administer social and environmental projects made possible by the FT premium. Land and labor productivity are thereby raised above those of non-FT producers, which translates into higher household income and willingness to invest in long-term projects. According to some studies, FT producers report a greater sense of well-being and a more positive outlook for their future than non-FT producers do. Nutritional standards are higher and infant mortality rates lower than in households without access to Fair Trade organizations. Participation in Fair Trade has been found to reduce farmers’ economic vulnerability, assist in poverty reduction, enhance family stability, improve children’s education, strengthen the role of women in their community, and benefit the natural environment.⁵

On the other hand, these positive effects are not universally observed, in part because the certification process is not foolproof and FT standards are not consistently enforced. There are relatively few impact studies of Fair Trade, and the ones that exist do not always have sound methodologies. One thing known for sure is that few FT producers are able to sell most of their product to FT outlets, because of insufficient demand. Fair Trade is still a very small fraction of global trade even in such commodities as

coffee and bananas; about 1.5 million farmers and workers around the world participate in it.¹ In 2011, FT producer revenues in the export of coffee, bananas, cocoa beans, and cane sugar were less than 1 percent of the global value of exports (although FT markets are growing at a brisk pace).² Some critics worry, too, that as FT becomes more mainstream, it is losing its commitment to the values that originally sustained it. Other common criticisms are that FT doesn't necessarily benefit migrant laborers, that its impact on non-FT producers is ambiguous at best, that the premiums consumers pay do not always directly benefit farmers, and that FT's consumer-driven model means it "cannot address the core problem of excessively concentrated markets in which a handful of over-powerful transnational corporations dictate terms of trade and suck profits up into their own coffers."³

Insofar as there is justice to these criticisms, the best answer to them is probably the one that applies to all initiatives in the solidarity economy: they cannot realize their transformative potential unless backed up by social movements. But if they are, and if the capitalist state feels existentially threatened so that it has to tolerate and support them, then they can indeed be components of systemic change. Fair Trade has already raised consciousness in the global North, making people more aware of conditions in the South and proving that consumers are willing to pay extra for products if doing so benefits farmers and workers. The task now is the admittedly difficult one of making the movement more mainstream while simultaneously shoring up its commitment to strict standards of producer empowerment. As producers improve their living standards, get access to more resources, and develop a greater sense of collective self-worth, they will have more success in pressing for political changes in their own countries. Fair Trade can also potentially assist in building solidarity movements in the North, and it can provide issues on which to pressure governments—and resources by which to do so. It's true, though, that ultimately the main component of systemic change is the transformation of the class structure, and here Fair Trade, in its current form, must play a subordinate role. The main strategic emphasis has to be on movements that directly attack the power of transnational corporations and aim to bypass them by organizing economic activity through different paths. What those paths will be is still not clear.

There are obvious possibilities, however—and even obvious necessities. As John Restakis argues, any future moral—and sustainable—regime of global trade will have to give a central place to agricultural cooperatives of the sorts that already exist across the South (and North). Only cooperatives, whether of separately producing farmers or of workers who collectively manage a single farm, can provide producers with the democratic agency and protections they need. One relevant model of a regional economy is the Emilian Model mentioned in chapter two. This system that permits small farmers organized in cooperatives to produce many of Italy's food products could be replicated in other parts of the world, with assistance from the global cooperative and Fair Trade movements. It's worth quoting some of Restakis's speculations on this score:

The global co-operative movement contains within itself the material resources to do what the fair trade movement alone cannot do. Credit is one example. The credit unions of both rich and poor nations have the capital to establish a Fair Trade and Development Bank to do what the World bank and the IMF will never do—give direct support to farmer organizations, NGOs, business groups and local communities to build regional economies based on democratic control and ownership. An international co-operative development bank with members and progressive stakeholders from among consumers in the North and small producers in the South could provide the credit necessary to fuel the kind of value-added development that is now beginning to emerge in these areas. Among its top priorities

³ Felicity Lawrence, "Fairtrade shouldn't all be down to the consumer"; Colleen Haight, "The Problem with Fair Trade Coffee," *Stanford Social Innovation Review*, Vol. 9, No. 3 (Summer 2011): 74-79;

would be to build up local credit unions that can play a regional role in this development process. This has already begun. The World Council of Credit Unions (WCCU) and the national co-operative federations of many countries have been working to build the development infrastructure of Southern regions for many years....¹

What the future holds for global trade is anyone's guess, but it isn't impossible to imagine a new regime that gives a much more prominent place to Fair Trade organizations, regulatory structures that protect small farmers, and regional coordination of development among cooperatives and local governments.

Turning to the North, in particular the U.S., recent research has illuminated potentially revolutionary developments of a different character than those we have been discussing. Gar Alperovitz is the scholar who has done the most work on this subject, and his books *America Beyond Capitalism* (2006) and *What Then Must We Do? Straight Talk about the Next American Revolution* (2013) are essential reading. Alperovitz is not alone, however: a veritable industry of reportage and scholarship is growing to document the systemic alternatives that are emerging throughout the North. As these alternatives become more widely known, one can expect them to continue spreading on an almost exponential scale, as people clamor for change.

One example that Alperovitz discusses is "municipal enterprise," effectively a kind of small-scale socialism whereby local government owns and operates properties and businesses. As the website Community-Wealth.org reports, "Increasingly, local governments have turned to municipal enterprise to both raise revenue and promote local jobs and economic stability by developing a more diversified base of locally controlled wealth."² For instance, there are over two thousand publicly owned electric utilities in the U.S., which, together with a number of co-ops, collectively supply 25 percent of U.S. electricity—more efficiently and at lower cost to the consumer than private utilities do. Hundreds of cities have built public internet networks too, and hundreds more are building them now.³ Many other cities are involved in hotel construction and ownership, hospital ownership, transit development projects, ownership of land that is leased to companies for a profit, and environmentally friendly businesses like methane-recovery.

Important initiatives are in the works on the state level as well, most notably, perhaps, proposals to establish public state banks. North Dakota is the only state that has such a bank; it has been in operation since 1919. Its public bank is one reason why North Dakota is the only state to have been in continuous budget surplus since 2008. As Ellen Brown notes, "The bank has contributed over \$300 million in revenues over the last decade to state coffers, a substantial sum for a state with a population less than one-tenth the size of Los Angeles County."⁴ Public banks allow governments to invest in local communities, in ways that actually benefit the community rather than some distant corporate elite. Accordingly, a public banking movement is growing; as of 2013, at least twenty states were considering establishing a state-owned bank.⁵ Counties and municipalities are likewise beginning to consider proposals for public banks.

Another type of institution with great potential is the benefit corporation (B Corp), which is a new legal form created in 2010. This kind of corporation differs from others in that "the goal is both to make profits and to use some part of them for social purposes."⁶ Shareholders can't sue these businesses for failing to prioritize profits above all else, as they can in the case of a conventional corporation. The depth

of public support for B Corps, and in general for a new, more socially conscious way of conducting economic activity, is shown by the fact that as of 2013, sixteen states had passed laws for benefit corporations. The number in early 2010, again, was zero.

More common than B Corps—because older—are community development corporations (CDCs), community development financial institutions (CDFIs), and community land trusts. CDCs are

nonprofit organizations dedicated to bringing about the revitalization of a clearly defined geographic area—often an urban neighborhood scarred by decades of disinvestment and concentrated poverty or an isolated and underdeveloped rural area. Governed by boards of directors composed primarily of local residents and other citizens with a strong stake in the community, most CDCs engage in some form of economic development within their service areas.¹

They have been most successful at housing development, but in recent years have tried to return to the vision of their original founders (in the 1960s) and engage in “comprehensive economic, social, and political development activities,” including community-owned and -controlled business development and economic revitalization. By 2005, 4600 CDCs had created over 1,252,000 units of affordable housing and generated 774,000 jobs.² They rely for funding on nonprofits, foundations, corporations, and all levels of government. CDFIs, similarly, are institutions that give credit to communities shunned by traditional lenders; they include community development banks, community development credit unions, microcredit programs, etc. Community land trusts, on the other hand, of which there are several hundred in the U.S., are nonprofit corporations that hold and lease land to keep it affordable for the community by removing it from the sphere of the market. The National Community Land Trust Network states that the purposes of these nonprofits are “to provide access to land and housing to people who are otherwise denied access; to increase long-term community control of neighborhood resources; to empower residents through involvement and participation in the organization; and to preserve the affordability of housing permanently.”³ What their long-term potential may be is still not clear, but if sufficient public pressure is broad to bear on government, they could easily become of more than marginal significance.

The same is true of the more experimental and radical movement to establish “Transition Towns” around the world, where initiatives exist to “rebuild local agriculture and food production, localiz[e] energy production, rethink healthcare, rediscover local building materials in the context of zero energy building, [and] rethink how we manage waste.”⁴ As Richard Heinberg characterizes it, “the ‘transition’ that’s being referred to is away from our current growth-based, fossil-fueled economy and toward a future economy that is not only sustainable but also fulfilling and interesting for all concerned.”⁵ The movement began in 2005 in Totnes, England, and has spread to well over a thousand towns in at least 43 countries, all of which have initiatives inspired by the belief that “communities must become more resilient in the face of three catastrophic threats: peak oil, global warming and economic instability.”⁶ These initiatives include such projects as community gardens, community-owned energy production, community-owned bakeries and

breweries, local currencies, and programs to incubate sustainable businesses. One celebrated initiative is called Transition Streets, which, in Totnes, “brought residents together, block by block, to support each other in decreasing their home energy use through improvements like insulation and solar panels. On average, each of the 550 participating households cut its annual carbon use by 1.3 tons and its annual energy bill by £570 (about \$883).”¹ Such projects admittedly seem too tiny to make much of a difference, but this may change as they become more common and publicized. The vision of “localization” that is behind them is likely to be ever more appealing, indeed necessary for survival, as the capitalist status quo disintegrates in the next century.

Turning to politics, a radical reform called participatory budgeting is gaining momentum around the world. First developed in Porto Alegre, Brazil in 1988, when the Workers’ Party was elected, it has spread to over 1500 cities on all inhabited continents.² Erik Olin Wright describes its functioning in Porto Alegre as follows:

Without going into details, the basic idea [of municipal participatory budgeting] is that citizens meet in popular assemblies throughout the city to deliberate about how the city budget should be spent. Most of these assemblies are organized around geographical regions of the city; a few are organized around themes with a city-wide scope—like public transportation or culture. At the beginning of the budget cycle each year these assemblies meet in plenary sessions. City executives, administrators, representatives of community entities such as neighborhood associations, youth and sports clubs, and any interested inhabitant of the city attends these assemblies, but only residents of the region can vote in the regional assembly. Any city resident participating in a thematic assembly can vote in those. These assemblies are jointly coordinated by members of municipal government and by community delegates.³

In Porto Alegre, participatory budgeting has consistently had high levels of participation and generated positive results. One resident observed in 2002 that before participatory budgeting, “there was no sewer, school, health clinic, or transportation. Now, a reservoir has been built with 6 million liters of water, the streets have been paved, and a school opened.”⁴ In fact, as reported by the World Bank, “Sewer and water connections in the city... went up from 75 percent of total households in 1988 to 98 percent in 1997. The number of schools has quadrupled since 1986. Porto Alegre’s health and education budget increased from 13 percent in 1985 to almost 40 percent in 1996.”⁵ There has been a “massive shift in spending toward the poorest regions of the city,” corruption has been dramatically reduced due to transparency, and a “thickening” of civil society has occurred, with civic groups of all kinds being stimulated by issues of democratic budgeting.⁶ In the 2000s, participatory budgeting began to spread at an accelerated pace, finally reaching the United States in 2010 (in Chicago). The remarkable successes it has had here and elsewhere are showcased on the website Participatory Budgeting Project, at participatorybudgeting.org.

The point, again, is that democracy, cooperation, and transparency are not only ethically imperative but more socially efficacious than the top-down, corporatized, bureaucratic, secretive methods of the contemporary *ancien régime*. When ordinary people have a democratic say in budget allocation, the money goes where it’s needed most, not where it will benefit only some politically connected corporate interests. Schools are built, streets repaired, libraries expanded, facilities improved. Poor neighborhoods see more

money, and can expect greater accountability, than they would otherwise. At the same time, involvement in the political process creates a better informed and more active citizenry, empowering people to form associations and networks through which they demand ever greater expansions of democracy from political officials. Participatory democracy reinforces and expands itself, so to speak. It counteracts social atomization, builds community, militates against apathy, and captures resources for people who will use them to further improve democracy.

Measures of even greater democratic significance have been enacted in Kerala, India. When Kerala's Left Democratic Front coalition came to power in 1996 it began a program of administrative, fiscal, and political decentralization to 1214 local governments. This ambitious campaign took advantage of the 1993 Constitutional mandates to increase local government power as a response to India's developmental failures and crisis of democracy.¹ A brief summary gives some sense of the project's scale:

The nested design of the Campaign's core institutions—Grama Sabhas (ward-level assemblies), development seminars, task forces, and local governments—represents a deliberate attempt to broaden avenues for citizen participation. In every year since 1997, local governments in Kerala have formulated and implemented their own development plans. These plans take shape through a multi-stage process of iterated deliberation between elected representatives, local and higher-level government officials, civil society experts and activists, and ordinary citizens. The process begins in open local assemblies, called grama sabhas, in which participants discuss and identify development priorities. Development seminars formed by the grama sabhas are then tasked with developing more elaborate assessments of local problems and needs. The development seminars give way to multi-stakeholder task forces that design specific projects for various development sectors. These projects are in turn submitted to local elected bodies (municipal councils called panchayats) that formulate and set budgets for local plans. Final plans are presented back to grama sabhas for discussion. These local plans are then integrated into higher-level plans (blocks and districts) during which all projects are vetted for technical and fiscal viability.²

The logistics are very complex, but the campaign seems to have been successful both at invigorating democracy—it is extremely popular—and at implementing development more effectively than before. This is partly because “popular involvement increases problem-solving efficiency through better and more rapid feedback and increases accountability by multiplying the points of scrutiny.”³ Much greater priority has been given to basic needs like sanitation, housing and drinking water than in the past, and there are now significant interregional differences as opposed to the “one-size-fits-all logic of the past.” Just between 1997 and 1999, 98,494 houses were built, 240,307 sanitary latrines constructed, 50,162 wells dug, 8000 kilometers of roads built, and 2,800,179 people received support for seedlings and fertilizers—all of which far exceeds achievements from earlier comparable periods.⁴ At the same time, corruption has declined significantly, as happened, too, when the cooperative KDB was formed.⁵

The innovations in Kerala demonstrate the possibility of a politics different from the anti-democratic paradigm of the present. As an alternative economy develops, a Kerala-style politics may follow in its wake.

All these quasi-experimental “radical reforms,” involving millions of people and thousands of institutions across the world, cannot be a mere historical curiosity. They have epochal potential. One participant contrasts them with the dreams of the old anarchists and socialists who looked forward to a cooperative commonwealth: “The old cooperativism,” he says, “was a utopia in search of its practice, and the new cooperativism is a practice in search of its utopia.”¹ The contrast is apt. The tragedy of the old cooperativism, from a Marxist perspective, is that consciousness outran material conditions, material possibilities, and so it was doomed to failure; the new cooperativism has placed consciousness at the service of people’s immediate economic interests, so that new modes of production and of governance are evolving step by step. Utopian dreams are being subordinated to economic realities—thus, perhaps, making possible the realization of “utopian dreams” in the distant future.

The obvious question, though, is the one that has been posed to radicals from time immemorial: *how* will the old world succumb to the new? How is that possible? What will the process look like? At this moment in history, characterized by a convergence of crises, it is easier to imagine catastrophe than a new and more stable civilization. We’re traveling headlong into a perfect storm of crises. For example, the UN projects that the world population will be almost ten billion by 2050, which of course will put severe strain on human and natural resources.² At the same time, global warming is expected to have an incalculably destructive impact on civilization and the global ecosystem: ocean levels could rise three feet or more by the end of the century; temperatures will rise at least 2.7 degrees Fahrenheit, probably much more; extreme heat waves will contribute to difficulty growing food and to massive changes in plant and animal life.³ In addition, the sword of Damocles hangs over humankind in the form of possible nuclear war, whether provoked by state or by non-state actors. And then there’s the economic crisis I’ve already discussed. These circumstances in themselves are enough to show that there will be no smooth or peaceful transition to a more equitable and just society.

Some commentators, such as Chris Hedges and Richard Heinberg, insist that we are headed for a near-apocalyptic scenario. “The steady depletion of natural resources,” Hedges writes, “especially fossil fuels, along with the accelerated pace of climate change, will combine with crippling levels of personal and national debt to thrust us into a global depression that will dwarf any in the history of capitalism.” Heinberg speculates that soon our economic system will “implode”:

And when it does the financial system will seize up far more dramatically than in 2008. You will go to the bank or the ATM and there will be no money. Food will be scarce and expensive. Unemployment will be rampant. And government services will break down. Living standards will plummet. “Austerity” programs will become more draconian. Economic inequality will widen to create massive gaps between a tiny, oligarchic global elite and the masses. The collapse will also inevitably trigger the kind of instability and unrest, including riots, that we have seen in countries such as Greece....⁴

These dire prophecies may be accurate, or they may be wildly exaggerated. What should be uncontroversial is that multifaceted crisis is here to stay for a very long time. It’s predictable what popular reactions to it will be: demonstrations, periodic rioting, looting (in the case of natural disasters, as after Hurricane

Katrina), perhaps a rise in crime, and grassroots organizing on both the political left and the right. What will determine how it all plays out is the reaction of the ruling class, which possesses most of society's resources and so has disproportionate power over the directions in which history proceeds.

Above I made some rather vague predictions regarding the behavior of governments and the ruling class, which I will qualify and elaborate on now. Of course it's impossible to predict the long-term future with any certainty. For all we know, nuclear war will destroy much of the species in the next century, or the collapse of our current world system will lead to two hundred years of wars over natural resources. Nevertheless, I think it can be useful and interesting to speculate on possible paths that the future will take—and not only because I consider apocalyptic scenarios to be implausible. Assuming that human society doesn't revert to some kind of Hobbesian state of nature, one can sketch plausible paths of historical development and use those sketches to help guide strategy.

As I said above, the point to keep in mind is that governments and ruling classes are not monolithic entities. This fact is what makes possible a paradigm of revolution different from the orthodox Marxist one: rather than the working class suddenly rising up as one in a titanic social explosion, bursting through the straitjacket of a unified ruling class that has refused to reform capitalism, what can and should happen—and has happened in the past—is that popular struggles exploit divisions in the ranks of the elite so as to achieve gradual progress. Many wealthy people and institutions are reactionary, but many are progressive. In order to accomplish lasting, democratic change, it is necessary for popular movements to get some of the progressive elite at least partly and provisionally on their side. Universities, nonprofits, philanthropic foundations, liberal millionaires and billionaires, progressive businesses, and politicians are just some of the entities whose wealth and influence can be critical to the success of a movement or a new idea. By any means necessary, one must get their support—because if it isn't forthcoming, the combined might of the reactionary and the liberal elite will squash the left.

Fortunately, the last 150 years of Western history have taught us that when crisis afflicts society, much of the liberal elite is willing to favor measures that benefit the populace and are not dictated solely by the short-term interest of the capitalist class (or some narrow section of it). There exist wealthy benefactors of environmentalism, public education, civil liberties, the labor movement, infrastructure development, and the social and solidarity economy. As the reign of neoliberalism deepens the crises that beset the world, more and more entities in the ruling class will divert more and more resources to assuaging popular discontent, in many cases by funding radical new initiatives such as have been surveyed in this chapter. The rot that runs through traditional government and civil society makes this “experimentalism” utterly predictable—because “bad times call for bold solutions,” etc. It's highly doubtful that social crisis will abate, so radical reforms, insofar as they are demanded by the masses and seem to work, will spread from region to region and country to country, as they are already doing.

It's instructive to contrast, again, the present situation with that eighty or a hundred years ago. Aside from the comparatively serious and multifaceted nature of contemporary crises, there are crucial differences between the periods that should hearten present-day radicals. Certainly the national and international left does not appear to be in good shape. On the other hand, a closer look at things reveals glimmers of hope. First of all, popular movements potentially have far more resources available to them now than in the 1930s or before. Technology is infinitely more advanced than it was, making possible global resistance movements and more effective coordination between them. Electronic media make it easier to publicize, on a wider scale, projects in an alternative economy and politics. Society is awash in wealth and knowledge, which, although it's concentrated at the top now, could be harnessed and used for the benefit of “the 99 percent” and their dissent. Many of the people who will be in dire economic straits in the coming decades are highly educated, college graduates, articulate and aware, who were raised with high expectations and are likely to be radicalized relatively easily. Moreover, their education and former position in the middle class will probably ensure that their protest is less ineffectual than those of some more marginal group might be.

From one perspective, the fragmentation of the contemporary left isn't even a bad thing. For it arises, in part, from the fragmentation of society itself, the dissolution of an integral capitalist civil society and the nation-state. A decaying social fabric—and a decaying national state—signifies, in the long run, a

decaying corporate capitalism, a doomed civilization. It was different in the Great Depression, though: then, it was clear very quickly to far-seeing liberals that what was necessary to save capitalism was a stronger state, more state intervention in the economy, and stronger labor unions to bargain for high wages and so keep demand high and the economy running. With the strengthening of the state and unions would come a repairing of the social fabric and, in fact, the heyday of the nation-state system. Now, eighty years later, no one has a clear idea of how to save society (neoliberal globalization having made Keynesian nationalism impracticable)—which, in a sense, is a *good* thing for radicals, because it suggests that we really are nearing the end of the capitalist epoch. Systems and institutions are floundering; the left, for now, is floundering, as is the center, as is (in some cases) the right. But all this floundering opens up space for “decentralized” innovation, grassroots experimentation, localism and regionalism, under-the-radar moves toward cooperativism. This slow, semi-interstitial process is the natural way in which social (economic) systems yield to their successors.

Another respect in which the present has promise is that its transnational framework militates against fascism. Whatever revolutionary potential the 1930s had was vitiated by the (inevitable) consolidation of state capitalism, which in this early phase was easily susceptible to fascism, or “palingenetic ultra-nationalism.”¹ Fascist movements marched all over Europe in the 1930s, and in some cases they achieved total or partial control of the state. After all, they were useful to certain sections of the ruling class in their struggle to beat back the labor movement, Socialists, and Communists. At the present, the same goal exists among similar reactionary entities of beating back the labor movement and progressivism of whatever form, and some of these entities are even willing to bankroll semi-fascist movements for this purpose. The Koch brothers’ funding of the Tea Party is a well-known example. It’s also true that as the middle class declines, one can expect many of the aggrieved to have sympathy with right-wing groups like Golden Dawn in Greece and the Tea Party in the U.S. This fact presents clear dangers for the left.

Nevertheless, the dangers are surely not what they were in the 1930s. The point, again, is that the world is simply too interconnected now, and transnational corporations have too much power, for a return to the era of sovereign and autonomous nations to occur. In the thirties it was much easier to assemble the political apparatus of reactionary ultra-nationalism than it is in an age of advanced globalization, unparalleled access to information from global sources, widespread higher education, and greater political sophistication among the elite than when they allowed fascist leaders to come to power in the early twentieth century. Nor should we discount the lessons that people and institutions have learned from the experiences with Italian Fascism and German Nazism. Historical memory is not always acute, but in this case its power is not insignificant. The main threat that semi-fascist movements might pose is just that they will slow down progress—or in some instances reverse it temporarily—and exacerbate social problems. The possibility is minimal that they will decisively take over national governments and start World War III. Worldwide, there is every reason to expect that far more people will join progressive movements than fascist ones.

As for the much lamented decline of the middle class, there are silver linings in this (insofar as it is happening). The “middle class”—by no means a monolithic entity—has tended to be the bastion of centrist conservatism, the ballast that has steadied the course of capitalism (or, at times, turned it to the right). No transition to post-capitalism could have occurred as long as the middle class was stable and intact, because few people whose material circumstances are satisfactory would ever give that up to fight for the mere hope, and the very risky prospect, of a completely different social system.² That is to say, as long as traditional labor unionism was strong, thus keeping the middle class strong, revolutionary hopes were doomed. Unions and collective bargaining had to decline—as did the welfare state—in order for radical possibilities to open up. This is an unpleasant and ironic truth that many leftists prefer to deny, but it *is* true. As I argued above, post-capitalism never could have happened within the corporatist framework of the nation-state; and industrial unionism and the welfare state were an essential component of the mature

¹ That’s Roger Griffin’s definition, quoted in Stanley Payne, *A History of Fascism, 1914–1945* (Madison, Wisconsin: University of Wisconsin Press, 1995), 5.

² Erik Olin Wright makes this argument in *Envisioning Real Utopias*.

nation-state. So they had to go. (And they were bound to go sooner or later, given capital's aggressiveness and its increasing mobility on a global scale.) In any case, capitalism cannot end except in the context of economic crisis, as Marx sensibly argued. And crisis on the scale necessary is incompatible with the existence of a large and protected middle class. So the decline of this "class," while presenting dangers in the form of semi-fascism, is a necessary prerequisite to a transition out of capitalism.¹

The old question remains: is such a transition "inevitable," as many Marxists have thought? Is corporate capitalism *necessarily* going to succumb to its own contradictions and to the crises, and resistance, it engenders? On this question, too, I'm an optimist, as I indicated above. For one thing, no social system is permanent; everything in history is transitory and in flux. More substantively, I agree with István Mészáros: "The fraudulence and domination of capital and the exploitation of the working class cannot go on forever. The producers cannot be kept constantly and forever under control."² Indeed, the inevitability of the current social order's demise seems so obvious to me that I can scarcely argue for it. The facts speak for themselves. No civilization can possibly weather the crises that are in their infancy now—the chaos of climate change, overpopulation, economic stagnation, class polarization, government retrenchment, privatization and exhaustion of resources, commodification of everything, and possible nuclear war. Radical reforms are inevitable.

One way the future may play out is that such reforms, eventually supported by much of the elite, continue to spread for many decades as social instability increases. They build up a constituency that acquires a vested interest in their maintenance and expansion. Since national governments and bureaucracies are simultaneously becoming ever more dysfunctional and inadequate to the task of ensuring social order, the "reforms" typically amount to a partial ceding of powers to the regional, local, and international scales. Military and police repression of far-left movements continues in many places, and such movements or parties are rarely permitted to capture national governments (because they're too important), but on less visible scales, such as the local and regional, "the people" do have more and more say in governance—because the elite finds it necessary to make some concessions, and it's less dangerous to do so on lower levels of governance than on higher levels. Nevertheless, even on the national level the left makes slow progress—simply because the right can't control things forever, otherwise society would completely collapse. The left's increasing success is partly a result, too, of the fact that the ranks of the hyper-elite are thinning due to the repeated bursting of economic bubbles, the protraction of economic crisis, and the consequent colossal destruction of wealth.

As the centers of global capitalism become more preoccupied with internal problems while having fewer resources to devote to policing world politics on behalf of corporate interests, leftist movements in the global South have greater success against their governments. Quite possibly, democratic initiatives such as have been pursued in Kerala, India become more common, as do participatory budgeting, public banking, and comparable experiments. This gives more resources to the left, which therefore grows. Social and physical infrastructure continues to decay in places where the right still has control and improves where the left does—but, because the left is growing, the long-term trends are largely positive. Environmental deterioration and economic stagnation counteract these trends, but in many regions governments are able to alleviate the effects of these negative forces by, for instance, sponsoring programs to establish worker cooperatives and coordinating the distribution of resources to where they're needed most. Regarding the environment, the severity of the crisis and the clamoring of the people finally force governments around

¹ Marx had intellectual integrity, so he wasn't afraid to embrace unattractive but correct implications of his thought. During and after the 1850s he looked forward to economic crisis and was quite happy when it arrived, because he recognized that it fostered the conditions for revolutionary movements. (See Jonathan Sperber, *Karl Marx: A Nineteenth-Century Life* (New York: Liveright, 2013).) Nowadays, many self-styled Marxists, such as the editors of *Jacobin*, who lack Marx's hard-headed realism and appreciation of history's "dialectical irony" think that twentieth-century social democracy could potentially have led straight into socialism if only things had gone differently, and that some sort of resurrection of the welfare state can still lead to such an outcome. See, e.g., Peter Frase and Bhaskar Sunkara, "The Welfare State of America," *In These Times*, October 22, 2013. I'll consider these fantasies in the final chapter.

² István Mészáros, *The Structural Crisis of Capital* (New York: Monthly Review Press, 2010), 170.

the world to take substantive measures against global warming and other forms of pollution—although for centuries to come, environmental disasters are frequent. Indeed, probably billions of people in the next century are severely affected by climate change and other such calamities, so that innumerable inter- and intra-governmental organizations are established to address these problems (by reforestation, promotion of renewable energy, distribution of water and food to devastated populations, and so forth). On local levels, governments tolerate and even encourage the proliferation of nonprofits, communal “crisis centers,” large communal housing cooperatives and other “self-help” institutions, and grassroots endeavors we can’t presently foresee to mitigate the impact of extreme weather patterns. The reason for this political support, again, is that such organizations promote social stability and are demanded by both the public and a large part of the elite.

In general, the only adequate way to respond to crisis is by pursuing measures that are the opposite of privatization, marketization, and commodification. This fact alone should make a leftist optimistic with respect to the long run. As the world’s corporate sector faces declining profit-rates from global overproduction and underconsumption,¹ and even the financial industry is suffering from replays of the 2008 collapse (and other sources of instability), its resistance to progressive movements becomes less effective than it once was. More and more corporations succumb to bankruptcy. One can’t rule out the possibility that some businesses critical to societal well-being are nationalized. In any case, the point is that over many decades, the character of the economy, society, and politics changes such that the “public sphere” expands, albeit typically in less centralized and nationalistic ways than in the mid-twentieth century. After a long evolution, new modes of producing and distributing resources have spread around the world, modes that we can’t clearly foresee at present. What national governments will look like at this point is impossible to predict, except that they will probably be attenuated relative to the growth of other political forms. Certainly the principle of nationality itself will be hollowed out, since it will hardly serve any economic purposes any longer.² The corporate capitalist class will have so thinned by this point that in many countries it will be possible for the “working class” (now in a different form, much of it consisting of members of cooperatives and other democratic organizations) to effectively take over national governments and continue to transform them into mere extensions and enablers of lower-level and higher-level administrative apparatuses. Throughout this long history there will have occurred innumerable bloody clashes between armed enforcers of the status quo and proponents of democracy, but repression cannot work forever. Maybe 150 years from now, things will have started to settle down and the contours of the post-capitalist global order will be clear.

—That’s one possible scenario, a relatively optimistic one. It doesn’t seem wildly implausible, though. The premise underlying it is the commonsense truth that corporate capitalism and privatization are unsustainable, i.e., a democratic reaction against them is inevitable. Given this fact, the above scenario is one plausible account of the future. It does leave out such eventualities as nuclear war or the destruction of most of the human species by climate change, neither of which is out of the question. Another unpredictable variable is the politics of white rage, i.e., semi-fascism, which may be manipulated and co-opted by interests with a stake in imperialist rivalries, for example between the U.S. and China.³ Nonetheless, whatever

¹ See Brenner, *The Economics of Global Turbulence*.

² This statement doesn’t imply the crude economic reductionism one might think. Raymond Williams was right that in cultural and political analysis one has to take into account the “residues” of previous systems; for example, Christianity is a residue of the Middle Ages, though in modern times it has assumed new political and social functions that have time and again reinvigorated it. Likewise, the idea of nationality will persist for a very long time, even as economic and political transnationalism and localism make it ever more obsolete. See Raymond Williams, *Marxism and Literature* (New York: Oxford University Press, 1977).

³ Recently the U.S. has been engaged in a “Pacific Pivot,” “a major initiative announced late in 2011 to counter a rising China. According to separate statements by Secretary of State Hillary Clinton and Defense Secretary Leon Panetta, 60 percent of US military resources are swiftly shifting from Europe and the Middle East to the Asia-Pacific region.” Koohan Paik and Jerry Mander, “On the Front Lines of a New Pacific War,” *The Nation*, December 14, 2012. New military bases are being added to the hundreds that the U.S. already has on foreign soil in the Asia-Pacific, and the Trans-Pacific Partnership “free trade” agreement excludes China. Nikolai Bukharin’s *Imperialism and World*

scenario one concocts, it is surely inevitable that modes of economic, social, and political cooperation will evolve to partially or totally replace the privatized competition that has led humanity to the brink of catastrophe. If most of the species is destroyed, for instance, democratic cooperation will probably be essential to the survival of the remaining humans. Certainly corporate capitalism will no longer exist.

It is largely futile to speculate on the future of the market or whether new forms of sophisticated barter or economic planning will emerge. What is certain is that, for all the reasons I gave above, no other model of revolution than the “gradualist” one I’ve sketched is relevant to a transition from capitalism to a more just society. Worker cooperatives may well be an important element in the accumulation of resources by leftists and “the people” that is necessary for the latter ultimately to achieve political power. The recognition among unions that a social movement unionism has become necessary will cause more to promote and form cooperatives, even as more workers follow the example of Argentinians after 2001 by taking over businesses in the wake of economic collapse and turning them into co-ops.

Incidentally, these happenings provide an opportunity for us to observe history’s fascinating, albeit inhuman, symmetry and logic: while the wave of worker cooperatives in the late nineteenth century succumbed to an ascendant corporate capitalism, the wave that is just beginning now—a product of comparable conditions of inequality, economic “chaos,” and insufficient government intervention in the economy—will continue to build as its nemesis corporate capitalism dies. Thus, cooperative movements sprang up in the fractured dawn, or pre-dawn, of an era in the 1870s and 1880s, and they spring up at its fractured dusk—only to enjoy a success they could not earlier when their nemesis was in its childhood rather than its old age (and when they themselves didn’t have the resources they do now). Neoliberalism has thereby been an unwitting tool of the “cunning” of historical reason, by precipitating the demise of the very order whose consummation it was and making possible the rise of a new one.

New Era Windows, which I’ll discuss in the following chapter, is one of the cooperatives in the vanguard of the coming revolution. It is still a rather lonely outpost overlooking a vista of economic desolation, but its loneliness will surely be a temporary condition. After decades of concessionary bargaining and passive rearguard action, the labor movement is finally, by virtue of the enormity of its predicament, being forced to embrace revolutionary strategies such as worker ownership. Herein lies the hope for the future. If current trends continue, in our lifetimes we may even see a recrudescence, in a more sophisticated global form, of the old heroic battles on behalf of cooperation against the robber barons, as the beauty of Catalonian socialism in 1936—thousands of people joyously birthing a new world—emerges from behind the veil of memories into a world of possibility.

CHAPTER FIVE NEW ERA WINDOWS

It may seem awkward to descend from the lofty heights of the previous chapter to the low terrain of a case-study, but it is precisely on the level of local institutions and their mutual self-help (with political assistance) that a new economy will have to develop. Its cooperative dimension will emerge in a variety of ways: people starting a co-op from scratch, buying out an employer, benefiting from liberal initiatives as in Cleveland, using their union to start a cooperative, etc. In the following I’ll consider the second case, that of buying out an owner. In the U.S., since the late 1970s there have been countless attempts by workers to buy out employers that planned to shutter factories; few of these have been successful, typically because of capitalist resistance. For example, in 2010 a hundred employees at an aerospace plant in Taunton, Massachusetts that was about to be closed by their employer, Esterline Technologies, wanted to buy its equipment so as to run the plant themselves. After being rebuffed by the company, they and their union, United Electrical Workers (UE), convinced the city of Taunton to pursue the use of eminent domain to seize Esterline’s machinery and buy the factory on behalf of the workers. This was unprecedented in recent labor

Economy (1915) is worth reading in this context, being a classic analysis of the dynamics that still govern the world economy.

history, and the tactic holds great promise for the future. Unfortunately, it didn't work in this case, for complex reasons we need not dwell on here.¹

Despite past failures, one can expect that such attempts will continue, indeed will probably become more numerous as unions and the progressive elite embrace the idea of employee buyouts and/or using eminent domain to save jobs. The more success stories are publicized, the more attractive these options will be (and the easier it will be for workers to find financial assistance). One such success story is that of New Era Windows, which bought its factory from the former owner in 2012. This case is particularly interesting and instructive given the workforce's history of militancy, including factory occupations, and success in confrontations with employers.

For people who want to start a co-op from scratch, there are dozens of books and manuals, some of them available at www.american.coop and www.usworker.coop. University courses are now being offered as well, at UMass Amherst, Rutgers, the University of Connecticut, Southern New Hampshire University, MIT, and other places.² It is probably more feasible, however, that large cooperatives are started by buyouts and takeovers than from scratch by entrepreneurs, so those scenarios are what I focus on in this chapter.

The New Era Windows cooperative is run by a workforce that, since 2008, has grown used to the glare of the media spotlight. In 2008 these workers symbolized the nation's disgust with the greedy and corrupt bankers who had run the economy into the ground and then gotten bailed out, and their defiance of the leviathan that is Bank of America was inspiring. Even Barack Obama, no leftist, felt compelled to express support for them: "I think they're absolutely right and understand that what's happening to them is reflective of what's happening across this economy."³ Six years later, they symbolize not only defiant action for workers' rights but defiant construction of an alternative to corporate capitalism. Coverage of their actions by the *New York Times*, the *Washington Post*, the *Chicago Tribune*, *The Nation*, *Yes! Magazine*, the major television networks, *Democracy Now!*, *Al Jazeera*, and innumerable other media outlets around the world testifies to how deeply their story resonates with the public. The obvious questions, then, are: what is their story?; how have they accomplished all that they have?; and how can their victories be replicated?

Journalist Kari Lydersen published an excellent account in 2009 of the workers' struggle against Bank of America and Republic Windows and Doors, entitled *Revolt on Goose Island: The Chicago Factory Takeover, and What It Says about the Economic Crisis*. In the first part of what follows I'll draw disproportionately on her book, summarizing some of its main points in order to provide context for the discussion of the cooperative later.

Republic Windows and Doors was formed in 1965, and continued to grow until the end of the century. By the 1990s it was selling vinyl replacement windows and patio doors not only to small home-improvement contractors, as earlier, but to businesses, factories, and apartment complexes. It owned a large factory on Goose Island in Chicago where it employed hundreds of workers, primarily Latinos who had left Mexico and their families behind. This predominance of Latino workers is, of course, not an unusual thing in the postindustrial U.S. More than 50 million Latinos live in the United States, 23 million of whom are in the labor force (employed or unemployed).⁴ Millions of these people are recent immigrants who regularly send money back to their relatives at home or try to earn enough for their families to join them someday in

the U.S.; for instance, three-quarters of the workers at Republic had emigrated from Mexico.¹ In part because of the rising proportion of Hispanic immigrants, low-wage workers in the U.S. are increasingly likely to be Hispanic.²

Given these trends, it is not much of an exaggeration to say that “the future of America’s labor movement will be written in Spanish.”³ This fact should, perhaps, be encouraging to labor organizers, because, as the Republic occupation and other militant actions in recent decades suggest, there are clear tendencies for Latino and indigenous American workers to be more easily radicalized than white or African-American workers.⁴ The latter groups have been socialized into the neoliberal American way of behaving and thinking, an unfortunate amalgam of atomism, loneliness, cynicism, interpersonal alienation, semi-passive resignation, disdain for unions, and so forth. Latino immigrants, by contrast, having come from a very different society with its own history and culture—in most cases a vibrantly leftist or “populist” one at the grassroots—have not typically internalized American atomism and ennui in the way that the mainstream has. This is evident simply from impressionistic observation. Moreover, the very fact of constituting a minority in another country, speaking another language, being more cruelly oppressed than most mainstream groups, and to some extent possessing a common culture different from the dominant one, pushes people towards solidarity, mutualism, and militancy in social and political struggles. These are good omens for the future labor movement in the United States, especially considering that Hispanics are the largest and fastest-growing minority group.

Richard Gillman, who became the owner of Republic in 2005, thus had the bad luck of inheriting an intractable workforce. This was particularly the case because the workers had voted in 2004 to end their association with a union called the Central States Joint Board (CSJB) and affiliate with the UE, one of the most militant and progressive unions in the country. Disenchantment with the conservative, undemocratic, and corrupt CSJB had become acute in 2001, when the union negotiated a dismal contract with Republic. As Lydersen recounts, workers were so disgusted that they organized a wildcat strike a couple months later, in January 2002. For more than two weeks, in the freezing cold, they held out against the opposition of the company, the union, and the police, who all encouraged workers to cross the picket line (as some did each day). “On a particularly frigid morning,” for example, “some workers were lured across the picket line by the quintessentially Chicago bait of Krispy Kreme doughnuts and coffee.”⁵ Despite the support of Latino elected officials, including U.S. Congressman Luis Gutierrez, the strike failed and workers were forced to return to their jobs—while continuing to nourish the hope that someday they could get rid of their union.

Through informal contacts with labor-rights and immigrant-rights groups in Chicago, the workers eventually met with UE organizers, who convinced them that theirs was a much more effective union than the CSJB. In late 2003, about a year before the CSJB’s contract was going to expire, “the UE launched its typical organizing drive, holding meetings to inform workers of their rights, providing stickers and flyers, and pointing out all the things the CSJB was not doing for them.”⁶ As is usually the case, a “militant minority” among the workers was crucial to the success of the organizing drive (and would prove crucial to the 2008 factory occupation). Armando Robles, for example, a maintenance worker in his late thirties who had started working at Republic in 2000, discussed with his coworkers week after week the merits of the UE, passing out flyers, holding meetings in community centers, and in general trying to counter the company’s anti-union propaganda. When it came time for the election, the UE trounced the CSJB, 340 votes to 9. (About 100 workers voted for no union at all, having been disillusioned by their earlier one.)

Since the UE played a critical role in later years, it’s worth saying a little about this unique union. It was formed in 1936, when independent local unions attended a conference in Buffalo, New York to create

a national union that would organize the radio and electrical manufacturing industries. A few months later, it became the first union granted a charter by the newly formed CIO, which was a progressive alternative to the old, craft-union-based AFL. In the legendary years of the late 1930s when the United Autoworkers was organizing the automobile industry, the Steel Workers Organizing Committee was organizing the steel industry, and the Packinghouse Workers of America was organizing the meatpacking industry, the UE was making swift and fantastic gains at General Electric and other major corporations. Its victories continued through World War II, so that by 1945 it was the third largest CIO union, with over 500,000 members.

The organizational structure that made possible these early successes—as well as the union’s later tenacious survival in difficult times—was unusual in the U.S. labor movement. The UE was and remains a much less centralized and bureaucratic union than others, with radical democracy enshrined in its constitution and by-laws. Union members not only elect, from among their ranks, local officers, stewards, negotiators, and delegates to national conventions; they also decide, themselves, when to strike and to end a strike, when to accept a contract and what terms to demand, and how to use local dues. The salaries of union staff and executives do not exceed the highest wage in the industry, a provision unique among American trade unions. On rights for women and African-Americans, the UE was far ahead of its time and most other unions, for example supporting “equal pay for equal work” during World War II and fighting to end workplace discrimination against blacks. It has also not been afraid to take controversial political stances such as opposing the Vietnam War (when the AFL-CIO resolutely supported it) and being actively involved in the civil rights movement. On the whole, it is hard to imagine a more progressive and militant union.¹

In the context of the Cold War, however, progressivism was not unequivocally an asset. It led several unions, including the UE, to be branded as Communist and hounded out of the CIO. The 1950s were a dark time for the UE: under a barrage of attacks from business, the federal government, and mainstream unions, its membership plummeted to 60,000. It’s a miracle that it survived at all; virtually no other left-wing union did. In the 1960s it began to rebuild its numbers, but the deindustrialization of the 1980s and 1990s wiped out many gains. At present the UE has about 35,000 members, and even this relatively low number has only been made possible by the union’s trademark radicalism and flexibility. It has branched out from its traditional industrial jurisdictions to include teachers, nurses, and clerical workers, and it was one of the first unions to embrace undocumented immigrants. It has also been at the forefront of efforts to build transnational alliances, having formed a close alliance with the Mexican union *Frente Autentico del Trabajo* in the 1990s when they were both fighting NAFTA.²

In the light of this honorable history, it should come as no surprise that the contract the UE negotiated with Republic was excellent from the workers’ point of view: “They obtained a nearly unheard-of average \$3-an-hour raise over the course of three years, with \$1.75 in the first year. They overhauled a subpar bonus system. And they won the right to have 19 union stewards on the shop floor, compared to five before. This meant more power for the union and more ability to file and win grievances.”³ A couple years later, Armando Robles was elected president of the local—Local 1110—and Ricky Maclin vice president, forming a partnership that would prove effective and long-lasting.

Being a democratic union, the UE gives leadership training to its members, particularly the stewards. This “consciousness-raising” and confidence-boosting is essential to giving members a sense of empowerment, efficacy, and self-respect vis-à-vis management. Leah Fried gives the example of training in grievance procedures. Stewards will learn about the different kinds of grievances, the steps involved in filing a grievance, and how to follow through in meetings with management. After reading through the contract and learning all the procedures, they then simulate a grievance meeting: one person plays the boss, another is the steward, a third the worker filing the grievance. Later, after a real grievance meeting, they

³ Lydersen, *Revolt on Goose Island*, 42.

meet to go over what went well and what to do differently next time, and so the learning process continues over months and years. Gradually the workers become more effective at standing up for their rights.

For instance, one time a Republic worker was fired for taking out the garbage. Literally: as Fried recalls, “he took out the garbage and the supervisor fired him, saying ‘You weren’t supposed to take out the garbage!’ So we got everybody to wear a picture of [the worker who had been fired], and they marched into the boss’s office during their break...” Combined with the filing of a grievance, this collective action got the worker rehired.

Horizons, in short, weren’t very sunny for Republic on the labor side of things; but the business side wasn’t doing much better. The situation became especially dire in 2007, when the real estate boom collapsed. The loss of customers meant that Republic quickly used up its \$5 million line of credit from Bank of America, which refused to grant more loans. By the summer of 2008 the company had lost \$10 million in less than two years, and its factory was in the process of being downsized from 500 workers to 250. November 2008 is when the real drama started.

Robles and other workers noticed that factory equipment was being spirited away in the night, to an unknown destination. Managers assured them and UE officials that nothing was amiss, an obvious lie given the business’s economic troubles (of which workers were well aware). It was revealed later that the equipment was intended for a factory in Iowa that Richard Gillman planned to be the base of operations for a new, un-unionized, company; at the moment, all that the workers knew was that they couldn’t sit idly by while their factory was dismantled, an action sure to presage the elimination of their jobs. As Lydersen relates, the workers organized a surveillance team to keep an eye on the factory during nights and weekends. One Saturday, Robles and Sergio Revuelta, a union steward, were fulfilling their watchman duties in the parking lot when they saw boxes being loaded onto two trailer trucks at the factory’s front entrance. They decided to follow them, curious where they were headed. Fifteen miles later they ended up at a truckyard, where the trailers were parked. Robles called UE representative Mark Meinster, who drove out to them to discuss what they should do. Angry at Republic’s brazen contempt for its workforce, Robles suggested stealing the trailers to force the company to negotiate with them. Or at least deflating their tires. Meinster, likewise determined to get the truth about what was going on, hit upon another idea: occupy the factory. Robles liked the suggestion, and in the following days he and Meinster found others enthusiastic as well.

So that’s how the idea was born. Factory occupations are more common in Mexico and other parts of Latin America than in the United States, so it isn’t surprising that a mostly Latino workforce would be attracted to the idea. The local’s executive board certainly was; its members saw no other option in the case of the plant’s closure. Many other workers were similarly enthusiastic, and it was easy to find volunteers to occupy the plant. No action was taken for the moment, except to organize 24-hour surveillance over the long Thanksgiving weekend, each shift lasting two hours.

The workers’ strange “limbo” situation lasted until December 2, when the plant operations manager called them to a meeting in the cafeteria and announced, predictably, that the plant would be closing on Friday, December 5. They wouldn’t get severance pay or accrued vacation pay, and their health insurance would end on December 15 (in fact earlier, as it turned out). This sudden closing of the plant was in apparent violation of the Worker Adjustment and Retraining Notification (WARN) Act, which requires that employees be given either sixty days’ notice or sixty days of severance pay, a fact that would be exploited by workers and their allies in the following days, when they declared to the media that it was illegal to close the plant under these conditions. After bringing his grim tidings the manager hastily retreated, leaving everyone to contemplate the destruction of the lives they had known.

It’s at this point that *connections* became especially important. Most things in the modern world depend on connections; luckily the Republic workers had them, through the UE. Union representatives got in touch with their contacts in the Chicago political world and such groups as Interfaith Worker Justice and Jobs with Justice; it was decided that the next day there would be a rally in front of Bank of America’s headquarters downtown. This was the strategy they had decided on: it made more sense to publicly shame Bank of America than Republic, in part because the latter had insisted that everything was the bank’s fault for having cut off credit, and in part because the bank had just received a \$25 billion bailout from the government and was by no means popular with the public. This was, after all, the moment when Americans

were enraged by the financial sector's sabotage of the economy and disgusted by the TARP bailouts of the chief culprits. Attacking Bank of America for destroying jobs even after accepting public funds was a brilliant strategy—which the media, for its part, was happy to facilitate, given the public's mood.

As Leah Fried explained later, the union and workers crafted their image in a very conscious and knowing way. The issue couldn't be worker rights, because, as she said, "the media doesn't cover worker rights. It's very rare that they will. In fact, some of them right up front said we can't cover a union story." So instead, the union framed it as a story of the bailout. "This is what the taxpayer bailout is really doing. It goes to these financial institutions who then turn around and shut down factories. People are losing their jobs, and on top of that, they're not even being paid the money that they earned."¹ This so effectively tapped into the public's rage that, in the end, the workers had much more success than they expected.

The rally on Wednesday gained visibility for the coming struggle, but of course it was the occupation that captured international headlines. On Friday morning Robles, Fried, Meinster, and other union leaders met with the full workforce to ask once more if they wanted to go ahead with their plan: everyone did. "Si se puede!" they cheered. "Yes we can!" About thirty people said they would occupy the plant, while the others would support them outside on the picket line. (The action was illegal, after all, and some workers were worried about the repercussions for their families if they were arrested.) Later in the day, though, when a final vote was taken just before the action was to commence, *everyone* wanted to occupy, no doubt caught up in the thrill of what they were doing. They formed committees to organize it, deciding, for example, that only thirty or forty people would occupy the plant at any given time; only workers, union staff, and family members would be allowed inside (with exceptions for political figures); and the place would be kept tidy for the sake of public image. Soon after the occupation had begun at 5 p.m., managers called the police to implore that the workers be forcibly removed; the police, however, refused, having been told earlier by the city councilman representing Goose Island that this was a labor-management dispute in which they shouldn't intervene.

This points to the importance, again, of having connections with progressive members of the elite. From the very beginning, Congressman Luis Gutierrez was an articulate defender of the workers, an intermediary (along with union officials and others) between them and Bank of America, and an effective coordinator of resources such as food. Other political figures who showed support in the following days included the Illinois Attorney General, concerned whether Republic had broken laws in its treatment of workers; Governor Blagojevich, who visited the factory on Monday (three days after the occupation had begun) to declare his support for the workers; Obama, who on Sunday had done the same thing in a press conference; Jesse Jackson, who showed up at the factory to hand out turkeys and offer encouragement; U.S. Senator Dick Durbin, Congresswoman Jan Schakowsky, various city councilmen, and county commissioner Mike Quigley. All wanted to bask in the popularity of these workers who were seen as defying the monster that is Bank of America.

The press, including correspondents from national and foreign media, were already at the factory on Friday before workers emerged to announce that they were occupying it until their demands were met. UE's contacts with the media and activist groups around the city thus paid off from the start. Republic officials hadn't shown up to a meeting on Friday with Bank of America and union leaders, so the sit-in continued into the weekend. A support rally on Saturday drew several hundred people, and donations of food, sleeping bags, pillows, and other items flooded the plant. Jobs with Justice continued to organize solidarity rallies nationwide in the following days. Inside the factory the atmosphere was in fact somewhat festive, despite people's fear of arrest. Initially, indeed, they expected to be arrested, and yet were determined not to leave. When several policemen ventured inside the plant on Friday night some of the occupiers prepared to chain themselves to the equipment, but were relieved to see that the police were only checking for vandalism. The lengths to which workers were prepared to go to defend their jobs is a poignant illustration of their outrage and desperation, shared by millions of others that winter.

Another meeting with Bank of America and Republic was called for Monday, but this one didn't go very well either, at least at first. Gutierrez and a couple city councilmen joined Robles, Maclin, and

¹ Leah Fried, interview with Bob Bruno, *Illinois Labor Works*, Chicago Access Network TV, December 17, 2011.

union reps, all of whom faced a room of representatives from the bank, the Chamber of Commerce, the city treasurer's office, and other state agencies and interest groups. Maclin got angry when a Chamber of Commerce official asked the workers to tone down their statements to the media and stop making the bank look so bad; he slammed his fist down on the table, cursed loudly, and retorted that he'd tell the media whatever he wanted. Things went a little more smoothly later, but still no resolution was reached.

On Tuesday, after another day of the media "eating out of the workers' hands"¹—even Fox TV, no friend of labor, praised them—talks resumed, this time more fruitfully. Richard Gillman angered the labor side when he asked, incredibly, that any new loan from Bank of America (to pay workers' wages) include severance pay for himself and funds to pay the leases on two luxury cars—"even his own attorney looked at him like he was crazy," said Maclin later—but after a huddle with the negotiators he withdrew his request and agreed to pitch in \$117,000 of his own money to meet his ex-employees' final payroll. The bank then agreed to extend a "loan"—really a donation, since there was little chance it would be paid back—to cover the rest of the money owed the workers. The deal couldn't be finalized immediately, though, since UE officials, consistent with the union's democratic traditions, insisted that all the workers would have to vote on it later.

On Wednesday a final meeting occurred with Bank of America and JP Morgan Chase, which had 40 percent equity in Republic. Their proposal amounted to \$1.35 million from the former and \$400,000 from the latter to cover workers' severance and vacation pay, and two more months of health insurance. At the factory that evening the workers, thrilled at their victory, voted to accept the offer—and yet were disappointed that it appeared the plant wasn't going to be kept open. How would their families survive the next year? What kind of jobs could they get in this dismal economy? They decided right away to start a new trust fund, the "Window of Opportunity Fund," to raise money to buy the plant themselves or find another buyer. In the meantime, they accepted their partial victory and celebrated with their supporters, both in the immediate community and, in spirit, all over the world.

What had made their victory possible, then, was an unusual confluence of factors. First, they were lucky enough to be represented by a union as militant and democratic as the UE. Leah Fried says it well:

Here's what made it possible for UE to do this [sit-in]. Number one, we had spent the time building the leadership in that local. The leadership had gained a lot of skill and knowledge. People had been through fights before.... We had built relationships with other unions, with community groups, with the immigrant-rights movement, with important coalitions in the city like Jobs with Justice and Interfaith Worker Justice.... We had built relationships over time, and we called on those relationships when the moment was right. And folks rallied, because they saw this as their fight, not just a UE fight. So, I think anybody could do it; you just gotta practice fighting, and you gotta build relationships with the rest of the movement. And start acting like a movement when the moment comes.²

If the labor movement as a whole acted more like the UE—or like the Chicago Teachers Union when it organized its internationally celebrated strike in September 2012—things might improve for workers. Unfortunately, the momentum and direction of entrenched bureaucracies, such as exist in mainstream trade unions, are not easily set on a new course. Timid, conservative, and establishment traditions cannot be reversed unless circumstances *force* them to be—that is, unless a context of prolonged crisis for the bureaucracies themselves finally necessitates their radical change. The labor movement seems to be undergoing this change now, at long last. It does have a ways to go before it catches up to the UE, though.

The very fact of having a union at all, or at least having a nearby worker center that can lend its support and resources, is virtually a prerequisite for the sort of action that Republic's employees undertook. Certainly if the action is to have some success, organizational resources—and the confidence that comes

¹ Lydersen, 91.

² Leah Fried, interview with Bob Bruno.

with them—are a necessity. This may help explain why the Republic occupation didn't cause many similar acts around the country. The unionization rate in the U.S.'s private sector is less than seven percent, which doesn't translate into a lot of organizational resources for workers.

Similar incidents did happen, though. The most notable was after the Colibri Group in Rhode Island, a jewelry maker, laid off its 280 employees (mostly immigrants) without giving advance notice; some actually arrived at work the day the plant closed only to see a sign informing them of the fact. And that was it, even for those who had worked there twenty or thirty years. "I gave them so much, my whole life," one worker said later, "and then they just closed the doors on us like we were animals. I felt like my heart was on the floor."¹ Since no notice had been given, the employees were entitled (under the WARN Act) to sixty days of severance pay and health insurance. They had no union, but some of them got in touch with a local immigrant- and labor-rights group called Fuerza Laboral—which had just two staff members—and organized a protest rally a couple weeks later, on February 3, 2009. Three days later, coincidentally, Armando Robles and other Republic workers and UE officials came to Providence on a tour they were taking around the country—called the Resistance and Recovery Tour—to spread word of their story and raise money for their trust fund mentioned above. The fifty Colibri workers they met with were inspired by what they heard, all the details of how a couple hundred Latino workers had shamed Bank of America before the world. So they decided to enact a similar campaign to shame the majority owner of Colibri (Founders Equity) and two banks that were creditors. In the following months they and Fuerza Laboral took many actions, including marching on the state capitol, protesting in front of Founders' Manhattan headquarters, initiating a national letter-writing drive, and filing a lawsuit to get the money they were owed. But the act most reminiscent of the Republic sit-in happened at an auction of Colibri's assets on March 19: fourteen people, including ten workers, were arrested for sitting on the street to block traffic to the auction.²

While the campaign got attention from the media and sympathy from politicians, it didn't have the success of the Republic sit-in. The workers were never paid, because creditors got everything left over from the business. Why this failure? One obvious reason is that the factory had already been closed, so it couldn't be occupied. As Occupy Wall Street showed in 2011, occupying an area can be a uniquely effective tactic if it draws media attention and/or prevents members of the elite from using facilities valuable to them. It forces the authorities either to give in to protesters' demands or deploy the police to violently disperse them, which never makes the elite look good. Thus, none of the actions of the Colibri workers quite "packed the punch" of a factory sit-in. Nor did the workers have the resources of a battle-hardened union, powerful coalition partners, or extensive ties to power-brokers.

The Republic workers also benefited, of course, from perfect timing (although Colibri workers' timing wasn't much worse). It was soon after the TARP bailouts had been announced, jobs were hemorrhaging—awful employment numbers came out on the very day the sit-in began—and people worldwide were enraged at the corporate sector. Hopes for comparable or greater victories in the future should be raised by the knowledge that for a very long time to come, economic stagnation and crisis will be the norm. Crises will continue recurring, and as they do so the public will grow more angry at big business and more sympathetic toward factory occupations. While it won't always be possible for workers to invoke unpopular "bailouts," they will still be able to attack corporations for destroying jobs and not paying employees what they're owed—two compelling soundbites, as Bank of America learned to its cost. If unions and their allies have the will, the "way" will present itself.

I've spent so much time discussing the 2008 sit-in because I think this tactic is the most radical and effective of all, and I suspect it will grow more common in the next few decades. As seen in Argentina after the 2001 crash, it can even lead straight into the formation of a worker cooperative. In the case of the Republic workers, the route was a little more circuitous. Let's consider that route briefly now, after which I'll discuss the co-op itself.

¹ Emilio Blanco, quoted in Lydersen, *Revolt on Goose Island*, 150.

² Lydersen, 148-154; "Police arrest protesters at E. Providence plant," *Associated Press*, March 19, 2009; Kelsey Abbruzzese, "RI workers suing jewelry maker for pay, benefits," *Associated Press*, May 21, 2009.

A company called Serious Materials (later Serious Energy), which manufactures energy-efficient building materials, bought Republic's factory and equipment in February 2009. With the help of Obama's 2009 stimulus package, it hoped to hire back all of Republic's former employees by the summer. Things didn't work out as planned, though: by September 2009, only twenty employees had been rehired, for reasons having to do with bureaucratic delays and insufficient stimulus funds.¹ Over the next couple years, in fact, only about 75 workers were hired back. Then, on February 23, 2012, UE was notified in a meeting with local executives that the plant would be closed that very day, because of "ongoing economic challenges in construction and building products, collapse in demand for window products, difficulty in obtaining favorable lease terms, high leasing and utility costs and taxes, and a range of other factors."² This time, at least, management said it would pay workers what they were owed under the WARN Act; union officers and staff, however, wanted time to find a buyer for the factory, so they could save the jobs. Management refused.

Because of a recent layoff, only 38 workers were employed at the moment. After the meeting with Serious, therefore, Robles and Fried called laid-off employees, asking them to come to the plant. Fifty workers met at 2 p.m., the end of the shift, to discuss the situation. Journalist Jane Slaughter describes what happened next:

Robles presented [their options] soberly: Do nothing, or fight—stay and occupy the plant again. Without much hullabaloo, matter-of-factly, the members voted unanimously to occupy.

They had no food, no sleeping bags. Workers and leaders immediately started to phone fellow workers, allies, and the media. They called the local alderman and asked others to alert the mayor's office. Occupy Chicago came with tacos. Stand Up Chicago arrived.

Workers from other UE locals, including recently organized railroad van drivers, were there. Republic workers who'd never been called back to Serious but who still came to union meetings were there. The crowd inside grew to 65 and outside to 100.³

UE regional president Carl Rosen got in touch with Serious CEO Kevin Surace to tell him the workers were prepared to be dragged out and arrested, as they were in 2008. (Such an outcome, indeed, is what they had expected then, before the event became a media circus.) The police showed up after being summoned by management and warned the workers that in five minutes they would be arrested if they didn't leave the plant. And maybe they would have been, if not for the many supporters outside with cellphones and cameras, including local TV news cameras. So the police thought better of their threat and let the workers stay. By 5 p.m., Occupy Chicago was raising tents as workers inside played dominoes and ate donated food.

Soon, corporate headquarters in California took over negotiations, having decided they didn't want a big confrontation with the union. By 1 a.m. they had agreed to all their employees' demands: the plant would stay open for ninety days, giving time for the workers and their union either to find a new buyer or arrange to run the factory themselves. The latter is the course they chose, thanks largely to Robles' advocacy.

The co-op idea had been in the air for a while. In 2006 Robles had attended the World Social Forum in Venezuela and heard a group of electricians discuss the cooperative they had formed, but at the time he wasn't able to pursue the idea. During their "victory tour" around the U.S. in early 2009, however, he and his coworkers got a step closer to starting a co-op. In an interview on Democracy Now! in New York they met Naomi Klein and Avi Lewis, who had made the documentary *The Take* about factory occupations in

Argentina and, since then, have been deeply committed to the cause of worker cooperativism. They introduced Robles to Brendan Martin, founder (in 2004) of a nonprofit called The Working World, which would provide crucial assistance to the New Era Windows cooperative formed later. As stated on TWW's website, it helps design, fund, and carry out cooperative projects—hundreds of them in the last ten years, in Argentina, Nicaragua, and the U.S. While its business model might seem risky, in that it gives low-interest loans to relatively poor people who don't have to pay them back until their businesses make a profit, its loans have a 98 percent repayment rate.¹

Martin pitched the idea of a co-op to Robles, but at the moment it was too late: Serious Materials had already stepped in. Robles was hopeful, though. As he recalls, “my answer [to Martin] was: you know what? Things happen. Owners are owners, they close. Sooner or later we could be in that spot, and then we'll give you a call.” Almost exactly three years later, his prediction was borne out.

As he says,

when [Serious] announced the close of the factory [in 2012], I keep mention [sic] all during the whole occupation— twelve hours—every single minute talk to the people, we should buy the factory, we could make a co-op. 'Cause I already have the idea. I see the movie *The Take* and it inspired me a lot. I have the opportunity from Brendan Martin who offered to us the financial support, and he has the dream to start the movement in the United States. So I see it as a big opportunity.²

At Robles' request, Leah Fried called Brendan Martin, who was in Argentina but flew to Chicago a couple days later. He met with Robles, Ricky Maclin, and a steward to start planning the co-op, for instance by choosing which workers they wanted to invite into the business. Initially it would have to be a small group of people who could be expected to get along well; later, the co-op could expand. They got in touch, therefore, with a few dozen former employees of Republic, not all of whom were interested. After all, the equipment hadn't even been purchased yet, and the whole idea of starting a co-op struck some people as crazy. Many saw themselves exclusively as workers, not bosses, and they couldn't break out of that mindset.

Nevertheless, progress was being made that spring of 2012. At an event showcasing the achievements of the Evergreen cooperatives in Ohio, the small group of planners fortuitously met Dennis Kelleher, executive director of the Center for Workplace Democracy. This institution assists cooperatives and community-based organizations in Chicago through advocacy, technical support, and financing. After hearing about the project that would soon come to fruition as New Era Windows, Kelleher organized classes in cooperative business administration for the workers who had agreed to join the co-op. In the spring and summer of 2012, therefore, when the status of the future business was still very uncertain, workers attended weekly classes run by Kelleher at the UE hall. The content of these classes was useful, but perhaps most important was the fact that—in these doubt-full early months—they brought people together every week and so fostered a group cohesion that, in retrospect, was “absolutely necessary,” as Fried says.

One reason cohesion was so necessary is that there were still unforeseen battles ahead. Serious had agreed on February 24 to sell the factory—or rather, its equipment³—instead of liquidating it, thus giving workers the opportunity to buy it. Negotiations between the company and its ex-employees began soon after: the workers painstakingly selected which equipment they wanted to buy and negotiated the prices with Serious, Brendan Martin serving as an intermediary. Things were looking so positive that the 17 future worker-owners took steps to incorporate New Era Windows on May 30, 2012, though they didn't yet have equipment or a place of business. Negotiations continued for weeks until suddenly, at the beginning of July, Serious informed them it wasn't going to sell its equipment after all—thus renegeing on the contract it had signed at the end of February.

¹ Elie Winninghoff, “The Giving Generation,” *Barron's*, December 3, 2012.

² Author's interview with Robles, January 8, 2014.

³ Serious owned the equipment but not the building, which it leased.

Immediately the workers launched a petition on Change.org to pressure Serious to comply with its own prior agreement; within 24 hours, the petition had received 3000 signatures. (Seventy-five thousand more would follow in the next two weeks.) Meanwhile, the UE filed for arbitration over Serious's violation of the February 24th agreement. The next day, July 5, the union organized a rally in which workers and supporters, armed with stacks of their signed petition, marched on one of the chief financial backers and board members of Serious Energy, Mesirow Financial.¹ In less than thirty minutes, the march grew from twenty people to about eighty. Evidently this frightened Serious and its investors, for, in a conciliatory mood now, they promptly got in touch with the workers. "Stop," Robles paraphrases them, "don't go to the media, we're going to work with you guys."

This incident shows, once again, that Glenn Greenwald's characterization of bureaucrats in the National Security Agency applies to functionaries of power everywhere: they're like cockroaches, happy to operate in the dark but extraordinarily skittish once light is shined on them. In most cases they'd rather concede defeat in some battle than have their dark machinations be exposed. Doing so, or threatening to do so, is one of the most powerful weapons in the arsenal of democracy.

So negotiations resumed, continuing through the summer. Meanwhile the search for a new factory continued, since the old one on Goose Island was too expensive and much too large. Even Serious hadn't needed all the space or used all the equipment it had bought. The cooperative, in contrast, would start out small and without a large surplus of cash, a fact that encouraged its members to be much more efficient and sparing in their purchase and use of machinery and facilities than large corporations tend to be. They looked at over ten possible buildings, eventually deciding on one in southwest Chicago that was significantly cheaper than the property on Goose Island.

To pay for the equipment they were buying, each member contributed the \$1000 that was his or her buy-in to the co-op, and The Working World provided the rest—in fact, more than the rest. It raised over \$600,000, though in the end the equipment cost only about \$400,000. The rest of the money it raised has served as a line of credit for New Era.

However, the whole cooperative venture almost fell apart again in September, when Serious dropped another bombshell. After months of negotiations over individual pieces of equipment, its executives changed their mind and declared that New Era had to buy everything or nothing. Since it didn't have the money to buy everything, the business could have ended just then, before it even began. Luckily Brendan Martin came to the rescue: he found a company that liquidates factories and arranged for it to buy 60 percent of the equipment while New Era bought 40 percent (which included much it didn't need, such as extra computers, tables, pallets, and lots of odds and ends the workers sold later). The deal was signed, and New Era had its equipment, finally.

The task now was to transport everything from the factory on Goose Island to the new one in south Chicago. Aside from four heavy machines that they hired someone else to transport, the workers moved all the equipment themselves—almost seventy trailers' worth. They hired a driver, but the loading and unloading they did themselves. Robles recalls with pride how effectively they organized this operation. They had bought four trailers from Serious; after filling them up they called the driver, who drove them one by one to the new factory, where another team of workers unloaded them. The efficiency with which they carried this out defied everyone's expectations, as Robles says:

Against all the predictions from the Wrigley people, who's been the owner of the Goose Island building, and against the predictions of the liquidators—they assumed like how the workers gonna move, we don't have experience to do nothing like that. Well, with experienced people [who transported the equipment the liquidators had bought] they moved like four trailers, at most they moved four trailers a day. We reached, in three consecutive days, moving ten trailers a day. So we moved around seventy trailers to this facility.

¹ Laura Flanders, "Workers vs. Investors: Chicago Window Factory in Danger of Liquidation," *The Nation*, July 4, 2012; "New Era Windows Workers Continue Struggle With Serious Energy," *Chicagoist*, July 11, 2012.

That was in October 2012. In the following months they fixed up the plant, which was not in good shape. Old mattresses were piled high, the ceiling was an ugly brownish color, there were no lights and no heaters. With help from the building owners they cleaned it all out, painted the ceiling white, installed heaters and lights, ran pipes to each machine, and eventually built a break room and a large office on the factory floor. They didn't have fancy architectural drawings to guide them regarding the layout of the plant; instead, they just put the machines where they thought they should be, based on memory. "I was working here, I need this amount of space, this is the next machine, I could put this other one here... We make straight lines better than Republic or Serious," Robles says, "because we tried to do step by step."

Finally, late in the spring of 2013, they were almost ready to open—except for the required fire inspection, which they were worried about. Any little irregularity, whether with the sprinkler system, the fire extinguishers, the proximity of electrical panels to machines, or "all the chemical stuff," could pose a serious problem. It turned out they had no cause for concern, though: they passed the inspection without a hitch, and so were able to open their business on May 9.

Businesses rarely start making a profit very quickly; New Era has not differed much in this regard (though it has been successful more quickly than most businesses). The first summer was spent building up a base of customers, and not much production was done until the fall, which is in any case a more active season for the windows business than summer. In fact, the workers didn't give themselves their first paycheck until the fall. Their pay, which they calculate themselves, is based on a combination of sales and how many hours each person has worked, with everyone receiving the same rate. Nine months after opening, their individual earnings have fluctuated as the number of windows manufactured each week changes.

As the cooperative has expanded its business, the UE has been an invaluable resource. New Era's worker-owners are still unionized, but the role of the union has of course changed: it now serves to represent the co-op, giving it support with advertising, legal work, promotion among other unions and social justice groups, conflict mediation if that's necessary, and other issues that might arise. For example, if there's a protest or some kind of mass event, the union will get in touch with New Era to send people who can pass out flyers (while wearing their New Era t-shirts) and talk to the media. Also, the UE has connections that help it find customers who otherwise wouldn't even have heard of New Era. Suppose, for instance, that the city or state government wants to weatherize some buildings. If a small co-op offers to supply the windows, the government will just laugh at it. If, on the other hand, a union backed by 35,000 people pressures the government with petitions coming from all over the country and other such tactics, officials will listen. And there's also the influence that the UE can bring to bear on contractors as opposed to end users. All this can add up to the difference between a failed business and a successful one.

The union can perform other services too. At this writing, Leah Fried is arranging to get health insurance for the members of New Era. She's also facilitating the adoption of a "collective bargaining" agreement—not in the traditional sense, as between a boss and employees, but merely in the sense of a set of rules that the members commit themselves to obey. It isn't a particularly urgent issue at the moment, when the business is small and personal conflicts are infrequent, but if and when the cooperative brings in new members it could prove useful to have such a statement of principles and rules.

Brendan Martin has remained just as involved with the co-op as Fried. Amidst his continent-hopping he regularly comes to Chicago to work on behalf of New Era, primarily in sales, meeting with government representatives, construction companies, and other potential customers. Meanwhile, another member of The Working World, Steve Wong, works at New Era in sales, purchasing, technical support, and other areas. In addition, the worker-owners energetically advertise themselves, seeking out clients in person around the city.

As a result, business is steadily growing. Robles recalls that his first paycheck in the fall of 2013 was only \$20—and yet even that was satisfying, because it was symbolic. "It was money from our own work, from our own factory, from our own product. That was a big thing, to make me successful, to make me feel comfortable and happy, 'cause in the end it was the fruit of all our work we put in this." In less than

ten weeks after their first check, everyone's biweekly pay had shot up to \$580. Winter is an off season in the industry, but they expect sales to increase dramatically in the spring.

When talking to the members, it's striking how positive and optimistic they are about the cooperative. Joel Cruz, a middle-aged man with six children, thinks his future is much more secure now, just as the present is much more satisfying. "My life is different. Maybe next year, with more customers, I forgot everything, my problems [in 2008 and 2012]... You know, when you're in the company, you have a supervisor; the supervisor say, 'Why you come in late? Hey, what happen? You talk too much, you go to line! Back to line, back to work!' Now, nothing like that." As one would expect, he's motivated to work harder now that he partly owns his business; at the same time, he's able to relax occasionally without worrying he'll be punished. For some of the members, indeed, the co-op also serves as a kind of social club, and they enjoy coming to work to see their friends. The only complaint Cruz has—which is shared by the others—is that, for now, the pay is too little. To provide for his family he has to work a second job on the weekends, as a saxophonist with a Mexican band. Other members, such as Robles, have had to be supported by their spouses.

William Swanson is, if anything, even more enthusiastic than Cruz, about everything except the pay (so far). He worked at Republic for 26 years, then at Serious for two years, and now it seems that for the first time he actually enjoys his job. He views it as a kind of adventure, an adventure in freedom-from-a-boss. For him, that's by far the best part. But he also enjoys the learning process, learning how to do purchasing (which is his main responsibility now) and the other duties they all share. "It's fun! It's knowledge, we're learning. That's the good part about it. We're learning something, and we can always have this, you know? We'll always have this under our belt. And we ain't got no bosses standing over us telling '*C'mere, ya gotta do this!*' 'cause we know what we gotta do. If we don't do it, we don't make money." Ricky Maclin has the same attitude as Swanson—something like exhilaration—and is absolutely confident about the future.

The co-op has five female members, whose attitudes toward their business do not differ much from their male coworkers'. Arizona Stingley worked at Republic for twenty years, then Serious, and now is loving her new role as a worker-owner. The small size of the business and its cooperative nature make it feel like a "family," very different from the impersonal environment of her two previous employers. Neither she nor Victoria Amaya, another long-term employee of Republic, has noticed any sexism at New Era; in fact, Victoria is one of the more dominant voices in the business and at their weekly meetings. These meetings, at which important business decisions are made (such as what materials to buy or how to address some problem that's arisen), are structured fairly informally, typically with a 75 percent supermajority being required on any given decision.

In short, things are going smoothly at New Era. The members hope to start a second shift and bring in new people in 2014, though they haven't yet decided on the specifics of that process. New members will probably have to pay a larger buy-in than the current members did, since the latter did all the hard, unpaid work of getting the business started. For now, though, they're just looking forward to enjoying the economic fruits of their intensive two-years-long labor.

Several lessons can be drawn from the history outlined in this chapter. First, militancy works. Or rather, it can work, if it has institutional support such as the UE and The Working World provided in this case. At each step of the way, it was by acting "impolitely," even illegally, that the workers were heard and got justice. The whole of labor history, of course, confirms this conclusion. For example, it was the sit-down strikes of 1936 and 1937 that led to the unionization of the automobile and other industries, whereas the concessionary bargaining of the 1980s and later did nothing to stop the decline of the union movement. It's time that mainstream American unions took the UE as their model.

The other obvious lesson is that media savvy is an invaluable tool for activists and workers. The slogan Leah Fried came up with in 2008, "Banks got bailed out, we got sold out," perfectly captured the public's mood and justified the workers' struggle. It was a catchy soundbite that simultaneously directed ire at banks and highlighted the injustice of what had happened to millions of people in the country. It's necessary to spin stories in such a way that the media will cover them, and then to conduct visible protest

actions. Especially if one has already built relationships among the liberal elite, it's quite possible that militant tactics will force authorities to come to the bargaining table, or even to concede all demands so that the issue goes away.

Regarding the cooperative itself, the history of New Era is vivid confirmation that starting a sizable co-op is extremely difficult and labor-intensive, and requires institutional guidance and support. Without Brendan Martin and *The Working World*, or the UE and its skilled organizers, New Era Windows never would have happened. If the U.S. had anything like a sensible industrial policy, government at all levels would provide much of the support needed to start co-ops and so give employment to some of the millions who desperately need it. For now, though, it seems that activists and visionaries will have to fill in the gap left by the government's inaction, while simultaneously pressing for policy changes.

A more encouraging lesson comes out of New Era's capital-intensive nature: it reminds us that worker co-ops need not be limited to labor-intensive industries. The record of Mondragon already demonstrates this, as does the cooperative sector in Emilia-Romagna and the success of other high-tech co-ops such as the long-running Isthmus Engineering & Manufacturing.¹ Still, to have a successful high-tech cooperative run by a working-class membership of Hispanics and African-Americans is yet another nail in the coffin of conservative conventional wisdom. Indeed, the diversity of the workforce demonstrates that, despite the scholarly stereotypes summarized in chapter two, homogeneity of cultural background is by no means a prerequisite of successful worker co-ops (however much it may conduce to success). What matter, rather, are commitment to the business and some degree of flexibility and amiability in relations with coworkers.

The broadest implication of the New Era Windows story is that one doesn't need a sophisticated formal education or a middle-class background or millions of dollars to stand up to corporate titans and win, or to start an ambitious manufacturing cooperative that is poised for indefinite expansion a few months after its inception. Such qualities as creativity, intelligence, ambition, and initiative are not limited to any one class of people but spread evenly throughout the population. It so happens that current social structures are designed to stultify these qualities in people who don't belong to the elite, but with determination, capitalist resistance can be overcome. If working people, with assistance from activists, tap into their enormous collective reserves of energy and defiance, there are no limits to what they can accomplish.

CHAPTER SIX CONCLUDING THOUGHTS ON REVOLUTION

While worker cooperatives are the main subject of this book, I am much more interested in revolution than cooperatives for their own sake. The future of civilization is what concerns me, the future of cooperatives only derivatively. Given the unsustainable nature of corporate capitalism, society will necessarily undergo a transition to a different system sooner or later. The question is, how will that transition happen? And what will it lead to? In chapter four I tried to answer these questions, admittedly in sketchy ways. No certain or precise answer is possible. I used Marxism because no other relevant set of intellectual tools approaches it in explanatory power, theoretical fruitfulness, or historical resonance. The revision I made to Marxism, though, is important enough to warrant further consideration, not only for intellectual or academic reasons but because it bears on debates that activists have been having since the split between Marx and Bakunin in the nineteenth century. The most important implication of my revision is that the opposition between Marxists and anarchists virtually dissolves upon a deeper understanding of Marxism itself.

Now, there is a sense in which, say, Noam Chomsky's attitude toward such debates as these is right: they don't matter, they're elitist and intellectually masturbatory. We know what's necessary to bring about

¹ See Michael Billeaux et al., "Worker Cooperative Case Study: Isthmus Engineering & Manufacturing," University of Wisconsin Center for Cooperatives, staff paper no. 9 (October 2011).

social change: education and organization. Education about how the world works—namely through class war, exploitation of workers, big business’s near-total control of national politics, etc.—and organization to take over factories, defend public resources, and so on. Chomsky’s “anti-intellectualism” is refreshing and largely valid. On the other hand, insofar as millions of people do have a sectarian commitment to some particular ideology, it is not merely an intellectual exercise to argue that sectarianism is counterproductive and based on misunderstandings. Doing so can have positive practical consequences. The world needs an ecumenical left, a left that can countenance and integrate all kinds of radicalism, from cooperatives to political parties. Marxists, anarchists, feminists, environmentalists, unionists, anti-racism activists, and other such people ought to understand that they’re basically on the same side and should work together.

I have to admit I’m also interested in theory for its own sake (and for the sake of interpreting history), and accordingly will elaborate on the discussion in chapter four in order to clarify what a twenty-first century Marxism entails. I’ll return briefly to the topic of cooperatives later in the chapter.

Since the publication in 1978 of G.A. Cohen’s *Karl Marx’s Theory of History: A Defence*, the academic school of Analytical Marxism has tried to reconstruct Marx’s theory of history in the light of the Anglo-American philosophical pursuit of logical precision. Debates have erupted over the role that such questionable methods as functional explanation play in Marxism, and the discussions of Marx’s “base/superstructure” metaphor could fill a small library. As is usual with academics, most of this labored intellection has been unnecessary and unproductive. Being an academic, I would, nonetheless, contribute to it myself were this an academic book; instead I’ll make a few suggestions that eschew the obsession with logical precision in favor of old-fashioned commonsense reasoning. After making a couple observations on the base/superstructure metaphor, I’ll confine myself to the theory of revolution.

The imagery of “economic base vs. political, ideological, and cultural superstructure” is woefully imprecise but intuitively reasonable, which is why it still commands attention even after generations of criticism. Its meaning and truth are revealed in the single consideration that the institutions and institutional actors with the greatest access to resources are going to have the greatest influence over society. Fewer resources, less influence. Institutions directly involved in the production and accumulation of resources—of money, capital, and technology—are naturally going to have the most direct access to these resources, i.e., the greatest control over them. The people who control these institutions, then, are going to have more power than other people, and they will seek to make other institutions (and ideas) throughout society “compatible” with their power or subservient to it. Which means making them compatible with the form of organizing relations of production in that society that has the most control over the most resources. In other words, the “dominant mode of production.” In non-prehistoric societies, the class structure and implicit class struggle, which are defined by the relations between antagonistic positions in the mode of production, will therefore be central to social dynamics. The more exploitation of the producing class(es), the more power there will be in the hands of the exploiting class(es), i.e., those who occupy the dominant positions in the dominant mode of production. (Their dominant position is a function of their control over the resources necessary to force others to produce for them.) The exploiters will try to increase exploitation as the exploited try to diminish it. The vicissitudes of this struggle will go far towards explaining other political and cultural phenomena, because the struggle—which is integrally connected to the evolution of the relations of production, of the class structure, of economic institutions, as well as the closely related evolution of the forces of production—largely determines who has how many and what kinds of resources when, what sorts of institutions and values the people with resources will promote, etc.¹

All this is sheer common sense, although its schematic nature demands the sort of elaboration for which I don’t have space here. It leads directly into the theory of revolution, which I’ll consider now. Analytical Marxists have spent decades wringing their hands over the supposed Marxist commitment to functional explanation, which is scientifically incomplete compared to causal explanation. For example, to say that birds have hollow bones because this allows them to fly—which is a functional explanation—is not to give a complete explanation, which requires invoking the causal mechanism Darwin identified of

¹ This paragraph is taken from my *Notes of an Underground Humanist*, 146, 147.

natural selection by random variation. Similarly, Marx's argument that revolution happens when production relations start to fetter the use and development of productive forces gives no causal mechanism to explain why this is the case. As I said earlier, my revision supplies the necessary mechanism, and thus renders all the hand-wringing over functional explanation superfluous. Such explanations are merely shorthand for causal accounts.

On the basis of my arguments, one can translate problematic statements by Marx into statements that are both substantive and possibly true. An example is his hypothesis that "No social order is ever destroyed before all the productive forces for which it is sufficient have been developed, and new superior relations of production never replace older ones before the material conditions for their existence have matured within the framework of the old society." Said in this way, the statement is objectionable. It's functionalist and isn't even entirely meaningful. One can translate it, though, as follows. "The overwhelming mass impetus necessary to effect a revolution in the dominant mode of production will not arise until the latter has nearly exhausted its resources, has reached a point of dysfunction such that it cannot efficiently use or develop productive forces any further; however, there also has to exist an alternative mode of production that has reached such a level of societal influence that it can withstand attempts by the old ruling class to destroy it." In some ways this is quite different from Marx's original statement, but it is both inspired by it and more cogent.

This translation also answers the question that no one has ever satisfactorily answered, namely, why hasn't a truly "post-capitalist" revolution occurred anywhere despite all the problems with capitalism? It isn't hard to think of various superficial reasons, such as that the capitalist class has had enough means of violence at its disposal to crush rebellions. What is needed, though, is a more comprehensive answer that acknowledges that the failure of past revolutions necessitates a substantial correction to orthodox Marxism, which predicted revolution long ago. But what, precisely, has to be corrected?

It turns out the answer is pretty simple: there is not only *one* condition for the success of revolution but *two*. First, capitalism has to be fettering the productive forces such that the majority of people live in poverty relative to the conditions they could be living in if society's productive potential were not so shackled. This is the condition Marx stated. The second condition, to repeat, is that a more rational or socially appropriate set of (*viable*) production relations has to already be spreading and attracting hundreds of millions of people worldwide who understand its superiority to capitalism. If this condition doesn't exist, then it doesn't matter how much "fettering" the old production relations are guilty of; they'll continue to predominate. The ruling class will still be able to maintain its hold on power, because it commands more resources than its relatively impoverished opponents do. In fact, radicals should be resigned to the fact that the capitalist class *will* retain substantial control over society for a long time to come, until capitalism has virtually *no* reserves of power left—as the European feudal aristocracy had virtually none left in the early twentieth century, when its remnants were still frantically trying to maintain their hold on the reins of power. (It took two world wars to destroy all vestiges of feudalism in the West.) Revolution is not a matter of swiftly overthrowing the state, shooting all your opponents, and then organizing a "new society" from the top down.

One might ask if the second condition I've identified will *ever* arrive, given that we're still waiting for it. The answer has to be yes, if only because the unsustainable nature of capitalism has become blindingly obvious. Unless the human species completely destroys itself, which likely isn't possible, a new mode of production will necessarily evolve as the old one succumbs to its contradictions and catastrophic environmental consequences. It's worth remembering, too, that the fact that radicals have been expecting an imminent socialist revolution since the 1840s means precisely nothing—except that they've been wildly over-optimistic and have wildly misunderstood history. Feudalism was around for many centuries; industrial capitalism has been around for barely two, and for less than fifty years in much of the world. It would be nice if history went faster, but, as it happens, it prefers to go very slowly.

Thus, as painful as it is for a Marx-lover to admit this, it's clear that Marx wildly misinterpreted mid-nineteenth century radicalism. It's time we revised our understanding of history and resurrected the idea of "historical necessity." All the popular discontent and rebellions from 1848 to 1871 to 1917 and afterwards were nothing like what Marx thought or would have thought—were not pregnant with historic

potential in the way he hoped: all these battles were fought by heterogeneous masses, some of them, like the craftsmen who felt themselves besieged by this terrifying new thing called industrial capitalism, “reactionary radicals,”¹ and others proletarians in the classic Marxist sense, but whose miseries could have been (and eventually were) effectively meliorated by mere reform. They were not proletarian armies “disciplined, united, and organized by the process of capitalist production”² but disparate masses of the lower classes with disparate interests—some progressive, some reactionary—temporarily thrown together by the sheer chaos of early industrialism. As capitalism matured in the twentieth century, the working class was “disciplined and united” into explicit reformism, and this was both good and inevitable. When reform is possible, revolution is not. Only when broad welfare-statist reform has become impossible is (gradual) revolution possible, because the dispossessed are forced to turn from obvious reformist solutions to less-obvious radical ones.

That is, there is no conflict between reform and revolution. People should always be fighting for reform. Only when it becomes impossible on a large scale does the question of revolution arise.

This idea that “necessity” plays some role in history begs the question: what about the twentieth-century revolutions in Russia, China, Cuba, and so on? What did they “mean”? Were they socialist revolutions, as their leaders claimed? Or merely some form of radical coup? Do they have any implications with regard to the ideas I’ve presented in this book? Such questions are made more important by the fact that these “revolutions”—the Russian in particular—still bewitch many radicals, who mistakenly look back to them for inspiration and strategic lessons. The reality is that they have very little to say to us who live in advanced capitalist societies, and they were certainly nothing like Marxist or socialist revolutions. I’ve discussed the Russian example briefly elsewhere, and I’ll be even briefer here.³

Good scholarly accounts of the Russian Revolution, such as Christopher Read’s *From Tsar to Soviets* (1996) and Orlando Figes’ *A People’s Tragedy* (1996), make several facts abundantly clear. First, the revolution was something of a historical accident. A thousand incidents leading up to the October coup had to go just right in order for Lenin’s wild schemes (considered wild by his associates) to succeed, and if the prime minister Kerensky had shown a little backbone the Bolshevik leadership might have ended up ignominiously imprisoned months before the coup was attempted. And yes, the events of October *were* a coup and not a mass uprising, as any disinterested retrospective observer has to admit. Conspiratorially, secretly, Trotsky, Lenin, and the Military Revolutionary Committee (MRC) of the Petrograd Soviet planned out what would happen on October 24 and the following few days, namely that soldiers loyal to the MRC would occupy the city’s telegraph offices, the railway station, nearby bridges, etc., and then take over the Provisional Government’s headquarters at the Winter Palace. The coup was a swift, decisive series of acts that triggered hardly any fighting and barely disrupted the city’s functioning. In the following weeks and months the Bolsheviks miraculously clung to power, perhaps in part because of Lenin’s immediate moves to establish dictatorial control over the government.

The main reason, of course, that the party was able to stay in power in the subsequent weeks was that, for the moment, it had the support of most soldiers, industrial workers, and peasants. Why? Because Lenin was an astute politician. Since April 1917 he had distanced the Bolshevik party from the unpopular Provisional Government and used very popular slogans to propagandize for his party, in particular “All power to the soviets!”⁴ and “Peace, bread, land!” The vast majority of the population wanted an immediate end to the European war that Russia was mired in; urban workers, many starving, wanted an end to the shortages of food; and peasants wanted *carte blanche* to seize aristocrats’ land. So Lenin spent months

² Marx, quoted in Murray Bookchin, *The Spanish Anarchists: The Heroic Years, 1868–1936* (San Francisco: AK Press, 1998), 281.

³ See *Notes of an Underground Humanist*, chapter two. My paper “Causes of the Russian Revolution” (on www.academia.edu) gives a more detailed summary of the events and commentary on them.

⁴ The soviets were popular, relatively democratic institutions that had sprung up in many cities and towns after the February revolt against the tsar’s rule.

telling them that the Bolsheviks would grant their wishes. Not surprisingly, he became exceedingly popular, such that when his coup occurred most soldiers in the vicinity of Petrograd accepted it.

In the following years, the Bolshevik dictatorship and bureaucracy grew so bloated and inefficient that even Lenin complained about it. Workers' earlier factory takeovers (before and right after the October coup) were reversed as a hierarchy of managers and bosses was reinstalled. Popular uprisings against the Red dictatorship were crushed in the context of civil war and afterwards, as even the Bolsheviks' former supporters grew terribly disillusioned with this "socialist" government that was in many ways more repressive than tsardom. Russia was so devastated by its civil war that in 1921 Lenin deemed it necessary to end forced grain requisitions and partially reverse some of the nationalizations of industry that had taken place since 1918. His New Economic Policy began, the most important achievement of which was to restore market relations to agriculture and thereby stimulate food production. This partial "retreat" to capitalism ended in the late 1920s, when Stalin ordered a return to full nationalization of the economy, organized the collectivization of agriculture, and began his Five-Year Plans to industrialize the Soviet Union. The Stalinist bureaucracy proceeded to liquidate millions of people and effectively enslave the rest for the sake of developing the USSR's industry and military. This situation lasted until the country's collapse in 1991 (though things did improve after Stalin's death).

Now, does any of this seem like workers' democratic control of the economy? That's what socialism means, after all. Does a secretly planned coup in a backward, semi-feudal country eighty percent full of peasants seem like a mass working-class revolution in an advanced capitalist country? The historical meaning of the so-called Russian Revolution is no mystery. In the late nineteenth and early twentieth centuries (before the Bolsheviks took over) Russia was undergoing the transition that some Western European states had already experienced, from being a late-feudal country with an absolutist monarchy to being a semi-industrial capitalist country with either a constitutional monarchy or some other form of representative government. Unfortunately, Nicholas II was a desperately incompetent ruler reminiscent of France's Louis XVI, not least in being utterly resistant to even minor democratic reforms that the population was clamoring for. Combined with the unstable state of Europe at the time, riven by imperialism, nationalism, racism, and an international arms race—all of which led to the height of "instability," World War I—this fact of the tsar's incompetence made it likely that Russia's decades-long "bourgeois revolution" would go off the rails sooner or later. It finally did, in the context of a world war that exacerbated the population's grievances. A new elite with good intentions took advantage of mass discontent to seize power—and used it to establish a much more vicious kind of state capitalism than existed in the West. Classic historical irony.

The point is that none of this was revolution, at least not in the Marxian sense. The same is true of the Chinese case and others. All these signified nothing but transitions to a mature capitalism that got waylaid for a few decades and ended up in an (inevitable) return to paradigmatic capitalism by the 1990s or 2000s. The only lessons they hold for us are in how *not* to do things.

The Russian case had another pernicious consequence: it cemented the idea in the minds of many Marxists that the way to make a revolution is to seize the national state and then remake society. This is exactly the opposite of the proper path, and the opposite of what Marxism (despite Marx) prescribes. In chapter four I explained the reasoning behind my revision, or rather purification, of Marxism, showing how it follows from a simple conceptual alteration and dramatically changes the thrust of the theory of revolution. I'll recapitulate that argument now before considering how it bears on the old, and rather tired, debate between Marxism and anarchism.¹

To frame the conflict that leads to revolution as between two sets of production relations rather than between one set and the productive forces it shackles (as Marx does) has other advantages besides making the theory more meaningful, supplying causal mechanisms that answer academic complaints about functional explanation, and answering the question of why revolution hasn't happened yet. It also gives the

¹ A good introduction to anarchism is Daniel Guérin's *Anarchism: From Theory to Practice* (New York: Monthly Review Press, 1970). His *No Gods, No Masters: An Anthology of Anarchism* (San Francisco: AK Press, 1998) is a panorama of the original writings.

theory a grassroots, democratic emphasis, since the new set of production relations—which, in the context of the transition out of capitalism, are necessarily “cooperative” as opposed to antagonistic—cannot but emerge gradually from the energies of “ordinary people.” In the case of the post-capitalist transition, they emerge from ordinary people’s efforts to adapt to a world in crisis, efforts that take the form of creating cooperatives of all kinds, joining movements for public banking and municipal enterprise, pressing for nationalization of key industries, joining radical political parties with agendas to confiscate wealth, agitating for comprehensive participatory budgeting, taking over factories and making them worker cooperatives, demanding improved and cheaper public resources, and forcing expansion of the social and solidarity economy. Eventually, perhaps, one can talk about taking over the national state (in whatever form it may exist), but not until the corporate capitalist class has been enormously weakened by crisis and all the democratic initiatives that have accumulated over decades.

It’s obvious how these arguments bear on the “Marxism vs. anarchism” issue: they bring Marxism closer to anarchism, by jettisoning the (implicit) statism of most orthodox Marxists and Leninists. In fact, I’ve argued that the essence of Marxism always was anarchist in this way, since the idea of a national state organizing a radically new economy—abolishing class structures, ending authoritarian hierarchies, eliminating the exploitation of workers and an elite’s appropriation of the surplus they produce—is both a thoroughly “un-dialectical” notion and inexplicable in Marxian terms. Historical actors almost never understand the broad significance of their acts or succeed in their designs as they interpret them (a Marxian apothegm ironically borne out by the Bolsheviks’ total misunderstanding of what they were doing, thinking they were establishing socialism or leading a working-class revolution when they were really, in effect, just opportunistic political adventurers who founded a regime that magnified some of the worst aspects of capitalism). History is always an agonizingly slow and unconscious process; one cannot sit in the driver’s seat, so to speak, look at a map, and direct it where to go. If one tries, as Lenin did, one will find that History in fact is still in control and has another destination in mind.

Even the old Marxist strategy of forming workers’ parties and entering the electoral arena—which is something that anarchists have traditionally been hostile to, since they regard politics and the state as an evil—is not especially “Marxist,” though it is realistic and can produce gains for the working class. Its un-Marxist element is that such parties can, and historically have, become integrated into the dominant political and economic order, so that their radical edge is dulled and the essential antagonism between labor and capital is blurred. They can end up functioning as props for the stability of the system they were originally created to overthrow. This was the fate, for example, of the German Social-Democratic Party, which already by the time of World War I had shed much of its former radicalism. (It supported Germany in the war, a nationalist position anathema to many Marxists of the time.) Later, European Communist parties followed a similar trajectory.

On top of this, there is the tendency for party activity to degenerate into the “parliamentary cretinism” that Marx and Engels loathed, “a disorder which penetrates its unfortunate victims with the solemn conviction that the whole world, its history and future, are governed and determined by a majority of votes in that particular representative body which has the honor to count them among its members, and that all and everything going on outside the walls of their house...is nothing compared with the incommensurable events hinging upon the important question, whatever it may be, just at that moment occupying the attention of their honorable house.”¹ In general, the real conditions and struggles of the working class can be forgotten or neglected by an insular party elite seduced by power or its illusion.

If there is nothing essentially Marxist about forming political parties, so there is nothing *un*-Marxist about the favored anarchist tactic of “direct action.” Marx himself and most of his followers have consistently engaged in and supported direct action of all kinds, including strikes, sit-ins, armed insurrections, and every manifestation of civil disobedience. Indeed, insofar as direct action highlights antagonistic and asymmetric power relations, striking at the fulcrum of society in the economic sphere or demonstrating that the rule of the powerful rests on pure violence, it emerges straight from the logic of Marxism. Here too, then, anarchism and Marxism are one.

¹ Friedrich Engels, *Revolution and Counter-Revolution in Germany* (1852), chapter 15.

If my revision of Marx's conception of revolution is justified, it follows that the ideas bearing his name have much more in common with anarcho-syndicalism than Leninist vanguardism, elitism, and statism. Anarcho-syndicalism is committed to the task of building the new society within the old, according to its understanding that "every new social structure makes organs for itself in the body of the old organism," as Rudolf Rocker writes. "Without this preliminary any social evolution is unthinkable. Even revolutions can only develop and mature the germs which already exist and have made their way into the consciousness of men; they cannot themselves create these germs or generate new worlds out of nothing."¹ This statement seems like common sense, but, judging by the writings and practice of a number of Marxists, it is either beyond them or they don't understand its implications. The institutions around which anarcho-syndicalists hope to construct a new society are trade unions and labor councils—organized in federations and possessing somewhat different functions than they have in capitalist society—but whatever one thinks of these specific institutions as germs of the future, one can agree with the basic premise of prefigurative politics (or economics). And it is this that is, or should be seen as, quintessentially Marxist. The new society will necessarily be erected on the basis of new production relations, and these will necessarily emerge through generations of popular struggle in the framework of a dying corporate capitalism.

In addition, the "economism" of anarcho-syndicalism that Gramsci so deplored is of course reminiscent of Marxism's materialism and economism. Both schools of thought privilege economics over politics and culture, focusing on economic struggles and such tools of working-class agency as trade unions and labor councils. For both, the class struggle is paramount. For both, workers' self-organization is the means to triumph over capitalism. James P. Cannon has a telling remark in the context of a discussion of the anarcho-syndicalist IWW: "The IWW borrowed something from Marxism; quite a bit, in fact. Its two principal weapons—the doctrine of the class struggle and the idea that the workers must accomplish their own emancipation through their own organized power—came from this mighty arsenal."² The very life and work of Marx evince an unshakeable commitment to the idea of working-class initiative, "self-activity" (*Selbsttätigkeit*), self-organization (with the assistance of dedicated organizers, a qualification accepted by every leftist worthy of the name). The word "self-activity" evolved into the even more anarchist concept of "spontaneity" under the pen of Marx's disciple Rosa Luxemburg, who devoted herself to elaborating and acting on the Marxist belief in workers' dignity, rationality, and creativity.

For instance, in her pamphlet "Marxism vs. Leninism" Luxemburg inveighs against the "military ultra-centralism" in party organization that Lenin advocates, counterposing it to the spontaneity and vitality of a living revolutionary movement organically connected to the working masses. Her concluding sentence even harkens to Kant, the philosopher *par excellence* of human freedom and dignity: "Historically, the errors committed by a truly revolutionary movement are infinitely more fruitful than the infallibility of the cleverest Central Committee."³ (Compare the quotation from Kant in chapter two of this book.) "The working class," she declares, "demands the right to make its mistakes and learn in the dialectic of history." Left-Marxism, i.e., true Marxism, thus merges with anarchism, the only remaining task being to scrap the impurity of "a dictatorship of the proletariat"—which simultaneously updates Marxism for the twenty-first century and provides a theoretical framework to interpret the new and growing alternative economy, including worker cooperatives.

To give due credit to history, however, we should remember that the old statist formulations favored by a broad swath of radicals were a product of their time and appropriate to it. They were fantasies that never could have been realized, but, given their historical context, they were powerfully appealing and may even have seemed plausible. The nation-state was still in the ascendant—a fact that many Marxists would have denied, believing on the contrary that states had entered their terminal phase already in the early twentieth century. But Marxists' overwhelming commitment to state action—"everything for the sake of

taking over the state as soon as possible!”—itself belied their hopes, for it grew unconsciously out of the social environment of capitalist governments consolidating their rule, expanding their bureaucracies, regulating behavior ever more intensively, reaching ever further into society’s nooks and crannies to take control, growing more aggressive in every respect. It was perfectly reasonable in this context to think that revolution necessitated seizure of the state apparatus and manipulation of it or “smashing” of it for one’s own purposes. And the anarchist notion that political activity was unnecessary, that revolution could proceed automatically from a general strike or a succession of them that would bring the state to its knees, was utterly utopian. As if other states wouldn’t immediately send in their armies to crush the workers if things got really serious!

While governments therefore had to be reckoned with—“seized”—because of their vitality, they were not yet the unimaginably hypertrophied entities they became later and are today. Today, it’s just idiotic to think “the working class” can take over a national government; a hundred or more years ago, it wasn’t quite so idiotic. Especially considering the vibrancy of labor movements then, the radical consciousness and militancy of a sizable proportion of the working class, the wide spectrum of political parties, and the tumult of a civilization experiencing transformations unique in history, it was surely easy to believe, if one wanted to, that successive conquests of national governments were possible. In retrospect we can see how *impossible* that was, and maybe intelligent people should have known better; but the combination of moral outrage and frenzied hope has ambiguous cognitive consequences. Certainly when reading radical tracts of the time, one gets swept up in the emotion and the compelling logic and is almost astounded that revolution *didn’t* happen. But then in the cold light of reason one remembers that history is slow, and that ideologies and intellectual self-interpretations are never scientifically accurate.

Anarchists and Marxists had one conviction in common (aside from their shared moral critique of capitalism and vision of an ideal society): they both thought that a revolutionary *rupture* was possible and desirable. They had a millennial faith in the coming of a redemptive moment that would, so to speak, wash away humanity’s sins. By concerted action, the working class would with one fell blow, or a series of blows, overturn capitalist relations and establish socialist ones. This is the basic utopian mistake that Marxism (if purified) can prove wrong but anarchism cannot, because it doesn’t have the theoretical equipment to do so. Even anarcho-syndicalists, despite their verbal recognition that the seeds of the new society had to be planted in the old, shared the utopian belief in a possible historical rupture, not understanding that the only feasible way to realize their “prefigurative politics” was to build up a new mode or modes of production over generations in the womb of the old regime.

Since this was historically impossible eighty or a hundred years ago, when the capitalist nation-state was waxing in power, it would have struck revolutionaries as much more unreasonable and utopian than the hope for a sudden social upheaval. It made some sense then to adopt the Marxist attitude of contempt for worker cooperatives and other such “interstitial” endeavors as being distractions from real revolutionary work. As the capitalist state and civil society continue disintegrating in the coming decades, that attitude will no longer make historical sense. The arguments I’ve put forward in this book will seem merely truistic. The necessity for a wide range of revolutionary strategies, from interstitial to politically confrontational, will be obvious—for the interstitial will be the seeds that will have to be guarded and supported by the politically confrontational, which itself will be increasingly reliant on the interstitial for access to resources and a base of support.

—History is kind enough to offer its own, correct, solutions to old problems. Hegel was right about this. The truth appears when the moment is ripe.

In the end, doctrinal points about Marxism and anarchism are not as important as the single overriding imperative that anarchists, Marxists, and other radicals have too often violated: *work together*, don’t consume oneself and each other in sectarian squabbles. Strict adherence to points of principle is sterile and counterproductive. David Graeber probably thinks he is espousing a magnanimous position when he says that anarchists ought to be “willing to work in broad coalitions as long as they work on horizontal principles,” but even this seems inadmissibly sectarian.¹ Surely it’s conceivable that coalitions not

¹ David Graeber, *The Democracy Project: A History, A Crisis, A Movement* (New York: Spiegel & Grau, 2013), 89.

organized on anarchist principles can do valuable work. Hierarchy, even in a moderate form, may be a violation of human dignity, but the world is in such a state that activists should be prepared to tolerate hierarchy for the sake of getting things done. Likewise, it's ridiculous for Leninists, or anyone, to refuse to work with anarchists, or to refuse to support worker cooperativism. It should be common sense that the transition to a new civilization will happen on multiple axes.

For the sake of clarity, though, I do think it would be useful for leftists to abandon their typically voluntaristic conceptualization of radical change. It's an attitude strikingly common among every group from centrist liberals to Leninists to anarchists. Given the balance of forces, it's natural for activists to interpret their task as that of battling overwhelming tendencies, of pushing back against reactionary entities with exponentially more power and resources than the left and its popular constituency have. One of the problems with such an attitude, at least in the context of hope for systemic change, is that it sets one up for disappointment: historical movements on the colossal scale of neoliberalism cannot be halted in their tracks or reversed by some counter-organizing among trade unions and their allies. That simply isn't how history works, nor does the democratic resistance have anything remotely comparable to the resources of the global corporate elite. In particular, it is hopelessly benighted to think (as, for example, the editors of *Jacobin* apparently do) that a revival of the centralized welfare state is possible.¹ That social formation was appropriate to a time of industrial unionism and limited international mobility of capital; it has been dying for forty years (starting in the U.S. and U.K.), and no such magical incantation as "We propose a new anti-austerity coalition" can call it back to life. Coalitions of that sort are desperately needed, and their targets should be at every level of government, but their outcome will not be a new manifestation of twentieth-century social democracy.

The proper way for a radical to conceive of his activism is in terms of the *speeding up* of current historical trends, not their interruption or reversal. Systemic trends have never been reversed, and cannot be. What radicals are doing now, and should be doing, is to contribute to the (self-)undermining of corporate capitalism and construction of an alternative. This self-undermining is the trend we are witnessing, which coincides with the trend to carry capitalism to its most pathological extremes. Just as the earlier liberal phase of capitalism's history eventuated in the Great Depression and *had* to come to such an end—this was its natural endpoint, even its *telos*, so to speak²—so the current neoliberal phase cannot but end in a virtual disintegration of the nation-state, its social fabric, and its political economy. That is the historical "meaning" and "mission" of neoliberalism, its essence, its "secret," as Marx might have said.³ One should understand this and interpret one's activism accordingly.

Again, most leftists don't like to admit that things have to get worse before they get better, preferring the liberal's optimistic faith that if only we got our act together and *willed* a system-wide change for the better—perhaps a return to the welfare state—it could happen. No acute social crisis is necessary, only determination and competence. This elevation of will above objective social conditions and possibilities, aside from being the opposite of Marxism, is reminiscent of Lenin, who evidently thought a revolution could emanate from the will of one or two men (if they organized a coup and so on). One might even agree with what Orlando Figes says in the following comments:

All the main components of Lenin's doctrine—the stress on the need for a disciplined revolutionary vanguard; the belief that action (the "subjective factor") could alter the objective course of history (and in particular that seizure of the state apparatus

¹ Peter Frase and Bhaskar Sunkara, "The Welfare State of America."

² See, e.g., Richard Du Boff, *Accumulation and Power*, 91: "What had really happened between 1929 and 1933 is that the institutions of nineteenth-century free market growth broke down, beyond repair. Had the chain of circumstances been 'right,' it could have occurred in 1920-21 or possibly 1907." Some academics like to mock Marx for his "teleological" conceptions, as if invoking that term constitutes an argument. This lazy mode of pseudo-argumentation, which simply assumes that anything hinting of teleology must therefore be wrong, is a legacy of the shallow positivism that has guided mainstream social science for too long.

³ Jonathan Sperber, *Karl Marx*, 404-407.

could bring about a social revolution); his defense of Jacobin methods of dictatorship; his contempt for liberals and democrats (and indeed for socialists who compromised with them)—all these stemmed not so much from Marx as from the Russian revolutionary tradition. Lenin used the ideas of Chernyshevsky, Nechaev, [etc.]....to inject a distinctly Russian dose of conspiratorial politics into a Marxist dialectic that would otherwise have remained passive—content to wait for the revolution to mature through the development of objective conditions rather than eager to bring it about through political action. It was not Marxism that made Lenin a revolutionary but Lenin who made Marxism revolutionary.¹

While Marx himself, being a man of action, was occasionally susceptible to this “Leninist” way of thinking, the logic of his system does demand that one “wait” (though not passively) for conditions to mature rather than believe that skilled propagandizing, political maneuvering, and coalition-building alone can get the job done. Thus, just as the mature welfare state couldn’t happen until things got worse—as they did with the Great Depression and World War II—so a transcending of capitalism can’t happen until things get much worse than they are now. It is this that will force people to come together, as it did eighty years ago, to effectually demand systemic changes.

Given that the centralized welfare state is becoming structurally untenable,² what will necessarily evolve is an alternative economy. Exactly how this cooperative economy will interact with a decaying capitalism is impossible to predict—although it is already so interacting in places all over the world. Particularly in the early stages of the process, before they have established a myriad of supporting institutions, cooperatives and other anti-capitalist organizations will have to compromise some of their principles in order to compete successfully and survive in a hostile political and economic environment. But as the networks accumulate capital and experience, as well as grudging support from political and economic elites—as happened, too, during the transition from feudalism to capitalism (with regard to absolutism’s support for capitalist industry)—they will acquire such power that they undermine the foundations of the current society. The world-order will come to consist of a mix of cooperative and competitive social relations such that it is no longer clear what is the “dominant” mode of production. Eventually this will change; cooperativism will continue “snowballing,” propelled by its own momentum, as capitalism was in an earlier era. Just as worker co-ops’ current rarity reinforces itself, so will their future growth reinforce itself. Throughout this history the nation-state will be declining, in part because many of its functions will be taken over by other institutions. Whatever counterattacks there are from the elite will not be able to stop these processes; capitalism will have lost any competitive advantages over cooperativism, because the latter’s efficiencies, which were in some ways ill-suited to a competitive, atomistic, profit-driven society, will finally be irresistible. It seems likely that even at the end of this process there will remain a role for the market and the price-mechanism—and even, in a minor capacity, for wage-labor, which will probably never be completely abolished everywhere in the world³—but precisely what that role will be is, again, impossible to say.

Prophecies are not necessary, however. What is necessary is only to embrace and institutionalize the attitude of people like Armando Robles and his fellow workers, Brendan Martin, Leah Fried, and the whole grassroots vanguard of the revolution. Militant action is what will birth a new world; abstract intellection, such as this book contains, will not. We need only remember the old truth, “The people united will never be defeated!” That is the pith of the Left’s accumulated wisdom, and the guide to action.

¹ Orlando Figes, *A People’s Tragedy: The Russian Revolution, 1891-1924* (New York: Penguin, 1998), 145, 146.

² See Takis Fotopoulos, *Towards an Inclusive Democracy: The Crisis of the Growth Economy and the Need for a New Liberatory Project* (London: Cassell, 1997).

³ The world is a complex place, and different modes of production will always coexist. The capital/wage-labor relation will probably constitute for centuries a more-or-less large part of the world economy. But will it still be the *dominant* mode of production, the one that determines the dynamics of the whole system? There are good reasons to think the answer is no.

So many implications flow from a simple revision to the Marxist theory of revolution!

It's stunning that Marxists before me either didn't think of or didn't appreciate the importance of the revision I've made to the theory of revolution. For example, it renders moot all the arguments put forward by E. O. Wright and others—even in his latest book he's still rehashing the arguments (in his bland, bloodless academese)—about how the middle classes won't support a revolution because the mere *hope* for something better isn't enough to motivate them to risk everything. Okay, fine, maybe that's true. But it's irrelevant with regard to the scenario I've sketched.

Parts of *The Rosa Luxemburg Reader*, edited by Peter Hudis and Kevin Anderson. I'm ashamed to say I've never read Luxemburg.

The coming decades may well be the most cataclysmic in history.

Raymond Williams' *Marxism and Literature* (1977). Words like 'culture,' 'society' and 'economy': from original meanings of immediacy (centuries ago) to great abstractions now. Reification of language as society becomes more dynamic and interconnected. Reification of how one sees the world and talks about it.

Williams isn't a rigorous or lucid thinker, but his heart is in the right place: analyze the *material practices* that produce culture. He insists on the material production of ideology, entertainment, politics, art, culture. He's right that the base/superstructure opposition can be, ironically, a hindrance to a proper Marxist analysis of culture. *Material processes* rather than "abstract totalizations" or fixed generalities like "ideology" and "political superstructure" are what count. "It is the reduction of the social to fixed forms that remains the basic error" in analysis (129).

It's interesting to think of the media, as in the "mainstream media," as being the *media* of something, the medium through which something happens. Mediation. Mediation between the individual and society? Between the individual and the state? The media are the medium in which society becomes conscious of itself? In which ideologies are produced? In which people *live*? Through which a class maintains its hegemony? The media are a mediation of society.

The chapter on hegemony and the following ones are much better than the first half of the book. Make me think.

For a long time I've wondered why mass consciousness so often lags behind social being. Ideologies from an earlier era hang on until they're quite anachronistic. Williams has some good ideas on this. I like his concepts of the residual, the dominant, and the emergent. The dominant tends to be that on which the rule of the upper classes rests. The practices, habits, expectations, internalizations, "shaping perceptions of ourselves and the world," which, in being shaped primarily by the (practices embodied in and extending from the) dominant mode of production, serve to uphold the rule of the dominant class(es). In other words, it's basically the hegemonic. The residual has been formed in the past "but is still active in the cultural process, not only and often not at all as an element of the past, but as an effective element of the present."

Thus certain experiences, meanings, and values which cannot be expressed or substantially verified in terms of the dominant culture, are nevertheless lived and practiced on the basis of the residue—cultural as well as social—of some previous social and cultural institution or formation. It is crucial to distinguish this aspect of the residual, which may have an alternative or even oppositional relation to the dominant culture, from that active manifestation of the residual...which has been wholly or largely incorporated into the dominant culture.

For example, organized religion is mostly residual, but it has both "alternative and oppositional" elements and "a larger body of incorporated meanings and values," which in practice are compatible with and may even be used to legitimize the dominant order. Through "reinterpretation, dilution, projection,

discriminating inclusion and exclusion,” much of the residual is made compatible with the dominant culture.

Anyway, Williams suggests that “those meanings and values which were created in actual societies and actual situations of the past...still seem to have significance because they represent areas of human experience, aspiration, and achievement which the dominant culture neglects, undervalues, opposes, represses, or even cannot recognize.” This is obviously true. Examples are easy to think of. No dominant culture in itself is going to provide a palliative for every yearning, every doubt, every source of conflict to which humans are susceptible. Indeed, it necessarily “excludes the full range of human practice.” What it excludes “may be seen as the personal or the private, or the natural or even the metaphysical.” Hence, for certain purposes people will have to turn to either residual or “emergent” practices. The former, though, have an advantage over the latter (I think) in that they’ve already been consolidated for centuries. They already exist, whereas the emergent has to be birthed laboriously. And since it is oppositional or alternative vis-à-vis the dominant culture, it will often be actively suppressed. (Or it may be incorporated—and diluted in the process—as happened with the radical popular press in 19th-century England, as well as working-class lifestyles in general during the past couple of centuries, which have been incorporated into journalism, advertising and commercial entertainment. Or think of rap, which started out as oppositional and has been incorporated into the dominant order.)

It seems to me that with respect to *any* power-structure, the “emergent” (or pre-emergent) can come into play and be either suppressed or incorporated. For example, [a famous Marxist intellectual who read chapter 4 of my thesis and was skeptical] is part of an academic power-structure, so he has an interest in suppressing new ideas or in denying “originality” to people outside the power-structure who challenge his own ideas and his self-identity as an authoritative, original, *correct* thinker. People within the power-structure who challenge him are at least his “equals,” so he has to take them seriously; and moreover, chances are that they approach issues in the same way he does, they share his assumptions about the proper way to do “scholarship,” they shy away from “overreaching” or having the gall to seem excessively original, “tactlessly” original, *too* challenging, etc. But people outside the power-structure, or new to it, who pose challenges to it can be brushed aside as unimportant, with the effect that potentially “emergent” practices or ideas are stifled, and the power-structure reproduces itself in relatively unaltered form. The interests of the individual thus coincide with the interests of the structure.

Williams’ concept of “structures of feeling”—in fact, the emphasis throughout his book on the phenomenology of culture—has a lot in common with what I meant by “objective spirit” in the first short paper I wrote on John Brown. “Structure of feeling” isn’t a particularly original concept, though it has been treated as such by academics because it was formulated by one of their own.

I like his semi-reconceptualization of art. Not a spiritual, ideal, “higher” sort of thing, but ineluctably material practices, craftsmanship, manual work, techniques of production, saturated with materiality and implicit social relationships, power-relations, class structures. The romantic idealistic ideology of art was a reaction to the material monstrosities of the Industrial Revolution, the commodification of art, the degrading of culture. Think also of the ideology of genius, of inspiration, the divine expressing itself through the artist. It ties into the aristocracy’s reaction against industrial capitalism, commercialism, the bourgeois order, seeing itself as the guardian of all that is beautiful in life, of aesthetic pursuits as against the lust for filthy lucre. In this sense the idealization of art is somewhat residual even though it didn’t fully exist prior to the eighteenth century. It’s a transformed residue of aristocratic ideologies, the celebration of leisure and autonomous self-expression. As the aristocracy melted away or blew itself up in the twentieth century, this romantic ideology became untenable. What you had then was modernism and postmodernism. The death of the author, all that. (Death of individuality, autonomy, an “aristocratic” haven from the herd.) The hegemony of mass culture and commercialism, and the despair of art. Hence Andy Warhol and the like.

The “productive process” of writing and of reading. Material production. “Notations [in writing] of order, arrangement, and the mutual relationship of parts; notations of pause, of break, of transition; notations of emphasis: all these can be said to control, but are better described as ways of realizing, the process of the specific productive relationship that is at once, in its character as notation, a way of writing

and a way of reading.” The emphasis on writing and art as material production can be taken too far, but it’s a corrective to idealism. Williams is surely right, though, that a work of art is in a sense a social relationship, between the creator and the perceiver. Each of its many elements involves a relationship between at least two parties, and the way these elements are understood and constructed depends on the social position of the parties. “Every communicative element is a social process which...becomes a social product.”

“What is at issue in form is the activation of specific relations, between men and men and between men and things.” Suggestive. Epic, drama, novel, lyric, romance...

On the whole, however, I think literary theory tends toward masturbation.

For the last couple of hours I watched videos on YouTube of Mailer, Buckley, Martin Amis, Hitchens and such characters. It was almost an unreal experience. These people and evidently their circles were/are not ordinary, in the worst possible way. I was watching degenerates, narcissists, poseurs, boors, and bores. No doubt brilliant in their own diseased way. But I couldn’t help thinking I was in the electronic presence of personified decadence. Hitchens of course is the embodiment of sleaze, his whole being *icky*, *greasy*, *slimy*. Those are the adjectives that come immediately to mind when I look at him. The perfect emblem of this group of people, this whole literary cocktail-party subculture, would be a picture of Hitchens’ face in the midst of an attempted smile. A grotesque, false image. Pop culture meets pretentious intellectualism meets Roman homosexual orgies.

...The essence is simple: with those people, as with most pop culture, I can feel myself being lowered—to the particular. With Chomsky, as with classical music, I can feel myself being elevated—to the universal. It is pollution versus cleanliness. Shiny pollution versus radiant cleanliness.

It seems to me that “structural” explanations partially break down in revolutionary situations. Individual leaders and the humanity of the masses then become decisive. Of course, invoking structures and systemic dynamics always provides only an approximate explanation anyway, since, as I said above, the world is not a closed theoretical system.

Naomi Klein’s *The Shock Doctrine: The Rise of Disaster Capitalism* (2007). Fantastic book. Klein is now one of my “idols.” A great human being. Milton Friedman, on the other hand, was...a criminally stupid man, a crackpot ideological fanatic who probably did more evil in the world than Chomsky has done good. (And that’s very impressive indeed.) Of course not someone to be taken seriously, but nonetheless one of the most dangerous intellectuals of the second half of the twentieth century. It’s almost hard for me to read Klein’s book, I’m so disgusted by Friedman and his band of intellectual thugs at the University of Chicago. No less ideological and impervious to facts than Hitler or Sarah Palin. Fetishists of mathematical models, awesomely naïve about how the world works even as they “pal around with terrorists” like Pinochet, urging them to be even more ruthless than they are by nature and to eliminate (*eliminate*) social spending, impose a flat tax on the population, deregulate business, and privatize everything from education to social security to national parks—in fact, everything, with the exception of the army and the police. The horrors perpetrated by their protégés and friends—not believable. The evil of stupidity.

Friedman represents, among other things, the most vulgar of vulgar economics. He is worse than Frédéric Bastiat.

Paul Bairoch’s *Economics and World History: Myths and Paradoxes* (1993) is an excellent corrective to the simple-minded fantasies of a Milton Friedman.

Ignorance may be blissful, but its consequences are quite the opposite.

On the one hand you have Gandhi: “The movement against war is sound. I pray for its success. But I cannot help the gnawing fear that the movement will fail if it does not touch the root of all evil—human greed.” Ideas we *instinctively* recognize as good, noble, desirable, moral. On the other hand you have Friedman, Ayn Rand, Friedrich Hayek and all the other ideological hacks doing the bidding of big business by defending greed, saying it’s inevitable and good, selfishness makes the world go round, everyone is necessarily greedy and should be. Reducing human life to a cost-benefit analysis, as vulgar and inhuman,

anti-humanist, as the behaviorist ideology of stimulus-and-response. It would be a horrible thing if these deniers of humanity and compassion, creativity, love, solidarity and cooperation, were right. Fortunately they're wrong. The world is not what their ideology implies it is, a dystopia of frenzied individualism. That sort of anti-paradise has been approximated only in Nazi concentration camps and such environments of sub-animal existence. Greed and selfishness—unless the concepts are broadened so much as to be meaningless—are in fact of marginal importance to human life. Ordinarily they're recognized as pathological. They have no place in family life or between friends or lovers. Generosity is infinitely more common on the level of personal relationships than greed and selfishness are. Cooperation and concern for others are universal, except in the perversely structured realms of the economy and politics in “civilized” societies (as opposed to tribal societies). The existence of greed has far more to do with warped social structures than human nature.

But at least Friedman, Hayek and their like were consistent: rather than recoil from repulsive personifications of their ideology like Pinochet and military juntas, they embraced them and facilitated their brutality, advising them, giving them the cover of intellectual respectability. Hayek was very impressed by Pinochet, and Margaret Thatcher became his firm friend. And when the ideology led to worldwide misery, Friedman maintained “the courage of his convictions,” like George W. Bush, and never recanted or modified his position. Doggedly loyal to his vision of greed and selfishness.

...My Facebook status-update today: “The ideological spectrum of politics should be conceptualized not as ‘left’ to ‘right,’ which has a relativistic flavor, but as ‘top’ to ‘bottom,’ which is more in line with the fact that truth, freedom and compassion are fundamentally on the side of the ‘left’ while error, authoritarianism and bigotry belong to the ‘right.’ It’s round-earthers vs. flat-earthers. Do you take the latter seriously?” Dave Melton, my former roommate, is one of my few acquaintances who seems to like my partisan status-updates.

An obvious truth that you’ll never encounter in the mainstream media: “Chicago School economics [is] particularly conducive to corruption. Once you accept that profit and greed as practiced on a mass scale create the greatest possible benefits for any society, pretty much any act of personal enrichment can be justified as a contribution to the great creative cauldron of capitalism, generating wealth and spurring economic growth—even if it’s only for yourself and your colleagues.” Why else do you think neoliberalism is orthodoxy? Because of its truth or intellectual integrity? Ha. Even if it were true or had such integrity, that would have nothing to do with whether it would become “the Washington Consensus.” It is simply the best system of ideas ever devised to justify an elite’s orgiastic indulgence in greed and profit-mongering. ‘The best thing for society is to let big capitalists do whatever they want.’ It’s so shameless and so contrary to common sense that you need the elaborate mathematical fantasies of neoclassical economics to make it remotely plausible, and you need to drum these fantasies into the heads of students in every major university in the world. The students really talented in the art of self-deception and theoretical perversity fused with verbal dexterity and confidence will go on to get jobs at the IMF, the World Bank, the U.S. Treasury, or top universities, so as to fulfill their function of providing a veneer of intellectual respectability for business’s smashing of civil society and democracy all over the world.

When you read accounts in the mainstream media about how this or that measure favored by business will “create jobs,” remember that what’s really being said is it will generate profits. “Jobs” = “profits” in business-speak. Business has no interest in creating jobs, and usually the number of jobs created by its activities is paltry compared to the number that could be created through public spending, which would also direct funds to where they’re needed most.

Chomsky has a nice way of taking us outside our subjective personal outlooks and considering matters from something like an objective viewpoint: he invokes hypothetical Martians surveying our planet from afar. For example, consider Martians encountering Earth for the first time. Think about what they’d see, the super-Gilded-Age inequality within countries and between countries. Millionaires and billionaires riding private jets over Somalian-type poverty and misery; “oligarchs racing around in black Mercedes convoys, guarded by top-of-the-line mercenary soldiers,” as the homeless are curled up in blankets on the street; people in suits hurrying past hungry children in the street; politicians, lawyers, doctors, businessmen living in opulent suburbs as a billion people live in slums. Would these Martians not have the impression

that our world is, at least to a first approximation, divided up between a class of cartoonishly evil power-brokers and a much larger class of the cartoonishly unfortunate poor?

...The more you read, the more you realize that the last 44 U.S. presidents, more or less, have been geniuses at being alternately incompetent and indifferent to the point of “evil,” at least from an “objective” perspective. A few of them, admittedly, have had brief spells of truly effectual moral engagement—aberrations. Off the top of my head I can’t think of any examples in the last forty-five years. (Obama has been a failure. Clinton was an epic failure, from the moral point of view.)

Michael Wolfe: “Conservatives cannot govern well for the same reason that vegetarians cannot prepare a world-class boeuf bourguignon: If you believe that what you are called upon to do [e.g., work in the public sector] is wrong, you are unlikely to do it very well. As a way of governing, conservatism is another name for disaster.”

July

The last few days I spent retyping the journal from my senior year of college and that summer, since I didn’t have it saved anywhere except as a hard copy. Thank God I’ve finished! I’ve matured a lot since those years.

Reading Melvyn Dubofsky’s *Hard Work: The Making of Labor History* (2000).

The amusing thing about many radical feminists is that by being close-minded, dogmatic, somewhat irrational, prone to logical fallacies (especially *ad hominem* and setting up ‘straw man’ opponents), quick to take offense, quick to take everything personally, they manifest stereotypes about women.

I got into a debate on Facebook with a radical postmodernist-feminist fanatic, and ‘destroyed’ her. But where does my satisfaction in ‘winning’ come from? The very words we use in such cases are illuminating: ‘destroy,’ ‘crush,’ ‘demolish,’ ‘pulverize,’ ‘trounce,’ ‘thrash.’ The psychoanalysts had great insights: it all has to do with internalizations, not with objects (subjects) themselves. What I found noxious wasn’t the girl herself but the girl as I had temporarily ‘internalized’ her, the girl as she appeared to me. This ‘image’ in my mind so conflicted with notions integral to my selfhood about how the world is, what’s true and what’s false, the value and truth of my opinions, that I had to ‘destroy’ it, ‘thrash’ it.¹ Only then could I return to a conflict-free state of mind wherein no strong oppositional construct existed to upset my ‘equilibrium.’ –It does have to do with equilibrium too, as Freud might say. Confrontation with an opposed self somehow raises ‘tension’ in my mind, an unsettling energy-level, and I have an unconscious urge to return to the prior, ‘settled’ state. (You might (think you) enjoy vehement debates, but a deeper part of you has an urge to transcend the agitatedness they induce in you—as shown precisely by your vehement attempts to convince your opponent that you’re right. If he acquiesces, then you have succeeded in extirpating the self-opposition in your mind and so return to the prior pleasant state of calmness.)

Been working out at the gym for a few weeks to get ready for Chicago. It’s nice to be mildly beefed-up again, at least relative to what I was a month ago.

By the way, that crazy feminist I debated is not necessarily unintelligent; she studied philosophy at Wellesley and is a Harvard graduate student. But, being a postmodernist and a radical feminist, she hasn’t absorbed philosophy’s strictures against logical fallacies. When I suggested that capitalism was more of a problem for billions of people than the “patriarchy,” she accused me of “mansplaining,” as if that had anything to do with my argument. I observed that this was blatant *ad hominem*; she countered that no it wasn’t because she hadn’t called me an idiot. People always think ‘ad hominem’ means ‘to insult a person,’ when it needn’t have anything to do with that at all. So I gave her a lesson in elementary logic, which she proceeded to ignore. Like all such feminists, virtually all her assertions were saturated with logical fallacies and gratuitous personal attacks. These so-called intellectuals, who think they’re rebelling against

¹ I didn’t destroy the girl herself, after all. So it must be that I destroyed my momentary ‘construct’ of her (as a person who challenged my conceptions).

stereotypes about women, are more stereotypically feminine than even 'ordinary' women are! The latter, after all, are not as petty, *ressentiment*-fueled, and downright irrational as people like Ana Trandafir (my esteemed interlocutor).

Ugh. The leftist who is worse than the conservative.

Now I'm reading *Understanding Power: The Indispensable Chomsky* (2002). The man is a force of nature. Possibly the greatest mind in history, all things considered. (Not necessarily the profoundest, though.) A whole website is required to showcase the book's footnotes [which include long passages from the sources]. I'm trying to read most of them.

It's incredible how few radicals have understood that Leninist elitism is essentially incompatible with the logic of Marxism, and how much more Marxist is Luxemburg's faith in the multitudes. They'll act when they act. When they're ready—when social relations have made them ready. If they have to be *directed* by a centralized party that seizes power for them...first of all, that's not much different from voluntarism—individual leaders having huge significance—which isn't historical materialism. But secondly, the relations involved in an elite's domination and direction of the masses have too much in common with capitalist relations (or relations in a capitalist society) to be revolutionary in any genuine sense. It's basically state capitalism, or state-socialist state capitalism. The very fact that "revolutionary elitism" is necessary and possible at a given time proves that socialist revolution is impossible then. Whatever happens, workers' control will not be instituted, because dispersed power cannot evolve in any direct way from concentrated power. To get workers' control, workers first have to direct themselves in their revolutionary movements—network with each other, etc. This will of necessity be an enormously long process.

One of the reasons I'm hopeful about the future is that big business has been unequivocally in control for over three decades. From Reagan to Obama, or even from Ford to Obama, business has been having a field day. It has been the reign of business—with small steps in a different direction under Obama. Well, thirty-five years is a long time for one phase of a cycle. The reaction has to kick in eventually.

Email to Chomsky, with his responses in bold:

Professor Chomsky,

I share your aversion to pretentious highfalutin theorizing like much postmodernism, etc. But I wonder if your condemnation of certain areas of philosophy is not perhaps a bit too hasty. **[I'm happy to be shown.]** For example, while I don't know what your exact ideas are on the phenomenological method used by old existentialists and many psychoanalysts, I suspect you're dismissive of it because of the periodic obscurity of its results. Of course, much of what Sartre wrote is verbiage. But I think that sometimes "phenomenology" – this sort of 'intuitive,' 'introspective' analysis of consciousness and the 'self' – can lead to real explanations of human behavior – can help people understand why they act as they do. **[I quite agree. I've never hinted otherwise, as far as I can recall.]** R. D. Laing, for instance, used it in occasionally fruitful ways. You often say that in fact we understand very little about human psychology, and from the perspective of 'hard science' I think that's true; but it seems to me that there are significant insights in some of Nietzsche's reflections on *ressentiment*, some of Laing's thoughts in *The Divided Self*, some of what Sartre wrote, etc. It's a different mode of explanation than conventional 'hard science,' but perhaps not wholly illusory. (Indeed, the relation between these two 'modes' of explanation is itself an interesting, and puzzling, topic.) **[I've often pointed out that we learn more about people from serious fiction than from scientific psychology. The same is true of some nonfiction.]**

Maybe a better example of the potential fruitfulness of initially obscure theorizing is Marxian so-called "dialectics." Your disdain for the pretentious word is surely justified,

but, for example, I think Michael Albert has a useful (albeit sloppy and metaphorical) summary of the basic idea in a book from 1974: (a brief excerpt) –

“It is the assertion that real changes are due not to factors outside reality [or a particular ‘system’] and imposed upon it, but to factors within reality from the start and only slightly affected by conditions imposing from without. It is the assertion that history does not change by the effects of some absolute, or in pursuit of some absolute, but rather in accord with its own internal contradictions and their continuously evolving resolutions. **[A good illustration of why I don’t see much point in this pontification. Sometimes factors outside a system have a huge impact on changes within it, e.g., military conquest, but much else as well. Sometimes they don’t. Same with the rest. It’s either misleading, or close to truism.] [...]**”

—It seems to me that, understood this way, "dialectics" can be useful as a way of orienting oneself in sociological investigations and even in revolutionary activism. It leads to a particular, not-empty interpretation of what exactly it is that one is doing. Moreover, I think it's possible to take these Marxian intuitions and flesh them out in more precise, literal ways than most Marxists have done, and thereby reach an abstract 'meta-level' understanding of what one is doing when investigating structures of capitalism or possible historical trajectories of capitalism, etc. For instance, this sort of methodological framework seems presupposed by Marxian political economy, which itself can be quite illuminating, far more so than the neoclassical stuff. **[It can be, and I read it with interest, discarding what seems to be a needless and mostly obscurantist framework.]**

Sorry for the long email. Thanks for reading.

I still think it isn't totally useless to invoke 'dialectical contradictions' and so on, provided that one explain very clearly what that term means—as no one has ever really done—and give plenty of examples. Maybe it's otiose to use the word 'dialectic,' since all you mean is that there are structures etc. with tendencies etc. that conflict etc. and so lead to new tendencies and conflicts etc. But 'dialectic' sort of conveniently sums that up, indicates a 'dynamic-structuralist' approach to society, places the emphasis explicitly on ('holistic') structures, development, instability, conflict. Yes, it may be a virtual truism, but most bourgeois social science ignores it or downplays it, so it isn't a truism to everyone.

By the way, I've decided to change how I use quotation-marks. From now on I'll use inverted commas except when I have in mind a direct quotation. Quotation-marks are too clunky.

Just before MLK received the Nobel Prize in 1964, the FBI sent him an anonymous letter saying that they would release to the media a faked audio recording of him having orgies with prostitutes unless he committed suicide before receiving the Prize. –Not surprising, just illustrative.

Chomsky's remarks on economics and economic history are characteristically brilliant. I'll quote what he says about comparative advantage and "free trade":

The basic assumption of the classical economists was that labor is highly mobile and capital is relatively immobile—that's required, that's crucial to proving all their nice theorems. That was the reason they could say, "If you can't get enough to survive on the labor market, go someplace else"—because you *could* go someplace else: after the native populations of places like the United States and Australia and Tasmania were exterminated or driven away, then yeah, poor Europeans could go someplace else. So in the early nineteenth century, labor was indeed mobile. And back then, capital was indeed *immobile*—first because "capital" primarily meant land, and also because the extent that there was investment, it was very local: like, you didn't have communications systems that allowed for easy transfers of money all around the world, like we do today.

So in the early nineteenth century, the assumption that labor is mobile and capital is immobile was more or less realistic—and on the basis of that assumption, you could try to prove things about comparative advantage and all this stuff you learn in school about Portugal and wine and so on.

Incidentally, if you want to know how well these theorems actually work, just compare Portugal and England after a hundred years of trying them out—growing wine versus industrializing as possible modes of development. But let's put that aside...

Well, by now the assumptions underpinning these theories are not only *false*—they're the *opposite* of the truth. By now labor is *immobile*, through immigration restrictions and so on, and capital is highly *mobile*, primarily because of technological changes. So none of the results work anymore. But you're still taught them, you're still taught the theories exactly as before—even though the reality today is the exact opposite of what was assumed in the early nineteenth century. I mean, if you look at some of the fancier economists, Paul Krugman and so on, they've got all kinds of little tricks here and there to make the results not quite so grotesquely ridiculous as they'd otherwise be. But fundamentally, it all just is pretty ridiculous.

I mean, if capital is mobile and labor is immobile, there's no reason why mobile capital shouldn't seek *absolute* advantage and play one national workforce against another, go wherever the labor is cheapest and thereby drive *everybody's* standard of living down. In fact, that's exactly what we're seeing in NAFTA and all these other international trade agreements which are being instituted right now. Nothing in these abstract economic models actually *works* in the real world. It doesn't matter how many footnotes they put in, or how many ways they tinker around the edges. The whole enterprise is totally rotten at the core: it has no relation to reality anymore—and furthermore, it never did.

He then discusses the real historical record—protectionism in every industrialized country (especially America), etc. Excerpt from an article in *Dollars and Sense*: “In the long run, there are no laissez-faire transitions to modern economic growth. The state has always intervened to create a capitalist class, and then it has to regulate the capitalist class, and then the state has to worry about being taken over by the capitalist class, but the state has always been there. That is what the N.I.C.s [Newly Industrializing Countries] show... Import substitution [through state intervention] is about the only way anybody's ever figured out to industrialize. Increasingly often, the industries that were created by import substitution turn out to be viable... What the extreme deregulators will tell you is that you don't have to go through this stage, but they don't have any cases [to support their claim].”

The *Monthly Review* rejected a shortened version of the fourth chapter of my thesis.

Reading Sweezy and Baran's *Monopoly Capitalism: An Essay on the American Economic and Social Order* (1966).

I remember reading Milton Friedman's article on methodology: he argued that in science, the less realistic the model, the better. A typically simplistic argument. But for a neoclassicist it served the function of making a virtue of necessity, and thus allowing him to continue to believe his theories: since neoclassical economics is the most unrealistic, most idealized, most counterintuitive economic model of all, it's the best! This Friedmaniactal methodology therefore lets economists retort to criticisms regarding the inability of their models to explain what happens in the real world, “That's just because of the messiness and imperfections of reality! It doesn't prove that our *models* are wrong. You policy-makers simply have to make reality conform more closely to our logically beautiful models.” Sure. Make *reality* conform to *models*, rather than making *models* conform to *reality*. To quote Herman Daly, former Senior Economist at the World Bank: “My major concern about my profession today is that our disciplinary preference for logically beautiful results over factually grounded policies has reached such fanatical proportions that we economists have become dangerous to the earth and its inhabitants.”

When translated into policy, the fetish of a *pure idea* always leads to mass suffering. Nazism, Fascism, Communism, radical Islamism, and the Free Market ideology. Nothing is more inhuman than the urge to remake people and society in the image of an ideal model.

...Went to Bristol for two days with Yuja, stayed at my parents' house, went biking, had a grand time. They took quite a shine to her, and she reciprocated. Mom told me I'll probably never find any girl better than her. (Pretty, she said, and funny, personable, cute, talented, we have a lot in common. Just not enough.) It's true that she and Aniela are, on the whole, better people than most I've known—better conversationalists, more easygoing, more reasonable, less 'snobbish,' less fickle, more 'simple' in the best way—and everything *human* is simple. The worst people tend to be the really 'witty,' 'clever' ones—the artificial veneer of civilization—the ones who want to show themselves off, the un-serious ones who want to 'get ahead.' Serious people like Yuja and Aniela, who are fun-loving and good-humored, are sincere, honest and essentially simple (albeit complicated in another way, an *authentically human* way).¹

Baran and Sweezy: monopoly capitalism “tends to generate ever more surplus, yet it fails to provide the consumption and investment outlets required for the absorption of a rising surplus and hence for the smooth working of the system. Since surplus which cannot be absorbed will not be produced, it follows that the *normal* state of the monopoly capitalist economy is stagnation.” (108) The rising ‘unrealized’ surplus (surplus being defined as the difference between what a society produces and the cost of producing it) manifests itself as excess capacity, unemployment, underutilization of existing material and human resources, etc. (But how is an ‘unproduced’ surplus possible? Isn't that a contradiction in terms? It seems that what they're talking about is really the *potential* surplus, the surplus that *could* be produced and absorbed if existing resources were used to their full potential.) To the ordinary citizen, “the economic problem appears to be the very opposite of what the textbooks say it is: not how best to utilize scarce resources but how to dispose of the products of superabundant resources.” Too much supply, not enough demand. Monopoly capitalism is even more contradictory than competitive capitalism, because in the latter the phenomenon of ‘too much’ “described a temporary derangement, not a normal condition... Only under monopoly capitalism does ‘too much’ appear as a pervasive problem affecting everyone at all times.” The supply of labor is too high, the supply of products is too high, profits tend to be excessively high (not enough investment outlets for soaring profits), etc.

According to a Marxian analysis, ‘supply-side economics’ (giving money to businesses rather than consumers and workers), far from curing economic problems, risks *aggravating* stagnation in the real economy. But it became the law of the land anyway because it raises profits, which can be invested in finance rather than the real economy, which therefore stagnates more and more as profits are siphoned away from it. (The reason society hasn't fallen apart from declining demand is that consumer credit [and government debt] has assumed gigantic proportions.) Eventually the contradiction between the stagnating real economy and the booming financial economy becomes so profound that investors finally withdraw their funds even from financial outlets, and a Wall Street collapse occurs. The contradiction can't be ignored forever, after all. But soon the government puts the financial world back on its feet again while doing very little to stimulate the real economy...so the stage is set again for an ever-intensifying contradiction to develop, and then another financial collapse, etc.

...Example of my ‘brilliance’: in a freaking *footnote* in my thesis I reconceptualized the whole base-superstructure metaphor—in a non-metaphorical way—and so accomplished what no other Marxist, to my knowledge, has, despite thousands of pages and many decades devoted to the topic. I just said, “Oh and by the way, here's the answer, you fools. But let me get back to my argument...”

Short summary from J. B. Foster of part of *Monopoly Capital*'s argument:

At the core of *Monopoly Capital* was the thesis that Marx's fundamental “law of the tendency of the rate of profit to fall,” associated with accumulation in the era of free competition, had been replaced, in the more restrictive competitive environment of

¹ [Actually, those compliments are truer of Aniela than of Yuja.]

monopoly capitalism (in which a handful of giant firms tended to control key industries and the economy as a whole), by a law of the tendency of the surplus to rise. The nature of the price mechanism under monopoly capitalism (an argument that went back to Sweezy's earlier theory of the kinked demand curve) meant that capital tended not to adjust to shortfalls in final demand by lowering prices, but generated instead chronic excess capacity, as plants were idled to protect profit margins.

As one analyst has cogently summarized the basic contradiction spelled out by Baran and Sweezy, in the technical language of professional economics:

"The potential surplus (which includes profit, interest, rent, surplus employee compensation, government spending and other wasteful expenditures) rises as productivity growth allows production costs to fall relative to prices. This potential fails to be fully realized, however, since investment spending stagnates when excess productive capacity is not eliminated by margin-squeezing price competition. Thus the existence of monopolistic conditions and so downwardly rigid mark-ups lead to inadequacy of effective demand by weakening the inducement to invest while maintaining the profit share and so restricting the growth of consumption."

[Deleted a description of my thesis defense.]

Another reason to love Chomsky: he stays far away from academic conferences.

Most intellectuals are little more than a set of defense-mechanisms, internalizations of roles, and multidimensional glibness.

[...] I had dinner last night with a good person, not a James Green [the labor historian]: Yuja. And stayed at her place for the night, slept together but without sex. After dinner we sat in her car in the parking lot and she let me know of her depression, her suicidal thoughts, the extreme pressure she's been feeling from her mom to get married and have kids. (Yuja just turned 31.) She's certain her parents are ashamed of her for still being single. Tears as she calmly told me with absolute conviction that she had decided to kill herself at 35 if she still isn't married. I went along with it for a while, figuring that was best; we discussed the best way to kill oneself. Life has become empty for her, she professes to care about nothing—"Nothing matters, we all die anyway, why not at 35 instead of 85?" Nothing gives her joy anymore, not because she's lonely (says she isn't, despite her lack of close friends in Boston) but because of the intolerable pressure to get married and the inability to find someone. The thought of having to go through it all over again now that I'm leaving for Chicago, the meeting people and acting in a charade and not being interested in the boring guys but having to feign interest and not knowing whether if she starts another relationship it'll lead to marriage or nowhere except months of wasted time, absolutely depletes her. The conversation was painful for me; to see her in that state was akin to torture. I gave her advice, did what I could to help, listened sympathetically. Mentioned that a better option at 35 than suicide was a sperm bank, etc. In Bristol I'd given her hours of advice about meeting men, which since then she's followed: has started going out with her coworkers, for example, which she's rarely done in the past. But it's going through the whole shit again that crushes her... Sleeping next to her with her breast in my hand was like nostalgia.

August

I want to get published, and it's easier to do so by writing about empirical stuff than theory. So I'm researching public banking in order to submit an article to *Z Magazine* and others.

If I excerpted from every informative passage in *Understanding Power* I'd rewrite the whole book, but here's something particularly interesting:

...By now, about a trillion dollars a day moves around in international speculative markets—and that has a huge effect on national governments. In fact, by this point, what it means is that the international investing community has virtual veto-power over what any national government can do.

[In America in the 1990s] real wages were going down, growth was very low, production was low—and even the slow growth that's been taking place has been halted at times because the bond market, as they put it, "signaled" that it didn't like the growth. See, financial speculators don't want growth: what they want is stable currencies, meaning *no* growth. In fact, the business press talks very openly now about "the threat of too much growth," "the threat of too much employment": they're perfectly open about all of this, to one another. And the reason for it is, people who speculate against currencies are afraid of inflation—because it decreases the value of their money, so therefore it's a big threat to them. And any kind of growth, any kind of stimulation of the economy, any decline of unemployment all threaten to increase inflation. Well, currency speculators don't like that, so if they see signs of stimulative economic policies or anything that may bring economic growth, they'll just take their capital out of that country's economy—and even a slight withdrawal of that sort can easily trigger a recession in those countries.

So what's happened as a result of all of this is a big drift internationally towards low-growth, low-wage, high-profit economies—because national governments trying to make economic and social policy decisions just have very little leeway to do so by now, or else their economies will be wrecked by capital flight...

[For example, the Wall Street Journal recently reassured its readers that if Clinton tried to initiate a program of social reform, it would immediately be cut off. The reasons are as follows.] The United States is deeply in debt—that was part of the Reagan/Bush program, in fact: to put the country so deeply in debt that there would be virtually no way for the government to pursue programs of social spending anymore. And what "being in debt" really means is that the Treasury Department has sold a ton of securities—bonds and notes and so on—to investors, who then trade them back and forth on the bond market. Well, according to the Wall Street Journal, by now about \$150 billion a day worth of U.S. Treasury securities is traded this way. The article then explained what this means: it means that if the investing community which holds those securities doesn't like any U.S. government policies, it can very quickly sell off just a tiny signal amount of Treasury bonds, and that will have the automatic effect of raising the interest rate, which then will have the further automatic effect of increasing the deficit. Okay, this article calculated that if such a "signal" sufficed to raise the interest rate by 1 percent, it would add \$20 billion to the deficit overnight—meaning if Clinton (say in someone's dream) proposed a \$20 billion social spending program, the international investing community could effectively turn it into a \$40 billion program instantly, just by a signal, and any further moves in that direction would be totally cut off...

Bought a subscription to the *New Left Review*. From an article on Darwinism that criticizes, among others, sociobiologists: "From Wilson onward, the argument is that biological evolution has not been able to keep up with the rate of cultural change. It is this gap that fosters the contradiction of 'Stone Age minds in the 21st century.' [An extremely stupid proposition, of course.] However, the evidence points to the speed with which culture has driven human biological change, from digestive physiology to brain structure. For example, originally, most human adults, like most other adult mammals, had difficulty digesting milk. The enzyme present in infants which makes it possible to digest the milk sugar, lactose, is deactivated as the child matures. However, over the past three thousand years, in societies that domesticated cattle, mutations that permitted lactose tolerance in adults spread. Today most adults in Western societies, as opposed to those in Asia, carry the mutation, and milk products are part of the normal adult diet." Fascinating. I didn't know humans had evolved at all in such a short period of time.

The authors marshal several arguments against sociobiology and evolutionary psychology, one of which is expressed in this sentence: “For Donna Haraway, as for Marx, the scientists’ account of nature reflects and constitutes society and culture [rather than being ‘universal’ or ‘objective’ or just an uncovering of timeless biological truth, as many sociobiologists think].” This Marxian position is sound -- but its apparent logical culmination in the relativism of poststructuralism, postmodernism and the ‘sociology of knowledge’ is not. It’s ironic that a doctrine implicit in Marxism would be explicitly embraced and carried further by postmodernists. But they’re wrong to think that the Marxian insight into the social construction of knowledge implies that there is no such thing as truth. Marx understood, at least implicitly, that the point is to be self-conscious about one’s methodologies, to use a rigorous scientific method, to try to be impartial and prevent the integrity of one’s investigations from being undermined by institutional power-relations. By this means one can progressively formulate better and better doctrines, approach truth ever more closely.

I’m in Chicago. Already I much prefer this city to Boston. Happy years ahead! Right now looking for apartments.

Reading Robert Brenner’s *The Economics of Global Turbulence: The Advanced Capitalist Economies from Long Boom to Long Downturn, 1945–2005*. To quote Chomsky, the book is exceptional.

The reason that the philosophical question ‘Why do I exist here and now rather than at some other place and time?’ is meaningless is that humans, like all things, are nothing but matter. We are thinking matter. If we were a spiritual substance the question would not be meaningless: it would mean ‘Why and how is this soul attached to this particular piece of matter?’ But since we are matter, the question means only ‘Why does this piece of matter exist now and here? -- i.e., why is it *this piece of matter*?’, and that’s just silly. It isn’t a genuine question. And yet the question in the first sentence of this paragraph *seems* meaningful to us. What this fact shows is that *epistemological* dualism is true (although metaphysical dualism is false). We necessarily half-consciously think of ourselves as different from brute matter, in other words not completely reducible to ‘our’ body. (And the fact that we say ‘*our* body,’ or rather ‘*my* body,’ thereby distinguishing ourselves from our bodies, is another indication of our implicit adherence to dualism.)

Something I wrote with the aim of getting published:

Marx’s Theory of Revolution in the Twenty-first Century

[A long essay distilling some of the arguments in the thesis.]

*

Noam Chomsky in a recent interview: “Journalist Chris Hedges is doing research on the New York Times, and a few weeks ago he came across a memo from the managing editor of the New York Times to the writers and columnists, saying that they were not allowed to mention my name. National Public Radio has said in print that I’m the one person who will never be allowed on their primetime news and discussion programme.” Sometimes I wonder how people in the mainstream media manage not to be suicidal out of self-contempt. Obviously a lack of integrity has its advantages.

Among the things I’m reading this semester: John Dittmer, *Local People: The Struggle for Civil Rights in Mississippi*; Richard Evans, *In Defense of History*; Willie Thompson, *Postmodernism and History*; Trevor Burnard, *Mastery, Tyranny, and Desire: Thomas Thistlewood and His Slaves in the Anglo-Jamaican World*; Natalie Zemon Davis, *Trickster Travels: A Sixteenth-Century Muslim Between Worlds*; Joan Wallach Scott, *Gender and the Politics of History*; James Vernon, *Hunger: A Modern History*; Jon Coleman, *Vicious: Wolves and Men in America*; Marcus Rediker, *The Slave Ship: A Human History*; Luise White, *The Comforts of Home: Prostitution in Colonial Nairobi*; Matthew Countryman, *Up South: Civil Rights and Black Power in Philadelphia*; Richard Goodwin, *Remembering America: A Voice from the Sixties*; Godfrey Hodgson, *America in Our Time: From World War II to Nixon -- What Happened and Why*;

Christian Appy, *Working-Class War: American Combat Soldiers and Vietnam*; Fredrik Logevall, *Choosing War: The Last Chance for Peace and the Escalation of War in Vietnam*; Lisa McGirr, *Suburban Warriors: The Origins of the New American Right*; Doug Rossinow, *The Politics of Authenticity: Liberalism, Christianity, and the New Left in America*; Beth Bailey, *Sex in the Heartland*; Jack Greene, *Pursuits of Happiness: The Social Development of Early Modern British Colonies and the Formation of American Culture*; Colin Calloway, *New Worlds For All: Indians, Europeans, and the Remaking of Early America*; Ira Berlin, *Many Thousands Gone: The First Two Centuries of Slavery in North America*; T. H. Breen, *The Marketplace of Revolution: How Consumer Politics Shaped American Independence*; Joanne Freeman, *Affairs of Honor: National Politics in the New Republic*; Daniel Walker Howe, *What Hath God Wrought: The Transformation of America, 1815-1848*; Robert Abzug, *Cosmos Crumbling: American Reform and the Religious Imagination*; Walter Johnson, *Soul by Soul: Life Inside the Antebellum Slave Market*; Eric Foner, *Free Soil, Free Labor, Free Men: The Ideology of the Republican Party Before the Civil War*; Chandra Manning, *What This Cruel War Was Over: Soldiers, Slavery, and the Civil War*. There are also a number of articles and excerpts from books. I can't wait!

September

Living in Logan Square with two frat-boyish but likable guys my age, Mike and Mike.

In one class I have to write a short summary every week of the book we're reading. Here are some of the summaries:

In *Pursuits of Happiness* (1988), Jack Greene contrasts two interpretations of the colonial era of American history, the *declension* model and the *developmental* model. The former is the traditional one; the latter is Greene's own preferred interpretation of most colonial experience. Briefly, according to the declension model England's colonial settlements progressively 'declined' from an initial state of communal wholeness, order, tradition, primitive simplicity, to social complexity, fragmentation, individualism, modernity. In the developmental model, by contrast, settlements began as materialistic, individualistic, socially 'thin' or 'attenuated,' overtly profit-driven, secular, and over decades became more cohesive, coherent, socially 'thick,' metropolitan, complex, permanent. Greene admits that the declension model is partly applicable to New England's history, but he argues that New England, with its puritan origins, was exceptional; the Chesapeake, the mid-Atlantic colonies, the southern continental and Caribbean colonies, and Ireland followed the path of the developmental model. Most of the book is devoted to supporting this argument with empirical analysis.

Stated another way, Greene is trying to unseat New England from its privileged place in scholarship and the popular imagination as the main symbol and determinant of future American culture. Far from being 'normative,' New England's experience was unique. The colony was founded by people who had a millennial vision of establishing 'a city upon a hill,' of founding a true Christian commonwealth as a model for the rest of Christendom. They saw themselves as God's chosen people; they rejected contemporary English civilization in favor of a traditional, highly regulated social order, "with strong patriarchal families, elaborate kinship networks, and visible and authoritative leaders" (27). In a sense, they were self-conscious primitivists, and the society they created was not as similar to old England as has often been thought. But its original 'utopian' conditions gradually succumbed to centrifugal forces that, from the viewpoint of traditionalists, threatened to tear the social fabric apart. Most other colonies, on the other hand, developed in much the same direction that England developed in the seventeenth and eighteenth centuries, namely from a 'centrifugal' state of outright conflict, polarization, undisguised brutal exploitation, crude materialism and commercialism, individualism, toward the 'centripetal' state of a thickly articulated social structure, a 'civilized' organic unity between social classes. In the Chesapeake, for example, early super-profits realized through the cultivation of tobacco entailed extreme exploitation of white and black labor; as the profits declined, so did social polarization. Similarly, the decreasing incidence of disease and death over the course of the seventeenth century, as well as the equalization of the ratio between the sexes, led to

demographic growth, which made possible a more complex and cohesive social structure. In New England, such growth led to a *less* cohesive social structure because the original society had been astonishingly conflict-free, communal and closely regulated. The typical colonial pattern was the Chesapeake's, not New England's.

It is true that America's later celebration of itself as an exceptional nation destined for greatness has much in common with New England's original theological self-conception and might seem to be an outgrowth of it, but Greene notes that this later myth of American greatness was mainly secular, revolving around the notions of freedom, the pursuit of happiness, and Americans' high material well-being. It is really only in the nineteenth century, with industrialization and the discrediting of slavery, that New England's influence decisively increased in relation to the South's.

Colin Calloway's book *New Worlds For All* (1997) is a concise summary of the ways in which Native Americans and European settlers influenced each other in the colonial period of American history. Each chapter is devoted to a particular sort of cultural interaction, such as religion, medicine, trade, and war. While Calloway describes in great detail the profound impact that Europeans had on Indians, it is clear from his introduction and conclusion that he is most concerned to emphasize that Indians changed Europeans as well. The latter's process of Americanization was in many ways a process of 'Indianization.' Scholarship has tended to ignore this fact, indeed to treat Indians less as agents in their own right than as objects of European colonization. In recent decades, it is true, historians have done much to remedy their earlier neglect of Indians' agency and subjectivity, but, arguably, they still underestimate Indians' impact on Europeans, being more interested in how Indians coped with European imperialism. Thus, traces remain of the 'passive Indian vs. active European' paradigm, which Calloway wants to do away with. In general, though, his book is simply an overview of more than three centuries of intercultural adaptation. His observation in the preface is worth repeating: the Indian-European encounter was not a mere 'moment'; it lasted longer than the history of the United States itself has, and so provides a record rich with ambiguity and cultural cross-fertilizations.

Examples of Indian influence on Europeans are too numerous to list, but it is worth mentioning a few. An obvious example is Europe's introduction to new foods, such as potatoes, corn, tomatoes, squash, and beans, foods that would have tremendous economic, demographic, and even political importance in the Old World in the coming centuries. In addition to eating American foods, colonists, for instance among the Spanish, also sometimes adopted Indian clothing -- which even became an act of cultural self-assertion, a means of asserting their new 'American' identity vis-à-vis their European heritage. Calloway notes that the colonists in the Boston Tea Party who dressed up as Mohawk Indians were not disguising themselves; "they were proclaiming a new, American identity" (7). This new identity extended also into methods of waging war. To Indians, European warfare was a fearsome thing: it entailed mass destruction, guns, the burning of villages, slaughter of women and children, *total* war. But Europeans eventually found Indian tactics useful as well: guerrilla warfare, hit-and-run tactics, silent sneaking up behind an enemy, were lessons that colonists learned quickly and continued to rely on even when fighting other Europeans. George Washington used such tactics to good effect in the Revolutionary War.

According to some historians, the American Revolution itself might not have happened, or not when it did, had there been no Indians to help mold an independent, non-British identity among the English settlers. "Without the steady impress of Indian culture," argues James Axtell, "the colonists would probably not have been ready for revolution in 1776, because they would not have been or felt sufficiently Americanized to stand before the world as an independent nation. The Indian presence precipitated the formation of an American identity." Colin Calloway's book provides a thorough substantiation of that claim.

Ira Berlin's *Many Thousands Gone* (1998) is a social history of the first two centuries of slavery in the U.S. In the tradition of E. P. Thompson and Herbert Gutman, Berlin looks at the 'lived history' of black slaves through a Marxian lens, emphasizing the primacy of material conditions and economic change as determinants of black life. Slavery, he argues, was not something that remained constant and fixed in its

essence from the early seventeenth century to the early nineteenth; it was subject to change and continual 'renegotiation' on both a micro and a macro level. Specifically, on the one hand, slaves and masters, as living actors, engaged in a continuous process of mutual role-adjustment, implicitly negotiating and renegotiating their positions with respect to the other, testing boundaries, challenging the other's legitimacy and power. Of course the master had most of the power in this equation, but even so, the complex 'dialectic' of real life cannot be reduced to the simple opposition of power/powerlessness or activity/passivity. On the other hand, the institutions of slavery as a whole underwent great change up to the time of the American and French Revolutions: over two centuries they evolved through several distinct phases. With the "charter generations," i.e. the first black arrivals and their children, what existed were not full-fledged slave societies but merely societies with slaves. Slavery was not the dominant mode of production but one mode among others, and plantation workers included slaves, indentured servants, and wage-laborers. As the seventeenth century gave way to the eighteenth and the great landowners consolidated their power, these societies with slaves turned into slave societies, and the "plantation generations" of slaves succeeded the charter generations. The late eighteenth century saw the birth of the "revolutionary generations" as American society experienced the upheavals of war and political independence from Britain, as well as the ideological reverberations of revolutions in France and Haiti. Slaves' hopes soared during this period: in both the South and North they sought emancipation and greater rights. In the North, indeed, they made progress, as slavery was slowly eradicated, though only to be replaced by other methods of control and coercion. In the South, however, slavery actually expanded from the late eighteenth to the early nineteenth centuries as cotton production spread, and the ideology of white supremacy became formalized and institutionalized in vicious ways.

Throughout his discussion, Berlin's focus is on the transformations induced in the lives of African-Americans by changing material and economic circumstances. For example, blacks in the charter generations -- most of whom had already been semi-Europeanized, having come not straight from Africa but from the Caribbean -- lived in societies where racial prejudice was relatively limited and black slaves socialized with white servants. It is revealing, for instance, that "the respectable class in the northern colonies widely shared the perception that the social cleavage ran between free and unfree, not white and black" (60). As slavery became more important to production, especially in the South, both the position of slaves -- who were now imported directly from Africa -- and intermingling between the races declined. With the heightened severity of their condition, blacks became more receptive to Christianity than hitherto: from the Great Awakening to the antebellum period (but especially in the latter), black churches sprouted across the South. Such examples of slaves' coping with economic transformations in their lives could be multiplied, but in this limited space I cannot do justice to Berlin's analysis. *Many Thousands Gone* successfully restores agency to the downtrodden without simultaneously minimizing the horror of their plight.

In *The Marketplace of Revolution* (2004), T. H. Breen reinterprets the American Revolution within the framework of his answer to the question, "What made it possible for the American colonists to transcend their myriad divisions and disagreements and come together as a single people in opposition to England?" His answer is that their shared experience as consumers of British goods both gave rise to their grievances and provided them with a means to unite and prove their loyalty to the new "imagined community" of Americans. The first claim is familiar: Parliament stoked discontent in the colonies by imposing numerous regulations and taxes on commodities that Americans imported. The second claim is original to Breen: the "consumer revolution" of the mid-eighteenth century first went a long way toward culturally homogenizing America, and then later, in the late 1760s and early 1770s, it made possible the colonial boycott of British tea and other goods, which provided ordinary people with the means of proving their commitment to the revolution -- indeed, of getting involved with it at all -- and thus of coming to trust each other during the political fight with England. Thus, the *consumer boycott*, which Breen credits Americans with inventing, was a necessary condition of the Revolution. By participating in it -- that is, by sacrificing the private pleasures of drinking tea and buying British products for the sake of achieving a common political goal -- colonists effectively created and identified with the new community of 'Americans,' and so created the

revolution.

Breen devotes the first part of his book to an analysis of the consumer revolution itself. He shows how it came about and what its social ramifications were. Within three or four decades, people of almost all classes went from living the simple life to living the fashionable life, so to speak: even the lower classes insisted on buying new and colorful goods from England, including trendy clothes and, of course, tea. External distinctions between the upper and lower classes began to break down, and a democratic, liberal consciousness of consumer rights prevailed everywhere. Conservative moralists lamented that one could no longer tell who was a commoner and who a gentleman or lady: they all looked similar. In short, consumption-patterns that ordinary people would previously have considered luxurious became necessary, a necessary component of the good life. This fact is what made their voluntary boycotts of tea and other products during the constitutional crisis with Britain such a powerful statement.

The second part of the book explains in detail the role of massive boycotts in preparing the nascent nation for revolution. As Parliament was passing and repealing in succession the laws and taxes that its colonial subjects found so onerous and insulting (given their lack of political representation), Americans realized that their greatest source of power with respect to England was as consumers of its exports. Due to its size, the American market was extremely important to England. The colonists decided to leverage their economic power to influence Parliament's policies. Breen traces Americans' first tentative steps in the late 1760s toward organizing consumer boycotts and shows how the populace grew increasingly radicalized year by year -- up to 1775 -- as its boycotts became more ambitious. The politicization of consumer choice achieved through boycotts was essential to this process of radicalization in that it injected politics even into the domestic sphere; not only men but women were compelled to identify with America, to adopt its cause as their own, by foregoing the pleasures of British goods. By 1776, ordinary colonists had thus constructed a new political identity for themselves.

Joanne B. Freeman's *Affairs of Honor: National Politics in the New Republic* (2001) is a study of the personal and political ties that held together, however tenuously, the new American government in the 1790s, when political parties did not yet exist in the modern sense. Freeman asks the question, 'What determined the dynamics of relationships between national politicians when government had virtually no infrastructure, no impersonal governing apparatus, no modern party system, and aristocracy was beginning to succumb to democracy?' Her answer is that national politics revolved around a code of honor to which all gentleman, and thus all politicians, were expected to adhere. This code, she says, "formed the very infrastructure of national politics, providing a governing logic and weapons of war" (p. xviii). Politics was essentially personal; everything depended on one's reputation as an honorable man. "Honor was the core of a man's identity, his sense of self, his manhood" (p. xvi). As a result, honor, or the concern for one's reputation, was seen as the force that would keep politicians' behavior within the bounds of respectability and integrity, and in so doing would lubricate the gears of political machinery. It would permit the functioning of the political arena, prevent its descent into a chaos of self-interest and greed. The code of honor was therefore the precondition for republican virtue and public-spiritedness.

Freeman divides her book into five chapters (or six, including the epilogue) each of which focuses on a particular politician and a document he wrote. William Maclay, Thomas Jefferson, John Adams, Alexander Hamilton, and Aaron Burr are thus the principal characters of the book. In each chapter Freeman looks at one facet of the honor code through the refracted lens of her chosen document. For example, the papers that Jefferson collected from his tenure as secretary of state and assembled into three volumes show the centrality of gossip to politics. "Focused on attacking and defending reputations, [gossip] was the language of national politics" (p. 69). Gossip that impugned a man's honor could do such damage to his reputation that he might challenge the 'gossiper' to a duel as a last resort to prove his honor. The gossip, spoken or written (in newspapers, pamphlets, letters), that saturated political circles therefore ensured that beneath the polite veneer of this chivalrous society were fierce rivalries, suspicions, petty resentments and longstanding feuds, changing alliances, bonds of friendship that could mutate suddenly into implacable hatred. The book's culmination is a detailed account of the divisive election of 1800, which took the form of a war between Federalists and Republicans and ended in a tie between Burr and Jefferson. In Freeman's

interpretation, the election and its aftermath were the ultimate expression of the personal nature of politics and the political nature of politicians' private socializing in this era prior to impersonal party bureaucracies.

What changed with the institutionalization of parties was not the mudslinging or gossip or even the venomous nature of politicking but the decline of the aristocratic code of etiquette, the code of honor. In lieu of the honor code as the recognized means of regulating politicians' behavior arose the anonymous discipline of the party organization. Political enemies could now remain friends; as politicians they acted in an 'impersonal' capacity. In the republic's early years when there were no genuine parties, "political losses or public humiliations were no temporary setbacks; they struck at a man's core and threatened to rob him of his self-respect as a man and his identity as a leader" (p. 283). With political parties, by contrast, politicians had 'safety in numbers': they "were freed from personal responsibility for party directives" (p. 284). The culture of the honor code and the duel receded as politics and society became more impersonal.

In chapters 7 and 9 to 13 of *What Hath God Wrought: The Transformation of America, 1815 - 1848* (2007), Daniel Walker Howe narrates and interprets the Jacksonian era in politics, from the end of the Era of Good Feelings, which coincided with John Quincy Adams's ineffectual presidency, to Martin Van Buren's presidency, which is sometimes called Andrew Jackson's third term. Howe portrays a country that is exploding with energy, expanding literally and figuratively even as it struggles to keep itself together. Among the momentous changes occurring at this time is the emergence of a relatively modern party-system under Jackson and Van Buren, as Jackson's half of the old Republican party splits off from Adams's half to become the Democratic party in opposition to the National Republicans and later the Whigs. Howe is more sympathetic toward Adams than Jackson and Van Buren, but his account is evenhanded -- as evenhanded as one can be toward violent white supremacists, Machiavellian politicians, and upholders of the law only when it suits their interests.

John Quincy Adams was almost the polar opposite of Andrew Jackson. Where Jackson was domineering, dictatorial, mercurial, a partisan dispenser of political patronage, an avowed racist and defender of slavery, a frontiersman obsessed with destroying Indian nations in order to make way for the white man, a state-rights advocate except when states contravened his own will, an old Jeffersonian Republican determined not to let the federal government accumulate too much power, Adams was a sophisticated, religiously devout, nonpartisan Northern intellectual who preferred to govern by consensus and had an expansive conception of the federal government's role: the government would actively facilitate economic and cultural development through transportation projects, public education, national universities, an astronomical observatory, the establishment of a Department of the Interior (which was finally created in 1849), the completion of the continent-wide postal network, and other such enterprises. Adams also tried to deal fairly with Native Americans, for instance by resisting Indian Removal and annulling a corrupt, exploitative treaty with the Creeks. Ultimately, however, Adams's nonpartisan approach was inadequate to his ambitious goals. America was becoming increasingly partisan, characterized by inter-regional, inter-class, and party strife. Martin Van Buren was an expert manipulator of partisanship and proved a formidable opponent to Adams; indeed, through his concern with organization and patronage he is often said to have created the modern American political party. He and Jackson handily defeated Adams in 1828.

The Age of Jackson was, in a sense, a democratic one, but as Howe notes, it was a democracy of white men in the service of white male supremacy. It was a violent, lawless age, when even presidents felt free to violate treaty obligations, ignore Supreme Court decisions, and break laws that were seen as undermining the political and economic sovereignty of the white man. It was an authoritarian, herrenvolkish version of popular democracy, for which Andrew Jackson was the perfect symbol. In the name of the common man he made war on the Bank of the United States as an unaccountable, undemocratic governmental tyranny, and he won; he purged government bureaucracies and installed men loyal to himself and the Democratic party (i.e., for him, Democracy), thus reducing the government's effectiveness and increasing its corruption; he forced Indians to move west of the Mississippi (thereby, however, "provok[ing] opposition from the strongest nationwide democratic protest movement the country had yet witnessed" (p. 357), a movement among evangelical Christians and other outraged whites); he supported the censorship of abolitionist publications in the mail so that they could not reach subscribers in the South; he killed

Adams's plan to use the federal government to build the nation's economic infrastructure, leaving it to the states to do so. Ironically, some of his 'anti-elitist' and anti-'big government' economic policies ended up hurting the common man by contributing to the financial panics and depressions that plagued Martin Van Buren's presidency.

In short, Howe provides a rich account of the political, economic, cultural, regional, and religious divisiveness that made the Age of Jackson the age of ferment that it was. In hindsight, one can see that the country was already heading down the path to civil war.

(Notes for a presentation on *The Market Revolution in America: Social, Political, and Religious Expressions, 1800-1880* (1996), edited by Melvin Stokes and Stephen Conway.) In recent years historians have suggested that a market revolution occurred in early 19th century America. (The book goes to 1880 because during Reconstruction the market was still extending into the South and expanding around the country.) Reaction against 'consensus historians' in the mid-20th century, like Richard Hofstadter, who thought America had been born capitalist, so to speak. Puritan settlers had supposedly brought a capitalist mentality, Lockean liberalism was the American outlook, the farmer was committed to moneymaking objectives, etc. But this is oversimplified or wrong. More recent historians have emphasized early farmers' self-sufficiency, household production, the barter economy of small towns. Only with a growing population, a diminishing availability of land, better transportation facilities, and initiatives from merchant capitalists (the putting-out system, etc.) did the market extend into rural communities. Many social and political ramifications. Artisans fought the commodification of their labor, resented big capitalists, and workers and farmers opposed paper money and banks; hence one aspect of Jacksonian democracy. Also, reform movements and revivalistic religion were influenced by the social and cultural needs of an expanding market.

Charles Sellers's *The Market Revolution: Jacksonian America, 1815-1846* (1991) -- the book to which this anthology is a response -- synthesizes recent research. It "is constructed around the great divide between land and market." Eastern coastal areas market- and profit-oriented, interior lands largely self-sufficient. In the 18th century a population explosion, hence a flooding of the interior which isolated most Americans from the market. "What ultimately doomed the subsistence culture was a combination of rising land prices and expanding population." Families needed cheap land to provide for their numerous offspring; when it became less available in the Northeast, fathers supplemented their meager income (with which to pay higher taxes and buy land for their sons) through market activities while their wives became involved in putting-out systems. "In the struggle to maintain a traditional way of life, the farming families of southeastern New England were pioneering the changeover to capitalist methods of production." For Americans in the South and West, the boom following the war of 1812 led to the beginnings of capitalist transformation. Government involvement, especially on local levels, was important: pro-business policies and public-private partnerships to develop infrastructure. Also, sympathetic Supreme Court decisions. (Lawyers "the shock troops of capitalism" -- and, incidentally, the guardians of it ever since.) Cultural repercussions, such as pro-capitalist and anti-capitalist versions of religion -- what Sellers calls, unconventionally, arminianism vs. antinomianism. Many other not-terribly-original ideas about social consequences of the market's extension.

The anthology of essays critiques and elaborates on all these arguments in Sellers's book. For example, one essay evaluates Sellers's ideas on the religious expressions of the supposed *Kulturkampf* between "the traditional rural, democratic order of subsistence farmers, marked by communal cooperation, family obligation, patriarchal authority, honor, and independence" and the world of market production, characterized by specialization, division of labor, competitive individualism, etc. Sellers thinks the 'New Light' revivals over the period of a century, "from the mid-eighteenth-century Great Awakening through the turn-of-the-century Great Revival to the culminating Second Great Awakening of the 1820s and 1830s," were an antinomian reaction against capitalism and the market on behalf of egalitarianism, democracy, plainness, and communal love. Baptists and Methodists, "plebeian movements of subsistence farmers and working people," belonged to this category. On the other side was the market-friendly arminianism popular

amongst Yankee merchants and entrepreneurs that made salvation a function of one's work-ethic and worldly accomplishments. But there are problems with this scheme, aside from the unusual terminology.

It's true that Methodism was for a long time primarily a movement of the poor (rural laborers, subsistence farmers, mechanics, artisans), which "criticized worldly ostentation and the love of money and display." Methodists objected to market activities on the Sabbath and other occasions, and they opposed exploitation of the powerless, condemned excessive profits, etc. By the mid-nineteenth-century, Methodism had become more respectable and middle-class; some of its adherents looked back fondly on the old days of simplicity and communalism. But "why did the process of embourgeoisement provoke so little resistance in the church?" There were few schisms or major conflicts. The reason, according to Richard Cawardine, is that early Methodists were hostile not to enterprise and the capitalist ethic but to "genteel patriarchy and aristocratic pretension, creating [their] own community against a world of deference and honor, and not against industrious effort and self-improvement." They bought and sold to each other, employed other Methodists in their businesses, tried to 'improve themselves' even through commercial undertakings, etc. Cawardine gives a lot of evidence that Methodism was not anti-'Protestant ethic.' Quite the contrary. It wasn't a communitarian creed. During the Jacksonian years, "Methodists' enthusiasm for the new economic order did not make them blind to the greed and exploitation of the capitalist market, but in general its Methodist critics sought to Christianize or sanitize the new order, not resist it."

Cosmos Crumbling: American Reform and the Religious Imagination (1994), by Robert Abzug, is an account of the religious origins of New England's reform movements from the 1820s to 1840s. Abzug emphasizes the importance of 'cosmic' or 'cosmological' thinking to this age of reform. In fact, the term 'reform,' he argues, does not capture the full significance of what was happening: such movements as temperance, Sabbatarianism, abolitionism, manual labor reform (premised on the sacred value of physical labor), vegetarianism, and early feminism were intimately bound up with the Second Great Awakening. They embodied a sacralizing of ordinary life -- the reformer's vision of a fusion of the cosmic and the personal. Central to Abzug's history is Max Weber's conception of "religious virtuosos," people who are "tuned to heavenly rather than earthly matters, and who in most societies [have] lived as monks, holy men, mystics, and the like" (p. 4). It was these people who led America's so-called reform movements -- Lyman Beecher, Charles Finney, William Lloyd Garrison, Sylvester Graham, William Andrus Alcott, Catharine Beecher, and many others. They tended to see America as having a millennial mission, and were deeply disturbed by growing indications of its waywardness.

Abzug divides his book into three parts, titled respectively "Foundations of the Reform Cosmology," "Evangelical Reform," and "Radical Transformation." As is evident from its title, the first part is concerned less with the reform movements themselves than with the social and intellectual material from which they grew. Thus Abzug discusses Benjamin Rush, who anticipated the later movements in his passionate Christian republicanism and millennialism. "He imagined the [American] Revolution to be the first battle in a grand millennial fray.America must lead human efforts to prepare the world" either for Christ's literal return or for that glorious era when "Christ's spirit would inform every act and thought" (p. 19). Inevitably, Rush grew disillusioned, along with the thousands of Americans who shared his hopes. But these hopes were revived across the northeastern United States during the Second Great Awakening, which Abzug characterizes as a time of Manichean fanaticism and sectarian ferment, a radical revival that helped trigger radical reform in the 1820s. In the second part of his book he focuses on the three major issues that preoccupied evangelical reformers in the '20s, namely temperance, the holiness of manual labor, and Sabbatarianism (strict observance of the Sabbath). The frustrations that reformers encountered in proselytizing for these causes led them on to more radical ventures that even New England's evangelical establishment shunned -- movements such as Garrisonian abolitionism, feminism, communitarianism, and spiritualism. By the 1840s, for example, feminists were reinterpreting Genesis as not implying the subordination of women to men, a revision that threw into question the very structure of the patriarchal family. Spiritualists turned away from denominational churches, indeed from Christianity itself, toward Transcendentalism or various post-Christian faiths. Communitarians advocated communal ownership and personal renunciation. "Reform had thus moved from changing habits such as drinking to rethinking the

basic theological and social foundations of Western culture” (p. 228). By the mid-nineteenth century, as Abzug suggests, the evangelical Christian cosmos was crumbling.

The central argument of Walter Johnson’s *Soul By Soul: Life Inside the Antebellum Slave Market* (1999) can be summarized in a single sentence: “The history of the antebellum South was made...in the slave pens” (p. 214). The slave pens, located in slave markets, were where African-Americans were stored and exhibited to buyers. The domestic slave trade was a significant portion of the South’s economy from the early nineteenth century to the Civil War; a total of two million slaves were traded locally and between states. Johnson’s book is a social history of the trade from the perspective of each of the four categories of participants: the seller, the buyer, the trader who served as middleman and brought slaves -- sometimes hundreds of miles -- to the market, and the slave himself (or herself). Johnson analyzes the experiences of everyone involved to understand the essence of the South’s social system, to penetrate the cant of ‘paternalist’ rhetoric and slaveholders’ self-understandings.

For example, slaveholders liked to think of their system as pre-capitalist: they saw themselves as having human relations with their slaves, as being benevolent protectors rather than callous buyers-and-sellers of labor-power as in the North. But this ideology depended on the slave-regime’s supposed isolation from the market -- an isolation that did not in fact exist. Hence slaveowners’ hatred and contempt for the “coarse, ill-bred” slave-trader (as they characterized him), “provincial in speech and manners....with cold hard-looking eyes and shabby dress” (p. 24). His existence belied their ideological self-justifications. “In the figure of the slave trader,” Johnson writes, “were condensed the anxieties of slaveholding society in the age of capitalist transformation: paternalism overthrown by commodification, honor corrupted by interest, and dominance infected with disorder” (p. 25). Thus, when slaveholders did sell slaves, they invented elaborate excuses to justify their ‘capitalist’ act and deny a pecuniary motive for having cruelly separated slave families and friends.

Not surprisingly, blacks resisted this separation; that is, they resisted having what Johnson calls the ‘chattel principle’ forced brutally into their relationships and sense of self. Every slave, of course, was subject to the chattel principle: his identity “might be disrupted as easily as a price could be set and a piece of paper passed from one hand to another” (p. 19). Communities were destroyed, identities wrecked -- and paternalism was proven a slaveowner’s fantasy. Or, more accurately, as a white man’s self-conception it was something that could be bought in the slave market -- the very place, however, whose existence refuted the paternalist ideology.

Johnson describes in detail the operation of the market, the nature of the transactions occurring in the slave pens, the tactics of negotiation and evasion that slaves used so as to be bought together with their loved ones (if indeed they were being sold in the same market), the tricks that traders used to package their commodities -- slaves -- in appealing and deceptive ways that would fetch a high price. The book’s most interesting discussions, however, are of the systemic implications of the slave market and its paradoxical importance to the slaveowner’s identity. Everything definitive of Southern society could effectively be bought in the slave market: the white man’s racist pride, his luxurious living, his potentially indolent lifestyle, his benevolent and chivalric self-conception, even the myth that the landed aristocracy lived in splendid isolation from the capitalist market. As Johnson states, slaveholders were “men made out of slaves,” men who “lived through the stolen body of a slave” (p. 214). It is appropriate, therefore, that in the mid-nineteenth century the abolitionist movement came to see the slave market, not the plantation or paternalism or Southern political structures, as the essence of slavery. Southerners, tacitly ashamed of slave-trading, fought this abolitionist campaign, but they lost. “The crude spectacle that was daily on view in the slave pen -- a human being publicly stripped, examined, priced, and sold -- thus became an image that stood for the whole of slavery” (p. 219). There is poetic justice in the fact that the slave market, perhaps the central institution binding together a society of slaveholders, would, through abolitionism, end up contributing to the downfall of slavery.

In *Free Soil, Free Labor, Free Men: The Ideology of the Republican Party Before the Civil War* (1970), Eric Foner argues against Progressive historians who saw the Civil War as originating merely in a

clash of economic interests, or as furthering the interests of Northern economic elites. These historians downplayed the importance of ideologies, going so far as to claim that the issue of slavery was of little relevance to the war's outbreak. Foner argues, by contrast, not only that slavery was of major significance but that by 1860 the Republican party had put together a coherent and powerfully motivating ideology that exacerbated sectional tensions to the point of civil war. Foner's book consists of an elaboration of this ideology and a demonstration of its social power.

Central to the Republican ideology was the notion of free labor, which was opposed to that of wage labor and chattel slavery. The free laborer was a figure of inherent dignity, the necessary foundation of a dynamic and democratic society. Be he a farmer, a planter, a mechanic, a laborer, or a small businessman - all occupations that did not profit by another's labor, such as the banker and the lawyer -- he was the rock of a society in which the best men rose to the top and, theoretically, no man had to remain poor who possessed talent and initiative. For the Republican, the North epitomized the 'free-labor civilization,' while the South was its antithesis. Rather than economic development, social mobility, and political democracy, the South had a stagnant economy, a fixed hierarchy, and an aristocracy of slaveholders (p. 40). It was a rotten civilization that could not be allowed to expand west, and according to many Republicans must eventually be destroyed even in the states where it already existed. Abolitionists shared these goals and values with Republicans, but there was one preeminent difference between the two ideologies: abolitionism based its opposition to slavery on the *moral* argument that slavery was inhuman and bad for black people, whereas Republicanism tended to base its opposition on the argument that slavery was bad for poor whites, in that it stifled social mobility and all the virtues associated with the Protestant ethic. This position was more popular with ordinary whites than the abolitionists' moralism.

Each chapter of *Free Soil, Free Labor, Free Men* explores a different facet of the Republican ideology. For example, Foner discusses Salmon P. Chase's popular legal argument that in trying to extend slavery into the territories and new states, Southern slaveholders were acting unconstitutionally: after all, the Founders abhorred slavery, had refused to acknowledge it explicitly in the Constitution -- in the three-fifths clause they had referred to '*persons*,' not 'slaves' -- and had hoped that eventually it would wither away. In another chapter Foner addresses the role of Radical Republicans in ensuring that the party did not stray too far from its anti-slavery principles. On the other hand, the party also included conservatives, moderates like Lincoln, and ex-Democrats; Foner accordingly delves into the relationships between these factions and the circumstances through which they fused into a single party. In two of the final chapters, Foner considers the not-insignificant roles that nativism and racism played in Republican politics -- the latter, for instance, ensuring that Republicans' commitment to black social equality would be half-hearted during the Reconstruction era.

The book's greatest value, perhaps, is its sophisticated defense of the 'irrepressible conflict' thesis, that the North and South were inevitably headed toward a confrontation sooner or later. That Foner argues for the thesis by analyzing -- and attributing great power to -- ideologies rather than economic structures makes his book no less convincing.

Chandra Manning's book *What This Cruel War Was Over: Soldiers, Slavery, and the Civil War* (2007) examines soldiers' letters and diaries, as well as camp newspapers, to discover "what ordinary soldiers thought about the relationship between slavery and the Civil War" (p. 4). She argues against the common view that soldiers did not think much about the issue at all, that they were non-ideological, or that, if they did interpret the war in 'ideological' terms, slavery was not important to their thinking. On the contrary, the historical evidence establishes that the large majority of soldiers on both sides believed that slavery was the fundamental cause of the conflict, and that it had to be either abolished (according to Union soldiers) or defended (according to Confederates). Manning organizes her book chronologically, so that the reader sees how soldiers' attitudes changed from year to year.

For example, as Union soldiers entered the war in 1861, most of them were not committed to emancipation of slaves. They shared the racist prejudices of their day, and in fact continued to do so throughout the war. However, as they encountered Southern society, they began to understand the horrors of slavery as well as its adverse consequences on the fabric of even white society. Most whites they saw

were poor and ignorant with no hope for social advancement; the whole civilization was backward, stagnant, with stretches of fertile land lying fallow. In the beginning, Union soldiers had volunteered to fight in the war because of their millennial faith in the greatness of the American republic, its universal significance as proving to the world that “republican self-government based on the principles expressed in the Declaration of Independence could work” (p. 40). If the Union collapsed, then so did America’s divine mission. Later, though, this understanding broadened: “contact with slaves and southern society convinced many Union troops that the immoral and blighting institution of slavery was antithetical to republican government, and that any republican government that tried to accommodate slavery was doomed to eventual failure” (p. 50). This belief also explains the troops’ reverence for President Lincoln: whereas their own loved ones in the North did not comprehend their conversion to abolitionism, Lincoln did (at least in the troops’ eyes). He came to articulate and embody the true mission of the war, as redeeming the nation from the sin of slavery and making possible a new birth of freedom.

Confederate soldiers, on the other hand, saw themselves as defending slavery, their families, and the southern way of life. Most soldiers did not own slaves, but they fought for slavery anyway because it “buttressed the ideals of white liberty and equality,” it “stabilized an otherwise precarious social structure,” it provided a mechanism of race control, and its abolition would surely lead to anarchy (p. 32). It was the foundation of whites’ manhood. Confederate troops underwent an evolution comparable to that of Union troops: just as the latter became more committed to emancipation as the war went on -- for only that could justify the deaths of so many of their comrades -- Confederates identified the war even more with the defense of slavery. The Emancipation Proclamation, for example, appalled southern troops.

What This Cruel War Was Over puts to rest any doubts about the ideological leanings of Union and Confederate troops. As they wrote in their letters home, the institution of slavery was the crux of the matter. For Northerners, the Union could not be preserved if slavery continued to exist; for Southerners, the preservation of the Union had no importance compared to the preservation of slavery. Luckily, the North won the war.

America In Our Time (1976), by Godfrey Hodgson, is a history of America’s post-World War II ‘liberal consensus.’ In particular, Hodgson analyzes the origins and ultimate social consequences of an ideology that guided policymakers for thirty years. His concern is to explain how America fell from the heights of confidence it enjoyed in the wake of the war to the fractured despair of the mid-1970s. The book’s subtitle says it all: *From World II to Nixon, What Happened and Why*. Hodgson’s argument can be summarized in two sentences (p. 491):

The point of departure for this book was the idea that, for a few years on either side of 1960, American politics and society had been ruled by a consensus, and that this consensus in turn rested on an ideology. What happened in the twelve years separating the beginning of Kennedy’s and the end of Nixon’s first terms in the White House, I have argued, can best be understood in terms of impact of events on that interlocking body of ideas and beliefs.

Hodgson’s account is thus more ‘idealistic’ than materialistic -- it places more emphasis on ideas than on structural dynamics -- but it is not entirely one-sided, fortunately. Nevertheless, it is incomplete, and the frequent persuasiveness of particular arguments is marred by the shallowness of the book’s overall perspective.

America’s postwar liberal consensus, Hodgson rightly notes, was not leftist but centrist. It united almost all Democrats and Republicans, business elites, academic intellectuals, the foreign policy establishment, and most other mainstream institutions and figures. Some of the components of the ideology were as follows: (1) capitalism can not only function well but can operate democratically and justly, if managed properly; (2) economic growth is the be-all and end-all, since ‘a rising tide lifts all boats’; (3) because growth benefits everyone, society is ultimately composed of a harmony of interests; (4) government

can solve all social ills if policymakers have sufficient expertise (or are advised by experts); (5) the United States has a duty to aid the cause of freedom, i.e. capitalism, all over the world, which means to fight Communism. Liberals' fetish of expertise, rational planning, governmental coordination of society, led to their love-affair with the presidency as opposed to Congress or democratic public debate: experts could be trusted to administer society. There were 'insiders' and 'outsiders,' and the latter were ignorant and meddling, lacking information and expertise. In the end, the liberal centrist creed paid lip-service to democracy but placed far more faith in *technocracy* as the means to societal harmony.

One consequence of this faith, according to Hodgson, was that the presidency in the 1960s became isolated from the broader world. The bureaucracy of the executive branch, especially the national-security bureaucracy, withdrew into its bubble of pseudo-rationality and pseudo-expertise, the expertise of numbers, charts, graphs, statistics, day-to-day targets, the 'domino theory' of the spread of Communism -- in short, instrumental rationality rather than substantive rationality. In the Pentagon there was virtually no debate over *ends*, only over *means*. Almost no one questioned that it was necessary for the sake of American prestige to fight Communism in Vietnam; the domino theory was not seen as the hollow, simplistic illusion it was, because the bureaucracy stultified independent thought. No real debate occurred over Vietnam. Lyndon Johnson heard the figures from McNamara, heard the arguments from the generals, heard no dissent, and launched the war while lying to Congress and America. Liberalism's celebration of technocracy thus led to Vietnam, which contributed to the collapse of liberalism.

Hodgson also places the blame for Vietnam on the liberal doctrine of foreign intervention in the service of freedom. Old conservatism, the conservatism of Robert Taft, had been isolationist; liberalism and the new conservatism (which accepted, with qualifications, the liberal consensus) were interventionist, fanatically anti-Communist. There was no Left in the mainstream anymore to challenge the Truman Doctrine; the Vietnam War was the result. Hodgson sums it up by saying that the liberal error was to believe that "the United States could use its military power to change the world in conformity with its wishes and not itself be changed in the process" (p. 497).

Another liberal error that led to the ideology's downfall was the belief in economic growth as a virtual panacea. More specifically, liberals were wrong to think that America's resources were limitless, that one did not have to take from one group of people in order to give to another. Johnson and his aides thought they could pay for the Great Society and Vietnam at the same time -- after having just passed a major tax cut! The tax cut may indeed have stimulated economic growth, but it reduced the revenues with which to pay for the government's huge expenditures, thereby giving rise to budget deficits, which caused inflation. Moreover, the spending for Vietnam eventually became so high that Johnson had to cut his beloved Great Society programs. Evidently society's interests were not all harmonious, America's resources were finite, and economic growth could not be the foundation of social justice. "You cannot abolish poverty if you won't pay higher taxes. Only if a real transfer of resources has taken place has relative inequality been diminished; it is the relative, not the absolute, situation of the poor that must be changed if poverty is to be abolished" (p. 497). By not taking from the rich to give to the poor -- and, in addition, by believing that massive foreign intervention could be undertaken without cost to domestic programs -- liberals ensured that their creed would founder on the shoals of social conflict.

The civil rights and black power movements further revealed the bankruptcy of liberalism. The coalition of blacks and Northern liberals was unstable, and it was bound to fall apart as liberals showed how shallow was their commitment to social reform. Their ideology did not countenance the possibility that racism and inequality were more than mere relics of the past, that they were of the very essence of American society and could not be eradicated without major economic redistribution. By the mid-1960s, most blacks understood that liberalism was part of the problem, not the solution. For them, radicalism was the answer -- but it failed too, and furthermore antagonized whites across the country, who punished Democrats for their coalition with blacks by electing conservatives.

Liberalism, says Hodgson, was not just the dogma of a faction or school; it was "the operational creed of a great nation at the height of its confidence and power" (p. 492). As this confidence and power waned, in large part as a result of policies and non-policies that grew out of liberalism and its illusions, the ideology necessarily waned as well. Conservatism rose in its stead: government would no longer position

itself in the center, no longer base its policies on the myth of unlimited economic expansion and a harmony of interests, but would unapologetically favor the privileged over the oppressed (at least in the *institutional realities* of conservatism, though not necessarily in its rhetoric). It would accept that certain interests are irreconcilable and so would do what liberalism had been unwilling to do: it would redistribute resources to benefit particular interests at the expense of others. That is, it would take from the poor to give to the rich.

America In Our Time offers a compelling interpretation of the postwar years in America, but in the end it does not fully explain why the liberal ideology was constrained in the ways it was -- why it was constrained to adopt silly illusions, to view the world in simplistic Manichean ways, to place such faith in technocracy and class harmony. Liberalism can be thoroughly understood only if one places it in the context of the social structures within which it became hegemonic, and in particular, the class structures. The fact is that it served the interests of certain sectors of business in a certain period of history, and this is why it was propagated and celebrated. The ideology itself was important, but more important were the structural mechanisms that propagated it, the institutional realities that were sublimated into a belief-system, and the social dynamics that favored or frustrated particular policies. Policymakers did not act simply in accordance with their *beliefs*; on a deeper level, they tended to act as they were driven to by institutional power-relations, institutional constraints. Had they not believed in this ideology called liberalism, they would not have risen to such positions of influence as they did. Thus, on the deepest level it was social structures, power-relations, class structures, that mattered, not mere beliefs. In other words, liberalism was not just an 'intellectual error'; it was an institutional necessity in postwar America, and it was inevitably going to wane as the institutions that it legitimated evolved in tension with other institutions and social movements to the point that they mutated, like much of society, in more 'conservative' directions.

Despite its flaws, the book is well worth reading. Its panoramic vista is a welcome corrective to the minutiae of scholarship, and by glancing over an immense array of issues it stimulates new insights and makes new connections. It is worthwhile, after all, for academics to read popular literature.

In recent decades American history has begun to be reinterpreted: historians have turned from the old paradigm of American exceptionalism and relative isolation from the world to the new paradigm of transnational history, placing the country in the context of world developments. As the nation-state has started to decline in importance and globalization has accelerated, nation-state-centric history has been eclipsed by an emphasis on global and regional interconnections. Without question, this has been a positive development. In the modern world especially, social dynamics in a particular country cannot be understood apart from their connections to tendencies in other societies; this is no less true of the United States than of France or England. The presence of two oceans and a relatively open expanse of land in the western half of the country does not exempt America from the necessity of interacting with the world. What happens within its borders, therefore, is determined by and determinative of what happens elsewhere. There is no U.S. "exceptionalism" except in the truistic sense that every nation's history is different from every other's.

The value of a transnational perspective on American history is demonstrated in *America on the World Stage: A Global Approach to U.S. History* (2008), which consists of short essays on a variety of topics by respected American historians. They show that while the new historiography rarely rejects established interpretations in their entirety, it supplements and qualifies them, adding subtlety and putting them into a broader context. By viewing events in America in the light of events elsewhere, new patterns are discovered, phenomena that were previously seen as uniquely American are seen as permutations of more general or multiply instantiated processes.

For example, in chapter eleven Patrick Wolfe compares the treatment of Indians by American settlers with that of Australian Aborigines by British settlers and finds that three phases characterized both: the initial phase of destruction of indigenous groups, whether by outright slaughter, starvation or introduced diseases; the second phase of removing surviving groups to reservations; and the third phase of assimilating them into white society, through miscegenation and other means. These practices contrast with the treatment of blacks in the American South after Reconstruction, when miscegenation was considered a terrible crime and racial segregation was viciously enforced. What accounts for the disparity in treatment?

The answer is that in Australia and the United States, settlers wanted the land, not the labor, of indigenous people; once they had seized it, the most effective and least conflictual way of dealing with indigenous survivors was to absorb them into the dominant society. Their demonization served no further purpose, so it continued to exist only in residual ways. Blacks, on the other hand, were useful not for their land but for their labor, their exploitability, and so their segregation from whites and confinement to work on plantations was maintained with utmost severity.

An even clearer example of the utility of taking a transnational perspective is provided by David Armitage's essay on the Declaration of Independence, that quintessential symbol of America. We have come to associate it with the celebration of individual rights -- "life, liberty, and the pursuit of happiness" -- as well as a sort of affirmation or confirmation of America's unique status among nations, but it was conceived as something more mundane. As Armitage states, "the Declaration's primary meaning in 1776 was to affirm before world opinion the rights of a group of states to enter the international realm as equals with other such states" (p. 20). It was as much a declaration of interdependence as of independence. After its original goals had been won, Americans placed less emphasis on its first and last paragraphs and saw its liberalism as its most important aspect, but around the world revolutionaries have tended to invoke it more as a legitimating model for their own attempts to establish sovereign nation-states than as an affirmation of individual rights. Armitage's essay thus places the Declaration in its proper international context and shows that Americans themselves have partially misunderstood it.

In his essay "Returning the West to the World," Stephen Aron tackles that other revered symbol of American uniqueness, the narrative of the American West as a virgin wilderness that forged the national character by imbuing settlers with a democratic, freedom-loving, individualistic spirit. What is at issue here is not just a set of theses propounded by Frederick Jackson Turner in 1893 but an American way of *seeing* the world, a sort of gestalt. Implicit in it are the half-formed ideas of Manifest Destiny, entitlement to a continent, a new world in the truest sense, a memory-erasing of prior colonizations by Spain and France -- a forgetting of the whole centuries-long history of colonial wars, conquistadores, Indians' defense of their homeland, mass migrations. Aron remarks rightly that the so-called 'West,'¹ "what Turner deemed 'really American,' was international before it became national" (p. 90). He continues:

Not until the West ceased to be a zone of inter-imperial rivalry did it become manifestly American. Nor did this "effective Americanization" make the history of westward expansion particularly exceptional. To the contrary, the frontier processes that unfolded across North America readily -- and sometimes uncomfortably -- equate with numerous episodes of colonization and resistance around the globe.

For instance, German and Japanese expansionists took inspiration from America's genocidal expansion, and when one applies the term 'ethnic cleansing' to America's decimation of native populations, a host of more recent associations comes to mind (p. 91). Moreover, the idea that the West in the nineteenth century was somehow isolated from civilization is quite false. It was a land boiling with violence, a cauldron of cultural conflict and cross-fertilization, as millions of immigrants from China, Mexico and Europe clashed with Indians and Americans from the Mississippi to California. Turner's thesis is not wholly without foundation, but Aron's essay proves that it is an extreme oversimplification.

Other chapters in the book are less compelling than Aron's and Armitage's, but they too are insightful in their reconceptualization of American history. For example, Philip Morgan notes in his chapter on the "Origins of American Slavery" that 'the peculiar institution' was by no means peculiar to the United States, as we sometimes assume. "Almost every society in the history of the world has experienced slavery at one time or another" (p. 36). In fact, the Arab and Muslim slave trade between the seventh and twentieth centuries transported at least as many slaves -- most of them sub-Saharan black Africans -- to North Africa, the Mediterranean and the Persian Gulf as Europe transported to the New World. Muslims did enslave

¹ The very name is mythical, since, as Aron states, the territory had to *become* 'West.' To different peoples it was north, south, east, and home.

Europeans too, but “medieval Arabs came to associate the most degrading forms of labor with black slaves” (p. 38). It is true, however, that the racism of American and Caribbean slavery was uniquely virulent.

Mark Noll places America’s “Nineteenth-Century Religion in World Context” by showing how much it influenced and was influenced by religious movements elsewhere. Even between 1800 and 1870, when “religious connections, influences, and exchanges between the United States and the rest of the world were probably at their low point” (p. 56), the country was affected in numberless ways by international currents, largely as a result of the influx of Catholic and Protestant immigrants. In the final decades of the nineteenth century the U.S. also made significant contributions to religion in the international arena, for example through its thousands of missionaries in Asia, Africa and Latin America. In 1903, one-fourth of the 16,000 Protestant missionaries around the world were from the U.S.

In short, *America on the World Stage* effectively demonstrates not only the usefulness but the necessity of abandoning the narrative of American exceptionalism in order to understand the country’s history and its place in the world. The book’s publication also testifies to the welcome fact that many historians have finally acknowledged this truth.

Marcus Rediker’s *The Slave Ship: A Human History* (2007) is a beautifully written but horrifying account of Europe’s slave trade in the eighteenth century. Its focus is on the slave ship and everything that transpired there, although Rediker also discusses how Africans ended up on the ship in the first place and what happened to them after they had reached the New World. Among scholarly books, *The Slave Ship* is surely one of the most gory and disturbing ever written. Rejecting an abstract analysis of institutional relations, Rediker describes in grim detail the actual experiences of slaves and sailors on the ship, this “floating dungeon” and torture-chamber. Anecdote after anecdote lends credence to the judgment of British abolitionist William Wilberforce: “So much misery condensed in so little room is more than the human imagination had ever before conceived” (p. 327). Reading the book is an awe-full experience.

Consider a few examples. One captain, facing a “rage for suicide” among his slaves, decided to teach them a lesson by tying a woman with a rope under her armpits and lowering her into the water. “When the poor creature was thus plunged in,” remarked a witness, “and about half way down, she was heard to give a terrible shriek, which at first was ascribed to her fears of drowning; but soon after, the water appearing red all around her, she was drawn up, and it was found that a shark, which had followed the ship, had bit her off from the middle” (p. 40). Another captain punished slaves for an attempted insurrection by cutting them up with an axe as they were still alive: first their feet, then their legs below the knee, then their thighs, then their hands, and so on, all the while throwing their limbs and heads into a group of trembling slaves who were chained on the deck. But this torture was not enough (p. 219):

[For the next group, the captain] tied round the upper parts of the heads of others a small platted rope, which the sailors call a point, so loosely as to admit a short lever: by continuing to turn the lever, he drew the point more and more tight, till at length he forced their eyes to stand out of their heads; and when he had satiated himself with their torments, he cut their heads off.

More common was the use of thumbscrews to crush thumbs over a period of hours or days, and of course rape and incessant floggings of disobedient Africans.

However, the book is not just a record of unremitting brutality, one nauseating anecdote after another. Its principal virtue is, admittedly, that it presents the Middle Passage in its human reality and consequences. But Rediker interprets the whole sordid story from a definite perspective, and that perspective is a Marxist one. He bookends his study in the introduction and conclusion with a condemnation of capitalism, the argument that the horrors he chronicles “have always been, and remain, central to the making of global capitalism” (p. 13). Distant merchants and capitalists were the ones who kept the system going; the slave captain was their representative, the representative of capital, who did their dirty work, but in a sense they were as bloodstained as he and equally or more guilty. The system had a hierarchy of power:

at the top was the tyranny of capital, which supported the tyranny of the ship's captain over his crew and, at the bottom, the slaves naked and dying belowdecks. The sailors functioned as proletarians, so to speak, who worked on the raw material of Africans to turn them into slaves, i.e. degraded, dehumanized, cowed beings whose will was their master's. (Needless to say, the transformation was rarely complete: resistance was common.) As proletarians, moreover, sailors were tyrannized and brutalized themselves -- by the captain. They channeled their frustrated wrath into cruelty toward blacks.

The sailor's situation was not much better than the slave's. Often he had been forcibly recruited while drunk; other times he was a prisoner or debtor the condition of whose freedom was to work on a slave-ship. After the ship had arrived on the coast of Africa it would sit for five to seven months as it filled up with human commodities; the subsequent voyage to the Americas took two or three months. During all this time it was the seamen's duty not only to sail the ship but also to guard the slaves and take care of them. For instance, during the daytime hours when the slaves were on deck, sailors went below to clean their 'apartments.' This entailed emptying the tubs of urine and excrement and scrubbing the deck to remove all the filth. Mortality among sailors was sometimes even higher than among slaves: they succumbed to African diseases, poor food, and harsh treatment by the captain and officers. Mutiny, desertion, and piracy were not rare. Upon reaching the West Indies, captains typically discarded sailors who had proved rebellious or were in a bad condition for some reason or other, with the result that Caribbean ports and coasts teemed with seamen scurvy-rotted, starving, and dying.

Sailors did fight back, on one occasion memorably: in Liverpool in 1775 thousands of them struck for higher wages. Together they went to the local prison to free their comrades, and then for two days they set about unrigging and immobilizing ships in the harbor. At the Mercantile Exchange the merchants rebuffed their wage-demands; again the next day the sailors met with no success but were ordered to disperse. Instead they began throwing bricks at windows, whereupon the besieged merchants fired on them, killing several. For the sailors, this meant war. The following day, therefore, the strikers broke into gunsmith shops and warehouses, and even commandeered horses to drag ships' cannon up a hill from which to fire on the wealthy slave-trading district. "As shot rained down on the center of business, privilege, and power, terror gripped the city" (p. 256). Men broke into the homes of the wealthiest merchants and destroyed their property. At last a regiment arrived from Manchester, which soon put down the rebellion.

Worse off than the sailors, however, were the slaves. The numbers involved are staggering. Over the nearly four hundred years of the slave trade, about 14 million people were captured, 1.8 million of whom died in Africa, another 1.8 million during the Middle Passage, and 1.5 million during their first year in the New World. The golden age of the slave trade, to which Rediker confines his analysis, was from 1700 to 1808, when the trade was abolished. During this period the slave ship was a world unto itself, a machine perfectly calibrated for transforming humans into commodities. Its very structure and dimensions, as well as the peculiar devices of torture and control with which it was outfitted, served the function of creating a terror regime that was meant to extirpate humanity. It never wholly succeeded. Rediker devotes much of the long chapter "From Captives to Shipmates" to slave resistance on the ships, which took a variety of forms. Chained to each other belowdecks, men separated from women, the slaves sometimes sang. "Song was an essential means of communication among people who were not meant to communicate" (p. 282). Through song they could communicate information and "forge a collective identity." Storytelling and drumming were other means of resistance, of asserting humanity. The Africans spoke different languages and were from different, sometimes hostile, cultures, but in the bowels of their floating prison they found ways to communicate and overcome mutual hostilities. It is not exaggeration to say that they constructed a collective identity in opposition to whites; they forged an identity as *Africans* or *blacks*, a single people oppressed by white demons. Miraculously, they were able to coordinate insurrections, hunger strikes, mass suicides (to return home in their afterlife), and they created new bonds of 'fictive kinship' that would carry over into the New World. "In a dialectic of stunning power," writes Rediker, "the community of mortal suffering aboard the slave ship gave birth to defiant, resilient, life-affirming African-American and Pan-African cultures" (p. 307). It is indeed a magnificent confirmation of Hegel's master-slave dialectic: the slaves went on to found cultures of Christian love and soulful living -- the Negro spiritual, gospel, ragtime, blues, jazz, arts of sublimated emancipation -- while the slave-masters' culture, based on

idle leisure and violent exploitation of a productive people, withered away.

Rediker also touches on the abolitionist movement at the end of the eighteenth century, showing how it made advances by invoking the reality of the slave ship. The famous *Brooks* image of hundreds of blacks crammed together on a ship was republished many times around the Atlantic; according to one abolitionist, it made “an instantaneous impression of horror upon all who saw it” (p. 309). In this way, the diabolical design of the ship, perfectly suited to its task, itself contributed to the eradication of the slave trade.

The Slave Ship is such a thorough, well-researched and well-written book that it is hard to find faults with it. Perhaps, ironically, it is *too* thorough: the stream of anecdotes surges on relentlessly, such that the book becomes repetitive and almost tiresome at times. It could have been fifty pages shorter without losing any of its power. Instead of hammering the reader with yet more instances of cruelty and barbarism, Rediker could have devoted some of those extra pages to a discussion of how French ships differed from British ones, or whether there were significant differences between the slave-trading practices of the Portuguese and the British. The author also could have spent more time describing the fate of Africans after they had disembarked in the West Indies or North America, and how their fates diverged from region to region.

Nevertheless, if a book is to be judged by how well it fulfills its author’s intentions, *The Slave Ship* is an admirable success. It portrays in vivid detail the conditions of life on a ‘slaver,’ and it rescues from historical obscurity the heroism of all those Africans who resisted their enslavement. Appropriately, it ends on a note of affirmation: testimony from discarded sailors on the Caribbean shore, disease-ravaged wrecks of former men, relates that when the white world had turned away from them, blacks carried these living cadavers into their huts and tended to them, their former tormentors. And when the broken bodies finally died, it was blacks who buried them. In the darkness of a nightmare, a flicker of humanity.

It is well known that the New Left of the 1960s was not a classically revolutionary movement, nor did it emerge from classically revolutionary conditions. It was primarily a movement of middle- to upper-class white youth and was centered around universities in San Francisco, New York, Madison, Ann Arbor, Austin, and a few other places. Historians have long known that it was the product of a ‘post-scarcity’ culture and was fueled by students’ alienation from mainstream society. It is surprising, therefore, that not until Doug Rossinow’s *The Politics of Authenticity: Liberalism, Christianity, and the New Left in America*, published in 1998, did an author argue that the New Left’s origins lay in an existentialist yearning for personal and cultural authenticity rather than solely in outrage against social injustices. “More than a new existentialist departure in a continuous history of leftist agitation,” Rossinow writes, “the new left was a newly insurgent departure in a continuous and multifaceted history of existentialist hopes for authenticity” (p. 164). Thus, the New Left should be located, first and foremost, in the existentialist tradition, not in the leftist tradition. It adopted a radical politics through its encounter with the civil rights movement in the South, which students interpreted as a rebellion against the inauthentic, rotten, artificial, alienated society they themselves abhorred. Rossinow analyzes students’ existentialist rebellion by focusing on their experiences in Austin, Texas, although he also considers extensively the trajectories of the New Left movement as a whole.

The Politics of Authenticity is divided into two parts: the first considers ‘existentialist’ developments at the University of Texas in Austin during the late 1950s and early 1960s, while the second considers the later history of the New Left in Austin and around the country. Austin in the 1950s was a very conservative place, from which liberals of secular and Christian persuasions were decidedly alienated. Christian liberalism and existentialism, however, associated with the writings of Dietrich Bonhoeffer, Paul Tillich, Gabriel Marcel and others, became influential at the university through the presence of two institutions: the Christian Faith-and-Life Community and the YMCA-YWCA. Here, the social gospel was preached and lived as “young people, influenced by existentialism, came to believe that activism was the path to authenticity” (p. 85). They studied existentialist authors like Tillich and Albert Camus, but more importantly, they manifested their commitment to spiritual ‘wholeness,’ anti-conformism, authenticity,

freedom, love and personal regeneration by taking up the cause of civil rights. White and black students mingled at the university Y, which desegregated itself in the 1950s, and the whites came to identify with the emerging Southern struggle for racial integration. Indeed, secular white students too yearned for a social life in which blacks and whites could be 'natural' around each other, in which the vision of a 'beloved community,' free of estrangement, could be realized. After the 1960 sit-ins in North Carolina, students in Austin therefore began their own interracial sit-ins and stand-ins at movie theaters and other venues, with some success. Activist organizations spread among Christian liberals. Rossinow suggests that the interracial contact of the civil rights movement in Austin and elsewhere affected white students more deeply than anything else, pushing them to the left. It was in fact "the annealing experience" in which the New Left was formed.

All that came before [the civil rights experience] -- Christian liberalism, secular liberalism, libertarianism, existentialism -- might have come to very little, politically, had it not been for the moral challenge that the civil rights movement presented and the deeply personal meaning it held for young white activists. This experience told them that although they were implicated in a rotten society, they could be redeemed. It told them they could feel love and acceptance and that they could spread these things outward.... It also helped push the 1950s quest for authenticity out of the realm of the individual self. Instead, in the 1960s this quest became a search for a 'whole' and democratic society [p. 151].

In part two of his book, Rossinow discusses the many directions in which this search took the New Left. The antiwar movement, the counterculture, feminism, environmentalism, the co-op movement -- all were expressions of the urge to overcome forms of alienation that the affluent society had produced. New Left activists were endlessly asking themselves which group evinced the most authenticity and hence had the greatest revolutionary potential: was it the poor, young people, women, blacks, workers, or all of these? Participatory democracy was celebrated, for instance in the *Port Huron Statement*, as the most authentic kind of political experience, and it was practiced as well. One of the main differences, in fact, between the old and the new left was the latter's attempt to *live* the new world, the future authentic culture, rather than simply 'bring it about' politically. This is related to the New Left's emphasis on cultural revolution rather than 'mere' political and economic revolution. A change in *values*, in *lifestyles*, was the desideratum; the youth would embody the new culture in their daily life, and they would work to bring it about through political activism. Rossinow distinguishes between the counterculture and the New Left, but he argues that they both belonged to the larger youth existentialist movement and rejected mainstream society for the same reasons, as being a culture of death, dishonesty, and repression.

The New Left branched off into new movements in the late 1960s, but these too manifested the broadly existentialist orientation to social change that had been evident a decade earlier in Austin. Environmentalists, for example, sought an end to estrangement between humans and nature. As one participant stated, "Nature is not where the skin stops. We exist in nature, not with it" (p. 279). Insofar as both Communism and capitalism demonstrated a hubristic urge to control nature through technology, they were equally alienating. The proper goal was to live harmoniously, not to dominate fellow humans and nature.

A particularly successful movement that arose in the late 1960s was feminism. Women had come to see in the New Left an overt sexism that was supposed to be justified by the fact that mainstream society had emasculated men. Masculinity had been domesticated and attenuated by bureaucracy and 1950s social norms; young men were now determined to reclaim their authentic manhood. In practice, however, this led them to lord it over women in such organizations as SDS. Women rebelled against the equation of authenticity and masculinity; they sought their own authentic womanhood in response, launching thereby a powerful critique of sexism. Some activists focused on sexual liberation and a critique of monogamy, while others advocated for women's rights over their bodies in connection with abortion. The point is that the common goal uniting all their efforts was existential empowerment and cultural revolution, an end to the objectification and subordination of women.

Rossinow is very sympathetic to the New Left's attempt to forge a more meaningful politics and culture, but he argues that ultimately it was unsuccessful. "In the end, the new left achieved instead a holistic consumer society, naturalized sexual commodities, a less bureaucratic university education, and an authenticated capitalism: a softened social experience for themselves, not a transformed society" (p. 295). Moreover, he sees in contemporary society the same search for authenticity that took a political turn in the 1960s; now, however, it has become apolitical, more personal and 'therapeutic' in orientation. All these judgments are surely correct and not very controversial; few participants in the New Left, for example, would now claim that they succeeded in their overall goals. What is controversial is Rossinow's existentialist reinterpretation of the New Left, his placing it in the tradition of middle-class revolts against anxiety and cultural alienation rather than leftist revolts against oppression. How much truth is there in his analysis?

It would have been illuminating, first of all, if he had considered in more depth earlier instantiations of the existentialist tradition. There is certainly no dearth of examples to choose from. The 'Beat Generation' of the 1950s comes to mind, as do the existentialist and literary circles in France after World War I and up to the 1970s or later. European fascism in the 1920s and 1930s had the function, for many people, of alleviating anxiety and alienation in what was thought to be a corrupt, selfish, materialistic, individualistic bourgeois culture, uniting the masses in a more authentic and spiritual nationalist experience. Going back further, one could point to the Transcendentalist movement in New England and the Romantic movement in Europe, both of which were occupied with 'spiritual' questions of how the alienated or semi-alienated middle-class individual could live an authentic life. America's First and Second Great Awakenings, too, in the mid-eighteenth and early nineteenth centuries were definitely existentialist in essence, addressing as they did anxieties generated by rapid social change and the perceived breakdown of old traditions and communal ties. The Protestant Reformation itself is plausibly interpreted in this existentialist vein. One can even take this tradition back to antiquity, with such philosophical sects as the Stoics, Cynics and Epicureans, as well as the proliferation of magical and mystery religions in the Hellenistic era, when the Mediterranean world was in flux. In China and India, Taoism and Buddhism arose to salve the anxious soul. Returning to more modern times, one might, ironically, locate the New Right at least partially in the same tradition as the New Left, to the extent that it was a middle-class response to what was perceived as an increasingly degenerate, meaningless, Godless, inauthentic modern culture.

Does it make sense, then, to place the New Left in such a tradition? The answer has to be yes. It is hard to define this 'tradition' with any precision -- certain movements might have an ambiguous character, and such disparate phenomena are classed together that one is inclined to doubt the meaningfulness of the so-called tradition -- but it surely has *some* meaning. And insofar as it does, the origins of the New Left, which Rossinow analyzes in relation to Austin, show that these white youth movements of the 1960s exemplified the existentialist tradition just as well as existentialism itself did. They turned left due to the broader social context of the time, particularly the civil rights movement.

The Politics of Authenticity is an unusually thought-provoking and original book. The controversy it has stirred is justified, but so are most of the conclusions Rossinow reaches about the character of the New Left. The paucity of institutional connections between the Old Left and the New Left is yet another indication that the 'essence,' the social origins and motivations, of the two broad movements differed. Rossinow's book may well stimulate further reconsideration of the continually reconsidered 1960s.

In a sense, writing history is an *intrinsically moral* activity -- although different kinds of history embody different degrees of morality. Writing a 'sympathetic' history of oppressed and forgotten people is the most moral; writing such a history of states and power-structures is the least. But in both cases you're asserting human dignity in the face of the absurd, the absurd and appalling denial of man's dignity implicit in the facts of death and forgottenness. Whole civilizations forgotten, as if they never existed. A total absence of recognition, the cruelest denial of humanity. Historians are like heroic Don Quixotes engaged in a desperate and losing battle against time's inhumanity.

(But that's only from one perspective, like a lot of things in this journal.)

I'm reading articles on structuralism. What I wrote in the paper on Marx's theory of revolution was rather unfledged, intuitive and improvisatory, like everything I write. I want to be more sophisticated. So: "The Offspring of Functionalism: French and British Structuralism" (1991). "Sociological Reductionism' from Parsons to Althusser: Linking Action and Structure in Social Theory" (1982). "Marx and Parsons in Soviet Sociology" (1974). "Parsons' *Structure* in American Sociology" (1988). "Social Theory and Talcott Parsons in the 1980s" (1985). "*Structure* After 50 Years: The Anatomy of a Charter" (1989). "On Social Structure" (1940), by Radcliffe-Brown. "What Is Structuralism?" (1969). Other articles just for the hell of it: "Psychoanalytic Psychology of the Self and Literature" (1980), on Heinz Kohut's self psychology. "Protestantism and the American Labor Movement: The Christian Spirit in the Gilded Age" (1966), by Herbert Gutman. "Workers' Control of Machine Production in the Nineteenth Century" (1976), by David Montgomery. "Objectivity Is Not Neutrality: Rhetoric vs. Practice in Peter Novick's *That Noble Dream*" (1990), by Thomas Haskell. "New People of the Newest South: Prospects for the Post-1980 Immigrants" (2009), by Leon Fink. "Reconciling the Old Labor History and the New" (1993), by David Brody. "Communism and the Great Steel Strike of 1919" (1951). (The epithet "Commie!" as an invaluable weapon with which to break the strike.) "The Task of Cultural History," "The Political and Military Significance of Chivalric Ideas in the Late Middle Ages," and "The Problem of the Renaissance," by Johan Huizinga.

One reason why I tend to have less respect for a person the more educated he is is that education often indoctrinates him out of common sense. Chomsky has made the point many times, but I've seen it borne out repeatedly in personal experience. It's true that if you go to certain areas of the country and talk to uneducated people, you can be sure to encounter some pretty ignorant and prejudiced views. But I suspect that common sense is right below the indoctrinated surface, and if you simply appeal to their experience and knowledge of the world, you'll find that in ten minutes they start agreeing with you about the evils of big business, the necessity of popular struggles against business, the virtues of direct action in the realms of the economy and politics, the value of labor unions, the importance of environmental issues and a host of other 'liberal' concerns, and probably even the fact that immigrants, gays, etc. are infinitely less a problem than Wall Street. Of course there are stupid people and ideological fanatics in every social class, but my hunch is that most people in the lower classes, especially minorities, have an ample reserve of common sense and sympathetic humanity. I hear it sometimes in conversations among African-Americans on the train -- rants against the 'big criminals downtown,' politically sophisticated explanations of inner-city poverty. With the average educated person, on the other hand, the 'indoctrinated surface' is very deep. These people have all kinds of intellectual defense-mechanisms, sophisticated tricks of argumentation, tactics of evasion, excuses for the behavior of power-structures, and beneath it all is a fundamental lack of seriousness and *humanity*. They've been indoctrinated out of their humanity. It's a truly contemptible sight -- privileged people giving excuses for not caring about the multitudes.

Institutions tend to extirpate humanity. You talk to people outside institutions or who haven't internalized institutional norms and you encounter sensible, compassionate humanity; you get near institutions and you get farther away from both intelligence and morality.

I asked Chomsky his opinion of Habermas. Ten minutes later received this: "I don't know Habermas's work very well either. The reason is that when I've read some of it, I didn't find much that encouraged me to go on. I don't see much in the way of "theory," but that's no objection. Most of what he says sounds rather reasonable, but as far as I can tell not particularly novel or far-reaching. Others have tried to explain to me what they find important in his work, but I had the same impression. It could well be that I am missing something. I'm open-minded about the matter, and if instructed, will be glad to learn. But to be frank, it's just not a high priority for me."

Why are women often attracted to 'innocent' young men, 'pure,' 'sweet' boys? Yuja has a mini-crush on a 24-year-old Polish boy, although she doesn't want to date him because he's too young. "For some reason, I keep having feelings for the young Polish boy. He is so darling!!! I think the reason I like him is that he's always very innocent, simple, pure like a crystal." To say it's their 'mothering instinct' doesn't explain much. I want to know the phenomenological mechanisms. What exactly is going on in their

consciousness? They find ‘sweet’ young men irresistible...but what is this ‘sweetness’ and this ‘irresistibility’? The former is a childlikeness, a vulnerability, a lack of ‘hardness’ or worldly ‘cockiness,’ a perceived sensitiveness and kindness, an almost feminine immersion in the immediate moment, a perceived lack of the sophistication necessary to dissimulate and manipulate, a simple *sincerity*. This kind of man has no mask (or such is the woman’s impression); his self is *right there*, plain on his face -- he has an ‘open’ face, a soulful face of goodness and sincerity, an uncorrupted, childlike self. All this means that she can make a connection with him, she can directly connect with his self, so to speak, more intensely and closely than with a sophisticated and mature man’s self, which is relatively hidden behind the worldly and somewhat cynical exterior. A woman tends to crave such close and immediate connectedness. In addition, she wants to be able to make an impression on her man; she wants to be needed, loved, valued -- wants to become a part of the man’s sense of self, and thereby have her own self confirmed in the world. (The man has the same desire with respect to the woman.) Her feminine nurturing of the man is a way of being valued by him and thus of valuing herself (through him), ‘realizing,’ so to speak, her prior implicit self-valuing. (That’s what people want, to *realize* their implicit but so far ‘imaginary’ self-love/self-valorization. They want to *validate* their self-love.) But with the sweet boy, she can not only nurture him but also *protect* him, protect him from the cruel world that threatens to destroy the beautiful openness and transparency of his self, his good-hearted and naive sincerity. Thus she is, or sees herself as, particularly important to him, and so is attracted to him for his being a powerful way of confirming her value. (Don’t think this is implausibly ‘underhanded’ or selfish. People tend to like another person to the extent that he confirms their value to themselves, for example by liking them or relying on them or whatever.¹) In fact, the sheer direct connection with another self that she craves, which I mentioned above, is itself desired on account of the confirmation (‘recognition’) of her self that it entails.

Of course, the fact that he’s male is important too. His being male means that he is the archetypal other, whose recognition is most valuable. Many of his traits are quite feminine, but the fact of his masculinity hovers above them all and ‘filters’ them. Indeed, another way to explain his appeal to the woman may be to point out that his feminine character allows her to half-consciously identify with him or to feel closer to him than to stereotypically masculine men; she senses an affinity between the two of them. But since despite his femininity he remains a man, the affinity coexists with a romantic spark and sexual tension.

Incidentally, a male pedophile’s attraction to innocent, sweet girls or boys differs strikingly from a woman’s attraction to the sweet, innocent young man. It is really an extension of the masculine love of women (who are loved, at least implicitly, as being relatively innocent, sweet, pure, childlike, delicate, beautiful). The woman’s attraction to the sweet boy, by contrast, is not an ‘extension’ of her attraction to men but exists almost in tension with it. She is attracted to men, after all, for virtually the opposite reasons (their strength, activeness, maturity, dominance).

And why are men attracted to feminine sweetness, beauty, passivity, childlikeness, etc.? Partly for one of the reasons that women themselves are, and everyone is (as a human being): these qualities signify a receptiveness to the other. This is in fact a very important element in the masculine love of women. Women ‘receive’ men openly, spontaneously, appreciatively, such that the man’s self is validated/confirmed. Men love being with these receptive, laughing people: the man’s sense of, and desire for, self-certainty (-confidence, -value) is being reinforced. But the element of physical beauty is important too. And that’s harder to explain, not least because beauty is impossible to define. You know it only when you see it. And what does the pleasure of looking at it come from? It’s just a brute fact, unexplainable, unanalyzable. Or maybe that’s wrong. Maybe it’s misleading to refer to the ‘pleasure’ of looking at a woman: the point is that implicit in the male’s look is the half-conscious desire to *touch* the woman, and a sort of *anticipation* of touching her. The look is a sensual act, an implicit touching, or desire/anticipation/imagining of touching. And to touch a woman, to caress and squeeze her, is to assert oneself, to act, to confirm one’s being in the world, the presence and reality and thus value of one’s self. This also explains the frustration implicit in merely looking at a beautiful woman: the half-conscious

¹ La Rochefoucauld, as I’ve said before, was right, but he expressed the insight in an unnecessarily negative way.

desire/imagining of touching her is being thwarted. The same 'act,' therefore, is both pleasurable and unpleasurable.

The reason it isn't particularly pleasurable to look at a man is that the man's physical features don't convey *receptiveness* or *passivity*, as the woman's do (in a virtually unconscious way). Feminine features - softness, plumpness, curviness, even the 'gentle' facial features -- express (to the man), on an intuitive, instinctual level, a *needing-to-be-touched*, *yearning-to-be-touched*. [...] Action, after all, is pleasurable because it is self-confirmation, self-projection-into-the-world, and action on a woman's body is especially pleasurable because it means acting on another self -- being valued by this other self, this receptive self, giving it joy and pleasure, and thereby having one's own self be validated.

All this shows, incidentally, that Merleau-Ponty was right that there's such a thing as bodily intentionality, and that much of it is an extension of the *self's* intentions. (Actually, I don't know if he argued the latter claim, but it's true.) Whatever has to do with recognition, interpersonal interactions, etc., has to do with the self.

By the way, don't reject all these phenomenological analyses just because you think it doesn't make sense to say that thoughts or perceptions of which we're not explicitly aware are present in certain attitudes or states of mind. That happens all the time; *in every moment* things are happening in our consciousness that we're not 'reflectively' aware of, i.e. that our attention isn't focused on, but which can be brought to our attention in an instant. A second ago I wasn't fully 'aware of' the sensation of the chair pressing against my thigh, but now I am because my attention has been brought to it. *Intentions*, too, can be present in consciousness half-consciously (or 'unconsciously,' so to speak), from moment to moment.

After reading about Thomas Thistlewood and Jamaican slavery in the eighteenth century -- reading alone in a dark and empty apartment at night -- one has to clean oneself with the slow movement from the Archduke trio. Thistlewood the slave master who kept a diary of his practices but didn't comment on them, didn't reflect on his feelings or those of his slaves, just matter-of-factly recorded daily events without self-consciousness. Considered himself a man of the Enlightenment, was interested in botany and horticulture, read books. But the punishments he meted to his slaves -- no different from the punishments other plantation-owners visited upon their slaves in this probably most brutal of societies in history -- are not light reading. Of course the daily floggings and the sexual predations on his female slaves and all that. But also his invented tortures, like having a slave defecate into another's mouth and then wiring the mouth shut for hours. How do you reconcile these practices with Thistlewood's self-conception, his civilized Britishness, his intelligent ordinariness? The answer is obvious, but it says a lot about humanity. As I've said before, it's all about *categorizing* people. One feels sympathy, compassion, empathy to the extent that one *identifies* with another, categorizes him as an extension of one's self. Blacks were seen as not fully human, etc. The human capacity for *abstraction*, for *mediation* -- that most lethal and most magnificent capacity, which has led to man's villainies and glories -- allowed whites to mediate their experiences of blacks with the ideas of inferiority, filthiness, semi-subhumanity, *dirty otherness*. Hence, no self-identification of whites with blacks occurred, and so no pity or compassion. Blacks, while acknowledged to be human, became for whites effectively objects (of a nasty sort), like Jews in Nazi Germany. Whites could do whatever they wanted to them while still retaining in their own eyes a civilized humanity.

The postmodernist Lyotard speaking in 1987 on his famous little book that brought the term 'postmodernism' into general circulation: "I made up stories, I referred to a quantity of books I had never read, apparently it impressed people, it's all a bit of a parody.... It's the worst of my books, they're almost all bad but that one's the worst." This statement expresses the general attitude of postmodernism (with some exceptions). Making up stories, adopting an ironic and self-parodying stance, playing games with oneself and others, not taking things too seriously, not caring about intellectual rigor and honesty or science or the accumulation of knowledge. Playful solipsism. Culturalism, literary expression over communication, the 'play of signifiers' over genuine argument. It's more appropriate to the analysis of literary and artistic creations than to the sciences or social sciences, because art criticism usually has less to do with truth, seriousness, 'fixed meanings,' intellectual standards, than with playful interpretations of artworks,

experimental probings of possible meanings, nuanced investigation of forms, artistic and linguistic self-reference that has no contact with an external reality, streams of consciousness that don't reach definite conclusions, speculative masturbation. Hence, postmodernism had great influence on artistic and cultural analysis and less on the sciences and social sciences. The latter march on much as they did before, while postmodernism is dead -- or at least you rarely hear about it anymore.

By the way, one reason phenomenology was so attractive to a lot of postmodern thinkers is that it has tendencies to solipsism, it makes no reference to a world outside consciousness. Husserl enjoins thinkers to ignore the 'objective, external world' and analyze 'ideas' instead. So then later on you have European postmodernists, influenced by Husserl and Heidegger, saying that there *is* no external world, there is nothing outside language or discourse or whatever they choose to call it. It's just subjective idealism jargonized for the benefit of a more sophisticated and less honest intellectual class. Nothing but meta-stupidity. Questions about causes and explanations of phenomena cannot even be raised -- like, explanations of language, or digestion, or anything else -- because in the idealist scheme, it makes no sense to talk about causes the operations of which we're unaware of (because there is nothing outside consciousness). So natural science is thrown out the window -- as should have been obvious anyway because it refers to mind-independent *matter*, but Berkeley and Schopenhauer and Ernst Mach and the logical positivists somehow managed to overlook that fact.¹

It's ironic, isn't it, that the logical positivists can from one perspective be lumped together with poststructuralists: they both effectively denied or ignored external reality, though in different ways and for different reasons. It isn't surprising, though. Even as science has made giant leaps forward by investigating a mind-independent physical world, the progress of modern society has made the individual ever more internal to himself, more skeptical of the world, set in opposition to the world, fixated on his consciousness (or his 'sense-data'), more *aware* of himself as an individual distinct from the world. Hence you get phenomenology, existentialism, logical positivism, postmodernism, personal and subjective worldviews of all sorts.

....Not all postmodernists were neo-'subjective idealists,' but nearly all were idealists of the more general anti-Marxist sort. Because they were obsessed with language and so-called discourses, most of them had little interest in sociology or social history, economics or economic history, analysis of material conditions, class-structures, the state, business, 'non-discursive' institutions. They basically ignored everything of real importance. In historiography, they had far more influence on cultural and intellectual history than anything else. In all his histories of madness, sexuality, the prison system and whatever else, Foucault somehow was able to disregard class, the economy, and the state, a fact which itself proves that he wasn't a serious thinker. He was essentially a rhetorician and an artist-historian, a historical artist who was prone to periodic flashes of insight. (He takes great liberties with the facts, his scholarship is one-sided and unreliable, but his writing can be beautiful and occasionally insightful.) But all this idealism and sloppy thinking was appropriate to a time (post-1960s) when Marxist hopes had died, intellectuals were disillusioned with the working-class and class analysis, business was on the offensive against progressive movements -- formerly radical intellectuals had become socially irrelevant, so they retreated into their little academic world and pretended to effect revolutions in *theory*, devoted themselves to playing around with language and discourses and texts, declaring that these were the only realities. They were making a virtue of necessity: they had been outcast from social reality, so they decided that social reality was an illusion; only discourses, only *their* world, existed. It was collective therapy, or rather collective self-justification.

¹ For the philosopher-casualists: I know the logical positivists didn't self-identify as idealists. But they wanted to avoid the 'metaphysical' question of the existence of mind-independent matter, so they recognized only sensations, sense-data, logical constructions out of the latter, etc., which means effectively that they were idealists. (Bracketing the external world, admitting only consciousness, sense-data, language, logic, mathematics, and trying to construct a philosophical system around sense-data as if 'matter in itself' didn't exist. -But sense-data are private, internal to consciousness (by definition, since we're aware of them) -- don't try to get around that fact through some philosophical trick or other -- whereas science makes reference to events external to consciousness. Ergo, the logical positivists were morons. Q.e.d.)

Postmodernist arguments, such as they were, should not be read on their own terms; they should be read as symptoms, as clues of a social malaise and of the post-1960s relation between particular intellectual institutions and the broader world. (For example, what kind of inter-institutional relations would result in the production and popularity of postmodernist tracts?)

Moreover, postmodernism was *allowed* to be influential -- it made it through institutional filters, as Chomsky would say, media filters, economic and political filters, academic filters -- because it played into the hands of business and political power. It didn't challenge consumer capitalism but in a sense justified it, celebrated it, proclaiming that 'simulacra' were the only reality, that television was the new reality, that social class was just a 'construct' and not very important -- thus effectively encouraging people to accept the world as it was and not to fight economic power. Any potentially oppositional 'discourse' that reeks of solipsism or masturbation will be favored and propagated by powerful institutions, because it militates against social engagement.

...Me and Chomsky:

I've been reading the logical positivists. I have one question for you. It seems as though their attempt to formulate or 'reconstruct' science in terms of sense-data was doomed from the start, because sense-data are surely internal to consciousness (by definition, since we're conscious of them), whereas science makes constant reference to 'mind-independent' external events in the physical world. On the one hand, then, you have 'private' sense-data, while on the other hand you have 'public' matter (physical processes 'out there' in the world). The logical positivist project therefore seems essentially contradictory. Do you agree?

On a related topic, I find it peculiar, to say the least, that subjective idealists like Berkeley and Schopenhauer could deny that their philosophy makes natural science nonsensical. For it seems obvious that scientific explanations of, say, digestion, which are in terms of physical processes external to consciousness, contradict subjective idealism, which proclaims that there is no reality external to consciousness.

I think the basic answer was given by Russell, in the 1920s. As he observed, we accord highest confidence to our own direct experience. We then try to construct a conception of the world that makes sense of it. The parts of that effort that are conscious and undertaken in a fairly controlled and considered way we call "science," and we accord less confidence to what it postulates. Among the entities sometimes postulated are sense data -- they are not "given." Others are taken to be mind-independent.¹ I don't think there's any contradiction.

They would presumably respond that natural science may be exactly correct, except in its assumption that it reaches to a world beyond consciousness. It might be, say, that Newton's laws predict the conscious observations that we seek account for, but that we go too far in assuming that they exist independently of the mind.

Yes, that's what I don't understand -- how idealists can deny that science reaches to a world beyond consciousness. Science postulates that things like cells and atoms exist and have causal interactions when we're not aware of them. That claim, that 'realism,' is the essence of every scientific hypothesis; it is precisely how science is able to explain anything at all.

¹ [But is that true? I thought logical positivism was committed to avoiding 'metaphysical' talk about a mind-independent external world and such.]

From another email Chomsky sent me: "In my view [existentialism] is only interesting as an illustration of cultural pathology, in France probably the result of their loss of perceived status as the world cultural center after WWII, and the suppressed guilt about collaboration. There's nothing 'absurd' or 'meaningless' about our existence, as everyone knows who has a family, friends, interesting work, concern for other humans and their fate, etc." He's basically right, but still, this is another example of his closed-mindedness about philosophical positions with which he disagrees. It seems to me that existentialism has a kernel of intellectual honesty, that it expresses real doubts and confusions about life that humans have had for millennia.

*

Death-ambition.-- My life-ambition is that I'll still be read 500 years after I die.

*

Mainstream laziness.-- Nothing is easier than to be agreeable. What one should strive for is to be 'disagreeable' -- to provoke out of shallow complacency.

*

The acid test.-- You can tell how morally and intellectually serious an 'intellectual' is by how familiar he is with Chomsky's works.

*

Noam Chomsky.-- One would not have thought it humanly possible were there not a human who had proved it possible.

*

Silliness.-- I respect a man for collecting a lot of women as little as I respect a man for collecting a lot of money.

*

Epiphenomena.-- Postmodernists rebelled against the idea of a social *reality*, against society itself -- withdrawing into their cocoon of literary theory and discourse-mongering -- even as, and because, they implicitly accepted and embraced the new social reality of consumerism, narcissism, fragmented selves, fragmented ideologies, and political disenchantment. Their contempt for social reality was an expression of social reality.

*

The internal external.-- Men see women's bodies as *intrinsically sexy*: the delicious sensuality is in their flesh, an essential part of it. It isn't projected from us to them, a projection of our desire. It is *there*. But this is how the brain sees everything; all the world's properties that we perceive are seen as external to us even though the brain constructs them.

*

Happiness and social norms.-- The best part of life is women. The worst part of life is not being

permitted to enjoy the best part.

*

Life.-- Listen to a festive Irish fiddle, think of peasants dancing outside in the spring, shouting, cheering, clapping, and you can't not love being alive.

*

Anatomy of human destructiveness.-- What makes possible cruelty and violence? Dis-identification with the other. This is the universal condition, the condition even for *self*-cruelty and -violence -- dis-identification with oneself (which is a kind of other). In fact, whether the violence is directed inward or outward, a lack of identification with oneself *and* with the other is occurring, because the other is a projected instantiation of one's self and one's self is an internalization of the other.

*

Wright vs. Chomsky.-- Chomsky's writings tend to lack 'human interest' and psychological depth; my writings lack immense command of facts and perfect clarity of logical vision.

*

Two thinkers.-- What makes them great is the fusion of creativity with an intellectual disinterestedness as close to pure objectivity as is possible for the human mind. Many people have one quality without the other; few have both.

*

The otherly other (the beautiful other).-- Why do men get so excited to see a woman naked? Why is there such desire to see the breasts underneath the t-shirt, the buttocks and vagina underneath the miniskirt? Because that is to see the *woman* in the woman. It is seen as the feminine self, the beautiful other's essence, which is maddeningly concealed. To see, and then to act upon -- and to act upon implicitly in seeing -- and so to assimilate.

*

On Nietzsche.-- One cannot overcome oneself, not literally. But figuratively one can, and to do so is noble both morally and intellectually. It is to achieve greater power over oneself, for one is detaching oneself from prior uncritical attitudes and predispositions and consciously trying to commit to new ones. Ironically, so to self-detach oneself is, in a sense, to affirm oneself on a higher level, for the part of the self doing the detaching is the crucial part, the *active* part. However, the psychological essence of the self-detaching can be, as Nietzsche says, either healthy (*deeply* self-affirming) or pathological (*deeply* self-rejecting, however superficially self-empowering it seems to be).

*

Self-unclarity.-- I wish somebody would interpret me, write a book on my ideas, so I could understand myself.

*

Self-enclosure, happiness.-- The times I feel most myself, most at home, are when I'm alone with my journal and my music.

(But 'self-enclosure' need not entail solitude. In fact, usually it entails self-reflection in a friendly other. I'm just unusual, that's all. I self-enclose myself by creating and listening to beauty.)

*

Sorry, Beethoven.-- The 'healthiest' music ever written, the 'purest,' is that of Bach, Handel, and Mozart.¹

*

Life for its own sake.-- The universal fear of death shows that in life itself is a profound, though profoundly subtle, pleasure.

*

Wisdom in language.-- Politicians used to 'stand' for election; now they 'run' for election.

*

Old habits.-- Two hundred years ago, Southerners complained about the haughtiness and unfriendliness of New Englanders. Nowadays, Southerners complain about the haughtiness and unfriendliness of New Englanders.

*

Against politically correct stupidity.-- According to a scientific study, women with congenital adrenal hyperplasia "as a group have a lower interest in getting married and performing the traditional childcare/housewife role. As children, they show an unusually low interest in engaging in maternal play with baby dolls, and their interest in caring for infants, the frequency of daydreams or fantasies of pregnancy and motherhood, or the expressed wish of experiencing pregnancy and having children of their own appear to be relatively low in all age groups." In other words, shockingly, adrenal glands, sex steroids, and genetic mutations play some role in determining the sexually differentiated behavior of men and women, and 'socialization' isn't everything. Only someone highly educated, i.e. brainwashed, would have to be told this.

*

On Andrew Jackson.-- With him, for the first time, you see the baleful essence of the political appeal to the 'common man,' i.e. the common conservative white man (who might also happen to be a white woman). Later on the same phenomenon would underlie modern conservatism, as in Reagan and Bush 2 -- except that this time the rhetoric about simplicity and old-fashioned values would disguise a servility to big business, which is very anti-Jacksonian. In fact, the real meaning of the appeal to the common man would change: with Jackson it was relatively sincere, and there was a genuine aversion to big, undemocratic power-structures as symbolized by the Bank of the United States. Jackson and his Democrats were also ambivalent about capitalism; they were not disguised servants of capital. They were like Jeffersonian Republicans, not Hamiltonians. (In that respect, as in others, their ideology was reactionary and doomed. The future was in wage-labor.) Modern conservatism, however, is more

¹ (Insofar as Beethoven's music induces *joy*, however, it is arguably healthier in a different sense.)

ambiguous than Jacksonian democracy. Among the people, it taps into a real, albeit unconscious and confused, ambivalence about modern capitalism and a nostalgia for traditional security and hierarchy; among the powerful, it is a tool of big business and profit. But elements of Jacksonianism are nevertheless used in business propaganda (i.e. conservatism) because of the implicitly authoritarian, *pseudo*-democratic, demagogic, racist, obfuscatory, divisive, scapegoating, anti-government nature of the Jacksonian creed. Almost any ideology that favors the white man above all is useful to business.

*

The Jacksonian era.-- Despite Daniel Walker Howe's arguments, I think the Age of Jackson isn't entirely misnamed; after all, it was a rough-and-tumble time, a time of exceptional violence, white supremacy, the frontiersman, lawlessness, social transformations affecting everyone from the bottom to the top. 'Democratic' white supremacists were everywhere, though they called forth opposition in women's movements, abolitionism, and evangelical movements. A protracted market revolution was reaching into corners of the country and upending old traditions; the common man opposed it and celebrated it. America's was no longer a 'government of courts and parties'; it was becoming modern, with genuine party rivalries and popular politicking. Between the 1820s and 1840s the American masses took a decisive step onto the historical stage.

*

Stupid white men.-- Ironically, Jacksonian democracy was not wholly in the economic interests of ordinary white men. In this respect, as in others, it is similar to modern conservatism. Specifically, its destruction of the National Bank contributed to years of depression; also, its opposition to federally directed 'internal improvements' like transportation projects -- an opposition that slowed and undermined the market revolution -- was at best of ambiguous use to most farmers and small businessmen. But it did benefit Southern slaveowners, who feared the implications for their power of a highly interconnected national market and a powerful federal government. As usual, therefore, an ideology with emotional appeal to the lower-class white man yielded tangible economic benefits to the upper-class white man.

*

The throes of transition.-- A society in which a Glenn Beck can become a sensation is dying, and deserves to die.

*

The intellectual virtue of humility.-- The fact that intuitively we find it a *complete mystery* how our limbs move -- 'miraculously' -- when we 'will' them to proves the hopelessness of our trying to understand ourselves. Consciousness is sunlight glancing off the ocean's surface.

*

Glib but sort of true.-- Men are about as interesting as plants. Women are not much more interesting. But *people* are fascinating.

*

"Can't take my eyes off you."-- The life of a young man consists of continuous painful sexual frustration.

*

Thoughts on chemistry.-- Lovelorn people agonize over ‘Why isn’t he attracted to me?’ or ‘Why doesn’t she like me?’, but the answer is pretty straightforward. It’s because she doesn’t see him as sufficiently masculine, or he doesn’t see her as sufficiently feminine. Attraction revolves around the dialectic of masculinity and femininity. Either a man is masculine enough (in the eyes of a particular woman) or he isn’t. Either he makes her feel like a woman or he doesn’t. The matter, it must be said, is simpler in the case of men: anything that’s pretty and breathes is attractive to men. How he ‘feels’ matters little, except with regard to *love*. Of course, being ‘attractive’ is only one element of the equation; people may choose not to enter a relationship with someone they’re attracted to, or they may not *like* someone they’re nevertheless attracted to.

On a more substantive level than mere ‘attraction’ or ‘chemistry,’ an explanation in terms of masculinity and femininity is inadequate. A woman may hate an exceptionally masculine man, or a man may have contempt for a stereotypically feminine woman. Insofar as people are humans and not just animals, what’s necessary is a compelling (to a given person) admixture of the masculine and the feminine in a single personality. Otherwise the romantic relationship will be dysfunctional, torn between the extremes of activeness (in the man) and passiveness (in the woman).

*

Inured to the barbaric.-- An essential skill for the labor historian is that he learn to suppress his gag reflex. He must overcome nausea in the face of everything that is horrible and despicable in man.

*

The inconvenience of having an intellectual conscience.-- I read labor history because I feel like I should. I read cultural history because I enjoy it.¹

*

Two kinds of realism.-- Humans are innately realists, not nominalists, and realists, not idealists. However, anti-nominalist realism is false, and we can’t know whether anti-idealist realism is true (though it almost certainly is).

*

The essence of man.-- The human spirit (the self) has three major manifestations, which are experientially united but can be analytically distinguished: to freely understand, to freely create, and to freely love. The frustration of one or more of these urges may result in psychological disorders.

*

Talent vs. genius.-- Emerson’s and Thoreau’s journals are repetitive, self-indulgent, boring, and poorly written compared to mine.

*

One of the best books ever written.-- Every so-called intellectual should read from Studs Terkel’s *Working* before he goes to bed each night. It isn’t ‘how the other half lives’; it’s ‘how the 99 percent lives.’

¹ [Not *postmodern* cultural history, but Huizinga’s and the like.]

*

Drink, fuck, make money.-- As you encounter more businessmen and politicians, you realize that the main problem with the world is that it's run by frat-boys.

*

Life.-- Right now, in this moment, a dozen people are having their fingernails torn out, one by one. Hundreds are burning to death. Dozens are being butchered with machetes. Hundreds of women are being raped. Millions of children are starving to death. And yet I remain a cheerful and happy person.

*

Pigs.-- The role of police officers is not so much to protect *people* as to protect *order*, i.e. power-structures. To ensure people's well-being is at most indirectly related to the cop's vocation, as shown by the regularity of police brutality, their implicitly or explicitly violent behavior not only in any kind of unusual situation but even on the daily beat (aptly named). In general, the police defend specific *social relations* between people more than people themselves.

Said differently, the police officer is the 'bouncer' for society, whose role is to keep out undesirables, those who do not conform.¹

*

Human conservatism.-- People are not primarily reasonable creatures. Underlying their opposition to most things is the argument, 'I'm not used to it.' Once they get used to it, they're not opposed to it anymore.

*

On WikiLeaks.-- In general, if something is bad for power, it is probably good for people.

*

Gramsci's inadequacy.-- What is the relation between Gramsci's explanation for the failure or nonexistence of a workers' revolutionary uprising in the 1920s and 1930s and my own explanation? Gramsci invoked the idea of hegemony: most workers 'bought into' the bourgeois practices and ideologies of popular culture, politics, the economy, etc.; they didn't question the legitimacy of capitalism in any deep or sustained way. But to say so is really just to restate the original question in a more specific way: why didn't workers vigorously challenge hegemonic practices? Why didn't they coordinate massive resistance to bourgeois culture and norms? The reason, obviously, is that business had immensely more economic power and resources than workers, such that the latter could not marshal and coordinate resistance to a business-dominated culture. The terrain of social life was constructed in large part by business: the varieties of entertainment (movies, songs, radio programs) and sources of information that were propagated across societies (such as newspapers) were produced and/or filtered by business interests, in other words on the basis of their compatibility with capitalism. So workers were socialized into a semi-bourgeois state of mind and behavior. Here is where *my* 'explanation' comes in: the phenomenon of bourgeois hegemony was a sort of proof of the fact that capitalism, from a strictly economic point of view, was not decrepit enough to collapse into socialism. The economy itself was not 'ready' yet. Or, from another perspective that amounts

¹ (Yes, I know that's all simplistic and one-sided. I'm talking only about tendencies and ideal-types.)

to the same thing, no alternative mode of production had yet reached some degree of societal maturity or viability. The presence of an already-partially-built-up, 'interstitial' socialist mode of production is in fact necessary for a decisive mass overcoming of bourgeois hegemony, because people need *resources* to resist being socialized into a (semi-)hegemonic set of structures and ideologies. If in their work and play they're immersed in bourgeois structures and norms, they probably won't even *try* to rebel en masse. But if many people have begun to work in cooperative or semi-socialist relations of production around which they can organize their lives, it will be possible for them not to yield to the larger society's still-existing (though weakened) bourgeois norms -- and their resistance will be able to spread as their mode of production does. And *that* will spread as a result of capitalism's strictly economic dysfunctioning in its terminal phase. (More and more people will have to turn elsewhere to gain a livelihood.) Anyway, the point is that 'cultural hegemony' rests on other conditions, and so in itself it does not fully explain anything. Invoking it, while potentially illuminating, does not get to the heart of the matter.

*

'Meaning.'-- A purpose, a goal, a project, self-transcendence, community, recognition, self-confirmation in the world, the realization of self-ideals, purposive self-projection into the world, making a contribution, changing something, making *lasting* change, devoting oneself to something 'other,' love, commitment, faith, hope, spiritual 'ordering,' 'centering' oneself, awareness of *connection*, transcendence of atomizing self-consciousness, transcendence in various ways of the merely 'given,' immersion in the other, passion, truth, authenticity, spontaneity, affirmation.

*

Edmund Morgan: "The rise of liberty and equality in this country was accompanied by the rise of slavery. That two such contradictory developments were taking place simultaneously over a long period of our history, from the seventeenth century to the nineteenth, is the central paradox of American history. The challenge, for a colonial historian at least, is to explain how a people could have developed the dedication to human liberty and dignity exhibited by the leaders of the American Revolution and at the same time have developed and maintained a system of labor that denied human liberty and dignity every hour of the day." I'm not sure it's as paradoxical as he thinks, but it certainly is interesting.

Beautiful irony:

American reliance on slave labor must be viewed in the context of the American struggle for a separate and equal station among the nations of the earth. At the time the colonists announced their claim to that station they had neither the arms nor the ships to make the claim good. They desperately needed the assistance of other countries, especially France, and their single most valuable product with which to purchase assistance was tobacco, produced mainly by slave labor. So largely did that crop figure in American foreign relations that one historian has referred to the activities of France in supporting the Americans as "King Tobacco Diplomacy," a reminder that the position of the United States in the world depended not only in 1776 but during the span of a long life time thereafter on slave labor. To a very large degree it may be said that Americans bought their independence with slave labor.

But not only their independence. Also, perhaps, at least in Virginia, the limited democracy that existed in the late eighteenth century. Morgan points out that almost up to the end of the seventeenth century in Virginia, social tensions between the 'rabble' and the large landowners continually threatened to break out into open conflict, as in Bacon's Rebellion. The problem was that as indentured servants (usually young men) kept being imported to work on plantations, rising numbers of poor ex-servants who lacked access to land swelled the colony. They lacked land because of pressure from Indians on the borders, competition

from other ex-servants, and the rich's monopoly over 'safe' land. The roving population of poor white bachelors, constantly increasing (partly because of longer lifespans), posed a threat to the social order. Gradually, therefore, a turn to black slavery occurred, as planters found that slaves were easier to control, cheaper in the long run, and solved the dangerous reliance on white indentured servitude. As Virginia imported fewer and fewer white laborers -- and at the same time the colony took ever more land from Indians -- it became easier for (the fewer) poor whites to acquire plots of land, which stabilized society. With the rising numbers of small landholders, representative government became deeply ingrained in the social fabric, and the ideology spread of the rights and powers of independent, property-holding yeoman farmers, the rights and liberties of Englishmen. Thus, "it was slavery that enabled Virginia to nourish representative government in a plantation society, slavery that transformed the [royalist] Virginia of Governor Berkeley to the [republican] Virginia of Jefferson, slavery that made the Virginians dare to speak a political language that magnified the rights of freemen, and slavery, therefore, that brought Virginians into the same commonwealth political tradition with New Englanders. The very institution that was to divide North and South after the Revolution may have made possible their union in a republican government."

Also, of course, the presence of blacks as a degraded race at the absolute bottom of the social structure raised the relative status of poor whites and thereby encouraged them to have a stake in the social order, to identify with other whites however wealthy they were. Racial differences confuse(d) and counteract(ed) class differences.

Lance Hill's *The Deacons for Defense: Armed Resistance and the Civil Rights Movement*. (Introduction and Conclusion.) Persuasive argument that, despite the revered narrative, nonviolence as a tactic wasn't particularly successful,¹ and violence and the threat of violence were absolutely essential to the changes that took place. SNCC's peaceful local organizing in the early '60s actually didn't bring about many real, tangible gains: months-long campaigns that succeeded in registering minuscule numbers of voters. Intractable white power-structures, racism, relentless Klan violence; King's "moral suasion," his hopes to shame Southern whites out of racism, failed utterly. In the end the activists had to turn to the coercive power of the federal government. But the government refused to act for years: nonviolence, numberless complaints submitted to the Justice Department, moral appeals, did not bring about legislative reform or enforcement of the laws. Finally in 1964 things were threatening to get out of hand, with black riots and some white deaths, so the government was able to pass the Civil Rights Act -- and enforced it only sporadically, usually when compelled to by violence or its threat. The Deacons, who didn't eschew violence, were in some respects far more effectual than SNCC. They also did more to restore dignity and pride to working-class black men (think of Frantz Fanon's theory), many of whom saw nonviolence as just a continuation of age-old submissiveness and an excuse for Southern whites to persist in their views of blacks as children and cowards. By fighting back, blacks forced local whites to take them seriously. Nonviolence was a useful tactic for getting white liberal support, but without the threat of black violence always lurking in the background it would have accomplished little. ("One of the great ironies of the civil rights movement was that black collective force did not simply *enhance* the bargaining power of the moderates; it was the very *source* of their power.") After all, states are not moral agents, as Chomsky says, that can be swayed by moral suasion; they are power-structures that respond to attacks on, or threats to, their power. In the end, even the reforms of the civil rights era did little to materially improve the situation of most blacks, blacks in ghettos, in rural poverty; they were very good, however, for middle-class blacks. (It's the old revolutionary pattern of poor people doing most of the real work and middle-class people getting most of the rewards.)

Pacifism is admirable but wrong, at least if you want change. For that you have to look at tactics, not adhere blindly to principles.

¹ Also, obviously, it was just a fringe movement -- with the support of the powerful.

Richard Goodwin, one of the best and the brightest, speechwriter and adviser to Kennedy. *Remembering America*, a flabby liberal whitewashing of history. Hero-worship of a young pretty personification of charismatic egomania whose assassination was in fact not all that tragic -- far less so than King's and X's. (Tragedy requires a contrast between promise and reality.) The intelligence of the 'good and bright' overwhelmed by an utter lack of *wisdom*. A McNamara absence of moral imagination. The Vietnam War was an 'error,' the Bay of Pigs invasion a 'miscalculation,' the Reagan terrorism in Central America a 'terrible error,' and so forth; none of this was fundamentally *wrong*, because by definition everything we do is done with good intentions. And through it all, this litany of apologetics and qualified self-criticisms, is an abdication of responsibility (even when momentarily admitting that 'we liberals' were, despite ourselves, responsible for an error or two): the ultimate truth is that our good intentions were ineffectual in the face of reality, fate, bureaucracy, inertia, whatever abstraction comes to Goodwin's mind. It's a rotten book, disgusting.

And the platitudes, my God the pieties! Kennedy the symbol of the American idea, the great man who could have led the country to moral greatness, the "exemplar who led others to discover their own strength and resurgent energy," the man who "fueled the smoldering embers" of the 1960s (terrible writing), who could do no wrong even when he did wrong because at heart he was a hero for the ages, and of course don't forget the gloriousness of America as a symbol, an eternal beacon of light, the ideal of a restless, searching people who expanded to occupy a continent (let's not talk about those other people who had already occupied it for millennia)... But now, alas, we've become a nation of cynics! Ah, if only we had continued to follow the light of reason, the inner American in us all! Woe are we who have lost our faith! - -This nostalgic liberal apotheosis of Kennedy and America and democracy and freedom evinces a mind-boggling moral and intellectual immaturity, a stunning childishness in thought and deed. It signifies little more than the liberal intellectual's celebration of himself, his defense of himself: 'Yes, some of the things we did were wrong: we were too idealistic! We didn't understand the evils of the world. We thought we could use reason to remake the world, but alas, the world is an unreasonable place.' Astonishing, despicable shallowness, being so self-blind as not to see that one's effusive praise of the so-called American idea is nothing but effusive praise of oneself. It's also totally stupid in its own right. Christianity is a far more rational religion than this liberal American one.

'The best and the brightest,' i.e. the worst and the stupidest.

...The book is enlightening, however, as a window into the mind of the Harvard liberal, revelatory of the sort of thoughts this kind of person has, his worldview. Liberalism from the inside. A prettified ideology, bland but appealing, with the reference to spiritual truths, reason, ideals of harmony and peace, a rising tide lifting all boats, the fundamental compatibility of all interests in society (except for those we don't like, of course), the nonexistence of class struggle, government's ability to solve all social ills, history as a progressive battle between knowledge and ignorance, light and darkness, reason and unreason, open-mindedness and bigotry, and any other set of binary abstractions you can think of. The whole ideology hovers above reality in the heavenly mists of Hope and Progress. It's all very pretty, hence its momentary resurgence -- succumbing even now to disillusionment -- with Barack Obama. And hence its ability to get through the filters of the class structure, to become an element in the hegemonic American discourse, floating above institutional realities like some imaginary golden idol one worships in lieu of common sense. It serves a very useful purpose for business, averting people's eyes from the essential incompatibility of class interests toward the idea of Gradual Progress by means of tinkering at the margins, making nice policies.

One is almost surprised at the contradiction in people like Richard Goodwin and Arthur Schlesinger, on up to Robert Reich and Paul Krugman, between native intelligence and blind liberal stupidity. But institutions mold people to fit into them -- or rather, they mold those people who are willing to be molded, i.e. who are ambitious and obedient. However intelligent you are, if you're ambitious you're going to have to let yourself be taught to believe what you have to believe in order to fit into your chosen institution. Thus arises the phenomenon of apparently brilliant people who you suddenly notice have this gigantic blind-spot in their mind that underpins their brilliant maneuverings.

....Lyndon Johnson after his presidency: “I knew from the start that I was bound to be crucified either way I moved. If I left the woman I really loved -- the Great Society -- in order to get involved with that bitch of a war on the other side of the world, then I would lose everything at home. All my programs. All my hopes to feed the hungry and shelter the homeless. All my dreams to provide education and medical care to the browns and the blacks and the lame and the poor. But if I left that war and let the communists take over....then I would be seen as a coward and my nation would be seen as an appeaser.” Evidently it was more important to him that he not be seen as a coward than that he help millions of poor and oppressed. Just the sort of sociopathic megalomania that’s necessary to become president.

[...]

Another question, unrelated: why is it that societies so often seem to return to earlier ‘stages’ but on a ‘higher’ level? It’s a very Hegelian phenomenon. For example, in the first decades of the 20th century, American Progressives advocated a cultural pluralism that would discriminate against no ethnic groups but celebrate them all. A similar movement arose after the 1960s, called multiculturalism. Or consider the fight for black civil rights. In the 1930s and ’40s it was integrated into labor’s battles for economic justice; later, after unions and radicalism had been devastated by the conservative postwar backlash, the civil rights movement reemerged (in the late 1950s) in a different form, this time centered around the black church. Conservative movements too crop up again and again. Think of the Klan after Reconstruction, then again in the 1920s, then again in the 1960s, and then we had Reagan and now the Tea Party. But all these formulations are simplistic and misleading. There are not really sudden ‘upsurges’ like this. Instead, throughout history there is a continuous struggle between people in opposing institutions and conditions -- the relatively disadvantaged fighting for greater power, the relatively advantaged trying to retain their power. At times the conflict will be only implicit, as when slaves resigned themselves to their status or rebelled only in daily acts of trivial insubordination. But given the universal disparity in power-relations and the similarity of particular institutions across society, the potential is always present for a *movement* to develop on the side either of the advantaged or of the disadvantaged. Inevitably, whether it’s a conservative or a progressive movement, it will not achieve its ultimate aims, because it will never be able to *eradicate* resistance (unless it destroys all its opponents and their institutions). Also, even if the movement makes substantial progress, things are always more or less in flux. Populations are growing or shrinking, new institutions are developing, people are migrating between societies, etc. Thus, whatever progress has been made is always being threatened by the facts of change and of resistance from people who sense that their power is being eroded. So, years or decades later, discontent among those people who had earlier made progress will again have reached the point of massive visibility, and a movement similar to the old one will (be said to have) emerge(d), though it will have to deal with new conditions somewhat different from the earlier ones. And intellectuals will judge that a ‘new stage’ of society has been reached, that the ‘dialectic’ has moved one step higher, that the negation of the negation is in the offing. But really on a smaller scale ‘movements’ are frequently or continuously happening against each other; the less powerful are fighting the more powerful and vice versa.

For example, Jacquelyn Hall is right to note in “The Long Civil Rights Movement” (2005) that it’s potentially misleading to formulate the era in terms of (1) progress for workers and minorities in the 1930s and early 1940s, then (2) a conservative backlash in the late 1940s and 1950s, then (3) more progress for blacks and other minorities in the 1960s, and then (4) another backlash in the 1970s and 1980s.... In reality, the backlash and the progress were happening together from the very beginning. Even during World War II, poor middle-class whites in Detroit who had purchased homes with the help of the New Deal were jealous of their new property and wanted to keep blacks (migrating from South to North) out of their neighborhoods. So even though, as auto workers, these whites might have been expected to choose a New Deal mayor endorsed by the UAW, they chose the conservative who pandered to their fear and resentment of blacks, as Nixon and Reagan would do later. They also prevented adequate public housing from being built for blacks, adequate funds from going to their neighborhoods, etc. --Despite all this, though, there is truth in the more simplistic conception. Anyway, I’ve answered the question I set out to answer.

“Gilded Age business practices cannot be understood without realizing that for most entrepreneurs ‘economic activity stood apart from the sphere of moral and personal considerations.’” Yes. Within the institution, people act in accordance with institutional norms; outside the institution they’re free to act as their conscience dictates. Think of Stanley Milgram. People obey institutional necessities however horrifying they are, because momentarily they ‘internalize’ them (accept them, internalize the commands, accept the internalized authority-figures); once they step outside the bounds of the ‘institution,’ they return to their so-called normal selves. That is, they’re free to act in accordance with a broader social morality. But there are different moralities for different institutions, and people accept them within the limits of the given institution.

It’s funny that Christianity can be used to justify a lack of generosity toward the poor. Russell Conwell, from the 19th century: “The number of poor to be sympathized with is very small.... To sympathize with a man whom God has punished for his sins, thus to help him when God will still continue a just punishment, is to do wrong, no doubt about it.” The real is the rational. We have to accept the world, do nothing about it. By trying to change it we’re going against God’s will. Religion to its logical conclusion (at least from one perspective).

From another perspective, obviously, religion can be a great stimulus for social change. Jesus himself was kind of a revolutionary, as was Martin Luther King. The ‘social gospel.’ Early Christianity, a movement of the poor. And liberation theology. It all depends on the social context, and on who is speaking. (One preacher will be reactionary, another revolutionary. But which way the masses go depends on politics and the social context.)

The credo of all oppressed people in history, formulated by Byron:

Hereditary bondsmen! Know ye not
Who would be free themselves must strike the blow?

The world is falling apart, but that statement is “all ye know, and all ye need to know.”

....Bernard Bailyn on the American Revolution:

The outbreak of the Revolution was not the result of social discontent, or of economic disturbances, or of rising misery, or of those mysterious social strains that seem to beguile the imaginations of historians straining to find peculiar predispositions to upheaval. Nor was there a transformation of mob behavior or of the lives of the “inarticulate” in the pre-Revolutionary years that accounts for the disruption of Anglo-American politics. The rebellion took place in a basically prosperous if temporarily disordered economy and in communities whose effective social distances....remained narrow enough and whose mobility, however marginally it may have slowed from earlier days, was still high enough to absorb most group discontents. Nor was it the consequence simply of the maturing of the economy and the desires of American businessmen for greater economic autonomy, or of the inevitable growth of infant institutions and communities to the point where challenges to the parental authority became inescapable: neither economies nor institutions nor communities are doomed to grow through phases of oedipal conflict. There was good sense in the expectation occasionally heard in the eighteenth century that American institutions in a century’s time would gradually grow apart from England’s as they matured, peacefully attenuating until the connection became mere friendly cooperation. American resistance in the 1760s and 1770s was a response to acts of power deemed arbitrary, degrading, and uncontrollable -- a response, in itself objectively reasonable, that was inflamed to the point of explosion by ideological currents generating fears everywhere in America that irresponsible and self-seeking adventurers -- what the twentieth century would call political gangsters -- had gained the power of the English government and were

turning first, for reasons that were variously explained, to that Rhineland of their aggression, the colonies.

It seems to me that too much ink has been spilled on the ‘meaning’ of the American Revolution as opposed to the French. Its radicalism or conservatism, etc. Sure, it was less radical, in a way, than the French, just because the French revolutionaries had centuries of feudal traditions and institutions to sweep away, and millions of starving poor, and hordes of resisting aristocrats, and were surrounded by hostile European nations. A complete social upheaval was necessary for there to be a republican, ‘democratic’ revolution in such a country. Americans already had relatively free institutions and lived in a fairly modern, (pre-)bourgeois society (compared to France), so their reaction against arbitrary authority did not have to take an uncompromising, world-overturning form. It wasn’t feudalism they were fighting against but a much milder form of oppressive power-structures. Nevertheless, the two revolutions were inspired by similar Enlightenment ideologies of liberty and republicanism, similar impulses against oppression and inequality, and they both signified early, ‘bourgeois’ stages of the masses’ eruption into modern European history.¹ The English Civil War and Glorious Revolution had largely the same significance. Circumstances vary between countries and so social transformations take different paths, but on the broadest scale the meaning of all the classical revolutions even into the nineteenth and twentieth centuries, with the events in Russia and China, was the struggle against feudal or, more generally, undemocratic power-structures, the middle and lower classes’ reaction against economic and political oppression, and the spread of ‘popular’ ideologies (be they liberalism, republicanism, democracy, or socialism) and people’s power. Fascism, by the way, and all its variants are different and paradoxical: popular movements *against* various kinds of people’s power. Popular reactions to economic and political dislocation that look toward the past, toward order and hierarchy, rather than toward the future and increased freedom for all people. This is what makes them relatively acceptable to the ruling classes -- and that is why they have been so influential since the early twentieth century or before. Business would prefer not to have the masses involved at all, but since they have to be somehow or other (as they didn’t for most of history), business propagates reactionary instead of progressive popular ideologies. It’s a risk -- the masses can get out of hand -- but it’s far preferable to the alternative of economic democracy.

If we understand the ‘American Revolution’ to be the long process of social change from about the 1760s to the early decades of the 1800s -- in which case one could even argue that the Civil War, a war against a pre-capitalist and ‘undemocratic’ society (or mode of production), was its final stage -- then we can place it even more clearly in the tradition of the English and French revolutions. It’s true that the American struggle for independence in itself didn’t have the same relation to society as the other revolutions, since it didn’t constitute an effort to remake an essentially feudal politics and society but was instead a mere revolt against a mildly oppressive imperialist power, and thus was more ‘accidental’ than the chain of revolutionary events in Europe -- especially because, as Bailyn says, wise political leaders in England could probably have defused the crisis and prevented the war -- but Gordon Wood is right that it was symptomatic of underlying, long-term changes in economic and social relations, which in some form were happening in Europe too, albeit in more convulsive ways. And don’t forget that there were, after all, traces of feudalism even in America, and these were going to be erased under various pressures. Economic and social relations were going to be progressively liberalized under the pressures of trade, manufacturing, population growth and migration, incipient industrialization, etc. At the same time, under the influence of early industrialists, protectionist laws and tariffs were almost inevitably going to be erected sooner or later in America, even if the Revolutionary War hadn’t happened. The ties with England were inevitably going to be attenuated in either gradual or convulsive ways during the transition to early industrialism and greater commercialism. All this grew out of basically the same underlying processes of economic change occurring all over the West.

¹ Certain stages of the French Revolution were far from bourgeois, but ultimately its bourgeois characteristics prevailed. Especially after Napoleon came to power.

Again, it's true that the power-structures that Americans revolted against were very different from the structures that the French revolted against a decade later. Starting in the 1760s, Americans became painfully aware -- through economic depression, England's imposition of 'intolerable' regulations and taxes, etc. -- of their humiliating status as colonial dependents. In some respects Americans were becoming increasingly prosperous, free, and sophisticated (theirs was a very literate culture, for example); commercialism and mass consumption were among the forces undermining old norms of subservience between the classes and between the mother country and the colonies. Ordinary people were becoming more conscious of their dignity as producers and consumers, the freedoms and rights they were entitled to; their degrading treatment by Parliament, their status as mere outposts on an empire whose metropolitan center didn't even recognize their right to political representation, contrasted outrageously with the vibrancy of their civilization, its economic importance to the empire, and the democratic, rights-conscious practices present throughout every colony. They were a people bursting with energy, but England treated them contemptuously. And its behavior only got worse, not better. So an explosion occurred, a 'democratic,' popular rebellion.

Conditions in France were so much worse that, in a sense, its revolution proceeded from nearly opposite causes: the peasantry and urban underclasses were miserable, not growing in self-confidence or increasingly aware of their substantive freedoms and rights as contrasted with their political disfranchisement. Nevertheless, with both revolutions it was a matter of the multitudes' and middle classes' clamoring against harsh treatment by power-structures. In both cases there were *ancien-régime*-ish straitjackets on the economic and political enfranchisement of the population even as inexorable economic pressures were tending to burst open these straitjackets and empower the disempowered. [And even in France, as in the American colonies, it was becoming clear to commoners and peasants that the aristocracy was losing its political legitimacy, its right to rule. Its 'hegemony' had long eroded. In France the nobility no longer had any important economic, political or juridical functions; it was becoming a class of useless parasites, and the peasantry knew this. Compounded with their economic misery, this led them to revolt.]

The two things I'm proudest of having written are my essay on values and my Job satire. I don't even remember the whole essay, but I remember the exhilaration of writing it and the certainty of saying something important. If it isn't the final word, it's the foundation of the final word.

So is my Master's thesis, especially the part on Marxism. That thesis is actually the most important thing I've written. It contains the most important revision of Marxism since....no, since never, since ever. I have purged Marxism of everything merely ideological, such as the prophecies of a socialist insurrection (which has never happened and never will, at least in its classical form) and a proletarian dictatorship. Everything utopian and 'unscientific' is gone now; the system is logically consistent, elegant, realistic, empirically adequate, more truly 'dialectical' than it was originally. There is no longer any tension between 'structural development'/'the initiative of the masses' and the role of individual leaders to guide the masses; I've elevated the significance of structures and 'the masses' at the expense of leaders and 'the revolutionary party.' In fulfilling Marxism¹ I've made it 'irrelevant' -- I've explained why ideologies will have little importance in a possible transition to socialism. What matter are mundane economic and social interests, grassroots networking, slow political advances, not revolutionary ideologies that infuse passion into millions so they can throw themselves against the state and be smashed. My thesis itself is a kind of manifesto for our time: it has approximately the same relation to contemporary society that the *Communist Manifesto* had to its society. That is, it's a little ahead of its time; it highlights developments that are now in their infancy but decades hence will (probably) be at the forefront of social change.

October, November

¹ [Actually, that statement is simplistic. Marxism is complicated, with several different tendencies. Nevertheless, an argument can be made that I've brought many of its basic premises to fruition.]

I'm going to be reading a bunch of books on 1968 for a historiographical paper I have to write. Some only skimming, some reading more thoroughly. Starting with Chris Harman's *The Fire Last Time: 1968 and After* (1988). International context.

Fredrik Logevall argues convincingly in *Choosing War* that Johnson's escalation of war in Vietnam was completely unnecessary, avoidable, not at all 'overdetermined' by a lot of structural, political, economic, and ideological pressures. The evidence Logevall amasses is overwhelming. In a sense, it was four guys who made the decision: McNamara, Bundy, Rusk, and Johnson. But really it was Johnson. Vietnam happened because of Johnson's personal insecurities. He had resolved not to be the man who lost Vietnam, the only president in history to lose a war. He never seriously contemplated withdrawal even though ample opportunities existed, virtually all of America's allies favored it, most elite mainstream opinion in America thought escalation would be a mistake, and there were plenty of face-saving devices for the U.S. to get out of the war before 1965. Yes, there were pressures to escalate, but there were pressures (international and domestic) not to escalate too. But Johnson didn't want to be labeled a coward by his political opponents. Unlike Kennedy, he had never served in a war; he wanted to prove himself. Criticism of his foreign policy he interpreted as criticism of himself and/or encouragement to be a wimp, so he refused to give it consideration. Kennedy *might* have chosen the path Johnson did between December of 1964 and February of 1965, but it was by no means a foregone conclusion. For one thing, Kennedy had no insecurities and felt no need to prove his mettle in the foreign-policy arena, especially after the Cuban Missile Crisis. He had shown himself willing to listen to allies, all of whom except Australia were by 1964 against escalation. He had a more reflective and flexible mind than Johnson. The Bay of Pigs had predisposed him not to trust military advisors. Anyway, it doesn't matter; the usefulness of such speculation is just that it highlights the fact that it wasn't *structural necessities* but *personal decisions* that led to Vietnam. Ironically, Johnson's lack of moral courage was itself cowardly.

....If I stepped back and read my whole journal from beginning to end, I'd probably be surprised at my strength and resilience. And the contradiction between everything I've lived and the freshness I still feel most of the time. It's surprising that someone like I exists in America in 2010. Had I been born ten years later or ten years earlier, the fragile equilibrium that is Chris Wright would surely have been impossible.

Under one of the Youtube videos in which Chomsky refutes a reporter's objections to his analysis of the Israel-Palestine conflict, someone wrote a brilliant comment: "People who attack Chomsky are like balloons attacking a cactus."

David Brody's classic *Steelworkers in America: The Nonunion Era* (1960).

The role of chivalry in the Middle Ages is fascinating. "The idea of chivalry constituted for these authors the sum total of general concepts with the aid of which they explained to themselves the realms of politics and history." "In spite of the confusion and the monotonous horror of their tales, they saw [the history of their times] bathed in an atmosphere of gallantry, fidelity, and duty.... All these authors are firmly convinced that the salvation of the world and the maintenance of justice alike depend on the virtues of the nobility." Self-sacrifice, honor, pride, the desire for justice, protection of the oppressed, solidarity with one's comrades, devotion to a leader and/or a cause -- these are the positive elements of chivalry. Huizinga sees the origin of patriotism in chivalry. And the honor code among America's Founding Fathers in the 1790s, which could lead to dueling -- that too is a legacy of chivalry, which in a few decades was about to die out under the influence of capitalism and party politics. Even the Founders' republicanism may be an afterimage of chivalry mingled with the Enlightenment's nostalgia for classical antiquity. --But what is the 'meaning' of chivalry? What was its significance in the context of the Middle Ages, and of its revival in the late Middle Ages? What were its origins? Surely it arose out of traditions of the Germanic tribes. Actually, its significance isn't hard to fathom when you think about the economic system of feudalism -- its militarism, the phenomenon of vassalage, the need to protect serfs and peasants from marauders, etc.

Random thoughts on political conservatism.-- The liberal, individualist strain vs. the traditional, communal, hierarchical, 'religious fundamentalist' strain. Partially reconciled in shared anti-Communism and anti-socialism, but still in great tension. Perhaps also reconciled in implicit anti-

egalitarianism? (Conservatives wouldn't admit to that, but it's basically true. Equality (between races, classes, ethnic groups, etc.) is not an important value for conservatives, while it is for leftists.) But leftists valorize community just as much as traditionalist conservatives; they simply fuse that value with their love of freedom and equality. It's a different kind of community they have in mind, a free, equal, un-hierarchical community that permits the flourishing of the individual's unfettered personality. Another irony: leftists usually realize the libertarian conservative's emphasis on individual freedom better than the conservative himself. Think of the 1960s' flourishing of radical sects, the undisciplined, un-hierarchical, 'participatory democratic' approach to social change, as opposed to the fledgling conservative movements' organizational genius with its top-down structures and its slow, patient infiltration of existing institutions for the sake of achieving power sometime in the future. Quasi-Leninist organizations and means of organizing! An anti-individualism in the service of an ideology, or at least a rhetoric, that exalts individual freedom, limited government, free markets, etc. But essentially it was just an obsession with achieving power, an obsessive drive to achieve political power so that the white middle-class (and sectors of big business) could defend its perceived prerogatives against subaltern groups clamoring for power supposedly at the expense of the white middle-class. (I should acknowledge, too, that parts of the white working-class had similar anxieties to those of the middle-class, similar racist impulses, a similar desire to defend what few advances they had made in preceding decades against black barbarians at the gate.) For most conservatives -- not including those for whom conservatism is just a tool of business and power -- the whole ideology they've constructed is essentially a way to rationalize economic, cultural and psychological anxieties that impel them to lash out at subaltern groups who they think are rising in status at their (the conservatives') expense. Incidentally, for the sometimes-conservative white working class, the economic grievances are real; it's just that workers are "chanting at the wrong spook." But it's true, racism does still exist throughout the population. It's a hard thing to overcome, especially in a society of scarcity (we never lived in a "post-scarcity society," as liberals argued in the '60s) and economic insecurity. Just imagine, for example, that the impoverished people living in inner cities now were not blacks and Hispanics but whites; do you think their miserable conditions would have been allowed to persist as long as they have? Would their schools still be as dilapidated as they are if they were full of white children? No way. America is still fundamentally racist, but it's an almost-unconscious, structural racism.

I'm thirty years old. Starting a new decade. My twenties are over! My whole life -- I feel like my whole life, almost, has been lived in my twenties; before that was the Dark Ages, which I don't remember well. It was in my twenties that I became a full human being. A phenomenally productive time intellectually; less so socially and sexually, but that's not entirely my fault. It's partly due to the perversity of American society, where attractive women don't like good, easygoing and intellectual men. Hence my greater success with Europeans, Latinas and Asians.

In the beginning of January I'm going to talk to Noam Chomsky for half an hour in his Cambridge office.

....A few nights ago met a Polish-Norwegian-Native American (but fully American) girl from OkCupid.com at a bar, a beautiful 24-year-old artist. We talked for hours -- she's a great conversationalist, intelligent and articulate, confident, easygoing with a sense of humor. Named Ashleigh. The next night I met a beautiful 23-year-old actress-singer-playwright, overflowing with energy and charisma, who however is overfond of talking. Both girls enjoyed themselves (sent appreciative texts afterwards), but I preferred Ashleigh. Not so manic as the other, Kathleen, and easier to talk to. Met Ashleigh again tonight, coffee and then dinner. Again, gripping conversation. She's almost intimidating but seems to think I'm very intelligent and interesting, respects me for my thought-fullness or whatever. As we waited in the subway station I took advantage of a pause in the conversation to ask, "Would you terribly object to my kissing you?" She smiled -- "That was cute" -- so I leaned in and kissed her.

[A couple nights later.] Sex with Ashleigh. The best thing about sex, for men, is not really the physical pleasure but the acting on (in) another person. That says a lot about human nature and is contrary to the thrust (ha) of Freud's system.

December

Papers:

Factors Determining the Success of Labor Unionism: Lessons from 1919 and 1937

For the U.S. labor historian, the dates 1919 and 1937 have profound meaning. One signifies defeat, despair, a succeeding decade of acquiescence to the status quo; the other signifies triumph, hope, future years of progress. In the former -- 1919 -- a colossal wave of strikes across the country, which in some cases extended into the early 1920s, was mostly crushed; in the latter, a wave of strikes that had begun in 1936 and would continue into the early 1940s resulted in the achievement of that long-sought dream, unionism of the unskilled and semi-skilled workers in the nation's core industries. More than four million workers struck in 1919, including shipyard workers in Seattle, policemen in Boston, textile workers across the east coast, steelworkers in the East and Midwest, railroad workers around the country, coal miners from West Virginia to Oklahoma, and workers in scores of other occupations; in 1937 and the following four or five years, workers struck to unionize in the auto industry, steel, meatpacking, farm equipment manufacturing, electrical equipment, and other industries. The question is, what caused these respective strike waves and why did the first fail while the second succeeded?

A large scholarly literature has arisen around these questions, and I cannot consider all of it here. Certain contributions, however, have been particularly valuable, and in the following I will review the lessons they have taught us. Among these contributions are David Brody's *Steelworkers in America: The Nonunion Era* (1960) and *Labor in Crisis: The Steel Strike of 1919* (1965), Lizabeth Cohen's *Making a New Deal: Industrial Workers in Chicago, 1919-1939* (1990), Sidney Fine's *Sit-down: The General Motors Strike of 1936-37* (1969), Irving Bernstein's *Turbulent Years: A History of the American Worker, 1933-1941* (1969), and Melvyn Dubofsky's *The State and Labor in Modern America* (1994). I will also review articles from the 1950s to the 1990s.

In a short paper I cannot address all the major strikes that occurred in the two periods under consideration; what I will do is look at certain emblematic labor struggles and the conditions that determined their outcomes. The efforts to unionize the steel industry have been studied most closely, so I will focus on them as well as the famous Flint sit-down strike among autoworkers in 1937. We will see that workers in 1937 were more favored in almost every respect than those in 1919.

1919

Steelworkers in America, by David Brody, is a classic of labor history. It is considered a transitional work between the old and the new labor history, in that it incorporates elements of the old institutional, trade-union-based history with the contemporary emphasis on social history, workers' experiences and 'agency.' However, it does not emphasize workers' agency or resistance to oppression as much as the work of Herbert Gutman and David Montgomery, who are considered the other two founders (along with Brody) of the new labor history. Brody is more interested in the sources of *stability* in the steel industry than in the sources and modes of worker resistance. He has been criticized, as a result, for implying that workers merely acquiesced to conditions created by management, that they did not forge their own culture.¹ There may be some justice to this criticism, but, nevertheless, political correctness does not always equal truth. Sometimes workers *are* more 'reactive' than 'active'; in certain periods, or maybe all periods, workers *have* been unequivocally 'victims,' though not completely passive ones. This is true of the era that Brody analyzes in *Steelworkers in America*, from the end of the nineteenth century to the end of the 1920s (at which time the Great Depression led to major changes that made possible greater agency on the part of workers).

¹ See, e.g., Brian Greenberg, "What David Brody Wrought," in the appendix to Brody, *Steelworkers in America: The Nonunion Era* (Chicago: University of Illinois Press, 1998).

During this period, industrial unionism, or the inclusion in a single union of all workers in a particular industry, did not exist in steel or other core industries; there was only craft unionism, i.e. unionization by occupation, or skill, rather than industry. In steel, the most important craft union was the Amalgamated Association of Iron, Steel and Tin Workers, which mostly represented skilled workers rather than laborers. The latter, in fact, belonged to no union at all. However, even the Amalgamated Association lost much of its power after its catastrophic defeat in the strike at Andrew Carnegie's Homestead plant in 1892. On the eve of World War I it was very weak. This did not prevent skilled workers, usually Americans, from being well off compared to unskilled laborers, most of whom were immigrants from southern and eastern Europe. These workers had low wages of from \$1.50 to \$2.00 a day (which, however, was more than they could earn in Europe), miserable living standards in the mill towns, and terrible working conditions with high accident rates. Immigrants regularly worked twelve-hour days, seven days a week -- when they could find work. In depressed periods of a few months at a time, they were lucky to have a job at all. The vast majority were single men who had come to America to make money for a few years, after which they hoped to return to their peasant families in Europe with a lot of money saved up. The hope of returning soon to the old country helped them tolerate the misery of the steel industry.

For many years, Brody states, two factors prevented the Amalgamated Association from trying to organize unskilled workers. First of all, nativist sentiment divided Americans from 'dirty,' 'ignorant,' 'slavish' Eastern Europeans with whom they could not even communicate, and who were willing to work for a pittance in degrading, dirty work. Skilled workers would not accept the unskilled in their union. Secondly, union leaders were worried that by attempting to organize laborers they might jeopardize existing contracts with the steel companies. Their own union members -- a small minority of all employees -- seemed relatively secure in their contracts with employers, so there was little incentive to organize the unskilled.

In the years before World War I, however, things began to change. In 1909 U.S. Steel, which set trends for the entire industry, declared that it would no longer recognize or negotiate with any union at all, even the Amalgamated. Collective bargaining, it had decided, interfered with the prerogatives of management. The philosophy of paternalism, which anticipated the welfare capitalism of the 1920s, would henceforth guide management's relationship with its employees. Given this 'open-shop' announcement, the Amalgamated Association no longer had anything to lose by organizing unskilled immigrants, and potentially much to gain. If it could recruit workers from all ranks of the industry it might be able to force U.S. Steel to negotiate with it. So after 1909 the AFL and the Amalgamated Association set about organizing the entire industry. They failed for a variety of reasons, but the experience at least prepared them for future efforts during and after the war, leading to the 1919 strike. At the same time, immigrants were becoming increasingly militant as more of them settled in America permanently, bringing their families over from Europe.

With World War I came the end of the status quo. The demand for labor skyrocketed with the demand for steel, and soon there was a labor shortage throughout the industry. Since the war halted the flow of new immigrants from Europe, steel companies recruited blacks from the South. They also raised wages for all workers and tried to improve living conditions in the mill towns. Most importantly, to offset the labor shortage the companies barraged employees with patriotic propaganda designed to raise output. Steelworkers were helping to 'make the world safe for democracy'; they were the linchpin of the war effort, they were proving their devotion to America and freedom, they were the pillars of democracy. This supercharged atmosphere of patriotism had its intended effect: immigrants threw themselves enthusiastically into their work, and profits surged (far more so than wages). At the same time, ordinary workers for the first time felt that their work was essential and highly valued by society. Immigrants embraced America, celebrated it in marches and flags draped from their windows, and felt that America embraced them for their contribution to the war effort. Consequently, as the war dragged on and conditions in the overpopulated mill towns deteriorated -- and laborers worked at a frenetic pace twelve hours every day, without being paid what they thought they deserved -- discontent built up. Employees' poor treatment was not commensurate with their value, reaffirmed daily in political and business propaganda. If immigrants were fighting for world democracy, why couldn't they have a modicum of democracy in their working lives? By the summer of 1918, the rank and file was ripe for unionization.

As the situation thus changed in the factories, so it changed in the lofty heights of national politics. To secure the wartime cooperation of workers and unions, President Wilson and the National War Labor Board he established in 1918 defended the right of workers to organize. Indeed, in adjudicating disputes between employers and employees, the NWLB usually sided with the employees. The whole changed political climate had several notable effects. First of all, it infused confidence into workers, courage to organize, since they knew that their efforts would be supported by the government. Steelworkers were doubly confident now that the labor shortage had eliminated the possibility of their being fired for trying to join a union. Secondly, the government's pro-labor position encouraged the AFL and the Amalgamated Association to resume their attempt to organize the steel industry. They took action in the summer of 1918.

However, the very structure of their organizations hindered them from the beginning, as Brody argues. Twenty-four craft unions claimed some jurisdiction in the steel industry, though most represented a very small number of workers. During the organizing drive of 1918 and 1919, this fragmented structure led to jurisdictional disputes, each union's petty guarding of its authority, and miserly financial support from each union for the semi-coordinated organizing effort. What was needed was industrial unionism, not conservative craft unionism. Moreover, the unions provided too few organizers for the national campaign. This precluded a 'lightning strike' across the whole country. Instead, organizers began in Chicago and eventually went to Pittsburgh, Youngstown, Cleveland, and elsewhere, thereby losing the element of surprise in their war against the employers.

Nevertheless, the campaign was quite successful. Everywhere the organizers went, workers were eager to unionize. In fact, the unskilled immigrant laborers were more eager than the Americans, who worked in better conditions and usually hoped to be promoted. Black workers, who constituted about 10 percent of the labor force, were the least susceptible to unionization, given their segregation and the outright prejudice they regularly encountered from whites. But the organizing drive continued apace, employers not knowing how to react to it in light of the government's pro-labor policies. Over a hundred thousand workers signed up.

Grievances accumulated in the months after the war's end, as laborers failed to be rewarded for their wartime sacrifices. The NWLB lost its power and then disbanded in the summer, leaving disillusioned workers at the mercy of their employers. Unemployment spread in early 1919 as demand for steel shrank; the desired eight-hour day did not go into effect; some men were fired for union activities. By late summer, national union leaders had decided that they could no longer contain the restlessness of the rank and file, who in Youngstown, Chicago and other places were threatening spontaneous strikes unless the unions called a national strike. So on September 22, finally, union leaders gave in, having been rebuffed in their attempts to negotiate with the head of U.S. Steel, Judge Gary. By September 30, between 250,000 and 300,000 men were on strike, about half the industry's workforce.¹

Brody has a good account of the strike in his short book *Labor in Crisis*. From the beginning, the steelworkers were at a great disadvantage in light of the industry's tremendous wealth and power. Five years of unusually high revenues had placed the industry in a good position to withstand even a total strike; a partial strike such as the one that materialized therefore had little chance of success. Many mills around the country continued to operate, and as the weeks went by, thousands of strikebreakers (mostly African-Americans) were employed by the steel companies. In Pennsylvania and other centers of the industry, police repression was fierce. Picketing workers were arrested; indoor meetings among strikers were prohibited in some steel towns. "Local business and public men nearly everywhere....favored the management side from the start."² Even the federal government effectively supported management by refusing to intervene or mediate between the unions and the steel bosses. The Wilson administration had little incentive to act on behalf of labor, since an election was coming up and for months the administration had been publicly criticized for ceding too much ground to labor during the war.

In addition to waging a 'private war' against striking workers with the help of local law enforcement, steel companies waged a public war of propaganda to delegitimize the strike and undermine

¹ David Brody, *Labor in Crisis* (Westport, Connecticut: Greenwood Press, 1965), 113.

² *Ibid.*, 163.

workers' morale. The press cooperated in this venture. Crucial to its success was the national and international panic at the recent Bolshevik revolution and worry that Communism might conquer the world. The United States, after all, had already experienced by September of 1919 thousands of large and small strikes across the country since the war's end, an unprecedented explosion of labor militancy that terrified the ruling classes. For four days in February, Seattle had been convulsed by a general strike for higher wages. Several months later, the Boston police-force struck for union recognition and higher wages; it too was crushed by the city government -- all were fired from their jobs as volunteers and state guards temporarily took over police duties. In April, spontaneous strikes broke out amongst thousands of railroad workers who were protesting the recent rise in the cost of living and relative decline in wages; in this case, as in others, the national unions themselves helped business and government hire strikebreakers to destroy the movement, which they claimed (falsely) was led by Bolsheviks. Between April and June, Italian anarchists planted bombs in various American cities in an attempt to spark insurrection, though all they accomplished was their own deportation and savage government repression against presumed radicals. Later, in November, the United Mine Workers called a national strike, but the Wilson administration secured an injunction against it. (The mineworkers, however, at least were granted wage raises.)¹ In short, it was a time of extreme polarization and, correspondingly, extreme reaction by economic and political power-structures that had been strengthened by the recent war.

In "Communism and the Great Steel Strike of 1919" (1951), Robert K. Murray argues that the public fear of Bolshevism was a major factor in the defeat of most of these strikes, including that of the steelworkers. "Undoubtedly," he states, "the most spectacular phenomenon of this tempestuous year [1919] was the almost hysterical and paranoiac fear which the American public harbored for bolshevism... No strike, no act of violence, no deviation from the norm failed to bring charges that the probable cause was domestic bolshevik activity."² In undermining public sympathy for labor activity, such charges did much to undermine labor itself. For example, one of the leaders of the steel strike, William Z. Foster, was a former syndicalist and member of the Industrial Workers of the World. He claimed to have renounced his earlier radical views, but this did nothing to quiet the press's persecution of him as an anarchist and a 'Red.' Papers everywhere proclaimed that the AFL was being infiltrated by radicals, that the strike was an attempt to start a revolution, that it was un-American, instigated by socialist immigrants. In reality, its goal was quite conservative, namely to force the steel industry to accept collective bargaining. But Foster's background was enough to fuel charges of treason and subversion, and he was compelled to testify at a Senate hearing that he no longer subscribed to syndicalism. Nevertheless, the Senate committee concluded -- falsely -- that "behind the strike was massed 'a considerable element of IWW's, anarchists, revolutionists, and Russian Soviets' who were using the conflict 'as a means of elevating themselves to power.'"³ Murray may overstate his case when he declares that "the words 'revolution' and 'bolshevism' had killed all chance of the strikers' success," but he is undoubtedly right that the ubiquitous propaganda severely handicapped labor's cause.

It did so in another sense as well: business and the local press encouraged and exacerbated divisions between skilled American workers and unskilled immigrant laborers. It was the latter who were the backbone of the strike, since their conditions were the worst; many, or most, Americans were at best ambivalent, since they had more to lose if they were fired for union activity. Employers exploited Americans' ambivalence by appealing to their 'patriotism': the issue, stated one paper, was 'Americanism vs. Bolshevism.'⁴ The patriotic American was exhorted to resist pressure by labor agitators and foreigners and instead to return to work, to serve Uncle Sam. And in many cases he did. At the same time, employers and the press would demoralize strikers by spreading false rumors that elsewhere in the country, in Youngstown or Bethlehem or Chicago, the laborers had gone back to work and the strike was collapsing. Insofar as this tactic was successful, it was partly due to the inadequate coordination, manpower and

resource-distribution on the part of twenty-four separate unions each of which was jealous of its financial reserves and determined to protect its own interests. This craft-unionist fragmentation partially reflected and reinforced ethnic fragmentation.

Lizabeth Cohen argues in *Making a New Deal*, which is a study of Chicago in the interwar years, that ethnic divisions and community isolation were of crucial importance in vitiating the steelworkers' cause. "Fragmented into insular communities," she states, "the city's working-class population showed itself incapable of unifying across racial, ethnic, and territorial boundaries."¹ Aside from the linguistic, cultural and geographical barriers, there was also the simple fact of American prejudice against immigrants. As William Foster wrote in his account of the strike, "Everywhere American-born workingmen, unfortunately, are prone to look with some suspicion, if not contempt and hatred, upon foreigners, whom they have been taught to believe are injuring their standard of living."² Cohen notes, furthermore, that employers hired undercover spies and detectives to stir up bad feeling between, say, Serbs and Italians. "Spread data," spies were instructed, "among the Serbians that the Italians are going back to work. Call up every question you can in reference to racial hatred between the two nationalities."³ Steel companies also imported Mexicans as strikebreakers in addition to blacks, fostering further tensions. Similar divisions helped scuttle the unionization drive amongst Chicago's meatpacking workers in the early 1920s.

In the end, steelworkers' morale could not withstand the industry's many and varied attacks, and after weeks of struggle the strikers began to return to work. By the eleventh week, their number was only 110,000; on January 8, 1920, the National Committee in charge of the strike officially ended it. Workers and unions had gained no concessions at all from the industry; their defeat was total. It heralded labor's weakness in the 1920s.

1937

Sidney Fine's *Sit-down: The General Motors Strike of 1936-37* is the classic account of the strike that was more responsible than any other for leading to mass unionism in the nation's core industries. Fine not only gives a detailed history of the strike itself, which lasted from late December, 1936 to the middle of February, 1937, but also discusses its background and consequences. Several lessons emerge from his treatment. Most obviously, key to the success of the strike was the new tactic of the 'sit-down.' Rather than following established precedent and picketing outside the factory, workers occupied the plant. This had several advantages. First, it prevented General Motors from bringing in strikebreakers. Second, it made difficult the use of police to break up the strike, partly because strikers could defend themselves more effectively than in a picket line and partly because the employer would not want to risk damaging his machinery. Third, for various reasons it was easier to maintain high morale in a sit-down than in a conventional strike conducted outdoors.⁴ The new tactic became popular in labor struggles after the United Auto Workers' victory in Flint until it was outlawed by court rulings in the late 1930s.

Secondly, Fine emphasizes the importance of Michigan's Governor Frank Murphy in his refusal to crack down on the strikers either by denying them food and water or by forcibly evicting them from the factories they occupied. Instead, he served as a mediator between the union leaders and GM, proving himself fairly sympathetic to labor's cause. Franklin Roosevelt, too, had a benign influence in that he encouraged Murphy to facilitate negotiations rather than break up the strike. Thirdly, the Flint strike played a role in convincing the head of U.S. Steel (Myron Taylor) to negotiate with John L. Lewis, head of the new CIO, in March of 1937. Taylor decided that at a time when orders for steel were increasing from European countries preparing for possible war, it would be best to avoid a prolonged strike that would likely

end in concessions such as those that GM had made, including acceptance of collective bargaining.¹ As a result, he and Lewis signed a historic contract before any strike had broken out in steel. These two epoch-making contracts in the auto and steel industries generated a tremendous wave of enthusiasm among workers for the CIO, with its principle of industrial unionism, and led indirectly to further victories in the succeeding years. But how exactly had these two victories come about? What had made them possible, when only seventeen years earlier the labor movement had been rendered effectively moribund?

Perhaps the most obvious condition for labor's successes in the late 1930s was the New Deal's transformation of the state. In 1919 and during the 1920s the state was hostile towards organized labor; under Roosevelt the federal government defended workers' right to unionize and bargain collectively. In *The State and Labor in Modern America*, Melvyn Dubofsky gives a detailed account of just how important the state was in setting the terms for labor relations in the 1930s -- indeed, from the 1870s to the 1970s (where his book ends). In this respect, the book is in the tradition of the old institutional, 'labor-liberal' history, rather than the new bottom-up history. Dubofsky virtually ignores gender, race, and social history in general; his concern is to trace the extent to which the state has shaped conflicts between capital and labor. As he shows, that extent has been great indeed.

For example, in the 1930s all three branches of the federal government became more supportive of organized labor. Section 7(a) of the National Industrial Recovery Act, passed in 1933, "endorse[d] the right of workers to form unions free from employer interference and to bargain collectively with their employers,"² and later the president set up a National Labor Board to enforce the act. Workers across the country were emboldened by these developments to organize and strike en masse for union recognition, but, after a year of struggle between employers and workers, it became clear that the NLB lacked power to enforce workers' rights. As a result, a new law was passed in 1935: the National Labor Relations Act, or the Wagner Act. This act went further than the previous one in specifically outlawing various employer practices that interfered with labor's right to organize and in setting up a National Labor Relations Board, which was comparable to the NLB but with more power. Its job was to administer the new law and adjudicate disputes between business and labor. The NLRB proved to be very aggressive on behalf of workers' rights. At the same time, the executive branch, as we have seen, while not consistently pro-labor, was at least more genuinely neutral in labor relations disputes than it had been in the 1920s. At times Roosevelt supported the unions, at times he supported the employers. And in the Flint strike of 1937, his neutrality -- as well as Frank Murphy's -- worked to the advantage of labor in that it led to negotiations between GM and the UAW, and ultimately to collective bargaining in the auto industry.

Even the Supreme Court abandoned decades of precedent to favor organized labor over business. It upheld the constitutionality of the Wagner Act, the legitimacy of the NLRB, workers' right to picket while on strikes, and their right to bargain collectively. This was a real constitutional revolution, as Dubofsky states. Its sources, he argues, were the voters' progressive mandate in the elections of 1936, Roosevelt's plan to 'reform' the Court, and, most importantly, "the rise of the CIO, the growing assertiveness of militant workers, and the spread of industrial warfare."³ Had the Court remained wedded to its old corporation-coddling ways, workers' advances between the late 1930s and early 1940s would have been much more difficult to institutionalize.

The basis for all these governmental changes, however, was change in the broader society. And here, Cohen's *Making a New Deal* is a definitive work. It "is devoted to explaining how it was possible and what it meant for industrial workers to become effective as national political participants in the mid-1930s";⁴ to do so it examines the lives of workers in Chicago's ethnic and racial communities from the 1920s on. Cohen integrates racial, gender, labor, and cultural history to provide a comprehensive perspective on the changes unleashed by the Great Depression. She argues that, while changes in the larger

political environment were important, more important were gradual changes in workers' own 'orientation' during the twenties and thirties. After all, it was their mass militancy and solidarity more than anything else that allowed workers to consolidate major gains in the mid-thirties; the Wagner Act and other such measures were largely a response to this militancy and would have achieved little without it. It had not existed in the 1920s. So what happened to bring it about in the 1930s?

First of all, the working class grew relatively homogenized over the course of two decades. Whereas in 1919 Chicago had been fragmented into ethnic and racial communities, by the mid-thirties its workers had something like a collective consciousness and felt themselves integrally a part of the broader culture. This was due in large part to the explosion of mass culture in the 1920s. While Cohen insists that it did not have a single, simple 'homogenizing' impact on communities -- instead, workers grappled with it, adjusted to it, ethnic fraternities and benefit societies were forced to compete with it, blacks used it for their own culturally defiant purposes -- ultimately mass culture did foster assimilation of second-generation immigrants. (Immigration had effectively ended in the early 1920s with restrictive legislation passed by Congress. This, too, fostered homogenization.) "Although they did not always recognize it," Cohen says, "[by 1930] workers increasingly were shopping at the same chain stores, buying the same brand goods, going to the same chain theaters, and listening to the same radio programs on chain networks. Ethnic workers began to have more in common with their co-workers of different ethnicity and race and with their own children."¹ Not the least important effect of these developments is that more and more people spoke English.

The welfare capitalism of the 1920s, too, broke down the insularity of ethnicity and race, by forging ties between employees at their workplace. Employers offered services -- insurance, health, etc. -- that formerly had been provided only by ethnic organizations; this lessened the relevance of their communities for workers at the same time that it instilled a similarity of interests in workers of different backgrounds. When employers failed to deliver on the promises of welfare capitalism, employees identified with each other in their grievances. Moreover, welfare capitalism "legitimized standards workers would seek to institutionalize in the thirties. Job security, high wages, and benefits would never again be dismissed as the pipe dreams of industrial workers."² The latter, in short, would come together in the 1930s to demand a 'moral capitalism' such as they had been promised in the 1920s but had not experienced.

When the Great Depression savaged all these institutions -- ethnic benefit societies, building and loan associations, churches, welfare-capitalist employers -- workers had to search for new ones to fill the functions of the old. They turned to unions and the state. Since by the early 1930s unskilled workers identified more strongly with America than they had ten years earlier, they expected more from the federal government than they had earlier. Effectively they switched their allegiance from welfare capitalism to the welfare state -- especially as Roosevelt's weekly radio broadcasts brought the government into workers' homes, so that it became real to them. But they did not passively wait for the government to act on their behalf; they actively organized into unions, thinking that the state, personified in Roosevelt, would support them. On the basis of their common experiences, common grievances, and relative homogeneity (compared to 1919), steelworkers in the mid-1930s agitated in Chicago and elsewhere for higher wages, shorter hours, seniority rights, paid vacations, and union recognition. The conservative, craft-unionist AFL did not help them, but by 1936 the CIO had emerged to organize workers on an industrial basis.

Indeed, the birth of the CIO was as important an event as any other in the thirties. It made possible, at last, effective coordination of national organizing drives, an overcoming of the old craft-unionist inefficiency and organizational pettiness. This is clear from Irving Bernstein's *Turbulent Years*, which narrates the labor history of the 1930s through the top-down institutional stories of the New Deal, the AFL, the CIO, the NLRB, etc. John L. Lewis's CIO, which was born in 1935 when his union (the United Mine Workers) and several others split from the AFL, seized upon the seething discontent of industrial workers and channeled their organizational energies into coordinated national campaigns to unionize packinghouse workers, steelworkers, autoworkers, electrical workers, and others. Lewis poured unprecedented resources

¹ *Ibid.*, 157.

² *Ibid.*, 209.

into the organizing drive: the steel campaign alone cost \$2.5 million of the UMW's funds in just its first year.¹ The CIO also benefited from America's well-organized and efficient Communist Party, full of talented, devoted organizers. For instance, a third of the CIO's organizers of the steel industry belonged to the Party.² -In short, through such continent-wide institutions as these, rank-and-file determination was finally matched, or almost matched, at the level of national leadership, and industrial unionism became a reality. However, the lesson of *Making a New Deal* should not be forgotten in our appreciation of the CIO: a key foundation of workers' achievements in the thirties was the 'common culture' they shared as a result of developments in the 1920s and early 1930s, a culture they had lacked in 1919.

Michael Torrigian nicely summarizes many of the reasons for workers' success in the late 1930s in his article "The Occupation of the Factories: Paris 1936, Flint 1937" (1999). He notes that months before the strike at GM's factories in Flint, Parisian metal workers occupied a number of factories in a massive wave of strikes that forced employers "to introduce one of the world's most progressive systems of industrial relations."³ The use of the sit-down tactic, again, was essential, but this in itself would not have guaranteed victory for the workers without the state's at least passive support for labor. As in the United States, 1936 in France had seen a labor-sympathetic government come to power -- that of the Popular Front. In both countries, the tidal wave of electoral support for progressivism infused workers with confidence; in both countries, the progressive governments elected were unwilling to resort to force, or to let employers resort to force, against workers acting from their surge of confidence. This stands in marked contrast to the behavior of the U.S. government in 1919. The Great Depression (more severe in the U.S. than in France) had stirred labor's discontent for years, breeding a culture of radicalism. In some respects, of course, the depression and its prolonged unemployment weakened organized labor vis-à-vis employers, but in other respects it strengthened it. In particular, in France the "severe drop in employment closed off immigration..., discouraged rural migrants, limited the access of women and youth, curbed turnover, gave married men and skilled workers a preference in employment, and helped, for the first time in a generation, to homogenize the workforce." As in America, this homogenization ensured that workers were "better able to forge those ties necessary for collective struggle."⁴ The economic upswing of 1936, therefore, which both France and America experienced -- and which contrasted with the downswing of 1919 -- led to vigorous and effective action against employers.

The years after 1937 in America would see periodic defeats for labor, as in the partial collapse of the CIO's organizing drive in the textile industry, but they would also see the consolidation of mass unionism in core industries. The state and business would finally view organized labor more as a partner than as an enemy to be defeated. As long as this state of affairs lasted -- until the mid-1970s -- it is not an overstatement to say that America's social structure was in large part a legacy of the Great Depression and the labor movement it spawned.

*

The Agony and the Ecstasy: 1968 in the West

Sometimes in history a year appears as an explosion. Tensions and conflicts that have been simmering or forcibly suppressed finally erupt and society is thrown into crisis. 1789 was such a year; so were 1848, 1914, 1917, and 1936 in Europe. And then, three decades later, there was 1968. In this year, attempted mini-revolutions flared up in the capitalist and Communist worlds, in countries from Mexico to Poland; all were put down by the authorities. Students, workers, women, and minorities rose up -- and would continue to rise up in the succeeding years -- but in 1968 they met mostly defeat. The Establishment

would not yield power so easily. Ever since, historians and participants have studied the events of that year to determine what caused the upsurge, what went wrong, what its effects were, or just to reminisce and draw lessons for activists. In this paper I will review some of the literature on 1968 to explore how the scholarship has changed in the last twenty years and what its principal conclusions have been.

In the mid-1980s a number of works on 1968 appeared, among which were Chris Harman's *The Fire Last Time: 1968 and After* (1988), David Caute's *The Year of the Barricades: A Journey Through 1968* (1988), and Todd Gitlin's *The Sixties: Years of Hope, Days of Rage* (1987). Years later, in 2004, Mark Kurlansky's *1968: The Year That Rocked The World* appeared; then in 2007 Gerd-Rainer Horn published *The Spirit of '68: Rebellion in Western Europe and North America, 1956-1976*, and in 2009 the *American Historical Review* printed a forum on 1968. Many other relevant works have been published, of course, but I will use these few as a representative sample of the scholarship. When so much is written on a single year there are inevitably redundancies and common themes, such that a cross-section of the literature can reveal much about the tendencies of the whole.

A reasonable place to begin is with the recollections of a participant in the New Left, Todd Gitlin. His book is a particularly well-written and thoughtful exemplar of that genre, 'memoir-of-a-participant-in-the-Sixties.' It addresses not only 1968 but the decade as a whole from the perspective of an early member of Students for a Democratic Society. As a result, its analysis of the era is a bit one-sided: for example, Gitlin devotes relatively little attention to the later stages of the Black Power movement while recounting in great detail the demise of SDS. This is appropriate, however, in what is effectively a memoir, if an unusually analytical and historically conscious one -- the memoir of a movement more than an individual. Gitlin tells the story of the birth, rise and fall of the New Left, from the late 1950s to the early 1970s.

The principal virtue of his book, as of other such memoirs, is the *visceral* experience of reading it -- reading the testimony of one who lived the Sixties intensely, self-consciously, and is now remembering and critiquing the movements of which he was a part. To read the book, written in vivid, journalistic, partisan prose, is to encounter the Sixties from the inside. The existential commitments, the driving hopes and dreams, the violent disillusionments and fratricidal rage of 1968 and after -- this is the New Left in its lived immediacy, not the cadaverous abstraction dissected autopsy-like in most scholarship. Above all, it is *movement*. "A series of epiphanies," as Michael Rogin defined the New Left. A whirlwind of music, drugs, sex, self-discovery, cultural rebellion, revolutionary politics, bloody battles with the police, vicious internecine warfare among ultra-left factions each claiming the mantle of the Revolution -- ultimately 'the revolution devouring its own' after 1968 -- and through it all, the common thread of youthful middle-class alienation groping for authenticity against a violent bureaucratic world. That is the impression one gets from reading *The Sixties*: the New Left was full of very serious young people (and many not so serious), students and ex-students and young spirits of all sorts, who were disgusted with American culture and politics but would not have had any particular cause to rally around had the two issues of *civil rights* and *Vietnam* not appeared. Hundreds of thousands of restless middle-class young Americans, the product of a 'baby boom,' an expanding system of university education and a dynamic popular culture, were rebelling against old authority-structures, repressive cultural mores, political shibboleths like 'anti-Communism' that did not resonate with them, and all things that seemed opposed to freedom, love, life, self-expression, humanity, authenticity -- the values of the young. This 'existentialist' revolt took many different forms,¹ but politically it latched onto, first, the civil rights movement, with which it felt an instinctual sympathy, and second, the anti-war movement. Indeed, the war in Vietnam came to symbolize to these youth everything abhorrent about American society, and by 1968 the New Left was obsessed with it.

Gitlin's account of 1968, of all its hopeful and dreadful happenings, is as compelling and visceral as the rest of the book. He writes of the assassinations of King and Kennedy and their "enormous repercussions" -- "In two strokes, liberalism...was 'decapitated'";² he writes of the Democratic Convention in Chicago, the chaos, the thuggery of the police; he writes of the student movement's radicalization by the

¹ See Doug Rossinow's *The Politics of Authenticity: Liberalism, Christianity, and the New Left in America* (1998).

² Todd Gitlin, *The Sixties: Years of Hope, Days of Rage* (New York: Bantam Books, 1987), 305.

events of 1968 and its subsequent splintering into feminist movements and ever-more-radical revolutionary cliques like the Weathermen, which destroyed SDS from within. It becomes clear that, if there was a turning point, the turning point was 1968. By 1969 the New Left had “trapped itself in a seamless loop: growing militancy, growing isolation, growing commitment to The Revolution, sloppier and more frantic attempts to imagine a revolutionary class, growing hatred among the competing factions with their competing imaginations.”¹ However, Gitlin argues that the movement’s collapse in 1969 and afterwards, while probably accelerated by the traumatic events of 1968, was ultimately determined by a series of dilemmas or ‘structural tensions’ that had been present from the beginning. For example, as a student movement and a political movement at the same time, it “oscillated between narcissism (imagining itself to be the instrument of change) and self-disparagement (searching for the *real* instrument of change), eventually succumbing to the false solution of Leninism” with the elitism of the Weathermen, who hoped to ignite the revolutionary consciousness of the working class but ended up alienating the entire American public and legitimating political repression. Another dilemma is that, as an existentialist movement, the New Left “wanted to be both strategic and expressive, political and cultural”: it wanted to change the world in the future but *live* the change immediately -- values that were not easy to reconcile. Many such ‘structural’ conflicts foredoomed the youth movement.²

The Sixties is limited, however, to events in America, and it does not focus on 1968. To get a broader picture of that year in its international context we must turn to David Caute’s *The Year of the Barricades*, which surveys events throughout Europe and North America, and even Japan. As Caute narrates it, 1968 was the year that everything broke down. Anarchy was momentarily unleashed -- in the U.S., France, Czechoslovakia, Italy, Spain, England, Germany, Mexico, Japan, and other countries. Above all, power-structures could no longer contain the raging discontent of students. According to Caute, 1968 was truly the year of the students -- or, more generally, of the youth, since young workers in France and elsewhere played a role in instigating mass strikes. But student agitation seems to have lit the fuse everywhere, with the occasional help of intellectuals and academics, as in the coming of the Prague Spring. In Gramscian terms, the elite’s hegemony (whichever elite was in question in varying circumstances) had collapsed, and students led the way in trying to construct a new order, first and foremost in their universities. Hence the student boycotts and occupations of universities throughout the West. Grievances differed depending on the country and the repressiveness of its institutions. For example, in Spain, Poland, Yugoslavia and Czechoslovakia, where democracy was lacking, the complaints were not against technocracy, consumer capitalism or Vietnam but rather the “corruption, overcrowding, and administrative breakdown [that] dominated students’ lives,”³ as well as censorship of the press and political authoritarianism. Universities in France and Italy likewise suffered from overcrowding, as well as administrative inefficiency, poor housing conditions, segregation of the sexes, and general inattentiveness to the needs of students. One common student demand was for participation in administering their own education -- in hiring faculty, in the proceedings of administrative committees, etc. These demands were echoed in the U.S., where there was also outrage at elite universities’ complicity in the Vietnam war.

Caute discusses the counterculture and its offshoots as well -- radical art, theater, film, the drug culture, sex, women’s liberation -- and touches on the public’s hostile reaction to the radicalism of the youth, but overall his book lacks sufficient context. It does not explain why things erupted when they did, nor does it delve into the broader economic and social conditions of the time. The reader is left wondering how it was that essentially uncoordinated youth revolts broke out at the same time all over the world, between 1967 and 1970. What were the international dynamics that led to the synchronicity of student rebellions? How had higher education evolved to reach the bursting point of 1968? In fact, Caute’s emphasis on the young is surely misleading. Societies in their entirety were being torn apart, riven by economic, political and social ‘contradictions’ (in Marxian terminology). These contradictions, it seems, were expressed in a particularly dramatic way in the university-system, due to a confluence of factors: masses of

³ David Caute, *The Year of the Barricades: A Journey Through 1968* (New York: Harper & Row, 1988), 83.

young people lived and studied together, had the time and youthful energy to think critically about their society and try to change it; universities were and are places of unusual ferment, where people of different races, classes, backgrounds and ideologies are thrust together -- a sort of elite semi-microcosm of society; a contradiction can, and did, develop between the great freedom and privilege of university life and students' (and professors') consciousness of being cogs in a bureaucratic machine; because of the elite status of universities, media coverage of them can be glaring and political. As for why student rebellions mostly failed, or at best resulted in minor reforms, Caste offers no satisfactory explanation.

Chris Harman does, however -- or at least he provides the framework for one, even though, or perhaps because, he is far more interested in classic economic and political conflicts than in student radicalism. Harman is a Marxist, and this shows in *The Fire Last Time*. He focuses on the class struggles and class structures that he thinks underlay the unrest of 1968 and succeeding years; he also attempts to place in their historical context the events of 1968, partly by carrying the story up to the mid-1970s, when the fount of radicalism in many countries finally dried up. The student revolts he treats as manifestations of deep-rooted contradictions in the evolving state-capitalist social order, contradictions that were even more forcefully and meaningfully expressed in years of workers' strikes and agitation throughout the West. In much of Europe, for example, huge portions of the peasantry were still migrating to the cities in the 1950s and 1960s; when industrial work proved low-paying and exhausting even as deskilling of the workforce was taking place (and consequent loss of workers' power), strikes began to break out frequently. At the same time, political repression was fierce in several fascist and semi-fascist countries, including De Gaulle's France, which were trying to modernize their economies -- make them internationally competitive -- without yielding to pressures for political democratization. Harman's book is valuable as a reminder that students were not the only ones advocating democratization or increased power for the 'people'; workers and other oppressed groups were doing the same. The war in Vietnam became a symbol for many students of society's essentially authoritarian nature, but workers too, as well as African-Americans in the United States and other groups, fought for greater power in their own spheres -- sometimes against political regimes, as in southern Europe.

As for why student rebellions dissipated or were easily crushed, Harman's answer is that

the students did not have the power that workers have when they strike -- the ability to hit the source of their employers' profits. They could not build enduring organizations based on their ability to put permanent pressure on the authorities. The student upsurge could, by the very speed of its development, throw the authorities on to the defensive; it could force them to make concessions in a desperate attempt to reassert their ideological control over the mass of students. But it did not have the power to do real damage and that led the students rapidly to believe that little more could be achieved by direct action.¹

Harman argues that workers might have been able to force significant changes in certain European countries, for instance France in May of 1968, when the largest general strike in history occurred, had not the leadership of their unions and political parties been essentially conservative. Worker unrest was corralled into 'respectable' channels of opposition, such as electoral action; leftist parties and unions effectively collaborated with governments to undermine their membership's militancy. Ironically, in the long run the victory of conservative 'reformism' over more radical tendencies led to the undoing of the organized left: their own parties being merely diluted versions of the political center and right, workers in many countries eventually lost faith in the left and turned to the right for solutions to their economic problems.

The three works discussed so far are quite different from each other, but they share a tendency not manifested in more recent scholarship: they take it for granted that the nation-state should be the basic unit, or should define the 'framework,' of analysis. This older scholarship is sometimes international in scope, but it is rarely or ever *transnational*. When one compares it to more recent works it seems relatively narrow

¹ Chris Harman, *The Fire Last Time: 1968 and After* (Bookmarks: Chicago, 1988), 47.

and un-cosmopolitan. Timothy S. Brown expresses the perspective of the new scholarship when he writes, “[T]he nation-state cannot function as our primary frame of reference, not only because of the importance of transnational influences in shaping local events, but because of how intimately ‘1968’ was linked to the creation of globalizing imagined communities that cut across national boundaries.”¹ Even if most recent authors on 1968 do not explicitly argue for the latter claim (the creation of globalizing imagined communities), it is implicit in their work insofar as they downplay national boundaries and emphasize transnational connections and cross-fertilizations in social movements.

For example, Mark Kurlansky organizes his book *1968: The Year That Rocked The World* in a decidedly anti-nation-statist way, hopping around anecdotally from country to country, city to city, famous figure to famous figure, in a disjointed but engaging stream of narrative. His very style of writing is subversive of rigid boundaries and parochial fixations, being breezily popular in tone, ranging easily over stories from one side of the world to the other. One of the theses of his book is that 1968, or the eruption of liberatory social movements all over the world within several years of each other, was made possible by the relatively new phenomenon of television. “Television was coming of age but was still new enough not to have yet become controlled, distilled, and packaged the way it is today.”² Without television, the three other factors that he thinks brought about a global ‘1968’ could not have had the effect they did: America’s civil rights movement would not have inspired people elsewhere in the world; “a war that was hated so universally around the world that it provided a cause for all the rebels seeking one”³ would not have been broadcast to millions of homes; and “a generation that felt so different and so alienated that it rejected all forms of authority” would not have known that its alienation was global in scope, that people on every continent were rebelling against authority -- in imagined solidarity, as it were. By bringing visions of freedom to some homes and visions of savagery to others, television connected the world -- eroded national or regional traditions and authority-structures. In the end, Kurlansky’s conclusion is that “1968 was the epicenter of a shift, of a fundamental change, the birth of our postmodern media-driven world.”⁴

Richard Ivan Jobs writes in the same transnational spirit as Kurlansky but takes his analysis in a different direction: he argues for the importance of *travel* in breaking down national barriers. His argument focuses on European youth in 1968. “The events of that year marked a turning point in the emergence of a cohort of young people who had come, through travel, to conceive of themselves not merely as members of a particular nation, but as a continent-wide, transnational social group.” Specifically, young people traveled between protest sites -- Berlin, Paris, London, Prague, and so on. Their experiences “helped to shape a politicized European identity.”⁵

Jobs and Kurlansky illustrate another tendency of recent scholarship on 1968: rather than emphasizing the politics of that year, the political agendas of radical movements, it emphasizes the ‘spirit’ of 1968 -- “the transformed daily behaviors and interpersonal interactions that emerged during this period. Young people started to dress differently, they began to talk differently, and, yes, they had sex differently during the 1960s. The old ways never returned.”⁶ One author even titles his 2007 book *The Spirit of '68*. Actually, this book considers the political aspects of the movements in some detail, but it does so precisely to illustrate the spirit of 1968 -- the way of being, the zeitgeist that had emerged by the late Sixties. It was a cultural revolution. After considering the “medium- to long-term paradigm shifts in modes of interpersonal and institutional behavior and short-term material advances” that were achieved by young people and workers, the author concludes that

the most important rearrangements occurred on yet another, rather elusive, constantly shifting, and ultimately vanishing terrain: the concrete experience of a qualitatively different way of life, the exposure to non-hierarchical modes of social interaction, the lived environment of solidarity, the heated atmosphere of open debate, the concrete strivings for a common and mutually beneficial system-transcending goal.¹

For Gerd-Rainer Horn, the basic meaning of '1968' (the concept, not just the year) is *participatory democracy*. This is the meaning of the student occupations of universities, the popular revolts against dictatorships in Spain and Portugal, the experiments in workers' self-management in France, the strike committees and factory committees in Italy and France, the 'alternative' free schools and universities throughout the West during the 1960s, and many other manifestations of the mood of 1968. Of course, Horn's interpretation is not particularly original. To say that the spirit of 1968 was participatory democracy is just another way of saying that it was freedom, liberation, people's power, democracy, and so on. The point, however, is that his emphasis on the 'spirit' of the year exemplifies a recent trend in scholarship.

The subtitle of his book, which refers to the years 1956-1976, points to another trend: the placing of 1968 not only in a transnational context but in a broad historical context. This fits with the recent tendency to extend the 'Sixties' as a whole into the past and the future. For example, in her influential article "The Long Civil Rights Movement and the Political Uses of the Past" (2005), Jacquelyn Hall argues that we should conceptualize the civil rights movement as having begun in the 1930s, with the culture of the CIO, left-led unions such as A. Philip Randolph's Brotherhood of Sleeping Car Porters, the Popular Front against fascism and conservatism, the Communist Party's interracialism, and the various political advances made in the 1940s (such as FDR's Fair Employment Practices Commission and Truman's desegregation of the military). The Cold War put a temporary halt to progress, but in the late 1950s the movement resumed. In the same vein, Gerd-Rainer Horn finds that the 'spirit' of 1968 extends back to 1956 in some respects and forward to 1976 in certain European countries. Artistic and dissident circles in the late 1950s and early 1960s, such as Beatniks, Situationists and the Dutch Provos, anticipated the youth movements of the late Sixties, while the actions of, for instance, workers in Italy and collectivizing farmers in Portugal, as well as the multitude of popular far-left parties in the West after 1968, extended the rebellious spirit of that year into the Seventies.

The central element of all these innovations in contemporary scholarship is the 'problematizing' of established narratives. This is the case in all recent historical scholarship. The rise of various kinds of social history, cultural history, and postmodernism, as well as society's globalization, has made old narratives seem trite and narrow. The civil rights movement did not start with *Brown v. Board of Education* and end with the passage of the Voting Rights Act; 1968 was not *only* 'the year of the students,' nor was it some sort of inexplicable ultra-leftist aberration. As we have seen, earlier scholarship, such as Chris Harman's, made some of these same points; they have since become, however, the mainstream of academic literature, not the exception. The goal of writers now is to upset our preconceived notions, to 'layer' our understanding rather than letting it remain flat and complacent. Thus, in "Japan 1968: The Performance of Violence and the Theater of Protest" (2009), William Marotti gives a subtle analysis of the role of violence in Japan's student and anti-war movements, while also indicating the importance of "strikes, seizures, marches, and rallies [in] broaden[ing] the scope of political participation and [creating] new forms of political activism."² Sara Evans likewise unearths new meanings of 1968 by analyzing constructions of gender that prevailed in radical movements, against which women reacted in the resurgent feminism of the 1970s. Hippie culture was relatively androgynous, men dressing and behaving like women as women dressed and behaved like men, but in most leftist youth movements the men used their control of female sexuality -- their access to

the bodies of young women in the movement -- as a way of flaunting their rebellion against the middle-class mores of their fathers and reaffirming their own hyper-masculinity. Eventually women in turn rebelled against their subordinate positions in these movements, and modern feminism was born.¹

All these ‘problemizing’ features of recent scholarship are definite advances over older literature -- which, however, retains much value. The next step should be to fuse the best of the old with the best of the new. For instance, while Chris Harman’s *The Fire Last Time* has flaws (e.g., a certain superficiality and a doctrinaire Marxism), its ambition of locating the origins of 1968 in the evolution of international economic structures is commendable. Too much of recent literature focuses on culture while ignoring the structural economic changes that underlay the ferment of the late Sixties, “the radical and youth movements of [which] time were harbingers of the globalizing dynamic that would characterize subsequent decades.”² Economic dynamics are less ‘sexy’ than cultural ones but arguably more important. At the same time, the tendency of recent literature to study areas of the world that received scant attention in past scholarship on 1968, such as Latin America and Japan, is excellent and should be encouraged.

Even more ambitiously, it is perhaps time for some enterprising author to make an attempt at synthesis, at relating to each other all the best analyses and insights of the whole literature so that a comprehensive understanding is possible. Such a work would start with the ‘foundations’ of economic and technological change in the postwar decades and proceed to politics, systems of higher education, culture, and so on, illuminating how these spheres influenced one another and gave rise to the creative anarchy of the late Sixties. Part Two of this project would be to explain the dissolution of radicalism in the Seventies. Not the least benefit of such an enterprise is that it might provide lessons and encouragement to present and future radicals, whose task is no longer just to stop a particular war or help desegregate society but to ensure the very survival of our species in an age of world-upheaval.

*

A Review of Yankee Leviathan

The impact of the Civil War and Reconstruction on subsequent American development has been incalculable, and historical scholarship as a result never ceases to consider the events from new perspectives. Richard Franklin Bensel undertakes an important such analysis in *Yankee Leviathan: The Origins of Central State Authority in America, 1859-1877* (1990). As the title suggests, he argues that the Civil War caused an “explosive expansion” in central state authority -- not only in the Union but even more so in the Confederacy (a point overlooked in much of the literature). Reconstruction presented an opportunity for even greater state expansion as the North occupied the South in an attempt to rebuild its political economy, but by the early 1870s the attempt had effectively failed, and further growth of the state was halted until the turn of the century. The failure, Bensel argues, was due primarily to “internal contradictions within the [Republican] alliance,” especially the existence of a Northern financial class that had an interest in ending Reconstruction (p. 2). Its failure had major implications for national politics in the subsequent century, and Bensel discusses these in the final chapter of his book. It is a rich and wide-ranging work; in the following I will summarize and critique its main conclusions and consider its place in the relevant historiography.

Bensel characterizes the antebellum state as “self-effacing”: until the war, “the American state [was] little more than an arena in which contending forces and coalitions in the national political economy competed over decisions related to continental settlement and foreign policy” (p. 2). Indeed, the antebellum state was supposedly so minimal that Bensel treats the Civil War and Reconstruction periods as a case-study in state-formation. In this instance, it was revolutionary state-formation: the Republican party, which represented a “cohesive political-economic alliance,” captured the state apparatus, which caused its major

¹ Sara Evans, “Sons, Daughters, and Patriarchy: Gender and the 1968 Generation,” *American Historical Review*, Vol. 114, Issue 2 (April, 2009): 331-347.

² “The International 1968, Part 1 - Introduction,” 42.

opponent, the Southern plantation elite, to withdraw from the state and found its own country. Thus, the government of the North was a party-state, as was that of the South. Both states became 'leviathans' during the war, but the Southern especially so -- ironically because of the South's underdeveloped, premodern economy. While the Union "relied on an unregulated capitalist market to supply resources and manpower," in the Confederacy "the central state regulated almost all forms of production and manpower, often assuming direct control of private factories, impressing their production, and even constructing state-owned plants where private capacity was insufficient for the needs of the war effort" (p. 233). In these respects the Confederacy was more modern than the Union. The latter was premodern also in a particular consequence of the virtual identity between its state and a single party: the government used political patronage to fill its bureaucracy, which compromised the quality of its operations. This fact actually contributed to the failure of Reconstruction, as described below.

Nevertheless, the Union was quite modern in many respects, including its emancipation of slaves, its sponsorship of economic development through such measures as high tariffs, and its reorganization of the nation's financial system. The latter is a central focus of Bensel's analysis. He argues that the Union government financed the war mobilization in three ways: it abandoned the gold standard and issued paper currency (greenbacks); it created a national banking system that "abolished locally chartered banks of issue and effectively nationalized the currency"; and it placed, through the national banking system, a large part of the national debt with finance capitalists (p. 14). These measures effectively created a new and powerful class of financiers whose interests aligned with the state's. They wanted it to win the war, and they wanted its fiscal policies to succeed. This alignment of interests, however, fell apart after the war had been won, for several reasons.

First, the financial class favored an early return to the gold standard, which had anti-statist implications. Its support for the gold standard rested on a number of considerations: (1) the resulting program of deflation would benefit many creditors; (2) the systemic stability fostered by the gold standard would benefit those financiers who operated in fast-paced, high-risk markets; (3) "the greenback system compelled the Treasury to conduct open-market operations" for which it was ill-equipped (as financiers knew), being staffed by incompetent "party hacks"; (4) the financial community probably sought power and influence through resumption of the gold standard, knowing that the Treasury would thereby lose influence over the money market (pp. 294-296). On the other hand, the gold standard was anti-statist for precisely that reason: the state would no longer control the amount of money in circulation, and it would lose economic autonomy within the world system. Moreover, resumption of the gold standard would make impossible the statist project of radical Reconstruction, since such Reconstruction would entail high government expenditures, therefore a huge national debt, and therefore a maintenance of the greenback system. The financial class wanted budget surpluses, not budget deficits.

Financiers opposed Reconstruction for other reasons as well. The massive redistribution of wealth from planters to blacks and poor whites that would have been necessary to ensure a large Republican presence in the South and to set the region on a new economic and social path entailed a great expansion in government, to which the financial class was opposed in part because of its experience with administrative incompetence and in part because it would lead to higher taxes. Also, a class-centered policy of wealth redistribution might well have extended to the North, as labor and the lower classes demanded a similar policy on a national scale. Thus, the financial elite used its influence in Congress to subvert the ambitious proposals of radical Republicans.

In fact, according to Bensel, the only faction of the Republican party that was strongly committed to radical Reconstruction was the Southern Republicans. "Iron districts," for example, "were more interested in the tariff, capital-rich districts in the operation of the financial system, and settlement districts in internal improvements" (p. 363). In short, "as the interests of the different factions diverged, the party lost the revolutionary zeal that had attended its role as the agent of Union survival and increasingly became a broker organization within which political allies narrowly construed their interests" (p. 303). Bensel concludes that the Civil War and Reconstruction era provides an example of how a particular pattern of state development can be self-limiting. In this case, the Union created a financial class (by floating a huge national debt) to help it win the war, but this class then turned against further state expansion in the form

primarily of Reconstruction. The (semi-)laissez-faire state of the Gilded Age was the result -- though it also resulted from the demise of the revolutionary party-state due to factional strife in the Republican party and the return of former Confederates to the government.

With the failure of Reconstruction came the retardation not only of modernization of the state but also of Southern political and economic development. A more interesting insight of Bensel's, however, is that the party-system of Republicans and Democrats that emerged militated against social democracy or the national rise of a coherent labor party. This is because a "cross-sectional inversion of class alignments" occurred: Republicans represented Northern industrial and financial capital and Southern blacks, while Democrats represented Southern plantation-owners and Northern immigrant-workers and subsistence farmers. That is, each party -- the 'Northern' Republican and the 'Southern' Democratic -- included in its constituency the economically discontented of the *other* section of the country. The lower classes therefore could not use the two-party system to assert coherent class claims across the entire nation: "an attack on economic privilege could only be made by sacrificing the elite interests of one of the two major parties" (p. 421). This is one of the reasons why Bensel thinks that the major problem facing late-nineteenth-century American state-builders was not the social dislocation of industrialization but the fact of Southern "separatism."

Having summarized the book, let us consider its place in the scholarship. Bensel sees himself as arguing against the relevance of modernization theory to America in the Civil War era. Louis S. Gerteis expresses it well in his review of *Yankee Leviathan*: "Union victory and the triumph of the northern state did not integrate a premodern South into a single modern national political economy. In the wake of the Civil War, Bensel argues, the South was not modernized but marginalized" (*Reviews in American History*, Vol. 20, No. 2, p. 190). Modernization of the state and the South would have proceeded had Reconstruction succeeded, but the hostility of the North's financial class prevented that from happening. More generally, however, *Yankee Leviathan* shows that modernization theorists are wrong to think that broad political participation at an early stage of state development necessarily hinders political modernization (by "abort[ing] the development of the specialized and politically insulated bureaucracies necessary to a strong central government" (Bensel, p. 5)). The American state was strong enough to attempt Reconstruction, even as "that strong state was synonymous with a robust political party (the Republicans) and rested on wide electoral participation (by southern freedmen and poor whites)." Far from being weaknesses, these were strengths (pp. 414, 415). -On the other hand, the modernization theorists are partly right: as Bensel's own evidence shows, the political patronage and corruption that resulted in part from the robustness of democracy did weaken the state and signify that it was not yet modernized.

Brooks D. Simpson points out in his review of the book that while "the impact of the Civil War upon American institutions has long interested historians, [until *Yankee Leviathan* there had been] no systematic exploration of this topic employing the concepts of state building and political economy" (*The Journal of American History*, Vol. 79, No. 1, p. 276). Bensel goes further than previous historians in treating the Civil War as an example of state-*formation*, rather than merely -expansion. Indeed, he probably goes too far. As Gerteis notes (*op. cit.*, p. 192), *Yankee Leviathan* has no discussion of the statist implications of the creation of the Interior Department in 1849. Moreover, a state that could administer the massive, continental postal system is certainly not "self-effacing" -- or at least it is simplistic to label it so. Similarly, it is surely an exaggeration to claim that "the Civil War, even more than the end of British colonial rule, represents the true foundational moment in American political development" (Bensel, 10). Do the decades of state-development from the 1790s to the 1850s not count at all? Are they nothing but a 'prelude' to the 1860s? That seems a misleading way of interpreting the history.

Yankee Leviathan is a fusion of political science and history; it belongs to the 'new institutionalist' school, which Richard John characterizes as follows:

[It] focuses not only on discrete governmental institutions, such as courts, legislatures, or administrative agencies, but also on the configuration of institutions that gave the polity its distinctive character. For [new institutionalists], governmental institutions are best conceived of as agents with wide-ranging social and cultural effects. Often they focus not

only on the goal-oriented activities of policymakers, but also on the unintended and often unforeseen consequences of the organizational network in which specific institutions are found (Richard John, "Governmental Institutions as Agents of Change: Rethinking American Political Development in the Early Republic, 1787-1835," p. 367).

Bensel is thus concerned with institutions and their effects on society, not with social history or social movements or ideologies. This is perfectly legitimate, of course, but arguably it leads him to give an oversimplified interpretation of the failure of Reconstruction. He attributes its failure primarily to the opposition of the Northern financial class to an overweening statism; other factors, such as the resistance of Southerners, he downplays or ignores. No doubt he is right that factionalism in the Republican party was of major importance in causing the downfall of the Reconstruction regime, but by trying to interpret all the disparate phenomena he discusses through the lens of institutionalism, and more particularly through his focus on modernization and state-formation, he is forced to ignore features of reality that do not fit such a framework. For instance, he almost totally ignores the 'concrete reality' of Reconstruction, the ways in which Republican policies were carried out in the South and how that in turn influenced the policies. *Yankee Leviathan* exists on a very 'abstract' plane of analysis. The author has the right to choose what features of reality he wants to discuss or ignore in his book, but it is well to keep in mind the limitations of this study.

On the other hand, Clyde W. Barrow is right to point out that "Bensel's work breaks new ground by documenting the concept of a 'weak state' with an empirical analysis of the distribution of federal officials, troop deployments, arsenals, custom houses, lighthouses, etc." (*The Journal of Politics*, Vol. 54, No. 2, p. 602). The book's empirical data can even be overwhelming at times, and tedious to read. Yet somehow, at the same time, *Yankee Leviathan* seems very 'theoretical' and 'divorced from society' -- perhaps because the data amassed relate mostly to the behavior of political parties, interest-groups, Congress, and other institutions.

Yankee Leviathan is an extremely rich book, but through all the data-analysis, theoretical discussions, and attempts at resolutions of secondary questions (such as why the South seceded in the first place and why the North did not simply let it secede) runs the thesis that during the 1860s and 1870s a modern American state was in the process of being created. While its continued creation was halted with the end of Reconstruction, the foundations had been laid for further modernization in the next century. The framework of a 'politically neutral' state apparatus and bureaucracy had finally been established -- a "sovereign central authority...which could at least initiate (if not [fully] administer) substantive social and economic policies" (Barrow, op. cit., p. 602). This is an important and interesting conclusion, and in itself it makes the book well worth reading.

Does 'certainty' always indicate closed-mindedness?-- People should remember that there are two kinds of certainty: Sarah Palin's kind and Noam Chomsky's kind. The one is founded on unquestioning acceptance of the beliefs one has been trained to accept; the other is founded on continuous critical analysis of one's beliefs. It's the certainty of close-mindedness versus the 'certainty' of open-mindedness.¹

*

What is fascism?-- Populist conservatism.²

¹ (I may have made that point a few years ago. Excuse the repetition.)

² That's the essential core, but classical fascism manifested it in quite specific ways -- relatively 'pure' and 'complete' ways. Note that, as a form of populist conservatism, American religious fundamentalism has the same essence as classical fascism. (Fundamentalism in other social contexts can be connected with a liberatory political agenda.) It has similar social and political functions, is 'reluctantly' supported by similar sectors of the economic elite, etc. Whether fascism takes a nationalist, a religious or some other form is secondary to the fact that it goes against the class struggle

*

An incidentally true comparison.-- Like Mozart, I lack gravitas.

*

Are women 'inferior'?-- The sexist question whether women are inferior to men (or, more exactly, whether femininity is inferior to masculinity) is half-meaningless. Nothing and no one is simply *inferior* to something or someone; inferiority is always relative to some set of values or standards. Stalin was not *bad*; he was bad in relation to a set of values like compassion, sympathy for others, not-killing-millions-of-people, etc. Noam Chomsky is 'bad' in relation to the values of cruelty and ignorance: he is bad at being a thug. Femininity is 'inferior' to masculinity in some respects, while in other respects masculinity is 'inferior' to femininity. It may be, however, that the respects in which masculinity is superior are those that are typically used to judge that a person 'has value' or has a strong presence, such as assertiveness, confidence, physical bulk, and physical strength.¹

*

Present philistines, future scholars.-- What does it say about people that the most celebrated thinkers and writers in their time are usually not the most celebrated ones centuries later? It says that, in general, the recipe for success in life isn't genuine merit judged on the basis of transhistorical standards of reason, creativity, originality, beauty, etc., but skillful, 'talented' obedience to the social and institutional norms of one's day. It says that most people, especially most people in positions of power, don't know how to judge real merit *if it exists among them* -- and maybe don't even care, since what matters is fitting into institutions. However, they are better able to judge *past* merit, because institutional norms constrict their thought in relation to the present more than the past. They are supposed to apply to the living more than the dead -- and so the dead are allowed to step outside the bounds of institutional respectability.² Also, the withering away of older institutional norms and the rise of new ones means that works that successfully embodied the former are no longer celebrated.

*

Dionysian rape.-- Why do some women enjoy, or at least fantasize about, rape or semi-rape? It seems very paradoxical. I suspect that the secret enjoyment or fantasies are due to rape's being an extension of an aspect of sex that women find enjoyable: they like being genitally pounded by a man, half-violently treated like an object, being subjected to a frenzy of powerful masculine desire partly because it makes them feel desired (by a 'strong man') and partly because of its ecstatic release from self-consciousness, self-control, inhibitions. It's similar to the pleasure people get from being drunk, from going to raves, from indulging in any kind of orgiastic ritual. It's Dionysian pleasure, the joy of merging self with other.

and so is in the interest of business and the status quo (or reaction). This is why it keeps appearing -- is *allowed* and *encouraged* to appear -- decade after decade.

¹ Socialization is not solely responsible for our valorization of those traits, as can be seen by the fact that all mammals and all human societies valorize them.

² That also has to do with the arrogance of the present: a person who reacted (creatively) against the 'quaint' or 'benighted' old traditions of his day is seen as anticipating the more sophisticated present. By appreciating the past rebel, the present is proving to itself its open-mindedness, generosity, capaciousness of thought, superiority over the past. Moreover, it flatters itself by appropriating (for itself) the brilliance of the rebel. 'It wasn't until *we* came along that Nietzsche could be appreciated.'

*

J'accuse....moi!-- Your feminist vehemence in accusing me of misogyny possibly comes from your half-conscious sense that there might be *some* truth to ideas that aren't particularly flattering to women. (Just as there is truth to certain ideas that aren't flattering to men.) Sometimes, after all, they do seem, *prima facie*, plausible. As a result, you won't even *hear* these ideas: you'll shout them down, scream that their proponent is a misogynist, a sexist, a horrible person, not worth listening to, and if he starts to argue in a detached scientific manner, using logic and evidence to explain behavior, you'll accuse him ever more frantically of being disgusting and hateful, just to stop up the ears of your rational mind because you refuse to let it succumb to the temptations of a reasonable argument. Your frenzied value-judgments -- "Misogynist!" -- translate as "Shut up! I don't like what you're saying! I don't want to hear it! I'm afraid of it!" What it comes down to is fear, fear of ideas you don't like.

*

Feminism and prejudice.-- Some feminists are so sensitive that whenever they hear an argument that takes seriously the possible existence of a particular so-called 'weakness' of their sex and tries to understand it instead of just denying or ignoring it, they hear nothing but an attempt to justify contempt for women, which makes it impossible for them even to consider the argument's logic. They become *incapable* of thinking in an unbiased way. Even if perchance they succeed in really hearing the argument, it means little or nothing to them because what they're fixated on is what they imagine its *tone* is, its contemptuous tone, which in turn means that the person putting it forward is contemptible, has a misogynistic agenda, and so can be ignored. But contempt for women, despite all these feminist fantasies, might have *nothing* to do with the argument or be totally absent from the arguer's mind. It's not *his* fault if most people, including feminists, make the leap from logic and facts to the value-judgment that women are 'weak' and therefore, supposedly, 'contemptible.'

*

On the other hand.-- The person who is curious about the dark side of humanity is perfectly free to write down reflections that, while substantially true, might be seen (or misinterpreted)¹ as justifying misogyny. Given society as it is now, however, it would be irresponsible to publish such reflections in any form that might reach a mass audience. For you know what happens when the masses get hold of something. More important than communicating truth is protecting people from harm.

*

Anarchism.-- 'Anarchism' is a fancy name for a simple thing, a commonsensical thing that has been around for thousands of years amongst billions of people. As Chomsky says, it is not so much a worked-out political theory as a deep impulse in human thought and behavior. People don't want to be subordinated to power-structures; they want to be free. Whenever they rebel against authorities, that's anarchism in action. Whenever they come together to organize a grassroots democratic life, that's anarchism in action. A *pure* anarchist society probably isn't possible because every society, no matter how egalitarian, must surely contain power-relations, but I suspect we can approach such a society relatively closely.

*

¹ It might be a misinterpretation because the person suggesting the ideas might reject the conventional notions of what it is that would justify so-called 'misogyny.' He might not share society's values, so that, for example, what others see as weak he sees as human or even positively good.

Racism.-- Why does racism (in various forms) run like a blood-red thread through all of history? What explains the durability, the tenacity of this affront to reason and decency? It has nothing to do with a supposed human propensity to hate or distrust people who look different from one, because such a propensity would be meaningless and also because, insofar as it has any meaning at all, many or most people do not exhibit it. Many or most people are not racists. The real explanation is far more subtle. First of all, 'racism' as a full-fledged philosophy didn't even emerge until the middle of the 19th century or later, and it had a rather brief tenure in the public mind. As a more nebulous virulent prejudice it reaches farther back in time, but it's still largely a modern phenomenon, I think. Nonetheless, racial prejudice of some sort does extend far back into the mists of early history. It has existed more between *peoples* than *individuals* - - and that's the first clue to its character. 'Racism' appears where there are collective economic and/or political grievances that can be directed at a group or 'race' of people -- or where one people is economically exploiting another and so becomes contemptuous of it -- or where two peoples with different social structures and norms come in contact and, due to these differences or to the aggressive expansionistic institutions and ethos of one or both, develop mutual hostility -- or where there is some other such cause. The point is that racism is first and foremost a matter of economic and political conditions, not mere racial differences. And it's less a 'psychological' (or biological!) thing than a 'social' thing.

*

Thoughts on socialism.-- In retrospect it's obvious that something like socialism couldn't have happened until the nation-state system had disintegrated (which it's starting to do now), because the nationality principle conflicts with the class principle. Marx thought the latter was more powerful and important than the former, and in a sense he was right. But not in the sense he wanted: *business* tended to be more loyal to class than to the nation, and it used nationality to divide the working class. In any case, since capitalism and the nation-state had been historically connected in their development, with the capitalist class eventually becoming intermixed with the ruling political elite, the working class would have had to triumph over, as it were, two elites fused into one. And that was a utopian hope. Only when capitalism and the nation-state began to decline together according to their internal dynamics and not due to some 'voluntaristic' push from the outside would the wage-earning classes have the chance to supersede capitalism and the nation-state (with its false principles of nationality and nationalism).

*

The plight of progressives.-- The reason that advances in equality and freedom are so laborious in their birth is that, unfortunately, little gets done without help from allies in the business world. [See, e.g., the research of Thomas Ferguson.]

*

The last will be first.-- One of the ironies of history is that it's the poor and oppressed, the workers, the slaves, the marginalized -- and not the middle class or the privileged -- who carry on in their struggles the tradition of the Enlightenment, with its ideals of freedom, universal rights, humanity, and progress.

*

The sublime.-- "Romance" from Shostakovich's *Gadfly*.¹

*

¹ (At least, the arrangement I'm listening to, a piano and violin duet.)

Against postmodernism.-- If you want a simple criterion for artistic greatness, here it is: the artist who manifests longevity in both popular and critical approbation is truly great. -That excludes most postmodernists, who don't appeal even to *educated* popular audiences, only to super-educated, or super-indoctrinated, 'critical' ones.

*

Postmodernism yet again.-- It irks me, that's all, when in class we're told that someone like Joan Wallach Scott has been hugely important to the historical profession, and is widely admired, because of her theoretical arguments that extend Derrida and Foucault and 'the linguistic turn' of the 1980s into the discipline of history. Arguments like "We [historians] need to scrutinize our methods of analysis, clarify our operative assumptions, and explain how we think change occurs. Instead of a search for single origins, we have to conceive of processes so interconnected that they cannot be disentangled. [Truism.] ...It is the *processes* that we must continually keep in mind. [Truism, idiocy.] ...To pursue meaning, we need to deal with the individual subject as well as social organization and to articulate the nature of their interrelationships, for both are crucial to understanding how gender works, how change occurs. [Truism, idiocy.] Finally, we need to replace the notion that social power is unified, coherent, and centralized [-Who is stupid enough to think that social power is unified, coherent, and centralized?]- with something like Michel Foucault's concept of power as dispersed constellations of unequal relationships [utter truism], discursively constituted [?] in social 'fields of force' [pretentious, unilluminating metaphor]." Etc. This is what happens when people trained in history try their hand at theory, seduced, probably, by how profound and philosophical it makes them feel. But 'the poverty of theory' is most evident when a Joan Scott wades into it.

*

Parasitism in pre-capitalist and capitalist forms.-- I don't see much difference, in principle, between ownership of capital and ownership of land: in both cases one derives unearned income from the bare fact of owning property. Others do the work that makes the property productive in a real sense; the owner does nothing but supply some of the means by which the work is done (because he happens to have gained possession of these means, i.e. excluded others from possessing them; *not* because he has produced them). In principle he can lie on some beach and 'sip mint juleps' as he collects the profits of others' labor. And that is appalling. Unearned income, unless it is distributed equally amongst the people, is appalling.¹

*

Contrary to nature.-- Throughout history it has been the *parasites* who have had the most power and wealth.

*

Academic indoctrination.-- 'Economics' is a term of propaganda, inferior as such to 'political economy.' It went mainstream due, first, to the discipline's pretensions to science -- whereas in fact it is as little scientific as sociology -- and, second, to the bourgeois façade of purging economic problems of their inherently political character so as to obscure the conflict between capital and labor. In fact the economy is

¹ That many owners of capital do various kinds of productive work -- managerial, technical -- is not essential to their ownership of capital considered in itself. It is from this whence they derive their profits.

the most 'political' sphere of all; hence it is proper to call the discipline 'political economy.'¹

*

A revaluation of values.-- The quality of being a 'natural leader' is not particularly admirable. For one thing, it probably means that one tends to be overbearing, to act inimically to the collective exercise of spontaneous democracy. For another, 'charisma' is not in itself a moral quality. It is neutral, neither praiseworthy nor blameworthy. Thirdly, a person who aspires to lead others aspires thereby to have power over them, which is an amoral goal at best. The kind of involuntary respect that leaders usually command is subhuman.

*

Capitalism and 'patriarchy.'-- Women have indeed been subordinated to men throughout history, which means that patriarchal, sexist structures and norms exist that cannot be reduced to, and are not caused by, capitalist structures. Correspondingly, the supersession of capitalism does not entail the transcendence of every kind of sexist subordination. Certain kinds of such subordination may even be natural -- expressions of biological facts. The last sentence of the section above called 'Are women "inferior"?' provides plausible examples, as does my essay "On Women." Other, more culturally specific manifestations of subordination are a result of biological factors 'combined with' particular social conditions, and so can be abolished or mitigated by changing the social conditions. Some of these are capitalist in their origin, which means that, to this extent, modern class structures and forms of class oppression are 'prior to' modern sexist oppression -- i.e., that class has priority over gender. One author gives an example: capitalism, "with its concomitant free wage laborer, implies a separation, in some form, between the reproduction of workers and the production of goods and services. The separation [between private and public] seems also to imply a segregation, and denigration, of women," because due to the nature of childbirth and childrearing, women will probably be the ones to stay home and be in charge of 'reproducing' the labor-power that goes out into the world and secures the physical means of the family's survival. Women will end up being relatively confined to the domestic sphere and associated with the personal, the unpolitical, dependence on a man, and other demeaning things. Their subordination in these respects will not be overcome until the capitalist division between the private and the public has been overcome.²

*

Class, race, and gender.-- The significance of each of these is multidimensional. Class, however, seems to have a unique sociological importance insofar as class structures, or economic structures, constitute society's essential 'infrastructure,' the skeleton that is fleshed out ('dialectically,' not reductively) in culture, politics, ideological trends, etc. Race and gender, by contrast, are primarily subjective identities, not *objective structures* rigorously defined and enforced in the ways that capitalist class-relations are. In imagination, one can picture rearrangements of the occupants of positions in class structures; black people could occupy capitalist positions and whites occupy wage-earning positions, or the current relative places of women and men could be reversed in the same way. And society would continue to have basically the same institutional configuration it does now, with lower wage-earners viciously exploited -- only these would be white men. In fact, blacks and women *have* made advances along these lines, even as the real sources of mass oppression have barely been touched due to the lack of *institutional* change. To change the institutional structures and so *really* change society, capitalist class-relations have

¹ [On the other hand, the discipline as it exists today and has existed for 150 years *shouldn't* be called 'political economy' because it ignores the social context, ignores power relations and social dynamics. The term 'economics' seems appropriately 'static,' abstract, mathematical, pseudo-scientific, sterile.]

² (Now that I think about it, I vaguely recall jotting down these same ideas years ago. Sorry.)

to be abolished.

*

Two strains in populism.-- The dangerous thing about populism is that it does not seek only to improve the lot of the people; it seeks also to worsen the lot of their enemies. That can take benign, rational forms, as in social democracy (progressive taxation, welfare, government intervention in the economy), or it can take malign, irrational forms, as in fascism. Popular movements, even the 'good' ones, often have some of the bad populism in them, the blind resentment that lashes out instead of considering economic and social interests rationally. Authentic social-revolutionary movements always display some of this un-rationality (or even irrationality), but at least it tends to be more or less based on the rational foundation of insight into class-structures; more dangerous and irrational are the faux-populist movements like fascism and the Tea Party. [...]

*

The un-rational.-- Much as one wants to believe otherwise, there is little difference between Fred Phelps's flock of reason-proof homophobes and most people. The main difference is just the commitment the flock displays toward the single issue of anti-homosexuality. Their fanaticism is what distinguishes them, not necessarily their un-rationality and irrationality.¹ People constantly use reason, but their use tends to be half-hearted and ephemeral; it quickly succumbs to 'causation' (indoctrination, value-judgments, lack of interest). Consider my experiences in the class I'm taking on gender, in which everyone (it's all women) is a postmodernist but I. I argue against the famous historian Joan Scott, but it's quite impossible to change their minds on anything. They'll always be convinced, for example -- at least until they unconsciously evolve out of the belief -- that biology is totally irrelevant to history and gender-roles, that as historians we shouldn't even mention the word 'biology' unless we're studying the history of the science. -Needless to say, I never state directly that there are connections between biology and gender-roles. The women would burn me in effigy. I only suggested once that the association of women in the 19th century with the domestic sphere was due in large part to the biological facts of childbirth and nursing. One girl countered that not all women have children; I admitted that but said the point is that men can't give birth, that the female sex is the only sex that can. They stared at me uncomprehendingly; finally another girl said that's true *now* but might not always be true, due to science or whatnot. I let that pass, thinking it futile and irrelevant to argue the point; nevertheless (I said), in the 19th century it was true that only women could have babies. "There's such a thing as biology." But no, according to the professor biology is only an interpretation. Besides, as historians we have no business invoking biology. "But....we have bodies," I muttered despairingly. "So bodies are relevant to society. Which means biology is too." But I was forgetting that biology is just a social construction, and that arguing with these people was like smashing my head against a marble wall.²

*

¹ Those two qualities signify two different ways of not being motivated by rational considerations. The first term denotes one's being outside the domain of reason, as in emotional states and value-judgments; the second term denotes one's *contradicting* oneself either in acts or in thoughts. (Value-judgments can indeed be 'rational' or 'irrational,' but only in their *relations* with each other, so that, for instance, it is unreasonable to be committed to mutually inconsistent values; the act of valuing itself is outside reason, i.e. neither rational nor irrational.)

² The biological sciences are indeed 'interpretations' and 'social constructions,' but that fact has no interesting implications. In particular, it doesn't imply that they have no truth, i.e. that they do not at least partly correspond to reality. More fundamentally, the non-thinkers in my class are confusing biology the real thing with biology the science, which studies the real thing. They're effectively denying the existence of biology the real thing, the actual processes that occur in the actual body. (*These* are what I was referring to by invoking 'biology,' but the professor turned my meaning around when she said that biology is only an interpretation.) They're idealists, postmodern idealists. Or they would be if they had the slightest knowledge of any of this stuff.

Consonance and dissonance.-- I like people, I have pleasant interactions with them all the time. Laughing, joking, small-talking or large-talking. But if I got to know them better, I'd consider most of them fools, conformists, and/or moral midgets.¹ It's an uncomfortable inconsistency, and has gnawed at me for years. But both reactions, I suppose, are justified. As my fellow living creatures, it's right for me to be well-disposed to, even to 'love,' all people, despite every individual's particular flaws; and I can also like each person for his good qualities. On the other hand, insofar as people fail to live up to important standards, it's right for me to consider them 'unworthy' in these respects, and it's natural that this cognitive judgment will be reinforced by some degree of emotional aversion. -Nonetheless, some cognitive dissonance remains, and necessarily so. Such dissonance is part of the enlightened life.

*

Reading Jeremy Brecher's *Strike!*, a history of the U.S. labor movement from the perspective of the radical rank and file. 1877 to the end of the 20th century.

Barack Obama is turning out to be an even worse president than I thought he'd be. I was happy he was elected, but I didn't expect a whole lot from him. It's become clear by now that he's basically just another Bill Clinton. Except even more politically timid.² Evidently he wants to be a one-term president.

It's kind of fun to watch the world fall apart.

Gramsci's essay *The Southern Question*, a classic on the relationship between Italy's industrial north and agrarian south. I can't help thinking, though, that it's mainly of historical interest.

E. P. Thompson's *The Poverty of Theory*, his polemic against Althusser. A crushing demolition. I give Thompson credit for working through all the verbiage. He also draws some interesting parallels between Popperian positivism and Althusserian structuralism. -Let's talk about positivism for a minute, sometimes called empiricism. That word 'empiricism' has so many different meanings it can get confusing, but there are in fact connections between Popper's positivism and traditional British empiricism. At least, they fit together well. Positivism, in a nutshell, means a rejection of 'deep theories' meant to explain social phenomena, theories, like structuralist [or 'institutionalist'] ones, that get below 'appearances' or unproblematic 'facts' and posit tendencies or structural dynamics or other things that aren't experimentally 'verifiable' or falsifiable. Positivism wants only to record discrete facts with the help of statistics, computers, experiments, data-collection, etc. Minimal theorizing to explain it all. Social reality just is this collection of isolated facts; *relations* don't exist, only individuals. (See my paper from years ago.) You see how this shares the spirit of nominalism, which likewise acknowledges only 'individuals,' concrete particulars, and not universals (relations, etc.) -- because if those 'existed' then we would have to deal with a "prodigiously teeming Platonic heaven" of abstract objects floating around everywhere, and, you see, we're committed to Occam's razor, to postulating only those entities that are necessary to account for our best scientific theories. And so on and so forth. I need not point out how incredibly silly this all is: yes, it's true that only 'concrete particulars' in spacetime exist and not abstract objects -- because existence just *means* 'having a location in spacetime' -- but in another sense 'abstract objects' do exist, insofar as we use words, numbers, etc. Sure, they're a 'fiction' strictly speaking -- the number 2 doesn't *exist* in some place; the relation between worker and capitalist doesn't exist in the sense that you can point to it like a tree -- but we have to assume them in order to talk. Again, see my other paper, the one on ontology. Popper denies the existence of a 'class' such as 'army'; an army is just a collection of soldiers, he says. Okay, brilliant, way to go. But what is a soldier? Someone who belongs to an army. Oops. I guess armies exist after all. (See Alasdair MacIntyre, "Breaking the Chains of Reason.")

¹ Those judgments, incidentally, aren't just symptomatic of my supposed cynicism. They're largely true. All you have to do is look at how people treat each other, how they spend their days, or read history or the newspapers or personal blogs. (Of course, some people might judge *me* similarly.)

² That accusation isn't entirely fair. Big banks and other sectors of business are one of his core constituencies, so much of his apparent 'timidity' is in fact service to his base.

You see how this is all very ‘bourgeois,’ by the way. Thompson says it well in the last sentence of this passage, in which he speaks in the voice of a positivist:

The discrete facts are all that can be known. ‘History’ is an improper holistic concept to cover a sequence of discrete facts as in fact they succeeded upon each other. If we introduce concepts, we introduce these as ‘models’ which assist us to investigate and organize these facts; but we must be clear that these models exist in our heads and not ‘in’ the history. And we must develop ever more refined, value-free, and preferably quantitative empirical techniques to enable these facts to disclose themselves as in fact they took place. Whatever happens, I [the positivist] will make sure that no facts escape from their discrete prison cells, enter into relationships, or hold mass meetings.

By drawing attention away from social relations and structures, shared interests, etc., positivists reinforce the hegemony of an atomistic, individualistic way of life and ideology, thereby helping undermine social movements. They’re doing the bidding of the powerful (not consciously, though). It’s an “open society,” yes: no connections between groups of people in similar structural locations, no solidarity, no mass fighting for a common cause. Incidentally, it’s true that theories are ‘models,’ but they are supposed to be precisely models *of reality*. They’re supposed to ‘conceptually unpack’ what is implicit in reality (as I wrote in my senior thesis), the relations-between-elements that are implicit in reality. This is what the natural sciences do, and it is what the social sciences are supposed to do. It’s harder in the latter, though, or less precise, unmathematical, because of (the mystery of) free will, human’s undetermined nature (different from the determined nature of physical processes).¹

As for the affinity between traditional empiricism and positivism, it has to do with the fact that for empiricists humans bring nothing, or almost nothing, to experience; they just imbibe discrete events and inductively generalize from them, etc. Positivists try not to bring theories (a delusion), while empiricists deny that humans bring innate mental constructions. In both cases it’s a matter of ‘registering’ discrete events.

What are the parallels between Althusser and Popper? First of all, they’re both morons. More interestingly, Althusser’s ‘system’ is like positivism in discouraging an “arduous interrogation” of appearances, a grappling with evidence and theories, struggling to explain why a particular thing has happened. Althusser has basically no interest in history *as history*; he has his little system with all its peculiar concepts that he applies mechanically, ahistorically, being interested in history only insofar as it exemplifies ‘Theory.’ Both Popper and Althusser refuse to learn anything from history, deny that history can teach us anything meaningful. As two of Althusser’s disciples write, “Marxism, as a theoretical and a political practice, gains nothing from its association with historical writing and historical research. The study of history is not only scientifically but politically valueless.” It’s as stupid as postmodernism, and revealingly similar.² (What an intellectual freak, a postmodernist Marxism.)

Althusser’s idol, remember, is Spinoza, in whose system history can (apparently) not be accounted for (or so Alex Kojève says). Spinoza modeled his philosophy, or at least his *Ethics*, on mathematics, and Althusser likes math because it ‘proves itself.’ In the same way, says Althusser, historical materialism proves itself, and it doesn’t need to be confirmed by analyzing history. -If Thompson’s characterization is accurate...wow. Breathtaking. Althusser manages to overlook the fact that historical materialism is an *empirical* discipline while math is not.

An ironic thing about positivism, given its emphasis on empirical evidence, is that the theories, or ‘models,’ with which it’s associated, such as neoclassical economics, are flagrantly contradicted by the evidence. That shows -- doubly -- the essential dishonesty and hypocrisy of bourgeois intellectual culture. (Not just bourgeois, though. Any intellectual culture subordinated to power-structures.)

¹ As Thompson says, in history there are necessary causes but not sufficient causes.

² [I suppose I was referring there to its opposition to rigorous materialistic empirical investigation, its self-referentiality, its concern with language or ‘Theory,’ and other such things.]

Thompson points correctly to a tension in Marx's thought between his empirical open-mindedness, his realistic grappling with actual events, and his 'systematic,' 'idealistic' political economy which is almost Hegelian in its pretensions to tracing the 'immanent self-development' of capital from its most primitive forms to the final collapse of the society that has capital as its basis. This second side of Marxism arguably leads to the excesses of Althusser's Spinozistic, self-enclosed structuralism. But Thompson fails to see that this tension in Marxism is actually present to some degree in many theories: they try to explain the world, which means they have to be tested, but at the same time they have an internal logic that unfolds the theory out of itself, so to speak. They aspire to be 'transformed copies' of reality, but to the extent that they 'generate themselves' out of an internal logic they're stepping away, at least temporarily, from the world - though not really, because they think that the world follows the same logic. Anyway, Thompson's injunction to stay close at all times to the evidence is well taken. Marx's semi-Hegelian method in the *Grundrisse* is dangerous: society isn't a closed theoretical system, and even if it were, the method of 'pure thought' might well get it wrong. The theorist could take a wrong turn somewhere, which he might have avoided had he paid closer attention to empirical data. On the other hand, I think Marx is right that there *is* an 'inner logic' of some sort to capitalist economic development. But to what extent? What's the relation between the 'inevitable' unfolding of inner dynamics and contingent external factors (which are *everywhere*)? How do these interact? We'll never fully know; reality is too complicated. But maybe we can approximate the truth. I don't know how, though. I guess it's a matter of examining the history of capitalism and seeing where it accords with and diverges from the most plausible 'pure' theories of capitalist development -- just using good sense to judge when there are extra-theoretical 'interventions from the real' and when, on the other hand, real events result from internal systemic dynamics. Actually, I suppose it'll always be a combination of both. Like with the Irish potato famine: no theory of capitalism could deduce from its own premises that there would be an Irish potato famine, but given certain natural conditions in Ireland in the mid-19th century (a potato blight or whatever), the internal dynamics of capitalism¹ exacerbated the famine and turned it into a catastrophe of Biblical proportions. There is always this interaction between the contingent (the external) and the systemically determined (the internal). -But I shouldn't forget that 'the economy' isn't the only 'system' in society; there are all sorts of institutions influencing each other, social structures with their own dynamics. The economy 'overlaps' with them, determines and is partly determined. And everything is a big goddamned mess.

...Thompson's book is a useful warning to me not to get *too* structuralist [or 'institutionalist']. But I think he takes his criticism of Althusser a bit too far (*occasionally*). Human behavior is conditioned to a *huge* extent by roles, institutional structures; somehow we just have to navigate between 'structuralism' and 'humanism' (individual agency, etc.). They're both necessary, and with a little good sense they can be reconciled in the practices of history and sociology. Thompson would surely agree with that. But my greater commitment to so-called structuralism (than his) is revealed in the fact that I'm not convinced that the 'stages' of a given process of social development -- the stages in a very broad sense, not in their specific, concrete, multitudinous manifestations -- are not in some way 'determined' from the very beginning. The process in question has to be very general, on a broad 'systemic' level, not some little concrete series of phenomena. I grappled with this subject a bit in the Conclusion of my M.A. thesis, and it's sort of what I was referring to above. Marx and Engels were too teleological at times, but Thompson is perhaps not 'teleological' enough. But it's hard to navigate in this way between teleology and complete non-teleology. It's hard to find a middle ground. But look, if you go through history from the onset of capitalism to the present day, looking only at the most significant 'systemic' 'outlines' -- and not even the Russian revolution qualifies as that; I'm talking about things like the development of the liberal state in the 19th century, the state-capitalist state in the 20th, the incorporation of the working classes into society (think 'hegemony,' etc.), major military clashes between advanced nation-states sometime around when they occurred (early

¹ As enforced by a British government unwilling to interfere with the 'free market,' which ensured that the Irish didn't get the food they needed. (I think I read somewhere that Ireland was actually exporting potatoes to England during the famine. Elsewhere in Europe that year, governments took anti-free-trade measures to prevent starvation -- and they largely succeeded -- but the British government was under the sway of free-market economists.)

to middle 20th century), neoliberalism in the late 20th century -- you'll see that it all seems pretty damned probable, almost inevitable. Each 'stage' emerges out of the previous according to what appear to be 'logical' systemic dynamics, not contingent concrete events. And so, proceeding into the future, it seems that even though we can't predict with any certainty what will happen, in retrospect it'll be seen to be nearly inevitable. 'Nearly.' What does that qualification mean? Well, in my thesis (in a footnote) I tried to explain that too.

I don't mean to imply that there's a rigid succession of stages. I use the word only in a metaphorical sense. But historians use it too -- like the 'stages' or 'phases' called the Middle Ages, the Renaissance, the Reformation, the Enlightenment, etc. It's a convenient term, that's all, and it has some relation to reality.

In any case, my point is that Thompson underestimates the importance of 'extra-human' structural dynamics. In historical evolution on a grand scale, they're overpowering.

The thing with Ashleigh didn't last long. We're going to be friends I hope, but romantically she isn't feminine enough for me. And I'm probably not masculine enough for her. We have good conversations and I already miss her a little, but a relationship wouldn't have worked well. Not enough chemistry, I guess.

I'm reading Thomas Nagel's *The View From Nowhere* (1986). Nagel seems more sensible than most contemporary philosophers. For example, "The reductionist program that dominates current work in the philosophy of mind [by which he means functionalism, behaviorism, physicalism, etc.] is completely misguided, because it is based on the groundless assumption that a particular conception of objective reality [namely the 'physical' conception] is exhaustive of what there is." In other words, unlike Dennett and other fools, he admits that sensations and other 'inner' states exist, and that humans aren't robots.

Nagel's thoughts remind me of how sensible my 'solution' was to the mind-body problem. The essence is that a single substance -- neural stuff -- has, in its *activity*, two different ways of being: 'physical' and 'mental' (our mental *experience*). The nervous system itself is physical, composed of physical things you can point to (neurons, etc.). But its electrical and chemical processes can be 'considered' in two ways: serially and 'holistically.' On the one hand, you can think of neural activity as involving millions of electrical bursts, chemical discharges, etc., all interacting in an instant to give rise to a sensation or a thought. It's a series of interrelated physical events. On the other hand, you can think of all these events not serially but holistically, from the perspective of the 'whole' that emerges from their nearly instantaneous interactions. This emergent whole is the mental experience. It isn't 'located' anywhere -- except maybe vaguely and somewhat metaphorically, like 'in the hand' or 'in the head' -- it isn't a physical thing you can point to or that has a precise spatiotemporal location (comparable to that of a neuron, say); because of its emergent nature, it's just the sort of thing of which you can't predicate an exact location. So the mental experience isn't really 'in' the brain (as a neuron is), although in a loose, metaphorical sense maybe you can say it is. -That's the basis of the solution to the mind-body problem. It doesn't cease to be a problem, because we still have this mysterious phenomenon of emergence that will never be fully understood, but at least now we understand what it is we don't understand. Before, it was just a big muddle. I've reduced the problem to a specific phenomenon of biology.

More broadly, of course, the 'mind,' including all its *unconscious* aspects and cognitive structures and mathematical computations and so forth, is 'emergent' from the brain.

Nagel's common sense has limits. In the context of a discussion of the self he suggests that possibly "I am my brain." He thinks that's a reasonable hypothesis. *I -- this consciousness -- I am my...brain! This consciousness is the same thing as its....nervous system! Wow. It doesn't even occur to him that the self might be self-consciousness. (A hypothesis that has to be embellished, yes.)*

Later on, though, he shows that, for an academic, he has a deep mind: he shares my fascination with the intuitive distinction between the 'essential' *me*, or *I*, and the particular person Chris Wright, who is just like all other people, not at all different except for the fact that it is through him that *I* exist. In thought I can separate myself from Chris, hover above the city and look at all the people walking around, one of whom is Chris -- who, as it happens, is *me!* In a sense, I could have been any of those other people, but I'm *this* guy, this particular body and personality and so on. Sometimes when I'm in the train surrounded by people I actually think about that: I look at everyone else, all their faces, and then look at the reflection in

the window and see another face -- and I realize it's mine! But it looks no different from anyone else's! It isn't particularly special, it isn't glowing -- but it should be, because it has a unique connection to *this self*. This (seemingly) *essential* self (essential to itself, that is). This essential self, which is sort of 'outside' the world, appears to have an accidental connection to the body and personality of Chris Wright, who is a being *in* the world no different from all others. Nagel even uses the same terminology I used in my senior thesis, but reverses it: whereas I called the particular body and mind I happen to 'occupy' the objective self, which is opposed to my 'true,' most intimate self, my (sort of) outside-the-world self that inhabits a particular body and mind, he calls this 'true' self the objective self (because it can consider the world more objectively, 'stepping outside' the particular perspective of Chris Wright or Thomas Nagel). His analysis doesn't go as far as mine, though.¹ I went on to argue that the 'true' self Nagel is talking about is self-consciousness (*not* the brain), and then I speculated about how self-consciousness (the I, the 'active' self, the 'subjective self') -- which, in its purity, is a sort of abstract thing, contentless, 'universal' -- manages to identify itself with the objective self (as I called it), i.e. the particular body and mind it 'occupies.' Of course this language is somewhat metaphorical: I shouldn't say *it*, as though self-consciousness is a single entity, but rather 'the continuously present thought of "consciousness of consciousness."' I also tried to describe the composition of the objective self: for example, self-consciousness 'immediately' identifies itself more closely with other thoughts than with the body, so it seems as though *all* these thoughts I'm having right now (and always) in my consciousness constitute the essential me, the self, whereas in fact the 'essential' me is only the abstracted thought 'consciousness of this consciousness.' (But that's also my least particular aspect, the aspect I share with everyone else.²) Needless to say, this phenomenological stuff is one of the most difficult areas of philosophy, so my account wasn't satisfactory.

By the way, it isn't just because I'm an intellectual and preoccupied with thoughts that I say the self identifies itself more closely with thoughts than with the body. This is true of everyone, as shown by the fact that people intuitively understand the mind/body distinction and that they often see their bodies as 'rebellious,' somewhat foreign things they have to control, take care of, etc.

Despite all this, however, it remains true 'on another level' that the mind-body dualism is specious. We are physical beings; consciousness is not a different substance but an emergent expression of neural activity.

....Throughout his book, Nagel keeps referring to the 'objective self,' that which can separate itself from the perspective of the body and mind to which it is 'attached,' can step outside particular perspectives, can advance in knowledge by reflecting on itself and its conditions of existence, can doubt the significance of life by considering the smallness of each individual, etc. But Nagel can't account for it; it's a mystery to him. It doesn't even occur to him that the so-called objective self is, more or less, just self-consciousness. Self-consciousness is what's responsible for the continuous tension that Nagel is obsessed with between the subjective and the objective -- being occupied in one's own perspective and looking at oneself externally, from the perspective of an other. Yes, this tension is essential to what it means to be human -- which is to say that self-consciousness is essential to humanity. Not a terribly original insight. But Nagel doesn't even rise to this insight, because the 'objective self' is a mystery to him.

On another subject, though, he reveals his common sense: he thinks that skepticism about the physical world is irrefutable. "The possibility of skepticism is built into our ordinary thoughts, in virtue of the realism that they automatically assume and their pretensions to go beyond experience." He's also right to think that the problem of free will is a hopeless muddle, for more than one reason. For example, the idea of freedom or autonomy is itself unintelligible. One reason, which he doesn't discuss, is that the self is largely an illusion. *We* don't even exist, at least not in the way we incoherently think we do. How can it be the case that I determine all my actions if I am nothing but self-consciousness (roughly speaking)? Consciousness of consciousness can't *will* anything; all it can do is be aware of itself (aware of everything

¹ (After reading more, I see that his ideas and mine are quite different.)

² Enter: mysticism, John Donne's 17th Meditation, etc.

going on in consciousness).¹ But let's ignore this reason and talk about ourselves as we ordinarily do. Years ago I said that, although we have reasons for doing any given act, at some point the reasons break off and we just make a 'leap' -- we just do the act. We could consider reasons for or against it forever, but sooner or later we have to give up the weighing of reasons and act. This fact seemed significant to me, but I didn't really know why. Nagel has helped me see one reason for its importance: it shows that intentional explanations (which presuppose the idea of freedom, as opposed to causal explanations, which are deterministic) can only go so far. You can ask somebody why he acted the way he did, and he'll list the reasons. But then you ask why he found those reasons more compelling than all the reasons *against* the act, and all he can say is, "I don't know, I just did." From his intentional perspective, there's no explanation for why those reasons motivated him. But obviously there has to be *some* explanation, because they did, after all, motivate him. Clearly, then, the answer will take us "outside the domain of subjective normative reasons and into the domain of formative causes of my character or personality" -- or, on another level, neural processes. Only *causes*, not reasons, can explain why I'm motivated by some set of reasons. In other words, my values are explained not by reasons I have for holding them but by causes of my holding them. (Admittedly, I can be led to value some particular thing on the basis of reasons, but my valuing those reasons is not itself explainable by further reasons. In fact, the valorization of logic itself is not explainable by reasons (which would be question-begging); it's only causally explainable.) Thus, no act can be explained solely on the assumption of autonomy or freedom.²

Unfortunately we can't escape our sense of freedom and self-initiative, so....there you go. We're at a dead end. Complete freedom doesn't make sense, but we can't help believing that we're totally free, so we just have to accept the dilemma and move on with our lives. Or maybe it's better to say that total freedom makes *some* sense but not *really*: "We feel that in acting we ought to be able to determine not only our choices but the inner conditions of those choices [such as our basic values, or our preferences in a given moment], provided we step far enough outside ourselves.Yet the logical goal of these ambitions is incoherent, for to be really free we would have to act from a standpoint completely outside ourselves, choosing everything about ourselves, including all our principles of choice -- creating ourselves from nothing, so to speak." This is exactly what I said in my senior thesis, that *complete* freedom is incoherent for these very reasons.

By the way, it's also a total mystery *how* my 'will' could cause a given act or thought or bodily movement. We don't know how these things happen, but postulating a magical 'will' doesn't seem particularly fruitful. The explanation will be biological, i.e. deterministic.

....Am I justified in condemning William Calley for the massacre at My Lai? Leaving aside questions about free will and responsibility and all that, it's true that he doesn't exemplify certain values we hold -- in his murders he was quite the opposite of them -- which means that from the standpoint of those values he is bad. That's a fact: he is not or was not good at living according to those values. But is (was) he *morally* bad? Well, insofar as we call those values 'moral' ones, yes, he was morally bad -- or at least, what he did was morally wrong. And in the moment of doing it, or at that time of his life, he was morally bad. He was not a good person from the perspective of values that we call 'morality' -- or, rather, if those values define what it is to be a good person, then he was a bad person. By definition.³ None of this can be contested. What can be contested are more ambitious claims than that he simply didn't exemplify certain values, etc. Our inclination is to condemn him in a more 'absolute' way than all this; we want to get rid of the relativistic clause 'according to the values of such and such' and instead say that he was just *bad*. *A bad person, period*. Absolutely bad, bad in his 'essence,' so to speak, such that in describing him you

¹ This self-awareness is in fact what explains our perception of free will, as I've said before. In being *of itself*, self-consciousness cannot escape the impression that it is self-causing, that it is responsible for all of 'its' (or 'my') acts and thoughts -- the acts and thoughts that are registered in consciousness.

² [More accurately, in a narrow sense, yes, acts can be explained on that assumption. But in order to explain why particular reasons had motivational force, you have to go beyond that assumption, to a deeper, causal level.]

³ Again, free will isn't necessarily presupposed by any of this, just as it isn't presupposed when you say that your pet cat is a bad pet for whatever reasons.

could say, “He weighed 200 pounds, he was a lieutenant, six feet tall, and bad. Contemptible, repulsive.” Stalin and Hitler are even better examples, since they expose our intuition with perfect clarity. But as I’ve argued sufficiently in the past, this *absolutist* value-judgment is not meaningful. Nevertheless, we want to condemn him in a stronger way than I outlined a moment ago. Such a condemnation would be based on the presupposition that he was free in his actions, that alternatives were available to him and he chose not to take them. He callously disregarded human life -- he freely and knowingly killed innocent old men, women and children -- which says a lot about his character. The ‘mild’ kind of condemnation above is somewhat ‘external’ in its nature, as when you judge that your cat is a bad pet. You’re not condemning your cat’s character; you’re only saying that, as a matter of fact, probably for reasons out of its control, it isn’t a good pet. But Calley is a human being and so presumably has free will. He is therefore immoral in a stronger sense: *he’s responsible* for acting contrary to certain values, the *most important* values in life. The intensity of our condemnation is thus justified by two factors: the presumption that he’s responsible, and the fact that the norms he flouted were more important than any others. A third factor is probably also relevant: we assume he *knew*, on some level, that what he was doing was the worst thing a person could do. Or maybe this presumption of his moral knowledge is included in, or is an extension of, the presumption that he’s responsible for his actions, since *full* responsibility means he was perfectly aware of what he was doing.

But how meaningful is this stronger sort of condemnation? Insofar as it tends toward the ‘absolute’ condemnation I mentioned above, not very. But what other kind of condemnation is there, aside from the weak kind I discussed initially? There is, of course, the subjective aversion and disgust embodied in the judgment, but these *feelings* are not what I’m talking about. I’m searching for a *judgment* that has *cognitive content*. But there isn’t another one. The only *strong* (i.e., adequate-to-our-disgust) meaning of our condemnation is that in some sense we banish Calley from the human community for his apparently complete lack of respect for our most important values, as shown by his willful violation of them.

But how willful is it? How much responsibility does (did) he have? Maybe he lacked a moral sense. Maybe his time in Vietnam had desensitized him to violence and horror, or had destroyed his respect for human life. He had had it drilled into him by his superiors and so on to think of Vietnamese peasants not as people but as the enemy -- a thing. Maybe he had also already encountered so many massacres that he had lost his moral bearings, had lost his sense of who he was, etc. For many men, Vietnam meant absolute existential disorientation. To an extent, all this would, perhaps, erode Calley’s responsibility for his actions. Moreover, as we saw above, he couldn’t really have had control over his not valuing human life, because he didn’t *choose* not to value it. His attitudes were caused, not chosen. And his actions were at least strongly conditioned by his attitudes. If we keep going on in this way, he becomes less and less responsible for his acts, which means that our condemnation of him loses more and more of its justification, or its force. We can still deplore what he *did*, but we start to see him in a somewhat less condemnatory way.¹

Or even in the case of somebody like Jeffrey Dahmer.... ‘He is what he is.’ Maybe he could have chosen not to kill and eat those men, but why would he have, given his values and desires? People act on the basis of their values, which in general are not subject to their control. Even if they were, why would somebody choose to change his values? He would have to do so on the basis of some other value, which in turn would not be something he had chosen.

And yet we can’t help thinking, despite all this (and more -- for instance, the determinism of the brain), that people are basically free, responsible for everything they do. Calley chose to act as he did, he had alternatives, he didn’t have to throw a baby into a ditch and shoot it. And that’s true, in fact....but it’s not the whole story....

There are a lot of similarities between Nagel’s arguments and my old thoughts from college. Like his argument that prejudiced, narrow-minded and irrational people are less free than people without those traits, and that we can increase our freedom by cultivating reason, etc. Not terribly original ideas, but, as I

¹ But that doesn’t have to stop us -- after reading in detail about what he did -- from being horrified at him, perhaps thinking of him as a cautionary tale about what can happen to people in war. And even if in some sense he wasn’t completely ‘free’ in his choice to do what he did, we can still think of him as something dangerous that has to be locked up.

recall, I tried to deal with them relatively systematically in my thesis. That document has many problems - so many that I don't even want to look at it again -- but my ideas themselves, or most of them, were defensible.

According to Nagel,

Berkeley claimed that [the truth of the idea that to exist is to be perceived] became evident if we tried to form the idea of an unperceived object. It turns out to be impossible, he said, because as soon as we try to think, for example, of an unperceived tree, we find that all we can do is to call up a perceptual image of a tree, and that is not unperceived.

It would be generally recognized now that this argument involves the mistake of confusing perceptual imagination as the vehicle of thought with a perceptual experience as part of the object of thought. Even if I employ a visual image to think about the tree, that does not mean I am thinking about a visual impression of the tree, any more than if I draw a tree, I am drawing a drawing of a tree.

A similar mistake would be to argue that we cannot form the thought of something that no one is actually thinking about or the conception of something that no one is conceiving of. Clearly we can think and talk about the possible state of affairs in which no one is thinking or talking about Bishop Berkeley. The fact that we must talk about Berkeley to talk about the situation in which he is not being talked about doesn't make that situation either inexpressible or impossible.

Berkeley may indeed have made the mistake Nagel accuses him of, but the argument in the first paragraph above can be interpreted in another way: it can mean that when we try to think of a world independently of how it appears to us -- how it is 'in itself' -- all we can call to our minds is the world as it appears to us. We can't imagine what it 'looks like' independently of what it looks like to us. Obviously. I made the point a while ago: when we try to think of the world as it is in itself even on the most 'basic' level (underneath ordinary appearances), we find ourselves picturing cells or molecules or things like that, things that have *appeared* to us in photographs or artists' renditions or whatever. We can't escape the perspective of a subject viewing an object, even when we try to imagine an object as it is in itself without a subject looking at it. Where I disagree with Berkeley -- if *this* is what his argument was¹ -- is in thinking that this fact doesn't mean there is no external world. Our inability to imagine an external world 'in its contours' or 'in its details' -- i.e., as it *appears*! -- without adopting the perspective of 'being-appeared-to' doesn't entail that there are no things external to minds. It entails only itself, i.e. that we can't *imagine (visualize)* them (as they are 'when we're not looking at them').

Nagel's argument that objective values exist, values "independent of our beliefs and inclinations," is silly and confused. At one point he says that "to dispense with [objective values] is too radical a denial of appearances." He goes on: "If I have a severe headache, the headache seems to me to be not merely unpleasant, but a bad thing. Not only do I dislike it, but I think I have a reason to try to get rid of it. [Uh, yes you do, namely that you dislike it!] It is barely conceivable that this might be an illusion, but if the idea of a bad thing makes sense at all, it need not be an illusion, and the true explanation of my impression may be the simplest one, namely that headaches are bad, and not just unwelcome to the people who have them." What the hell? Headaches are bad, yes, insofar as they're painful: i.e., they're bad *to us*, because we value not being in pain. Their badness is relative to our desire not to experience pain. What would it even mean to say that headaches are 'objectively bad'?

Regarding moral values, the most that can be said is that they aren't mere subjective preferences with *no* independent basis at all; instead, there is a foundation for our common values in human biology. It is in our *biology* to (have a tendency to) think that the kinds of things that Stalin and Hitler did were bad or wrong; and other things being equal -- i.e., if social relations haven't warped a person's mind so much that he has lost touch with humans' natural morality -- we will so condemn Stalin and Hitler. Their acts were

¹ [After reading Berkeley's original argument I see that Nagel interpreted it correctly.]

literally *unnatural*. So in a sense, yes, there is an objective foundation of morality, viz. nature, in that nature predisposes us to act and value in certain ways.

Nagel is right, furthermore, that one can say that there are *degrees* of objectivity in value-judgments. One's morality can perhaps be called more 'objective' to the extent that one takes into consideration other people's viewpoints and values. But this doesn't mean that certain values *are objective*(ly justified), because there is no 'view from nowhere' in the ethical realm (or any other). There are only perspectives, desires -- desires and perspectives that determine what is seen as valuable. It's incredible that Nagel thinks there *is* a view from nowhere, a perspectiveless perspective, and that it is reached simply by stepping outside one's own 'subjective,' 'personal' viewpoint and considering things more 'objectively,' as an 'objective self.'

The more I read of the book, the more I see it's riddled with confusions.

But Nagel is right to reject Aristotle's and Plato's positions on morality. He distinguishes between the moral life and the good life: loosely speaking, in the first, one partially sacrifices one's own 'selfish' interests to those of others, while in the second, one's own interests take priority. (But it isn't ruled out that morality can be a component of the good life.) Aristotle more or less defined morality in terms of the good life -- which doesn't mean, however, that the two ideas are equivalent. "The test of moral principles is their contribution, either instrumental or constitutive, to the good life as a whole; but since we are social beings, this may entail some of the familiar moral virtues." Nagel rejects this because morality has its source in the claims of other people, which can't "be strictly limited by their capacity to be accommodated within a good individual life." For instance, it would be more moral for me to donate \$100 to some charity that would use it to save children from starvation than to spend \$100 on a meal in an expensive restaurant, even though fine dining might be considered a component of the good life. In a sense, living well (living the good life, which can be defined in various ways) is immoral when you know that other people are miserable, starving, etc. So Aristotle is wrong. Morality can't be substantially reduced to the good life.

Plato, on the other hand, defined the good life in terms of the moral life. That is, by far the most important thing in the former is the latter. But Nagel argues that "there is much more to us, and therefore much more to what is good and bad for us, than what is directly involved in morality." We have many different capacities and desires, and sacrificing most of them to the imperative to improve others' lives leads to the impoverishment of our own life. Thus, unlike Plato and Aristotle, Nagel thinks that the good life and the moral life [or at least the *most* moral life] can conflict. This is surely right.

Nietzsche thought that the good life overrides the moral life. I don't agree with Nagel that this position is simply *wrong* in the way that Plato's and Aristotle's are;¹ all you can say is that it's morally reprehensible. If you're happy living a life that has no concern for morality, then fine, that's your choice. Actually, if you accept that morality plays *some* role in the good life because it is in human nature to care for others -- and so to 'fulfill' yourself as a human, to live a good human life, you have to have some concern for others -- then a pure Nietzschean position that totally rejects morality in favor of the 'good life' isn't possible, since morality plays at least some part in the good (human) life. The opposite position is that the moral life overrides the good life. I think this, too, is neither right nor wrong; whether you accept it is a matter of choice, the values that you hold. My own position is that neither the moral life nor the good life should 'override' the other; we simply have to balance them as best we can. Try to be a full human being, which involves living morally but not *obsessively* morally (because then you'll neglect other sides of your personality, which will atrophy). But if you care far more about living 'right' than living 'well' and are willing to sacrifice your own interests to those of others, then do so; I'll respect you very much.

Interestingly, though, morality isn't only an other-oriented thing. In a broader sense, concepts like integrity, honesty and autonomy are relevant to it. This is more like a self-oriented morality; it implies that you can act immorally, at least in some loose way, with respect to yourself. And that makes sense, since you're a human being like all others. It seems as though this kind of morality has an even closer connection to the good life than other-oriented morality does (insofar as the two can be distinguished).

¹ Of course, you can define morality and the good life however you want, and different people will have different understandings. I just mean that if you judge by common intuitions, Plato's and Aristotle's definitions are inadequate.

I'm reading my dad's dissertation again, since I didn't finish it when I read it eleven years ago. *Being Oneself: Its Meaning and Worth*. "When somebody tells me to be myself, what does he or she mean and why should I do it, and when somebody charges me with not being myself, what is it that I have been charged with and why does it matter? These are the questions which I try to answer in this book." After laborious phenomenological investigation of a variety of ordinary situations, he decides that not being oneself usually involves letting one's concern for the opinion or approval of others guide one's conduct, such that one puts on airs. The reason this is bad is that it jeopardizes or destroys one's integrity, "and as that slips away from us, so does the respect both of others and of myself, to which I am otherwise entitled by virtue of being myself." But, again, why is it so good to be oneself? Why does it deserve respect? He continues: "The source of this respect lies simply in the good of dealing openly with each other and the expectation that at least at certain times nothing less is acceptable." That's a reasonable answer. It's definitely part of the explanation, but I suspect that a more important part is the even more 'primitive' respect people have for a self that is certain of itself, that is full and confident. It is virtually a biological response. (Compare the obvious 'respect' that higher mammals have for the dominant male in their group.) People naturally respect and are drawn to a self that is whole and spontaneously self-projecting, i.e. a person who has 'more of a self' than others. Remember what I wrote about this being the essence of charisma. It's a strange, metaphorical idea/definition, but phenomenologically it's the crux of the matter.

Integrity is a moral ideal. To have a self in the fullest sense, to *be* a self, a self with an 'incorruptible' core, a self that has 'integrity' like a physical structure that won't collapse; to have authenticity, to be an authentic self. That's a *moral* ideal. Interesting. It seems less like an example of other-oriented morality (except on the margins, e.g. by making you honest and sincere in your dealings with people) than an example of self-oriented morality. By lacking integrity you're betraying yourself first and foremost. People don't really get *angry* at you for lacking integrity, as though you've done them some wrong; they have contempt for you. They see you, at least implicitly, as not a whole self, not a fully developed and mature person, an actor, someone with a deep emptiness at his core.

On the other hand, insofar as the statement 'He has no integrity' is thought to be almost synonymous with 'He has no (or *little*) morality,' the crime is not only a crime against oneself but against others. It means that the person doesn't evince moral respect for others, he uses them opportunistically as means to his ends. So I guess that to lack integrity is in equal measure a crime against oneself and against others. When we say that Bill Clinton has no integrity we're communicating contempt for him on the basis of his lack of morality, honesty, 'principles,' respect for others in his dealings with them, sufficient respect for himself to make a stand on anything.¹ We expect a person to guide his behavior by principles, rules, norms that he applies consistently, rules he identifies with, which constitute the 'boundaries' of his self. And since determination is negation, without these rules or (moral) 'limits' on one's behavior, one's selfhood is not fully realized. Which can be expressed by saying that one lacks respect for oneself. Clinton doesn't respect himself enough to *define* himself, just as he doesn't respect others enough to treat them as 'defined,' fully existing selves or moral beings (i.e., according to moral rules).

Wait, I forgot about courage. Mom informs me that she associates a lack of integrity with a lack of courage, 'moral' courage. Strength. Yes, maybe that makes more sense than the stuff above. To lack integrity is to be *weak*, as if you can't give a 'law' to yourself (Kant), have no moral self-discipline, succumb easily to temptations or take the easy way out. Kant might say -- partially backing up what I wrote above -- that such a person is not truly autonomous and hence not a fully realized self, but I don't know how much the ordinary person or our ordinary intuitions would agree with that. I suppose the essential thing is just the lack of strength and courage, the not-asserting-oneself with respect to values that one is seen as sharing with everyone -- because everyone acknowledges on some level the worth of the ideal of integrity, and so if you nonetheless ignore it you must be weak, unwilling to follow through on your own values because they're too hard.

....Dad also discusses Sartre's analysis of bad faith and all that. I've written about these subjects before. Does Sartre succeed in showing that a person can't 'be himself,' that sincerity is an illusory ideal?

¹ Again, that isn't entirely fair. He took stands on measures that benefited business, such as NAFTA.

Mon père thinks not, and I agree. With qualifications. Supposedly humans cannot ‘be what they are’ because they are essentially consciousness, and consciousness is subject not only to facticity but to transcendence. It transcends itself, transcends its moods, its thoughts, its objects, its past, its facticity, etc. Humans are a fusion of facticity and transcendence -- the former is defined and unfree, the latter undefined and free. [Well, that may be simplistic; see below.] So if humans constantly transcend their facticity, their ‘givenness,’ the element of unfreedom in their being, they cannot *be themselves*, cannot be simply what they are, and so cannot be sincere or have integrity in any genuine sense. I think this is wrong on the level of ordinary daily life, common sense, interactions with people. Insofar as we can and do distinguish between, on the one hand, a person deceiving himself, deceiving others, dramatically adjusting his behavior to please others, acting with excessive concern for others’ opinions, etc., and a person who is being sincere, honest, acting with integrity, and so on, there is clearly some difference at work. In general, the latter is ‘being himself,’ the former not (depending on the specific circumstances).

However, on a deeper, ‘ontological’ level Sartre is not off the mark. His observations are in the same spirit as much of Kierkegaard, Dostoyevsky, Nietzsche and others, so they are certainly not mere fantasies. First of all, incidentally, making a distinction between facticity and transcendence is one way of expressing the incoherence of free will. (That’s ironic, since Sartre thought man is absolutely free. But he was confused.) Or, even more paradoxically, a being that is simultaneously facticity and transcendence -- and surely man is -- is a being shot through, at least for itself, with incoherence and paradox. ‘In itself’ it can’t be, since nature is not incoherent, but for itself, yes, such a being is a mystery. Partially free and partially unfree? How are we to make sense of that? Freedom and unfreedom mixed together in the same consciousness? Huh? How is that possible and what does it mean? We have good answers to neither question.

The distinction between ‘facticity’ and ‘transcendence’ is obviously imprecise and unclear, like many of Sartre’s ideas. It’s also a bit artificial, as though there are two definite and clear-cut sides to man. Whatever we decide the concepts mean -- and they do have some meaning -- human consciousness swirls them around together, so that to some extent there is facticity *in* our ever-present ‘transcendence’ and vice versa. Maybe you can also think of them as denoting our nature viewed from two perspectives: from ‘outside’ with facticity, as others observe you and judge you as *such-and-such*, and from ‘inside’ with transcendence, as you implicitly sense that no criticism of you is wholly and forever true, since (as Sartre says) you’re not a thing like an inkwell. You transcend yourself (cf. Nagel’s distinction between the transcendent ‘objective self’ and the particular person he happens to be); you cannot be completely summarized in any judgment like ‘He’s a coward.’ In reaction to such a judgment you can even consciously choose to act in the opposite way, thereby disproving the criticism, so to speak.¹ But there may nonetheless be some truth to it -- perhaps in terms of your ‘dispositions,’ or your desires, or the ways you usually act, or whatever. Compared to other people, it might be true that you tend to be less courageous and more fearful.

I could continue but I’m tired.

¹ But this stuff about transcendence, I think, is not solely a function of (the ‘universal,’ ‘equal’ fact of) human self-consciousness. It’s truer of intelligent people than of stupid people, who are more like a ‘thing’ than the former are. To a relatively large extent they are what they are. They don’t ‘transcend’ themselves as much. -You might think that’s silly, but it’s not. After all, the psychological reason for and meaning of our self-transcendence (or self-consciousness), which Sartre doesn’t really get into because he was obsessed with a confused ‘ontology,’ is that we internalize the other’s perspective. And as I said years ago, the meaning of one kind of intelligence is the ability to internalize or ‘imagine’ the other’s viewpoint (i.e., how the world looks to an other). Thus, greater intelligence means greater self-consciousness means greater ‘self-transcendence.’ So in a sense I was wrong a moment ago: transcendence *is* a function of self-consciousness, but different people have different degrees of self-consciousness and so of self-transcendence. And so of freedom. Stupid people are, in a way, less *free* than intelligent and rational people, as I said in my senior thesis. (They can’t *choose* their acts and beliefs -- on the basis of rational considerations -- to the degree that intelligent, rational people do.) --But these are all mere hypotheses.

Reading Thomas Ferguson's Chomsky-recommended *Golden Rule: The Investment Theory of Party Competition and the Logic of Money-Driven Political Systems* (1995). In an interview on Youtube he repeats an excellent point made by Jesse Jackson in his 1988 campaign: the U.S. subsidizes and sells arms to authoritarian regimes in Third World countries that destroy labor unions (with the help of U.S. wealth and technology), which results in persistent low wages in those countries. This, in turn, causes American companies to relocate their operations to those countries or to use that prospect as a bludgeon against unions, which then leads to lower wages and the destruction of unions in America too. You see the implications. A global decline in wages and workers' power occurs, and "society increasingly takes on the appearance of two opposed classes," or whatever the quotation is from Marx. In the age of globalization, power-structures are able to transfer capital and military technology to wherever they have to in order to extract high profits and suppress labor movements. If you looked at the world from the standpoint of a Martian you would see a mass of wealth and armaments constantly circulating globally among a small group of elites, traveling to wherever it was needed at the moment, wherever discontent was threatening to get out of hand and/or money could be made quickly. Fortunately the situation is too volatile to last forever.

Anyway, the obvious implication that struck me is that if the U.S. government had a real interest in raising American workers' incomes, it would stop supporting the suppression of labor movements elsewhere in the world.

The investment theory of parties is opposed to the more conventional "critical realignment theory," which "understands political change primarily in terms of changing patterns of mass voting behavior."

Most American elections, it considers, are contests within comparatively stable and coherent 'party systems.' While any number of short-term forces may momentarily alter the balance of power within a particular party system, and cumulative, long-run secular changes may also be at work, the identity of individual party systems rests on durable voting coalitions within the electorate. So long as these voting blocs (which in different party systems may be defined variously along ethnic, class, religious, racial, sexual, or a plurality of other lines) persist, only marginal changes are likely when administrations turn over. Characteristic patterns of voter turnout, party competition, political symbols, public policies, and other institutional expressions of the distribution of power survive from election to election.

'Normal politics,'¹ of course, is not the only kind of politics that occurs in the United States. The 'critical realignments' of critical realignment theory refer to a handful of exceptional elections -- those associated with the New Deal and the Great Depression of the 1930s, the Populist insurrection of the 1890s, the Civil War, and the Jacksonian era are most frequently mentioned, though other dates have also been proposed -- in which extraordinary political pressures find expression. Associated with the rise of new political issues, intense social stress, sharp factional infighting within existing parties, and the rise of strong party movements, these 'critical' or 'realigning' elections sweep away the old party system. Triggering a burst of new legislation and setting off or facilitating other institutional changes that may take years to complete, such elections establish the framework of a new pattern of politics that characterizes the next party system.

This theory emphasizes popular control of public policy; sweeping changes are ascribed to voter sentiment. Unfortunately, a lot of evidence has recently been collected that suggests that "the durable voter coalitions which are supposed to underlie party systems never existed, and that so-called critical realignments are not only very difficult to define, but simply have not witnessed major, lasting shifts in voter sentiment." Three researchers sympathetic to the theory argue that, contrary to its predictions, "indications of substantial continuity of the alignment of electoral forces across virtually the whole sweep of American electoral

¹ That reminds me of Kuhnian 'normal science.' The whole theory is reminiscent of Kuhn's work on scientific revolutions.

history can be observed.... Electoral patterns do not, by themselves, clearly and unequivocally point to the occurrence of partisan realignment.” In other words, partisan realignments, which have indisputably occurred periodically, can apparently not be explained by (massive changes in) electoral behavior. So we need another explanation. Ferguson provides one: in his theory, business elites, not voters, play the leading part. Parties are not what they have typically been conceived of, as machines to get out the vote. Instead, their real market consists of major ‘investors.’ (The word ‘investor’ is to be understood in a broader sense than the ordinary ‘investor of capital.’) “Blocs of major investors define the core of political parties and are responsible for most of the signals the party sends to the electorate.”

During realignments, I shall argue, basic changes take place in the core investment blocs which constitute parties. More specifically, realignments occur when cumulative long-run changes in industrial structures (commonly interacting with a variety of short-run factors, notably steep economic downturns) polarize the business community, thus bringing together a new and powerful bloc of investors with durable interests. As this process begins, party competition heats up and at least some differences between the parties emerge more clearly.... Assuming that the system crisis eventually eases....the fresh ‘hegemonic bloc’ that has come to power enjoys excellent prospects as long as it can hold itself together. Benefiting from incumbency advantage and the chance to implement its program, the new bloc’s major problem is to manage the tensions among its various parts, while of course making certain that large groups of voters do not become highly mobilized against it -- either by making positive appeals to some or by minimizing voter turnout, or both.

Ordinarily most voters can have almost no influence on public policy because they don’t sufficiently invest themselves in it. They have other priorities, e.g. living their lives. Hence, it will be major investors who set the political agenda. One predictive consequence of this theory is that “on all issues affecting the vital interests that major investors have in common, no party competition will take place.” This is clearly borne out by the evidence. Certain issues, namely the most important ones to voters, rarely show up in campaigns; and when something like healthcare reform does, it’s because one bloc of major investors no longer has an interest in ignoring it. If you look at polls you’ll see that voters’ attitudes on healthcare reform haven’t changed much in decades -- they’ve wanted national health insurance. But major investors haven’t, so it hasn’t happened.

Ferguson’s book is excellent.

Interesting point he makes in a footnote: “In regard to the progress of the movement for women’s rights, it surely mattered a great deal that two of the biggest and fastest-growing sectors in the early stages of industrialization -- textiles, and the brewing and liquor sectors -- were dead set against women’s suffrage. One was opposed because initially women’s suffrage would likely have led to a stronger political position for its own workforce (which included many women and children); the other because of the leading roles women played in the Temperance campaign. Nor was it accidental that the final successful campaign for women’s voting rights coincided with World War I, when public hysteria and official investigations had virtually immobilized the heavily German-oriented brewers.”

Ferguson briefly analyzes the successive party systems of American history: Federalists vs. Jeffersonian Republicans, the Jacksonian system, the Civil War system, the system of 1896, and the New Deal system. I would add that the most recent system has been the one that began in the 1980s, as the New Deal system finally collapsed. (I wonder, though, if this notion of party systems is a bit artificial, contrived.) Even Ferguson’s short sketch of that system in the first chapter is very interesting. He thinks that the most important segment of Roosevelt’s political coalition was not workers, blacks and the poor but “a new ‘historical bloc’ of high-technology industries, investment banks, and internationally oriented commercial banks.” Nonetheless, masses of ordinary voters did succeed for the first time in organizing themselves and “pooling resources to become major independent investors in a party system. Their success in this decade contrasts vividly with their failures during previous party systems, and vividly underscores the investment theory of political parties’ strictures on the importance of distinguishing between simple rises in voter

turnout, such as characterized the Jacksonian Party System, [and which are emphasized by conventional electoral theories of politics] and the real growth in the political power of mass voters that came with their effective organization.” Mere high levels of voting aren’t enough; *organization* is necessary, because unless you *invest enormous resources* in politics you won’t achieve anything.

Ferguson attributes the rise of right-wing nationalist sentiment in the Republican party during the 1950s and 1960s to the revival of world economic competition, which “sharpened protectionist tendencies in industries like steel, textiles, and shoes.” These and other industries were probably more important to Goldwater’s 1964 campaign than conservative grassroots movements, which, after all, would have gotten nowhere without funding.

Enlightening thoughts on business and politics in the early 20th century. Investment and commercial bankers had been in the Democratic party in the 1880s and part of the 1890s because it stood for free trade and I don’t know why else (I suppose it was also a little more pro-labor than the Republicans, and banks had no particular reason to be rabidly anti-labor); the Republican was the party of industrialists -- high tariffs, anti-labor, etc. But banks went over to the Republican party in the late 1890s when Free Silver and Populist advocates briefly captured the Democrats. (Banks favored the gold standard, I suppose because it meant a lower money supply and thus lower inflation.) Financiers stayed with the Republicans because their massive investments in the late ’90s and after in huge trusts that gave them a controlling stake in industry caused them to have largely the same interests as industry -- protectionism, etc. So Republicans, being, on the whole, the party of both finance and industry, dominated the era. World War I upset this situation. Many industrial firms became even more ardent economic nationalists because the worldwide industrial expansion had “left them face to face with vigorous foreign competitors.” The labor-intensive ones also remained viciously anti-union. On the other hand, capital-intensive firms like Standard Oil and General Electric, which had grown disproportionately during the war, preferred to be more conciliatory with their workforce, and the really strong ones favored lower tariffs, “both to stimulate world commerce and to open up other countries to them.” International banks shared these interests, because the war had turned the U.S. from a net debtor to a net creditor country, which meant that American banks wanted Europe to recover economically so as to pay off its debts. And in order to do that, European countries had to run export surpluses. “They needed to sell around the world, and they, or at least someone they traded with in a multilateral trading system, urgently needed to earn dollars by selling into the United States.” American banks therefore opposed the high tariffs that protected much American industry. –The conflict between, on the one hand, banks and capital-intensive, internationally oriented firms and, on the other hand, labor-intensive, protectionist industries like steel, textiles and coal, “runs through all the major foreign policy disputes of the 1920s: the League of Nations, the World Court, the great battles over tariffs,” and so on. Initially the protectionist forces had the upper hand: “they defeated the Leagues, kept the U.S. out of the World Court, and raised the tariff to ionospheric levels. But most trends in the world economy were against them. Throughout the 1920s the ranks of the largely Eastern internationalist bloc swelled.” The largest firms of the multinational bloc “also dominated major American foundations, which were coming to exercise major influence not only on the climate of opinion but on the specific content of American public policy.”

Incidentally, a number of businessmen in the capital-intensive, multinational bloc “played important roles in virtually all major developments in labor policy across the 1920s. These included the campaign that forced the steel industry to accept the eight-hour day; the milestone Railway Labor Act; and the increasing criticism of the use of injunctions in labor disputes....that eventually led to the Norris-La Guardia Act” of 1932.

“Under all these accumulating tensions the elite core of the Republican Party began to disintegrate.” (Another interesting side-note is that the fact that a lot of leading bankers were Jewish fomented the era’s anti-Semitism among industrialists like Henry Ford, who propagated the prejudice.) Many major businesses went over to the Democrats. But things got complicated in the late 1920s and especially with the onset of the Great Depression. Herbert Hoover was in thrall to big banks, which caused him to keep America on the gold standard (even after England had gone off it) and oppose expansionary monetary policies as well as deficit-financed government expenditures. Industrialists and farmers also wanted even higher tariffs, but Hoover wasn’t sympathetic. “Hoover’s commitment to gold began driving inflationist, usually protectionist

businessmen out of the GOP to the Democrats.” Even some powerful bankers came to support Roosevelt - and bank reform as eventually embodied in the Glass-Steagall Act, which completely separated investment from commercial banking -- as they saw that workers, farmers and many industrialists were “up in arms against finance in general.” Under pressure from almost everyone but banks, Roosevelt took the country off the gold standard in 1933, which helped the economy. His NRA, too, was good for industrialists and farmers, was in fact a coalition built around them. Thus, by the miracles of political alchemy, the formerly free-trade (and even more formerly bank-representing) Democratic party had temporarily become the party of protectionists and industrialists. The capital-intensive, multinational bloc discussed above was still (I think) loyal to the Democratic party, but for the moment its interest in free trade, insofar as it still existed in the depths of the Great Depression, was subordinated to the country’s need for the NRA-administered “national recovery.”

But not for long. The NRA was only a modest success, and Roosevelt turned toward freer trade and away from proposals for more inflation. That is, he embraced the banks and the capital-intensive industries that had good long-term prospects in the world economy. And so was born, as Ferguson says, “the first successful capital-intensive-led political coalition in history,” in 1935 or ’36, with the Second New Deal. This is when the party system of 1896, which had been defined by the hegemonic unity of (labor-intensive, protectionist) industry and finance in the Republican party, finally passed away into a new hegemony of capital-intensive, internationally oriented industries and (most) banks. (Hence “multinational liberalism.”) Unlike labor-intensive industries, they could afford to support, indeed to help write, the Wagner Act and the Social Security Act. In the election of 1936, when he was inveighing to the public against “economic royalists,” Roosevelt was being supported and funded by a galaxy of bankers and executives from oil, GE, IBM, tobacco, ITT, Sears Roebuck, etc. etc.

Ferguson’s investment theory of politics is so obvious, especially after you’ve read all his empirical substantiations of it, that you can’t help but...be *unsurprised* it has been attacked by mainstream political scientists, including Theda Skocpol. Obviously it isn’t the only way to understand political dynamics, as if no other approach has any value, but it’s clearly central to a full understanding. Contrary to Skocpol’s criticisms, I doubt that Ferguson significantly overestimates the role of business in American politics.

In another essay Ferguson starts out by noting that, despite all the propaganda, no ‘right turn’ occurred in the 1980s among the public. Polls prove this. As one author says, “the policy right turn of the Reagan years cannot be accounted for as a response to public demands.”

Now I’m reading George Orwell’s *Homage to Catalonia*. As Chomsky said, it’s outstanding.

Orwell discussing all the vicious hateful propaganda in the Spanish civil war coming from Communists, the bourgeois press and others: “One of the most horrible features of war is that all the war-propaganda, all the screaming and lies and hatred, comes invariably from people who are not fighting.”

January, 2011

Reading Hannah Arendt’s *Origins of Totalitarianism* (1958). One of my life-goals is to explain the first half of the 20th century in the context of the evolution of international capitalism. I want to understand all this imperialist and nationalist and totalitarian nonsense from the ground up -- from the economy up. And capitalism itself, or rather mature capitalism, is a semi-totalitarian system: corporations are totalitarian entities, and the state aims to enforce on the populace ideological uniformity and obedience (the hegemony of the bourgeoisie), etc. More broadly, I want to understand how and why the world-system has evolved as it has in the last three hundred years or so. Not just the empirical history, but the systemic dynamics behind it.

[This long description of Arendt’s book is insufficiently critical. Her book is very definitely not Marxist enough, and a lot of its arguments are wrong or simplistic.]

Even in the first few pages Arendt already puts forward provocative and illuminating theses about antisemitism in the early 20th century. Parallels with the masses’ reasons for hating the French aristocracy prior to the Revolution: not because of the aristocracy’s power but because of its *dying* power, its status as

a class of mere wealthy parasites who had no real power anymore. Same with Jewry in Europe later -- its power waning but its wealth less so. No longer had even the moderate legitimacy of fifty years before.

Somehow I've never taken very seriously the role of Jews in the rise of modern Europe and the world wars, I suppose because antisemitism has never interested me even as an object of study. It has seemed so stupid and contemptible that I've seen it as only a manifestation of xenophobia and scapegoating. But Arendt's fascinating analysis of the recent history of European Jewry has convinced me, more or less, that Jews, in being a non-national anomaly in the European nation-state system and having a command of massive wealth and financial know-how, international connections by virtue of being the (non-national) indispensable servants of political power, etc., were for a long time practically the linchpin of the nation-state system with its 19th-century balance of power. They were the state bankers, the sources of political news, the representatives of diplomatic cross-channels, the financial advisers and assistants in peace treaties, etc. With the age of imperialism, however, they started to become less important, since other sectors of the bourgeoisie finally decided that it could after all be productive to invest in the state -- a militaristic, expansionist state -- with the result that the state ceased to be primarily reliant on Jews for its credit and so forth. At the same time, the onset of imperialism gradually led to the demise of the precarious balance of power between states, which meant that the role of Jews as the emissaries of peace, diplomacy and internationalism became less valued. "Just because the Jews had been used as a non-national element, they could be of value in war and peace only as long as during the war everybody tried consciously to keep the possibilities of peace intact, only as long as everybody's aim was a peace of compromise and the re-establishment of a *modus vivendi*. As soon as 'victory or death' became a determining policy, and war actually aimed at the complete annihilation of the enemy, the Jews could no longer be of any use." Thus, ironically, it's precisely because Jews were the only non-national European people and even became the symbol of internationalism and comity between nations that they were threatened more than anyone else by the "sudden collapse of the system of nation-states." It's easy to see how they would become the *bête noire* of all European nationalists and imperialists, especially since their former power had relatively disappeared.

For a long time Jews, being the impartial servants of every state, were uninterested in politics as such. It's another irony, therefore, that because of their intimate ties to states they were the one social group associated (by the populace) with the state (which had ceased to be tied to one particular class). They were seen by many as the puppeteers pulling the strings of international politics, when in reality they had little interest in politics. But the misperception had its nefarious impact: because "the only social group that seemed to represent the state were the Jews," for over a hundred years antisemitism built up among groups of people who came into conflict with the state. In fact, "the only class which proved almost immune from antisemitic propaganda were the workers who, absorbed in the class struggle and equipped with a Marxist explanation of history, never came into direct conflict with the state but only with another class of society, the bourgeoisie, which the Jews certainly did not represent, and of which they were never a significant part."

Arendt outlines the history of 19th-century antisemitism and then notes that it largely receded from open political view in the two decades or so before World War I, as Europe expanded economically and politics became a monotonous, theatrical affair. Jewish bankers declined in power and importance as big business increased its influence over the state; shifts in Jewish occupations occurred. More Jews left finance for independent business -- the garment industry, food commerce, etc. -- and, even more significantly, intellectual pursuits. The birth of a Jewish intelligentsia "proceeded at a fantastic pace. The crowding of Jewish sons of well-to-do parents into the cultural occupations was especially marked in Germany and Austria, where a great proportion of cultural institutions, like newspapers, publishing, music, and theater, became Jewish enterprises." Perhaps to compensate for their lack of a national home, many Jews pursued lives in "the aura of fame, becoming outstanding reviewers, critics, collectors, and organizers of what was famous. The 'radiant power' [of fame] was a very real social force by which the socially homeless were able to establish a home." They became the representatives of "a nebulous international society [of the arts, the intellect, fame, etc.] in which national prejudices no longer seemed valid." The Jewish question no longer bothered serious statesmen and publicists, but "Jews became the symbol of Society as such and the

objects of hatred for all those whom society did not accept. Antisemitism, having lost its ground in the special conditions that had influenced its development during the nineteenth century, could be freely elaborated by charlatans and crackpots into that weird mixture of half-truths and wild superstitions which emerged in Europe after 1914, the ideology of all frustrated and resentful elements.” It was the ideology of *ressentiment* and envy, combined with contempt (for the Jew): a singularly confused and psychologically potent ideology. Social rejects like Hitler who hated society and the state -- both of which they identified with Jewry -- turned to antisemitism as their salvation, their means of revenge and victory over their nebulous enemies. In the end, “the Jewish question in its social aspect turned into a catalyst of social unrest, until finally a disintegrated society recrystallized ideologically around a possible massacre of Jews.”

Remember, too, the importance of ‘bourgeois decadence’ for the early national syndicalists and Fascists. For many in Europe -- those among the social and political outcasts, the *déclassés*, the discontented of all sorts -- Jews, who had a huge cultural, intellectual, social, artistic, and economic presence, became synonymous with bourgeois decadence. It’s hard now to imagine how integral Jewry was to the cultural and social life of Europe in the early 20th century, and how ambivalent everyone (including Jews) was toward this people -- fascinated with them, envious of them, contemptuous of them. Given the prior decades of near-universal European antisemitism, or something approaching antisemitism, it wasn’t such a leap for Germans and others in the 1920s and 1930s to reach new peaks of antisemitic fervor. All that was necessary to set it off was a series of shocks like the aftermath of World War I and severe economic dislocation. In fact, considering the decades of business-funded patriotic, imperialist, nation-worshipping propaganda, together with the ‘alien,’ ‘treasonous’ presence of Jews in the body politic, in addition to the catastrophic defeats of several countries in World War I, it would be surprising if something like Nazism *hadn’t* happened. Especially in light of its usefulness to certain sectors of business and the military. And of course the racial thinking of a decaying feudal ethos, with the aristocratic emphasis on ‘blood’ (and purity, caste, etc.) and the peasantry’s connection to the land (hence the nation, the *Volk*), made for a potent ideological concoction.

In contemporary popular conservatism there is no longer the emphasis on blood or race or the *Volk*, since that was all discredited with Nazism and in any case lost its ‘sponsoring’ social classes with the demise of the aristocracy and the later demise of the peasantry -- i.e., the final definitive death of feudalism and its mindset -- but there is still the concern with the nation and its hallowed traditions threatened by invading outsiders (who, as earlier, are conceived as allied with the state and big banks, and who are degenerate, treasonous, international-oriented, etc.).

....Arendt doesn’t really get into this, but European history is almost *beautiful* in the majestic sweep of its dialectical self-underminings. Let me experiment with some ideas. From the 1400s or so, the nation-state was born from the wreckage of feudalism through the agency of absolute monarchs, burgher-ish economic interest groups, mercantilist policies, aristocrats who ‘enclosed’ plots of land to destroy the village system of the peasantry and profit off the production of wool, etc. In other words, the nation-state was created in large part under the impetus of early capitalism, and capitalism could not have got off the ground without the creation and consolidation of nation-states (national markets, ex-peasant labor forces, centralized political and economic power-structures, and so forth). Also, the European power-balanced nation-state system seems to have required an international class of Jewish economic and political functionaries in both its birth and its persistence into the late 19th century. A network of unitary nation-states was thus created, along with the concepts of nationhood, people-unity, and various forms of nationalism. The old concepts of race and ‘blood,’ too, fit into this conceptual system, in fact were probably given new life by the modern phenomenon of nationhood.¹ The point is that all these un-capitalist concepts and things were originally created and continued to be propagated partially under the pressures of capitalism. And Jews, by helping to create and hold together the system of nation-states, were unwittingly instrumental in the spread of nationalist and racialist ideologies.

But capitalism kept expanding even as the nation-state increased its authority and power, until finally the former could no longer be kept within the bounds of the latter. “Imperialism was born [in the

¹ But they were especially reinvigorated by imperialism.

late 19th century] when the ruling class in capitalist production came up against national limitations to its economic expansion.” Largely under the influence of the bourgeoisie, expansion became “the ultimate political goal of foreign policy.” With imperialistic expansion came a new, more jingoistic nationalism and racism, which boded well neither for Jews nor for the nation-state system and its balance of power. A war-to-the-death among nations ensued (with alliances, yes, but only provisional); the tendency was for the bourgeoisie and political power-structures of each country to strive for continental and world dominance, i.e. world empire, which would destroy the very nature of the nation-state, namely the union of a single more-or-less homogeneous people.¹ In this process, for reasons discussed earlier, international Jewry would be bound to lose its influence with the state, which would happily sacrifice it -- this non-national people, this people of outsiders to every nation -- to the interests of imperialism. Some sort of catastrophe for the Jewish people would be highly likely in view of their no longer having allies among governments and living in the midst of rabidly nationalist, racist peoples. And when some of these nation-states failed in their imperialistic wars against others, their revengeful, bitter people would turn against outsiders in their midst. And more wars might well result, wars of revenge and further conquest, which, if the technology of destruction was highly advanced, might end in the final destruction of the European state system -- destroyed largely under the pressures of the very (economic) dynamics whose incipient expressions had given it birth centuries earlier. It would take the intervention of relative outsiders, such as the United States and Russia, to help reconstruct the old system in a less ‘nationalist,’ more integrated way. These outsiders (along with insiders) might even forbid the new old countries from investing in militaries and armaments; only the outsiders would be allowed to have powerful militaries to police the global order.

You see the dialectical logic to it all. I’ve barely even outlined it, though.

With the destruction of the old system, nationalism and imperialism would not be able to continue in the same forms as before. But new forms of exploitation of the rest of the world would be found, as they have been. Imperialism would take more ‘regulated’ and ‘coordinated’ forms as the connections between business and the state, and between various states and multinational businesses, etc., intensified such that a mature state-capitalism evolved. The nation-state would become more and more beholden to the bourgeoisie,² relatively less important and independent as supranational economic organizations and legal frameworks, etc., developed. Throughout all this, the nation-state would be slowly, imperceptibly deteriorating also because of the economic contradictions of capitalism, the repeated and prolonged social dislocations of millions of people, ever-recurring class polarization, explosive social and economic resentments, population growth, labor migrations, increasing capital mobility, and other divisive forces. That’s where we are now. As I see it, this time -- in the next fifty or a hundred years -- there’s no saving the nation-state. The system is decaying internally; its demise won’t be ‘external,’ the result of countries trying to conquer the world and/or destroy each other (in which case there would be the possibility that countries could be reconstructed after destructive wars like WWII), but internal, in that the very ‘structural integrity’ of the nation-state is collapsing. The state as a principle of organization is being superseded and internally undermined.

Actually, according to Arendt’s strict and literal understanding of it, the nation-state is probably already effectively dead. If indeed it ever existed.

....“The bourgeoisie, so long excluded from government by the nation-state and by their own lack of interest in public affairs, was politically emancipated by imperialism.” A bit simplistic. “It is well known how little the owning classes had aspired to government, how well contented they had been with every type

¹ In this strict sense, the U.S. obviously isn’t a nation-state.

² This would be even more probable due to the aristocracy’s destruction in the prior orgy of racist and nationalist wars. (To repeat: racism and nationalism are propagated through the intersection of old semi-feudal, aristocratic traditions/institutions with new capitalist economic dynamics. For instance, old habits of race-thinking are given new popular life by imperialism, becoming more virulent and dangerous in the process. (In general, ‘residual’ phenomena can be revived and exacerbated by modern tendencies -- as with fundamentalist religion.) And certain kinds of nationalism too are encouraged by imperialism, quite apart from the fact that nation-states themselves evolved with primitive capitalism.)

of state that could be trusted with protection of property rights. For them, indeed, the state had always been only a well-organized police force.” That may be true, more or less. The early forms of ‘state capitalism’ began when the bourgeoisie took effective control of the state to guide it directly toward their ends, in the late 19th century. Which coincided with the era of imperialism. Businessmen became politicians, but they didn’t even have to; they could control the state indirectly.

Arendt seems to think that one way to conceptualize totalitarianism, with its institutionalized terror and mammoth bureaucracy, is as the application of imperialist power-structures and -tactics -- which pursue the expansion of power for its own sake (and for the sake of profit), not for the more ‘respectable’ (liberal-democratic) sake of ‘laws’ or social order -- to the domestic population. That’s a little simplistic but thought-provoking.

Interesting:

When imperialism entered the scene of politics with the scramble for Africa in the eighties, it was promoted by businessmen, opposed fiercely by the governments in power, and welcomed by a surprisingly large section of the educated classes. To the last it seemed to be God-sent, a cure for all evils, an easy panacea for all conflicts. And it is true that imperialism in a sense did not disappoint these hopes. It gave a new lease on life to political and social structures which were quite obviously threatened by new social and political forces and which, under other circumstances, without the interference of imperialist developments, would hardly have needed two world wars to disappear.

In a footnote she quotes J. A. Hobson: “The [civil] Services offer the clearest and most natural support to an aggressive foreign policy; expansion of the empire appeals powerfully to the aristocracy and the professional classes by offering new and ever-growing fields for the honorable and profitable employment of their sons.”

“The most radical and the only secure form of possession is destruction, for only what we have destroyed is safely and forever ours.” Think of Oscar Wilde’s apothegm that ‘all men kill the thing they love.’ Again, simplistic, but insightful. In wanting to possess something or someone, you don’t want to let it live freely; you want to *freeze* it as *yours*. But there are different kinds of love, and in its active fullness love needn’t be, and probably rarely is, morbid. The love that Wilde talks about is surely a caricature of love. -Or perhaps it’s better to say that this urge to possess is only one side of any healthy love, because real love, in having respect for its object, also loves its object’s aliveness and freedom. So it seems that a basic tension is at the heart of love. The friend or lover wants his friend or beloved to be *his* before others’, but he also wants him or her to be a free, happy, living human being (which entails relationships with others, etc.). In any case, the more that love loves the freedom and aliveness of its object as opposed to its ‘possession’ of it, the more healthy and authentic it is.

Apparently Rosa Luxemburg thought that “the historical process of the accumulation of capital depends in all its aspects upon the existence of noncapitalist social strata,” so that “imperialism is the political expression of the accumulation of capital in its competition for the possession of the remainders of the noncapitalistic world.” But I don’t understand the reasoning behind her first proposition. Presumably it has something to do with capital’s needing investment opportunities for excess, ‘overproduced’ capital - - and for some reason these investment opportunities are supposed not to exist (at least in sufficient quantity) in a society that has become thoroughly capitalist. That may be true, but I don’t know exactly why. I guess it’s just because the ‘market gets saturated.’

....Imperialism of course had many uses. One of them is that at a time when class struggle and other divisions were threatening to tear nations apart, it basically unified the country. It provided different groups of people with a common interest. It also fostered patriotism. And it gave the excess population a place to go, which helped stabilize society. -In its uniting of capital and the mob, imperialism contains the seeds of fascism.

It also prepared the world for totalitarianism in its awe-inspiring brutality. Due to Leopold II's policy in the Congo, the population was reduced from between 20 and 40 million to 8 million.

....According to Arendt, the difference between the old colonialism and the 'new' imperialism is (I think) that the first meant colonial *trade*, whereas the second meant direct investment in another territory and the extraction of profits by the investors.

In her interesting discussion of imperialism in South Africa (which would later influence the Nazi elites) -- in which 'superfluous' men from all classes in Europe, elements of the capitalism-spawned 'mob,' sought their fortunes in gold- and diamond-mining, financial speculation, exploitation of cheap black labor, etc. -- Arendt concludes that "South Africa's race society taught the mob the great lesson of which it had always had a confused premonition, that through sheer violence an underprivileged group could create a class lower than itself, that for this purpose it did not even need a revolution but could band together with groups of the ruling classes, and that foreign or backward peoples offered the best opportunities for such tactics." Important lessons for Nazism.

"Nazism and Bolshevism owe more to Pan-Germanism and Pan-Slavism (respectively) than to any other ideology or political movement. This is most evident in foreign policies, where the strategies of Nazi Germany and Soviet Russia have followed so closely the well-known programs of conquest outlined by the pan-movements before and during the first World War that totalitarian aims have frequently been mistaken for the pursuance of some permanent German or Russian interests." An acute suggestion in the case of Bolshevism, though also debatable. But it's acute in recognizing that Bolshevism (as a mass movement and a set of political and economic structures) ultimately was more like a kind of nationalism and imperialism than Marxism or socialism. The initial Marxist and socialist impulses withered away; the end-result was just another imperialist 'nation-state' (loosely speaking).

Another way to look at totalitarianism isn't to ask why *did* it happen in Germany and Russia (and partly Italy) but why *didn't* it happen elsewhere. For the *potential* exists in state-capitalism everywhere, with its bureaucracy, imperialism, fusion of business and the state, suppression of opposition movements (like the labor movement), suppression of democracy, etc. The answer is that all these authority-structures are not enough to create a genuine totalitarian state; what is also needed is popular support, at least at the beginning. The people have to be so swept up in a movement that they willingly give up the elements of democracy that do exist, the popular institutions (representing specific interests) that exist. Then the state (and to an extent big business), no longer having to deal with 'countervailing forces,' will become all-powerful, and terror will probably be institutionalized to prevent popular opposition from arising in the future, etc. Fortunately the people don't voluntarily give up their power except in the most pathological of circumstances, when mass confusion and despair have caused them to be seduced by ideologies that implicitly benefit power while seeming to benefit the people.

Suggestive:

While overseas imperialism, its anti-national tendencies notwithstanding, succeeded in giving a new lease on life to the antiquated institutions of the nation-state, continental imperialism [as embodied in the pan-movements, like the German] was and remained unequivocally hostile to all existing political bodies. Its general mood, therefore, was far more rebellious and its leaders far more adept at revolutionary rhetoric. While overseas imperialism had offered real enough panaceas for the residues of all classes, continental imperialism had nothing to offer except an ideology and a movement. Yet this was quite enough in a time which preferred a key to history to political action, when men in the midst of communal disintegration and social atomization wanted to belong at any price.

Just as continental imperialism "sprang from the frustrated ambitions of countries which did not get their share in the sudden [imperialist] expansion of the 1880s, so tribal nationalism appeared as the nationalism of those peoples who had not participated in national emancipation and had not achieved the sovereignty of a nation-state. Wherever the two frustrations were combined, as in multinational Austria-Hungary and Russia, the pan-movements naturally found their most fertile soil."

Aside from being multinational, Austria-Hungary and Russia were also distinguished by their despotic character -- their rule-by-decree and -bureaucracy. This inheritance of relative lawlessness influenced the pan-movements (German and Slav), which had contempt for constitutional government. - Another example of how totalitarianism resulted in part from residual pre-modern features of European society.

Even in Germany there was no tradition of liberal democracy. The Weimar Republic was erected on a rotten foundation.

....Arendt points out some differences between Italian Fascism and German and Soviet totalitarianism. For one thing, in the latter two the totalitarian movements didn't let themselves become identified with the state, as Fascism supposedly did. The totalitarian Party distinguished itself from the state, which was subordinated to the Party. Fascism remained basically a nationalism not opposed to the state as such, whereas Nazism and Bolshevism were a 'supranationalism' that (at least in their ideology) aimed to destroy the state. Everything was to be subordinated to the movement and its *movement*, its never becoming static (state-ic). But surely this was a tendency in Fascist ideology as well.

Interesting:

Mussolini's Fascism up to 1938 was not totalitarian but just an ordinary nationalist dictatorship developed logically from a multiparty democracy. [Again, simplistic, because it at least *aspired* to be a movement and had some of a movement's features.] For there is indeed some truth in the old truism about the affinity between majority rule and dictatorship, but this affinity has nothing whatever to do with totalitarianism. It is obvious that, after many decades of inefficient and muddled multiparty rule [as in Italy], the seizure of the state for the advantage of one party can come as a great relief because it assures at least, though only for a limited time, some consistency, some permanence, and a little less contradiction.

I think she's mistaken in arguing that Fascism was *categorically* different from totalitarianism, separated from it by an abyss. It was indeed a 'movement' (and thus *potentially* totalitarian -- as after 1938) but simply much less of one than Nazism and Bolshevism. Also, surely Nazism got much of its support from the fact that ordinary Germans were fed up with the Weimar Republic's 'inefficient and muddled multiparty rule' -- and in this respect it was similar to Fascism.

The situation in Europe in the decades before and after the first World War was so unstable that the two great wars, as well as all the nationalist, 'supranationalist,' antisemitic, imperialist, racist, anti-capitalist, potentially totalitarian movements, seem nearly inevitable. So much nationalist, racist, feudal and capitalist oppression of hundreds of millions -- and the national strivings of so many peoples before and after the war -- and the simultaneous existence and intermingling of so many different social structures, some ancient and some ultra-modern: it was a volcano with a hundred possible erupting-points. In the 1920s there were all the artificial new countries in Southern and Eastern Europe with resentful minorities clamoring for 'national liberation' and states resentful of having to protect their minorities (or allow them to be protected by the League of Nations), and the stateless people in Central and Western Europe whose human rights were not recognized, and a diffuse attitude of cynicism and hatred of everything prevailed in the midst of general social disintegration. The plight of minorities and stateless people is particularly poignant. States without League of Nations-imposed 'minority obligations' were not, according to their political representatives, responsible for people of a different nationality who happened to live within their borders. Their laws didn't have to respect such people. The politicians who made these arguments "thereby admitted -- and were quickly given the opportunity to prove it practically with the rise of stateless people - - that the transformation of the state from an instrument of the law into an instrument of the nation [i.e. of 'nationals,' people belonging to the nation by blood] had been completed; the nation had conquered the state, national interest had priority over law long before Hitler could pronounce 'right is what is good for the German people.'"

As Arendt says, the danger of these developments, e.g. the rise of stateless people whose human rights were respected by no government, had been inherent in the nation-state from the beginning. "But insofar as the establishment of nation-states coincided with the establishment of constitutional government, they always had represented and been based upon the rule of law as against the rule of arbitrary administration and despotism. So that when the precarious balance between nation and state, between national interest and legal institutions broke down, the disintegration of this form of government and of organization of peoples came about with terrifying swiftness. Its disintegration, curiously enough, started at precisely the moment when the right to national self-determination was recognized for all of Europe and when its essential conviction, the supremacy of the will of the nation over all legal and 'abstract' institutions, was universally accepted."

When a person was de-nationalized by his government, as Jews were in Germany in the 1930s and millions of other people were elsewhere (such as Russians who had fled the Revolution), he became a 'legal freak.' He was a legal non-entity. No country wanted to import a flood of de-nationalized refugees, but their original country wouldn't take them back. So they were often sent to internment camps. They had lost all rights by virtue of being stateless.

It became the role of the police to deal with the stateless. The latter were *their* responsibility. "This was the first time the police in Western Europe had received authority to act on its own, to rule directly over people; in one sphere of public life it was no longer an instrument to carry out and enforce the law, but had become a ruling authority independent of government and ministries.... The greater the ratio of stateless and potentially stateless to the population at large -- in pre-war France it had reached 10 percent of the total -- the greater the danger of transformation into a police state." Once a state starts depriving people of citizenship on the basis of their race or nationality or political beliefs, etc., it becomes more and more difficult "to resist the temptation to deprive *all* citizens of legal status and rule them with an omnipotent police." The final stage of totalitarianism.

Arendt gives a plausible reason for the fact that full-fledged totalitarian regimes occurred only in Russia and Germany (and the latter became *fully* totalitarian only with the coming of the war, as the regime expanded into other countries): totalitarianism requires a huge surplus population in order to give free rein to its terrorizing and exterminating measures. Otherwise too large a percentage of the population will be sacrificed. Totalitarian movements occurred in many European countries and in some cases they came to power, but having done so they couldn't 'fulfill' themselves simply because "they did not control enough human material to allow for total domination and its inherent great losses in population."

She also makes an interesting distinction between the mob and the masses. The former is more characteristic of 19th century antisemitism, pan-nationalism, the 'butcher brigades' of the Dreyfus Affair, the Black Hundreds of the Russian pogroms, etc.; the latter is more characteristic of the 20th century and mass movements. The mob is still infected with a certain bourgeois individualism, and its members never reach "the point of complete loss of individual claims and ambition" such that their individual identity is extinguished permanently "and not just for the moment of collective heroic action." The mob is a byproduct of capitalist production; the masses, according to Arendt, emerge from the breakdown of class society. "The fall of protecting class walls transformed the slumbering majorities behind all political parties into one great unorganized, structureless mass of furious individuals who had nothing in common except their vague apprehension that the hopes of political-party members were doomed, that, consequently, the most respected, articulate and representative members of the community were fools and that all the powers that be were not so much evil as they were equally stupid and fraudulent."

The mass man is remarkably selfless. Arendt refers to "the radical loss of self-interest, the cynical or bored indifference in the face of death or other personal catastrophes, the passionate inclination to the most abstract notions as guides for life, and the general contempt for even the most obvious rules of common sense." Strangely enough, highly cultured people -- intellectuals, artists, etc. -- can be particularly attracted to mass movements; their "highly differentiated individualism and sophistication" can actually *encourage* their self-abandonment in the mass.

"The truth is that the masses grew out of the fragments of a highly atomized society whose competitive structure and concomitant loneliness of the individual had been held in check only through

membership in a class. The chief characteristic of the mass man is not brutality and backwardness, but his isolation and lack of normal social relationships. Coming from the class-ridden structure of the nation-state, whose cracks had been cemented with nationalistic sentiment, it is only natural that these masses, in the first helplessness of their new experience, have tended toward an especially violent nationalism, to which mass leaders have yielded against their own instincts and purposes for purely demagogic reasons.”

The totalitarian movement and subsequent regime is led by elements of the mob who had earlier withdrawn from society and then took advantage of the breakdown of the class system to lead the masses toward the mob's ends (such as pan-nationalism and destruction of the Jews). (One of the reasons for the mass man's selflessness, by the way, is that the class system's breakdown, or partial breakdown, goes a long way toward abolishing the particularity of interests that had defined political parties and had made possible the competitive play of self-interest in the earlier faction-ridden society. With the class structure in partial collapse, people from all classes can come together as one.)

The regime that results from the mobilization of the atomized but selfless masses is, at least in its logical conclusion, absolutely atomized and individualized. It has no room for human connections of any kind. Various devices are used to undermine family loyalty, friendship-loyalty and so on; all classes and social groups, including even the bureaucracy itself, are periodically liquidated in purges in order to keep the society atomized. (Presumably the Leader need not have all these intentions in his mind; he acts in paranoid, 'purge-happy' ways just because the structure of the regime itself fosters universal paranoia, suspicion and atomization.) In these respects it seems to me that the pure totalitarian regime is but the logic of bureaucracy taken to its horrifying and absurd conclusions.

(It's significant also that the goal of universal atomization is modern business's as well. America is extremely business-run and extremely atomized. But in fact all power-structures are opposed to human connections. Totalitarianism thus amounts to the ultimate realization of the logic implicit in every institution of power -- i.e., the extension of bureaucratic power-relations into every facet of life.)

Totalitarianism has no specific political program, and in the movement-stage its leaders always shun questions about the movement's program. All they preach is world-rule, some kind of solidarity (racial, class, nationalist), and hatred of some enemy or other.¹ “The practical goal of the movement is only to organize as many people as possible and to set and keep them in motion; a political goal that would constitute the end of the movement simply does not exist.”

....As you read about the mentality of the mob elements in the 1920s from which Nazism and similar movements sprang, you realize how saturated those elements were in *ressentiment*. Hatred, envy, resentment, self-hatred, the passion to destroy, contempt for everything life-affirming -- and contempt for everything bourgeois, for liberal hypocrisy, for the whole admittedly wretched civilization whose dregs they were. “There was no escape from the daily routine of misery, meekness, frustration, and resentment embellished by a fake culture of educated talk.” All this bred a yearning to lose oneself in a movement, a movement of cyclonic mass destruction.

Existentialism, too, was in part an expression of all this nausea. So was Dada, etc.

Both the intellectual elite and the mob were attracted to the “pronounced activism” of totalitarian movements. “What proved so attractive was that terrorism had become a kind of philosophy through which to express frustration, resentment, and blind hatred, a kind of political expressionism which used bombs to express oneself, which....was absolutely willing to pay the price of life for having succeeded in forcing the recognition of one's existence on the normal strata of society. It was still the same spirit and the same game which made Goebbels, long before the eventual defeat of Nazi Germany, announce with obvious delight that the Nazis, in case of defeat, would know how to slam the door behind them and not be forgotten for centuries.”

It's fascinating how new ways of thinking can sometimes strengthen old ways of thinking. Darwinism, interpreted in a certain way, gave 'scientific' legitimacy to residual feudal prejudices about race and the natural superiority of the highest caste and the right of conquest and so forth. The partisans of

¹ Lenin wasn't totalitarian. Russia became such only with Stalin.

tradition or the 'residual' can always interpret science or modern ideas in ways that support tradition. Or, more exactly, they can fuse the two to create a bastardized but apparently 'modern' set of basically traditional ideas.

"Totalitarian propaganda perfects the techniques of mass propaganda, but it neither invents them nor originates their themes. These were prepared for them by fifty years of the rise of imperialism and disintegration of the nation-state, when the mob entered the scene of European politics. Like the earlier mob leaders, the spokesmen for totalitarian movements possessed an unerring instinct for anything that ordinary party propaganda or public opinion did not care or dare to touch. Everything hidden, everything passed over in silence, became of major significance, regardless of its own intrinsic importance. The mob really believed that truth was whatever respectable society had hypocritically passed over, or covered up with corruption." Think of Rush Limbaugh, Glenn Beck with his conspiracy theories, and other such demagogues. Their audience is the mob. The obsession with Sarah Palin's 'death panels,' Obama's supposed lack of U.S. citizenship, and conspiracy theories is like something out of the 1930s. What makes it all possible -- what creates the 'mob' -- is the lack of a functioning civil society, in particular a labor movement. (Actually, even if there were a labor movement there would still be a mob, but it would be smaller and not as influential. There are always going to be people whom the capitalist system ruins and fills with a destructive resentment and hatred. --What's interesting, though, is that much of the contemporary mob is middle-class and reasonably well-off. It shows that mass hatred and resentment are not created only by economic hardship. More generally, they result from a perceived loss or insufficiency of power and recognition.)

Arendt is obviously right that mass movements derive their power from giving people something to belong to, something that restores the self-respect of millions of people who have been atomized and forced to feel powerless, unrecognized, confused.

It's a masterful book, but I think she's wrong to argue that totalitarian regimes and movements differ *essentially* from one-party dictatorships, despotisms, various ultra-conservative movements, etc. Or at least that's misleading. There are totalitarian tendencies in a whole host of phenomena. Think of Saddam Hussein's Iraq, Mussolini's Italy, McCarthyism, a capitalist corporation, Reaganite conservatism, and so forth. It isn't hard to find totalitarian *tendencies* in such things. Luckily the tendencies have rarely come to complete fruition because of countervailing forces.

The genius of full totalitarianism is that it fuses bureaucracy with popular enthusiasm and participation. Bureaucracy grows to an unprecedented level, so that it ideally structures every aspect of life and there is no room for humanity anymore, but it's bureaucracy in the service of a movement, a popular ideology. In order for the movement and ideology to continue dominating everything and retain their momentum, the bureaucracy can't be allowed to become static and ossified; there has to be a constant 'shaking-up' of things, constant motion and continuous devotion to nothing but the Leader, who embodies the movement and ideology. (Think of Mao's Cultural Revolution after he felt that the movement was losing steam. It can't be allowed to become *only* a bureaucracy -- because then it slowly deteriorates and ceases to dominate everything including the individual's inner life.) The Leader's importance is solely a result of that function he serves, not of his particular personality -- which is probably why totalitarian leaders are never particularly concerned with finding a successor. Almost anyone would fit the bill.

The 'pointless' terror of totalitarianism, which intensifies precisely as opposition collapses, is due to the necessity of keeping the movement in motion and all-dominating. 'Objective enemies' have to be invented so that the terror has an excuse for its existence.

Totalitarianism fuses, as it were, the two phenomena that have come into their own in the modern age: bureaucracy and popular movements. And it takes each to its logical conclusion (from one perspective) -- the humanity-negating nature of bureaucracy and the 'massiveness,' the masses-ness, of popular movements. In this sense it can be seen as the perfect symbol of modernity. --Actually it's a good symbol of modernity in more than one way.

Totalitarianism is a form of government, or state, that is logically and historically based on an ideology, such that the structure of the particular state is supposed to be 'logically deducible' from its

ideology and, in addition, has historically emerged from a mass ideological movement. Many modern governments, I suppose, have been swept into power on the basis of a mass movement inspired in part by an ideology, but unless the ideology has then totally dominated society, such that there has been no civil society, no differentiation between the public and private spheres, etc., the regime hasn't been genuinely totalitarian. Of course, a *pure* or *absolutely* totalitarian society has never existed, insofar as even in Nazi Germany and Soviet Russia the authorities couldn't completely extirpate freedom.

Arendt on solitude vs. loneliness:

....As Epictetus sees it, the lonely man finds himself surrounded by others with whom he cannot establish contact or to whose hostility he is exposed. The solitary man, on the contrary, is alone and therefore 'can be together with himself' since men have the capacity of 'talking with themselves.' In solitude, in other words, I am 'by myself,' together with my self, and therefore two-in-one, whereas in loneliness I am actually one, deserted by all others. All thinking, strictly speaking, is done in solitude and is a dialogue between me and myself; but this dialogue of the two-in-one does not lose contact with the world of my fellow-men because they are represented in the self with whom I lead the dialogue of thought. The problem of solitude is that this two-in-one needs the others in order to become one again: one unchangeable individual whose identity can never be mistaken for that of any other. For the confirmation of my identity I depend entirely upon other people; and it is the great saving grace of companionship for solitary men that it makes them 'whole' again, saves them from the dialogue of thought in which one remains always equivocal, restores the identity which makes them speak with the single voice of one unexchangeable person.

Solitude can become loneliness; this happens when all by myself I am deserted by my own self. Solitary men have always been in danger of loneliness, when they can no longer find the redeeming grace of companionship to save them from duality and equivocality and doubt. Historically, it seems as though this danger became sufficiently great to be noticed by others and recorded by history only in the nineteenth century.... What makes loneliness so unbearable is the loss of one's own self which can be realized in solitude, but confirmed in its identity only by the trusting and trustworthy company of my equals. In this situation, man loses trust in himself as the partner of his thoughts and that elementary confidence in the world which is necessary to make experiences at all. Self and world, capacity for thought and experience are lost at the same time.

Interviewed Chomsky for half an hour. I was going to write a transcription of it here, but the recording device didn't work. Predictably. Asked him first about any current developments in the sciences that he thinks are particularly exciting, but didn't get much of an answer. Got more of one with the question on what explains the decadent intellectual culture of France after World War II: thinks it's due partly to France's long tradition of cultural insularity and arrogance (from the Enlightenment on) -- most biologists were pre-Darwinian until the late 20th century -- and also to France's loss of its preeminent international position after the war. Maybe the arrogance and insularity were even accentuated by that and became perverse. (That's me, not him.) Then asked whether he accepts that it's hard for a radical to avoid continual hypocrisy by participating in society. But the only alternative, of course, is to live in Montana somewhere and avoid everything -- which doesn't help anyone or change anything. But then what about 'active' participation like paying taxes? Doesn't that compromise one's integrity? He was a tax resister for a while, but not on principle; rather, he hoped that would influence others. "The government will get your taxes one way or another," so that isn't really the issue. *Principle* shouldn't be the issue; *tactics* should be the issue. Maybe if you're some religious activist who thinks that his relationship with God requires him to act in certain ways -- principle matters then; but ordinarily it shouldn't be the main point. Then I asked what he thinks about the worker cooperative movement, how much importance he attributes to it, and suggested that maybe the nation-state system is slowly collapsing and as it does so cooperativism is rising like a

phoenix from the ashes. He isn't sure what to think, but is skeptical. Certainly in the U.S. it has huge obstacles; the situation is brighter in Latin America. Recently a multinational corporation closed a factory in Rhode Island; its workers offered to buy it and run it as a cooperative, but the company rejected that offer. Why? Because executives' class loyalty matters more to them than some extra profit. They simply didn't want workers to take matters into their own hands. I also asked a random question about his musical tastes; as I suspected, he prefers the classics (Schubert, Bach, etc.). Up to the 1930s. (My tastes almost exactly.) Used to listen to folk music with his wife. I'd hoped he would get into more detail about Bach and music theory -- prompted him with some remarks on the 'structure' of Bach's music, etc. -- but no such luck.

Nice guy and brilliant, but once you know his worldview his thoughts about things aren't very surprising. When you meet him he comes across as a simple man, just a good, kind guy who doesn't have dark impulses or a contradictory or tormented character, is maybe even somewhat innocent almost like a child. "Absolute moral integrity," as Mailer said. Very simple and pure. He seemed to like me -- I think we'd get along well.

We talked about Obama and politics briefly, and the Tea Party. He said that if you read the business press you'll see how worried business is right now about what it's unleashed, all the global warming-deniers and so forth. It ridicules these climate-deniers even as it continues to flood society with propaganda against global warming. But business is starting to get very worried about the long run. As for Obama, he was a "limp rag" coming into office and remains so, because his most important constituency is the rich. When the public was 2 to 1 against extending the Bush tax cuts but Obama caved to the Republicans, you've gotta wonder. If Obama had really been committed to ending them he could have marshaled his forces, rallied his popular support, and made the Republican opposition look terrible. He's a centrist; "he has no principles," as Chomsky said.

I would have liked to stay longer but didn't want to take up too much of his time. He gets a lot of visitors every day.

The main reason I saw him wasn't to ask questions. I didn't have any burning questions I wanted answered. It was just to have the experience -- to meet one of the greatest figures in history and see how I'd react, whether I'd be intimidated or could have a conversation with him or what. I was pleased with the result: I wasn't intimidated at all. We just had a pleasant conversation, which would have been even more pleasant had I not been aware of the time-limit. We're both easygoing people -- I suspect he appreciated my not treating him like a god. If we were closer in age I think we could be good friends.

I also saw Yuja, went to her apartment for a few hours. We had a good time. She's seeing a young Polish guy now whom she really likes, and who's leaving America for two years in one month. So, more heartache for Yuja. More tearful phone calls. It's quite upsetting; I wish she could be happy.

Me and Chomsky:

Professor Chomsky,

I talked to you a few days ago - (I was the one with the 'bodyguard')¹ - I enjoyed the conversation, and thanks for taking the time. But I think I should have pressed you a little harder on one point. You often say that 'principles' shouldn't matter as much as 'tactics,' and so you reject questions about the possible hypocrisy of being an anti-capitalist so-called 'radical' (like me) while perhaps actively participating in the capitalist system (by, if nothing else, paying taxes - or think of Engels, with his factory in Manchester). But surely there comes a point at which the question of hypocrisy has to be raised. You yourself, after all, criticize officials in the U.S. government for being hypocritical in having supported Saddam Hussein and then condemning him later when it was useful for them to do so. Integrity is an important virtue, and obviously you have great integrity, which means you

¹ Some guy had asked me if he could sit in on our conversation. Chomsky made a joke about his being my bodyguard.

adhere to your principles; - so, living according to principles is, in the end, very important. But it isn't *everything*: the issue of tactics is perhaps equally important (certainly if one cares about social change). If the two values of having integrity and contributing to social change should ever conflict in some case, then probably social change (i.e., tactics as opposed to principles) should take precedence. But apart from that circumstance, one surely has to behave according to one's principles, right? - within reason, of course. But there's the rub: what does 'within reason' mean? One simply has to evaluate situations as they come, I suppose.

Still, what do you think of Engels' owning a factory? It was contrary to his principles insofar as he thought wage-labor was immoral, but it helped Marx get his work done by allowing Engels to send him money every week. Actually, forget about that fact; suppose there was no side-benefit, and Engels was just a socialist who owned a factory that exploited workers. Is that not hypocritical? Or should we not care about that?

Thanks for your thoughts.

I don't see any conflict between principles and tactics, at least if we have the right principles. One dominant principle should be organizing our lives and actions so that they can help poor and suffering people, ward off potential catastrophes, and in general have a positive impact on the world. Take Engels managing a factory, while doing his groundbreaking work on the condition of the working class in England. Suppose, instead, that he had given up factory management, gone off to live in a working class slum, probably dying of the social diseases that he pioneered in bringing to light. My feeling is that that would have been opposed to the decent principles he upheld, those just mentioned. I don't see even a touch of hypocrisy in his choice. [That's right. But I wanted to disregard 'side-benefits' (like allowing him to do research) of his managing a factory. If there were none it would be hypocritical for him to manage a factory, just as, perhaps, it is hypocritical for me to pay taxes to a government I don't believe in.]

Similarly, you could extricate yourself from capitalist society, get a plot of land in Vermont, grow your own food, and feel self-righteous. Who would you help by doing that? OK if you want to do it, but I at least would not regard it as a principled choice, because you can play a much more positive role than that.

It's true that every option has to be considered on its merits. We all have to make complicated choices. In 1965, for example, I tried to organize national tax resistance, and shortly after undertook other more far-reaching resistance activities for which I was coming up for trial in 1968 -- called off after the Tet offensive. I made a conscious choice to face a probable long jail term, which, of course, would have ended or at least delayed any positive work I could have done in the outside society (putting aside the effects for my family; my wife went back to college after 17 years because we had three children to support). Maybe the choice was right, maybe wrong. But I don't see any issue of principle vs. tactics -- which also should accord with principles.

Difficult judgments, and often hard to work out, but I don't think that the conflict you describe is a useful way to look at these dilemmas. [But as I said, I wanted to disregard cases in which there might perhaps be such a conflict. Or rather, contributing to social change should be one of the most important principles that guides action, such that a

conflict between principles and tactics can't arise. But there are other principles one has, and in those cases when the question of contributing to social change doesn't come into play, one has to live by those other principles -- such as, it's wrong to support a government that wages imperialist wars, or whatever.]

I decided to send another email (and he wrote back, below):

Thanks. One final thought: what I should have made clearer was that I was trying to disregard cases in which the question of tactics, i.e. contributing to social change, comes up. In all such cases, the principle of furthering change is the most important, and so of course one's principles then can't conflict with tactics. But, 'other things being equal,' it would be hypocritical for a socialist to manage a factory, just as it is perhaps hypocritical for me to pay taxes to a war-mongering government.

I think A. J. Muste expressed it well when a reporter asked him, in response to his standing silently outside the White House every night with a candle in his hand (I think) during the Vietnam War, "Do you really think you're going to change the government's policies by standing here every night?", and he responded, "You've got it all wrong. I don't do this to change the government; I do it so the government won't change me." He just wanted to keep his integrity, quite apart from any considerations of tactics, and this principle required that he act in certain out-of-the-mainstream ways. As when Thoreau refused to pay taxes just for the sake of his integrity, not necessarily for the sake of changing society. These considerations about integrity are what give me a guilty conscience.

I admired AJ Muste very much, and for that reason contributed to the memorial volume devoted to him, defending his "radical pacifism" in one of the hardest cases. But I didn't admire the action you mention, because it was completely self-serving. The Vietnamese didn't give a damn whether he saved his soul. Same with Thoreau. It's no trick to spend a night in a pleasant jail, probably more comfortable than his shack at Walden Pond. I've spent many nights in much worse ones. I was a tax resister for many years, but went far beyond that to organize tax resistance. Right or wrong, those were not efforts to be able to feel self-righteous about my "integrity," but to try to end a terrible war. And when tax resistance barely made a dent, I turned to other measures. Thoreau went back to contemplating nature in Walden. That's OK. I'm not criticizing him. It's just that I don't see much to admire in this behavior.

Other things are never equal. If the hypothetical socialist gives up managing a factory and is replaced by some other manager, then what will change for the workers, the community, the outside society?

Those seem to me the serious questions, and they arise all the time. As it happens, one of the leading activists in this area for many years, from resistance to the war in Vietnam to civil rights and innumerable other issues, happens to work as an investment banker -- which, incidentally, also allows him to be a major funder and to enlist others to do so as well. Is that hypocritical? The question is what the human consequences would be if he were to make some different choice.

Anyway, that's the way I understand principled decisions.

Those are good points. But still, isn't there something to be said for integrity as a virtue in itself? Alleviating other people's suffering isn't *all* that matters, is it?

But Chomsky is right that you can fight the government in other and more productive ways than by not paying taxes. And if your main principle just *is* to further social change, then the way you have integrity is simply to work towards change. Or, even better: if you oppose the government or some business or whatever because its actions are harming people, then what you're bound to do on the basis of your principle is either to directly help the people or to try to stop the institution in question from hurting them. Which gets into questions of tactics. So yes, he's right: the basic principle in all this, or what *should* be the basic principle, is simply to improve people's lives and prevent business and government from hurting them. This principle, though, doesn't demand 'absolute' stances but rather considerations of tactics. You show integrity precisely by considering tactics carefully.

My refusal to pay taxes wouldn't change anything; it would serve only to get me arrested (maybe) and make me feel good about myself. What matters is *helping others*. Chomsky's right about that.

On the other hand, surely even a 'self-serving' act like Thoreau's or Muste's is better than doing nothing at all. But I guess it's only 'abstractly' better, 'morally' better but not in a *concrete* way, not in a way that actually helps people. Doing something only for the *principle* of it, only for the sake of 'having integrity' but not to help others, is somewhat masturbatory. It has no 'cash-value' (if it doesn't help others); it's academic, so to speak.

But then again, that might have odd implications. It implies that having integrity in itself isn't very important, is only an 'academic' consideration that serves no other purpose than to make you feel good about yourself. But that's bizarre, the notion that your desire to have integrity isn't moral but self-serving. In a sense, of course, it's true that such a desire is self-serving. But it's also 'moral,' surely: it evinces moral feeling, it indirectly bears on one's relations -- and relationships -- with others, it's grounded in a healthy desire for self-respect and indirectly shows respect for others (whom one is implicitly respecting by refusing to treat them as means to one's ends, by refusing to lie to them, etc.). Moreover, morality isn't *only* about helping (or not hurting) people. The principle that it's wrong to lie has at most an indirect relationship to the principle that it's wrong to hurt people.

Nevertheless, when it comes to acts that grow out of one's protest against real injustice in the world, like Thoreau's and Muste's acts, then yes, morality *is* only about helping people. *That's* the ultimate principle that brings forth Thoreau's tax-resistance: he doesn't want to participate in something that harms people ('unjustly'); i.e., he doesn't want to do evil to people but rather to do good. Which amounts to 'helping' them in some way. Which, as I said before, introduces questions of tactics and so takes us out of the realm of simple absolutist moral gestures like holding a candle outside the White House.

Sometimes being a moral person might involve following 'absolute' rules consistently, like (for the sake of argument) not to lie or not to steal or not to kill. --But no, even that isn't true. No such rule should be followed blindly. The basic moral principle is the Golden Rule, which requires that you treat each situation as the unique scenario it is. You have to evaluate each situation in the light of the question 'How can I best honor people's, or this person's, humanity here and now?' Then you'll see that Thoreau's and Muste's actions cited above are actually pretty poor stuff. Because, as Chomsky said, those acts don't matter a damn to the victims in question; if you take the perspective of a Martian you see that they're done more out of self-regard than regard for others.

And, to repeat, acting out of genuine regard for others is the *real, substantive* meaning of moral integrity. *Active compassion*, or *active* consideration for others' humanity,¹ is what it means to have moral integrity; compared to that, Thoreau's bare refusal to pay taxes seems formulaic, 'external,' passive, downright not-particularly-moral (because it's done largely out of self-love, not love of others).

Robyn Muncy, "Coal-Fired Reforms: Social Citizenship, Dissident Miners, and the Great Society" (2009). Ordinary workers didn't have only a negative, conservative role in the 1960s (opposing racial equality, etc.); in some cases they also stimulated progressive reform. "The behavior of coal miners in the

¹ You could extend that principle to the case of animals as well. It doesn't have to be only 'for humanity.'

eastern United States during the postwar period suggests that the relationship of rank-and-file workers to the Great Society was more complex [than the typical narrative suggests]. Many coal miners determinedly took part in protests, including violent ones, that galvanized officials in Washington to expand federal responsibilities. The actions of those miners help explain the emergence and shape of the Great Society. Most important, they demonstrate that at least some blue-collar workers participated in the active dissent that produced the third and final burst of progressive reform in twentieth-century America.” These miners, whose (sometimes violent) protests were well-organized, were concerned about losing benefits from their union’s health and pension plan. Actually, benefits had been fluctuating for years, and thousands of miners and their widows had been losing insurance since the 1950s. After a lot of agitation they won (in the early 1970s) increases in pensions, greater benefits to widows, etc.

But miners did not restrict their protests to the union and the [benefit] fund. They simultaneously agitated for intervention by the federal government. Employing tactics that ranged from roving pickets and arson to alliances with other social movements to conventional lobbying, electoral politics, and lawsuits, indignant miners exerted pressures that expanded the federal state. Sometimes, the miners’ efforts resulted in direct federal action in their behalf; at other times, the discontent roiling aggrieved miners contributed to a larger social unrest that included the civil rights struggle and the student movement. In fact, some miners reached out directly to those movements and imagined their struggles as akin. Rank-and-file workers thus contributed to the upheaval that opened opportunities for state expansion well beyond miners’ specific grievances. Their protests helped create the Great Society.

Miners’ discontent eventually contributed to state expansion in three areas: antipoverty programs, including regional economic development and relief in Appalachia; federal protections for private old-age pensions; and health care/workplace safety. Brief narratives of the three suggest the historical significance of the sense of entitlement miners developed from their experience in a private health and retirement program....

Finally reading E. P. Thompson’s *Making of the English Working Class*, the whole thing. I read only a small portion in college. Query: why was England so impervious to social and political change in the early and middle 19th century? Answer: in part because in the 1790s “the French Revolution *consolidated* Old Corruption by uniting landowners and manufacturers in a common panic; and the popular societies were too weak and too inexperienced to effect either revolution or reform on their own.” It’s like 1919 in the United States, when the Russian revolution helped consolidate the power of business as against workers.

....Minor epiphany. (Sometimes something you’ve sort of known for a long time suddenly sinks in or you appreciate its implications with utmost clarity.) One of the most commonplace sociological facts about pre-industrial or transitioning-to-industrial or newly-industrial societies is that the labor force or even independent artisans do not have a ‘Protestant work-ethic,’ a disciplined work-ethic appropriate to industrial capitalism. Employers and the like complain about the laziness, indolence, indiscipline, etc. of the lower classes and obsess over how to get them to follow mechanically the rhythm of the clock and the overseer. So you get the sheer physical brutality of the Industrial Revolution, the constant cumulative struggle on the part of employers to increase their minute control of the work-process and deprive workers of every shred of autonomy, Frederick Taylor’s scientific management, Ford’s and others’ attempts to ‘socialize’ workers into being good moral religious un-alcoholic dutiful citizens, and so forth. Wherever industrial capitalism is in its early stages, you see this Herculean effort -- this *war* -- to impose mechanical industrial rhythms on the workforce, through external coercion and more subtle ‘internal’ means. I say it’s ‘Herculean’ because, as Thompson points out, it’s like an attempt to refashion human nature. You have to stifle the desire for leisure, for social pursuits, for play and creativity -- in a being that is virtually defined by its love of play. No wonder there’s so much resistance to it! Centuries-long resistance! And of course, luckily, the enterprise is never *wholly* successful. Human nature, contrary to Lenin’s and Taylor’s hopes, can’t be erased

and redrawn. Even the nascent capitalist class, the one getting all the material benefits, needed psychological assistance to complete the transformation from semi-leisured medieval life to modern disciplined life; hence you had the spread of Calvinism and its notion of the 'calling' -- and individualism, self-discipline, acquisitive values, etc. (See Weber and Tawney.) But the working class too needed some such psychic mechanism to adjust itself to the new order, and so you had in England (and America? France?) during the Industrial Revolution the acceptance among this class of Methodism and other sects that preached the blessedness of poverty and hard labor, submission to authority, compensation in the hereafter, and the like. After quoting some emotionally overwrought Methodist literature (ecstatic convulsions of conversion, joyously self-abandoning abasement in God), Thompson says that

we may see here in its lurid figurative expression the psychic ordeal in which the character-structure of the rebellious pre-industrial laborer or artisan was violently recast into that of the submissive industrial worker. Here, indeed, is Ure's 'transforming power.' It is a phenomenon, almost diabolic in its penetration into the very sources of human personality, directed towards the repression of emotional and spiritual energies. But 'repression' is a misleading word: these energies were not so much inhibited as displaced from expression in personal and in social life, and confiscated for the service of the Church. The box-like, blackening chapels stood in the industrial districts like great traps for the human psyche.... These Sabbath orgasms of feeling made more possible the single-minded weekday direction of these energies to the consummation of productive labor....

Thompson's whole discussion is brilliant. You really see how Victorian England and Europe became the repressive, neurotic, hysterical place Freud encountered. It was all this religion, all this 'methodical' morality to discipline the instincts and personality for the sake (indirectly, unconsciously) of accumulating profit. Religions of repression spread through the whole population. "Since joy was associated with sin and guilt, and pain (Christ's wounds) with goodness and love, so every impulse became twisted into the reverse, and it became natural to suppose that man or child only found grace in God's eyes when performing painful, laborious or self-denying tasks. To labor and to sorrow was to find pleasure, and masochism was 'Love.'" In some of its early manifestations Methodism came close to worshipping death. But apparently it had softened and humanized itself a bit by the mid-19th century.

Why did the working classes submit to all this? Partly because of continuous, intensive indoctrination. From an early age -- in the Sunday schools, etc. Also, there was the immersion in community that it offered. And in its social reality Methodism was by no means always as harsh as its intellectual expressions could be. Fourthly, Thompson suggests that Methodist recruitment and revivals between 1790 and 1830 were the 'psychic (and social) consequences of the counterrevolution' (by which he's referring to the suppression of labor movements, the inability of the exploited poor to raise themselves out of misery). Methodism among the poor at this time was, perhaps, the 'Chiliasm of despair.'

I need hardly point out that once Europe and America went from being industrializing to being mass-consuming, mature state-capitalist societies (with the 'establishment-bureaucratization' of labor unions and their 'self-policing' of workers, etc.), the character of mass indoctrination changed from emphasizing thrift, industry, morality, submission to authority, assimilation, and Americanization, to emphasizing relative leisure, consumerism, sexuality, and instant gratification. Then new psychic disorders arose. (Narcissism, schizoid patterns, 'meaninglessness.')

I'll have to read Foucault's *Discipline and Punish* someday. Surely it bears on all this stuff about Victorian 'inner discipline,' social monitoring, the construction of a new order. (But I suspect it neglects the economic aspect, which is the most important.)

Incidentally, I should remind you that the new disciplined modern 'character-structure' wasn't only *imposed* -- externally -- on the working classes; they also socialized themselves into it. With the Knights of Labor in America you still see prohibitions against drinking and other unsavory activities, self-directed attempts to discipline workers into a modern labor movement.

An eloquent passage from later on in the book:

....The conventional picture of Luddism as a blind opposition to machinery as such becomes less and less tenable. What was at issue was the ‘freedom’ of the capitalist to destroy the customs of the trade, whether by new machinery, by the factory-system, or by unrestricted competition, beating-down wages, undercutting his rivals, and undermining standards of craftsmanship. We are so accustomed to the notion that it was both inevitable and ‘progressive’ that trade should have been freed in the early 19th century from ‘restrictive practices’ that it required an effort of imagination to understand that the ‘free’ factory-owner or large hosier or cotton-manufacturer, who built his fortune by these means, was regarded not only with jealousy but as a man engaging in *immoral* and *illegal* practices. The tradition of the just price and the fair wage lived longer among ‘the lower orders’ than is sometimes supposed. They saw *laissez faire* not as freedom but as ‘foul Imposition.’ They could see no ‘natural law’ by which one man, or a few men, could engage in practices which brought manifest injury to their fellows.

That’s what I love about E. P. Thompson. His impassioned partisanship of humanity.

Luddism (1811-1813, with later upsurges) was, in many of its manifestations, far from being the spontaneous, undisciplined outbreak of stupid rage-against-machines by riotous mobs that we’ve been taught to think it was. It was often highly methodical, sophisticated, well-planned and -executed by bands of masked men who went from village to village and destroyed only (specific) machines owned by men who were known to pay ‘unfair’ wages; the rest of the machines were left untouched. It was a widespread, ‘quasi-insurrectionary’ (according to Thompson), popularly supported movement. It also usually succeeded at least in its short-term objective of keeping wages up.

William Cobbett (in 1820) on ‘the lower orders’ before they had been corrupted by television, pop culture and business structures/ideologies:

Give me leave to say that...these classes are, to my certain knowledge, at this time, more enlightened than the other classes of the community.... They see further into the future than the Parliament and the Ministers. -- There is this advantage attending the pursuit of their knowledge: they have no particular interest to answer; and, therefore, their judgement is unclouded by prejudice and selfishness. Besides which, their communication with each other is perfectly free. The thoughts of one man produce other thoughts in another man. Notions are canvassed without the restraint imposed upon suspicion, by false pride, or false delicacy. And hence the truth is speedily arrived at.

Much of that description remains true, though.

Books I’m reading or half-reading this semester: Rebecca Scott’s *Degrees of Freedom: Louisiana and Cuba after Slavery* (2005), Charles Postel’s *The Populist Vision* (2007), Glenda Elizabeth Gilmore’s *Gender and Jim Crow: Women and the Politics of White Supremacy in North Carolina, 1896-1920* (1996), Thomas Andrews’ *Killing for Coal: America’s Deadliest Labor War* (2008), Margot Canaday’s *The Straight State: Citizenship and Sexuality in Twentieth-Century America* (2009), Mae Ngai’s *Impossible Subjects: Illegal Aliens and the Making of Modern America* (2004), Linda Gordon’s *Dorothea Lange: A Life Beyond Limits* (2009), Jennifer Klein’s *For All These Rights: Business, Labor, and the Shaping of America’s Public-Private Welfare State* (2003), Odd Arne Westad’s *The Global Cold War: Third World Interventions and the Making of Our Times* (2003), Richard Hofstadter’s *Age of Reform: From Bryan to F.D.R.* (1955), Oscar Handlin’s *The Uprooted: The Epic Story of the Great Migrations that Made the American People* (1951), Bethany Moreton’s *To Serve God and Wal-Mart: The Making of Christian Free Enterprise* (2009), Jesse Hoffnung-Garskoff’s *A Tale of Two Cities: Santo Domingo and New York after 1950* (2008), Piya Chaterjee’s *A Time for Tea: Women, Labor, and Postcolonial Politics on an Indian Plantation* (2001), Kathleen Canning’s *Languages of Gender and Labor: Female Factory Work in Germany, 1850-1914* (2002), Phyllis Palmer’s *Domesticity and Dirt: Housewives and Domestic Servants*

in the United States, 1920-1945 (1991), Londa Schiebinger's *The Mind Has No Sex? Women in the Origins of Modern Science* (1991), Thomas Klubock's *Contested Communities: Class, Gender, and Politics in Chile's El Teniente Copper Mine, 1904-1951* (1998), Wendy Goldman's *Women at the Gates: Gender and Industry in Stalin's Russia* (2002), *Global Woman: Nannies, Maids, and Sex Workers in the New Economy* (2004), Marla Miller's *Betsy Ross and the Making of America* (2010), Peter Way's *Common Labor: Workers and the Digging of North American Canals, 1780-1860* (1997), Paul Taillon's *Good, Reliable, White Men: Railroad Brotherhoods, 1877-1917* (2009), Larry Tye's *Rising from the Rails: Pullman Porters and the Making of the Black Middle Class* (2004), Kathleen Barry's *Femininity in Flight: A History of Flight Attendants* (2007), Leon Fink and Brian Greenberg's *Upheaval in the Quiet Zone: 1199/SEIU and the Politics of Healthcare Unionism* (2009), Shane Hamilton's *Trucking Country: The Road to America's Wal-Mart Economy* (2008), David Montgomery's *Fall of the House of Labor: The Workplace, the State, and American Labor Activism, 1865-1925* (1987), Kevin Boyle's *Arc of Justice: A Saga of Race, Civil Rights, and Murder in the Jazz Age* (2004), Le Ly Hayslip's *When Heaven and Earth Changed Places: A Vietnamese Woman's Journey from War to Peace* (1989), Catriona Parratt's "*More Than Mere Amusement*": *Working-Class Women's Leisure in England, 1750-1914* (2001). Also lots of articles.

Charles Postel argues persuasively that Populism, the greatest popular movement in American history, should not be called (as it sometimes is) anti-modern, 'traditional,' anti-industrial, anti-progress, even anti-capitalist in a broad sense. What it opposed was not 'modernity' or industrial progress or technological efficiency or the market but a particular kind of corporate capitalism. It wanted to modernize the farmer's way of life in a manner that benefited him, that enabled him to get out from under the thumb of banks, merchants, railroads, etc. Populism was decidedly *in favor of* progress -- which meant public education for millions in the South and West, scientific agriculture, cooperation between farmers and the land-grant universities conducting agricultural research and training, the development of savvy business practices amongst millions of isolated farmers deep in debt, extensive government intervention in the economy, the beginnings of a state welfare system, an income tax, progress in women's rights (women were a large part of the movement), centralized bureaucracies at the service of monopolistic cooperative business, the exploitation of economies of scale through large-scale cooperative enterprise, etc. In many respects, Populists were far ahead of their time. In some ways, of course, they were conservative -- for instance in their racism. But on the whole it seems that they were even less conservative than the Knights of Labor.

Nor was Populism by any means a total failure, even in its immediate objectives. It was an oppositional moment in the history of the farmer's encounter with corporate capitalism, but in part this opposition manifested itself through the development of more sophisticated business structures that have lasted in some form to the present day. The semi-monopolistic agricultural cooperatives in California and other states are the best examples. Far from being ultimately opposed to capitalism, these structures were integrated into it and became indispensable. It's the old story of a capitalist society rejecting the rigidly oppositional elements of a radical movement but gradually incorporating other elements that allow for the partial 'defusing' of dangerous discontent, the achievement of greater 'flexibility' and responsiveness-to-the-people in economic and political spheres, in fact the greater efficiency and effectiveness of the economy. The same thing happened after the movements of the 1960s. Radical movements sometimes end up stabilizing -- by effectively 'modernizing' -- the old order.

Richard Hofstadter: "Populism was the first modern political movement of practical importance in the United States to insist that the federal government has some responsibility for the common weal; indeed, it was the first such movement to attack seriously the problems created by industrialism." In Europe at around the same time, such movements were having much success; in the U.S., it failed. Until the New Deal. The damn race question got in the way, as did ethnic divisions and the sheer size of the country.

More Hofstadter: "The Populist movement, despite its defeat, activated a stream of agrarian organization and protest that subsequently carried point after point.... Populism was the expression of a transitional stage in the development of our agrarian politics: while it reasserted for the last time some old ways of thought, it was also a harbinger of the new...." Hofstadter, being a liberal Consensus historian of

the 1950s who didn't like mass movements, emphasizes the dark, conservative side of Populism, but he's surprisingly evenhanded.

He doesn't remark on this, but some impulses of Progressivism were similar to future impulses of fascism. First of all, as you know, Progressivism was mostly a movement of the middle classes -- professionals like lawyers, doctors and academics, and the American version of the gentry. They were upset by their loss of status and power relative to the new plutocracy, and the modern bourgeois civilization that was arising around them they found appalling in its decadence, filth, corruption, selfishness, materialism, moral and aesthetic ugliness. It was becoming a very un-heroic, un-individualistic, vulgar, chaotic society; many of the educated therefore sought a partial return, by 'modern' means, to a purer past. Like future fascist leaders, most of them almost equally hated the plutocracy and the contemptible masses, and they sought a middle road between ultraconservatism and socialism. Unlike fascists, they tended to favor genuine democratic reforms and to be concerned with the well-being of workers and even immigrants. Progressivism was in part a phase in the beginnings of modern statism, with its increases in bureaucracy and the power of government. So, like fascism, it was basically a middle-class reaction to the confusions, polarities and uglinesses of modern industrial capitalism, a movement that necessarily took statist forms (because the state was the only structure strong enough to have an impact on the war between capital and labor, and on the behavioral tendencies of millions of people in all walks of life). And it even included a eugenics movement, and in general was interwoven with strong strands of racism, nationalism, nativism, and Social Darwinism -- which were related to its 'perception of social chaos'-induced preoccupation with mastery and self-mastery, manliness and virility, achieving a moral, ordered, 'healthy' society¹ that exhibited 'self-control' amongst the masses, even the ideal of spreading American civilization to inferior races around the world. (It was the age of imperialism, after all.) Nevertheless, the differences between the two movements -- such as Progressivism's amorphousness, its individualism, and its preeminently *moral* animus² ('Reform! Reform!') -- may well outweigh the similarities. It would have been very hard for a true and massive fascist movement to develop in the U.S., in light of the enormous immigrant population and the country's tremendous size and fragmented character.

Theodore Roosevelt represents the fascist side of Progressivism, Jane Addams the moral, compassionate side.

....The Imperial Wizard and Emperor of the Ku Klux Klan in the 1920s wrote a statement that, with a few alterations, could have been written by a contemporary Tea Partier:

....Nordic Americans for the last generation have found themselves increasingly uncomfortable and finally deeply distressed. There appeared first confusion in thought and opinion, a groping hesitancy about national affairs and private life alike, in sharp contrast to the clear, straightforward purposes of our earlier years. There was futility in religion, too, which was in many ways even more distressing.... Finally came the moral breakdown that has been going on for two decades. One by one all our traditional moral standards went by the boards, or were so disregarded that they ceased to be binding. The sacredness of our Sabbath, of our homes, of chastity, and finally even of our right to teach our own children in our own schools fundamental facts and truths were torn away from us. Those who maintained the old standards did so only in the face of constant ridicule.

Along with this went economic distress. The assurance for the future of our children dwindled. We found our great cities and the control of much of our industry and commerce taken over by strangers, who stacked the cards of success and prosperity against us. Shortly they came to dominate our government....

¹ Hence the popular schemes to prevent the 'feeble-minded,' the insane, criminals, epileptics, etc. from reproducing.

² It's true that this harks to fascism's moral absolutism and concern for moral regeneration, but in fascism's case it was a false morality, an 'aesthetic' morality (of glory, heroism, the unified nation, racial purity, order), whereas many Progressives genuinely wanted to help marginalized people -- even though these properly moral considerations were mixed with an aesthetic or racial or nationalist or 'order-driven' morality of the Rooseveltian, semi-fascist type.

We are a movement of the plain people, very weak in the matter of culture, intellectual support, and trained leadership. We are demanding...a return of power into the hands of the everyday, not highly cultured, not overly intellectualized, but entirely unspoiled and not de-Americanized, average citizen of the old stock. Our members and leaders are all of this class -- the opposition of the intellectuals and liberals who held the leadership, betrayed Americanism....is almost automatic....

Whether the movement is *irrational* is a complicated question, but it's certainly unintelligent. In many respects it's definitely un-rational, and if you talk to the average Tea Partier you'll find that he or she displays a great deal of irrationality too (self-contradictoriness).

Hofstadter argues, plausibly, that the New Deal was not so much a continuation of the Progressive impulse after the 'hiatus' of the 1920s as a new development in response to new conditions. Its brand of statist economic intervention was foreign to Progressivism (although the U.S. had experienced something like it during the First World War). The New Deal was not about *morality*, moral reformation, in the way Progressivism was; it was about economic justice and experimentation, *pragmatism*, not moral absolutism or residual Protestantism.¹ In these respects it differed from fascism too (aside from the 'Protestantism' thing). It may be too much to say that America had left its moderately semi-fascist stage behind by the 1930s and was on to practical things like making the economy work and building a labor movement; on the other hand, that statement isn't wholly without truth. The quasi-religious, crusading, 'morality'-regenerating, 'purifying,' 'morally-appalled-at-social-disintegration-and-adulteration' impulse common to Progressivism and fascism had largely spent itself in mainstream America by the 1930s² -- though it had yet to play out its final act in Europe.

"The key words of Progressivism were terms like *patriotism, citizen, democracy, law, character, conscience, soul, morals, service, duty, shame, disgrace, sin, and selfishness* -- terms redolent of the sturdy Protestant Anglo-Saxon moral and intellectual roots of the Progressive uprising. A search for the key words of Arnold's books [which are representative of New Deal thinking] yields: *needs, organization, humanitarian, results, technique, institution, realistic, discipline, morale, skill, expert, habits, practical, leadership* -- a vocabulary revealing a very different constellation of values arising from economic emergency and the imperatives of a bureaucracy." I think Hofstadter underestimates the role of racial, biological, imperialist, nationalist and 'aesthetic' thinking in Progressivism, which intersected with the old Protestant and republican thinking in complex ways. America's Protestant and republican heritage was one of the things that saved it from fascism.³

(Incidentally, it's obvious that 'Progressivism' had different social meanings depending on what groups you're talking about. Working-class agitation meant something different from middle-class reformist agitation. What Hofstadter and I are referring to by 'Progressivism' is only a particular dominant stream of the time.

(Also, I should note that even the less obviously semi-fascist side of middle-class Progressivism, such as Jane Addams, was basically conservative, serving potentially dangerous interests. (Remember that Addams was sympathetic to eugenics.) It wanted to uphold traditional Anglo values, order, stability; reformers like Addams simply used different methods to attain ends similar to the eugenicists'.)

....Hofstadter is right that so-called 'populism' is dangerous. The masses can get out of hand, and they might not understand who their real enemies are or how best to improve their situation. They might become obsessed with prejudice, be misled by demagogues, blame a scapegoat for their problems. But these possibilities become far more probable when the middle class or lower-middle class is part of the

¹ I'm inclined to think that Hofstadter underestimates the purely 'pragmatic' side of Progressivism (think of scientific management, for example), but broadly speaking his points are illuminating and defensible.

² It still existed in the 1920s, in fact even more so, but rarely took 'Progressive' forms then. Instead you had the KKK and other such overt manifestations of semi-fascism.

³ Protestantism, of course, could be used in the service of something like fascism, as with the KKK. But its fostering of individualism militated against a movement in which the individual submerged himself in the mass.

movement. Movements of the working class (especially un-unionized workers) or the blatantly oppressed in any sphere -- and these are the most authentic 'people's' movements, not adulterated by business support and propaganda (public-relations campaigns, which can be very effective) -- tend to be relatively rational and potentially productive of real gains to society in the forms of democracy, freedom, and economic well-being. Middle-class mass movements are more ambiguous and can go either way, to the left or the right, because this class has 'contradictory locations' in the economic structure, sharing some interests with business/power and others with the working class. And to the extent that unionized workers (especially whites) approach the middle class and so have incentives to be conservative, i.e. to guard their privileges relative to other groups, they too can behave in apparently irrational, unintelligent or ambiguous ways in their political activity. For example, like the middle class, they might take up causes of 'cultural' repression. But these sorts of conservative movements are populist only in a degraded sense. They're in the interests of various kinds of power, not of people. And it's rare, in any case, that the majority of people supports them.

The truest kind of populism is popular revolution, the overthrow of authoritarian power-structures. This certainly can be a violent, wild affair, which means Hofstadter wouldn't like it, but it's a good thing anyway. It happens because reform wasn't working and no other options were available. [Think of Egypt's anti-Mubarak rebellion.]

*

Marla R. Miller's *Betsy Ross and the Making of America* (2010) complements in certain aspects T. H. Breen's *Marketplace of Revolution* (2004), in that where Breen considers the colonies and early American republic from the viewpoint of mass consumption-patterns, Miller considers it from the viewpoint of production-patterns. Admittedly, her focus is not as broad as Breen's: she is interested in narrating the life and times of Betsy Ross rather than tracing the development of a revolutionary consciousness among the colonists. Nevertheless, along the way she sheds light on the respects in which Americans' work-patterns contributed to their radicalization prior to and after the Revolutionary War, and so aided in the 'making of America.'

Because Betsy Ross worked as an upholsterer, i.e. an artisan or craftswoman, Miller discusses in great detail the culture and practices of American artisans during the latter half of the eighteenth century. What emerges from her treatment is, first of all, a sense of the centrality of artisanal life and work to the society she is investigating. Cities like Philadelphia, where Betsy Ross lived, teemed with craftsmen and -women producing all the accoutrements of a bustling proto-bourgeois society -- clothing, furniture, household implements, elegant finery, even houses and public buildings. It was a middle-class civilization, which at that time meant that urban society, especially in the northern colonies, was structured largely around independent artisans, storekeepers, small property-owners. This 'artisanal independence' entailed, in turn, a consciousness of and pride in liberty -- economic and political liberty -- a dignity and sense of self-worth engendered by economic independence. Historians know from the study of European revolutions and revolutionary movements that artisans have historically been in the forefront of radical social change. It was no different in the case of America. When the British Parliament began passing economically onerous laws like the Sugar Act, the Stamp Act and the Townshend Duties, raising taxes on various goods in which the colonies traded, artisans in Philadelphia, Boston and other cities rose en masse to organize (together with politicians, attorneys and some merchants) boycotts of British goods. They considered that their economic autonomy and political rights had been violated by a Parliament that raised their taxes without having offered them political representation first. Artisans in particular were affected by some of these taxes; for example, the Townshend Duties applied to such goods as plate glass, flint glass, green glass, red and white lead, painters' colors, and a wide range of papers (p. 88). Campaigns to 'Buy American' -- which would incidentally stimulate domestic industry -- spread throughout the colonies.

Thus, for many Americans it was through their work that the reality and immediacy of grievances against England were brought home to them. Consumer boycotts, too, as T. H. Breen argues, were essential to the process of popular radicalization. But once the populace had been sufficiently radicalized to conceive

of American political independence from England, artisanal work became even more relevant to the birth of the new nation, and to popular identification with it. For now craftsmen and -women like Betsy Ross had to supply the new American military with uniforms, bedding, tents, military standards, flags, drums and fifes, guns, ammunition, coffins, etc. For Ross and others, the Revolution was not some distant, abstract affair; it was a guiding event in their professional and private lives. Conversely, by drawing ordinary men and women so closely into the political life of the nascent nation -- that is, by politically and economically 'empowering' them, thrusting on them a sense of their relevance to affairs of state -- the Revolutionary War further radicalized and democratized society.

Indeed, Miller notes in passing that "the seeds of Philadelphia's labor movement" were planted by the Revolution: "the forces unleashed by the Revolution were transforming social and labor relations in the capital city." She continues: "A world in which deference to one's superiors had been assumed....gave way to a world in which men asserted their equality as a matter of principle" (p. 270). Such changes were taking place, first and foremost, in the world of artisanal work, in relations between masters and journeymen. Investigation of this fact would be a fit subject for another study as ambitious as *Betsy Ross and the Making of America*.

In *Gender and Jim Crow* (1996), Glenda Gilmore analyzes the many intersections between race, gender and segregation in North Carolina in the late 19th and early 20th centuries. Her focus is on black women and how they dealt with Jim Crow, but she also considers in detail the political behavior of black men, white men and white women -- how they negotiated and renegotiated the oppressive regime of Jim Crow in their politics, churches and civic organizations. In her account, after the effective disfranchisement of black men at the very end of the 19th century, it was their women who, in a "nonpolitical guise....became the black community's diplomats to the white community" (Gilmore, 148). In the darkest years of segregation, black women tried to keep hope alive by participating in community activism with their white 'sisters,' who were racists and white supremacists but were willing, in many cases, to cooperate with blacks for the improvement of the community. Through telling such stories of ordinary people, Gilmore humanizes Jim Crow, illustrating its concrete meanings for real people. It is not a happy tale, but in some of its lessons it is uplifting.

The story, however, of how North Carolina Democrats stripped black men of their political rights is not uplifting at all. It was after the Populist revolt of the mid-1890s, when the Populists and Republicans had cooperated to put the white-supremacist Democratic party in the minority. To regain their majority in the legislative elections of 1898, Democrats tried to prevail on poor whites to put race loyalty above class loyalty. And they succeeded, in large part by exploiting latent fears of black men's sexuality. These men were supposed to be sexual beasts, animals, rapists of white women -- hysterical stories of rape-outbreaks were manufactured and publicized around the state -- in short, such depraved creatures that white men had to protect their women in the streets and deprive blacks of political power. This theme of the black man as a sexual threat, an embodiment of raw animal sexuality, goes back centuries, although its origins are not entirely clear. Respectable society has never liked to dwell on it, since all things instinctual and insurgent are a threat to respectable power and must be repressed, but, for example, the sensation that Norman Mailer's essay "The White Negro" caused in 1957 suggests that the association of blackness with sexuality is always under the surface of the mainstream mind. Southern white supremacists manipulated it skillfully in 1898, and with the Republican and Populist parties thus out of power, it was finally possible to disfranchise North Carolina's black men and institutionalize Jim Crow.

One thing that Gilmore might have done more effectively is to draw general conclusions from her data about Jim Crow's impacts on gender relations and vice versa. She does note, for instance, that the campaign to protect white women from black men's sexuality served also to put women in their place, to enforce their dependency on men and thereby accentuate their femininity and supposed helplessness (Gilmore, 96). Conversely, depriving black men of political rights emasculated them, so resulting, paradoxically, in the relative equalization of power between black women and men vis-à-vis the white world. Thus, the Jim Crow regime reinforced ordinary gender roles in white society (powerful men, powerless women) and undermined such gender roles in black society (powerless men, relatively powerful

women). Later on, in the early decades of the 20th century, the greater relative power of black women resulted in their being the ones who most challenged Jim Crow norms, through their work with white women in social welfare, public health campaigns, charity groups, and women's suffrage groups. At the same time, all this was possible only due to their status as women, i.e. politically and sexually unthreatening people.

It is worth noting that the masculinity of poor white men was only partially served by Jim Crow. The contrast between their situation and that of black men affirmed their manhood and helped reconcile them to poverty, because at least they weren't the *lowest* group in society; on the other hand, the contrast between them and rich white men must have been humiliating and emasculating. One can't help thinking that an equally good strategy, or a better one, for affirming poor whites' manliness would have been to unite with blacks and seek power at the expense of rich whites -- as had been the strategy, to an extent, of the Republican and Populist parties of the 1890s. Evidently, though, blackness was seen as so contrary to proper manliness that such a strategy could not possibly be carried out in full. In other words, poor whites saw their race as a more powerful testament to their manhood than economic well-being would have been, so they chose race loyalty over class loyalty.

It is intriguing that these equations seem to have been reversed in the last few decades, since the 1960s. American culture now sees black men as quintessential males, as embodying athleticism, sexual prowess, masculine beauty (as testified by the recent series of Old Spice commercials acted by a black male model), and gritty inner-city toughness -- manifested in the very 'masculine' culture of rap and hip-hop. Similarly, there is a sense in which poverty and an inner-city life are considered more manly, because more difficult and 'real,' than wealth and an easy suburban life. A revaluation of values has taken place since the social movements of the 1960s and '70s.

In any case, from the foregoing it is clear that *Gender and Jim Crow* is a quite stimulating book. It would be interesting to study the evolution of gender roles and segregation up to the civil rights movement and beyond, to see exactly how the drastic changes of the last hundred years came about.¹

The Fall of the House of Labor: The Workplace, the State, and American Labor Activism, 1865-1925 (1987), by David Montgomery, has been compared with E. P. Thompson's masterpiece *The Making of the English Working Class*, in that, to paraphrase Thompson, it is essentially a biography -- an extraordinarily rich one -- of the U.S.'s working class in its formative years. It is, therefore, a work of synthesis. However, like Thompson's book, it goes beyond mere synthesis to provide a specific, and powerful, framework within which to interpret the fortunes of this class in its political and economic battles. In fact, Montgomery's account is arguably more focused than Thompson's: Montgomery sees struggles at the workplace over who will control work -- the employer or the employee -- as the crux of early industrial labor history, the most important source of conflict between workers and capitalists, and he emphasizes that the worker's worldview was formed above all at the point of production. Analytical continuities thus help to cohere what might otherwise have been an apparently arbitrary and bewildering discussion of a huge range of topics. Instead, the product is simply a monumental testament to scholarly rigor and capaciousness of thought.

The book is loosely divided into three parts of three chapters each. In the first part, Montgomery recreates in vivid detail the world and the work of three categories of workers in the late nineteenth century: skilled craftsmen (especially iron- and steelworkers), common laborers, and female factory operatives in the garment and textile industries. In the second part, he traces the rise of scientific management, which was a key component in employers' struggle to wrest control of the work process away from employees. The book's final three chapters are devoted to the explosive labor unrest that preceded, accompanied, and followed World War I -- and business and the state's reactions to this unrest -- as well as the creation of a conservative welfare-capitalist regime after 1922 characterized by a quiescent labor movement. The capitalism of the 1920s was the apotheosis of that social order whose construction had begun with the decline of competitive capitalism at the end of the nineteenth century and the rise of corporate capitalism:

¹ (Gender is boring, as you can see.)

it saw the final victory of management's attempts to control production and degrade the worker's conditions of work (while compensating him with 'welfare'). Only with the coming of the Great Depression would this form of capitalism, too, collapse -- at least in part -- thus providing America's labor movement with the opportunity for a new beginning.

Several noteworthy themes emerge in the course of Montgomery's analysis. As already stated, a particularly important one is the progressive degradation of work as management took over more and more productive functions and deprived workers of what autonomy they had once had. In the 1870s, many craftsmen had "exercised an impressive degree of collective control over the specific productive tasks in which they were engaged and the human relations involved in the performance of those tasks" (p. 13). They developed a group ethical code around their work relations, the most important component of which was the "stint," or "the collective definition of a reasonable day's work" (p. 17). That is, they restricted their output -- unilaterally, not in negotiations with their employer -- for the sake of maintaining regular employment, higher piece rates, and relative comfort in their work. Employers, understandably, could not abide such behavior that went on behind their backs; hence arose, eventually, Taylorism and scientific management, which entailed, for instance, "centralized planning and routing of the successive phases in fabrication [of a product]" (p. 217), as well as the standardization of work practices and the detailed supervision of workers. These developments, in addition to the rise of mechanization, contributed to an "epidemic of strikes" in the early twentieth century as workers rebelled against being reduced to machines.

An even broader theme, illustrated by the concept of the stint, is that an ideology of mutualism was fostered among workers by their relations with each other at the point of production -- an ideology quite opposed to the acquisitive individualism engendered by competitive relations between businesses. On the other hand, the racism and nativism that persecuted black and immigrant laborers tended to vitiate working-class mutualism. Montgomery paints the harassed lives of these laborers in poignant detail, illustrating in the process his point that "laborers' struggles bore the clear imprint of their rural origins and continuing ties to the land" (p. 87). Indeed, this is one of the great strengths of the book, namely that it places American labor history in the context of international capitalism and its devastating effects on the agricultural 'periphery' of the industrial 'core.' Developments in the former influenced tendencies in the latter. For example, the increasing mobility of rural people due to railroads and steamships allowed them to travel to industrialized countries by the tens of millions, among the effects of which in the West was the slowing-down of the improvement (due to high demand) in laborers' wages after 1878 (p. 70). By thus taking an international perspective, Montgomery avoids the parochialism of much labor history.

Being a social history, the book might have benefited from greater attention to the role of gender in conditioning behavior. Gender is by no means completely absent, however, for instance in Montgomery's account of the ethical code that governed machinists' behavior. "The moral imperative of a 'manly bearing,'" he notes, appeared often in machinists' discourse, as in that of other craftsmen. "The workers' code celebrated individual self-assertion, but for the collective good, rather than for self-advancement" (p. 204). Manliness was defined, therefore, not in relation to the individual but in relation to the group: if an individual upheld the code of the group and acted in solidarity against the common employer, he was prized as a man. Norms of femininity, on the other hand, appear even less often in the book than norms of masculinity, although Montgomery does devote many pages to the experiences of female factory operatives.

The Fall of the House of Labor is far too rich to be reproduced even in outline in a book review, but hopefully the foregoing has at least given the reader a small sense of its richness. The theoretically minded reader might appreciate the work for its substantial, though implicit, validation of Marxist historical methods and concepts, given Montgomery's constant return to the importance of production relations in shaping workers' experiences, hopes, and ideologies. In this respect, as in others, the work is very traditional. Whether that is a weakness is debatable; in fact, one might argue that the book itself proves the continuing value of traditional concepts and theoretical programs. For it remains a classic, almost twenty-five years after its publication.

One of the founding texts of contemporary social history, E. P. Thompson's *The Making of the English Working Class* (1963) remains unsurpassed in many respects almost fifty years after its publication.

Most obviously, its author was one of the best literary stylists ever to write history. More substantively, Thompson's scholarship is unusual in its breadth and depth, incorporating newspapers, magazines, pamphlets, memoirs, private correspondence, and parliamentary commission testimony. And it is all in the service of a noble enterprise, "to rescue the poor stockinger, the Luddite cropper, the 'obsolete' hand-loom weaver, the 'utopian' artisan, and even the deluded follower of Joanna Southcott, from the enormous condescension of posterity" (p. 12). By letting these vanquished people speak in their own words, on their own terms, Thompson rehabilitates them and their experiences. In the end, his book is a deeply humane, deeply imaginative, and deeply partisan work -- partisan toward humanity, against complacency in all its forms.

Thompson's historical method follows from his moral purpose. His central analytical tool is the notion of class, but, as he explains in the Preface, by "class" he does not understand a structure, a thing, or a category, but a "historical phenomenon," "something which in fact happens....in human relationships." Or, as he says later, "class is defined by men as they live their own history, and, in the end, this is its only definition" (pp. 9, 11). He intends his humanistic understanding to contrast with the Marxist Louis Althusser's structuralist, anti-humanist understanding; the whole book is in effect an empirical substantiation of Thompson's polemic against anti-humanism in its Marxist and bourgeois forms. That is to say, the work is supposed to demonstrate the fruitfulness of a "historical," "relational," "developmental" understanding of class, as opposed to one that considers people to be mere occupants of structural locations in institutions, bearers of social roles. In large measure, the attempt succeeds.

Thompson's project is to reconstruct the formation of a working-class consciousness among England's lower orders between about 1790 and 1832. He divides his book into three parts. The first is devoted to political radicalism amongst artisans and other workers in the 1790s, a radicalism stimulated by the French Revolution and Thomas Paine's influential pamphlet *Rights of Man* (1791). This agitation, brutally suppressed by the government, did not yet evince a working-class consciousness. In the second part, Thompson considers the economic changes and some of their cultural manifestations in the forty-year period he is analyzing. The third part returns to the narrative of political radicalism after the 1790s to show how it finally developed an unequivocally working-class character, so that one can say "the working class" had been born.

Among the many thought-provoking aspects of Thompson's discussion is his brilliant analysis of Methodism as in large part a means by which the poor were reconciled to their miserable lot, as well as his defense of Luddites as not just a lot of wild mobs running around smashing machines but rather well-organized groups of men who traveled from village to village sabotaging particular kinds of machines that were known to displace workers and result in lower wages. The sections on Owenism, William Cobbett, Peterloo, the government spy system, the 1832 Reform Bill, the "standard-of-living controversy" (about whether the Industrial Revolution improved or harmed the lives of the poor), and many others, are equally valuable. Through it all, Thompson refuses to pretend to be neutral on questions of value, instead bringing to bear stern humanitarian value-judgments, as when he argues against apologists of capitalism that the Industrial Revolution was in fact a catastrophe for the poor, and that statistics and quantitative averages of supposedly rising standards of living are inadequate to the qualitative reality of epochal social change (which affects groups of people unevenly, so that "averages" conceal as much as they reveal). The book's moral passion helps to make it the compelling work it is.

One of the book's few semi-unsatisfactory features is its theoretical introduction and framework. No doubt Thompson is right to insist that historical actors' experiences be recaptured and reproduced, and that a rigid sociological or economic "structuralism" is not appropriate to the historian's craft. However, such formulations as "Class is defined by men as they live their own history, and, in the end, this is its only definition" are inadequate, being nearly empty and truistic. People *do* occupy locations in social structures, and these locations do condition their consciousness. It is dangerous when a historian wades into theory, for he or she may oversimplify matters.

To make such criticisms, however, of a work like *The Making of the English Working Class* is but to cavil. Thompson's project is not so much theoretical as historical, and in this it succeeds magnificently.

As¹ the capitalist mode of production has colonized the world, it has required the development of new work patterns, new forms of community, new lifestyles and values. Pre-industrial, rural indiscipline has had to yield to industrial, clock-driven work processes. Stable working-class communities have had to evolve from the chaos and population-upheavals of peasants' mass eviction from the land.² In *Contested Communities: Class, Gender, and Politics in Chile's El Teniente Copper Mine, 1904-1951* (1998), Thomas Klubock picks apart the history of one example of such evolution, in a mining community in Chile from the early to middle twentieth century. In his words, he focuses on the process of class formation, "the transformation of a population of itinerant laborers into a settled and trained workforce in a modern capitalist enterprise" (p. 5). Working-class men and women created new sets of social relations, a new culture and politics, a new class-consciousness and gender-consciousness, "in response to initiatives by both North American capital and the state to establish a disciplined and stable labor force." Klubock's main interest is in gender: he argues that "the process of class formation in the copper mines must be understood as a 'gendered' process in which formal gender ideologies and informal norms, values, and practices surrounding sexuality shaped working-class structures of feeling and political consciousness.Proletarianization in the mine involved a reorganization of the gendered division of labor and redefinition of masculinity and femininity" (pp. 7, 8).

In 1904 an American company bought the El Teniente mine from Chileans; a few years later it passed to the Guggenheim family, and the Kennecott Copper Company was formed. Conditions at the mine were brutal, and labor turnover among the migrants was always high. Company executives were also constantly frustrated by workers' laziness, insolence, carelessness, gambling, drinking, absenteeism, and thieving. Women were not allowed to work in the mines, but many lived in the camps and worked as prostitutes, tailors, seamstresses, servers in bars, or owned small businesses. Small settlements in the environs of El Teniente also distracted miners from their work. In addition to all this, the workers were quite militant, staging major strikes -- "full-scale rebellions" -- in 1911, 1916, and 1919. To increase productivity and discipline, therefore, company executives decided they had to inculcate new habits and values in both the male and female workers, i.e. regulate their social lives.

In the spirit of welfare capitalism, the North American company took such measures as building better housing for married men in mining camps (to encourage workers to settle permanently), adding recreational facilities, schools, social organizations, sports clubs, libraries, cinemas, etc. The priority, however, was to restructure gender relations, because it was thought that stable households, middle-class family relations, were fundamental to a stable workforce. The company "sought to tie workers to their jobs by rendering women and children dependent on miners' wages" (p. 59). Thus, couples that cohabited were required to have legal marriage certificates. Miners were not allowed to live with extended family members. The company paper indoctrinated women with norms of respectable domesticity, middle-class consumption, and feminine beauty. Men, on the other hand, were expected to provide for their families, refrain from gambling and drinking, and train their sons to be disciplined and moral. The virtues of Chilean patriotism were also extolled, since patriotism and domestication were thought to belong together. Despite all these welfare policies, however, as well as the company's attempts to get the state involved in social regulation, traditional repression remained essential to the suppression of workers' movements in the 1920s.

The global economic crisis of the early 1930s restricted miners' mobility, due to the lack of available jobs elsewhere, so more people began to settle in El Teniente, "attracted by the company's corporate welfare system, high wages, and social benefits" (p. 81). A permanent, as opposed to migrant, workforce was thereby established by the late 1930s and 1940s. Industrial peace still didn't prevail, however, because work conditions remained horrible and people's freedom was limited. A union was organized with the help of Communist and Socialist party activists at the same time as the national government was becoming more responsive to leftist and labor influences, until finally in 1938 a Popular Front government was elected. The ideology and rhetoric of the Popular Front movement and government

¹ [This was supposed to be just a short outline for a presentation I had to give. So excuse the roughness.]

² In recent decades, by the way, these working-class communities in advanced capitalist countries have in turn been breaking apart, leading to new forms of chaos and population-upheavals. What these processes will lead to is unclear.

supplied, really for the first time, “a nationalist language of citizenship. ...Workers and peasants were now endowed with the universal dignity of citizenship and recognized as members of a new national category: Chileans” (pp. 112, 113). With the help of the labor-friendly government and the union, a fairly stable mining community was at last established in the 1940s.

Interestingly, the government, organized labor, and the North American company “shared common understandings of gender, social welfare, and cultural reform” (p. 118). The government wanted to build a new national culture of patriotism and moral citizenship, which entailed state and corporate welfare programs and social regulation along the gendered lines articulated by the company in the 1920s. Organized labor had similar goals but also thought that for an effective labor movement to come into being it was necessary for workers to overcome such vices as gambling and drinking and instead to educate and discipline themselves. On the other hand, in a challenge to conventional gender relations, the union argued that women should not merely embody domesticity; they should also fight on behalf of the working class, seize their potential political power. (And they did so, in the 1940s.)

Miners’ work itself was understood in gendered ways. It was an intensely masculine work culture, miners defining their labor “as a source of masculine affirmation and pride” (p. 138). They competed to prove their strength in battles with the mine, which was seen as a stubborn, threatening, consuming female that had to be dominated and conquered. The masculine work ethic expressed itself also in miners’ solidarity against foremen and supervisors, their willingness, for example, to physically assault their bosses “with enormous frequency.” They also fought each other frequently; fights between strikers and strikebreakers were especially common, the latter being seen as contemptibly feminine and treacherous. (In one case, a strikebreaker was forced to dress up as a woman and then paraded around the camp as a form of public humiliation.) Many workers refused to submit to the prohibitions against alcohol, gambling, and illicit sex, taking pride in their rough “masculine” lifestyles. Others internalized the “respectable” norms promulgated by the company and confirmed their manliness through hard work, higher pay, and social mobility. All, however, resented their substandard living conditions, which contrasted cruelly with the luxury of the neighboring mining camp for North American workers and their families, separated from the Chilean camp by fences and guards. Both the socially “responsible” and the socially “irresponsible” miners fought the company’s authority in their own individualistic ways, as well as in the collectivist ways made possible by the union and mutual aid societies.

Life was hard, then, for miners, but it was perhaps even harder for women. Single women had limited options for work due to company policies, and domestic service paid little. Many turned, therefore, to prostitution, which was dangerous; rape and physical abuse were common, and, due to regulation of female sexuality, the law usually sided with the accused man. Marriage was preferable to the single life because it promised relative economic security, but domestic violence abounded. Most husbands expected absolute obedience from their wife in return for the economic security they made possible; they resorted to violence when they did not receive this obedience. Women’s only defenses, unfortunately, were the police and the courts, because, due to their substantial acceptance of domestic roles, women did not have many social organizations of their own.

The Popular Front government ended in 1948, and a years-long repression of the Left ensued. The 1960s saw a rejuvenation of miners’ militancy, with strikes and protests focused on housing conditions, schools, services, wages, and work conditions. Women and children took part in these community movements, as they had in the 1940s. The 1960s was a decade of great advances in miners’ standards of living -- made possible through collective bargaining and frequent strikes -- which “further reinforced the stability of the nuclear family in the camps, the masculinization of work, and the relegation of women to the domestic sphere” (p. 281). That is, the hegemony of middle-class gender relations was reinforced by miners’ economic victories.

Roger Horowitz, *“Negro and White, Unite and Fight!”: A Social History of Industrial Unionism in Meatpacking, 1930-1990* (1997)

Introduction:

Unlike most CIO unions after 1950, the UPWA “retained the insurgent spirit of the 1930s’ workers’ movement in the changed circumstances of postwar America. The union remained, by and large, democratic and accepted considerable internal political diversity throughout its existence. UPWA locals generally retained considerable influence over the work process through extensive shop-floor steward organizations....” (2, 3). Committed to social justice and anti-discrimination activity on behalf of black members, and contributed to the civil rights movement.

Three general factors: “the endemic conflict over work between labor and management in meatpacking, the interracial composition of the workforce, and the capacity of the union’s founders to reproduce, in the 1940s and 1950s, a new generation of union militants” (3). These features explain the differences between the UPWA and other CIO unions after World War II. In many respects the union became *more* progressive after the war, not less. (However, it was less progressive on gender issues than racial issues -- even though women were about 20 percent of the workforce in every packinghouse.)

The book focuses on four meatpacking centers crucial to the UPWA and the industry: Chicago, Kansas City, Sioux City, and Austin, Minnesota. It takes its story up to the collapse of union power in the late 1980s.

The rest of the book:

Four histories of how unions were established in each of the four cities mentioned above. General themes: interracial unity, rank-and-file initiative. “Militant minorities” in the packinghouses. Chapter 6: the UPWA is born in 1943, succeeding the PWOC. CIO leaders want it to be structured like the USW, with top-down, centralized control, but the locals force it to have a relatively democratic, decentralized character. Their success in this struggle influences the UPWA’s progressive nature during the 1950s and 1960s.

The labor movement’s anticommunist hysteria between 1947 and 1950 had less effect on the UPWA than other CIO unions largely because of the great power that the locals wielded -- as opposed to the UAW’s top-down structure, for example. The rank and file’s influence ensured that the UPWA only paid lip-service to anticommunism; members knew how essential Communists had been to the union’s past victories, and they saw no need to eject them. Nevertheless, the union was forced to comply with the Taft-Hartley Act after a failed strike in 1948.

In the 1950s the UPWA expanded its social unionism, especially with regard to anti-discrimination activities inside and outside the workplace. It actively supported the voter registration drives of Martin Luther King’s SCLC, indeed was the only AFL-CIO union to send representatives to the formative meetings of the SCLC. Packinghouse workers also fought to end segregation in their own communities. On the other hand, the union’s masculinist bias ensured that its efforts on behalf of gender equality were far less aggressive than on behalf of racial equality. Nevertheless, women activists succeeded in eliminating the pay-differentials between male and female workers.

After World War II, the big packing companies with which the UPWA had contracts started to lose market share to expanding companies like Hormel, IBP, ConAgra, and Excell, which prioritized low labor costs. Technological innovation made it possible for firms to exert greater control over the work process, and the development of highways in the 1950s made it more efficient to build plants in distant rural areas with little unionization. As a result, the Big Four companies that had formerly dominated the industry were forced to reduce costs in competition with the “new” firms, and they did so by closing plants in the Midwest. The UPWA lost so much of its membership in this way that in 1968 it was forced to merge, on unfavorable terms, with the AFL-affiliated Amalgamated Meat Cutters. The decline of unionism in the industry continued, however, because workers were forced to accept concessionary bargaining with the Big Four firms (Armour, Swift, Wilson, and Cudahy) due to IBP’s significantly lower labor costs. (Some of IBP’s plants were unionized, but the company simply closed these unionized plants and built others in Texas, etc.) Eventually pattern bargaining itself collapsed; wages varied from plant to plant. Companies recruited Mexican and Asian immigrants, further reducing levels of unionization. The pace of work sped up, in part due to mechanization, and conditions in packinghouses continued to deteriorate. By 1990, the industry had returned to the “jungle” of sixty years before.

In a world that suffers from an ahistorical consciousness, in which the origins of social conflicts

are forgotten or not understood, such a work as Odd Arne Westad's *The Global Cold War: Third World Interventions and the Making of Our Times* (2005) is valuable. Placing contemporary world affairs in the context of history, Westad argues that the Cold War was far from being merely a conflict between the U.S. and the Soviet Union played out on the stage of Europe, with a few incidental repercussions in the Third World. Instead, the war's most important aspects "were neither military nor strategic, nor Europe-centered, but connected to political and social development in the Third World" (p. 396). Westad concentrates on events in the 1970s and 1980s, showing how in Latin America, the Middle East, Sub-Saharan Africa, and Southern Asia, the U.S. and the USSR intervened in ways that would shape these regions -- mostly to their detriment -- for decades to come. The book's survey is useful and informative, as is its partial reconceptualization of the Cold War, but Westad's commendable project goes badly awry in his framing the events he discusses primarily in terms of two opposing ideologies. "This book argues," he writes, "that the United States and the Soviet Union were driven to intervene in the Third World by the ideologies inherent in their politics. Locked in conflict over the very concept of European modernity... Washington and Moscow needed to change the world in order to prove the universal applicability of their ideologies..." (p. 4). The reader is thus supposed to think that certain political elites believed *so strongly* in their ideologies, were so totally obsessed by them, that they would do almost anything to prove their rightness. Everything was subordinated to the obsession with proving that one's ideology was better than one's enemy's. Surely such an understanding of world affairs is impoverished. *Institutional relations* were far more important than ideologies in determining the course of the Cold War and its Third World interventions.

To set the tone of his book, Westad opens it with two chapters that respectively trace the careers of American and Soviet ideology. In these chapters and throughout the book, passages abound that quote the rhetoric of political leaders, their self-understandings, the ways they justified to themselves and the world their foreign interventions. At times this reaches the level of farce. For example, after quoting a State Department spokesman on George W. Bush's invasion of Iraq -- "I believe in freedom as a right, a responsibility, a destiny.... The United States stands for freedom, defends freedom, advances freedom, and enlarges the community of freedom because we think it is the right thing to do" -- Westad states with no hint of irony that the Iraq invasion is a perfect example of how "freedom and security have been, and remain today, the driving forces of U.S. foreign policy" (p. 405). He is, to be sure, critical of many U.S. (and Soviet) interventions, but on the whole he accepts politicians' interpretations of them. Almost totally lacking is any discussion of economic context, of economic interests that may have been served by particular interventions, of whether certain industries or companies were pressing for some foreign-policy action that came to pass, of what institutions benefited from which interventions, of policymakers' ties to various corporations. What was the significance of the Middle East's oil reserves to the superpowers' policies in that region? Did the existence of a "huge offshore oil field in Timor's territorial waters," which Western oil companies knew would be difficult to exploit if East Timor were allowed to become independent, have anything to do with the U.S.'s decisive military support (which Westad ignores) for Indonesia's invasion of the island and subsequent decades-long genocide there?¹ Maybe many of the superpowers' foreign interventions were motivated in part by the tremendous profits that could be made by selling arms to Third World regimes. Economically, *what was going on* with the U.S. and Soviet governments during the Cold War? Westad leaves us in the dark.

The very method of relying on leaders' public and private statements -- or rather, only those private statements made in the scattered conversations that have been recorded in the documentary record -- in order to understand the motives or the causes of specific policies is flawed. Such statements as the scholar can find should be taken into account, but they do not usually provide the most important information for an understanding of policies. First of all, the documentary record of conversations is necessarily fragmentary. Policymakers are not tape-recorded in every minute of the day. The statements that make it into the record may well reflect self-censoring or posturing in front of one's colleagues, or they may be rationalizations that disguise underlying unsavory motives. Public statements, on the other hand, are almost

¹ Noam Chomsky, *Understanding Power: The Indispensable Chomsky* (New York: The New Press, 2002), p. 296.

always nearly worthless except as indications of what plays well to the masses.

More broadly, self-deception is as rampant among policymakers as it is among “ordinary” people. Politicians and high-level bureaucrats are just as human as the rest of us, maybe more so (in the sense of being more self-deceiving). Nobody wants to think he is beholden to corporations or whatever interests have financed and coordinated his accession to power; he will convince himself that in his political behavior he is defending freedom, defending democracy, defending his country’s security. Or, more likely, his having attained a high political position indicates that he has already been indoctrinated with the right ideologies, so that he genuinely believes what he is really doing is fighting some horrible evil called Communism rather than merely suppressing Nicaraguan or Guatemalan or Chilean independence from U.S. influence, or suppressing labor movements that might threaten the rule of business or set a bad example to neighboring countries by showing that popular democratic participation can improve people’s lives. Or maybe he is clear-headed and knows exactly what he is doing. The point is that what he *believes* he is doing does not matter much; it should interest psychologists, not political scientists. The question is, what kinds of policies does the network of political and economic institutions *allow* to be pursued? What do these policies actually do? What effects do they have? If the policies continue for years and the people who promote them remain in power, one can assume they are having the right effects (as determined by certain powerful institutions). The essential irrelevance of lofty ideologies to the policies and machinations of political institutions is revealed in the fact that one can list off the top of one’s head a dozen foreign interventions whose effects have totally contradicted the interventions’ stated ideological purposes. If security and “defense” are so important to U.S. political institutions, why were the recent wars in Iraq and Afghanistan waged, wars that transparently were going to increase the U.S.’s insecurity by fomenting terrorist activity? If freedom and democracy are so important to policymakers and the institutions they represent, why were Reagan’s wars in Latin America and Johnson’s and Nixon’s wars in Vietnam and Cambodia waged, which destroyed popular movements? Why has the U.S. government consistently flouted democracy by organizing coups to unseat popular leaders? Is it at all credible that policymakers are so disastrously incompetent that they cannot even understand their own ideologies, that whatever situation they stick their hands into they somehow manage to make infinitely worse than it was? Is it not more credible that they are merely paying lip-service to some nice ideology while acting so as to increase their own and their favored institutions’ power?¹

If the U.S.’s foreign interventions during the Cold War were really for the sake of fighting Communism, as Westad thinks, why didn’t the end of the Cold War end such interventions? Westad does not even consider this question, despite its obviousness. The Cold War effectively ended in 1989, or 1991, but then the Gulf War happened, and later the Iraq and Afghanistan wars and U.S.-supported coups in Haiti (1991 and 2004) and Venezuela (2002), and meanwhile the U.S. continued supporting Suharto’s aggression in East Timor, Turkey’s massacres of Kurds, Israel’s aggression in Palestine, etc., and it continued the

¹ [In his comments on this paragraph, the professor wrote (in caps because the comments were embedded in the paper), “AN EXTREMELY POWERFUL STATEMENT. HOWEVER, YOUR ARGUMENT ALSO RUNS INTO A ‘TRANSPARENT’ PROBLEM. IF SUCH POWERFUL INSTITUTIONS ARE SO CLEARLY IN CHARGE, THEN WHY DOESN’T EVERYONE KNOW THAT, AND ACT ON IT?” I answered him with “I’d say that people *do* know that -- at least, ordinary, non-‘intellectual’ people do -- as shown by the cynicism of everyone you talk to on the street. Ordinary people take it for granted that big business is to a large degree ‘in charge’ and that politicians mostly want to remain in power, they’ll do almost anything they have to to stay in power. Compromise whatever principles they have, etc. (Most intellectuals don’t like such ‘crude’ ideas, such ‘crude’ cynicism, but to label something ‘crude’ or ‘cynical’ isn’t, strictly speaking, an argument against its truth. No one ever said that truth has to be lofty and ‘idealistic.’) So why don’t people do anything about it? Because of the incredible atomization of civil society. People feel powerless, since, as far as they’re concerned, they lack effective institutions to fight back against ‘The Man.’ Hence most people’s political apathy. In the 1930s, when there was a functioning labor movement and a vibrant civil society focused around working-class communities and so forth, people were far from being apathetic. They were hopeful, as you know. Now that business and its minions have, in the last thirty years, decimated civil society and the labor movement, people have few resources to fight back against power. So they do nothing. Sit at home and watch TV.” It is telling that even an intellectual with some intelligence rejects such obvious truths.]

Cuban embargo, instituted economic sanctions on Iraq, and so forth. All or most of these operations were explained not as defenses against Communism, because the Cold War was over, but as defenses against terrorism. The rhetoric had changed, but the interventions persisted. Is it likely, then, that “anti-Communism” was the real reason for identical interventions from the 1950s to 1980s, or was it not more probably an excuse, just as “anti-terrorism” was an excuse later?¹

Even Westad’s broader thesis, that the Cold War shaped developments in the Third World, is only partially true. If anti-Communism was indeed not the main reason for U.S. foreign interventions but only a convenient excuse (which some policymakers may well have believed in, though that’s an academic question), it is probable that even had Russia or China never “fallen” to Communism, the United States would have intervened in the Third World on a large scale. Its purposes in doing so would have been the same ones it in fact had, namely to prevent countries from escaping its sphere of influence, from following independent, anti-“capitalist” paths, from establishing strong labor movements or building up the resources to resist pressure from American political and economic institutions. The suppression of such developments is the true “ideology” that American power-structures follow -- as is obvious from any honest consideration of the facts.

Notwithstanding all these criticisms, Westad’s book has its uses. Primarily, it is an informative survey of Cold War foreign policy. On another level, it provides insight into the thought-processes of a typical liberal intellectual. It is illuminating to see how such a person interprets the world, how he convinces himself of the essential justness of a given political order, and of the good intentions of policymakers (as if “good intentions” mean anything at all). The book is also useful in demonstrating the explanatory poverty of a worldview that emphasizes “ideologies” above material factors and institutional relations.

After reading Mae Ngai’s *Impossible Subjects: Illegal Aliens and the Making of Modern America* (2004), one may well be struck by what an *unnatural* form of social organization is the nation-state. This entity that sets arbitrary geographical boundaries between self and other, “us” and “them,” and has the power to enforce these boundaries to the point of giving remarkable protection to “us” and acting to the positive detriment of “them,” embodies the most vicious and dangerous kind of exclusionism. The citizen and the non-citizen -- the person and the non-person -- the full human and the half-human who can be stripped of rights he thought he possessed and imprisoned without due process, deported, moved around and manipulated with little legal recourse. In *Impossible Subjects*, Ngai tells the story of the most exclusionary and racist period in the history of American immigration law, between 1924 and 1965. Her title sums up the central and horrifying fact of restrictive immigration policies, namely that people can be present in a country illegally, that therefore they have few or no rights except at the pleasure of higher authorities (be they bureaucrats, judges, or legislators). Illegal aliens are *impossible subjects*, people who, according to the law, have no right to exist.

The danger of policies that limit citizenship was made clear by the Holocaust, which was perpetrated on people who had become stateless by having their citizenship revoked. As Earl Warren said, “Citizenship *is* man’s basic right, for it is nothing less than the right to have rights. Remove this priceless possession and there remains a stateless person, disgraced and degraded in the eyes of his countrymen. He has no lawful claim to protection from any nation, and no nation may assert rights on his behalf” (p. 229). Richard Rubenstein concludes that in fact no crimes were committed at Auschwitz, because the (stateless) victims had no rights.² According to domestic and international law they were non-entities.

¹ The ideology of “containing Communism” becomes even more threadbare when one considers that the Soviet Union was not an expansionist power, certainly not nearly to the extent that the United States was. As Chomsky noted in 1989, the USSR was actually “conservative”: “Whatever rotten things they [i.e., Russian Communists] have done, they’ve been inside the Soviet Union and right around its borders, in Eastern Europe and Afghanistan and so on.... They don’t have troops stationed anywhere else. They don’t have intervention forces positioned all over the world like we do. So what does it mean to say we’re ‘containing’ them?” *Ibid.*, p. 38.

² Richard Rubenstein, *The Cunning of History: The Holocaust and the American Future* (New York: Harper & Row, 1975), p. 67.

Fortunately, most “illegal aliens” are not stateless but remain citizens of the country of their origin, a fact that presumably provides them with some minimal legal protection. Strangely, Ngai does not discuss this matter in any depth; she does not indicate what rights, if any, illegal aliens have by virtue of (in some cases) being citizens of another country. What powers does their government have to protect them? Not many, it seems, since she does not mention them. She does describe some of the ways in which aliens have been granted rights, or something *like* rights, since the early twentieth century. For example, in the 1930s “deportation policy became the object of legal reform to allow for *administrative discretion* in deportation cases,” specifically cases in which deportation “separated families or exacted other hardships that were out of proportion to the offense committed” (p. 57). In later years this benevolent use of “administrative discretion” largely disappeared. More recently, in 1982 the Supreme Court ruled that undocumented children have the right to public education. Aliens have even been granted certain rights to due process in matters of deportation and detention (p. 268). In 1996, on the other hand, Congress passed laws that deprived legal and illegal aliens of many former rights, such as welfare benefits (for legal aliens) and judicial review in deportation cases. [...]

A fruitful way of looking at the history of U.S. immigration law is as a prism through which to view broader trends in society. A country’s treatment of the “other” illuminates its treatment of itself, or of the groups that constitute it. Obvious examples are the racially motivated laws from the late nineteenth century to the mid-twentieth. Before the early 1920s immigration was relatively open, except for the exclusion of Chinese laborers due to an act passed in 1882 and a 1907 “Gentlemen’s Agreement” with Japan that barred further Japanese emigration to the U.S. As Ngai states, “[O]n the United States Pacific Coast, Asian migrants collided with the racial imperatives of American manifest destiny, the ideology of continental expansion that had declared the West the domain of Anglo-Saxon civilization” (p. 18). Already in the 1880s, therefore, the U.S. had entered the West’s climactic period of racism, imperialism, and nationalism, which would last until World War II.

After World War I Western nationalism became even more shrill, a shrillness reflected in immigration laws.

[T]he international system that emerged with World War I gave primacy to the territorial integrity of the nation-state, which raised the borders between nations. For example, the introduction of passport controls in Europe and the United States, begun as emergency war measures, became, without exception, the norm in regulating international migration. In the United States, the Immigration Act of 1924 would require not only passports (documentary evidence of national identity) but also visas (documentary proof of permission to enter) for admission into the country [p. 19].

At the same time, the obsession with *race* reached new heights, such that the Immigration Act of 1924 fused racism and nationalism in a sort of uneasy truce. For instance, to limit immigration from southern and eastern Europe, Congress set up a complicated quota system based on national origins, according to which every country except those in the Western hemisphere had an annual quota of at least a hundred people, depending on the proportion of people inhabiting the U.S. in 1920 who were descended from it. Thus, the United Kingdom had a quota of 65,721, while India had a quota of 100. However, Congress also stipulated that Chinese, Japanese, Indian, and Siamese people were ineligible to citizenship and hence excluded from immigration. So, while each of these countries had a quota of 100, the people who “racially” belonged to them were barred from immigration. These kinds of absurdities are what result when one tries to reconcile racist thinking with nationalist thinking. But in the 1920s, the U.S. was evidently steeped in these two kinds of prejudices to such an extent that politicians, academics, “race scientists” and others would agonize for months and years¹ over how to devise a system that accommodated racism and nationalism at the same time.

¹ The complicated quota system was not finalized until 1929, five years after the Immigration Act.

Less than twenty-five years later, however, by the late 1940s, the unholy trinity of imperialism, racism, and nationalism had lost legitimacy, with the consequence that reformers started a campaign to purge prejudice from the nation's immigration laws. As the 1950s passed into the 1960s, increasing liberalism, cultural pluralism, and rights-consciousness lent greater urgency to these efforts, until finally in 1965 Congress passed an Immigration Act that jettisoned the system of national origins quotas, "replacing it with a new system of quotas that were at once global (applying to all countries) and evenly distributed (20,000 per country)" (p. 227).

And yet the new law remained very restrictionist in some ways, causing a rise in illegal immigration from Mexico. Which brings us back to the dilemma cited earlier, of how to treat all people as humans in a world organized around nation-states. Probably it is impossible, given the necessary distinction between citizens and non-citizens. The logical conclusion, then, is that society will not be humane until nation-states have withered away.

*

February

After reading Christopher Lasch's *Plain Style: A Guide to Written English*, I'm going to be more careful with my punctuation. Returning to how I used quotation marks before reading Raymond Williams' book.

Dating a 30-year-old named Joy, a graduate student at the University of Chicago writing a dissertation on Buddhist philosophy (she's a Buddhist). [...]

....Well, I spoke too soon, as usual. In an email she said she doesn't feel the "extra, mysterious 'thing'" between us that's necessary for a long-term relationship. Not terribly surprising. As usual, I'm too easygoing and "intellectual," or something, for there to be sexual tension. It's all about the masculinity. (Which, incidentally, is one reason for America's high divorce-rate. Women are attracted to their man but can't live with him.)

Life is merciful in finally desensitizing you to disappointment after two decades of it. -Well, *sort of* desensitizing you.

But how does one keep going? How does one continue to have the faith to keep going? In fact, how is it that I always return to optimism and buoyancy? It's decidedly unreasonable.

*

The irrational male.-- Relying on women for one's happiness is like relying on a known thief to guard one's property.

*

A false idol.-- The individualist is he whom everyone exalts in theory but condemns in practice.

*

For example, Tucker Max.-- One can take it as a rule of thumb that he who is beloved of women probably has little worth and should be avoided.

*

The mind-body problem.-- Watching people interact, the impression is inescapable that they truly are beings of *matter*. Earth-bound beings with muddy souls. And one returns to the realm of spirits with relief....

*

Hero-worship and other puzzles.-- It's easy to understand why I admire Noam Chomsky. But why do I *like* admiring him? Why is it emotionally gratifying? It isn't a mutual fondness; he barely even knows of my existence. For some reason, liking and, to an extent, admiring people is in itself pleasurable. That means that in some sense it's self-affirming, self-confirming. But that doesn't explain much. My admiration is a kind of self-activity, self-initiated activity, and so is satisfying. But again, that formulation is at best suggestive. Maybe it's actually misleading, in that liking someone is not so much an *act* as a *state*, the state of being impressed (half-consciously) by a person's "validation" of your own proclivities, your personal likes and dislikes, thoughts, beliefs, sense of humor, etc. You like someone insofar as you implicitly recognize yourself in him or her (even if "objectively" the two of you might appear to be quite different), whether because he values you and acts accordingly or because his behavior reflects what you value, such as your political beliefs or sense of humor. Similarly, you admire someone to the extent that he embodies your values (and thus, so to speak, *you*) perhaps better than you do. The "better than you do" is the part that can lead to envy and conflict; the "embodies your values" (thereby "validating," "confirming," "reinforcing" them) is what explains the subtle pleasure that exists in admiration.

*

American anti-intellectualism.-- The contempt in which intellectuals are held by most Americans is not necessarily contemptible. I'm inclined to think it is justified, though doubtless it takes crude and stupid forms. Intellectuals are parasites on the productive work that others do. They lead privileged, comfortable, isolated lives, and they unjustifiably consider themselves superior to others. Most of the work they do is basically irrelevant and masturbatory, and they usually don't do it very well anyway. They pride themselves on their independent-mindedness despite being arguably the most indoctrinated and least independent-minded class in society. If the average American gave these reasons for his contempt, I'd have to conclude that "American anti-intellectualism" is healthy and good. On the other hand, insofar as it arises from the emotional fascist ideas that "intellectuals aren't 'one of us,' they're unpatriotic, they're liberal," anti-intellectualism is stupid and potentially dangerous.

*

The natural divine.-- I believe in Bach, not God. Bach reveals a power beyond my understanding, and when I listen to his music I hear something too powerful to understand.

*

Pure liberalism, objectively valid.-- I used to "feel for" the plight of black cultural nationalists who thought that in order to exalt and be true to their race they had to return to their African origins and reject European civilization, even those aspects of which they approved. All their socialization of the last two centuries had been "inauthentic." But that's silly. The individual is the measure of all things; he is not bound to act or think in certain ways by virtue only of his family's or his "nation's" or his "race's" or any other group's past or present. A "heritage" is an imaginary construction, nonexistent outside a person's appropriation of it. There is nothing inauthentic about a black man identifying with European traditions, because collective identities are imaginary constructions that the individual is free to accept or reject. The concept of authenticity understood in some sort of "objective" sense can apply only to the individual's relation to himself, because, in the final analysis, the individual is all that exists.

*

Joyous women.-- The source of young women's naïveté is no mystery. It is that the feminine, as such, is more personal than objective, more immediately immersed in itself -- in the gentleness, softness, giggleness and excited spontaneity of femininity -- than soberly comprehending of the other. This is why masculinity loves it, and why it loves masculinity.

*

Listen not to my words but to the Logos.-- Insofar as the reader resists some of the potentially "offensive" ideas I jot down, it is in part because he pays attention only to the *words* rather than to what they refer to. He doesn't use his imagination to go beyond the words and consider the phenomena they're describing. The words seem offensive and silly, so the reader rejects them without thought; but their point is to stimulate imaginative consideration of something *beyond* the mere words, namely, for example, the actual ways that men and women think and behave. Arthur Danto reflexively dismisses Nietzsche's judgment that women (he should have said "women insofar as they're feminine") are "more personal than objective," or less 'detached' than men; it is clear Danto hasn't taken the time to *imagine* the *concrete* meaning of the words. If you sit outside and watch people's behavior, or if you observe a woman in the throes of emotion, and if you haven't been totally indoctrinated into political correctness, you'll see there is some merit to Nietzsche's statement.

*

Fields of gold.-- While I have never walked in fields of barley with my love, nor lain in meadows as the west wind moved above us, I am comforted by the knowledge that others have. In a world of sorrow, that knowledge is a consolation. And so I listen to this song imagining others' happiness, and smile.

*

From a YouTube comment on Contrapunctus XI from Bach's "Art of the Fugue."-- "It's amazing that one man could write this, another perform it, and yet a third could design cluster bombs disguised as children's toys to be dropped by the USAF in Iraq."¹

*

Three essences.-- The emotional logic of repressive conservatism is fear; the emotional logic of progressivism is hope. The middle and upper classes are prone to fear, since they do not want to lose what they have (including their "threatened" cultural values); the lower working classes are liable to hope, since they have little to lose. (The notable thing about fascism is that it combined fear with hope -- disguised repression as liberation. Hence its power, its appeal to both the powerful and the powerless.)

*

"Economic interests" vs. "status anxiety"?-- Hofstadter's and others' distinction (in political contexts) between "rational" economic concerns and "irrational" concerns over "status" or "culture" is not well-founded, and at any rate is unnecessary. Both concerns arise from the desire -- often institutionalized, thus becoming even more effectual -- to maintain or increase one's power relative to other groups. One might want greater economic power, greater political power, or greater power to have the kind of life and

¹ (I had to rewrite the original sentence for literary purposes.)

live in the kind of society one wants (for instance with respect to religion or traditions of authority -- or progressive environmental concerns, etc.). In all these cases the underlying desire is for *power* and *recognition*. Not necessarily recognition of *oneself*, but recognition of, or respect for, one's vision of how society should be. It is true, however, that particular forms of this desire may be more reasoned than others. Think of Jerry Falwell's homophobia as opposed to Egyptians' desire for democracy. Homophobia can be shown to be unreasonable (given other values and facts to which everyone implicitly subscribes), whereas democratic urges are eminently reasonable.

*

Fraudulent economics.-- According to the economist Robert Brenner, neoclassical economics, unlike the Marxian system, does not have a theory of capital accumulation. It cannot explain it. Since capital accumulation is the very essence of capitalism, the neoclassical system is....a joke. But its function, after all, is an apologetic one, so its explanatory thinness is not surprising.

*

How the public perceived a monster.-- Despite the campaign of disinformation to which we've been subjected in the last twenty years, Reagan was not a particularly popular president during his lifetime. In Gallup polls, his average approval rating was 53%, below Bush the First's, Clinton's, and Johnson's, and only four points above Bush the Second's. His highest was 68% and his lowest 35%. Carter's highest rating in the *Wall Street Journal's* polls was higher than Reagan's.

*

Is it the Sixties again in Madison, Wisconsin?-- Eighty thousand protesters in solidarity with public-sector unions, defending their right to bargain collectively. It is inspiring and exciting. But whether they win or lose this fight, the hits against unions are going to keep coming. Business is going to keep using government deficits as an excuse to bust unions. The labor movement is not strong enough to fight back in any effective way. The only long-term hope for workers is outside the framework of collective bargaining, outside the framework of unions as traditionally understood. Cooperatives and such alternative entities are the only hope, I think. But it will take decades for them to establish a presence; in the meantime, we're going to see a lot of unemployment and a lot of misery.

*

Innate humanism.-- When you watch the young child dancing and singing along to Beethoven's Fifth Symphony, or the child inquiring about the world's causes and life's purpose, or the child painting a picture vibrant with color, you realize that the higher things in life are not *taught to* people but *taught out of* them.

*

Healthy self-belittling.-- One of the reasons I respect Chomsky is that he takes himself profoundly seriously without taking himself seriously, indeed *by* not taking himself seriously. He takes humanity seriously, not himself. For example, while dissenters throughout history have celebrated themselves and their companions by arguing that to dissent -- from anything, even intellectual or artistic fads -- is a very "courageous" and "heroic" thing to do, Chomsky sensibly remarks that unless it entails real personal danger, there is nothing especially courageous about it. Political dissidents in Turkey are courageous; dissidents in America are doing what should be expected of any reasonable and moral person.

*

A note on Populism.-- Despite my general appreciation of the Populist movement, I have to admit that insofar as its ideology was based on a *geographical* opposition to the East, to Wall Street and northeastern America, it was dangerous and bore the seeds of later semi-fascist conservatism. For geographical concerns cut across class lines and can easily become cultural or even racial. People can start hating not only big business but everything else associated with a particular region, such as civil rights, intellectual freedom, and “intrusive” government. Businessmen can be celebrated just by virtue of having originated in the “us” region (as opposed to the “them” region) and sharing some of its cultural values, such as Sam Walton. This sort of populism is easily manipulable by business and the public-relations industry, so that ordinary people wake up thirty years later to find that their working conditions at good ol’ Sam’s business are intolerable, they’re paid little, and their communities are falling apart.

*

False consciousness.-- Leftists are sometimes criticized for being condescending toward the masses, for arguing that they are prone to displaying false consciousness in their political values and beliefs. But what *is* false consciousness? If you examine the notion rigorously, you’ll see that, on at least some understandings, it can make perfect sense and is often applicable. All you have to do is assume that people have certain basic values and interests, such as being economically well-off, living in integrated communities, having political power, and having control over their work. Given such values, it is perfectly legitimate to criticize “secondary” values and strategies like opposing unions, civil rights, health-care reform, and government regulation of business. A different kind of false consciousness is exhibited in mistaken factual judgments, such as disbelief in anthropogenic global warming and belief in God. In general, insofar as someone is immune to rational considerations, he is exhibiting what can be called “false consciousness.” (Truth, after all, is reached and tested through reason.)

People are free to have whatever values they want. If religion makes them happy, then fine. In that respect it is reasonable for them to be religious (for it makes them happy). But in other respects religious values and beliefs can be unreasonable, namely insofar as they contradict other values and beliefs the person holds. And they often, or always, do, implicitly if not explicitly.

Nevertheless, I find the notion of false consciousness to be not very useful. It is unnecessary; it has pejorative connotations and does not really clarify anything. In fact, it is such a broad, “multiply interpretable” concept that it obscures far more than it illuminates. For that reason I never use it. Still, it can have *some* substance, as I just showed.

*

The mind is more attuned to selves than ideas.-- It is psychologically interesting that people tend to argue *ad hominem* -- to assume, for example, that by saying liberals are “condescending,” one effectively refutes their positions. It shows that what people are really arguing against is not an argument but a self. What matter to them are not pure *ideas* or *arguments* but the fact that *a self is putting forward* certain challenging ideas. One wants to deal, first and foremost, with this self, not with the ideas it puts forward. The *opposed self* is what is offensive, its ideas only derivatively. As soon as one has come up with a reason to disregard the self in question, its obnoxious ideas no longer matter, being important not in themselves but only as symptoms of another’s implicit devaluing of oneself (by disagreeing with one’s ideas). Thus you have the amusing spectacle of adversaries screaming at each other, insulting each other, while completely ignoring each other’s ideas. People who are able to detach ideas from their proponents and, furthermore, be more concerned with the ideas than with the fact that a person is putting them forward, are rare. And even in such people, there is always a basic *ad hominem* consciousness that can be more or less transcended depending on moods, circumstances, etc.

Incidentally, I am not arguing that ideas don't reveal anything about the person who holds them. They often do. It is perfectly reasonable to dislike someone or make inferences about his character on the basis of his holding extremely obnoxious views. But this is separate from the issue I've been discussing.

*

Bareness

Looking at the snow, I know that I should go.
 The moon is hidden by orange street-light, but I should go.
 I am finished; my work is done, and things are dull.
 Dusty books, dusty desks, dry reading
 From dying books two years old, or dead-born.
 I'm tired of things, and things are tiring too.
 Outside the world, nature, nature is ever young,
 Ever young-returning, turning old men into young.
 There is a spot somewhere, snowy or summery, where
 It is bare, life is spare, one can sit and be aware. And there
 Is only silence or wind, no cares, trees standing quietly,
 Things barely moving in the wind except for grass or falling snow.
 -No, summer is where to be. Under the sun is where to be
 When one no longer feels young, when feelings are done.
 Warmth on the face upturned, eyes closed, all feelings
 Focused in the skin, memories forgotten. Books
 And desks and metal things and former hopes forgotten.
 Only immediate sensations and enormous space.

*

"All hope abandon, ye who enter here."-- Undergraduate essays are like portals into the heads of ordinary people, into their thought-processes. Unfortunately, the world into which one steps through these portals is not well-lighted, has shadows everywhere, and is very, very frightening.

*

Thoughts on Marxian common sense.-- An example of intellectuals' need to make everything more complicated and difficult than it has to be is the unending debate over the meaning and validity of the Marxian claim that the economy is the relative foundation of society, that production relations are ultimately the most important kind of social relations. One would have thought this claim to be commonsensical, but apparently it isn't. Its basic meaning and truth are revealed in the single consideration that people with economic power, who occupy high positions in institutions of economic production, generally have the resources to maintain or expand the societal role of their institutions, i.e. that other institutional actors, say in the realms of politics or the family or education, have less access to resources, and hence less power. That is to say, the institutions these latter actors represent have less social influence. As a result, for example, political and familial institutions in recent centuries have had to adjust to the capitalist mode of production far more than vice versa. Social revolutionary situations develop when powerful economic actors, along with the institutions they represent, start to lose their power, either in relation to a new set of economic institutions (as in the transition from feudal to capitalist society) or in relation to emerging social chaos, as in the Russian revolution. But, as I argued in my Master's thesis, in order for a new set of economic structures really to transcend the institutional legacies of the old structures, as opposed to reproducing them in a disguised form or succumbing to them later (both of which apply to the Russian and Chinese

experiences), the first scenario is what has to happen: new economic structures have to emerge in the old society, have to “compete with” the old structures and eventually prove their superiority by providing their partisans with greater access to resources than the “old” economic elite has.

Incidentally, insofar as a social revolution occurred in the American South between the 1950s and the 1980s, it was made possible in part by the substitution of certain new economic relations for older ones, itself made possible by advances in technology (mechanization, etc.) in the South and North (partially liberating blacks from their former servitude). And if you want to say that the New Left and similar movements in the 1960s and ’70s inaugurated a “social revolution,” this one too would not have been possible without prior changes in production relations and economic technologies. -The Marxian hypothesis, as you can see, is not really vulnerable to empirical refutation, being nearly axiomatic (or arrived at through something like pure reason), but it is not empty either. You might compare it in these respects to Darwinism, as I have before. Both theories can be refined and modified in numerous ways, but their central intuitions cannot be proven wrong.

*

“Queer theory.”-- The problem with academic interest in the history of gender and sexuality is that it stinks of cultural decadence. It stinks of subjectivism, postmodernism, political correctness, withdrawal into the private self. Unfortunately, in a contemporary history department it is *everywhere*.

*

The dialectic of business’s attacks on the public sphere.-- On a broad scale, business’s privatization crusade is unstoppable, at least for the foreseeable future. It will not stop until it succeeds in tearing society apart. By that time, new public institutions, more decentralized than the welfare state, will have effectively taken over many necessary social functions -- and they will continue to become more powerful. It is impossible to say, however, when the tidal wave of privatization is going to crest and start to break against the ground of these new public institutions. Not for decades, probably.

*

The farce of “progress.”-- Aside from during World War II, there has probably never been more suffering among the human species than there is now. And this statement will continue to be true for decades hence, each year seeing the aggregate level of suffering rise.

*

La Rochefoucauld in the twenty-first century.-- The world is falling apart, pain and sorrow are everywhere, yet I remain a basically happy person due to my high opinion of myself.

*

Male: external; female: internal.-- One way to express the differences between how men and women tend to experience sexual attraction is by saying that for men it is more “external” than “internal,” while for women it is more internal than external. This corresponds to the fact that masculine minds are externally oriented -- observing the world, inquiring into it in an “external” (“intellectual”) capacity, treating it (acting on it) as an object, not primarily feeling or empathizing or identifying-with or appropriating-into-the-self -- whereas feminine minds are less objective in this separation-between-self-and-other way. (Everyone’s mind has feminine and masculine aspects, but the terms are still useful in designating sexually differentiated tendencies.) Thus, masculinity wants to have sex with someone who

looks beautiful, whereas femininity wants to have sex with someone who provokes certain feelings. External vs. internal, metaphorically speaking.

Moreover, to repeat what I've said before: insofar as, or *if*, there is a natural basis for the unevenness in scientific, mathematical, and philosophical achievement between the sexes, it is related to the contrast between the masculine orientation to the objective and the feminine orientation to the subjective. Femininity is surely just as cognitively capable as masculinity in the realms of natural science and mathematics, but it tends to have less *interest* in these subjects due to its affective cast of mind. Things having to do with *people* are more interesting to the feminine than things having to do with abstract logic and objective investigation of the non-subjective. Hence, in part, the higher incidence of female psychologists, social workers, teachers, lawyers, and businesspeople than scientists, mathematicians, and philosophers. (No rule without exceptions -- which are, however, probably a result of the relatively high "masculinity" of the minds of female scientists, philosophers, etc. For example, in my experience, many women who choose philosophy as a career are lesbians or simply un-feminine. (Not that there's anything wrong with that!) Maybe someday it will be possible to confirm all these ideas by studies of hormone-levels or brain-structures and such.)

*

*Essentialism, a revolt against postmodernist "cultural imperialism."*¹-- The difference between social-constructivists and me is that I think there must be some hidden truth in the eons-old essentialist thought of rich cultures, from India to China to Greece to Rome to Europe to Native American tribes and elsewhere. I have reverence for ancient wisdom. More generally, I respect the insights of non-contemporary-Western societies.

*

Reading Christopher Lasch's masterpiece *The True and Only Heaven: Progress and Its Critics* (1991). "This inquiry began," he writes, "with a deceptively simple question. How does it happen that serious people continue to believe in progress, in the face of massive evidence that might have been expected to refute the idea of progress once and for all?" As he understands it, the idea of progress is "the assumption that our standard of living (in the broadest meaning of that term) will undergo a steady improvement." In his book he tries to reconstruct the opposition to progressive, liberal ideology that runs through American history from the very beginning, as in republicanism (civic humanism, civic virtue), varieties of "radical Protestantism," Emerson, William James, populism (he thinks), Martin Luther King's nonviolent resistance, and, in Europe, Thomas Carlyle and Georges Sorel, among many others.

A number of recurring themes informed the kind of opposition to progressive ideology that I have tried to recover and to distinguish from a more familiar lament for the decline of "community." The habits of responsibility associated with property ownership; the self-forgetfulness that comes with immersion in some all-absorbing piece of work; the danger that material comforts will extinguish a more demanding ideal of the good life; the dependence of happiness on the recognition that humans are not made for happiness -- these preoccupations, separately or in various combinations, reappeared in Sorel's version of syndicalism, in the guild socialism advocated by G. D. H. Cole and others, in Josiah Royce's "philosophy of loyalty," in Reinhold Niebuhr's account of the "spiritual discipline against resentment," and in Martin Luther King's practice of nonviolent resistance. What these thinkers shared with each other and with their predecessors was a sense of limits -- the unifying thread in the following narrative [i.e., this book]. An exploration of the idea of limits in various guises enables us to reconstruct not so much an intellectual tradition as

¹ Yes, "irony is the iron law of history."

a sensibility, one that runs against the dominant currents in modern life but exerts considerable force, even today.

It is most simply described, perhaps, as the sensibility of the petty bourgeoisie -- difficult to recognize as such, in major thinkers, only because we expect major thinkers to participate in the general revulsion against the petty-bourgeois way of life. These particular thinkers, I believe, embodied the conscience of the lower middle class, giving voice to its distinctive concerns and criticizing its characteristic vices of envy, resentment, and servility. Notwithstanding those vices, the moral conservatism of the petty bourgeoisie, its egalitarianism, its respect for workmanship, its understanding of the value of loyalty, and its struggle against the moral temptation of resentment are the materials on which critics of progress have always had to rely if they wanted to put together a coherent challenge to the reigning orthodoxy.

Lasch recognizes the unsavory aspects of lower-middle-class culture, such as nativism and racism, but wants to examine the positive aspects. His conservative vision, which is embodied as well in *The Culture of Narcissism*, is appealing, and I share it in many respects, but it's dangerous too. Or rather, it is dangerous if that side of it is emphasized that is little more than a sophisticated version of the "aesthetic morality" of the early intellectual fascists -- or national syndicalists -- in Italy and France. Lasch hates materialism, consumerism, spiritual shallowness, vulgar bourgeois selfishness, the breakdown of order and authority; he likes heroic cultures (such as ancient Greece), "spontaneity," moral consensus, the "legitimate authority" that has been corrupted by modernity, and dislikes "progress." He is concerned above all with the "devastated realm of the spirit." But look what happened when an intellectual ideology that shared these concerns was seized upon -- and embellished -- by the mob, by Hitler and his companions, Mussolini's minions, the French fascists. It is all too easy for this sort of conservatism or a similar kind to latch onto the nation or race as the agent of spiritual regeneration. Or to spawn something like the New Right. It is all too easy for an "anti-progress" ideology to be used to suppress democracy and human rights.

Here's something stupid: "The danger to democracy [today] comes less from totalitarian or collectivist movements abroad [because those effectively died in 1991] than from the erosion of its [i.e., democracy's] psychological, cultural, and spiritual foundations from within." Typical stupid idealism, which can lead to the bad sort of conservatism. Institutional facts -- the institutional configurations of corporate capitalism -- are what prevent democracy from happening, not the erosion of any cultural or psychological "foundations." That erosion is an effect of capitalism.

Lasch argues convincingly that the Judeo-Christian linear conception of time is not the origin of the modern notion of progress, and in fact is very different from it. For one thing, in the former conception, gradual *progress* isn't predicted to happen before the end of history. For another, the most common modern idea is that progress is open-ended and continuous, with no end to it. Things just keep getting better -- perhaps with periodic regressions -- as the productive forces expand, the standard of living improves, and freedom spreads. This is original. It derives not from Christianity but from the scientific revolution and the Enlightenment.

The Christian understanding of the temporal order is in fact not all that different from the ancient one. Both deprecate it, the ancient in the idea of endless cycles of birth and decline, the Christian in the idea of temporal corruption and transience, insubstantiality. Which is like Platonism. This has nothing in common with the modern secular ideology of indefinite progress, which valorizes the temporal order and deprecates, or denies, the spiritual and transcendent. Republicanism (civic virtue, etc.) is different from all this, but, to me, it seems closer to Christianity than to liberalism or "progressivism." It's inherently conservative and moralistic (in a sense), opposed to the endless accumulation of desires and needs on which modern progress rests. In some respects it's kind of like a secular version of Christianity, in that, for example, it encourages people "to find order and meaning in submission to a communal standard of conduct" and "associates the good life with a particular form of community and with the memories that constitute it." By contrast, classical political economy argued that "private vices," such as greed, become "public virtues" by stimulating industry and invention.

Actually, now that I think about it, the few similarities between republicanism and Christianity are entirely superficial and coincidental, since the two bodies of thought represent totally different traditions. Republicanism = a certain kind of aristocracy and urbanity, antiquity, this-worldliness, education and knowledge, a desire for glory and excellence; Christianity originally = the poor, the downtrodden and uneducated, the rejects from antiquity, other-worldliness, not reason but transcendent faith and love.

....It's funny that fascism has affinities with republicanism. Like the former, the latter celebrated (as I just said) masculine virility, honor, self-denying devotion to the common good for the sake of glory, and gazed wistfully on the noble and heroic, un-bourgeois civilizations of the past. It opposed the fracturing of society into independent interest groups, preferring to set up an educational system that would prepare citizens for disinterested public service. Fascism, at least in the mouths of its intellectual exponents, is sort of like the vulgarization, massification, industrialization, "nationalization," "heroicization," totalitarianization of republicanism.

Henry George. *Progress and Poverty*. Ideas on history: universal rules of growth and decay, etc. He argued that "specialization and the accumulation of wealth [always] steadily widened the gap between the rulers and the ruled; that advanced civilizations accordingly had to devote more and more of their resources to the maintenance of an idle ruling class; that they finally collapsed, top-heavy, under their own weight..." As true now as ever. Modern America is a perfect illustration of George's thesis, what with the ruling class's appropriation of more resources every year from the rest of society, which crumbles and starves.

Something surprising: I got positive feedback from a professor. Robert Johnston. He's quite good, one of the better teachers I've had. Sent me an email: "I'm writing to everyone now about their class participation. Yours has been excellent. You've had very challenging and insightful comments to make. Indeed, you are arguably the most challenging person in class, but you do your challenging in a quite collegial fashion. I appreciate how you wait to let other folks get on the table first and then come in (although you should feel free to be one of the early people to, if you wish). Overall, your comments are very well-considered, tied well to the texts, and always conducive to advancing the conversation. I'm very pleased." That was nice of him.

The economist John Hobson, a forerunner of Keynes, "challenged the orthodox consensus that savings and investment went hand in hand. Too much saving, according to Hobson, led to underconsumption and declining investment." Makes sense, surely. Excessive saving leads to low demand, which discourages investment. Keynes agreed with Hobson but wanted to find a more rigorous theoretical proof of his conclusions.

He decided that "The flaw [in orthodox economics], in effect, lay in the failure to reckon with the economic consequences of inequality, specifically with the 'psychological law that when income increases, the gap between income and consumption will increase.' Since the wealthy could spend only a small portion of their vast incomes, their disproportionate share of the national wealth meant that aggregate savings rose disproportionately as national income increased. A higher volume of savings did not generate a higher volume of investment. It led to a decline of aggregate demand, declining investment, and unemployment." Those ideas seem kind of obvious to me. Correlatively, the falsity of supply-side or "trickle-down" economics is obvious. (Even more so when you consider that nowadays the elite's investment is mostly in financial speculation rather than productive enterprise.)

....Lasch's thoughts on nostalgia vs. memory are of interest. It's falsity vs. truth. Escapism vs. reaching out to the world. Negation or rejection (of the *real* past but especially of the present) vs. affirmation (of the present and past). "Memory too may idealize the past, but not in order to condemn the present. It draws hope and comfort from the past in order to enrich the present and to face what comes with good cheer. It sees past, present, and future as continuous. It is less concerned with loss than with our continuing indebtedness to a past" that formed us. Active memory vs. passive nostalgia. Vitality vs. enervation. Engagement vs. alienation. Lasch contrasts the (healthy) Romantic and the (unhealthy) Victorian attitudes toward childhood. For the first, as Peter Coveney says, innocence is "valuable for what it might become."

I.e., the adult should retain a childlike spirit for the sake of maintaining his integrity in a corrupt world. For the later Victorians, however, innocence was seen not as a “resilient expression of man’s potential integrity” but as something to be “statically juxtaposed to experience, and not so much static as actually in retreat.” There was no place for innocence and integrity in the world, which is why Victorian novels so often had melodramatic childhood deathbed scenes. The pure child had to die, because life sucks. But it’s telling that, in practice, the Victorian age treated children quite badly -- restricted their opportunities for development, restricted their freedom and play. This shows the falsity, dishonesty, shallowness, emotional self-indulgence of the Victorian adoration of children. If they were *really* adored, adults would try to learn from them, infuse experience with a spirit derivative of the child’s, and treat children as they deserved to be treated rather than as prisoners or little wild things that had to be tamed. -The point is that the Victorian attitude exposes the essentially negative essence of nostalgia.

I used to wonder about the relation between socialism and republicanism, or between the “republicanism” of the Knights of Labor and that of the Founding Fathers. It isn’t hard to puzzle out, though. We’re basically talking about two different traditions, two different social essences, despite superficial similarities. As Lasch says, classical republicanism was aristocratic and agonistic, civic-humanist. “The republican ethic was nothing if not competitive. It was the ethic of the arena, the battlefield, and the forum -- strenuous, combative, agonistic. In urging men to pit themselves against the most demanding standards of achievement, it also pitted them against each other. In politics, it set a high value on eloquence, disputation, and verbal combat...” Its ethic was sort of a fusion of aesthetics and morality. Late-nineteenth century labor republicanism surely proceeded from very different social impulses and causes, however much it may have borrowed the language and some arguments of Thomas Jefferson. It was indeed conservative, like classical republicanism, but in a different way: its essential purpose was to protest against wage labor (and economic parasites like speculators and monopolists) and advocate for free labor. It was an early, not very self-conscious anti-capitalist movement. Classical republicanism shared its emphasis on economic independence -- because only propertied people could have the independence of mind to be proper republicans -- but it certainly was not an anti-capitalist movement. It was not a *protest* movement, except against monarchy, which it used as a foil to highlight its own inherently affirmative, antique, elitist ideals. Wage labor, insofar as classical republicans thought about it at all, was another foil. Labor republicanism was born amongst a different class of people -- artisans and so forth, not landowners and aristocrats. Just as socialism was an ideology for those who wanted to rise up out of wage labor (collectively), labor republicanism was an ideology for those who were worried about falling into (or remaining in) wage labor. It was a temporary, “reactionary” ideological stage in the transition from pre-industrial to industrial society; socialism has lasted much longer because it is not reactionary, it assumes industrialism but simply wants to organize it differently. In any case, classical republicanism, while not “reactionary” in the way that labor republicanism is, is the most conservative of these three ideologies, having been born in ancient Greece and Rome, revived in the Florentine Renaissance, and “picked up again by James Harrington and his followers in England and by Montesquieu and Rousseau in France.”

It is true, though, that as classical republicanism died out in the early years of the nineteenth century, its exponents started to sound more and more like future labor republicans, lamenting the commercial spirit of the age, extremes of economic inequality, the spread of wage labor, etc. They went from the offensive (as in the American Revolution) to the defensive. It isn’t a long way from this dying gasp of the old republicanism to the later slogans of the Republican Party and then the Knights of Labor.

...Lasch comments, rightly, that “the very essence of popular radicalism in the nineteenth century” was the distinction between the producing classes -- including artisans, shopkeepers, farmers, small business-owners, industrial workers, etc. -- and the parasites, mainly bankers, speculators, and lawyers. This reminds us that fascist ideology in some respects drew on nineteenth-century populist radicalism, since it too was (arguably) founded on the distinction between producers (including many types of capitalists) and parasites.

As I read Lasch, it occurs to me that liberalism and republicanism were often not sharply separated in the eighteenth century. The American Revolution, for example, drew on both. Thomas Paine borrowed

from both. So did Jefferson and many others. Classical liberalism, in fact, as Chomsky would say, was quite different from what was later understood as liberalism, which explains why so many people did not see it as incompatible with republicanism. Its basic tenet was individual freedom, which, in a different way, was a basic tenet of republicanism as well. I suspect the philosophies, insofar as they were clearly defined at all, were sometimes thought to be complementary. Liberalism meant rights, republicanism meant duties or “virtue.” The former was negative -- “freedom from” -- the latter positive, in that it provided a positive moral vision absent in liberalism. People should be free *from* state intervention, etc., *to* (preferably) develop themselves in noble and public-spirited ways, etc.

As Lasch makes clear, liberals had republican sympathies and republicans had certain liberal sympathies, and many writers were not clearly one or the other. Classical liberals were very ambivalent about what glimmerings of capitalism they saw, though maybe less so than people who were attracted primarily to republicanism. Think of “Locke’s argument that anyone forced by necessity to sell his labor lacked one of the essential attributes of freedom.” Locke was a liberal, but republicans made exactly the same argument. For both traditions, freedom was essential. Which meant that both traditions were bound to oppose wage labor, i.e. capitalism.¹ Thus, future opponents of capitalism, whether in the 1820s or the 1880s, could take inspiration either from Tom Paine (who was quite liberal) or from William Cobbett (who was quite republican). And scholars who argue that republicanism was basically the only source of opposition to capitalism are very wrong. Especially since Christianity was also a source of opposition! And there were spontaneous popular sources too (which frequently quoted arguments from old liberals and republicans). And of course European socialist traditions became sources of opposition as well -- and they cannot always, or often, be thought of as continuations of the republican tradition.²

It can’t be emphasized enough that most of the early opposition to industrial capitalism (or wage labor) falls under the category of “*producerism*.” Jacksonian Democrats, many liberals and republicans, the early Workingmen political parties, the early Republican party, the Knights of Labor, the Populists, etc. People shouldn’t have to rent themselves, they should be independent, productive property-owners, and bankers and speculators should be deprived of their power, etc. It wasn’t for a *long* time that the sophisticated Marxist understanding (wage labor vs. capital) was widely accepted in the labor movement. Twentieth-century fascists were still seduced by the producerist way of thinking. And, now that I think about it, “populist” currents in American society are *still* basically producerist. The ideology’s appeal is understandable: far-away parasites are leeching off the hard work of us ordinary folk. And “us ordinary folk” do, after all, want to make money and often own small businesses, etc., so a maturely anti-*capitalist* or socialist ideology is less attractive. Some variant of producerism is the alternative.

...“Nineteenth-century populism³ meant something quite specific: producerism; a defense of endangered crafts (including the craft of farming); opposition to the new class of public creditors and to the whole machinery of modern finance; opposition to wage labor. Populists inherited from earlier political traditions, liberal as well as republican, the principle that property ownership and the personal independence it confers are absolutely essential preconditions of citizenship.” But it’s misleading to say that populism -- i.e., an ideology and movement of the “people,” not just of a specific class -- is an inheritance of various intellectual traditions. It is just as much a “spontaneous” product of certain economic and social conditions, i.e. something that arises amongst people who have no exposure to traditions of European thought.

¹ Well, the type of liberalism that Adam Smith embodied accepted wage labor, an intricate division of labor, etc. But even Smith had definite reservations about these things, and deplored phenomena that later became characteristic of industrial capitalism.

² Aside from all that, “ethical-aesthetic” and Romantic sources existed too (arguably having affinities with republicanism). But they usually manifested themselves in art and philosophy, not social struggle. At least not until fascist leaders and intellectuals came along later. (One shouldn’t forget, either, the obvious conservative, semi-feudal sources of opposition to modernity. These were closer to the “ethical-aesthetic” opposition than anything else. Think of Edmund Burke.)

³ He uses the term in a much broader sense than the agrarian kind of the 1890s.

Liberalism, republicanism, democracy and so on are *human*. People who have never heard the words will arrive at the same ideas, because the ideas are common sense. Expressions of the urge for freedom.

Lasch has a stimulating discussion of the eighteenth-century Calvinist Jonathan Edwards (in whose tradition he places Emerson). Query: what is original sin? Does it consist in specific crimes we commit, such as Adams's bite of the apple? No. It lies "not in specific transgressions so much as in a rebellious, disbelieving heart. Thus even infants have a 'malignant nature, though incapable of doing a malignant action.'" People want to be happy, they think they have a right to be happy; their lack of happiness, therefore, causes them to resent God.

Rebellion against God, Edwards argued, was simply the normal condition of human existence. Men found it galling to be reminded of their dependence on a higher power. They found it difficult, moreover, to acknowledge the justice and goodness of this higher power when the world was so obviously full of evil. To put it another way, they found it impossible (unless their hearts were softened by grace) to reconcile their expectations of worldly success and happiness, so often undone by events, with the idea of a just, loving, and all-powerful creator. Unable to conceive of a God who did not regard human happiness as the be-all and end-all of creation, they could not accept the central paradox of Christian faith, as Edwards saw it: that the secret of happiness lay in renouncing the right to be happy.

Edwards's theology rested on careful observation of what happened to people -- himself first of all -- who renounced their claims on the universe.

The appearance of everything was altered; there seemed to be, as it were, a calm sweet cast, or appearance of divine glory, in almost every thing. God's excellency, his wisdom, his purity and love, seemed to appear in every thing; in the sun, moon, and stars; in the clouds, and blue sky; in the grass, flowers, trees, in the water, and all nature....

In a "personal narrative" of his own conversion, Edwards recalled how he "used to uncommonly terrified with thunder, and to be struck with terror" at the approach of a storm. The acknowledgement of God's sovereignty transformed his terror into gratitude and wonderment. "I felt God, so to speak, at the first appearance of a thunder storm; and used to take the opportunity, at such times, to fix myself in order to view the clouds, and see the lightnings play, and hear the majestic and awful voice of God's thunder,....leading me to sweet contemplations of my great and glorious God."

These words help to clarify what Edwards meant by "consent and good will to Being in general" -- the essence of "true virtue," as he called it in his treatise on that subject. "Consent" implied a love of God's creation in and for itself, without regard to the ways it thwarted or seemed to encourage human designs.Love of God, not love of mankind, was the "primary" meaning of faith, just as sin, the rebellious antithesis of "consent," was first of all an offense against God, not against humanity or particular persons.... "True virtue primarily consists, not in love of any particular Beings because of their virtue or beauty, nor in gratitude because they love us; but in a propensity and union of heart to Being simply considered; exciting absolute benevolence....to Being in general." Man has no claim to God's favor, and gratitude has to be conceived, accordingly, not as an appropriate acknowledgement of the answer to our prayers, so to speak, but as the acknowledgement of God's sovereign but life-giving power to order things as he pleased....

....Edwards stripped God of personal attributes.... God was simply "being in general." As such, he was "absolutely perfect, and infinitely wise, and the fountain of all wisdom," and it was therefore "meet that he should make himself his end, and that he should make nothing but his own wisdom his rule in pursuing that end, without asking

leave or counsel of any.” Virtue, then, lay in the joyous affirmation of the beauty and justice of such a God...

Wise thoughts, reminiscent in some respects of ancient Buddhism, Spinoza, and other profound traditions. As I wrote in my “satire” on the book of Job, happiness will come only when we stop grasping for happiness. (“Happiness is like an eel, slithering from our desperate grasp.”) It will come when we embrace *wonder*, when we look on the world with awe and gratitude. In this sense, yes, love of “God” (Being) might mediate love of humanity and even, to an extent, of self.¹

It’s true that the most important thing in a world of suffering, the most moral thing, is to work to eradicate suffering. But this can be done on the basis of something like Edwards’s ideas or Albert Schweitzer’s Reverence for Life or, more broadly, the sort of capacious, wonder-full, universally affirming attitude that these philosophies are supposed to express. You can reason and write and preach and poeticize as long as you want, but the only real value of such meditative excursions is their expressing and fostering the very simple attitude of “joyous affirmation,” “absolute benevolence,” and profound *care*.

But of course you don’t even need that, unless you personally need it. You might as well just try to help people.

...Edwards is right that self-love is the basis of “a mature conscience [and] the source of man-made morality.” For one thing, we have a tendency to obey social (and institutional) norms because by doing so we get people’s approval, which reinforces and expands our self-love. More interestingly, concern for others -- as well as the very ability to act according to norms, to take into account in your behavior people’s expectations and reactions -- is based on the capacity to internalize in some degree people’s self-love + experiences (i.e., their “perspectives”), or, what amounts to the same thing, to project one’s own self-love (or loved self) onto others. How else could it be unpleasant to observe others’ pain, or why would it give us pleasure to be in the company of happy people? Pleasure and pain work only on the self; you can’t directly experience another’s pleasure or pain. So, in order for another’s experiences to have some seemingly immediate effect on you, it has to be by your internalizing them (more or less intensely). That’s true by definition, in fact. Thus, humans have a natural urge to treat others well because of their self-projection/other-internalization combined with the fact of self-love on both sides (i.e. your self-love and your automatic understanding of their self-love -- which are components respectively of your self-projection and your other-internalization). This sort of interpersonal dialectic is possible by virtue of the fact that in your consciousness, in your self, is an “*abstract* other,” a general diffuse otherness (the existence of which explains how you can be an other to yourself, i.e. self-conscious, namely by being implicitly aware of your particularity as contrasted with the universality of the other, or otherness, in your consciousness²). For when you encounter a concrete self, a person, your “perception” or “experience” of him -- or, rather, *he as perceived by you* -- partly occupies or “fills up” the space of the general otherness in your consciousness. Which is to say, you “internalize” him (to some small degree), or his selfhood “instantiates” a part of your consciousness. Your self-love is thus in some tiny degree projected onto him (such that you implicitly, to a very small degree, “identify with” him and his self-love) -- or, alternatively, his self-love is internalized by you. Same thing.

Sociopaths and the like are simply people who are deficient in the capacity to *affectively internalize* an other’s perspective, i.e. to care about it (however cognitively or “intellectually” they might understand it).³ Some people, on the other hand, have a higher-than-average capacity for affective internalization (such

¹ From what I’ve read of Edwards’s thought in general, it is *very* different from Buddhism and other noble philosophies. But some of the ideas above are similar.

² To say it more clearly: you couldn’t be aware of yourself as a particular self unless you were also aware (on a half-conscious level) of some general otherness, some “abstract” general other. Particularity, as such, can exist, or can be known as particularity, only in contrast to universality. See my earlier thoughts on the subject.

³ The existence of sociopaths etc. shows that we have to distinguish between types of internalization, for these people do internalize others in some way(s), only not in the relevant “empathetic” way. I’ll have to think about this stuff in more depth later.

as empathy¹), for instance, probably, my mom. Or, more extremely, the woman who reported that when observing a massage or some such thing she could *literally feel* the same kind of sensations experienced by the other. Such a person demonstrates the truth of all these ideas, for in her -- who embodies to an extreme the tendencies of ordinary people -- the extension of the (loved) self to incorporate others is obvious, not merely implicit or hidden as in the rest of us.

I need hardly point out, by the way, that self-love is integral to, or part of the essence of, all or nearly all human -- or even animal -- acts and experiences. Human tendencies are but extreme versions of animal, or at least mammalian, tendencies.

...Years ago when reading Emerson I came across Harold Bloom's opinion that Emerson is "America's philosopher" or something like that. It struck me as wrongheaded. The spirit of America and the spirit of Emerson had little in common, it seemed to me. "Progress," "democracy," "egalitarianism," American optimism, materialism, commercialism are opposed to the profundity and deep-loving spirituality of Emerson's writings. Lasch agrees with me.² Of course, I probably misunderstood Bloom's meaning. But with regard to scholars' common locating of Emerson in the tradition of progress and optimism -- Lasch calls these misinterpreters "professional Pollyannas" -- Nietzsche's love of Emerson is enough to prove the falseness or shallowness of that interpretation.

In a deeper sense, however, the fundamentally affirmative thrust of Emerson's thought suggests that it can be seen as a "heroic," spiritual, semi-religious sublimation of young America's vigor and expansiveness. Old-world Calvinism meets new-world dynamism.³

I have to disagree with Lasch's disagreement with Alfred Kazin. Lasch says that Kazin's "assertion that we can still share Emerson's 'thrill' in the 'primacy that he shared with Nature and America itself' does not strike me as terribly helpful [?], especially when it is accompanied by disparagement of Emerson as a 'sage-at-large'; a believer in 'self-actualization' and 'rapturous self-affirmation'; a closet elitist whose 'underlying contempt for those who could not live up to his revelation' offends us as deeply as his conviction that "life"...was indeed nothing but what the "great man" is thinking of"; an apostle of 'perfect personal power' whose 'trust in the spiritual life' took no account of hard material realities; and, worst of all, an abstracted, 'unctuous' ex-preacher who gave the dominant classes their 'favorite image of the literary man as someone removed from "real" life while remaining an embodiment of the idealism professed as the essence of America.'" Nearly all these characterizations of Emerson strike me as accurate, or at least highly defensible. Lasch, being an arch-traditionalist and dogmatist, is excessively eager to attack (and to mischaracterize) others' opinions even when they have at least *some* obvious validity.

But, whatever. I won't cavil. The book is interesting. It's a nice diversion to think about all these idealistic philosophies, and it's a fine thing to do occasionally if you're a privileged intellectual who has too much free time on his hands, but it's also necessary -- and refreshing -- to return to the real world. The

¹ It seems to me that not only are there different kinds of internalizations; there are even different kinds of affective internalizations. Insofar as sociopaths care about someone's opinion of them, they have "affectively internalized" him to some degree.

² But even Lasch "used to think of Emerson as a foolish optimist." A strange mistake to make. Even the essay "Compensation," which seems so Panglossian, does not express "optimism" properly so-called, or even a shallow belief in life's goodness and the world's justice. It expresses *amor fati*, a probing beneath appearances to affirm that things are essentially in measure. The good and the bad come with compensations. E.g., the rich and powerful are fearful, suspicious, harried, pressured, and eventually for them "pleasure is taken out of pleasant things, profit out of profitable things, power out of strong things," because these people "seek to separate them from the whole." -One may dislike such ideas because of their tendency to reconcile the oppressed to the world as it is -- and, after the twentieth century, *amor fati* or whatever you want to call it has become impossible -- but they aren't as shallow as you might think. Anyway, you should read the essay. Emerson's writings are too deep (whatever their flaws) to be typically "American" in the bad senses.

³ As Lasch summarizes one scholar's views, "Emerson's rejection of a tragic view of life [read: the apparent implications of Calvinism] should be seen as a hard-won advance beyond tragedy, not as the product of a mind unacquainted with tragedy or unable to conceive it even as a hypothetical possibility." On the other hand, a case can be made that Emerson passed over tragedy and into affirmation too quickly.

age of Emerson and romantic idealism has passed. Reality has become too urgent for us to take seriously these games, variations on Solitaire.

Lasch aptly remarks that syndicalism and guild socialism were the last real challenges to the wages system. (Soviet Communism was basically a version of the wages system.) “They rested on a shared belief that ‘slavery,’ not poverty, was the overriding issue of modern times.” In this respect they were different from social democracy and state socialism. Unfortunately, guild socialism in England was eventually absorbed by social democracy, while syndicalism in France “remained intransigent and unregenerate” until its collapse around 1910, after which time its former supporters gravitated toward either the extreme right or the extreme left. “For the French syndicalists, the servile mentality allegedly fostered by wage labor could be countered only by a movement that upheld discarded ideals of honor, glory, and ‘pessimism.’” (E.g. Sorel.) The paradoxical aspects of French syndicalism, such as its being radical and proto-fascist at the same time, are due to the economic circumstances of its adherents. France was still economically backward in the early 1900s, craftsmen and artisans still being prevalent. It was they who spoke the “revolutionary and syndicalist phrases,” even though in practice they were more conservative than the unskilled workers. “Their radicalism derived in part from their resistance to new machinery.” But their “moral conservatism” was strong enough for many of them to join nationalist and fascist movements later.

American syndicalism, of course, was different from the French version. It was more progressive, appealing not to artisans and such but the enslaved masses. -Incidentally, William Z. Foster pointed out that the IWW was not syndicalist strictly speaking, since it aimed to organize all into “one big union,” whereas syndicalists wanted decentralization and local autonomy. Syndicalists weren’t necessarily industrial unionists; they saw decentralization as the issue, not any particular form of organization. -Nevertheless, the IWW in its practice and ideology did surely have a lot in common with syndicalism. Just look at its Wikipedia page.

...The mid-twentieth-century liberal-intellectual cult of the “expert,” the technocrat, the social engineer (administrator), with its accompanying contempt for democracy and the irrational masses among whom consent had to be manufactured through propaganda and advertising, actually began in embryo in the early 1920s with Walter Lippmann and a small constellation of like-minded intellectuals who felt alienated from vulgar mass culture. Maybe one could trace it even farther back to the undemocratic, efficiency-fixated elements of Progressivism. It is embodied, for instance, in the founding of the Council on Foreign Relations in 1921 by Lippmann and others. Then later with the New Deal this liberal statist tradition became more institutionalized, and then much more so with the Second World War and afterwards with the “military-industrial complex” and the expansion of the welfare state. The whole tradition thus matured with the maturing of corporate/state capitalism and a stable consumer society, given the necessity of Keynesian policies and a capital-labor “accord.” All these institutional necessities used Lippmann, Thurman Arnold, Robert Lynd and many other liberal anti-democrats as their mouthpieces, their ventriloquist dummies.

One of the things I like about Lasch is his defense of ordinary people against intellectuals’ and professionals’ contempt for them. He’s basically a populist. For example, in opposition to the conventional liberal invoking of white working-class and lower-middle-class racism and their finally being (in the sixties) “prosperous enough to resent high taxes and welfare programs [for blacks and minorities] but still insecure in the middle-class status” as explanations for the conservative “backlash” against liberalism and the civil rights movement, Lasch points out that these classes have always had to “struggle to keep even,” even in the late sixties and seventies, and in the eighties their economic situation got worse. Contrary to what both liberals and conservatives have thought, since the seventies the middle class has been shrinking, not growing. Thus, lower-middle-class whites were not only victims of “status anxiety” but had real economic grievances that they thought were not being met by the government. Moreover, anti-busing activists in Boston and other cities were not always out-and-out racists; they were concerned about the safety of their streets and the impact of desegregation on their schools. “In city neighborhoods where anxiety about these things has become a way of life, the attempt to achieve racial justice through busing and affirmative action presents itself as a contest between ‘rich people in the suburbs,’ as Louise Day Hicks put it at the height of

the Boston school wars, and the plain people of the city -- ‘the workingman and woman, the rent payer, the home owner, the law-abiding,...hard-working, forgotten American.’” Imagine what the reaction of suburbanites would have been if black students had been bused not to inner-city white schools but to suburban white schools! *Then* who would have been the “racists”??

Nevertheless, one should be cautious in one’s appreciation of the modern white working class and lower middle class. It remains true that these people are susceptible to divisive cultural and racial politics (but so is the more affluent middle class), that in their politics they often shoot themselves in the foot, and that in a different time and place most of them would have belonged to fascist parties. Still, they do have genuine economic grievances that propel their discontent, grievances more real than those of the Phyllis Schlaflys of the world.

“From the point of view of those [whites] who lived in deteriorating urban neighborhoods, liberals were not only indifferent to their needs but actively hostile, bent on destroying those neighborhoods if they stood in the way of racial integration.” For the working class and lower middle class, their neighborhoods were and are their world. Historically these groups have actually been more interested in preserving their communities -- perhaps with a little more security and money -- than in seeking upward mobility. So it’s understandable that they would revolt against a culture that seemed to threaten the things they held dearest, including their self-respect and their ethnic solidarity. As one worker said in the seventies, “The liberals and the press look down on hardhats like me, but we’ve invested everything we have in this house and neighborhood.” Urban renewal programs, too, were destroying old ethnic communities in the sixties and seventies.

In light of liberalism’s inability to solve the growing economic and other material problems of all these lower-class whites, it isn’t at all surprising that many white workers would turn to political conservatives who at least seemed to share their social values, were not disrupting their communities with school busing, gun control, the banning of school prayer, etc., and did not share the “anti-Americanism” of “privileged” antiwar activists and those long-haired hippies. The rise of conservative populism was utterly predictable -- especially when it was backed by suburban wealth and political connections and the enormous power of conservative sectors of business.

Most of these socially conservative lower-class whites were fairly radical in their economic views, favoring a general redistribution of income. They did support California’s tax revolt, but it was regressive property taxes they opposed, not the federal income tax.

Don’t forget, too, that liberals in the eighties pressed for heavy taxes on tobacco, beer, and hard liquor, “the traditional consolations of the working class.” Not surprising that this alienated much of the New Deal’s constituency, as yet another sign of government interference in their lives. On the other hand, had a true populist political party existed, a party in the radical tradition of old Populism, most working-class Reagan-supporters might well have switched their allegiance. Instead they had to make do with conservative pseudo-populism, which, in order to avoid stirring up the old populist hatred of big business, blamed society’s ills on a “new class” of intellectuals, bureaucrats, and liberals, supposedly allied with black “welfare queens” and other parasites.

As an aside, Lasch makes the excellent point that the “private sector” is misnamed. Much or most of it isn’t private but public, relying on money from the government, money taken from taxpayers. --Lasch is basically a confused thinker, but every so often he illuminates. (His whole book, by the way, consists, more or less, in his grinding his little ax against the ideas of liberal optimism and endless economic expansion. We have to celebrate *limits!* Human limits! Spiritual discipline! Republican *virtù!* Etc.! It’s like, sure, I’m in favor of those things too, but *wow* does this guy have an ax to grind. And *wow* is he an idealist in the bad sense. And *wow* is his polemic against Marxism misguided and one-sided.)

March

Reading Roger Horowitz’s “*Negro and White, Unite and Fight!*”: A Social History of Industrial Unionism in Meatpacking, 1930-90 (1997).

Sex with Amy. One of those passionate artists. It's incredible how much some women enjoy sex, and how frenzied they can get. [...]

Anyway, Amy and I have nothing in common. So that's that.

*

The politics of nostalgia.-- There is a nostalgia of the left and a nostalgia of the (populist) right. The former imagines a lost time of relative freedom and equality, or harmony between people(s), or environmental purity before industrialization, while the latter imagines a lost time of clear and harmonious social hierarchies and ideological certainty and uniformity. The right, however, seems to take far more interest in its nostalgic fantasies than the left. It constantly invokes religion and tradition, whereas the left rarely wastes time on backward-looking justifications but simply strives for change or to preserve threatened forms of popular power. This contrast is reflected in labels: the right is "*conservative*," the left "*progressive*."

It's partly because nostalgia is such a powerful feeling that conservative populism -- the populism of the middle classes, from lower to upper -- has been a potent force for almost two centuries. Fear and resentment, however, are just as essential to conservative populism as "nostalgia."

*

"Free at last, free at last! Thank God Almighty, I'm free at last!"-- When I step into the fresh air outside after enduring a three-hour-long class on gender and sexuality or the history of occupations or some other academic subject, I can almost literally feel myself breathing anew the air of intellectual freedom. I swell with love of the open world and of free thought. The academic dungeon, a dark and claustrophobic place, is forgotten. No more nodding appreciatively with a serious look on my face; [...] no more institution-thinking. The moment you bring up anything *real* in these discussions or refer to general implications, people either lose interest or get offended. Implications are not what interest them; the question "Why should we care?" is not in their arsenal of interrogatives (which is otherwise so well-stocked). They just talk and talk about....what happened, when it happened, how it happened, how the author could have improved his or her analysis of it, what parallels there are between some little thing and some other little thing. And all this archival work that people do, all these monographs published all the time on every conceivable little subject....so much of this stuff is, as Chomsky says, little more than clerical work. Not much creativity going into it, a lot of the time. There's more creativity in being, say, an auto mechanic, figuring out how to make an engine work, using your hands and brain to find a solution to something. But intellectuals need something to do, so they get together in their glorified book clubs (seminars, conferences, etc.) and talk about the details of the details of something that happened in some place sometime, making sure not to stray beyond the norms of what is institutionally acceptable. --It's even worse, by the way, in Philosophy.

So, in short, I step outside and am refreshed.

*

The tyranny of capital.-- The stripping of public-sector workers' collective bargaining rights in Wisconsin, while hardly surprising, bodes ill for America's labor movement. "As Wisconsin goes, so goes the nation" -- at least, historically.

To take one current example: In Michigan, "Governor Rick Snyder and the Republican-dominated state Senate passed, and sent back to the House, legislation today that allows Snyder to declare a local city to be in a financial emergency and appoint an emergency manager. That manager can, without anyone else's approval, cancel contracts, including collective bargaining agreements, force consolidation of schools, townships, cities and counties and, unbelievably, unilaterally remove local elected officials.... The

bill even allows Snyder to appoint a corporation as the emergency manager.” So corporations will be able to own and control towns. The *reductio ad absurdum* of privatization.

*

Ideas and social causation.-- In circumstances of a breakdown in public order or an exceptional state of fear and insecurity among a people, ideologies have a remarkable power to motivate. Ordinarily, however, it is not ideologies but simply institutional norms, as well as basic human desires and needs, that motivate and guide behavior. Actually, even in “ordinary” times it’s true that social movements are motivated by ideologies -- but *whenever* ideological motivation comes into play, material and institutional facts remain the fundamental causal factors. They structure the situation; they determine that a particular ideology will be accepted by the masses, due, for example, to the unequal allocation of resources between competing institutions propagating competing ideologies (so that the institution with greater access to resources will tend to have more success in its propaganda). Or, on the other side, people who want to escape from political or economic oppression will gravitate towards an ideology that focuses their (material) grievances. One can almost infer from the proportional distribution of ideologies in a society which sets of institutions have what degrees of economic power.

*

More on “idealism” versus “materialism.”-- To talk about ideologies and discourses, “ideological foundations” and discourses of class, gender, race, and politics, focusing your analysis entirely on language and symbols, is to be supremely asocial and ahistorical. To take an analogy from a “discursive practice” dear to my heart: it is like drinking only the foam atop a mug of Guinness, leaving the beer inside. [Discursive practice because beer drinking usually involves talking as well.] Actually, in such analyses it is impossible not to presuppose institutional relations; otherwise you would be dealing with a social vacuum of ideas and individuals’ psychology. Just a lot of ideas and symbols floating around, some of them being unaccountably “preferred” by certain people and others by others. The origins and meanings of discourses and self-understandings are explained by the complex of people’s interrelationships, which are structured according to institutional relations. Working-class “discourses” of mutualism arise primarily out of production relations: workers in a factory are “structurally” tied together in ways that define them in opposition to their employer, that condition their outlook towards the community and themselves, etc. Assuming these production relations, you can make sense of workers’ ideologies and discourses. It is true that in order to operate according to particular institutional relations (at work) workers have to communicate and so forth, but the ways they communicate are determined, or conditioned, precisely by the necessities of their institutional interrelations.

(Again, though, some institutions or social structures are more “necessity-governed” than others. Production relations are relatively inflexible; familial relations are relatively flexible, which means that subjectivity and freedom have a greater role to play, at least potentially.)

*

A voice from Vietnam.-- “While we worked in the rice fields, my mother taught me everything I had to know about life. In the West, for example, people believe they must ‘pursue happiness’ as if it were some kind of flighty bird that is always out of reach. In the East, we believe we are born with happiness and one of life’s important tasks, my mother told me, is to protect it. It seemed strange to me, then, when the Catholic teachers told us that little babies were ‘born in sin’ and must spend their lives struggling miserably to overcome it. How can one be happier than a little baby?”

*

A lesson from an analytical genius.-- Marx almost never used the word “capitalism.” He always used “the capitalist mode of production” (or *kapitalistische Produktionsform*). This is good analytical practice, given the vagueness and cultural connotations of “capitalism” as opposed to the precision and strictly economic connotations of “the capitalist mode of production.”

*

Slavery and capitalism.-- We look back now at slave societies in wonder and horror, wondering how it was possible that it was seen not only as necessary but as *good* that people were forced to sell themselves to other people just to survive. It doesn't occur to us that what we have now operates on the same principle: people are forced to rent themselves to others in order to survive. If it is morally wrong to (be forced to) sell oneself, it is morally wrong to (be forced to) rent oneself. The Lowell mill girls in the 1830s were wiser than our elite liberal intellectuals now; they understood that wage-labor is essentially wage-slavery. Whether a black slave was treated well or badly by his master did not affect the *principle* of the thing; similarly, whether an employee makes a lot of money or a little doesn't obviate the moral horror of having to rent oneself.

*

Unavoidable immorality.-- I can't escape the impression that for me to be happy when others are unhappy is morally repugnant. If a friend of mine is depressed, what right do I have not to be depressed with him or her? What right do I have to forget his depression long enough to have fun with people? How can I be *happy* while he is *miserable*? The callousness is breathtaking. How can I walk past a hungry homeless person in the street and continue my conversation with my friend as though the hungry person does not exist? I must be a monster. We all must be monsters. In every minute of our lives we show how little other people mean to us.

*

The joys of self-objectification.-- One who reads this journal might think that the writer has a powerful mind. I know myself, however. From the inside, my mind does not seem especially powerful; it seems quite weak, in fact. It is a totally inadequate mind. Hence my escape into writing.

*

Science, religion, and arrogance.-- Postmodernists and other religious people -- for postmodernism is a kind of religion, a fundamentalism, like free-market ideology and strains of Islam -- are fond of accusing reason's partisans, such as scientists, of arrogance in relation to other ways of reaching “truth.” It is ironic, therefore, that from one perspective scientists are actually the humble ones, Christians, Muslims and so forth the arrogant ones. For humility is the very essence of science. It is the *humility* of the scientific method that explains its power, and justifies its proponents' “faith” in it. Religious faith, on the other hand, is very arrogant, since, by definition, it isn't subject to continual testing and revision in the light of new evidence. It is a projection of the believer's desires and hopes into absolute truth. In other words, the believer takes himself -- his hopes, values, desires -- as the measure of truth, whereas the scientist's method is devoted precisely to suppressing his subjectivity.¹

*

¹ (Now that I think about it, I wrote down similar thoughts ten years ago. Sorry for the repetition.)

The meanings of voice-pitches.-- Mother Nature has designed humans in such a way that the pitch of their voice correlates with sexuality, i.e. with activeness or strength versus passiveness or weakness. Thus you have the deep male voice -- and the deeper, the manlier, the “stronger” -- and the high-pitched, “cute” female voice. And when a man talks in an artificially high voice, perhaps as a joke, he feels himself appearing more passive, weak, cute, feminine. Less sober, detached, in control; more in-the-moment, giggly, childlike. Children have the highest voices of all, which contributes to their incredible cuteness, the perception of their weakness and ‘having-to-be-protected’-ness. So, partly as a result, the desire is instilled in women to protect their children -- so cute and lovable with their adorable high-pitched voices and all that -- just as the high female voice instills the desire in men to protect women, so cute and lovable with their adorable high-pitched voices and all that.

*

Musical truisms.— Another obvious truth we’ve been indoctrinated out of is that musical rhythms, musical beats, tend to affect women and children more than men. (See St. Augustine, for example.) This is just common sense to any moderately intelligent observer of human behavior. For *all* people, though, to the extent that they are susceptible to music, they are not intellectually detached or emotionally detached. Other things being equal, they are more in touch with the primitive, the biologically and emotionally primitive, than music-unsusceptible people are. They have a greater potential for un-self-conscious interpersonal bonding, or loss of the self. Dionysian influences are more powerful than Apollonian. Just think of women’s and children’s crying, their need for catharsis, their immersion in the immediate moment, their emotional sensitiveness.

Dionysus is feminine, Apollo masculine. Insofar as I am emotionally or “rhythmically” or “primitively” receptive to music—which I very much am!—my mind is under feminine influences. (You see, incidentally, that “feminine” need not be a term of opprobrium.) One could spin out implications of these ideas, but I won’t do that now. You can start by reading D. W. Winnicott.

*

Speculations on love.— It’s ironic that the aspect of the mind that allows men to feel tender or sentimental or affectionate towards women is precisely the feminine aspect, just as it’s the feminine aspect of women that allows them to feel tender etc. towards men. The difference is that in men, the feminine aspect is mediating the expression of *masculine* sexual attraction, whereas in women it is mediating the expression of *feminine* attraction. Women can also express (and feel) their feminine attraction in masculine, aggressive ways, and men can of course express (and feel) their attraction in masculine, non-“tender” ways. But if love is synonymous with tender affection, it is the feminine aspect of minds (in men and women) that makes possible love.¹

Might one even say that the “soft” or “receptive” emotions are feminine, and the “hard” or “aggressive” emotions are masculine? That is, does a man who has abnormally high levels of testosterone and other male hormones, chemicals, brain-structures, etc., have relatively little experience of soft emotions like misty tenderness, sadness, sweet nostalgia, friendship-love? I don’t know. All these speculations could be wildly off the mark.

*

American anti-intellectualism.— Sixty-five years ago, Anais Nin observed that Americans were less interesting than Europeans. Recalling this in 2011, one finds evidence of the great stability of cultures.

¹ These are not just matters of arbitrary cultural definition I’m talking about; they are substantive points about the chemical and physiological makeup of brains. Science is at far too primitive a stage to substantiate them, however.

*

The closest thing to a saint.— One of the things I admire most about Chomsky is that a man of his moral and intellectual caliber, as close to personified purity as humans can get, has devoted most of his life to studying the sordid world of economic and political institutions -- and precisely the most sordid aspects of these institutions. He has surrounded himself with mountains of data on the crimes of power-structures, a nauseating record of infinite hypocrisy and crude economism. Crude technocratic calculations of power and profit. One of the noblest minds and personalities in history has willingly dived into this swamp and swum around in it for decades, without losing any of his nobility. His clarity of moral vision is as sharp today as it was sixty years ago.

*

Women, on which to hone one's self-discipline.— I was about to tell you of one of my recent dozens of encounters with the frustratingly childish aspects of women's femininity, but I'll restrain myself. Why descend from the universal to the particular?

*

Anti-Chomskys.— One of the most tiresome things in the world is the self-certainty, self-righteousness, and self-love of successful or powerful or beautiful or famous or "intelligent" people. It is despicably unoriginal and predictable, and almost never is it at all justified. Ultimately it's *boring*, like these people themselves.

*

The genius of Marxism.— The power and appeal of Marx's thought are explained by his fusion of science, morality, and romanticism. Three modalities of humanity -- pursuing truth, justice, and the beautiful or self-affirming -- are brought together in one great system.

*

The unrational self.-- In light of everything, nothing is more ridiculous than to think highly of oneself. In many people this self-love approaches the heights of absurdity, but even someone for whom it is measured, reasoned, tempered with self-knowledge, like me, cannot escape ridiculousness.

*

The puzzle of self-abasement.— Though I considered this question long ago, it has thrust itself on me again: what explains "the voluptuous pleasure of cringing and self-contempt," as Marx says in the context of a discussion of Christianity? How can self-contempt be pleasurable? Well, at the risk of repeating myself, I think it has to do with bringing your self-conception in line with the other's, or the world's, supposed perception of you. What the self wants, after all, is harmony between the inner and the outer. It wants its sense of self to be confirmed by the "other" (the world, people, its environment, etc.). If there is a great difference between your sense of self and the other's reaction to you, something will have to give. Such cognitive, or affective, dissonance cannot last forever. Maybe you'll assert yourself, your sense of self-value, by going on a murderous rampage against this world that has contempt for you, to force it to notice you or recognize your power or just to eradicate the thing that causes you so much torment, or something like that. Or maybe you'll become schizophrenic; your self will split up to protect itself, with an inner part that the outer world can't touch. Or you'll join a fascist movement of some sort, to destroy the part of the world that sees itself as superior to you and keeps you in society's gutter. Or, to eliminate the

contradiction that torments you, you might accept the other's negative evaluation of you, though in a different way than the schizophrenic does. That is to say, you'll alleviate the tension in your mind by no longer resisting the other's contempt for you but internalizing it, though not in such a way that you overtly split yourself up. By having self-contempt, you can at least experience the pleasure of having your sense of self be confirmed by the other, even if it isn't the sense of self you'd like to have and originally had. But since the self *has to* value itself on some level, however implicitly, its "chosen" self-contempt is precisely a means to that end, a last desperate refuge of self-love. For by bringing the inner and outer into harmony, the self is asserting its claim to belong in the world. It is saying, "I am one of you, you despisers of me! I agree with you! In loathing myself, I am just like you, you valuable people (or valuable abstract Other(ness)) who despise me. So, *like* me, at least a little!" Thus a piece of the self is salvaged from the wreckage, viz. the piece that looks down on the self. *This* at least has some value.

Or, from another, simpler perspective, the descent into self-contempt can be a way of accepting yourself. No longer do you struggle to be someone you're not; you accept that you're weak and small, and such self-acceptance brings comfort. Maybe not *enough* comfort, since eventually you might end up killing yourself due to insufficient self-love, but it is at least more comforting than constantly having to tell yourself that all these people who ignore you or laugh at you are wrong, that actually you're strong and valuable. Struggling with yourself, tormenting yourself like that, being full of self-tension due to the contradiction between your desire to love yourself and people's contempt for you -- that can be horrible. It's much easier, like a relief, to accept yourself in your shameful little essence. And then you thereby are able to find new pleasures, new vindictive, revengeful pleasures, as by imagining bringing people down to your level, plotting petty tricks on them, thinking malicious thoughts like the Underground Man. Imaginary wish-fulfillments, putting you and your enemies on the same level or raising yourself above them, as by physically torturing them (in imagination at least) or provoking them to act in petty ways like you.

Religious self-abnegation or "self-contempt" can be very different from all this, though. It can entail raising yourself up to try to commune with God, to love him and be loved by him. You have scorn for your physical nature but love your higher self. But what about severe self-flagellation? I.e., outright masochism (emotional and physical). How do you explain that? I forget what I've said in the past. The starting point for an explanation is that masochism is an expression of self-love -- self-love perverted into self-violence. In at least some cases, physical self-flagellation is a way of confirming your reality to yourself, a kind of intense self-assertion. Extreme self-affirmation, paradoxically. It takes an extreme form because you feel extremely dead, empty, nonexistent. Its use in extreme religious sects is understandable, then, given that these people spend their lives obsessing over their nothingness and worthlessness as compared to God. When they flagellate themselves, the contrast between their ordinary sensory deprivation (and self-deprivation, mental deprivation) and sudden over-stimulation, extreme self-activity, might well launch them into some twisted ecstasy. Their sudden perception of self-reality, so real that it's *painful*, can probably approach mystical ecstasy.

*

More masochistic puzzles and paradoxes.— Masochism surely is not always an expression of self-love. Authentic self-disgust or self-hatred can also motivate it, right? But what is the relation of these things to humans' underlying, sometimes repressed, self-love? It depends, because all such feelings have a different meaning depending on the context.

Ordinarily, of course, moments of self-contempt or self-hatred are unpleasant, something you struggle against. They happen through your temporary internalization of the perspective of an other who hates or has contempt for you. You momentarily understand that other's judgment of you, but probably you overcome it and convince yourself of your worth pretty quickly. In the case of someone like Dostoyevsky's Underground Man, however, his self-contempt is itself mixed up in his self-love, not necessarily opposed to it. In a way, yes, it is, since he probably still resists it in certain moods, etc. But in another way, he loves his self-contempt; it is comforting, it possibly allows him to feel superior to other people (because of his greater sophistication, self-knowledge, self-critical intelligence, etc.), it makes possible malicious pleasures

and the pleasures of brooding self-involvement, etc. Someone like Marmeladov, on the other hand, who is weaker, probably thinks on some level that his self-contempt sort of ingratiates him with people because he knows they have contempt for him. They'll like him (he thinks) at least a *little* if he doesn't resist their judgments of him. He's not resisting the world, he's accepting it. So to that extent it should accept him too, as part of it, or as a confirmation of it. To take a more concrete example: when a husband (e.g., Marmeladov) lets his wife beat him out of anger at his drunkenness or uselessness or infidelities or whatever, what is going on in his mind? He is thinking "I deserve it." But what does that really mean? It means he wants to be punished. It makes him feel better. By being beaten, he is atoning, washing away his sin. He is making things better with his wife, showing that he accepts ("confirms") her condemnation (hence her self-love, her desire to assert herself and be proven right) and thereby hoping she will forgive him and accept (confirm) him (his self-love) again. Or, to say it differently, if she can just let out her rage on him she'll feel better, and he'll feel better. There will no longer be the barrier between them of his shame and her resentment; he will no longer have to rebuke himself or feel bad about himself, at least to the same degree, because *she* will no longer hate him (for he has accepted and shown that he agrees with her anger, disgust, etc., which makes her feel better about *herself*). In short, his acceptance of her anger makes her feel better about herself (because, after all, his prior actions seemed to express contempt for her) and restores, to some extent, her fondness or love for him (maybe she "forgives" him), which makes him feel better about himself. Moreover, because he loves her and cares about her happiness, he simply felt guilty about causing her pain. By his showing contrition and letting her cause *him* pain, he is equalizing things again, so that she will not have to feel bad about herself (which she did implicitly, if not explicitly).

Anyway, to return to the idea that "masochism" is probably not always a mutated expression of self-love but sometimes arises from simple, unmediated self-hatred.... How do you clarify when it expresses self-love or at least helps restore it and when it doesn't? Maybe the latter, after all, is never the case. If someone simply *hates* himself (to the extent that his self-love has become totally repressed and unconscious), won't he just want to destroy himself instead of give himself pain?

*

At the risk of repetition....-- Self-love is the foundation of the self. In wanting recognition or self-confirmation, which is the self's essential urge, what you want is objective confirmation of your self-love. This achievement has to be mediated by the other, first and foremost by the abstract otherness in your consciousness, which (otherness) is a part of you. Thus, you yourself, your (self-)consciousness, is the fundamental mediator of the fulfillment of your own urge to "prove" your self-love (to test it and confirm its truth). You undertake this self-imposed project through self-activity, in every moment of the day. If your self-activity is "successful" (as judged by you, hence by the otherness in your consciousness), your self-love continues or increases (at least momentarily) -- though quite possibly only on a half-conscious level, because ordinarily all this stuff is merely implicit. Generally speaking, your constant self-activity is more or less constantly effective to some degree; you achieve your purposes, you act on and in the world, you communicate with other selves, and your reality and effectiveness are proven. To the extent that all this is stable, your (implicit) self-love is stable.

When you're in the company of others, they partly instantiate the abstract otherness in your mind, which entails that their reactions to you condition your reactions to yourself (because, again, your mind's otherness (to itself) is part of you, part of the self). The more "significant" these particular others are to you, the more their reactions condition your self-reactions and so have the potential to reinforce or upset your self-love. A significant other -- in the relevant sense (different from Winnicott's) -- is in part a person who exemplifies more than other people the vague half-conscious "idea" you have formed in your mind of a "valuable" person (which idea is, to a rough initial approximation, precisely the implicit otherness that accompanies you at all times¹), and in most cases someone you personally know and who probably cares

¹ In a sketch like this I don't have to be obsessively rigorous. But analytically speaking, the ill-defined, merely implicit, abstract "idea" in your mind of the sort of "valuable" person whose opinion matters to you is different from the diffuse

about you (but not necessarily), etc. Basically, I'm talking about someone you respect, whose opinion you value. The more "significant" a person is, the more complete is his or her instantiation of the "valuable" (and "abstract") other whose ill-defined "idea" implicitly accompanies you always. For example, if you deeply love and respect your girlfriend, when you're with her (or even not) your consciousness will tend to affectively "exhaust" itself or immerse itself in her, leaving little of a "remainder" (as there is when you're with people less important to you). Your consciousness will be less self-sufficient; she will take up much of the "space" in it devoted to the (valuable) abstract other(ness) (which ordinarily isn't taken up by, or associated with, any one person in particular). Which means that her opinion of you will matter to you very much.

Anyway, these are only notes. Were I to write an essay on the subject I'd try to clear things up, to the extent that it's possible. (The human mind is complicated, and phenomenology is hard.)

One final point. I have been talking about a "valuable" other (as judged by you), whether concrete or an "abstract" (general) unconscious conception in your mind, but I haven't said what *makes* an other valuable. The answer is: your unconscious or half-conscious impression that he or she exemplifies self-love, self-reality, self-effectiveness, self-certainty, self-coincidence, a sort of *solid, real, objective, deep, [confirmed]*¹ selfhood [**and self-love in particular**] (on the basis of such things as his or her self-confidence, intelligence, wit, good looks, popularity, and physical size and strength). As when I said years ago that "charisma" has to do with the (implicit) impression that a given person has "*more of a self*" or more "*depth of self*"² than most people. It's true that you might not really care what a particular charismatic person thinks of you, or you might not "internalize" him much -- a fact that might seem contrary to the ideas above -- but, after all, some given charismatic person (who, to that extent, tends to be implicitly seen as a "valuable" self) might not exemplify your own unconscious or half-conscious notions of a valuable self. For me, Noam Chomsky is infinitely more closely associated with the general other(ness) in my mind than, say, Bill Clinton. I've internalized Chomsky; I haven't internalized Clinton. This isn't because Chomsky "loves" himself more, as a crude interpretation of my ideas above would suggest; it's because I implicitly judge that "objective truth," or "objectivity," and his selfhood [**or self-love**] coincide relatively closely. His behavior and self-expressions project a kind of reality, certainty, "objectivity," "objective self-love" or "self-presence," "objectively self-loving (or self-certain/self-present) otherness." Since every self's project is to confirm itself (its *self-love*)³ objectively, by being reflected in a real, objective other or others, and since Chomsky's self implicitly seems more real and objective or "otherly" to me than other selves [**or, more exactly, his self-love implicitly seems more "objectively true" or "justifiable," real, confirmed**], I use his self more than others to confirm myself. That is, I internalize to a relatively high degree his self

otherness that structures your consciousness, even though the two are very closely related, in fact extremely hard to distinguish phenomenologically (i.e. if you introspectively examine your own mind). The difficulty in distinguishing them may be due to the fact that your conception of the type of person that is valuable is not really an *idea* at all; it is essentially unconscious, and is revealed only in how you react to people. You ignore person *A* -- you don't "internalize" him much, you're not impressed by him -- while you're very impressed by person *B* and care what he thinks of you. He instantiates to a high degree your "idea" of the valuable person. Nevertheless, because the ways you tend to react to yourself, or the value-judgments you (implicitly) make of yourself -- which, to repeat, emerge from, or are possible due to, the ("abstract") otherness in your mind (because this is what makes possible *self-consciousness*) -- are conditioned partly by the unconscious "idea" you have formed of a valuable type of person whose opinion matters (i.e., by your implicit expectation of how such a person, a valuable other, would react to you in a given moment), it seems to me that "the diffuse otherness that structures your consciousness" is very closely related to your unconscious conception of the type of person that is valuable. Perhaps they merge into each other somehow.

¹ [That's a later addition.]

² One has to use metaphors, unfortunately. My point is that, intuitively or "phenomenologically," there is more *otherness* in such a person than in "ordinary" people [i.e., his self-love seems more "objectively true" or "real," *confirmed* so to speak].

³ For example, insofar as I value myself for my ability to write, I want that to be objectively confirmed. Same with my valuing my masculinity, my philosophical talents, my political beliefs, etc. But I also just value myself period, and I want *that* to be confirmed too (e.g. through a woman's romantic love).

and its value-judgments. (Again, internalization is necessary because of the truism that the self's own consciousness is ultimately what has to judge the self's efficacy and value; but since it does so precisely through the *other's* reactions to the self, it has to *internalize* the other in order to get the job done. The self judges itself, or "recognizes" itself, through the other. And since Chomsky seems to me a particularly potent (objective, self-certain, un-self-divided, etc.) other -- although I have internalized *many*, to varying degrees, and *society's* judgments too, etc., until they have all merged into a vaguely indeterminate general other(ness) implicit in my self-consciousness -- I internalize him deeply, and he is a relatively important part of my mind's "general other(ness)" (to itself).¹

Note, by the way, the implication from the parenthesis that the self's essential project, taken to its logical conclusion of objective proof of the self's value, is unfulfillable. For the self can never get fully objective proof, because it itself mediates its awareness of the other's supposed recognition of the self's value. The self would have to coincide with the other, fuse with it, in order to get truly objective self-proof. But that's absurd. Hence, the self is always striving for more proof; it is restless, unsatisfied, undertaking self-expressive projects again and again. (Of course there are other reasons for that behavior too, psychological and biological reasons. Everything about the self can be interpreted in multiple ways.²)

Suppose the relatively "valuable" others that you internalize (or whose attitudes you internalize), thus incorporating them into the otherness in your consciousness,³ have implicit or explicit contempt for you. Suppose, for example, you're a black man sixty years ago who internalized whites' attitudes. Then you'll have some self-contempt, which you'll struggle against or try to reconcile with your self-love. [Didn't finish.]

*

More on self-love.-- A peculiar thing about self-love is that it is not only "absolute," purely *love of self*. It can be, or maybe *is*, relative to others, relative to their value. Some people in fact always tend to measure their own worth *in relation to* that of others, wanting to be better than everyone else, but this is a pathology. A healthy, natural person wants simply to be as respected as other people; he (implicitly) wants to respect and be respected by them in equal measure. However, if he is overshadowed by someone in a given situation, even the healthiest, most natural person will tend to have at least a moment of self-doubt or self-disappointment due to his apparent inferiority to the other person. Thus, self-love is, after all, an essentially relative thing. This is not because everyone is "naturally" in a kind of psychological competition with everyone else, but simply because being "shown up" by another person implies a negative judgment by the other (whether concrete or abstract) on one's worth. Actually, *any* implicit or explicit such negative judgment (not only when someone else makes you look bad) is essentially relative, for if the other looks down on you, he⁴ is thereby implicitly raising himself above you. If, say, people ignore you, or if you feel shame for some reason, or if you don't do as good a job as you'd hoped, or if you feel as though the world has rejected you, the implicit negative value-judgment puts you below the "normal" level of other people,

¹ It's ironic I keep mentioning Chomsky, because he would surely consider this whole discussion impenetrable or meaningless. Like most people, he seems to lack a phenomenological imagination, i.e. the capacity for deep introspection or "intuitive self-projection" into a given scenario.

² There are also other reasons for the unfulfillable nature of the self's "project." For example, there is no such thing as "objective value" at all. To objectively confirm one's value or self-love is impossible because the idea of doing so is meaningless.

³ In other entries I've used the word "internalize" in somewhat different ways. Maybe that's confusing. The problem is that, as I wrote above, there are different kinds of internalization. In a sense, just by being aware of someone or recognizing him as an other, you're at that moment "internalizing" him. In the stronger sense, though, you don't internalize everyone you meet. You don't "*permanently*" internalize everyone -- as a specific valuable individual, that is, whose opinion matters to you.

⁴ Or "it," if you're negatively judging yourself. For that means that no particular individual is judging you but rather the other in your consciousness. (Of course, you could say that *you're* the particular individual judging yourself, but that's superficial. More accurately, you're judging yourself *through the other's implicit judgment of you*.)

the normal level of value and self-love. The self's natural desire is to be as real, as loved, as self-certain as the objective world (which includes, of course, other people¹). It cannot literally achieve this, but being recognized as "one of us" by others, as a valued self whose recognition of others is itself valued by them, it realizes the ideal in a limited, non-literal way. For then it is at least as real and (self-)loved and self-certain as other people, though not as real and self-certain as reality itself. (God, or gods, then come into the picture. One appeals to them, these representatives of *objective reality*, for ultimate validation, the kind of validation one can't get from people. In other words, the self's inability in *our* world to confirm its self-love in a fully objective way tempts it to posit a *higher* world in which its self-love can be, and will be, objectively confirmed, when the self will finally coincide with itself by coinciding with reality (in Heaven, etc.).²)

*

"I miss you."-- What does it mean to "miss" someone? You want to be with him (or her), because then you enjoy yourself more. Why? Ultimately it's because he reflects, or confirms, your self-love to a high degree. That might be because he really likes you, or it might be because you see him as having a lot of value (due to his charisma or intelligence or good looks or whatever), such that his (implicit) recognition of your self-love (or self-value, etc.) means more to you than someone else's recognition. That is to say, you have internalized him to a relatively high degree. Thus, because he is a fairly important part of the other in your consciousness, his absence means that you feel relatively unrecognized, "empty" perhaps, as though a part of you is missing, and less loved or confirmed than when you are with him.

*

Maturity.-- One sign of "emotional maturity" is that you no longer need a high degree of explicit approval from actual others in order to feel good about yourself. You're more or less satisfied with your own self-approval (as mediated by the implicit approval of the other in your consciousness). Similarly, disapproval from other people no longer upsets you very much, or at least does not regularly make you feel bad about yourself and doubt your self-worth. Your internalization of the outside world (the "other" in a broad sense) has, over decades, become stable enough, consistent enough (in its "attitude" towards you) from moment to moment, that you have attained relative emotional stability. You no longer have to compare yourself frequently to others in order to assure yourself of your value.

For example, while in some sense I have "internalized" Chomsky, I almost never feel the need to compare myself to him, and if somehow I discovered that he thought little of me it would not upset me as much as it might have five years ago. -On the other hand, I, like you and everyone, do depend on a sort of general positive reaction from people I meet -- a semi-positive recognition of my selfhood -- for if everyone shunned me I'd start to feel like a nobody. This general positive reaction from others is an important basis for my general positive self-reaction (or the reaction of the other in my consciousness). Still, my point is that with "emotional maturity" all this becomes less fickle, less moment-to-moment, less conditional.

*

¹ Not that all other people, or even any, are necessarily seen by the self as "self-certain" or "objectively valuable" or "self-coinciding" in the desired way. But it is through their recognition that the self approaches this ideal.

² But, again, in not being *certain* of its value -- because it can't get truly objective, "ultimate" validation from people -- the self embraces the idea of Hell as a counterpoint to Heaven, as a realm where it will go if in fact, despite its present belief in its value, it actually "objectively" *lacks* value. All selves that lack value go to Hell, where they're separated from higher reality (God); the others go to Heaven, where finally they attain oneness with reality, thus having their value *truly* objectively confirmed. One's "objective confirmation" (in another self, etc.) in real life is always necessarily provisional, for reasons I laid out above and others too.

A riposte to an idealist.-- I can imagine that a contemporary “idealist” might defend the importance of ideologies by invoking the Tea Party and its Republican representatives, most of whom are definitely ideologically driven. I would respond that, yes, an ideology can be important in this way, but only because it serves the interests of some set of institutions. Sectors of business are funding and helping to organize these ideological movements because it is in their interest to do so. They are blasting society with billions of dollars’ worth of propaganda and political-campaign money. The very idiocy of the Reaganite, Tea-Party ideology, together with its popularity, is evidence of the power of moneyed interests -- because unless people had been subjected for decades to well-funded public-relations campaigns, they would not have succumbed to such a stupid ideology. Business propaganda is so ubiquitous it has destroyed people’s common sense. Thus arises an ideological movement like the Tea Party, which offers solutions to people’s material grievances that promise to *aggravate* their grievances.

So, in short, the Tea Party movement, far from being proof of the power of ideas, is proof of the power of wealthy institutions.

*

How to write history.-- When writing history, should you have in mind some particular theory, such as Marxism, or should you simply follow the “common sense” school of thought and not adhere to a specific explanatory model? I myself am very skeptical of writing history according to some theory or model. It should be enough to use your common sense to decide what things have caused a given event or situation. Unfortunately, “common sense” is contested. I find materialism commonsensical, while others are partial to idealism. Broadly speaking, of course, a historian should take account of all factors -- politics, culture, the economy, etc. He puts together a picture of a society at a moment in time; he invokes as many things as he finds relevant to that moment. The more things, the fuller the picture. -Well, that’s simplistic. Historians often choose some “*theme*” to analyze, like the politics or the religion of, say, Philadelphia in the nineteenth century. In such cases the question of “explanation” does not necessarily arise; what is being done is description. Here, common sense is surely sufficient. Even Joan Wallach Scott forgets her silly “theories” (which really don’t qualify as such in any interesting sense (as Chomsky would say)) and relies on common sense when discussing middle-class discourses about factory girls in the nineteenth century. When trying to explain something like the French Revolution, however, or any other thing that requires taking a “holistic” approach, you’re implicitly guided by basic theoretical considerations even more than when you do “description.” For you emphasize certain factors more than others. I’d emphasize the economy, others would emphasize culture. And both explanations would have value. But how do you decide which is “better”? Your criteria have to be based on a theory of some sort. I find Westad’s book on the Cold War to be explanatorily superficial because it contradicts my theory that institutional relations, and ultimately imperatives of power and economic profit, are more “basic” than the ideologies that political actors claim to follow. In fact, though, this “theory” of mine doesn’t seem like much of a theory at all; it seems like common sense! Since most scholars seem to lack common sense, it is necessary to give theoretical defenses of my approach (or my “method”). To that extent, theory has a place in the historical discipline -- namely as a justification for your prioritization of certain causal factors over others. But historians shouldn’t go around writing screeds against some method of doing history or in favor of some other method as the only legitimate one. All kinds of history have their uses, even ideological history. Just use your common sense, that’s all! ☺

*

My hope.-- History is so full of treasures, cultural and intellectual treasures, jewels of humanism scattered all over the earth -- and I’m worried they will be buried in time! So much might be lost to future ages! Our traditions are so rich, there is simply too much to assimilate. So it will all be scattered, with some people admiring this jewel, others that jewel, and most forgetting most of them. What a tragedy! It cannot be. So I have made it one of my missions to collect all my favorite jewels -- suitably re-cut and re-polished

-- and store them in this journal, to salvage them and pass them along to posterity. I want there to be *one place* to which people can go, one index, as it were. They will read about this and that, this artifact and that idea, and they will seek them out for themselves. And our tradition will reach a few more people (as will, incidentally, *truth*, of which this journal is a repository).

*

Contemporary conservatism.-- Republicans have, it is true, some things superficially in common with earlier conservatives, who espoused the positions, more or less, of classical liberals (while having forgotten the nuances, and to an extent the *spirit*, of liberalism). That is, Republicans want small government, like earlier conservatives -- but only in relation to taking care of the population, *unlike* earlier conservatives. They want the death of the people's welfare state but the growth of the corporate welfare state. *No state for the people, statism for corporations.* And that flatly contradicts turn-of-the-century conservatism. Or, to be even more precise, Republicans are not satisfied with a state in the service of corporations; they want corporations to *become* the state. They want the state and its functions to be privatized, so that democracy and public administration no longer exist. In a sense, this is the logical conclusion of twentieth-century corporate-statist trends. But it would horrify earlier conservatives, who detested the very existence of the corporation and especially the constitutional rights it had been granted by judicial activists.

*

A result of sexual evolution.-- Nature has designed women (as women) in such a way that when particularly impressed by intense masculinity their defenses sort of shut down, their hormones step up activity, their rational ego partially collapses and they lose most of their self-control, becoming "limp" almost or "swooning," so that the man can take them and have his way with them. [Think of women's reactions to Elvis Presley, etc.]

*

Aloofness.-- Aloofness is not only unpleasant; it is immoral. It means "I'm better than you; you're not valuable enough to pay attention to. So I'll ignore you." That isn't how you treat human beings.

*

Hero-worshippers coping with an irreligious society.-- Was Nietzsche's animating spirit not merely a more profound and severe incarnation of Carlyle's and Emerson's?

*

On late-nineteenth-century decadence and its sequel.-- What is the significance of the fact that in the late nineteenth and early twentieth centuries certain sectors of the middle and upper classes in Western society started obsessing over heroism, manliness, strength, military virtues, and, conversely, society's increasing effeminacy, "neurasthenia," desiccation, decadence, etc.? It was indeed a near-obsession, and it helped make possible fascism. What brought it about? Obviously imperialism helped foster the glorification of manly struggle, racial vitality and so on, but people genuinely perceived a *decline* in the vigor or health of their culture. Why? Again, imperialism breeding racism intensifying nationalism led to a fixation on the supposed dilution of the nation's purity through immigration and the presence of Jews, a concern ostensibly borne out by increasing crime rates, urban chaos and filth, social dislocation, etc. But I think that to a great extent all the worries and fixations were also a product of the traumatic contradiction between collective memories (still embedded in culture) of relatively unexpressed, unregulated, un-atomized, semi-peasantly

“spontaneous,” “carnival-esque,” semi-uproarious (see Thompson’s book), only *semi*-business-structured societies and, on the other hand, the new evolving repressive, atomized etc. social order. Western civilization was in the later throes of its transition from a post-medieval culture of full and only moderately regulated vitality (frequent festivals, carnivals, holidays, communal life, hard work, the majority of the population living according to the seasons) to a society of statist and business regulation and manifold means of instinctual repression (religion, welfare-capitalist programs of “Americanization” and such, patriotic mobilizations, regulation of holidays and pastimes of all sorts, increased policing of the streets, the beginnings of psychological therapy, mass advertising, mass education, Progressive reform movements such as temperance, etc.). Ex-rural immigrants and cities’ lower orders still had some uproarious tendencies, but they were slowly being extirpated. The essentially passive cult of *consumption* was conquering society. Consumption and ease, not self-affirming self-activity. Life, in short, was becoming more passive, more institutionalized, more indoctrinated, more atomized, with more idle free time, and more “excessive” comfort, for more people. Hence you had *fin-de-siècle* ennui and its desiccate cultural expressions. But at the same time, inevitably, you had the reactions, most of them reactionary. Cults of heroism, war, action, “superabundant vitality,” racial glory and conquest, etc. (which, again, were not only *reactions* but also served the purposes of various institutions and reinforced imperialist agendas). They had great appeal, promising remedies to boredom, resentment, and the frustration of people’s urges for community (i.e. recognition) and self-activity. Thus, in the end, fascism arose, intended at once to be a return to a more liberated society and a culmination of modern regimentation. (In this paradoxical fusion you see how it could appeal to both the masses and the institutions that wanted to control the masses.) Not surprisingly, the latter aspect prevailed over the former. Since it was regimentation/mobilization in the service of heroism, war, national rebirth and so on, it had to end in a holocaust. After the holocaust, however, the old trends continued, this time less dangerously or problematically because the old collective memories of cultural vitality had worn thin and people had finally become accustomed to modern atomized life,¹ and anyway national power-structures had learned to integrate and coordinate with each other more effectively so as to prevent another conflagration. So the old progress of “privatization” and repression continued, until in the 1960s and 1970s another Western revolt against atomization and dehumanization occurred (coinciding with more elemental revolts in other parts of the world, including America’s South). It was crushed, but its “instinct”-liberating grievances and tendencies were taken up by business for the sake of profits, with the indirect result that no such “liberatory” cultural uprisings would occur again because they had become less necessary.² The economic system had managed to make room within itself for some degree of (degraded) instinctual liberation, even as social atomization and regulation continued apace. So here we are now, with business more powerful than ever, society more atomized than ever, culture more desiccated than ever (although it has given people instinctual outlets, thus fostering social stability), and popular resistance to the ongoing destruction of civil society in as bad a shape as ever. What is to be done?

*

The narrating self.-- It’s fun to think about your life as if it is a novel in which you are the main character. What will happen to the hero in the next chapter? What adventures will he experience when he moves to a new city? Will he ever start a family or will he choose a life of restlessness and motion? How will he die? Narrating your life to yourself in this way makes it endlessly interesting. It also subtly encourages you to seek out “adventures,” to start new hobbies and go to new places, because then the narrative becomes more suspenseful.

*

¹ Television played a huge role in thus reconciling the middle classes to their generous allotment of free time, material comfort, boredom, communal fragmentation, cultural repression, and their patterns of passive consumption.

² After the 1970s, “identity-politics” movements continued but with far less disruptive potential than the earlier movements.

Freedom triumphant.-- It gives me joy to think that despite Franco's victory in the Spanish civil war and the succeeding decades of repression of the CNT and democracy, in the end fascism fell, public references to Franco's regime were banned, and the CNT blossomed again, with freedom.

*

From a review of David Foster Wallace's last novel.-- "Perhaps, he writes, 'dullness is associated with psychic pain because something that's dull or opaque fails to provide enough stimulation to distract people from some other, deeper type of pain that is always there,' namely the existential knowledge 'that we are tiny and at the mercy of large forces and that time is always passing and that every day we've lost one more day that will never come back.'" Nope. That ain't it. Such thoughts may come in moments of dullness, but they are side-effects and not intrinsic to the pain. The pain is primitive, not mediated by some awareness of life's meaninglessness. For me, the pain of something like filling out tax forms is associated with an impression of *unfreedom*. A *visceral* impression, not necessarily conscious. I am being forced to engage in something that has only a negative relation to my sense of self and my spontaneous self-expressing; the tax form is impinging on my self-contained world. Not only does it not provide me with self-confirmation; it denies me, blocks my impulses and ignores them. It is impersonal and obnoxiously not-responsive-to-me. Thus it flouts and insults my underlying self-love, my urge toward self-activity. So I'm "bored," being prevented from asserting myself (from putting my self into the world and appropriating the world into my self).

"How can these hypotheses be tested?" you rebuke me, channeling Karl Popper. "How can one evaluate Wallace's hypothesis versus yours?" You simply have to reason through the arguments, judge them in the light of what you know about human experience, introspect to detect thoughts that are implicit in your mind during moments of boredom, etc. Do you think it's likely that humans' fundamental impulse is to constantly seek things to distract them from the painful knowledge that "we are tiny and at the mercy of large forces and that time is always passing and that every day we've lost one more day that will never come back"? I don't. That strikes me as wildly implausible, for many reasons. So then you're led to my hypothesis, and you have to evaluate that one too in similar ways. Anyway, the truth of my ideas is evident from the simple fact that "I don't *want to do this!*" is implicit in my mind when I do taxes (or talk to people at a boring party, or whatever). I "*want to do something*" -- I want to express myself in *some* way, realize my self-love somehow -- but not in *this* way, because this is a *denial* of my self-love. It makes a mockery of my self-love by mocking my desires, my impulses, my freedom.

*

Violence as a tool of social change.-- Chomsky seems to argue that in general it is a mistake for dissidents to use violence in their resistance to an unjust state because the state has so much more force at its disposal that violence against it is effectively suicidal. I'm not sure I agree with him. Of course, it all depends on circumstances. In a relatively open and semi-liberal society, violent tactics might work in the long run. In the short run the state will forcibly suppress the revolts, or at least try to do so, but if they continue or get worse it might well have to accept reforms, as has been happening in the Middle East. Only in a closed and repressive society like Nazi Germany, Stalinist Russia, or the Jim Crow South in the early twentieth century is it always suicidal for a protest movement to use violence. But in such cases, protest itself is usually suicidal!

*

L'enfer, c'est les autres?-- If hell exists, it is not other people. It is the absence of other people. An eternity of not being reflected in an other. After a while, in fact, the self would simply dissolve for lack of something to contrast itself with and define itself in relation to. The general other in its consciousness,

which is essentially a half-conscious or unconscious residue of the totality of its experiences with other selves (including their expressions in books, television, magazines, etc.), would eventually lose whatever determinateness it has, which means that the self would lose its opposition to itself (in losing its internalized other), thereby losing its self-consciousness. One would revert to an animal state.

*

A riposte to a Social Darwinist.-- The person who likes people has a simple answer in response to those who justify poverty and inequality on Social Darwinist grounds (as resulting from the fact that the successful are more gifted and determined than the unsuccessful). There are many possible retorts to the Social Darwinist, but one is simply that, okay, for the sake of argument let's accept the wildly implausible assumption that luck and economic opportunities have nothing to do with it; nevertheless, everyone has gifts of some sort, whether as a mechanic, a plumber, a writer, a musician, a social worker, or whatever, and it is only a function of particular social structures that the gifts of being greedy and power-hungry and knowing how to get money and power are rewarded more than other gifts. There is certainly nothing "natural" in the idea that an aptitude for business indicates greater human worth than an aptitude for art or social work. Indeed, the contrary proposition is far more justified.

*

The superfluity of being.-- How is one supposed to be "happy" in a world that is utterly senseless?

*

A revaluation of people.-- I've always found it ironic that people sometimes accuse me of arrogance and closed-mindedness. It's even more absurd than accusing Noam Chomsky of that, partly because I'm more open-minded than he and partly because I'm even more unassuming and less cocky in my behavior. A sensible person would accuse other "ordinary" educated people of the sins that I'm supposedly guilty of, because these are the people who project arrogance and closed-mindedness. They're usually bad listeners, they love hearing themselves talk and talking about themselves, they rudely ignore people, they flippantly brush off opposing opinions rather than engaging with them meaningfully, and most of them revert instinctively to defensiveness instead of listening to the other's arguments. Ordinarily I'm unusually self-effacing and uniquely open to ideas, and yet I'm the one who is criticized. How do you explain that? -The answer, I suppose, is that I am seen as "different" and "challenging." I'm not "one of us." My ideas are different from most people's and I usually defend them competently and confidently; the combination of this "difference" and "confidence" makes me seem offensive (occasionally, to sensitive people). After all, other so-called intellectuals act similarly confidently, but since their views fit in more or less with everyone else's, they aren't criticized as arrogant or closed-minded. The most important virtue, as always, is conformism.

People get most offended when I argue in ways that are incompatible with postmodernism and relativism. When I insist that not everyone's opinion is equally justifiable, that some people are wrong and others right -- and that I'm in the "right" category. Then they always say, "What makes you so certain you're right? Lots of people in history have thought that, but they've been wrong." So I retort that *their* wrongness doesn't entail *my* wrongness. I also point out that everyone, not only I, thinks he is right and that people who disagree with him are wrong. (For example, Democrats think Republicans are wrong and vice versa.) I suppose the reason I'm attacked and they're not is that I take an almost wholly adversarial stance toward conventional wisdom; I question everyone and their postmodernist framework itself. It's true, too, that I can come across as dismissive of postmodernist positions I've heard espoused ten thousand times already.

Another factor is probably that I'm ordinarily seen as not identifying with other people, as being, perhaps, a little aloof. Really I'm just introverted, at least in group situations. I'm content to let others do most of the talking and clowning around.

*

Hyper-history.-- When I think about my past, it seems as though I used to live in a different world than I do now. Both internally and externally. The contemporary world enters a new era every five years or so. From 1994 to 2000: a new world. From 2000 to 2005: a new world (what with 9/11, Iraq, etc.). From 2005 to 2011: a new world. The changes in my own head have been even more dramatic....even though, paradoxically, I'm not all *that* different from how I was ten years ago.

*

A strange change.-- The approaches of the Western working class and the middle class to raising children have undergone near-reversals over the last hundred years. It used to be that middle-class parents were overly strict and repressive with their children, especially in the Victorian era, while working-class parents were laid-back and permissive. Now, the latter tend to be cruel and strict with their children (think of black or lower-income white mothers loudly scolding and slapping their children on the bus), while the former spoil theirs. When and how did this change take place? To be fair, I should acknowledge that working-class parents seem to fluctuate between negligence -- perhaps somewhat like their forebears -- and authoritarianism. Was the middle class still relatively authoritarian in the 1930s? Probably the 1960s and 1970s caused the decisive change in that regard, from mild authoritarianism to permissiveness, "liberation," etc. But things had already changed drastically between the 1910s and the 1940s. Mass public education and the welfare state must have played a role in undermining paternal and parental authority. World War I probably also undermined strict Victorian norms and puritanism, middle-class propriety, repression of the instincts -- and then the Roaring Twenties, the Jazz Age, the advent of mass advertising, movies, the democratization of culture partially liberated middle-class children from the parochial authoritarianism of the Victorian household. The 1950s, with their Cold War emphasis on authority and tradition, saw a partial regression, but authority was exploded in the 1960s (for reasons I discuss in my paper above). With astonishing swiftness, the demise of authority was institutionalized in the economy, for example in the forms of rampant sexuality (exploiting sex for every conceivable marketing purpose) and the fetishizing of youth and beauty.

What about the working class? When did its ethos change from exuberance, boisterousness, spontaneity, communal conviviality, to resentment and mean-spiritedness? To an extent, these opposites are caricatures of reality. But there is some truth to them. Insofar as they're true, I would say that the change started to occur in the 1950s and progressed with deindustrialization in the succeeding decades. Ironically, it seems that it was with workers' economic victories through the institutionalization of collective bargaining, the welfare state, and the bureaucratization of work and benefits that their culture grew impoverished. It lost the *joie-de-vivre* character it had had even in the 1930s. More exactly, the change is probably a consequence of the destruction of a genuine, grassroots labor movement in the late 1940s and 1950s, the destruction of semi-autonomous enclaves of working-class culture due in part to the advent of television and the corporatization/privatization of society -- as embodied, e.g., in auto companies' and governments' destruction of public transportation (for instance in Los Angeles, starting in the 1940s) in favor of highways and private automobiles. With "privatization" inevitably comes alienation, boredom, frustration, resentment and envy of people who have wealth and power, political apathy, a feeling of impotence, perhaps hopelessness, the sense that one has to rely on oneself and others are untrustworthy, the sense that one has to "look out for Number 1" and not care about others, etc. All this breeds a poisonous culture and a destruction of communal spontaneity. When combined with the ongoing scourge of deindustrialization, increasing poverty, an inability to improve one's prospects in life, business propaganda that tells you everything is the fault of government and "liberal do-gooders," a popular culture that is violent, hedonistic, and degrading to women, the proliferation of drugs and gang violence, police brutality, etc., it isn't surprising that improper parenting is the result.

*

“Spontaneous” women.-- A good way of putting it is to say that women tend to be more “*excitable*” than men. Naturally, not only due to socialization. Men are more “sober,” women more excitable. To quote a book I’m reading, “‘There is no doubt,’ one member of the constabulary testified [in 1879 before a Select Committee on intemperance], that ‘men may be said to carry their liquor more quietly than women.’ Nor was there much doubt that it was ‘the fact of the greater excitability of temperament upon the part of women’ that accounted for the high proportion of arrests of women that had been recorded in cities such as Liverpool, Manchester, and London.” Women’s and children’s excitability accounts in large part for their “cuteness” and attractiveness to men. (Actually, children are even more excitable than women; therefore, not only men but women find them adorable.) It also helps account for the universal half-conscious impression that they are somehow “subordinate” to men or tend to have “less of a self” than men, less self-certainty or “self-presence,” less of a *presence*. -Again, these are only tendencies -- but easily observable ones. In groups, for example, or meetings, a man’s contribution tends to have more weight than a woman’s. I’ve noticed that a woman might make a suggestion and she’ll be ignored, whereas a man who makes the same suggestion a minute later will be listened to.¹ He has a “weightier” presence.

Incidentally, these things are not always true. I, for example, pay more heed to less-noticed people than others do; I often ignore the charismatic person, who has enough attention on him or her already. But I’m unusual in this regard.

*

April

Email exchange:

Professor Chomsky,

I’m curious about your thoughts on a subject that has always puzzled me, as it has many philosophers and scientists. Modern science teaches us that “secondary qualities” do not inhere in external objects or “things in themselves,” but that they are constructed by the brain through its manipulation of sensory data. The world we perceive is not the world in itself. I see a black table, but “really” what is out there are molecules, electromagnetic waves, etc., not the object I see. So, when I turn around, for example, and look somewhere else, the table is “gone”; what remain are the only elements that were always there, namely the colorless particles and waves that physics postulates. Thus, in a sense our brains are massively deceiving us, somewhat like Descartes’s demon, in causing us to think that the objects we perceive have real, mind-independent existence. The world in itself has almost nothing in common with the world we perceive.

I don’t see any other way of interpreting modern science, but I’m curious if you disagree. Thanks for your time.

¹ The same is true with regard to me. My input will quite possibly be ignored, evidently because I have a less “weighty” self(-love) than other men [i.e. a less “**naturally self-confirming**” or “**naturally *real-izing*” self-love**]; someone else’s input will draw great appreciation even if it is essentially the same statement I just made. (This isn’t *always* true.) One of the few categories of people I respect are those who -- like the law -- “do not respect persons” in this way, who show respect to everyone who deserves it and not only people with “weighty selves.”

Descartes would have pretty much agreed. His theory of perception was based on the idea that the internal structure of the perceptual system interacts with external data to determine what we perceive. Thus to pick one of his examples, if I look at an audience in a talk, I perceive people, but I'm constructing that visual interpretation from very scattered and limited data, ideas that were developed significantly in the 17th century and beyond. I don't see what alternative there is.

Science is basically our way of trying to explain what we experience -- typically by careful experiment, other experience being far too complex.

I'm not really sure why I wrote that email, since it was pretty obvious what his answer would be. There's no alternative. (A lot of philosophers would disagree, but that's predictable.)

Sent another email afterwards:

Thanks for your prompt reply. -Honestly, I don't know how you manage everything with your busy schedule. Not even my family members reply to emails that promptly! -But I suppose that after a lifetime of receiving compliments you're a little sick of them, n'est-ce pas?

One other thought: while I agree with you about almost everything, I'm not sure you're right to dismiss the idea of "theories" in the realm of the social sciences. Certainly the theories don't have the level of rigor or substance that they have in the natural sciences, but theoretical ideas that pertain to society and aren't immediately commonsensical can be of use. For instance, Marxian materialism (i.e. emphasizing institutional relations more than ideologies, economic structures over intellectual culture, etc.) is quite a useful method, a useful way of guiding oneself, and it isn't common sense to most people. Maybe it should be. Or, to take another example, I found Erik Olin Wright's book *Classes*, which has a great deal of theory, to be very illuminating, largely because of its theoretical elements. In fact, the *Communist Manifesto* itself surely contains some powerful and not immediately obvious hypotheses. At least, they're extremely suggestive. And then of course there is economics. Robert Brenner's book *The Economics of Global Turbulence*, which you recommend in *Understanding Power*, has explanatory power because of the hypotheses it lays out at the beginning. Surely those count as "theories" even in a strict sense?

Anyway, these objections are probably just academic nitpicking. And usually, yes, the so-called theories one encounters in the humanistic disciplines have little value.

I'm glad you're still as active as ever. It'll be a blow to humanism when you're gone. (Sorry, another compliment.) Hopefully some of us can continue the tradition.

I agree with your opinions about the work you cite, and find them very valuable. I don't frankly see much in the way of theory, however, at least if we mean by a theory a system of principles that can be used to derive conclusions about the world, where the theories go beyond plausible generalization.

But it's a matter of taste, not substance.

Not sure what you're referring to of mine. I have criticized the vacuous pretensions of "theory" in cultural studies, literary criticism, postmodern posturing, etc., and theories that

are simply thin cover for ideology, like Efficient Market Hypothesis. But not work of the kind you mention.

Rereading Robert Brenner's *The Economics of Global Turbulence*, since I read only half last summer. This time I'm going to take notes. Brenner knows what he's talking about, and I don't want to forget his ideas.

Two periods in recent economic history: prosperity from the late 1940s to 1973, and slowed growth and economic turbulence from 1973 onwards. *Why?* Orthodox economics doesn't know, barely even acknowledges the trajectory. "The major existing alternative [to orthodox economics]...finds the source of the shift from long boom to long downturn in the increased power of and pressure from labour exerted against capital, itself the result in part of the long extension of the postwar economic upturn. But, with the benefit of hindsight, this thesis would seem to have been definitively undermined by the failure of the decisive weakening of labour vis-à-vis capital during the 1970s and 1980s to bring about the restoration of system-wide economic vitality."

Brenner sees *profitability* as key.

The realized rate of profit is the direct measure of firms' ability to derive surpluses from their plant, equipment, and software. It is also the best available predictor of the rate of return that firms can expect on their new investment. As a result, the rate of profit is the fundamental determinant of the rate at which the economy's constituent firms will accumulate capital and expand employment, therefore of its output, productivity and wage growth, and, in turn, of the increase of its aggregate demand, both investment and consumer. From this point of departure, an initial account immediately follows. What made possible the inauguration and long perpetuation of the postwar boom in the US, Europe, and Japan was the achievement, over the period between the late 1930s and late 1940s, of elevated rates of profit and their maintenance during the following two decades. What brought the postwar boom to an end was a sharp fall in profitability for the advanced capitalist economies taken individually and together between 1965 and 1973, focused on the manufacturing sector but extending to the private economy as a whole, beginning in the US but soon encompassing Western Europe and Japan. The reason that, as of 2000, there had been no clear revival of the global economy is that there had been no decisive recovery of the profit rate system-wide, or in the US, Western Europe, or Japan considered separately. The challenge posed by these results is, of course, to account for the pattern of profitability itself -- both for the system as a whole and for its various regional and national components.... To respond to that challenge is, simply stated, the project of this book.

Why does the rate of profit have a tendency to fall? Because of the anarchy and competitiveness of capitalist production, which "require individual capitals to cut costs in order to survive by introducing fixed capital embodying ever more efficient technology, but to do so not only without reference to the reproductive requirements of other capitals, but by threatening their profits and indeed their very existence. The outcome in aggregate is, on the one hand, to bring about the unprecedented development of the productive forces. But it is, on the other hand, to prevent firms with higher-cost methods of production frozen in their already-existing plant, equipment, and software from realizing their fixed capital investments. This manifests itself in over-capacity and, in turn, reduced profitability."

Okay, so, a lot of theory. How do you connect it to reality? Through an intermediate conceptual link, which gives a reason for thinking that capitalist economic expansion will take the form of uneven development. Namely, Brenner argues that there will be an early-developing bloc of capital (the U.S. in this case) that is technologically and socio-economically more advanced, and later-developing blocs of capital (in Western Europe and Japan) that are at first backward but are "able to exploit the potential advantages of coming late and of cultivating new, hitherto less developed regions." Eventually, the later-developing blocs challenge the earlier-developing "by combining lower-cost inputs [such as labor] and

equal or more advanced technology, making for an intensification of inter-capitalist competition that undermines the ability of large masses of fixed capital investments to realize themselves, leading to the onset of over-capacity and declining rates of profit.” This intensification of competition occurred between 1965 and 1973, and led to falling profitability system-wide.

But if that explains why the downturn started, why has it lasted so long? Especially given that firms, assisted by governments, have sought to restore their profit rates “by means both of the obsessive reduction of costs, above all direct and indirect labour costs, and the transformation of their ways of doing business.” Hence attacks on the working class and the neoliberalizing of the global economy. E.g., firms “shifted capital out of high-cost, low-profit manufacturing lines, especially into financial services, and turned increasingly to speculation.” All this was meant to cope with the problem of reduced profitability. But somehow it couldn’t prevent the performance of the advanced capitalist economies from *worsening* as time went on.

So what is the explanation? Simply that private sector profitability didn’t recover, due to the “paradoxical persistence of chronic over-capacity in international manufacturing.” What happened is that, “on the one hand, in response to falling profit rates, firms had to slow the growth of investment and employment, while seeking to reduce the level of their costs, particularly labour costs, in the multifarious ways indicated above. The outcome, in the face of the persistent failure of profitability to recover, was a chronic and worsening problem of investment, consumer, government, and therefore aggregate demand. On the other hand, contrary to expectations, the great firms of the advanced capitalist world sought only tardily and with the greatest reluctance to respond to their profitability problems by withdrawing their capital stock from oversubscribed lines of production. Instead, they defended their positions in the world market as long as possible by improving their competitiveness by expanding investment as much as they were able, even in the face of reduced rates of return.” At the same time, more regions in East Asia entered the world economy, as Western Europe and Japan had earlier. This led to more problems: increasingly sophisticated manufacturing products were poured into already over-supplied world markets, which increased still further the stress on world manufacturing profit rates.

Nevertheless, the intensification of over-capacity in world manufacturing markets (which resulted from both the unexpected persistence of incumbents from the advanced capitalist world and the unprecedented ingress of entrants from the developing world, especially East Asia) in the face of a deepening problem of insufficient aggregate demand (which resulted from universal cost-cutting and the slowdown of investment and job-creation consequent upon the decline of profitability) did not lead, as might otherwise have been expected, to a large-scale shakeout of high-cost, low-profit means of production by making for serious recession or depression. [This “shakeout” is what used to happen in the late nineteenth and early twentieth centuries.] This was because the governments of the advanced capitalist world, led to an ever-increasing extent by the US, made sure that titanic volumes of credit were made available, through ever more varied channels, direct and indirect, both public and private, to firms and households to soak up the surplus of supply over demand, especially in the wake of the serious cyclical downturns that periodically threatened stability. Rather than system-shaking crisis, we therefore witnessed the continuation, stretching over three decades, of persistently reduced rates of profit that made for ever-decreasing economic vitality on a global scale, along with ever more destructive asset price bubbles and financial implosions, and increasingly severe cyclical downturns. The upshot was the predicament facing the world economy as it entered the new millennium: namely, the still further continuation of the long downturn against a background of over-supplied lines of production, decelerating aggregate demand, and a mountain of over-priced paper assets, all made possible by the accumulation of private and public debt at unprecedented speed and at historic levels.

On one level, then, it amounts to too much supply, not enough demand. But it's not quite that simple, because if real wages had been allowed to rise in the decades after 1973, the rate of profit would have been even lower than it was. So, from one perspective, it was and is useful to business and economic growth to take more and more from labor, since that increases profitability. On the other hand, suppressing demand *too much* has disastrous consequences. So it's strange: a reduction in real wages (or in the growth of real wages) can be both bad and good for the economy. But ultimately, I guess, it's bad. For individual firms it's a good policy to reduce wages, but for the economy as a whole it's bad, at least in the long run, because then the masses won't have enough purchasing power to buy the goods that are being produced. So profit-rates will decline, which will cause investment to decline, which will result in laid-off workers and reduced wages, which will further decrease aggregate demand, etc.

"The contention, so dear to the hearts of business advocates and neoliberal politicians, as well as some neoclassical economists, that the turn to ever-freer markets and ever-deeper austerity must bring, and has brought, ever-greater economic vigour is in defiance of the evidence. The fact is that, for the advanced capitalist economies taken singly or together, economic performance has worsened, business cycle by business cycle, since the end of the postwar boom in terms of all of the main macroeconomic indicators: the growth of GDP, capital stock, labour productivity, and real compensation. Economic performance was less good during the 1990s than the 1980s, which lagged the 1970s, which was, of course, far worse than the economic performance of the 1950s and 1960s."

"Between 1970 and 1990, the manufacturing rate of profit for the G-7 economies taken together was, on average, about 40 percent lower than between 1950 and 1970.... As I shall try to demonstrate, the major decline in the profit rate throughout the advanced capitalist world has been the basic cause of the parallel, major decline in the rate of growth of investment, and with it the growth of output, especially in manufacturing, over the same period. The sharp decline in the rate of growth of investment -- along with that of output itself -- is, I shall argue, the primary source of the decline in the rate of growth of productivity, as well as a major determinant of the increase of unemployment. The declines in the rate of growth of employment and productivity are at the root of the sharp slowdown in the growth of real wages.

"To explain the origins and evolution of the long downturn through an analysis of the causes and effects of changes in profitability is thus the objective of this study."

"The fall in *aggregate* profitability that was responsible for the long downturn was the result of...the over-capacity and over-production that resulted from intensified, horizontal intercapitalist competition. The heightening of intercapitalist competition was itself brought about by the introduction of lower-cost, lower-price goods into the world market, especially in manufacturing, at the expense of already existing higher-cost, higher-price producers, their profitability and their productive capacity. The long downturn, from this standpoint, has persisted largely because the advanced capitalist economies have proved unable to accomplish profitably sufficient reductions and reallocations of productive power so as to overcome over-capacity and over-production in manufacturing lines, and thereby to restore profitability, especially given the growing presence of East Asia in world markets."

Brenner starts out by critiquing supply-side explanations of the downturn, which explain it in terms of declining labor productivity combined with a failure of real wage growth to adjust downward in tandem (due to workers' supposedly excessive political power, as well as to tight labor markets). Thus, rates of profit have declined because productivity growth has declined more than the growth in workers' wages has. There has been a squeeze on profits. Even Marxists and radicals subscribe to this theory. Brenner characterizes it as Malthusian because Malthus (and Ricardo) thought that in agriculture there is a long-term tendency to declining growth of labor productivity. Ultimately the upshot of this was supposed to be stagnation or crisis. Luckily Malthus was wrong: science came to the rescue by making possible various agricultural technologies that increased productivity. Nonetheless, many economists (on the left and right) are still attracted to the general "supply-side" idea that a secular decline in productivity growth can and does cause a fall in profitability. Even Marx himself embraced the idea (according to Brenner), despite his aversion to Malthus. His explanation for the tendency of the profit rate to fall was that as mechanization increases, more and more capital inputs and fewer labor inputs go into producing a commodity, which

means that less surplus-value is embodied in the commodity. (And profits arise from surplus-value.) As Brenner paraphrases Marx, labor productivity actually increases with mechanization, but *overall* productivity -- taking into account both capital and labor inputs -- declines.

Anyway, the point is that “Marxists and radicals have joined liberals and conservatives in explaining the long downturn as a ‘supply-side’ crisis, resulting from a squeeze on profits, reflecting pressure on capital from labour that is ‘too strong.’¹ In so doing, they have characterized the current crisis in terms just the opposite of those that have often been used to characterize the long downturn of the interwar period, a crisis widely viewed as a ‘demand-side’ or ‘under-consumption’ crisis, resulting from an overly high profit rate, reflecting pressure from labour that was ‘too weak.’” Interesting.

So why are the supply-siders wrong? First, while it’s true that full employment tends to result in higher wages (which squeeze profits), it also leads to higher sales, hence more profits. The latter effect may offset the former. Second, the acceleration of real wage growth tends to cause firms to substitute labor-saving capital for labor, which increases overall productivity. Third, because of the high demand for labor, immigration from abroad will probably increase, thereby reducing the tightness of the labor market. At the same time, capital will be exported to regions of the world where labor is cheaper. Etc.

But let’s suppose that full employment (and higher pay) does occasionally cause a significant fall in profitability. This still won’t cause a *long-term* reduction in the profit rate, because firms will inevitably respond to their reduced profitability by reducing investment. “As a result, sooner rather than later, the labour market will loosen sufficiently” to allow for the restoration of profitability. In response to this argument, supply-siders maintain that the postwar political power of labor (through unions, unemployment insurance, etc.) was such that the labor market couldn’t function properly. Profit-squeezing wages have therefore been able to persist alongside high levels of unemployment. Brenner counters that in *given* firms or industries for *given* periods of time, labor’s entrenched power might skew the operation of the labor market. But it cannot so squeeze profits as to cause a *long-term, system-wide downturn*, simply because firms can always choose to invest in some area where workers have less institutionalized power. And if they don’t so invest, they’ll go out of business, because other firms *will* so invest.

In any case, the fact that supply-side theorists explain the long downturn in terms of the operation of institutions and impact of policies means that they have to explain it in historically and nationally specific ways. But how can such explanations account for a *universal, simultaneous* and *long-term* downturn? Clearly they can’t.

After his demolition of the supply-side account, Brenner introduces his own approach in a very abstract and dense theoretical discussion. The main point is that, contrary to the received wisdom, when a new firm that uses cost-cutting technical advancements enters an industry -- or rather a “line” -- dominated by firms with relatively high costs of production and sells its products at a lower price than they do (because of its lower costs of production) so as to increase its market share, the old firms *cannot* be expected to take action immediately by either adopting the new techniques of the innovating firm or leaving the line as a result of their reduced profitability (which is due to competition with the innovating firm). The reason is that *if they have fixed capital* they will, first of all, not want to leave the line immediately as long as they can continue making profits that are at least above the costs of their circulating capital (viz., “the investment in labor power, raw materials, and semi-finished goods that is required to put their fixed capital into motion”). Their fixed capital is “sunk.” They’ve already paid for it, so they might as well keep using it as long as they can get at least some profit. As for why they won’t immediately adopt the new techniques of the innovating firm, that’s because the technical interrelatedness of their plants makes it difficult to adopt specific new inventions without changing the whole structure of the plant, or scrapping it all. And the cost of doing that may be prohibitive, especially if the plant is still basically efficient. Furthermore, even *between* plants and other units in a given productive system it may be “difficult to innovate in one part without changing some or all of the others.” Thus, productive systems are “inertial,” which increases their vulnerability to new, lower-cost production based on new techniques.

¹ Actually, that hypothesis is surely different from Marx’s “rising organic composition of capital” hypothesis, which has little or nothing to do with the political strength of labor.

But I haven't said the most important thing yet: because the new, innovating firm lowers the price of its products to steal market share from other firms, it actually does not make a higher rate of profit than those firms did before it entered the market. And once it has entered, the older firms have a *lower* rate of profit than they did because their market share is lower. So what has happened is that the average rate of profit in the line has fallen. This lower rate of profit can be expected to adversely affect profits throughout the whole economy, for reasons I won't go into.

Brenner thinks of fixed-capital investment throughout the economy as taking place in "waves" or being "embodied in large, technically interrelated, developmental blocs." "This occurs because each investment tends to depend on others to provide the demand to its output and the inputs for its production process. Think of the interrelated rise of railroads and shipbuilding, coal mining, iron and steel production, and machine-tool production in the middle third of the nineteenth century, or the interrelated expansion of automobile, steel, iron, coal, and petroleum production, along with highway construction, in the US economy in the years following World War II." These developmental blocs are inertial, hence vulnerable to new, more productive, developmental blocs that may appear. But these large-scale processes of technical change and cost-cutting will not appear in some sort of continuous, unilineal way. Because of barriers to entry in markets, cost-cutting investors will tend to develop in new geographical regions (e.g., postwar Japan and Germany) where they don't face immediate and vicious competition with already-dominant firms. Moreover, production can be cheaper in such late-developing regions because "producers have the potential to emulate the advanced techniques of their rivals from the old bloc while availing themselves of less expensive labour and paying lower rents than in developed areas where living standards have increased in accord with the growth of labour productivity." Also, sometimes producers in these new regions have the advantage of trade protection, beneficial state intervention, etc.

In the long run, capitalists in these late-developing regions will improve and expand their productive capacity to the point that they can profitably enter already occupied markets. New blocs of capital will thereby come into competition with the old. And so the average rate of profit will decline, etc., in accord with the scheme outlined above. High-cost firms in the old bloc might well respond to the new situation by counterattacking, defending their markets by investing in new fixed capital. This strategy will tend to provoke the original cost-cutting innovators to accelerate technological change themselves, "further worsening the already existing over-capacity and over-production" (which is "over-" in relation to the previously and still prevailing rate of profit; -- i.e., it drives the profit-rate down). As rates of profit fall, the growth of investment, of employment, and of wages necessarily falls as well -- i.e., demand falls -- which makes it more difficult for firms to change to new lines. And productivity grows more slowly too, because of decreased investment. "It becomes harder to find alternative lines in which old levels of profitability can be maintained for the simple reason that such lines are emerging and expanding less rapidly."

To make things even worse, still lower-cost producers might enter the market.

Just as the mere over-supply of a line of production cannot be counted on to force enough exit to restore its profitability, that same over-supply is insufficient to deter further entry that could bring down its profit rate further. On the contrary. The initial fall in profitability that results from processes of uneven development bringing about over-capacity and over-production can be expected to intensify the worldwide drive for even lower production costs for the same products through the combination of even cheaper labour with even higher levels of technique in still later-developing regions. To the extent this drive succeeds....it only intensifies the initial problem.

Firms will tend to respond to the hard times by taking out loans so as to increase investment or just to survive until things get better. This growth of borrowing facilitates the survival of low-profit firms and so exacerbates over-capacity and over-production, slows the restoration of profitability, etc.

Additionally, the fall in profitability *itself* generates further downward pressure on the profit rate by causing a reduced growth of productivity (due to the reduced growth of investment) -- and lower productivity, of course, means lower profits.

In the rest of the book, Brenner applies these ideas to the history of the international economy after World War II. Here's a short summary.-- From the early 1960s, due in part to the "dramatic reduction of trade barriers at the end of the 1950s," Germany and Japan took increasing shares of the international market at the expense of the U.S. and U.K. U.S. manufacturers found that their prices were under significant downward pressure, which meant that their rates of profit suffered. Partly because of the enormous size of the U.S. economy, aggregate profitability of the advanced capitalist economies fell in the years between 1965 and 1973. "Meanwhile, between 1969 and 1973, as part and parcel of the same processes of intensifying competition that brought down profitability in the US, the explosion of Japanese and German current account surpluses and US current account deficits -- catalyzed by the rise of record US federal deficits -- precipitated the collapse of the Bretton Woods system and with it a major devaluation of the dollar, leading to a dramatic restructuring of relative costs internationally in favor of US producers. The mark and the yen sustained major increases in value against the dollar, and, as a result, some of the burden of profitability decline was shifted away from the US economy and the international crisis was extended to both Germany and Japan."

"Rather than leave their lines, U.S. manufacturing corporations, aided by the even further devaluation of the dollar, sought to improve their profitability and competitiveness by launching a powerful wave of investment during the 1970s and radically reducing the growth of wage costs, direct and indirect." Given cheaper U.S. goods on the world market, German and Japanese manufacturers did the same thing as U.S. ones had, namely cut their costs, take out more loans, and *not* change production to different lines. Later, newly established producers in East Asia entered markets, perpetuating the downturn into the 1990s. Nonetheless, a series of major recessions did not lead to depression because of the massive growth of public and private debt, "made possible largely by the enormous expansion of government borrowing."

From the end of the 1970s, the epoch-making turn from Keynesian debt-creation to monetarist credit restriction and intensified austerity did accelerate the destruction of redundant capital, especially in manufacturing, but it simultaneously made more difficult the necessary allocation of investment funds into new lines. Meanwhile, from the mid 1980s, on the basis of another round of massive dollar devaluation against the yen and the mark, there began a major new shift in the locus of the most competitive manufacturing production -- in favor of the US and against Germany and Japan. In the US, while growth remained slow, profitability did begin to rise, dramatically so towards the mid 1990s. This was in part because wage growth was so effectively held down and the dollar so heavily devalued against the currencies of Germany and Japan. But it was also in part because the US manufacturing sector achieved a certain rationalization and revitalization, largely through shedding redundant, ineffective capital and intensifying labour.

Nevertheless, largely because the growth of domestic demand in the advanced capitalist economies was curtailed by restrictive macroeconomic policies, etc., "there was no transcendence of the underlying problem of reduced system-wide manufacturing profitability." Advanced capitalist economies oriented themselves increasingly toward growth in manufacturing exports as domestic markets grew much more slowly. Thus, over-capacity and over-production continued.

[Met an interesting girl from Poland, etc. Blah blah.]

....I'm in Greensboro, North Carolina, waiting four hours for a bus because the Greyhound ran out of seats (last leg of the journey) even though I'd paid \$260 for the trip from Chicago. -You've got to avoid institutions as much as you can, especially businesses and large bureaucracies, because they always find a way to fuck you. Anyway, I'm going to UNC-Chapel Hill to do archival research on the Textile Workers Union of America in the 1960s for a paper. Thrilling, I know, you envy me.

--Actually you should, at least today and tomorrow, because this university is a little utopia. The people I've met so far in the South themselves live up to their legend. What friendliness and openness! Smiling, greeting, helping, thanking. It strikes me as almost anachronistic, this supreme civility in a world

or at least a country where I've known mostly aloofness and suspiciousness. I'm on a different planet over here. A guy on the bus just overheard me asking the driver about the location of a particular hotel; he asked me its address and name to look it up on the internet and then, unbeknownst to me, actually called them up to ask where they were and how to get there. That sort of thing seems to be fairly routine here. -The feeling of *belonging* in a place is very strange to me.

And what a town and university! Perfectly charming. *Perfectly*. Beautiful young women in short shorts playing frisbee on the grass, students traversing the campus between classes, people sampling cafés in the town nearby. And oh Lord the girls here. Not only achingly beautiful but friendly and open. (Openness! How I love thee, you who make life worth living!) The kind of girls I wanted to know in college.

It's easy to be a little envious of these students [...]. How different would my life have been...? Maybe not so many morbid journal entries. I could fall in love with half the girls I've seen here. But I'm not really that "envious"; I'm too capacious for real envy, I think. It's possible, you know, to identify with others' happiness, to make it in some distant sense your own. I don't dwell on the past; I try never to think about it. I don't want to know about it. But had it been spectacular it would have passed anyway, so what's the huge loss? The present and the future are what matter, until they too are in the past.¹ Anyway, Emerson is right that good things and bad things tend to have "compensations," as I wrote years ago in Korea when I desperately needed to be reminded of such compensations. I'll enjoy being here and then return to Chicago, where I'll enjoy being too.

As for the actual research I'm doing down here, the collection has virtually none of the stuff I was hoping for. And as it turns out, the main national collection of the TWUA is at the State Historical Society in Madison, Wisconsin. (Maybe I should have found that out beforehand.) So I came all the way down here for nothing, and I lost a weekend when the paper is due in a couple of weeks. -I haven't started writing; in fact, I don't even really know yet what I'm writing about.

Back to Brenner. Over the course of the 1950s and 1960s, "in one key industry after another" -- textiles, steel, automobiles, machine tools, consumer electronics -- Germany and Japan forged ahead of the U.S.

After the war, the U.S.'s labor movement, unlike Germany's and Japan's, was strong enough to push up wages rapidly, "especially when cyclical upturns pushed down unemployment, as at the time of the Korean War." Wages in Germany and Japan were much lower because of large industrial reserve armies and the labor movement's suppression with the advent of the Cold War. Hence, higher profit rates. Conservative trade unions in fact gave top priority to the needs of capital accumulation. Thus, "the postwar boom in both countries was predicated more on the defeat of labour than on its recognition, more on the explicit subordination of labour than the consolidation of any putative 'capital-labour accord.'" To say it differently, "it was the long postwar expansion itself which made possible labour's substantial material gains and its ulterior (partial) socio-political integration through the emergent trade-union bureaucracies -- not vice versa." German and Japanese workers hinged their fates to that of 'their own' firm. Through enterprise unions and works councils, they facilitated their firms' achievement of international competitiveness.

In the U.S., on the other hand, rapid economic growth from the late 1930s to the late 1940s "raised barriers to further improvement by leaving in its wake masses of fixed capital capable of deterring further entry and investment, by using up factor supplies, especially surplus labour, and by facilitating labour resistance." Also, the great manufacturing corporations and international bankers had an interest after World War II in helping other countries rebuild, because that's where many of the best opportunities for profit would be. So these forces got the U.S. government to support "a policy of free flow of goods and investment funds that would allow the multinationals and international bankers to make direct investments and loans abroad and allow imports to flow back into the country." Besides, U.S.-based exporters needed to allow their prospective customers abroad to sell goods to the U.S. in order to earn the currency they

¹ (I'm intentionally stating an "extremist" philosophy of life here, perhaps an impoverished one, which I'm not sure I agree with.)

would need to buy U.S. goods. For these and other reasons, the government opened up the U.S. market to exports from its economic rivals while accepting their own protectionism. “It thereby helped to create the conditions for the secular decline of competitiveness of U.S. domestic manufacturing.” In other words, it made possible the export-driven economic growth of Germany and Japan, which eventually undercut the markets and profits of U.S. domestic manufacturers.

One of the morals of the story is that it *wasn't* “new arrangements for keeping domestic demand up with production” that were responsible for extraordinary growth rates of Germany and Japan. Their economic miracles were based on *supply-side* advantages, including various institutional and policy advantages, not on *demand-side* facts. Indeed, their governments held down the growth of domestic demand (by imposing balanced budgets and relatively tight credit) in order to achieve low inflation in the interest of overseas sales.

In the long run, Germany's and Japan's growth of exports was self-undermining, for several reasons. An important one is that its obverse side was the “tendential decline of U.S. manufacturing competitiveness, the tendential rise of U.S. external deficits, and the tendential decline of the U.S. currency. Implied was the declining capacity of the U.S. market to absorb its allies' and rivals' goods and thus to serve as the ‘motor of last resort’ of their economies. The very processes by which the German and Japanese economies achieved rapid growth during the postwar boom tended to destroy the foundations of their success.”

Brenner briefly argues against Sweezy's theory of capitalist stagnation arising from the predominance of monopoly capital. It is true that the U.S. economy grew more slowly as the 1950s progressed. But Sweezy's main ideas were merely reifications of temporary and specific aspects of the U.S. economy in the 1950s. The *world* economy was not at all stagnant at this time, and the U.S. economy was only *relatively* stagnant compared to Germany and Japan. Moreover, its stagnation was simply a result of the fact that the U.S.'s “manufacturing sector offered relatively limited opportunities for profitable investment compared to those available in manufacturing outside the U.S.” Firms thus invested abroad in order to generate profits, resulting in relative stagnation in the U.S. It's true, too, that in certain restricted senses “oligopolistic competition” fettered investment in the 1950s and 1960s. And as we've seen, high wage-rates decreased profitability as compared to the low wage-rates that permitted high profitability abroad.

“The slow growth of investment [in the U.S. in the 1950s] may well have been partly responsible for the reduction in the growth of labour productivity in manufacturing.” I should note that Brenner backs up every statement with extensive empirical data.

“While the powerful surge of manufacturing productivity growth of the immediate postwar period petered out in the 1950s, wage growth failed to follow suit. The 1950s was the true golden age for the American worker.... *If there was a major squeeze on profits by the action of labour at any point during the postwar epoch, it took place in manufacturing in the course of the 1950s.*” (Brenner's italics.)

“With wages rising, with slow investment growth helping to push down both labour and capital productivity growth, and with capacity utilization declining, the 1950s understandably witnessed a very major decline in manufacturing profitability. Between 1950 and 1958, the manufacturing profit rate fell by 41 percent....” As if all this weren't enough, the American economy experienced inflation in the latter part of the decade as employers tried to pass on wage increases in the form of price increases; U.S. prices rose above those of its competitors.

Recessions occurred in the U.S. at the end of the 1950s. But the economy recovered in the first half of the 1960s. Manufacturing output grew fast, GNP grew fast, etc. Why? Because of a spectacular rise in the rate of profit. “Between 1958 and 1965, profitability in manufacturing rose by no less than 80 percent, in the private business economy by 45 percent. Increased profitability brought about increased growth by spurring a powerful boom in investment.” Critical to the rise in profitability was an employer offensive against labor, made possible in part by the rise of unemployment due to recession that had itself been partially brought on by high wages' squeezing of profits. Employers defeated their workers in several large strikes, and they resisted extensions of unionization increasingly successfully, often by building new plants

in the un-unionized south and southwest. Unions won workplace elections less frequently, rates of unionization began to fall, there was a stepping up of supervision on the shop floor, etc. "All of these trends have continued to the present, and one cannot but conclude that the decade from the mid 1950s to the mid 1960s marked a turning point for the U.S. union movement, the beginning of a long and precipitous process of decline." The upshot of the employer offensive was a significant lowering of the rate of wage growth. Investment therefore increased, productivity increased, and exports increased.

The recovery couldn't continue forever, though, because the trends of reducing wage growth on which it was largely based could be carried only so far. And the German and Japanese economies were still growing, etc. In fact, even in the mid-1960s the U.S. saw its share of world manufacturing exports fall from 18.7 percent to 15.8 percent.

Let's look at Germany. Its impressive growth after the war was due primarily to its export dynamism, made possible by the fact that "it could use its very cheap labour and historical endowment of very highly skilled labour to emulate, and in some cases surpass, U.S. production methods and, on that basis, seize markets formerly held by U.S. manufacturers." Incidentally, the Korean War was important in jumpstarting, after a severe recession caused by a deflationary monetary policy, Germany's export-driven boom (since American demand shot up). In general, the growth of demand in the American economy, "and particularly the stabilization of demand there by means of large-scale military spending," contributed mightily to the expansion of Germany's export-oriented economy (which was itself founded on anti-Keynesian policies -- i.e., budget surpluses, tight credit, high interest rates).

In causing high demand for labor and nearly full employment, why didn't the boom lead to significant wage increases and corresponding pressure on profits? Because of the large reserves of labor in the countryside and abroad. Also, mass immigration of skilled labor from East to West Germany helped keep the labor market loose.

"During the late 1950s and early 1960s, while the U.S. economy temporarily broke from its long-term pattern of relatively slow growth, the German economy sustained an interruption of its momentum." From the mid-1960s, the economy regained some of its former dynamism. But what caused the downturn between 1960 and 1965? Two things: "first, the rise of manufacturing producers across the advanced capitalist world prepared to challenge German producers for markets and, second, the self-limiting character of a German form of economic development that was structured to stimulate the growth of manufacturing exports at the expense of the domestic market." From the late 1950s, the German economy's costs of production rose in relation to those of its increasingly competitive rivals France, Italy, and Japan. In 1961 a revaluation of the mark exacerbated the problem by increasing relative labor costs. The growth of relative costs in turn sharply reduced Germany's capacity to export.

As for the self-limiting character of export-led growth: such growth was "buttressed by macroeconomic policy aimed at restricting the growth of demand so as to keep down prices," as I mentioned above. But the consequence of this was major current account surpluses, which in turn created strong pressures to revalue the mark (as was done in 1961). Mark revaluations, in turn, undermined competitiveness, for they tended to entail higher relative unit labor costs. "Germany's competitiveness thus threatened to self-destruct by bringing about an increase in German relative prices," either through inflation or through mark revaluation. -This is the side of economics I least understand, this international currency stuff. Exchange rates, all that crap.

Now Japan. In 1950 it had very low manufacturing productivity but even lower wage rates. Cheap skilled labor was key to the postwar economic boom. It's true that the labor movement was very strong immediately after the war, as it was in Germany, Italy, France and elsewhere, but with the start of the Cold War it was crushed. Between 1950 and 1960, Japanese manufacturing output grew at an astonishing pace, on the basis of equally astonishing growth in investment and hence productivity. "What made it possible to sustain such rapid growth was, as in Germany, the Japanese economy's ability to prevent the investment boom from bringing about the too rapid growth of costs." Wage pressure was minimal throughout the whole period. As a result, the profit rate soared.

Market forces, however, were not in themselves responsible for all these successes. Crucial were horizontal networks in manufacturing, to plan, reduce risk, etc., and the effective merger of finance and

industry. Banks heavily involved themselves in the operations of their manufacturer-debtors, which enabled the latter to finance themselves to an unusual extent on the basis of debt rather than equity, which was good because stocks typically require higher rates of return than loans (due to their higher risk). “Firms were thereby [and for other reasons as well] relieved of the need to pay large dividends,” which meant that they could channel more of their profits into investment than American and other competitors could. “They were allowed, moreover, to orient their operations to long-run returns, subject only to their ability to satisfy their banker-financiers.”

The state, too, played an important role in economic growth. “Largely at the expense of workers and consumers, it provided desperately needed investment funds, either directly or through the banks, to Japan’s leading corporations and effectively guaranteed their continuing existence. By making financial advances contingent on how these funds would be used, the state was able to go far in determining the direction of the explosive process of growth that its patronage made possible.” The state also made sure that interest rates were kept low for the great manufacturing corporations. And it made huge investments in infrastructure, and gave huge tax breaks on capital investment, and established massive protectionism across almost the whole manufacturing sector, and so on and so forth. The successes of all these measures, incidentally, demonstrate the bankruptcy of neoclassical orthodoxy.

One of the reasons why wages didn’t increase so as to squeeze profits is that, as in Germany, a large part of the laboring population was still in agriculture. But also, the labor movement was oriented to the needs of capital accumulation. Japanese unions, “enterprise unions,” were organized on a firm-by-firm basis. After the suppressing of labor’s militancy at the start of the Cold War, “workers saw little choice but to hitch their fate to that of their firms, and to seek to improve their condition by improving their firms’ profitability.” This system of collaborative labor relations actually served workers well, since they accrued steady wage increases (in absolute, not relative, terms) and had excellent job security. -However, only the labor force employed by leading manufacturing corporations was unionized.

Brenner sums up his discussion of the “long boom” by criticizing Keynesian explanations of it.

[He admits that] the increased steadiness in the growth of demand [from the late 1940s to the mid-1960s], resulting from the permanently increased size of the state sector in most of the advanced capitalist economies, must have helped endow these economies with greater stability than in the past. It may also have made for increased confidence on the part of capitalists, encouraging them to invest and innovate. But in Germany and Japan, where the most rapid growth took place, supply-side conditions were clearly responsible for economic dynamism. In the US, by contrast, the economy grew slowly during the 1950s, despite the subsidy of demand by public deficits and the growth of the wage share, and its brief takeoff during the first half of the 1960s was made possible largely by holding down the growth of wages and increasing productivity by means of intensifying labour.

Where the autonomous growth of demand *did* operate powerfully to augment investment, growth and stability, it did so, paradoxically, less within national boundaries than across them. German and Japanese manufacturers derived much of their dynamism by means of appropriating large segments of the fast-growing world market from the US and UK, while beginning to invade the US domestic market....

“The origins of the long downturn in the advanced capitalist world are to be found in the US economy in the years after 1965. Between 1965 and 1973, the rates of profit in the manufacturing and private business sectors fell by 40.9 percent and 29.3 percent, respectively.” Obviously, then, the fall in profitability that set off the long downturn cannot have been caused by the oil crisis of the 1970s, as is commonly thought. So what caused it? The answer, again, is not high wages or lower labor productivity growth but increased downward pressure on prices reflecting intensified international competition. The data Brenner presents against the idea that increased workers’ power, especially as embodied in a decline in labor productivity growth, led to the decline in profitability are absolutely decisive. For example, in the manufacturing sector labor productivity growth actually increased between 1965 and 1973, when

profitability started declining. Nor did *capital* productivity fall in this period. It's true that labor costs increased a little in manufacturing in these years, but the main problem was that companies were not able to raise prices sufficiently to wholly offset the growth in costs. The decisive fact, then, which needs explaining, is that they were prevented from raising prices enough.

The foundation of the explanation is that from the mid-1960s, world trade dramatically increased. Manufacturing exports shot up. One consequence of this was especially rapid international economic growth, at least in Germany, France, Italy, Japan, and the U.K. Another consequence, however, was newer, lower-cost producers based in such regions as Germany and Japan taking ever larger portions of markets thitherto dominated by U.S. and U.K. producers. This was made possible, for example, by exceptionally rates of labor productivity growth in Japan. Also, high government deficits caused an outbreak of inflation in the U.S. after 1965. "The sharp relative increase in US costs of production [relative, that is, to those in Germany, Japan, etc.] stimulated a further acceleration of manufacturing investment overseas by US multinational corporations, accentuating the already established trend[s]." In short, U.S. manufacturers started to lose markets abroad and at home. But even in the markets they retained, they were prevented from raising prices to as great an extent in proportion to costs as they had been accustomed to doing, "with unavoidable consequences for profitability."

The eruption of labor militancy that took place in the late 1960s and early 1970s was not so much a cause of declining profitability as an indirect result of it. In response to pressure from abroad, employers stepped up their offensive against labor from the mid-1960s. Union bureaucracies initially didn't respond very vigorously, so the rank and file stepped into the breach with wildcat strikes and so on. Finally in the late 1960s union leaderships organized a major wave of strikes, with limited results, however.

As for Japan and the European G-7 economies, "the final stage of the postwar boom paralleled the onset of the profitability crisis in the US." They benefited, of course, from U.S. producers' problems, by taking increased shares of their markets. "The transition to international economic downturn can thus be said to have begun, somewhat paradoxically, at a point when most of the advanced capitalist world was in full expansion, at the height of its postwar dynamism." The U.S.'s diminished vitality was about to spill over into the other G-7 economies.

In the mid-1960s the U.S. government increased its already substantial spending in order to keep the economy moving. But it failed to stimulate a corresponding increase in domestic investment and supply because of firms' declining rates of profit, relatively high costs of production in international terms, and an overall deteriorating business climate. Instead, Keynesian stimulus measures -- and major tax cuts in 1964 and 1965 -- called forth more rapidly rising inflation and imports. This was bad for America's international position and the dollar. The Federal Reserve tried to stop inflation in 1965 by tightening up credit, but then it reversed that policy (until the end of 1967) when a recession threatened. In 1968 the Fed again raised interest rates, "but by this time a major crisis was maturing." America's trade balances with Germany and Japan were falling rapidly, and "in 1971 the US experienced its first trade deficit of the twentieth century."

As all this was happening, "the money market inevitably placed renewed downward pressure on the dollar and upward pressure on the mark and yen" in the late 1960s. As speculators attacked the dollar, the Bretton Woods system, based on the dollar's strength, threatened to collapse (and did so in the early 1970s). In the meantime, Germany's spectacular current account balance in 1968 led to huge speculative inflows, which swelled the money supply. Thus, Germany began to experience "imported inflation." Finally in 1969 the government succumbed to the inevitable and revalued the mark, which threatened the continued growth of German exports (due to the effective increase in their prices). Japan experienced the same inflationary pressures as Germany, but it tried to avoid revaluing its currency, "inviting a wave of inflation that would eventually dwarf that of Germany."

In 1968 and 1969 the U.S. government instituted a variety of deflationary measures that briefly stabilized the international monetary situation but caused the recession of 1970. Unwilling to accept the political and economic costs of a serious anti-inflationary policy, Nixon reversed it in 1970. America's exporting of inflation therefore resumed, as short-term speculators fled the dollar because of its low interest rates. Eventually "the pressures for a reordering of international rates of exchange became unbearable," and in 1971 the mark, yen, and other currencies were revalued against the dollar. But fixed exchange rates were

still used, and that couldn't last in light of the unstable monetary situation. Inflation continued to rise in the U.S. because of expansionary policies; finally in 1973 the advanced capitalist countries established floating exchange rates. The upshot was that between 1969 and 1973, the German and Japanese currencies appreciated against the dollar 50 percent and 28.2 percent respectively. This, of course, was good for American exports because it made them and their costs of production relatively cheaper. "The reductions in US relative costs made possible by the devaluation of the dollar, along with the gains in capacity utilization secured with the recovery from recession, had a galvanizing effect on the US economy." Profit rates increased a little, etc. Germany and Japan, on the other hand, "now began to shoulder the burden of the world crisis of profitability."

German manufacturers had to accept lower prices on their exports in order to retain market share, even as labor militancy led to rising labor costs and so even lower profit rates. Japan's story is complicated, but basically manufacturers ended up facing a similar situation to German ones. The growth of the world market had slowed, and producers faced intensified competition from abroad because of yen revaluation, etc. But ultimately it was the fact that so many manufacturers around the world were producing similar goods, leading to overproduction and "over-competition," that caused the downturn in the world economy.

Short summary of the long downturn:

The oil crisis of 1974-1975 exacerbated economic difficulties. The cost of oil rose everywhere, especially in Japan. "Since wages and technology did not immediately adjust to the rise in energy costs, rates of profit fell further, and inflation accelerated. At this point, many governments had little choice but to put on the brakes, raising interest rates and limiting the supply of credit. A sharp deflation thus followed immediately upon the inflationary crisis, bringing about another step down in profitability and the greatest recession since the Depression of the 1930s." With investment growth, hence the growth of capital stock, sharply reduced, the growth of labor productivity naturally declined as well. And, "given the reductions in productivity growth and profitability, real wage growth was bound to be constrained and fell far more rapidly than did output per person. With the growth of both investment demand, especially in manufacturing, and consumer demand so much reduced -- as an expression of the slowdown of the growth of the capital stock and of the growth of wages -- the growth of output had to fall too; as it did, the manufacturing sector shed much labour, and unemployment increased precipitously. Between 1973 and 1995, the unemployment rate in the G-7 economies averaged 6.5 percent, more than double the average of 3.1 percent for the years 1960-73." The growth of international trade decreased too.

From the start, of course, employers and their governments tried to offset the fall in profitability at the expense of workers. "To reduce indirect labour costs, as well as to soften up labour resistance, governments across the advanced capitalist world launched severe austerity drives -- tight credit to drive up unemployment and reduced social services to weaken workers' safety net." But this didn't restore profitability. Actually, for the economy outside manufacturing such measures did allow the maintenance of high profitability -- which corroborates Brenner's thesis, because the non-manufacturing sector deals with non-tradables, so that international over-capacity and over-production cannot have a direct effect on that sector, while they can on the manufacturing sector.

The main problem, to repeat, was that manufacturers across the advanced capitalist world stubbornly refused to leave product lines that had become less profitable. Historically this is how problems of overproduction have been solved -- by the collapse of unprofitable firms, the development of new lines, etc. That didn't happen here for many reasons I'll get into later. It's worth noting now, though, that in Germany, Japan, and other economies (but not the U.S.), "the problem of eliminating redundant productive forces from over-subscribed manufacturing lines was made all the more difficult to the degree that this entailed transferring means of production into the service sector." The reason is that levels and rates of productivity growth were much higher in manufacturing than in services, which means that if a transfer from the former sector to the latter were to take place without a loss of profitability, reductions in wage levels and wage growth would be necessary. But for various reasons it was hard for employers in many countries to reduce service-sector wages more than they had already been reduced. "One therefore witnesses [in Germany, Japan, and even the U.S.] a striking shift into finance, insurance, and real estate, where productivity and profitability were evidently on the rise, but difficulties of profitable entry into service-

sector lines where productivity was low, such as retail trade and hotel and restaurants.” By contrast, in the U.S., where employers were able to reduce wages significantly, they had an easier time in recovering profitability and reducing unemployment than their competitors elsewhere.

As I stated above, too, the tremendous expansion of debt played a large role in stabilizing the world economy but prolonging the downturn (by preventing a decisive “shakeout” of unproductive and redundant capital). “Keynesianism,” that is, “made the downturn both milder and longer.” After its experiment with monetarism in the early 1980s, “the Reagan administration undertook the greatest programme of Keynesian pump priming that the world had ever seen. Through its record budget deficits, the US federal government massively raised demand so as to bail out yet again not just the US, but also the Japanese and German, economies from the recession of 1979-82 and to keep the whole system turning over during the 1980s.”

Now for more detail. In the 1970s, “because profitability failed to recover, the [government] subsidy to demand [through high budget deficits and so on] that kept the system turning over could not but bring about the same succession of developments as in the late 1960s and early 1970s: the build-up of increasing numbers of high-cost, low-profit firms that in the absence of the subsidy would have gone under; a reduction in the growth of output that could be obtained by any given increase in demand due to firms’ reduced access to surpluses and correspondingly reduced ability to invest; the corresponding acceleration of inflation, as any given increase in demand brought a smaller response in terms of supply than previously when profit rates were higher; rising interest rates and tight credit policies to combat inflation; and, ultimately, a new cyclical downturn. Another round of the same sort of stop-and-go cycle that had issued in the recessions of 1971 and 1974-75 thus culminated in the recession of 1979-82 and testified to the persistence of the economy’s underlying problems.”

In the 1970s Japan’s export growth continued but at the cost of a spectacular collapse of manufacturing profitability. Because of international competition (from new East Asian firms too) and yen revaluation, firms had to keep their prices relatively low, which meant lower profits. Which meant lower investment growth, etc. But labor productivity actually increased at a respectable rate because of organized labor’s self-discipline and various measures employers used to reduce labor’s cost and increase its commitment to work.

At the same time, Japanese industry was restructuring itself. Because of the oil crises that hit it particularly hard, as well as all the other factors I’ve mentioned, the economy moved away from (or, alternatively, rationalized) heavy, energy-intensive, and labor-intensive lines and into high value-added industries like cars and “mechatronics” lines (industries that combined electronics and machinery). This process of economic restructuring was coordinated largely by the state and consortia of private companies, and was helped enormously by firms’ close relationships with banks (which gave them much better access to finance than their overseas rivals).

Nevertheless, despite all these positive developments, “the Japanese economy could achieve only a limited recovery in the years after the oil crisis. This was because its expansion became even more reliant than previously on the growth of manufacturing exports, in a period in which international over-capacity and over-production were increasing as a consequence of the sharp deceleration of world trade and in which Japan’s own overseas sales were proving increasingly self-undermining because inextricably bound up with the build-up of Japanese external surpluses.”

Near the end of the decade Japan and Germany experimented with Keynesianism at the behest of the U.S., but, again, this was partly counterproductive in allowing high-cost, low-profit firms to remain in manufacturing and in making it more difficult to control wage costs. It tended to result in inflation more than sizable expansion of the economy. Eventually powerful interests like bankers and multinational corporations grew tired of the U.S.’s inflationary Keynesian policies that weren’t even doing much to restore profitability but caused instability in currency markets, and a switch to the opposite policy occurred. The order of the day was now austerity, to rein in inflation.

An obvious implication of Brenner’s argument is that when an economy starts to go bad, Keynesian policies are not what governments should enact. Either they should coordinate a transfer of capital from unprofitable to profitable lines, or they should allow, indeed encourage, the economy to collapse into

depression -- at least if their goal is long-term recovery. (And *then*, later, the government could go Keynesian.) Presumably these are the only two ways to get rid of redundant, unproductive capital. Or no, maybe there's a third option: instead of the U.S.'s "military Keynesianism" in the 1980s or an effectively half-hearted Keynesianism, the government could launch a *massive* spending program, a complete mobilization of society's resources to build up infrastructure, construct new industries, stimulate and *direct* a titanic level of investment. With the half-hearted Keynesianism of, say, the Vietnam War, the main result is a rise in prices rather than a large rise in productive investment because profit margins remain relatively low, not high enough to justify major new investment.

The course that the U.S. government chose in the 1980s was, first, effectively to encourage the destruction of unprofitable capital by restricting credit and government borrowing between 1979 and 1982, and then, second, to embark on a sustained program of military Keynesianism, which partially revived the economy. The problem with monetarism was the opposite one of Keynesianism: it indiscriminately reduced demand, such that, while it did encourage the elimination of unprofitable capital, it discouraged firms' entrance into new and more profitable lines. That is, it hit profitable and unprofitable capital equally. By reducing aggregate purchasing power, it set off a deflationary spiral that was hard to control. Thus, while helping to rationalize the U.S. economy through its setting in motion an extended process of "industrial shakeout," it triggered the worst recession since the 1930s, "pushing the U.S. economy in particular to the brink of collapse." The German and Japanese governments (and others) continued through the 1980s and beyond with tight credit and fiscal austerity (with a few major lapses) so as to reduce domestic costs and thereby increase exports, but the U.S. government went from monetarism to nearly the opposite extreme -- in *fiscal* policy at least. (The Federal Reserve moderated its monetarism.)

"The supply-side programme which accompanied monetarism in the US, highlighted by record tax cuts, did succeed in transferring enormous sums of money into the hands of capitalists and the rich from the pockets of almost everyone else. But it did not lead to the upsurge of investment and entrepreneurship expected by its advocates for the simple reason that, given the generally poor investment climate, tax reductions could not create the anticipated incentives. Yet, precisely because the tax cuts totally failed to vindicate their advocates' predictions that they would pay for themselves by bringing about higher growth and thus higher tax returns, they produced the highest federal deficits of all time. This was in a way fortunate, for major deficits were evidently necessary to bail out the US, and revive the rest of the world economy." But only partially, because the underlying problem of international over-capacity and over-production persisted, with the result that competition for (over-supplied) manufacturing markets continued to be a zero-sum game. The U.S. could gain only at the expense of its rivals and vice versa.

The combination of Reagan's (and others') Keynesianism with tax cuts and the Fed's monetarism actually exacerbated the underlying problem of reduced returns on investment by leading to record-high real interest rates. "This was because the rise in demand for credit coming from governments was very much amplified by that coming from corporations and workers, and was accompanied by the slowdown in the supply of credit that resulted from monetarist restrictiveness [in the Fed's supply of money, which continued to follow monetarist thinking], as well as the reduced rates of savings that were the unavoidable result of low profitability and low wage growth."

In the first half of the 1980s, high real interest rates and resultant dollar appreciation "spelled disaster for broad sections of US manufacturing." Exports fell, imports rocketed, etc. The service sector, on the other hand, "exploded" because of its low wages and so on. As did financial speculation.

But the competitive advantage that the high dollar gave the U.S.'s economic rivals was bound eventually to come to an end as it had in the early 1970s because, in undermining U.S. production, further driving up the U.S.'s external deficit, and pushing down the dollar, the relative value of currencies would eventually be reversed. And so in the mid-1980s the dollar's exchange rate plummeted, which caused export growth in America and decline in Germany and Japan. Moreover, dollar devaluation effectively implied a fall in international demand.

To sum up the 1980s in the U.S.: on the basis of federal deficits, the economy did achieve a long peacetime expansion from 1982 on. Nevertheless, investment growth was low, productivity growth in the private business economy was very low (partly as a result of the slowness of investment growth), and, in

general, despite talk of a “Reagan boom,” the economy “showed less vitality than in the much-maligned 1970s, especially when one takes into account the two major waves of high oil prices that undermined growth in the 1970s and the collapse of oil prices that promoted growth in the later 1980s.” This lack of vitality was also in spite of the unprecedented attack on labor, which of course helped business enormously.

By the way, I’ve often wondered in what sense high government deficits “crowd out” private investment (as economists like to say). The obvious answer is that they tend to cause higher interest rates (because they raise the demand for credit), which discourage investment. Also, government deficits mean that private investors are investing in government bonds instead of the economy. Of course these objections to deficits are stupid if the government itself is undertaking more productive investments than business is.

In the 1990s profitability in the American economy finally began to approach and then surpass its level in 1973, largely as a result of decades of slow or nonexistent real wage growth combined with high exports due to dollar devaluation. Investment and productivity didn’t improve much at first, but the prospects were good. Meanwhile Clinton retreated from decades of Keynesianism by pursuing balanced budgets, as he had to in light of the political and economic environment. (This had the effect of exacerbating Germany and Japan’s economic problems, since these -- and other -- countries had relied on U.S. deficits to sustain their anemic economic growth.) The Fed continued to stick with its austere monetarist policies because growth by the mid-1990s was thought to be gaining “excessive momentum,” despite the 6-percent unemployment rate. The question, therefore, is why fiscal and monetary policy in these years was so austere even though the economy was growing (by 1996) at only a mild rate. The answer is that “a mild economic expansion was just what the political and economic establishment wanted.” The U.S. economy that had emerged in the 1980s and 1990s was very different from in the 1970s and before:

US capital had become profoundly dependent on close to zero real wage growth, as well as low inflation. Employers required the repression of real wage growth inside manufacturing to help counter intense competition from their leading international rivals; they required it outside of manufacturing so that they could increase their profit shares and profit rates, despite the snail-like pace of non-manufacturing productivity growth. US capitalists needed low price increases as well as low wage increases because they had profoundly increased their involvement in finance and in speculation on the stock market, and thereby had become exquisitely sensitive to rises in prices that would undercut their returns from lending or further push up their costs of borrowing for purposes of financial manipulation.

Brenner explains in detail how this new economy emerged, but much of what he says is an elaboration of what I’ve written above. “During the 1970s, it will be recalled, US manufacturing corporations, encouraged by a devalued dollar and sharply reduced wage growth, as well as declining real interest rates, had launched an impressive wave of investment aimed at restoring competitiveness and profitability. Their failure to bring about significant improvement in the rate of profit by the end of the 1970s must have done much to discourage the continuation of such a strategy. In any case, under the combined impact of the deep recession of 1979-82, the very high real interest rates which largely persisted throughout the decade and into the next, and a new, if temporary, rise of the dollar, US manufacturing corporations had little choice but to cut back and change their modus operandi if they wished to survive.” Especially with the major increase in imports from the East Asian “tigers,” manufacturing profitability in the U.S. fell (although profitability outside manufacturing didn’t do so badly because of the non-manufacturing sector’s relative isolation from international competition).

In addition to all this, stockholders in the 1980s secured radically increased dividend pay-outs (which had been cut back in the 1970s). And, encouraged by the deregulation of finance, labor’s vulnerability, and tax breaks that ensured higher returns on unearned income and capital gains, “financial manipulators borrowed heavily to purchase controlling interest in companies in expectation of wringing increased returns from them -- especially by way of the stepped up exploitation of labour, the speeding up

of depreciation and refusal to invest, the shedding of manpower, and downsizing in all forms.” As a result of all these factors, corporations deeply cut investment.

Manufacturing labor productivity did, however, improve significantly from 1979 on -- not because of investment, which was low, but because of the removal from operation of outdated and inefficient plant and equipment (along with the workers who had manned it), as well as from the intensification of work. *Downsizing*, therefore, led to higher labor productivity, but so did technical advance -- “secured, for example, by means of robotization and the application of computer-aided production and design.” And so did American firms’ adoption of Japanese methods of making labor input more intense, continuous, and effective. *Outsourcing* was important too, for it allowed employers to pay lower wages.

So, as I said above, all these things in combination with dollar devaluation after the mid-1980s *finally* led to a partial restoration of manufacturing profitability at the end of the 1980s and then even more in the middle and late 1990s. As a result, investment growth finally accelerated in the late 1990s, which “opened up the potential for a decisive US economic turnaround.”

But remember, from 1979 the place of manufacturing employment in the economy shrank sharply, until in 1996 it was only 16 percent. At the same time, service employment rose. These trends weren’t good for the economy because labor productivity growth was much steeper in manufacturing than in non-manufacturing. In fact, the latter’s productivity growth was the lowest in U.S. history. Thus, “far from an expression of economic rejuvenation, the rapid net increase in the number of US jobs during the 1980s and first half of the 1990s, all of them outside manufacturing, was a manifestation of US economic decline.” Why was productivity growth so low outside manufacturing? Because extremely low wages (and no pressure from foreign competition) ensured that employers had little incentive to adopt labor-saving technology. They continued to add jobs in low-productivity sectors like restaurant services and retail sales. Aggregate unemployment did, therefore, decrease, but this was not bad for business because of low rates of unionization and low wages. “The upshot has been a truly vicious circle, in which low wages have made for low labour productivity growth which has in turn rendered ‘unrealistic’ any significant growth of wages and thereby provided the basis for continued low productivity growth. So much for the Reagan-Bush-Clinton ‘morning in America.’”

“The other side of capitalists’ refusal to place much of their capital in production was their search for alternative ways to make money. With profitability down, interest rates up, and instability heightened, investors had increasing incentive to avoid the risks associated with longer-term placements of new plant and equipment. Still, to profit merely by buying cheap and selling dear is normally no simple task: for every gain there is an equivalent loss, for every winner a loser. Capitalists and the wealthy accumulated wealth with such success during the 1980s largely because the state intervened directly to place money in their hands -- enabling them to profit from their own business failure through lucrative bailouts, offering them giant tax breaks which played no small part in the recovery of corporate balance sheets, and providing them with an unprecedented array of other *politically constituted* opportunities to get rich faster through fiscal, monetary, and deregulation policies -- all at the expense of the great mass of the population.” The pattern, he notes, was clearly established under the Carter administration.

The details of the wealthy’s increasing wealth are pretty sordid. For example, major tax cuts in the 1980s benefited the rich directly, but in increasing the federal deficit they also benefited the rich indirectly, since those with great wealth did most of the lending to the federal government. Interest payments as a part of the federal budget almost doubled in the 1980s to 13.4 percent. These payments were covered by tax revenues largely from the working-class. Thus, despite their low income and standards of living, workers effectively gave their money to the government so that it could then be given to the rich -- in *many* different ways, of course, not only as interest payments.

Enough about America; let’s look at Japan. I’ve already said a little about it. In the first half of the 1980s, Japanese money poured into the U.S. Treasury because of high interest rates; this meant that less money was available for domestic investment in Japan. Then the yen soared because of high current account surpluses (as stated above), exports fell, and a severe recession threatened. Luckily the Japanese government “launched a policy of extreme monetary ease,” sharply reducing interest rates, which stimulated investment and “helped to force-feed a new boom, which lasted through 1990-91.” What it was

trying to do was to wean Japan off its reliance on exports, since this reliance always proved self-undermining in the long run. (High growth of exports led to high external surpluses, which led to a high yen, which made exports relatively more expensive, which caused a decline in exports.) For a few years the policy was successful, causing a boom in domestic investment (partly because low interest rates also stimulated consumption, i.e. demand, by giving people an incentive not to save -- because of the low returns -- but to spend).

While the yen's revaluation was bad for exports, it was good for foreign direct investment. As a result, Japanese foreign investment skyrocketed in the later 1980s. In many cases firms relocated production to the U.S., both to get around import barriers and to take advantage of the U.S.'s cheap labor. They also invested in the East Asian NICs and even increased their exports to this region. Etc. Despite all these positive developments, however, the profitability of Japan's private business economy simply could not withstand "the increase in costs entailed by the massive revaluation of the yen." With the onset of the U.S.'s recession in 1990 and the Japanese government's raising of interest rates to gain control over the prior bubble, Japan entered its worst recession of the postwar epoch. This "recession that began at the end of 1991 and continued into the second half of 1995 was, in part, a reaction to the bubble itself. After engaging for almost half a decade in the most massive accumulation of capital stock, inventories, and labour without succeeding in raising their rate of profit, Japanese manufacturers could not but, sooner or later, cut back compensatorily on the growth of new plant and equipment, inventories, employment, and wages. The reductions had to be that much more severe because so much of the previous spurt of capital accumulation had been financed through the accumulation of debt." So, with the government's turn to higher interest rates, firms had to impose across-the-board cuts. "The resulting, extended collapse of both investment and consumer demand was at the root of the recession."

Actually, the ultimate basis of the recession was the underlying structural problem of the economy's dependence on manufacturing exports together with the secularly rising yen (which rose in the 1990s too) and the consequent inability to restore manufacturing profitability (given international competition -- i.e., overproduction "with respect to the prevailing rate of profit").

What about Germany? In the 1980s and 1990s it pursued "monetarism in the name of exports." Balanced budgets and relatively tight money -- i.e. holding back the growth of domestic demand -- "with the goal of keeping down costs and prices and intensifying competitive pressure on domestic producers so as to spur rationalization and improvement, in the interest of promoting the growth of exports and thereby investment." This policy did succeed in reducing costs of production, such as labor, partly through downsizing, getting rid of inefficient capital and its workforce. Also holding back the growth of wages, etc. The growth of exports did accelerate, but not enough to reduce high unemployment in the late 1980s or to revivify the economy, "for the simple reason that the expansion of exports could not stimulate the required major increase in the accumulation of capital." In the absence of such an increase, labor productivity growth continued to stagnate.

As usual, a major problem with Germany's export-based economic growth is that insofar as it worked, it undermined itself. German current account surpluses led to an appreciation of the mark in the late 1980s, which reduced the international competitiveness of exports. Manufacturing profitability therefore remained low. Firms dramatically increased their investments *outside* Germany because there were so few opportunities for profitable investment domestically. --Incidentally, *non*-manufacturing profitability stayed relatively high because of its insulation from international competition.

By the way, it seems that monetarist austerity tends to undermine the positive effects it can have on the profit rate (by reducing costs) in that it leads to higher real interest rates, which undercut gains in profitability. Also, again, monetarism is partly misguided in that, while encouraging the destruction of unproductive, unprofitable capital, it discourages the introduction of capital into new, potentially profitable lines. In Germany, monetarism led to an average of 8.5 percent unemployment between 1982 and 1990.

After a brief boom between 1988 and 1991 due to capitalist governments' expansionary policies in response to the stock market crash of October 1987, the German government cut spending, raised taxes, and "initiated an extended period of high interest rates to ensure long-term price stability." The result: an undercutting of growth in Europe, and an appreciation of the mark. These and other factors caused a severe

recession between 1991 and 1995. Even after the recession, the manufacturing sector continued to shed labor and have very low investment domestically. In 1997 unemployment in West Germany was close to 10 percent.

In the last chapter (before the Afterword written in 2005), Brenner considers and refutes mainstream arguments given in the late 1990s that the U.S. and maybe the world had finally entered a new and long-term boom. For example, cheerleaders for the American economy argued that low rates of price increase and low unemployment were clear indicators of economic vitality. Brenner points out, first, that “even contemporary economic orthodoxy has failed to establish that inflation rates of up to 8 percent have *any* negative impact on the economy’s vitality.” Inflation isn’t that bad if it’s kept below 8 percent. Indeed, “the grand crusade to control inflation” in the 1990s was very costly to most people, as monetarism always or almost always is, benefiting only the owners and lenders of capital.

Actually, the low rates of inflation and unemployment were simply the results of the extraordinarily slow growth of both demand and wage costs. “Nor is the slow growth of aggregate demand a mystery; it is the direct expression of the slow growth of investment demand, arising from low profit rates and secularly high real interest rates, the stagnation of consumer demand resulting from the long-term stagnation of wages, and the collapse of governmental demand stemming from the sharp turn to budget balancing under Clinton.”

Another good point: “Most indicative of the real condition of the US economy has not been its ability to control prices, but its dependence on controlling the price of labour, its *incapacity* to accommodate virtually any real wage growth.”

Despite all this, it’s true that by 1997 the economy’s profit rate had finally returned to its level in the late 1960s. Even the manufacturing sector’s profitability was high. In the mid-’90s manufacturing investment growth accelerated, as did productivity growth and export growth. These trends, naturally, were based primarily on long-term wage repression, dollar devaluation, and “rationalization [of manufacturing] and technical change.” But in 1997 real wages rose noticeably for the first time in five years, though not enough to put a squeeze on profits.

So the U.S. economy seemed to be doing pretty well. But in order for the long downturn to be transcended, a *system-wide* recovery of profitability would have to take place. It didn’t. Japan and Germany were in almost as bad a condition as ever; U.S. gains in exports were made at their expense, because of their appreciated currencies. –Remember how important exports had become to all these countries by the 1990s. Domestic demand had contracted in the advanced capitalist countries (which means that the world market had contracted) because of semi-monetarist policies intended to slow direct and indirect wage growth and weed out unprofitable capital. Had monetarism worked the way it was supposed to, by eventually stimulating a surge of new investment by surviving firms, the market would not have contracted but expanded. But governments and corporations weren’t willing to tolerate recessions severe enough to get the job done (i.e. to reduce wages sufficiently, kill enough redundant capital, etc.), instead relying on various forms of credit and Reagan’s military Keynesianism to prop up the world market -- policies that, because of continued monetary restrictions, caused a sharp rise in real interest rates, discouraging investment. The upshot was that a system-wide investment boom never materialized; instead, there was declining growth of aggregate demand that exacerbated manufacturing over-capacity and over-production, and sharpened the tendency of international trade to take a “zero-sum” character. One country tended to gain at the expense of another.

Brenner sketches an optimistic scenario for the world economy, according to which the U.S. boom triggers export expansions in Europe and Japan (as it in fact did a little) such that the classic Smithian scenario is realized of “mutually self-reinforcing growth through [international] specialization and the gains from trade.” Complementarity would override competition. Europe and Japan would export to the U.S., which would export other goods to them, etc. He finds this possibility unlikely, however. “The fundamental point is the obverse of the Smithian hypothesis just referred to -- that since virtually all of the world’s leading economies are seeking to emerge from their difficulties through major, simultaneous increases in their reliance on the world market, based on still another and deeper phase of wage repression and

macroeconomic austerity, the inevitable flood of exports is more likely to issue in redundancy of output, intensified competition, and over-supplied markets than in the mutual gains from trade.”

One piece of evidence for the latter scenario is that the 1995 currency accords that raised the value of the dollar in order to prevent Japan’s economic collapse had by the late ’90s caused an erosion of the U.S.’s decade-long export boom. But the resultant increase in exports from Germany and Japan did not catalyze economy-wide expansions. In Germany, the reason is that the cost-cutting and monetary austerity that made possible a new export boom shrank domestic demand. In Japan, the government for some reason raised indirect taxes even as the currency devaluation was failing to secure complete economic recovery, with the result that a new and severe recession arrived. It was temporarily alleviated in 1998 by major fiscal stimulus.

Meanwhile, the other economies of East Asia descended into crisis. They had benefited from the yen’s high value by exporting to markets previously held by Japanese producers -- because the NICs’ currencies were pegged to the dollar, so that the dollar’s devaluation (in relation to the yen, etc.) from the mid-1980s until the mid-1990s helped them. Japanese multinationals were also investing in these countries because of their export boom. But then the yen was devalued in 1995, and things went downhill for the NICs. They “suffered sharp reductions in their export growth and/or profits, especially under the impact of intensified Japanese, as well as Chinese, competition...” When it became clear that their future wasn’t bright, “Western and Japanese banks rushed to withdraw their mostly short-term capital, precipitating a run on the money markets.” Foreign lenders withdrew their money in a panic, and eventually the affected currencies were devalued -- which worsened the crisis by making it harder for manufacturers to repay their huge loans.

“It was here that the IMF stepped in. The IMF might have attempted to get the international banks to agree formally to act together to keep their money flowing into Asia so as to counteract the panicky withdrawal of credit, for pouring in money is the normal remedy for a liquidity crisis. After all, the underlying problem facing many Asian firms was the insufficient international demand for their goods, not the inefficiency of their production, let alone their dependence upon (nonexistent) government deficit spending. Some firms would no doubt have had to be trimmed back; others would have had to go under. But the whole regional economy did not have to go down. As it was, the IMF, mainly concerned that European, US, and Japanese banks be repaid in full, demanded, in Hoover-like fashion, that credit be tightened and austerity imposed, radically exacerbating the debt crisis and ensuring a devastating depression.” (The IMF also took the opportunity “to break down and open up the East Asian statist and organized capitalisms, notably in Korea.” Naomi Klein discusses that in her book, as I recall.)

Brenner predicts (in 1998) that among the consequences will be cheaper exports from East Asia (because of the currency devaluation) and a shrinking of the world market because of the depression-induced shrinking of demand in the affected countries. In other words: the intensification of international competition and over-production.

At the same time, China was becoming a growing presence on the world market, even as its consumer demand was growing slowly (which is not good).

Japan, by the way, was itself severely damaged by the East Asian crisis because, among other reasons, East Asia was a huge market for its goods. An indirect consequence was that Japan’s aggregate demand shrank.

The end result is that the growth of world exports is likely to increase while the growth of world markets is likely to contract, with obvious implications for international over-capacity and over-production. Prices will fall, profit rates will fall, investment will fall, productivity will fall.

Probably only a major world depression can get us out of this situation. Either that or an internationally coordinated campaign of epic Keynesianism and state-managed development, something approaching or embodying state socialism. And that ain’t gonna happen.

Here’s an email I wrote to my Thomas Friedman-loving fellow TA after a little debate we had, which I put here because it’s how I think about this stuff:

One last comment: while international trade is obviously necessary, it doesn't have to take "neoliberal" forms. That's all I'm saying. Friedman thinks it does, but he's forgetting that England, the U.S., France, Germany, Japan, the East Asian NICs, etc. developed initially through protectionism and (in the last century at least) intensive government involvement in the economy, funding and directing of infrastructure development, etc. Neoliberalism has, on the whole, not been great for the masses in any country. Just look at the devastation it (has) wreaked in Chile, Argentina, Mexico, Russia, much of Eastern Europe, India (although I know less about that), much of Africa, etc. On the other hand, the recent leftist regimes in Brazil, Venezuela, Bolivia and so on, which have partly opted out of neoliberal so-called "free trade" (a huge misnomer of course, since there's nothing free about it; it's premised on massive subsidies to and protection of well-connected corporations and an almost total lack of protection for the politically unconnected masses), have succeeded in alleviating poverty, improving education and health care, etc. Plenty of scholarship documents that.

Trade barriers should be lowered after countries have already developed their industries and raised living standards, as with Japan and the NICs. Then let international competition flower, when its effects on workers won't be as devastating as they have been in the last 35 years. --Anyway, that's how I look at it.

Charles is an example of that paradoxical but nearly ubiquitous phenomenon among the chattering classes, an intelligent (semi-)idiot. I like him pretty well anyway.

This is all academic of course, because the wealthier and more powerful corporations are more or less going to get their way. They're going to succeed in lowering trade barriers most of the time if it benefits them, especially if it also benefits the elites in the other country (as it usually does).

I admit, too, that these issues are too complicated to permit of such a simple prescription as I suggested in the email. International trade is inevitable. But it isn't a "yes or no" thing -- either yes to trade or no to trade -- as Friedman implies in his infantile manifestoes for neoliberalism. Trade agreements can be done in intelligent and subtle ways, with protections for the workers that might be hit hardest, programs for re-training, maybe long-term public-works projects if large numbers of workers are expected to be laid off as a consequence of "trade" (or corporate investment in lower-wage countries), provisions for paying workers in the cheaper country a specified minimum, provisions for the protection of labor unions (which can be good for the economy, in that their pressing for higher wages leads to higher demand, higher consumption), etc. These things aren't possible, however, unless global agencies like the WTO enforce them, which they won't because corporations won't let them.

From another email to Charles: "Actually, I suspect that insofar as China is doing well economically, it's due largely to the many ways that its government ignores neoliberal orthodoxy as formulated by Friedman, the IMF, etc. Same with Argentina, probably Chile and so forth -- because neoliberalism, as I understand it, means austerity, privatization, deregulation, destruction of the labor movement (and it was largely by virtue of the labor movement that the U.S.'s working class was able to rise to middle-class status), whereas modern development requires state intervention, industrial regulation, some fairly robust form of labor unionism, non-austerity, only semi-privatization, etc. As some economist said once (I forget who), these sorts of interventionist policies are the only way that anyone has ever figured out how to industrialize successfully. --How all this bears on Wal-Mart I'm not entirely sure. I suppose I think that if America was going to be deindustrialized, in an ideal world the government would have cushioned the blow by providing for massive re-training programs or public works projects (killing two birds with one stone) or whatever. Of course that was impossible, given our political economy. -I'm not sure you agree with the whole 'public works' idea, but the way I see it is, why not cut out the middleman and let a democratically elected government direct investment where it is most needed instead of where the most profit can be made by grinding workers down as much as possible?"

Later in that same email: “I guess ultimately my point is that, notwithstanding the conventional wisdom, the 'state sector' tends to be more efficient and effective -- and more potentially democratic -- than the corporate or private sector (except when the private sector interferes with the state's proper functioning -- as it more or less constantly does -- and introduces inefficiencies). And so state involvement should be encouraged at most levels. Look at how the internet was developed, and computers, and satellites, and containerization, and the atom bomb, and the space program, and so on: through the state sector. Look at how inefficient and ineffective America's private health insurance system is as compared to the relatively effective Canadian system (which has problems, yes, but far fewer than ours). Look at how popular Medicare and Social Security are. Look at how integral to Japan's postwar recovery an extremely active state was. (And the same in China now.) And think of the effectiveness -- (as I understand it, their effectiveness was almost universally acknowledged) -- of the WPA and the TVA.”

...Went to the Wisconsin Historical Society last weekend. As luck would have it, the TWUA's collection is so large that it's stored in an off-site location, which is open only on Wednesdays. So, I went back to Chicago empty-handed. Returned to Wisconsin this weekend because the archivists had brought a few boxes from the off-site location to the main site. *Finally*, therefore, I was able to do productive research. Archival research isn't a very thrilling thing, but there's something seductive about it, about sitting in a library room perusing folder after folder of old correspondence, memos, newspaper clippings, notes for speeches, minutes from meetings, etc. And looking at microfilm is strangely seductive as well. Page after page of voices from the past. Dramatic moments at conventions, inspirational speeches, delegates' comments and complaints, moments of humor, an endearing rank-and-file respect for the procedural rules of laborite democracy. I can almost understand how scholars can let themselves devote years of their lives to uncovering the minutiae of some minute topic that only a minute sliver of the minute world that is academia cares about.

One needs a Nietzschean “instinct for self-defense.”

The 2005 Afterword of Brenner's book reviews the history and updates it.

“The turn by the Federal Reserve to monetarist tight credit at the start of the 1980s was aimed, in the first instance, to force up unemployment so as to further reduce wage pressure and break the back of inflation. But it was also intended, with the help of big tax breaks for the corporations and a major dose of financial deregulation, to detonate a major restructuring of the US economy -- by eliminating the huge overhang of high-cost low-profit means of production that continued to hold down manufacturing profit rates, by dealing a death blow to unions so as to make increases in real earnings ever more difficult, and by opening the way for a reallocation of means of production out of industry into financial services. In fact, the cataclysms and shifts that were detonated by the Volker quake did set the US economy on a new course -- toward manufacturing revival, the expansion and consolidation of a low-wage economy outside of manufacturing, and the dramatic ascent of finance.” The “gargantuan shakeout” caused by the Volker recession “established the necessary condition for the revival of the manufacturing profit rate and thereby that of the private economy as a whole”; as a result, between 1985 and 1995, U.S. manufacturers were able to achieve a dramatic turnaround. Very important to this turnaround was the Plaza Accord of 1985, in which the G-5 powers, “acting in response to the devastation of US manufacturing capacity wreaked by record high real interest rates and the rocketing currency, detonated a decade-long plunge of the dollar.” I've reviewed all this above.

Between 1989 and 1993 the Fed brought “the real cost of short-term borrowing in the US close to zero”; “the real cost of long-term borrowing had, meanwhile, continued its long-term slide.” Under these conditions, the U.S. manufacturing sector “was finally ready to shake off its lethargy. Manufacturing investment, output, and exports all suddenly thrust forward, initiating an extended acceleration and providing a major stimulus to the rest of the economy.”

Unfortunately the U.S. had to deal with a world economy, which wasn't doing very well. Here's a nice summary:

As a consequence of the continuous, precipitous fall in profit rates that resulted from the worsening of global over-capacity and intensifying international competition between the later 1960s and early 1980s, there emerged, in classical fashion, a dual problem of weakening aggregate demand and weakening productivity growth, which tended to be self-perpetuating. In order to restore profit rates, firms across the advanced capitalist economy moved immediately and decisively to reduce the growth of real wages, while government cut back sharply on the increase of social spending. Because, as an expression of reduced profitability, firms could secure only declining surpluses for any given increase in their capital stock, they were simultaneously obliged to reduce the growth of investment, as well as employment. As a result, the growth of consumption, investment, and government demand were all forced down, leading to the reduced growth of purchasing power economy-wide. Meanwhile, because firms, in the face of declining profits and prospects, neither wished to nor could expand their plant, equipment, and software as rapidly as before, a decline in the rate of growth of productivity naturally resulted. Of course, the slower growth of productivity further threatened profits, leading firms to exert further downward pressure on wages and, thereby, aggregate demand.... Slower growth of aggregate demand itself undermined profit rates further and firms responded by reducing capital accumulation and wage growth even more, leading to the further reduction of productivity and aggregate demand growth, and, in turn, profitability....a self-sustaining, indeed self-intensifying, process. Between the late 1960s and 1995, as profit rates fell and failed to recover on a system-wide basis, private investment (capital stock) for the US, Japan, Germany, the eleven members of the EU taken together, and the G-7 grew ever more slowly, business cycle by business cycle, as also did productivity, employment, and real wages, as well as private consumption and government demand, along with GDP.

Because of the ever-increasing downward pressure on the growth of productivity and aggregate demand, “the advanced capitalist economies were obliged to rely, as they had already begun to do in the middle to late 1960s, on ever larger government deficits to keep them expanding. From the mid-1970s, US federal deficits were responsible for pulling the world economy out of every cyclical downturn.” Only with Clinton’s “epoch-making” turn to budget-balancing and Europe’s macroeconomic tightening in the run-up to the Maastricht treaty did the advanced capitalist countries “shift in earnest toward governance by way of the free market.” Private-sector initiative became more important than ever. But in a situation of low aggregate demand, the way to restore profitability was not to increase investment and employment but to downsize and suppress wage growth. This “made for the weakening of purchasing power system-wide and deepening recession in much of the world economy between 1991 and 1995.”

Etc.

In 1995 the “reverse Plaza Accord” happened, i.e. the revaluation of the dollar and devaluation of the yen and mark. This was a reversal of policy for the Clinton administration (though probably an inevitable one), because it meant a reduction of manufacturing competitiveness. The new economic trajectory was “based on cheap imports, rising asset prices, and the influx of foreign money to buy US Treasuries, corporate bonds, and corporate equities” (because they were worth more now, given the higher value of the dollar). In broad terms, what the Clinton administration was doing was embracing the political economy of the Reagan administration. “As in the first half of the 1980s, financiers would be favoured not just by low inflation enforced by inexpensive commodities from overseas, but by asset prices that would be driven up in international terms with the value of the dollar. Businesses that relied on imports, either for inputs into production or to sell directly, not least wholesalers and retailers, would also stand to benefit....”

“The reverse Plaza Accord of 1995 turned out to be the turning point for the US economic expansion of the 1990s and thereby the world economy, as it both set off the ‘New Economy’ boom and ensured that it would have feet of clay. The stepped-up purchases of US Treasury instruments by foreign governments drove down long-term interest rates, even as the Federal Reserve simultaneously reduced the short-term cost of borrowing (to stabilize the economy in the wake of the Mexican peso crisis). The stepped-

up purchases of dollars that these purchases required drove up the dollar's exchange rate against the yen and the mark. Taken together, these two trends -- toward cheap credit and an expensive dollar -- would persist through the end of the decade and shape the path of economic development on a global scale." As we saw, among the consequences was a decline in the U.S. manufacturing profit rate and a decline in East Asian manufacturing profit rates leading to financial crisis. Also, consequences included "the greatest stock market bubble in American history; an accelerating economic expansion driven by the wealth effect¹ of rocketing equity values; and a radical worsening of already existing manufacturing over-capacity, which resulted from a massive wave of mis-investment in high-tech industries set off by the bubble in New Economy equities."

After 1997 the manufacturing profit rate declined precipitously, "depriving the economic expansion of the 1990s of what had hitherto been its main objective foundation." The expansion actually speeded up because of the spectacular take-off of the stock market -- but this was a classic bubble, since corporate profits *declined* between 1997 and 2000. Again, a major reason for the rapid increase in equity prices -- an increase that wasn't justified by corporate profits -- was the easing of credit brought about by the reverse Plaza Accord.

Alan Greenspan's Federal Reserve did its part to encourage the stock market bubble. After the reverse Plaza Accord and Clinton's shrinking federal deficits -- both bad for investment (in the latter case because federal deficits had boosted aggregate demand) -- Greenspan evidently decided he had to do something to keep the U.S.'s expansion going. So he turned to the equity markets and their wealth effect to stimulate demand. "Indeed, the strategy that he evolved during the second half of the 1990s -- and has continued to implement ever since [up to 2005 at least] -- might usefully be called 'stock market, or asset-price, Keynesianism.' In traditional Keynesian policy, demand is 'subsidized' by means of the federal government's incurring of rising *public* deficits so as to spend more than it takes in taxes. By contrast, in Greenspan's version, demand is increased by means of corporations and wealthy households taking on rising *private* deficits so as to spend more than they make, encouraged to do so by the increased paper wealth that they effortlessly accrue by virtue of the appreciation of the value of their stocks, or other assets." Thus, Greenspan kept equities rising by means of ever-easier credit: between 1995 and the middle of 1999 he failed to raise interest rates except once in 1997. His purpose, again, was to keep the economic expansion going by compensating for insufficient demand in the "real" economy.

But surely -- this is me talking, not Brenner -- low interest rates are good not only for stock market investment but more substantive investment too, right? Greenspan kept interest rates low because he wasn't worried about inflation anymore, since the reverse Plaza Accord, the decimated labor movement, and low federal deficits had killed off inflation. His real concern, as Brenner says, was to keep the economy going; and obviously a good way to do that is to keep interest rates low. For all kinds of investment, not only for equity markets.

Someday I'll have to get clear on everything about interest rates, inflation, exchange rates, etc. It's all rather bewildering.

Between 1995 and 2000, "profits became increasingly hard to come by." Nevertheless, "corporations were able to fund stepped-up capital accumulation with consummate ease on the basis of runaway stock values that bloated market capitalization and thus apparent collateral beyond recognition." Borrowing increased too: "by the end of the decade, they were using borrowing to fund capital accumulation at the highest rates in history."

Households -- especially the top 20 percent of them in terms of income (which owned 95 percent of all financial assets) -- "also treated the rapid rise in equity prices as an opportunity for radically stepped-up borrowing and, on that basis, spending.... As the flip side of the coin, they felt free to sharply reduce their rate of savings as a proportion of consumption, so as to raise their rate of spending.... As one pundit put it, the boom of the later 1990s was the first in US history to be heavily driven by yuppie expenditures."

¹ According to Wikipedia, a wealth effect is "an increase in spending that accompanies an increase in perceived wealth."

In the second half of the 1990s, “non-financial corporations allocated as much of the huge sum that they borrowed to buying shares as to accumulating capital.... Through share repurchases funded by borrowing, corporations avoided the tedious process of creating shareholder value through actually producing goods and services at a profit, and directly drove up the price of their own equities for the benefit of their stockholders, as well as their corporate executives who were heavily remunerated with stock options. Higher equity values made for still more collateral, further borrowing, greater stock purchases, and so forth. The same sort of process would soon be at work once again in the escalation of housing prices.” The New Economy boom was underpinned in this way by the wealth effect of rising equity prices on both businesses and households.

Rising equity prices accounted for between one-quarter and one-third of the increase in GDP between 1995 and 2000. And one-third of the increase in consumption.

At the same time, retail trade and wholesale trade did very well due to the consumer spending spree and cheap imports (a consequence of dollar revaluation). So did the FIRE sector of the economy. The construction industry too, benefiting from an “astonishing, seemingly unending, increase in the demand for homes,” enjoyed what would turn out to be a decade-long boom. And with the abolition of Glass-Steagall, huge conglomerates that combined commercial banking, investment banking, and insurance emerged, such as Citicorp and J.P. Morgan Chase. In 2000, the profits of the financial sector amounted to almost 40 percent of total corporate profits.

“The years between 1995 and 1997 constituted a brief era of overlap and transition, between the extended period of manufacturing-led profitability revival culminating in economy-wide revitalization between 1993 and 1997 and the period of stock-market-driven expansion leading to New Economy boom and profitability crisis between 1995 and 2000. Due to the lagged effect of the revaluation of the dollar, the recovery of manufacturing profitability had not yet ceased to impart its momentum to the economy. The wealth effect of the equity price boom was already, moreover, providing its own impetus. As a consequence, the economy displayed a vitality not seen in decades.”

But then things went bad in East Asia, as we’ve seen. “As the rising dollar, accompanied by easy credit, enhanced US asset prices and thereby US economic growth from 1995, while shifting the weight of international over-capacity and reduced profitability from Japan and Germany to the US, similar forces brought about similar effects and a similar pattern in the economies of East Asia at the very same time, setting off a chain reaction of crisis that would ultimately engulf the US itself.” Stock prices rose in East Asia (excluding Japan) while profit rates declined (because of revalued currencies and the consequent reduction in earnings from exports). “The growing divergence between falling profits and rising asset prices was unsustainable. As export remittances fell sharply, East Asian producers found it ever more difficult to repay loans.” From the beginning of 1997, financial-industrial conglomerates in South Korea started to go bankrupt. “In expectation that loans would henceforth be more difficult to collect, funds began to quit the region, and with ever greater speed. As a consequence, asset prices began to crumble, which accelerated the outflow of funds and soon made for downward pressure on the local currencies. But devaluation only raised the dollar value of foreign debts in terms of the local currencies, making them that much more difficult to repay. Central banks raised short-term interest rates to stem the exodus of capital and prevent currencies from collapsing. But this caused financial institutions, which depended on borrowing from central banks, to go bankrupt, leading to the collapse of asset prices and the panicked flight of capital.”

The crisis got worse in 1998. Currencies collapsed and the price of East Asian goods fell with them, “placing great pressure, direct and indirect, on the rest of the world economy” (presumably because of a decline in exports and/or a necessary reduction in their prices in order to compete with exports from East Asia, and a resultant loss in profits). “During the summer of 1998, the East Asian crisis spilled over into the less-developed countries. In August, the Russian government defaulted on its debt. The Brazilian economy started to melt down shortly thereafter....”

Page 302 nicely summarizes the reasons for Japan’s stagnation and recession in the 1990s. I’ll just say that the East Asian crisis hurt Japan too because that region was the main market for its exports. It collapsed into recession again, which further crippled East Asia and thereby boomeranged back onto Japan.

The annual increase in U.S. exports dropped virtually to zero in 1998. Other bad things happened too, so the Fed stepped in to bail out a hedge fund, lower interest rates, etc., with the result that markets were not only rescued but “sent into orbit.” The new U.S. expansion “pulled the rest of the world from its recession and motivated a new global expansion, most especially in East Asia.” U.S. demand was huge, and by 2000 even Western Europe had emerged from stagnation, “driven by its German dynamo.” The U.S.’s exports could not remotely compete with its imports (partly because of the currency revaluation of 1995), so trade and current account deficits skyrocketed. “These external deficits brought with them enormous downward pressure on manufacturing profits, making a crisis for the manufacturing sector unavoidable.”

“In the end, there was no escaping the fact that the explosion of investment and consumption that drove the last phase of the US expansion -- as well as the major uptick in productivity growth to which it gave rise -- was heavily dependent upon a historic increase in borrowing, which was itself made possible by a record equity price run-up that was powered by speculation in defiance of actual corporate returns.” There was a titanic misallocation of funds into high-tech paper assets, and a consequent misdirection of new plant, equipment, and software into over-subscribed manufacturing and related lines, especially information technology. This was all largely a result of the deregulated financial sector’s necessity of chasing short-term profits because that’s what shareholders *et al* wanted. “As equity prices began to rise strongly from 1995-1996, fund managers were thus under heavy pressure to buy, even if, in light of the growing gap between stock prices and profits, they doubted the long-term viability of their purchases.” Their competitors were doing the same thing, so if in the end the assets they’d purchased went sour (as they did), they wouldn’t be held responsible. The Fed’s behavior contributed to all this by reassuring investors.

Between 1997 and 2000, total corporate profits after taxes *fell* by 20 percent even as the index of the NYSE rose by 50 percent.

“From July 2000, ever-worsening earnings reported by corporations precipitated a stock-market collapse and, in turn, a sharp cyclical downturn, both by reversing the wealth effect and by revealing the mass of redundant productive capacity and the mountain of corporate indebtedness that constituted the dual legacy of the bubble-driven boom.” Firms found it harder to get loans -- and in many cases they didn’t even want to, being overburdened by debt already. With loans and profits harder to come by, the growth of jobs and new plant and equipment was cut back, undercutting both investment and consumer demand and triggering a self-sustaining downward spiral. “The crisis of profitability had, in classical fashion, brought about a crisis of aggregate demand.”

The rest of the world followed the US downward. Just as the stock market’s last upward thrust had rescued not only the US but also the world economy as a whole from the international financial crisis of 1997-98, setting off a short-lived hyper-boom, the collapse of US equity prices and investment reversed the process. As the economy rapidly lost energy, US imports plunged, with the result that the economies of Japan, Europe and East Asia lost steam as fast as the US, while the developing world, notably Latin America, was, after a brief honeymoon, projected back into crisis. A mutually reinforcing international recessionary process was thus unleashed, rendered all the more problematic by the degree to which the rest of the world had, over the previous two decades, in the face of stagnating domestic demand, oriented their economies to exports -- and thus perforce to the US domestic market. As the rest of the world, deprived of its US motor, sank ever further into recession, the US could look only to itself to launch an economic recovery upon which most of the global economy depended.

The center of the storm was in the manufacturing sector, especially in high-technology lines. Because of their immense over-capacity, capacity utilization plummeted. In the year following July 2000, 4200 high-tech companies lost more money than *all* the profits they had realized during the five-year boom of 1995 to 2000. “As one economist wryly noted, ‘What [this fact] means is that, with the benefit of hindsight, the later 1990s never happened.’ So much for the New Economy boom.”

Outside of manufacturing, the economy actually did pretty well during the recession, because the non-manufacturing sector wasn't plagued by systemic over-capacity or intensifying international competition. Critical in the long run was its ability to take advantage of the recession to reduce the growth of real wages. But it was also able to raise prices, unlike manufacturers, of course.

Nevertheless, because of the shock to manufacturing, the growth of GDP, investment, and exports declined faster than in any other twelve-month period since 1945. So the Fed intervened and lowered the cost of borrowing so much that the real Federal Funds rate was *below zero* for three full years. This didn't help much. "Vastly oversupplied with means of production and overburdened by debt, corporations had little incentive to increase hiring or step up the purchase of plant, equipment, and software....no matter how far interest rates came down." Instead, they eliminated millions of jobs.

Nor were households able to increase their borrowing and thereby consumption (and stimulate the economy that way), because jobs were disappearing and wage growth was falling. But the Fed was forced to rely on them anyway because its measures were having little influence on private businesses. So it turned again to "asset-price Keynesianism." This time, though, instead of pumping up corporate equities to spur corporate borrowing and investment as well as household borrowing and consumption, it had to do what it could to "force down mortgage rates and inflate the value of residential housing so as to facilitate stepped up household borrowing and, in that way, amplify personal consumption. Thanks in large part to the Fed's actions, long-term borrowing costs did fall significantly and housing prices did rise precipitously [in *real* terms].... These changes together laid the basis for the cyclical upturn."

At the same time, Bush substantially increased military spending, which did a little to help the economy stay afloat, and pushed through enormous tax cuts for the rich, which didn't help much because it only encouraged them to buy financial assets and not to raise their consumption. As a result, "the economy would have to continue to rely mainly, as it had been doing since the later 1990s, on asset-price Keynesianism."

"Households did assume the vanguard role assigned to them. Between 2000 and 2004, they took advantage of rocketing housing values and falling interest rates to raise their annual borrowing as a percentage of personal disposable income to an unheard-of 11.8 percent." Personal consumption expenditures thus accounted for *all* the growth of GDP from 2000 to 2004.

As the real economy outside manufacturing was doing pretty well because of households' consumption, the financial sector was doing great too. The housing market simply replaced the equity market. "...Like the stock-market bubble, the real-estate bubble fed upon itself, and increasingly so, with increased borrowing facilitated by rising paper wealth and easy credit making for greater housing demand and still higher real-estate values, which provided the collateral for still more borrowing making for more demand and higher housing prices, and so on." What set the whole process in motion apparently was the rise in asset values of houses (whatever that means), which allowed homeowners to borrow more and so spend more, etc.

"On the basis of the huge on-paper appreciation of the value of their residences, households were able to withdraw dramatically increased funds from the home equity -- by selling their houses at prices surpassing their mortgage debt, buying new ones, and still having cash left over; by refinancing and increasing the size of their existing mortgages, extracting cash in the process; and by taking out new home equity loans in the form either of second mortgages or lines of credit." Because of housing's contribution, the average annual growth of GDP between 2000 and 2005 was 2.4 percent instead of 1.7 percent.

In his wisdom, Brenner remarks that "nevertheless, it is hard to see how housing's huge subsidy to the economic expansion can long sustain itself." After 2008, we know he was right.

Between 2000 and 2005, U.S. external deficits kept the world economy going, as always. Its imports greatly exceeded its exports, and its share of the world market in manufactures shrank to its lowest level of the postwar epoch (9 percent). This happened despite the dollar's decline in value. In large part this was due to the annual growth of China's exports (over 25 percent). The turning point in the expansion of China's trade occurred in the first half of the 1990s, "when the government opened the way for banks to impose a major tightening of credit....while itself implementing a major devaluation of the renminbi."

Unlike Japan and the NICs in their periods of development, China did not “tightly control foreign direct investment in statist and mercantilist fashion.” Instead, it welcomed a huge influx of foreign-owned companies and foreign investment. “By 2004-05, foreign firms had come to account for no less than one third of Chinese manufacturing output and 55-60 percent of its exports.” Brenner goes on about China for a few pages, but it’s mostly Greek to me. In the book’s final pages he gives more reasons for pessimism about the world economy, such as the slow growth of investment and job creation resulting from not-high-enough profit rates.

*

The Nineteenth-Century Campaign to Control Working Women’s Leisure

Since antiquity, authorities and men have been alternately fascinated and horrified by women’s supposed bacchanalian inner tendencies ever ready to unrepress themselves in riots of sexual abandon. In Greece there were the maenads, orgiastic followers of Dionysus; in nineteenth-century England there was something quite different but similarly appalling to middle- and upper-class sensibilities: working-class women uninhibitedly enjoying their off-hours. The ways they did so, and the ways that their social betters tried to prevent them from doing so, are the subjects of Catriona Parratt’s stimulating book *“More Than Mere Amusement”’: Working-Class Women’s Leisure in England, 1750-1914* (2001).

One way to read this work is as a study in what the pioneering social historian E. P. Thompson might call the disciplining of the “instincts,” or of humans’ essential ludic nature, for the sake (indirectly) of a smoothly functioning industrial capitalism. It is one part of the story of how English peasants’ and ex-peasants’ obstreperous life-celebrating culture was disciplined out of existence from the eighteenth to the twentieth centuries, helping make possible first a repressive Victorian society and later our own sexually unrepressed but communally fragmented society.

The world that is gone was indeed a “communal” one, as is evident from Parratt’s first paragraph:

Throughout the eighteenth century and into the nineteenth, women were visible and vital participants in popular recreational culture. In their cottages and workshops, in urban streets and on village greens, in alehouses and on farms, they worked and socialized alongside men. In the daily ebb and flow of labor and release from labor, and in the seasonal and annual round of celebrations, feasts, and holidays....they shared in an array of amusements that were gregarious and open. They gossiped and gambled....got drunk and got rowdy at private parties and public assemblies....and trekked out into open fields and onto moors to listen to ranting preachers....

It was a culture of hard physical labor and hard partying, alcohol flowing abundantly at popular festivals where fights broke out frequently (women participating), “lads and lasses [meeting] at the public-house” where they drank, smoked, and danced, and women battling one another in prizefights, sword fights, footraces, cricket, handball, and “folk” football.

As the eighteenth century progressed, such unrestrained merry-making became more offensive to many among the aristocracy and middle classes, who from the 1780s or so started trying to tame it or eliminate it. Before, the governing classes had treated the “almost Rabelaisian” popular recreational culture with good-humored tolerance, as befit the “benign paternalism” that they thought characterized their relations with the lower orders. But the long era of relative tolerance came to a convulsive end with the Industrial Revolution. The founding of the Society for the Suppression of Vice in 1802 marks this new stage of culture, although it was far from the only such organization. “Magistrates, justices of the peace, and the new police force vigorously licensed, prosecuted, and jailed in an attempt to promote the moral elevation of the nation.... Alehouses were closed, fairs were suppressed, wakes and other customary holidays were ‘tamed.’” Employers, reformers, evangelicals, and politicians all had their own interests and goals in the transformation of popular culture they oversaw.

It is an old story that Parratt tells, but unlike other scholars she focuses on the mutations in women's, not men's, leisure during the nineteenth century. What fascinates her is the laborious, and only partly successful, domestication of working-class women. One of the catalysts of this domestication, not surprisingly, was religion, which has so often proved invaluable to "domesticators" of whatever sort. The evangelical movements of the late eighteenth and early nineteenth centuries did much to popularize conservative notions of femininity and masculinity, a patriarchal order of subservient females. Upper-class evangelicals such as Hannah More, author of *Cheap Repository for Moral and Religious Tracts* (published between 1795 and 1798), did moral missionary work amongst the benighted poor, particularly women, to prepare them "to be good wives and good mothers, as well as good Christians." These well-intentioned bringers of the truth were precursors, as Parratt remarks, of upper- and middle-class Victorian purveyors of "rational recreation" schemes to fill young women's idle hours.

We should always keep in mind, however, that people are not merely passive receptacles for indoctrination. "The working class made itself as much as it was made," E. P. Thompson said. Accordingly, Parratt devotes much space to analyses of working-class men's and women's self-education and self-disciplining. Chartism, for instance, a mid-nineteenth-century workers' movement, "played a major role in inscribing...restrictive gender ideologies deep within popular and working-class culture." Married women were expected not to work outside the home; working people's leisure was not to be consumed with drinking and dissipation; the working-class wife's purpose in life was to give comfort and happiness to her husband and raise his children to virtue and knowledge. Earlier, the Owenite movement had urged similar practices amongst the laboring classes in preparation for socialism, had similarly emphasized order, decency, sobriety, frugality, and familial responsibilities (although its understanding of the relations between the sexes was more egalitarian than that of Chartism). Later in the century, trade unionists continued this tradition of exalting women's domestic role, their function of providing men with a "haven in a heartless world," and often protested as much as middle-class reformers the existence of female wage-labor, which supposedly corrupted women and rendered them deficient in housewifely skills.

A working-class married woman's leisure was thus severely constrained, and was supposed to be, so that she could devote herself to satisfying her husband during *his* hours of leisure. But in addition to these cultural constraints, Parratt has a chapter on the material constraints that tended to deprive working-class women of their former leisured pastimes. She notes that as unionized male workers were getting the nine-hour- and then the eight-hour-day in the late nineteenth century, many women still had to work ten hours a day or more because their industries were not unionized. Female domestic servants often had it even worse: "In the 1890s, many could expect to have only two or three hours of free time a week, taken on a Sunday." Women's wages were of course far lower than men's, which further restricted their leisure activities. And wives and mothers had the unending housework to take care of.

All this adds up to a pretty bleak picture, perhaps misleadingly bleak. Throughout the nineteenth century, millions of working-class women found ways to spend their leisure time as they wanted. Even the ones who barely earned enough to live on somehow found the means to go on shopping sprees. "One week they have been on the verge of starvation," a contemporary said, "another they have shared in a 'blowout.'" They were inveterate hedonists who had "learnt to hate monotony, to love drink, to use bad language as their mother tongue." And the street culture in which they cavorted was a world of infinite stimulation. Crisp Street in London, for example, was a universe of entertainment: "the barrel organ playing outside the public house, the man playing the violin with his eyes closed, the Indian man with his head and legs all bound round with cloth...the noise, the smell, the music and, oh, the life!" Upper-class observers noted that "people laughed easily, whistled, sang on high days and jiggled in the street -- that great recreation room." Working-class women were thus not necessarily doomed to lives of uninterrupted drudgery and monotony. Quite the contrary.

Parratt devotes the last part of her book to the late-nineteenth-century phenomenon of "rational recreation" organized by middle- and upper-class women who wanted to guide their less privileged sisters into the light, to prepare them for the woman's proper roles in life. Working girls' clubs offered classes, lectures, space to indulge young women's love of dancing -- men were even allowed on such occasions (though subject to strict supervision) -- and simply opportunities to socialize with friends. Some employers

even organized classes and recreational programs at the workplace and offered such amenities as dining rooms, sports fields, and rose gardens to exert a “healthful” influence on the young female employees. The efforts that were taken to control or influence young women’s leisured pursuits are astounding -- and yet despite everything they were only partially successful. Working-class women had a magnificent willfulness and pride.

That, indeed, may be the central theme of Parratt’s book. Nineteenth-century English women among the lower orders would not let upper-class reformers destroy their independence or their raw passion for life. Their “bacchanalian” spirit remained subversive right up to the time of World War I and beyond.

*

Laboring Against Racism: The TWUA in the South during the 1960s

The conventional understanding of labor unions and their membership in the 1960s is of a conservative and bureaucratic set of entrenched interests that played either a negligible or a reactionary role in the progressive upsurges of that decade. The AFL-CIO’s support for the Vietnam War and the U.S.’s imperialist agenda can be seen as a symbol of organized labor’s supposed integration into established power-structures. Among the rank and file, too, conservatism is said to have held sway, white unionized workers being a key component in the backlash against civil rights that elected Richard Nixon and would eventually sweep the Reagan regime into power. The popular image is of construction workers beating up “unpatriotic” students and hippies protesting the Vietnam War.

There is much truth to this caricature, but it oversimplifies. The labor movement in the 1960s was not some granite obstruction to progress or some monument to racial injustice. It is well known, first, that a number of progressive unions funded and participated in civil rights struggles, among them the UAW, the UPWA, and the Hospital Workers’ Union, Local 1199.¹ Less known is that even rank-and-file Appalachian coal miners, for example, by violently protesting in the early 1960s against the potential loss of their health and pension benefits, pressed the U.S. government toward progressive solutions such as an expanded welfare state.² The majority of white workers and their unions were not unequivocally on the wrong side of history, even if they did tend to have certain racial prejudices.

Historians have intensively studied unions with a progressive membership in the 1960s, such as the UPWA, but have arguably paid less attention to unions that had to navigate that decade with a relatively conservative membership. That is, the ambivalent relationship of such unions to the civil rights movement, to African American rights in the workplace and society, has not been exhaustively studied. Many unions had a progressive national leadership but a socially conservative rank and file. Did these unions alienate their base by taking liberal stances on civil rights? Were they very successful in unionizing new black workers? How did white workers in the South react to the desegregation of their unions and workplaces? What were things like for newly unionized blacks?

In this paper I consider such questions in relation to a union with a relatively conservative white membership, the CIO-affiliated Textile Workers Union of America. When blacks in the 1960s, under the protection of the Equal Employment Opportunity Commission, started entering production jobs in the industry and then participating in the union, did the behavior of their white coworkers and the union hierarchy exemplify the narrative of organized labor’s conservatism? As I will argue, the answer, unsurprisingly, is not a clear-cut “yes” or “no.” On matters of civil rights there were indeed tensions between the TWUA’s more progressive national leadership and its rank and file -- especially in the South

-- just as there were tensions between blacks and whites in the workplace. However, white textile workers did not usually let their segregationist sympathies prevent them from joining blacks in struggles against employers (at least if they thought they had something to gain); in fact, many whites were radicalized by blacks' unionization, and they came to respect the latter's militancy. On the whole, the TWUA's record in the tumultuous 1960s does not reflect badly on organized labor.

Until the late 1960s the TWUA was overwhelmingly white, because most jobs in the textile industry, especially higher-paid "production jobs," were held by whites. Blacks did have a long tradition of working in the mills, but mainly as laborers. They "performed tasks which ranged from cleaning floors to installing electrical wiring to repairing looms to constructing mill buildings and mill housing."¹ Many of them, even in the South, were nevertheless unionized, but in separate locals from whites. Segregated locals stretched back even to before the TWUA was founded in 1939. For example, during the 1934 General Textile Strike black locals were organized in most major southern textile centers.²

It is worth noting that blacks themselves often considered segregated unionism preferable to integration, because it gave them a unified voice that whites could be forced to recognize. In Danville, Virginia, for instance, in the late 1940s, the TWUA had two large white locals and a black local, each of which elected representatives to a joint board. As a result, in cases of disagreement between whites, the black local had power disproportionate to its numbers. Danville also showed the potential of unionism to break down barriers of prejudice, in that blacks were elected to positions of responsibility based on their abilities, which were recognized by whites. As one worker testified, "in many cases, when the white workers within the shop steward area would find that the black shop steward was much more able than the white shop steward within the same area, they would take their grievances to the black shop steward."³ Or, on interracial trips to national union conventions, white delegates would sometimes refuse to eat in diners that insisted blacks eat separately. "If we couldn't eat together," said one member recalling the TWUA's 1946 convention, "we didn't eat separate." Timothy Minchin says that these types of incidents were remarkable, "given the intense hostility that had marked black participation in the union during [a] 1944 strike." In the 1950s, too, union members would travel together only if buses were integrated. At one convention a white worker stated, in support of a resolution endorsing civil rights, "We have better relations with the colored people since we organized. They carry a lot of the responsibility."⁴

Despite the accomplishments of segregated unions in the South, conditions in the industry remained deplorable. Discrimination was rampant, blacks remained a tiny minority and were rarely promoted to higher-paying jobs, and divisions persisted, of course, between white and black employees. Only with the passage of the Civil Rights Act in 1964 and the creation of the EEOC did things really start to improve. "Within five years of the act's passage, a rash of major lawsuits had been brought against many of the South's largest textile companies."⁵ Civil rights organizations such as the NAACP, the American Friends Service Committee, and TEAM (Textiles: Employment and Advancement for Minorities) played important roles in the racial integration of the industry, pushing recalcitrant employers to improve their hiring records by means either of legal action or of personal persuasion, in the latter case by visiting mills and talking to employers.⁶

Firms were in fact not always opposed to hiring blacks to production jobs, because a booming economy in the 1960s, as well as the departure of many white employees to more enticing positions in other

industries, had led to a labor shortage. One newspaper reported in 1963 that “Negroes are quietly moving over to the heretofore all-white production line in Southern textile mills.... Throughout the South these days, they are talking labor shortage. Practically every textile plant -- cotton, synthetic, woolen, worsted, glass fiber -- is searching for willing and trainable help.” The article goes on to suggest that “Within the individual mills, there has been peaceful integration. Whites and Negroes realize they must work in harmony.”¹ We will see shortly that this was by no means always the case, but it does indicate that even in the early 1960s white employees were not so hopelessly bigoted they refused to work alongside blacks.

As the federal government and civil rights groups were forcing the integration of the textile industry, the TWUA was cautiously supporting desegregation and actively unionizing new black workers. Internal records make it clear that the union leadership strongly supported civil rights but was reluctant to proclaim its support too vociferously. At a staff meeting in 1966 to discuss the issue, the union decided to continue making public statements in support of integration but not to “spearhead the civil rights fight” because that would hurt it with its “present Southern membership.”² The union had only a minority position in the industry, after all; successful organization was a higher priority than “the development of favorable membership attitudes on civil rights.”³

Nevertheless, it must be emphasized that the national union did try to influence its white members on the matter of civil rights -- *cautiously* tried to educate them, nudge them towards liberal attitudes. This is evident from national conventions in the 1960s, which were attended by hundreds of delegates from locals around the country. These delegates in fact generally seem to have supported civil rights. For example, a resolution that was passed without vocal objections at the 1966 national convention recommended, among other things, “the passage of effective legislation making it a federal crime to commit acts of physical violence against and harassment of civil rights workers and organizers.” It concluded with the declaration that “We pledge to continue our close cooperation with men, women and organizations of goodwill within the labor movement, as well as outside of it, to make our country a better place in which to work and live and to rid ourselves of prejudice, hate and discrimination whenever, wherever and against whomever we find it.”⁴

Even more tellingly, the 1968 convention was visited by Alexander Barkan, former director of the TWUA’s Political Action Committee and, in 1968, director of the AFL-CIO’s Committee on Political Education. He gave an impassioned speech on the necessity of not letting members get “sidetracked by phony issues,” in particular racial prejudices, in the 1968 presidential election. “In 1966,” he states, “we permitted our enemies to sidetrack us all over the country. We were sidetracked.” He proceeds to give numerous examples of how white and black workers in Maryland, California, Illinois, New Jersey, and other states let politicians race-bait them into voting against their economic interests. For instance, the previous New Jersey legislature had given workers a higher minimum wage, improved workmen’s compensation, and unemployment compensation for strikers. To unseat the Democratic majority and repeal unemployment compensation for strikers, “the Manufacturers Association got up a million-dollar slush fund” to spread the lie that “the Superintendent of Schools of New Jersey was going to push through a program of bussing ghetto school children into the white suburbs. There was not any such plan. The Governor denied it. The Superintendent of Schools denied it....” Nevertheless, such racial propaganda swayed many white workers in the suburbs, who helped elect a large Republican majority in 1966. The first act of this majority was to repeal unemployment compensation for strikers.⁵

Barkan also noted in his speech that the AFL-CIO’s “Virginia organization” had taken a poll of its members in 1968 and found that, while Hubert Humphrey was the overwhelming choice, George Wallace got 21% of the vote. Barkan concludes with the fervent exhortation that delegates educate their members

on the issues. “Over and over and over again, you have to talk about these issues” -- “the real issues” -- “from now until next November 5.”

White textile workers tended to be among the more socially conservative members of the AFL-CIO, so Barkan’s speech, while testifying to the progressive character of the national TWUA and the AFL-CIO, also shows what the union was up against. Its conventions were very progressive affairs -- in 1970 Bayard Rustin spoke, to standing ovations and prolonged applause, on the importance of civil rights and racial integration, after which the union unanimously adopted a civil rights resolution “amid applause and cheers”¹ -- but the reality in the mills and their communities was not quite so uplifting. Timothy Minchin notes that the passage of a resolution condemning the White Citizens’ Council at the union’s 1956 convention “caused damaging fallout in local unions,” leading to the resignations of many members across the South.² Eleven years later, in 1967, TEAM observed that “A check of union plants indicates that the racial mix is no better” in unionized than un-unionized plants.³ The priorities of southern locals during these years are reflected in the fact that the enormous archives of Scott Hoyman, Southern Regional Director for the TWUA in the 1960s and ’70s, contain very few references to African Americans or civil rights.⁴

In the 1950s and early 1960s, when the TWUA was taking tentative steps toward integrating plants and locals in the North and, to an extent, even the South, its organizers encountered predictable opposition among many whites. Integration nonetheless took place in a number of formerly segregated plants, even before the creation of the EEOC. Paul Swaity, an organizer in the 1950s and ’60s, remarks that integration was easier in the Midwest than the South partly because employers in the former region exploited not racial divisions but ethnic divisions amongst their employees. Even so, in order to integrate plants in St. Louis, for example, organizers had to do extensive preparatory work among white workers. They would ask shop stewards what they thought would happen if blacks were brought into the plant -- how whites would react, what the steward himself would do, and so forth. They would canvass ordinary workers too. Only after deciding whether any departments, and *which* departments, had a minimum of hostility to the idea of bringing in blacks would organizers coordinate with the employer the hiring of a few black workers.⁵

Even after passage of the Civil Rights Act and substantive or nominal integration of plants and local unions, combating discrimination was, for a long time, not a priority of most locals. In December 1966, only 2.6 percent of all southern TWUA contracts had a nondiscrimination clause, and very few had black stewards or officers. Locals also were reluctant to file grievances on behalf of black members.⁶ The union did provide protection against unfair discharge and disciplinary issues, and its enforcement of seniority was invaluable to black workers, but in the 1960s and early ’70s locals often ignored blacks’ complaints about unequal pay. One worker, for instance, testified in a court case in 1972 that “the Union represents you for being fired or something like that, but as far as coming to get more money, they don’t do very much representing towards the blacks.” In many cases locals also tried to keep blacks out of leadership positions, even after the black membership had become a majority. Sometimes “whites resigned from the union en masse when the first African Americans were elected to positions of responsibility.The union found it very difficult to run mixed locals, finding its locals becoming either heavily black or staying all-white.” According to one black woman, racism in her local union was greater than in the plant as a whole. In fact, her union president was “a card-carrying member of the Ku Klux Klan.”⁷

Despite all this institutionalized racism, black workers understood that it was far better to have a union than not to have one. Indeed, they were among the most militant and organizable workers in the country, and they pushed their fellow employees toward greater militancy. This is evident from a memo

that Paul Swaity filed in 1970 (when he was the director of southern organizing), in which he argued that “The climate for organizing textile workers in the south is better today than it’s been since the early ’40s. There is a general discontent that is growing in the textile mills of the south, particularly in the states of Georgia, Alabama and Tennessee.” He continues with the following observations:

A new generation of workers is entering the industry. They are much more independent.... Black workers, receptive to organizing efforts, are entering the industry in growing numbers. Most textile plants employ more than 15% black and in those textile mill areas where labor is extremely short, black employment is reaching the 50% mark. The black workers pride themselves on what they’ve achieved through unity and confrontation in the civil rights field. They know these same techniques are applicable to economic progress. Their attitude to a union is, therefore, generally favorable.Even among older textile workers, there is a pronounced change taking place. The confrontations and civil rights progress of the black people has had an impact on white textile workers. The entry of blacks into textile plants and the manner in which blacks stand up for their rights has made the docile textile workers sit up and take notice.¹

Organizers therefore anticipated great gains from black unionization. Their optimism was largely justified, for many union elections were won because of black support. In Allendale, South Carolina, for example, organizers reported that a representation election in 1970 had been won because the “majority of workers were black and were self-organized and the company could not crack their solidarity.”² In many campaigns, records show that the union had 100 percent support from black employees -- far more support than among whites. “Major victories at Oneita Knitting Mills in Andrews, South Carolina, in 1973 and at J. P. Stevens in Roanoke Rapids, North Carolina, in 1974 were due in large part to black militancy.”³

David Griffin, white president of Local 250 in Erwin, North Carolina -- “the heart of Klan country,” as a billboard on an interstate highway near the town announced -- believed in 1969 that black employment would be advantageous for his union. “I think within the next few years we’ll have many more Negroes,” he said in an interview. “Whites hate to organize. They want to ‘get along’ with management. But Negroes *know* it’s not on *their* side. They’ve known that kind of thing all the way back to slavery times.” Interestingly, in this deep Klan country white and black employees seem to have got along fairly well. As a spokesman for Burlington Industries, the textile employer in Erwin, said, “I think the greatest surprise some of our managers had at first [after integration] was the acceptance by whites of Negroes.” The reporter who interviewed him concluded that the Klan’s “violent spirit has not been evidenced in the attitudes of Erwin’s mill workers as integration has proceeded. What is found among the ‘hands’ is a perhaps surprising amount of tolerance, with some genuine friendships across racial lines, but also a large measure of unsophisticated prejudice.”⁴

It would be naive to think that “unsophisticated prejudice” could be overcome in just a few years in a society that had known it for centuries, but whites did soon learn to value the contributions of black unionists. A typical attitude was that expressed by a white worker in Roanoke Rapids in 1977: “I really admire the black folk. They stand up for their rights. I think the whites have a lot to learn about that.”⁵ Doubtless this particular worker was able to act in prejudiced ways toward blacks, due to decades of social conditioning, but he was also able to rise above his prejudice and join together with fellow workers to achieve a common good. Whites in an un-unionized plant were perfectly happy to follow blacks into a union, to let them take the lead in organizing it. In many cases they were even willing, at least after the

initial shock of integration in the mid-1960s, to have a black president or vice-president of the local. In the 1970s it was common to have a white president and a black vice-president; in fact, whites would sometimes encourage black leaders to run as a way of strengthening the union.¹ In Fitzgerald, Georgia, a black woman who was elected president of her local union in 1970 apparently encountered no resentment among whites, who accepted her leadership even though she had recently been active in the local NAACP.²

In short, while examples can be multiplied indefinitely of local-union discrimination against blacks in the 1960s and 1970s, other examples can be multiplied indefinitely of successful cooperation between whites and blacks. The point is that the conventional narrative of labor's conservatism in this era is simplistic. Society is too complex to permit of such simple generalizations. The reality is that the TWUA's national union was at least as racially progressive as mainstream America -- a fact indicated by its progressive national conventions, the progressive attitudes of its leaders, and its progressive organizing efforts -- even if it did not try to influence its rank and file as strongly as it could have on the issue of civil rights. This was a strategic decision, a response to the perceived attitudes of most white members of the TWUA in the South.

And yet, to repeat, even these rank-and-file whites were not monolithically reactionary on civil rights. Especially by the early 1970s, many admired what African Americans had achieved in civil rights struggles; they admired the practice of "sticking together" to achieve collective gains, and were themselves willing to stick together with blacks if they thought it would help them economically. For their own part, blacks observed that the opening of production jobs to them in the 1960s and their subsequent participation in integrated unions often changed the way whites perceived them. As one African American said, "The atmosphere changed [after integration]. They [i.e. whites] changed and I changed. We got closer together in every way."³

Lest this paper end on too sanguine a note, we should acknowledge that employers in the South continued to exploit racial divisions amongst their workforce even into the 1990s. Bruce Raynor, former southern director of the ACTWU (successor to the TWUA), observed in 1995 that "to this day every campaign we run the company makes race an issue, every single one. The company will tell the whites, 'The union's going to force us to give the good jobs to blacks.'It's still a big weapon against us."⁴ Racial fears are extraordinarily tenacious, and the record of integration in the southern textile industry is by no means one long success. It is a story of victories and defeats, and it should be recognized as such -- a complicated human story, not the caricature of reactionary whites and bureaucracies vs. heroic individuals that we encounter in popular history. Reality, after all, is always more interesting than myth.

*

A Critique of Current Historical Scholarship

If the history profession in the United States were to take stock of itself in 2011, it would have the right to be proud in many respects. It has come far in the last fifty years, become far more sophisticated in a number of ways. Social history has enormously enriched our understanding of the past, in particular the past of subaltern groups of people who tended to be ignored by academic historians up to the 1960s. Labor history is no longer mainly about trade unions and institutional politics; it also encompasses the *lives* of workers, as well as of their families and communities. The history of minorities is no longer excluded from the mainstream, and women are finally integrated into the historical profession -- both as scholars and as subjects of study. The history of gender and sexuality has explicated the formation of subjective identities and shed light on varieties of oppression that were hardly even recognized in the past. Historians have become methodologically more self-conscious and self-critical, and their scholarship has become incredibly

meticulous. Like culture itself, history-writing is incomparably more *inclusive* than it was fifty years ago - inclusive of more people, more ideas, more methods, more agendas, more countries and societies (hence “transnationalism”). It is diverse, and it is huge. Nevertheless, the discipline has by no means perfected itself, nor should it be complacent about what it has achieved. In some ways it has not taken its recent democratic achievements far enough, while in others it has taken them too far, thereby losing sight of important issues and old insights. The discipline is also too fragmented and specialized, like most of the humanities and social sciences. One can accuse it, moreover, of being too “academic.” Being humanistic, it should not isolate itself from society but should critically engage it, bring history to bear on the burning political questions of our time.

There is a myth among academics that “objectivity” entails “neutrality,” that to take a partisan position in some controversy is by definition to be non-objective and unscholarly.¹ This belief goes back decades, and helps justify the political disengagement of scholars that is a function in part of the insularity of their institutions. According to conventional wisdom, the university system is not supposed to be the plaything of political agendas; it is supposed to be dedicated to politically innocuous research and the unpartisan education of students. Otherwise universities might not be able to get funding from a variety of sources, and they would not be able to maintain their supposed autonomy from the rough-and-tumble world of politics. Corresponding to these institutional facts is the academic conviction, which serves to justify an apolitical stance, that to take a politically controversial position in scholarship or popular writing is to depart from the “disinterested” pursuit of truth.

This is a fantasy, as is the idea that the university system is even moderately removed from political influence and agendas. By virtue of their particular locations in social structures, academics are already integrated into the political economy in ways they might not even know about or like. They are already serving certain economic and political interests in their research and teaching, both of which are inherently political. Whatever position one takes in teaching or writing, one cannot escape the implicit commitment to some set of political interests and institutions. By not challenging conventional interpretations, for example, one is upholding the hegemony of power-structures and the status quo, implicitly taking the “partisan” position that mainstream narratives, which like all interpretations exclude certain voices and include others, are substantially correct and that the powerful therefore are not only basically right but should remain powerful. By consciously avoiding political controversy in one’s work, one is making a statement that to some other group of interests, an unrepresented group, is controversial.

There is no such thing as “disinterested” scholarship. In Nietzschean terms, one necessarily proceeds from a particular perspective. Jean-Paul Sartre said something similar in arguing that one is inescapably *committed*, whether one knows it or not. On the other hand, it is possible to be “committed” in a relatively “objective” and “rational” way, namely by encompassing more voices, more facts, and more arguments in one’s position, and by being willing to assess it according to canons of logic rather than emotion or some other standard. An intellectual’s work can serve the interests of freedom and democracy in more objective and rigorous or less objective and rigorous ways, just as it can serve the interests of the powerful in rigorous or unrigorous ways -- or, alternatively, in open and honest ways or implicit and unconscious ways (as it usually does). Every social scientist and humanist should decide which interests and values he intends to support in his work, and then do so as objectively as possible.

Historians, one might retort, often do serve democratic values and agendas in their work, as evidenced by the rise of social history in all its forms. This is true. However, there is still too much of a pretense of neutrality on issues of political moment, a neutrality that effectively supports the status quo. In many cases this neutrality takes the form of a specific *method*, viz. an “idealistic” method. In *The Global Cold War* (2005), for example, Odd Arne Westad argues that “the United States and the Soviet Union were driven to intervene in the Third World by the ideologies inherent in their politics.”² He pays little attention

¹ See Thomas L. Haskell, “Objectivity Is Not Neutrality: Rhetoric vs. Practice in Peter Novick’s *That Noble Dream*,” *History and Theory*, Vol. 29, No. 2 (May, 1990): pp. 129-157.

² Odd Arne Westad, *The Global Cold War: Third World Interventions and the Making of Our Times* (New York: Cambridge University Press, 2005), p. 4.

to economic dynamics and institutional imperatives as explanations of the superpowers' foreign policy, instead relying to a great degree on policymakers' self-understandings and rhetoric. His idealistic method lends legitimacy to powerful actors, their institutions, and their policies, thus implicitly legitimizing the political status quo and undermining the popular democratic hopes and strivings that he ostensibly supports.

Social historians, on the other hand, sometimes adopt a kind of status quo-supporting idealism precisely by virtue of their "democratic" method of telling people's stories more or less as they lived them. Books like Bethany Moreton's *To Serve God and Wal-Mart: The Making of Christian Free Enterprise* (2009) and Lisa McGirr's *Suburban Warriors: The Origins of the New American Right* (2002) embody the commendable project of taking ordinary people's experiences seriously and revealing such people as "active, articulate participants in a historical process."¹ However, these works can have an extreme emphasis on ideology and culture insofar as people interpret their own experiences that way. Political correctness frequently suffuses this sort of scholarship; everyone is given "agency," assumed to have control over his or her life because to deny that would be insulting or condescending. Institutional contexts and influences are frequently played down as the individual's motives and self-interpretations are elevated. The consequence is to divert the reader's attention from class structures and the overall distribution of power relations, which in turn often prevents this work from being politically very challenging or subversive.

Ironically, one can object to idealism not only morally but also by invoking the "disinterested" rational standards that scholars are so concerned with. For a materialism and "institutionalism" along Marxian lines is singularly *plausible* too, as contrasted with the various types of idealism manifested in much political history (e.g., *The Global Cold War*), postmodernist cultural history (e.g., Joan Scott's *Gender and the Politics of History* (1999)), and a fair amount of social history, the "humanism" of which tends to have factually incorrect implications. To quote the political scientist Thomas Ferguson: "That ordinary people are historical subjects [as social historians assume] is a vital truth; that they are the primary shapers of the American past seems to me either a triviality or a highly dubious theory about the control of both political and economic investment in American history."² The point is that one can overemphasize the historical importance of ordinary people's experiences and self-interpretations, and that many historians do this. The simple fact is that in the history of capitalist society, large business interests or corporations have vastly more sway over society than ordinary people do. They have incomparably more historical agency by virtue of their access to material resources -- surely a commonsense truth. Thus, if historians want to explain the dynamics and trajectories of societies, they would do well to emphasize economics, moneyed interests, and class structures far more than they do. Furthermore, as stated above, this would have the morally desirable effect of highlighting the injustice of current institutional arrangements, thereby bolstering popular struggles.

The intellectual's moral and scientific responsibilities, which arguably are not being adequately served by much contemporary historical scholarship, can be reduced to the responsibility to *challenge conventional wisdom*. Intellectuals are in a unique position to do this, having the necessary skills, leisure, and access to enormous amounts of information. Instead, they are usually the guardians of conventional wisdom, not its challengers. Most of their work reinforces the notion that class relations, which determine differences in groups' control over productive resources, are, far from being the most important determinant of social dynamics, not of especial significance, that, if anything, culture, ideology, gender, group psychology, and so forth are historically more important than the brute institutional realities of control over economic and material resources. The age of postmodernism has ushered in a scientifically dubious and morally objectionable (in its political implications) subjectivism, culturalism, and obsession with "discourse," as if cultural discourses were not shaped precisely by institutional, ultimately economic, conditions and the play of competing interests. (It requires access to resources, after all, to propagate discourses, and access to resources is primarily an economic fact, i.e. determined largely by the dynamics

¹ Thomas Ferguson, *Golden Rule: The Investment Theory of Party Competition and the Logic of Money-Driven Political Systems* (Chicago: The University of Chicago Press, 1995), p. 96.

² *Ibid.*

of class relations, conflicts between groups of people with different economic interests by virtue of their occupying different locations in social structures.)¹ Analyses of discourses, ideologies, and gendered, sexual, and racial identities have their place in scholarship, but authors should keep in mind that to emphasize ideas and identities at the expense of structures of, and struggles over, economic production and distribution is already a political act, in that it tends to focus attention on politically peripheral issues and does little to develop a critique of the central power relations in society. This fact, of course, helps explain why it is so predominant in academia: institutional mechanisms tend to filter out materialistic critiques of economic and political relations, since such “leftist,” “radical” arguments challenge society’s most entrenched power-structures, the structures that fund universities and influence political policies toward them. From the perspective of these moneyed interests, it is far safer to write about the formation of sexual identities or ordinary people’s “agency,” their supposed power over their lives and influence over politics. To emphasize ideologies, too, is politically safe, since it suggests that ideas matter more than institutions and that it is more important to change the former than the latter.

History should stop being as “academic” as it is; scholarship should more often be motivated by current political struggles. Historians could do popular movements, not to mention *truth*, a service by placing in its historical context, for example, business’s ongoing assaults on public-sector unionism, or by tracing corporations’ influence on federal and state politics or their systematic, decades-long dismantling of civil society (unions, communities, public transportation, etc.), or the ways in which public-relations firms craft media campaigns and thereby propagate “discourses” favorable to business. There is no shortage of politically controversial subjects -- the controversial nature of which, incidentally, suggests their importance, their subversion of shallow conventional wisdom. That such scholarly projects are “partisan” is no argument against their essential truth, for there is no reason to think that truth should be benign toward or supportive of entrenched interests. Quite the contrary. It would be startling if social truths were unpartisan, i.e. acceptable to powerful interests, whose concern is not to propagate truth but to advance their own agendas.

Consistent with the foregoing critique is the criticism that historical scholarship is altogether too specialized, not “synthetic” enough. There is little cross-fertilization between economic history, political history, social history, cultural history, labor history, business history, and so on. To place everything in its proper social context, integration among fields is necessary. Historical materialist methods should in general be the foundation of most kinds of history, since they are common sense (notwithstanding their having been knocked out of people’s heads due to their politically subversive implications). Economic theory, too -- at least the “realistic” kind of theory, e.g. Marxist economics,² not neoclassical fantasies about efficient markets, perfect competition, etc. -- is very relevant to history in that it helps explain social dynamics, and historians should study it. The consequence of *not* studying other fields or disciplines is the postmodern parochialism that pervades academia, the overemphasis on gender, sexuality, discourse, ideologies, subjective identities, in addition to the more general counterproductive fragmentation that itself does much to vitiate the political potential of scholarship.

¹ This paper is not an appropriate place to set forward all the arguments for “materialism”; the best we can do is give examples of scholarship that shows its true power. Thomas Ferguson’s above-cited book is one example. Others are Karl Polanyi, *The Great Transformation: The Political and Economic Origins of Our Time* (New York: Beacon Press, 2001); Noam Chomsky, *Understanding Power: The Indispensable Chomsky* (New York: The New Press, 2002); Robert Brenner, *The Economics of Global Turbulence: The Advanced Capitalist Economies from Long Boom to Long Downturn, 1945-2005* (New York: Verso, 2006); Erik Olin Wright, *Classes* (London: Verso, 1985); and Charles Beard, *An Economic Interpretation of the Constitution of the United States* (New York: The Macmillan Company, 1913).

² See, for example, Robert Brenner, *The Economics of Global Turbulence*; Fred Magdoff and Michael D. Yates, *The ABCs of the Economic Crisis: What Working People Need to Know* (New York: Monthly Review Press, 2009); John Bellamy Foster and Fred Magdoff, *The Great Financial Crisis: Causes and Consequences* (New York: Monthly Review Press, 2009); and Robert Brenner, *The Boom and the Bubble: The US in the World Economy* (New York: Verso, 2002).

One can argue, in fact, that “intellectuals” have a moral obligation to serve progressive political struggles, being the beneficiaries of other people’s “surplus labor,” of an exploitive economic system that perpetuates poverty and disfranchisement among the large majority of the world population. Intellectuals have extraordinary privileges, which, because they are made possible by other people’s *lack* of privileges, they are morally obligated to use for these other people’s benefit. Such arguments, however, start to take us outside the realm of scholarship, so we will leave them here as suggestions.

The point is that political activism and scholarship need not be mutually exclusive, that politically partisan scholarship (or scholarship with partisan implications) can embody the highest standards of academic rigor, and that, far from being unrespectable, it is scientifically and morally imperative that humanist intellectuals use their work to undermine conventional narratives. To do so, as I have said, historians ought to broaden their scholarship, integrate social history with economic history with political history and so forth. We have a lot of monographs on every conceivable subject; it is time we did more to integrate the best scholarship in numerous fields and so make it more compelling to the general public. The public hungers for knowledge untainted by political dishonesty -- as evidenced by the popularity of such figures as Howard Zinn, Noam Chomsky, Naomi Klein, Mike Davis, Holly Sklar, and others who bring knowledge to the masses. This is the next frontier in the history of the intellectual; historians should recognize that and celebrate it.

*

May

I witnessed my first shooting today. Or at least, I was there when it happened (didn’t see it) -- across the street, in the exact spot I would have been thirty seconds later, in front of the train stop. Two shots that I thought were a car’s backfiring until an instant later people yelled “Gunshots!”, women screamed, and a nearby restaurant owner herded women and children around the corner to safety. So I followed him and them with some urgency because it was disconcerting to imagine a bullet entering the back of my head. (While running it occurred to me that these could be my last moments alive, if the shots continued and stray bullets hit me.) A police station was right there, so in a few minutes the scene was cleared up and everything continued as before. It didn’t look like anyone was injured; just three black guys standing in front of the train station being arrested as I walked by.

It’s moments like that when you’re glad the police exist. I didn’t want to walk over there until they had done their thing.

...Reading Charles Beard’s *Economic Interpretation of the Constitution of the United States* (1913). He quotes (p. 15) Seligman’s formulation of “the economic interpretation of history” and calls it “as nearly axiomatic as any proposition in social science can be.” As Seligman says, “The existence of man depends upon his ability to sustain himself; the economic life is therefore the fundamental condition of all life. Since human life, however, is the life of man in society, individual existence moves within the framework of the social structure and is modified by it. What the conditions of maintenance are to the individual, the similar relations of production and consumption are to the community. To economic causes, therefore, must be traced in the last instance those transformations in the structure of society which themselves condition the relations of social classes and the various manifestations of social life.” Sheer common sense, which only the highly educated could dispute. (Seligman doesn’t formulate it very precisely, but the intuition is compelling.)

Beard proposes to show that “substantially all of the merchants, money lenders, security holders, manufacturers, shippers, capitalists, and financiers and their professional associates” supported the Constitution, while most of the opposition came from non-slaveholding farmers and debtors. His economic interpretation of history is, therefore, corroborated by his study of the Constitution. “The direct, impelling motive [of support for the Constitution] was the economic advantages which the beneficiaries expected would accrue to themselves first....”

“Nationalism [among Americans in the late 18th century] was created by a welding of economic interests that cut through state boundaries.” He mentions the identity of interest between creditors and the wealthy in many different states, as opposed to “their debt-burdened neighbors at the back door.” For example, southern planters shared the interest of Massachusetts creditors in having a strong federal government that could put down insurrections, in the former case among slaves and in the latter among debtors (as in Shays’ Rebellion).

Interesting: “[*The Federalist*] is in fact the finest study in the economic interpretation of politics which exists in any language; and whoever would understand the Constitution as an economic document need hardly go beyond it.” I’ll have to read those articles someday. It’s worth noting that James Madison was basically a historical materialist in the broad sense, as is clear from Federalist No. 10. “....The most common and durable source of factions has been the various and unequal distribution of property. Those who hold and those who are without property have ever formed distinct interests in society. Those who are creditors, and those who are debtors, fall under a like discrimination. A landed interest, a manufacturing interest, a mercantile interest, a moneyed interest, with many lesser interests, grow up of necessity in civilized nations, and divide them into different classes actuated by different sentiments and views.” Etc.

In general, “the live and persistent economic force which organized and carried through the ratification [of the Constitution] was the personal interests [i.e. mercantile, securities, manufacturing, etc.] and particularly the public security interests. As has been pointed out, these had the most to gain immediately from the Constitution. Continental paper bought at two and three shillings in the pound was bound to rise rapidly with the establishment of the federal government...”

I need hardly add that the processes of writing and ratifying the Constitution were the opposite of democratic. For instance, probably not more than one-sixth of adult males voted to ratify the document. And no popular vote was involved in calling the Convention and selecting delegates. In fact, the whole process was frankly illegal, flouting as it did the provisions in the Articles of Confederation for amending that document. The Articles were simply ignored.

I also needn’t add -- but will -- that the Constitution itself constitutes a “marvelously dexterous system of barriers to [democracy’s] expression” (Robert Lynd).

Now I’m reading Robert A. Brady’s *Business as a System of Power* (1943). These materialistic books are the sorts of things we don’t read in courses, so I want to educate myself this summer. This particular book is all about the concentration or centralization of business, the similar state-capitalist forms it takes in fascist and liberal-democratic systems, and its having emerged organically from earlier trends.

After remarking that fascism is counterrevolutionary, Brady says this (p. 56):

But why should such sweeping and vigorous counterrevolutionary action occur first in Italy, one of the least industrialized among the capitalistic states? There is an interesting historical analogy here with the contemporary situation in Russia, which helps to throw the Italian situation at the end of [World War I] into sharp relief. In Fascism capitalistic institutions were able to triumph; in Communism they faced defeat. Yet both Italy and Russia were among the “weakest links” in the chain of capitalist nations. In each case, at a critical point the pendulum seems barely to have swung the way it did. It is probably not too far from the truth to say that had Russia not turned Socialist in 1917 it would have adopted some form of “Fascism,” and had Italy in 1922 not fallen unexpectedly to the Fascists it would have become a Socialist state....

Both countries were primarily agricultural. In both, rural life was characterized by deep contrasts between vast estates owned by politically powerful and immensely wealthy families on the one hand, and an overwhelming majority of more or less propertyless, poverty-stricken, ignorant, and repressed peasantry on the other. In both, important feudal carry-overs survived intact down to the outbreak of the [First] World War. In neither had Parliamentary institutions or the first grudging concessions to popular sovereignty seriously affected the vast proportion of the population. Both were political patchworks,

and in neither had largely borrowed, nationalistic sentiments penetrated far beneath the thin upper layers of class-conscious jingoism.

....Industrialization came comparatively late, and in both cases, once begun, the pace of growth and development was unusually swift. At a time when industrial technique of its own momentum was becoming large-scale, and capitalism of its own native driving power was resorting everywhere to monopoly devices, this forced-draft growth tended at once to sharpen the social cleavages and to strengthen and unify the forces of antidemocratic reaction. By the “accidents of history,” monopoly forms of capitalism, mercantilistic sentiments, and feudal social institutions were in both immediately juxtaposed.

In Russia proletarian forces won the throw of the die; in Italy, property. For the spread of the Socialist-Communist state Russia lacked industrialism; for the dominance of capitalist institutions Italy lacked a widespread business system. Russia undertook to solve her problem by a backward step into NEP, in order to lead more easily into the industrialization program of the Socialist Five Year Plan. Italy devised the Corporate System. And the Corporate System is to be understood as that morganatic alliance between organized, Italian, patrimonial capitalism and the type of feudal controls long advocated by the Papacy, from which it was hoped to find at once an end to class war and full defense of the existing social-economic status quo.

He emphasizes the Catholic ideological origins of Fascist¹ corporatism. A recrudescence of the medieval guilds, etc.

After reading this chapter it occurs to me that one of the reasons why fascism and hence the Second World War were in large part the products of lingering feudal traditions is that the Church and other pre-capitalist (or pre-industrial capitalist) elements did much to push the class collaborationist ideology of fascism, the ideology of harmony between classes and cooperative coordination of economic activity. Industrial capital was less committed to such ideas than reactionary, “residual” (in Raymond Williams’s sense) and (also) un-capitalist elements were. (Not all un-capitalist or un-bourgeois elements were wholly residual.) So when the struggle between capital and labor threatened to reach a political stalemate, or even to result in labor’s triumph, in the 1920s and 1930s, big business, in order to remain securely on its throne, had to let residual and/or un-“bourgeois” forces seize political power and impose corporatism on society, which kept business on top in, perhaps, not entirely the way it would have liked. Business couldn’t win the political class war on its own; it needed help from the reactionary, indebted-to-Catholic-corporatist-doctrine forces that coalesced around Mussolini, Hitler, and fascist figures in France.

It’s true that even the U.S., which lacked a feudal past and so was not very influenced by Catholic or other elements that hoped to resurrect medieval guilds, adopted somewhat corporatist, “harmony between labor and capital”-promoting measures under Roosevelt. In Europe, however, probably because of its feudal residues, corporatist ideas seem to have carried more reactionary connotations and been tied up with anti-materialism, anti-socialism, anti-laborism, even anti-Semitism. (The Church was anti-Semitic, of course.)

Anyway, it’s obvious that feudal residues -- class structures, ideologies, religious and political institutions -- had much to do with all the hierarchical, undemocratic, and anti-Semitic elements in Europe that helped lead the way to fascism.

Think of Japan too, with its even more obvious “feudal carry-overs” that made possible its version of fascism. (Some of the causes -- or rather necessary conditions -- of Japanese fascism were very different from those of the European kind, but some were similar. To that extent it had a similar essence.)

I’m in Warsaw with Aniela. Spending three weeks in Europe, also going to Italy with her, where we’ll briefly meet up with my parents in a town called Lucca in Tuscany. It’s great to be back on this continent, especially with Ania, who not only tolerates but seems to appreciate my quirks, my absent-mindedness and so on. Recently she has been pursued by a guy she calls Mr. Proper, who is rich, handsome,

¹ By ‘Fascism’ with a capital ‘F’ I mean the Italian variant.

intelligent, comes from a distinguished Polish family (his ancestor was the first president of independent Poland in the nineteenth century), and mingles with power-brokers and celebrities. The kind of guy most women dream of being with. But she isn't interested in him because....he's too perfect. Not "real." His glamorous world of parties is not real; it's boring. You see she's an unusually sensible and self-confident woman, who knows what she wants.

In the radio business she met and interviewed all kinds of famous people, including movie stars, musicians, artists, politicians -- the president of Poland -- and so on. And she herself has charisma. She oversaw hundreds of people as station manager, most of whom apparently found her intimidating. So I ask her what she sees in me, and she says I'm "real."

Reading Robin Hahnel's *ABCs of Political Economy: A Modern Approach* (2002). Chomsky recommended it. Nice overview of radical, i.e. commonsensical, political economy.

What he calls the macro law of supply and demand, postulated by Keynes, is that aggregate supply will follow aggregate demand if it can (if, that is, the economy isn't already producing at full capacity, in which case high demand will lead to inflation rather than an increase in production). This law explains the possibility of "downward spirals," or not-self-correcting recessions. "Keynes pointed out that weak demand for goods and services leading to downward pressure on wages and layoffs was likely to further weaken aggregate demand by reducing the buying power of the majority of consumers. He pointed out that this would in turn lead to more downward pressure on wages and more layoffs, which would reduce the demand for goods even further." Downward spiral.

The reason that few economists before Keynes acknowledged the possibility of such a downward spiral is that they had been seduced by Say's Law, which is basically the reverse of Keynes's macro law of supply and demand. It says that in the aggregate, supply creates its own demand. "Say's Law implies that there can never be insufficient demand for goods in general, and governments therefore need not concern themselves with recessions, which should cure themselves." As David Ricardo expressed it, the rationale between Say's Law is that every dollar of goods produced generates a dollar of income or purchasing power, either through wages or profits. And while it's true that people don't spend all their income on consumption but instead save some of it, which means that consumption demand falls short of the value of goods produced, the money they save goes into banks which then lend it to businesses -- *all* of it, at the equilibrium rate of interest -- because if they don't lend, they can't make profits. And businesses in turn use the money to invest. So the shortfall in consumption demand is made up for by investment demand, and as a whole, aggregate demand equals aggregate supply.

The flaw in this reasoning, which Keynes pointed out, is that, "while it is true that every dollar's worth of production generates exactly a dollar's worth of income or potential purchasing power, it is not necessarily true that a dollar's worth of income always generates a dollar's worth of demand for goods and services." Aggregate demand can be greater than income if, for example, actors use *previous* savings to spend more than their current income, or if they borrow against future income. Or aggregate demand can be *less* than income because the fact that at the equilibrium rate of interest the supply of loans is equal to the demand for loans does not mean that business demand for investment goods has to be equal to household savings. After all, businesses do not use all the loans they receive to buy investment goods (capital goods). Sometimes they buy government bonds or shares of stock in other businesses, which does not add a single dollar to demand.

"A given value of production *does* generate an equal value of income. But *when* that income gets used to demand goods and services can make a great deal of difference. If less income is used to demand goods and services in a year than were produced in that year, aggregate demand will fall short of aggregate supply and production will fall, as the macro law of supply and demand teaches. If the sum total of household, business, and government demand is greater than production during a year, production will rise (if it can), as Keynes's macro law teaches."

Hahnel's remarks on inflation and unemployment are illuminating. Cyclical unemployment, you know, results when "low aggregate demand for goods leads employers to provide fewer jobs than the number of people willing and able to work," while structural unemployment occurs when "the skills and training of people in the labor force do not match the requirements of the jobs available." Structural

unemployment can be caused by changes in the international division of labor, rapid technical changes in methods of production, and educational systems that are slow to adapt to new economic conditions. If structural unemployment is the problem, policies that increase aggregate demand won't help much but instead will cause inflation, as in the 1970s. What are necessary are programs to retrain and relocate the workforce.

There are different kinds of inflation too. Demand-pull inflation tends to occur when the economy is reaching its full potential of output but demand is still increasing. So prices rise. Cost-push inflation is when, say, employers raise prices because employees have negotiated a wage increase. So the rise in prices compensates for the wage increase.

"It is important to note that structural unemployment can exist in the presence of adequate aggregate demand for goods and services, and cost-push inflation can exist even when aggregate demand does not exceed aggregate supply." In other words, stagflation can happen. "Our Keynesian macro model does *not* help us understand how stagflation is possible." The point is that "demand-pull inflation can coexist with rising structural unemployment, and cyclical unemployment can coexist with increasing cost-push inflation. Often conflicts over distribution, changes in the international division of labor, and rapid technological changes generate significant amounts of structural unemployment and cost-push inflation to go along with the cyclical unemployment and demand-pull inflation the simple Keynesian macro model explains."

As for inflation, Hahnel debunks some myths. It is *not* bad for everyone. It means that prices are rising *on average*, at different speeds. "If the prices of the things you buy are rising faster than the prices of the things you sell" -- and everyone sells something, be it labor-power or goods or whatever -- "you will be 'hurt' by inflation. That is, your real buying power, or real income, will fall. But if the prices of the things you sell are rising faster than the prices of the things you buy, your real income will increase. So for the most part, what inflation does is rob Peters to pay Pauls. That is, inflation redistributes real income.Inflationary redistribution is essentially determined by changes in relative bargaining power between actors in the economy." So if corporations and the wealthy are becoming more powerful, inflation will make the distribution of income more inequitable, because prices will rise faster than wages.

Sometimes inflation can be so extreme or unpredictable that it makes businesses invest less and people work less, in which case it reduces output. But that's rare. "Most of us should think long and hard before joining corporations and the wealthy who put fighting inflation at the top of their list of problems they want the government to prioritize. The wealthy rationally fear that inflation can reduce the value of their assets. And employers have an interest in prioritizing the fight against inflation over the fight against unemployment because periodic bouts of unemployment reduce labor's bargaining power."

....Hahnel argues that "wage-led growth" is possible, that higher wage rates don't have to lead to lower long-run economic growth by means of lower capital accumulation (because of a wage squeeze on profits). The point is that higher wages mean higher aggregate demand, which stimulates greater capacity utilization. "Depressing wages and thereby consumption does leave more output available for capital accumulation, but by lowering the demand for goods and services it also decreases capacity utilization." It could lower the rate of growth of actual GDP even while increasing the rate of growth of potential GDP.

Such ideas, put forward by Michael Kalecki and Josef Steindl, provide a plausible explanation of the lower rates of economic growth in advanced economies over the past thirty years. "As corporations have increased their power vis-à-vis both their employees and their customers, they have been able to drive real wages down over the past thirty years. This has prevented aggregate demand from increasing as fast as potential production and led to falling rates of capacity utilization and lower rates of economic growth." Think of the fact that Scandinavian economies had higher rates of growth than most other advanced economies for fifty years despite higher tax rates and lower rates of technological innovation. "Could it be that strong unions, high real wages, and high taxes to finance high levels of public spending are not detrimental to long-run growth at all, but quite the opposite?"

Hahnel challenges the conventional wisdom regarding international trade, too. Sure, it *can* be efficient because of comparative advantage, but it can also be very inefficient. Adjustment costs, for example, can be significant -- moving people and resources out of one industry and into another -- and the social costs (environmental, etc.) of a country's specialization in some good are not reflected in prices, even
