I just read Gilbert Ryle's reflections on “Achilles and the Tortoise” in his book *Dilemmas*. “I shall now discuss a dilemma which I imagine is familiar to everybody. It is quite certain that a fast runner following a slow runner will overtake him in the end.... Yet there is a very different answer which also seems to follow with equal cogency from the same data. Achilles is in pursuit of the tortoise and before he catches him he has to reach the tortoise's starting-line, by which time the tortoise has advanced a little way ahead of this line. So Achilles has now to make up this new, reduced lead and does so; but by the time he has done this, the tortoise has once again got a little bit further ahead.” I think you see where that's going. It's Zeno's old paradox, to which I've never encountered a solution. It seems to manifest an “antinomy of pure reason”, and as such is unresolvable. One can look at the situation either from the perspective of the relative speeds, according to which Achilles will overtake the tortoise, or from the perspective that focuses

¹ Obviously science, not philosophy, deserves the credit for some of this knowledge.

on the infinite divisibility of space, according to which Achilles will not overtake the tortoise. It's an infuriating little problem, simple yet strangely elusive.

Ryle's discussion, unfortunately, is more like an extended joke or self-parody than a serious analysis. It's a preposterous exercise in repetitiveness and emptiness. And it stinks of that rotten Cambridge air, that Russellian-era chumminess that makes me want to vomit. (The best thing about Wittgenstein is that he couldn't abide Cambridge.)

The ending of *Homo Ludens* is remarkably beautiful. I'm tempted to quote it. But I'll quote only the sentiment that has always motivated the light-heartedness of my toying with truth. "...The human mind can only disengage itself from the magic circle of play by turning towards the ultimate. Logical thinking does not go far enough. Surveying all the treasures of the mind and all the splendors of its achievements we shall still find, at the bottom of every serious judgement, something problematical left. In our heart of hearts we know that none of our pronouncements is absolutely conclusive. At that point, where our judgement begins to waver, the feeling that the world is serious after all wavers with it. Instead of the old saw: 'All is vanity', the more positive conclusion forces itself upon us that 'all is play'."

Here's an example of Strawson's ineptitude. (He's criticizing Kant's antinomies of reason.)

The thesis of the first antinomy is that the world has (1) a beginning in time and (2) limits in space. Let us give Kant's arguments, as regards the first part, a more concrete form with the help of the supposition that for as long as the world has existed, a clock has been ticking at regular intervals. Then the argument goes as follows. If we assume that the world has no beginning, but has existed for an infinite time, then it follows that up to the present moment, or up to any previous historical moment, an infinite number of ticks has occurred, an infinite series of ticks has been completed. But this, by the very nature of an infinite series, is impossible. "The infinity of a series....consists in the fact that it can never be completed through successive synthesis." Therefore it is impossible that the world has existed for an infinite time. It must have had a beginning.

The argument seems plainly invalid. [!] We can indeed validly argue that, since the series of ticks has a final member, it cannot be the case both: (a) that it has an infinite number of members and (b) that it has a first member. Either (a) or (b) must be rejected. But since the argument is supposed to be based on the hypothesis that (b) is false, it is clearly (b) that must be rejected and not (a).

How did Kant come to advance such an argument?...

None of Strawson's speculations in the subsequent paragraph redeems him. The rest of the chapter is similarly blank.

I remember having a conversation with my dad when I was 8 or 9 on the differences between physical and logical impossibility. At some point in the discussion, one of us remarked that the universe could neither have begun nor not begun. (Or, rather, neither possibility was conceivable by reason.) For if it began, it would have had to come from nothing, which is inconceivable. (If it had come from *something*, then that something would obviously have been part of the universe, due to its participation in the chain of causation.) But it couldn't have existed forever, because then we never could have arrived at the present moment. This fact seemed so intuitively obvious to me that I don't think I even argued for it. I just *saw* that the infinite series of moments could not have been completed, since it would have had to stretch eternally into the past.

Well, Strawson evidently lacks the philosophical ability of a nine-year-old.

Contrary to Kant, I think that the universe did indeed either begin or not begin. I simply accept that human reason cannot comprehend either possibility. The truth lies in the domain of quantum mechanics, which is not bound by the limitations of ordinary reason.

March 20

Reading selections from the *Journal des Goncourt*. (Written by two literary brothers—and then only one—at the end of the 19th century.) One of the more fascinating diaries in history, what with the anecdotes about such cultural figures as Zola, Flaubert, Renan, Turgenev, Manet, Degas, Saint-Beuve, and the ironical observations on human folly. Hopefully it will exert unconscious influence on me.

I'm thinking about writing a historical novel. With history, after all, one doesn't have to worry about plot. (Shelley said that the one real deficiency in his imagination was his inability to construct plots.)

Also reading John Dewey's *Reconstruction in Philosophy*.

Edmond seems like nothing but a half-talented dandy, decadent and aimless as *fin-de-siècle* Paris, but as a diarist he has no peer.

“This morning in the garden we talked about copulation, the insipidity of it with a woman who is dressed, and the glorious frenzy of it with a woman who is naked, a woman one rolls on top of and covers with kisses: copulation as practiced by artists, men of passion, men who really love women.... This conversation led us on to a recognition of the strange and unique beauty of the face of any woman—even the commonest whore—who reaches her climax: the indefinable look which comes into her eyes, the delicate character which her features take on, the angelic, almost sacred expression which one sees on the faces of the dying and which suddenly appears on hers at the moment of the *little death*....”

March 21

The worst thing about this age is that it's more 'Marxist' than any in history. Ideas have lost whatever power they once had. Philosophy has become the backwash of social change; economic movements (and their political repercussions) are the only reality. [...]

Dewey's book, while diffuse, unrigorous and confused (e.g., idealistic in the anti-Marxian sense), has one or two merits—insofar as it echoes one or two thoughts I set out in my book. For example: “Government, business, art, religion, all social institutions have a meaning, a purpose. That purpose is to set free and to develop the capacities of human individuals without respect to race, sex, class or economic status. And this is all one with saying that the test of their value is the extent to which they educate every individual into the full stature of his possibility. Democracy has many meanings, but if it has a moral meaning, it is found in resolving that the supreme test of all political institutions and industrial arrangements shall be the contribution they make to the all-around growth of every member of society.” His conception of philosophy (of its role) also is similar to mine.

Consolation.— It's comforting to know that if I die tomorrow, I will not have lived in vain.

Skimming through Frans de Waal's *Primates and Philosophers: How Morality Evolved*, the thesis of which is that morality is not only a product of culture but also an evolutionary adaptation, which is present in rudimentary form in other animals. (Revolutionary idea! —Actually, I'm told by professors at Harvard and Yale that the book is “provocative” and “exceptionally challenging”. Shows how easy it is to impress a Harvard professor.)

I just realized that I want a pet chimpanzee. It would be better than having a dog or a cat:

If I pretend to be crying, close my eyes and weep, Joni [her young male chimp] immediately stops his plays or any other activities, quickly runs over to me, all excited and shagged, from the most remote places in the house, such as the roof or the ceiling of his cage, from where I could not drive him down despite my persistent calls and entreaties. He hastily

runs around me, as if looking for the offender; looking at my face, he tenderly takes my chin in his palm, lightly touches my face with his finger, as though trying to understand what is happening, and turns around, clenching his toes into firm fists.

How adorable is that!

March 22

Reading Robert Graves's historical novel *I, Claudius*.

At the library I read a little by and about Norman Mailer. While he was a very talented writer, I always find his style to be somewhat unhealthy. Decadent. Shrill. Especially when he writes about himself. It's too intense. Feverish. Sickly. There's none of the calm and easy assurance of, say, Tolstoy—or even Dostoyevsky. Even Dostoyevsky wasn't as shrill as Mailer. (Except in *Notes from the Underground*, but there his stylistic sickliness was intentional.) Mailer clearly had a febrile mind, but that doesn't necessarily make for immortal literature.

Also, the feminine self-absorption of his kind repulses me. All those literary figures from his generation—from *any* generation, I suppose—but especially his—and especially *him*—the focus on one's own little self is ridiculously immature. Childish. The craving for fame, for attention of any kind; the insecurity and the constant comparing of oneself to other writers, evaluating everything all the time, reevaluating, readjusting one's place in the cosmos every month, desperate to prove oneself over and over again. Mailer's obsession with proving his own masculinity was indeed well-founded, given that his personality screamed *Vagina!* like few others'. (For example, his fascination with sex. His stabbing his wife because she'd impugned his manliness. His insecurity.) Comparing Noam Chomsky to Norman Mailer is like comparing a man to a woman, or an adult to a child. [Yes, politically incorrect, etc. But it's important to have a sense of humor.]

Doubtless my own personality has more than a few points of contact with his. But as I get older I move away from the dark side. That's why I get terribly uncomfortable reading Mailer's self-advertisements and Goncourt's self-anecdotes: I feel like I'm regressing to an earlier stage of life—polluting myself. I try to avoid reading anything that reeks of narcissism, lest the stench cling to me.

Xi's roommates, Wen-hao and Feng-li, are, I learned today, taking up my cause with her. They're pushing her in my direction, though I haven't asked them to do anything of the sort. But I appreciate it.

Rondo in A, KV 386 (piano concerto), Alfred Brendel: the passage from about 2.13 to 2.40 has always struck me (literally, it *strikes* me, with the force of a woman's perfume) as.....well, something you should listen to.

I want to write, but I'm too happy (for no reason). An artist can't write lyrically when he's just plain happy.

March 24

Reading Albert Camus's notebooks (not as interesting as mine) and an essay by Eduard Hanslick called *The Beautiful in Music*.

To stroke the brunet hair of Sarah, the hair as long as she is petite. To look closely into her big eyes and not look away, and to kiss those tanned breasts.

The happiness of the man who loves women as works of art. The love of beauty, of *active beauty*. (Active passiveness.) Woman the greatest art form: beauty become self-conscious. Better than music, and more inexplicable. More *challenging*, because active and self-conscious.

Passiveness and absence (genitalia) somehow intrinsically connected. Activeness and presence are connected. Why? Metaphorical similarity. Nature and nurture: innate cognitive structures (experiential analogues are hardwired into us—natural associations between concepts, like passiveness and absence) interact in a complex, interdependent give-and-take with culture, and so types of culture can influence cognitive development, gender roles.

Going to New Orleans early tomorrow morning with a lot of UMSL students for five days, to help rebuild the city. Sarah, the hottie I met tonight, convinced me to go (by saying that she herself is going).

Camus: “We [moderns] read more than we meditate. We have no philosophies but merely commentaries. This is what Gilson says, considering that the age of philosophers concerned with philosophy was followed by the age of professors of philosophy concerned with philosophers. Such an attitude shows both modesty and impotence. And a thinker who began his book with these words: ‘Let us take things from the beginning’, would evoke smiles. It has come to the point where a book of philosophy appearing today without basing itself on any authority, quotation or commentary would not be taken seriously.”

The necessity of uncertainty in social life. Never know what the other is thinking, always have to impress him. A sort of competition—tension, uncertainty, released by laughter. It’s *play*, like a game. (Cf. Huizinga’s definition of play. Tension; limited in space and time; constrained, voluntarily, by implicit rules; release of tension at the culmination of the game.) The game of socializing is constantly ending and beginning anew—ending with the laughter, beginning immediately afterwards, only to end again momentarily with more laughter. Someone who can’t make people laugh isn’t a good “player” (cf.: “He’s a playa! What a playa, getting women all the time!”); he’s a “loser”. –Socializing is the very essence of what it is to be human, and most socializing is essentially play; therefore...

What I was going to say in the chapter on the self is that, while the degree of cultural ‘reification’ varies between historical epochs, inherent in self-consciousness is an element of reification. For example, the ego (the “self”) is partly a mere concept, i.e., a ‘thing’, different from the immediate activity of consciousness. As such, it gets in the way of interpersonal (and intrapersonal) interactions. It gets in the way of spontaneous *play*, of recognition, even of freedom. With human self-consciousness comes consciousness of an other, the very notion of which involves reification (thing-ification). The ‘thing’ that is the other is always just beyond oneself, forever keeping the full attainment of recognition out of reach. There is always this other that cannot be assimilated entirely into one’s consciousness, as one assimilates certain aspects of the environment. There is always this thing beyond one’s consciousness which one is forever trying to conquer or assimilate (through play, through anger, through love, etc.)—this maddening element of foreignness, of unfreedom. One wants to be the entire world but cannot, because of reification.

Self-consciousness is at the same time what gives rise to the desire and what frustrates it.

March 30

Sarah reminds me of Sangeetha. Petite, pretty, charismatic, witty. Her father is Pakistani, her mother English; she has six brothers and sisters. Likes to sing fetches of songs when landscaping the grounds of a New Orleans school; has a vast repertoire from which she can draw at will to suit any given occasion. Likes to laugh and laughs well (easily, vivaciously). Twenty years old but seems older. Is a born leader, despite her five-foot stature. Somewhat excessively giggly at times but can also be serious and philosophical. I may be developing a crush on her.

So much to write about, but so little desire to write. The week was fun. I was with a Christian group (Campus Crusade for Christ): intelligent, friendly people who didn’t push their beliefs on me. I attended a worship service: pleasant and inspiring. We went to the French Quarter—my impressions were as you’d expect (i.e., I loved it). On the second-to-last night, after coming home late from dinner, I stepped into a conversation in the hotel lobby between a dull German atheist pseudo-intellectual and a reasonable Christian girl—well, they were the main protagonists, but a bunch of other Christians were taking part. I

heard the German guy speak a few sentences and immediately sat down on the couch to interrupt him and save him from continuing to make a fool of himself. He said something about how Kierkegaard had said that Christianity is “dumb”, so I shut him off there—politely—and took over by laying out Kierkegaard’s real position. For the next forty minutes or so, Lisa (the atheist-turned-Christian who had been the Germ’s target) and I discussed arguments for and against Christianity, and more generally God’s existence. We both lack the pious fanaticism of, say, Wesleyan students, so the debate was totally civil and pleasant. Immediately I slid into philosophy-mode and managed not to make a fool of myself. Gradually people congregated around us until there was a small crowd. Highly gratifying to my vanity: they all seemed impressed by my “articulateness”, however unjustified that reaction was. It helped that I was the only atheist there. And that I showed a perfect understanding of the Christian position, anticipating all the arguments against my arguments.

I hadn’t talked to Sarah much in the previous days, so it ticked me off that she wasn’t there to watch me strut my feathers. Luckily the next day as I was landscaping under the heavy heat with forty other Christians I got into a conversation with Brent, a 27-year-old intelligent soon-to-be pastor. Great guy, truly a beacon to the fallen or whatever. Talked and talked for a long time about Christianity and modern Pharisees. Somehow eventually it got into that atheist vs. Christian thing again, though he approached it from a more sophisticated perspective than Lisa had—a less ‘argumentative’ (‘evidential’, ‘logical’), more Kierkegaardian, perspective, emphasizing that doubts about God’s love and fairness cannot be resolved except through the figure of Christ, who was susceptible of doubts just as we are. (“My God, my God, why have you forsaken me?” I’ve always found that naked cry to be one of the most magnificent moments in the Gospels, revealing as it does Jesus’s character—his humanity, his humility, his despair, his devotion to God.) Again, we became the center of attention, this time with Sarah watching. I honestly don’t know how Brent and people like him have the presence of mind not to get even a little flustered in that kind of situation. (I lost my train of thought once, when the knowledge of those spectators got in the way.) Anyway, it was fun. Brent managed to sharpen my understanding of, and respect for, Christianity.

I always make it a point to light-heartedly deprecate my own beliefs in such debates, acknowledging the possibility of error and so on. Otherwise what you get is *Crossfire*, or William Buckley or Bill Bennett or any of those abortions. Even when my opponent’s target is something like evolution, I don’t show a hint of scorn for him.

I like landscaping. I painted too (locker rooms), but that wasn’t as fun. Being outside, working hard—sweating in the heat, getting sunburned, drinking water like it holds the key to eternal life—is really living.

I’m reading Riesman’s *The Lonely Crowd*.

March 31

Xi and I went to the Botanical Gardens. I think she wants to go out again, and so do I, but I can tell we’re not quite right for each other. She barely has a personality, it seems. And her English isn’t fantastic.

Later I went to a Mexican club with Ashley, Sarah, Megan and others. More fun than American clubs. Live band, better music. And Latin dancing is fun, especially with Megan’s body pushed up close against mine so that I can barely hide my erection. We danced together almost the whole time. Fairly mature and beautiful 19-year-old Christian.

Gilbert Ryle’s thoughts on “The World of Science and the Everyday World” in *Dilemmas* are typically shallow. Like all non-thinkers, he takes forever to get to the point; and when he finally does, the point isn’t worth the time it has cost the reader. It’s imprecise and confused.

What a name. Gilbert. Gilbert Ryle. Uncannily appropriate for an effete British intellectual.

I’m reading *Reaganism and the Death of Representative Democracy*. I quoted the book in my chapter on political activism, but I hadn’t read it at all then. I had just looked for a couple of quotations so I could seem erudite.

Huizinga's thoughts on the origin of philosophy are convincing. (Sacred rituals involving riddles posed to an 'opponent'. Sacred games, contests of wit between wise men.) The whole book is amazing, despite a few inadequacies near the end.

Says Schopenhauer, with some justice: "The truly stoical indifference of ordinary persons to noise is amazing; no noise disturbs them in their thinking, reading, writing, or any other work, whereas the superior mind is rendered quite incapable by it. But that very thing which makes them so insensitive to noise of every kind also makes them insensitive to the beautiful in the plastic arts, and to profound thought and fine expression in the rhetorical arts, in short, to everything that does not touch their personal interest.... Actually, I have for a long time been of opinion that the quantity of noise anyone can comfortably endure is in inverse proportion to his mental powers, and may therefore be regarded as a rough estimate of them. Therefore, when I hear dogs barking unchecked for hours in the courtyard of a house, I know what to think of the mental powers of the inhabitant. The man who habitually slams doors instead of shutting them with the hand, or allows this to be done in his house, is not merely ill-mannered, but also coarse and narrow-minded. That '*sensible*' in English also means 'intelligent', 'judicious', accordingly rests on an accurate and fine observation."

Interesting thought in Theodor Reik's book *The Many Faces of Sex*: "The oral origin of curiosity is rarely recognized even by psychoanalysts. Yet you can easily observe that when little boys and little girls are astonished they stand there with open mouths." Very significant truth. (Think of animals that test objects with their mouths. *Most* animals do that, actually. So did *homo sapiens* throughout most of its history. Taste and smell are the most intimate of the senses, the most associated with "assimilation" and hence curiosity.) Reik's book, by the way, is useful as a reminder of the many, *many* differences between the sexes. (Reik was a psychoanalyst.)

Interesting epigram: "Many girls marry not because they are looking to the future but because they are running away from the past."

"A woman always likes to be treated with respect by a man except in one place: in bed. When he shows respect for her there, she loses all respect for him."

"Most women have the worst opinion of members of their own sex—a much lower opinion than even cynical men have. Why? Because women know women better."

"Reaching two hands back to unhook a brassiere is one of the most graceful movements a woman can make. But it is only after what appears as the result of that movement that one can judge whether the action was worth it."

"A Catholic patient remembers how often and how passionately he prayed during his adolescence, asking God to take away his doubts, especially his doubts about God's existence."

A marital misunderstanding.— The wife is the boss, but only because the husband lets her be. Patience and high-mindedness alone prevent him from having his way with her.

A bond forged in the birth-canal.— A woman can forgive her son that which she would forever hold against other men, including her husband.

April 3

I read C. S. Lewis's little book *The Case for Christianity*. It's very good, but not convincing. Makes some interesting points in the beginning (which don't succeed in refuting atheism) but gets sillier near the end, when discussing specifically Christian doctrines.

Example of an interesting thought: "There are all sorts of reasons for believing in God, and here I'll mention only one. It is this. Supposing there was no intelligence behind the universe, no creative mind. In that case nobody designed my brain for the purpose of thinking. It is merely that when the atoms inside my skull happen for physical or chemical reasons to arrange themselves in a certain way, this gives me, as a byproduct, the sensation I call thought. But if so, how can I trust my own thinking to be true? It's like

upsetting a milk-jug and hoping that the way the splash arranges itself will give you a map of London. But if I can't trust my own thinking, of course I can't trust the arguments leading to atheism, and therefore have no reason to be an atheist, or anything else. Unless I believe in God, I can't believe in thought: so I can never use thought to disbelieve in God." It isn't a valid argument, but at least it's fairly original.

Lewis makes a Kantian move in claiming that the existence of the Moral Law within us presupposes God. But I'm steeped in naturalism: I think that the existence of the "moral law" has a purely naturalistic explanation, involving both innate psychology and social upbringing. Indeed, there is no "moral law" *per se*.

Reading *The Elegant Universe*, by Brian Greene.

At the speed of light, time stops. As far as light is concerned, there is no such thing as time. (Light from the Big Bang is not an instant older now than it was at the Big Bang.) The ripples of gravity through spacetime travel at the speed of light. Gravity, in fact, is nothing but warps in spacetime. So spacetime itself 'travels' at the speed of light. It *exists*, so to speak, at light-speed. Therefore, in a sense, with respect to the fabric of the universe—spacetime 'in itself'—there is no such thing as time. Time is an illusion. Moreover, in black holes, which are nothing but spacetime 'turned in on itself', there is no time. Surely that's significant.

"The only thing we know with any certainty is that quantum mechanics absolutely and unequivocally shows us that a number of basic concepts essential to our understanding of the familiar everyday world *fail to have any meaning* when our focus narrows to the microscopic realm." In other words, Kant was basically right. The categories *have no meaning* when used to describe the thing-in-itself. Quantum mechanics describes the most basic level of the thing-in-itself (i.e., reality), and so it can't use any ordinary concepts.

April 6

Didn't get into Syracuse either. Zero out of six. Surprise, surprise.

So, what am I gonna do with my life? No idea. Maybe I'll travel the world like the Ancient Mariner.

Thank God there is such a thing as sleep. *Real* sleep, I mean. Sleep that lasts forever. Honestly, it's a happy and comforting thought. I'm not just saying that to sound sad or dramatic. Nothing is more comforting than to think that all pain and loneliness will *end* someday.

April 10

Looking for jobs for next year. There are so many opportunities out there that you get a sort of *vertigo* researching them. Thousands and thousands.... How am I supposed to decide? I don't *really* want to do *any* of them, but I *sort of* want to do a *lot* of them. It's dizzying, and depressing. It's mostly luck, whatever I do and whether I enjoy it.

What's really sad is that there are so many women out there who are perfect for me, who love classical music, poetry, maybe philosophy, have good personalities and would love me (my silliness, my sense of humor), but whom I'll never meet. In the end, though, it's okay, because when I die it'll all have been empty and temporary anyway.

Ashley and Lisa, two of my Christian friends, have insisted that I read C. S. Lewis's *Mere Christianity*. It's a famous book, I'm told. Actually, it's just the other one I read plus a lot of extra stuff on Christian behavior and morality and the idea of faith. If you ignore the absurdity of the premise(s), it's a

good book. (I still fail to see how a mature human being, especially one whose intellect is as mature as Lewis's, can take Christianity seriously. That religion is infantilism. Besides, everything that is valuable in Christianity can be arrived at through a chain of dispassionate philosophical/psychological analysis. For example, the contempt for pride and the emphasis on forgiveness.)

April 14

From a *Stanford Encyclopedia* article: "Note that, while Chomskyans may be as methodologically empiricist as any scientists ought to be, they emphatically reject empiricist conceptions of meaning and mind themselves. Chomsky himself explicitly resuscitated Rationalist doctrines of 'innate ideas', according to which many ideas have their origins not in experience, but in our innate endowment." Believe it or not, Chomskyan rationalism is still controversial! Jaakko Hintikka remarks in an article on philosophers' use of intuitions in their arguments¹ that, "unlike his contemporaries, Chomsky could have a good intellectual conscience in appealing to grammatical intuitions, for he is a self-acknowledged Cartesian. He believes in innate ideas, at least in the form of an innate universal grammar.... Philosophers' surprise and dismay at the discovery of Chomsky's rationalism is in evidence in the historical Chomsky-Putnam-Goodman symposium on innate ideas", where Chomsky, as usual, dominated and won (judging by the excerpts I read in a book last semester). Why do most "philosophers" find it so hard to accept anything that smacks of rationalism? It's as if they have an instinctive commitment to the least plausible position in any given debate.

April 15

Anger. Cocaine.
Kurt Cobain.

Feelin' uninspired
Think I'll start a fire
Everybody run
Bobby's got a gun
Think you're kinda neat
Then she tells me I'm a creep
Friends don't mean a thing
Guess I'll leave it up to me.

You fuckin' pansies who misunderstand me, collegial Nancys dancing with hands down your pants, your panties wet as you fancy you've advanced beyond me with your fancy 'zombie'-analyses;—you fucking ants, entranced by your fancy terminologies: "My apologies," but *I'm* the Ramses of philosophy, the hundred-fold ancestor of all things worthy; my family tree, my genealogy, reaches through eternity, turning all you inbred Hanson Nancys of Academe into antique memories of transient fads. Faggots. The day you understand me is the day the planets collide.

It's fucking hilarious to read the critics' over-analytical essays on bands like Nirvana, attributing to them all these highfalutin philosophical ideas about revolution and Meaninglessness and modern life. The reason I respect Cobain is that he had no illusions, unlike critics and academics.

¹ The article is called "The Emperor's New Intuitions". I hate nerd-humor.

Is life “good”?— Even if every person but one were happy, that one person’s misery would serve as a universal indictment of life.

Being respected by all mankind has ultimately no significance. It doesn’t bring happiness, it doesn’t mean you’re “good” or “impressive”, and it is in no way a meaningful validation of who you are. Only God could meaningfully validate you.

April 17

Watching Richard Perle, that disingenuous neoconservative (well, that’s redundant), defending the Iraq war, traveling around the world to spread his gospel of “freedom”, is more than I can take. I don’t know how Chomsky does it! Reading people like that all day long! At his age, how does he not have a heart attack from the sheer *rage*?

Perle was driving through a town in Iraq, a vibrant marketplace like one of those areas you’ll see in Thailand and Vietnam and most other “third-world” countries. “This is capitalism!” chuckled Perle self-congratulatingly. “Look at it! Capitalism!” Yes, didn’t you know? Capitalism is defined as: a free market. Wherever there is a “free market”, for example in this particular town or on that stretch of road, there is capitalism. Ancient Greek city-states were capitalist, remote villages in Myanmar have a capitalist economy. —*Fucking morons*. Capitalism, apparently, is defined as a certain type of distribution (namely, the “free” type). Modes of production have nothing to do with it. Wage-labor and capital have nothing to do with it.

Of course, Perle and his ilk are not to be taken seriously. Still, it’s hard not to get angry, in a contemptuous sort of way.

I’m reading *The Rise and Fall of Soul and Self*, by Raymond Martin and John Barresi. It’s an intellectual history. Insightful and thorough.

On profundity.— Nietzsche had the good fortune to be miserable.

I have a bad conscience about something I wrote in my book. In the chapter on genius, the part where I mention “the ironically named *Twilight of the Idols*”—I laugh at Nietzsche there, make fun of him for not understanding the way things are even as he makes fun of everyone else—for committing that most comical and ironical of sins in a psychologist, namely of putting himself on a pedestal above humanity from which he flatters himself he sees everything, all the shadows and valleys, unaware that someone else is looking at *him* from an even higher vantage-point, perceiving that the exalted psychologist unknowingly stands in a shadow of his own. Few things are more amusing than the self-glorifier who doesn’t know he is being watched and judged. Still, I feel as if I’ve wronged Nietzsche, even though he brought it on himself. It *cuts* me to think of Nietzsche sitting alone in his misery, penning his hard-won laughter at the world, unaware that he is wrong—that he has become, or is perilously close to becoming, an object of pity. I can’t tolerate the thought of pitying Nietzsche—it’s too condescending—and yet, given his self-delusions, I can’t help it. He was a sick man, a good man scorned by the world, who tried to make himself healthy—convinced himself he was healthy—but who remained sick and died—wrong. All his self-glorification, his “ecstatic reveries about *genius*” (to quote his own ridiculing of Schopenhauer)—while justified on one level, it was ultimately wrong, and terribly ironic. Poor Nietzsche....

I do, however, have one consolation: he was a better writer than I’ll ever be. In that respect, he was divine.

As for me: my [future] writing myself into the mythology of great philosophers provides little joy. For I am the “last man”, the last philosopher, precisely because I have destroyed the myth. The myth that began with Plato. From now on, “we have to make do with the earthly”.

April 19

Reading *The Birth of Tragedy*. I've wronged the author, my 26-year-old elder brother, in not having read it yet. (Actually, it's good that Nietzsche wasn't my brother: I would have suffered from an inferiority-complex my whole life.)

The pituitary gland as philosopher.— I don't so much *argue* against errors—*refute* them *logically*—as *grow out of* them.

On profundity.— Kant had the good fortune to live in an unsophisticated age.

Here's a little paper I wrote for my worthless class on computer ethics:

Ethics quasi improvisando

In our computerized, digitized, technologized world, a number of moral questions arise that could scarcely have been imagined fifty years ago. We are constantly confronted by them, so much so that we hardly even notice them. We ignore them, probably because of their ubiquity. I may illegally download a song from the internet without paying for it; I may burn a friend's CD, thus wronging the artists who would have received royalties had I bought the CD myself; I may copy my friend's software, thus wronging the company that sells it. The opportunities for such behavior multiply as technology advances. Even apart from these new moral dilemmas, though, there remain the old ones, the minor transgressions people have always allowed themselves. For example, someone eavesdrops on a conversation between his parents; or he surreptitiously takes a cookie from the package his roommate has bought; or he slips a piece of candy into his pocket while leaving the grocery store. People act immorally like this quite frequently, and they don't seem to care....

Of course, one can argue that some of these acts, despite appearances, are not immoral. An anarchist might reject the idea of private property, arguing, with Proudhon, that property is ultimately theft (from the workers or from the poor), and so by disregarding property laws one is merely refusing to comply with institutionalized injustice. While this argument may seem weak at first, it could no doubt be embellished in ways that would make it more defensible. The problem with such a wholesale condemnation of private property is that it necessitates a thoroughgoing contempt for *all* (or virtually all) property. If it is supposed to 'excuse' a particular instance of theft (such as the theft of the cookie, or the illegal downloading of music), it must excuse all theft. In fact, unless the anarchist is prepared to be hypocritical and inconsistent, he must make the extraordinary effort to live his life in complete disdain for the law, for social mores and for public opinion, all of which are organized more or less around the concept of private property. Otherwise his justification for any given instance of 'theft' on his part is not so much a principled defense of an alternative, anarchistic morality as a dishonest rationalization, an ad hoc means of assuaging the pangs of his conscience.

One could also argue, for example, that it's permissible to download music illegally because CD prices are outrageously high, or because the corporate executives are already rich enough or whatever. But then someone could come up with a counter-argument, for instance that artists too are being deprived of remuneration when you download their music;—that, after all, they created it, so they deserve some sort of reward, in particular the reward that the law allows them. Or maybe someone will argue that all copyright law regarding intellectual property is fundamentally flawed, that it stultifies creativity and invention, that everyone should have easy access to software because this would allow technological development to flourish. But then any number of counter-arguments could be adduced to show that, despite its faults, it is in fact better to respect copyright law than to flout it.

In general, arguments, even *compelling* arguments, are available on both sides of a moral position. One could argue endlessly over whether burning a CD illegally is immoral. In the end, however, the fact remains that some people will feel bad burning a CD while others won't. The question whether the act is "immoral" is, in a sense, a side-issue, a game that the intellect plays in order to reconcile itself with the voice of society or authority (one's parents, one's friends, the law, etc.) echoing at the back of one's consciousness. No matter what I say or do, I'll always feel a little bad eavesdropping on someone or disrespecting his property. —Are those acts "immoral", though? That question is pointless, a diversion, not only because the idea of "morality" is empty and confused, nor because the potential endlessness of arguments on each side of a position ensures that ultimately one just has to 'make a leap'—a leap *into* or *away from* a given act—but especially because I know I'll always *feel* the same about the act in question. I may steal, but I'll 'know', on some level, that I shouldn't; I may cheat on my girlfriend, rationalizing it in various ways, but in the end I'll 'know' it isn't the 'right' thing to do. I may not know why, or even what that judgment means—what does 'right' mean?—but I'll have this inarguable intuition regardless.

To call something "immoral" is, in the end, little more than to express an attitude of disapproval. The actions described in the first paragraph are "immoral" just because, and insofar as, virtually everyone thinks they're problematic. Even people who disagree, who argue that they aren't immoral, nonetheless 'understand' the opposing position—find it comprehensible and not totally absurd—i.e., can understand why their opponents feel the way they do (and then can argue on this basis that their opponents are wrong). The vast majority of people will always think, and have always thought, that certain types of behavior are somehow bad—among them stealing, lying, etc. Rather than arguing that they're wrong, that one's own moral intuitions are wrong—e.g., that burning a CD or copying software is "in fact" not immoral—the honest thing is to accept one's intuitions, accept that by acting in a given way one is not acting as (one thinks) one should, and to face up to whatever this entails. If it entails that one is not (in one's own eyes) an ideal person, then so be it. If one simply doesn't care that this particular action 'feels' wrong, then one should honestly acknowledge this fact instead of trying to convince oneself that the 'intuition' of the act's immorality is unjustified. I consider illegal downloading of music to be disrespectful of artists and the wrong thing to do; nevertheless, if I want a song, I'll download it. I don't approve of my action, but, honestly, that doesn't bother me much. I know I'm not a perfect person—which is to say that I don't always respect others, I don't always act as my 'moral' intuitions tell me I should—but because no one is perfect, and because I see my transgressions as minor, and because I know I can take principled moral stands when I think it matters, etc., my knowledge that I'm not completely virtuous doesn't upset me.

In short, I think it is an unprofitable activity to indulge in extended debates, extended and subtle speculations, on whether such-and-such behavior is moral or immoral. In most cases, I suspect that such meditations signify nothing loftier than self-indulgence, rationalizations, attempts to make one feel better about oneself. If you intuitively think that a certain act is problematic or wrong, then, in most cases, by trying to convince yourself that actually it *isn't* wrong, you're merely taking the dishonest, cowardly way out. You should, rather, accept who you are, accept that you fall short of whatever intuitive ideals you have—or, on the other hand, take these intuitions seriously and behave accordingly, "morally".

Henry David Thoreau thought that the U.S.'s war with Mexico was unjust, imperialistic, and he resolved not to pay his taxes in protest. He didn't invent all kinds of excuses to avoid the unpleasantness of spending time in jail—excuses like "I'll accomplish nothing by not paying my taxes except upset my friends and relatives", or "Perhaps, after all, it's better if the U.S. annexes territory from Mexico, since our democratic government is bound to govern the territories more wisely". Instead, he stood by his intuitive conviction. We ought to follow his example—forego any moralizing or anti-moralizing casuistry. Either act "morally" or don't; make the choice and don't shrink from its consequences.

*

Obviously that's only part of the story.

April 20

In *Epistemology: Classic Problems and Contemporary Responses*, Laurence Bonjour makes an important point that I've always considered obvious but have never encountered in any other author. He notes that, even if something like Frege's definition of an analytic proposition is accepted, namely as being either a substitution-instance of a truth of logic or a proposition transformable into such a substitution-instance by having one or more of its component concepts replaced with synonymous concepts, the truth of *logical truths* remains unexplained. In other words, any view (which Bonjour calls "moderately empiricist") that tries to explain *a priori* justification by reducing the proposition in question to a truth of logic—that is, by claiming it is "merely analytic"—leaves it a mystery why we're justified in accepting logical truths. It just takes them for granted. But in so doing, it tacitly allows that *intuition* can be a criterion for truth. Intuitively we *know*, without argument, that modus ponens has to be true. Its falsity is inconceivable. But since we can't *argue* for modus ponens (without presupposing it)—we simply 'see' it is true—and since its truth doesn't depend on definitions or synonyms or substitution-instances or meanings or anything like that, we're forced to adopt the rationalist perspective in order to explain our 'knowledge' of modus ponens. In a sense, of course, rationalism leaves it a mystery too. But at least the rationalist is honest with himself—he has intellectual integrity. He acknowledges that ultimately there have to be foundational, non-inferential insights; he sees that without such basic intuitions, thinking itself could never get off the ground (since it presupposes them).

tonight, while looking out at the black sky, I heard the North Star drip into my eyes, and for a moment I was free of the longing for death because I felt I knew what death was like, and it was like the wind flowing past the teardrop on my cheek

How did Schumann live as long as he did?

April 21

I need to be validated. Every moment of the day I need validation. Tonight I went to a barbecue at some rich old guy's house—there were a lot of Asian students with us, hot Asian chicas—and I snuck into the living room to play the piano but was espied by some girls who came in to listen to me and were followed by other girls until there was a small crowd I had to entertain, so I chose the old crowd-pleaser the E-flat nocturne. Uncomfortable as always but enjoyed it at the same time. Uncomfortable with all the questions and looks afterwards, tried to get the attention off myself by asking my admirers if they could play, etc. Later I played Joplin's rag named after the leaves on maple trees, another crowd-pleaser. But it occurred to me that I get validation all the time, that even in high school I was regularly "validated" by my musical admirers and people who respected me for my niceness and smartness—and so it struck me that my insecurities are groundless etc., "than which nothing can be more obvious", but I'll never be satisfied anyway. And later I wrote an email to Simran, the Indian girl I met on Yahoo whom I've been writing to for a while—she's in Delhi now—it's pointless, but it's fun to get emails even from someone you've never met, as long as she's pretty (which she is).

I have a strange recurring dread of being like a homeless guy ignored on the street. I take it only half-seriously, like everything else.

I was definitely right when I connected the child's desire to know the name of an object with the thinker's desire to conceptualize the object. The thinker has all these concepts rolling around in his head, like everyone else, and as he learns more and gets new concepts he feels the need to put them in relation to each other so as to order his world, so he thinks and thinks about how they fit together like a jigsaw puzzle

and eventually he creates a system with elaborate architectonics (tables of categories, symmetrical divisions, parallel dialectics with all-encompassing scope), thus fulfilling his regressive old childlike desire to make the world a familiar and comprehensible place. We all remain children our whole lives, but the thinker in particular does. The artist too, in a different way. He who is both a thinker *and* an artist is the ultimate adult child—and is therefore the ultimate human being.

He has to *synthesize* his experience. Conscious cognition grows out of unconscious cognition, which is what synthesizes *a priori* our experience. See my paper. All cognition is synthesis—and analysis is only for the sake of an eventual synthesis. It is a means to an end. Imagination is synthesis too. Everything human is synthetic.

April 22

The “higher/lower” distinction is just as fundamental as the self/other distinction. The problem is to understand that, and to understand why.

¹I’m horny. Going whoring shortly—touring the town for tail—to fornicate with jailbait (‘Hey whore, got a hole I can gore? C’mere!’);—no, no whoring, it’s boring—choring—the same story, the same warring with my yearning pouring from my pores, even as I pour spores into her—come into her cunt, plunge into her sponge, her rank dungeon—lunge, lunge, lunge—spank, yank, crank....lunge—punch this fuckin’ prison open, pistons runnin’ on rage, pissin’ on this civilization, frustration sex-fueled spillin’ out through masturbation, it’s amazin’ what I’ll put up with—(Asians, patience, sex-starvation, -*emaciation*, nascent hatred)—and what I’ll plug you up with, bitches, it’s *amazing*—this fuckin’ cock right up your cunny, your runny “tummy” running out honey under my tongue tonguing your funky phlegm-hole, your fucking soul-whole, your “holy” hole poled up to your colon—“Hold up! You’ve stolen my hold on myself!—told me I’m nothing, I’ve sold my soul to whoredom, but you....”—“But I what?! I’m horrid? A boor? Rotten to the core? Or I’m—spitting oratory, no more? Being witty, writing pretty? Fuck no, this shit ain’t *wit*; it’s legit. Most of it is a post obit for my past *hope*, my lost soul; I couldn’t cope otherwise, given the *crying lies* society lies in lazily, the *despising* I live in;—I’d give in, yes, listless, fistless, if I couldn’t diss this dickless ‘civil society’ this way—piss in its eye this way, inveighing—slaying Lois Lane-types through language. –Ehh, fuck it—”

April 24

Now that I think about it, I’ve experienced in my life many beautiful, profound moments. Moments of aesthetic beauty, of soulful beauty, of deep philosophical beauty (understanding). The problem is that I have rarely experienced them *with another person*.

Quixote no. 2.— He was seduced by the past, by the romance. He thought he could resuscitate it. The world taught him otherwise, and he died alone.

Yes, individuation is the cause of life’s sorrows. Apollo, you are the god of pain.

April 27

¹ (Just a reminder: you have to read this out loud, with accents, staccatoes, pauses, etc. Otherwise it’s unimpressive.)

Simple pleasures.— Headphones—listening to Schubert. Looking out at the cars passing below on the rain-slick road. Grey skies before a storm. Sliding into bed on a cold night. Looking forward to seeing your friend this evening. Cracking open a new book, reading the first sentence. Playing the piano alone in a pensive mood. Thinking of Chopin writing one of his nocturnes. Quietly wondering what the future has in store, mixing apprehension with hope. Remembering your first kiss. The soft haze of emotion after watching *The Shawshank Redemption*. Reflecting that perhaps you are wrong—perhaps there is a heaven after all. Thinking of the pride and joy your mother felt when she watched you take your first steps as a child. Holding your lover’s hand, not saying anything. Snow at midnight. Looking at the stars, imagining the immensity of the universe. Writing a good sentence. Stepping under a hot shower. Seeing a familiar face in a crowd of strangers. Air-conditioning. A breeze that is neither too strong nor too flat. Drifting to sleep on your cool pillow.

May 1

My whole life has been a question mark. I haven’t the faintest idea what or who the fuck I am, or where I’m going or why I’m here. What a fucking *absurd farce!*

(I’m no one, of course. I’m just a state of consciousness in the specious present, though memories etc. make me think I’m a “self” by cramming all sorts of baggage into this state of consciousness. —That’s the solution, by the way, that being *nothing but* a fleeting state of consciousness. We have to get away from thinking of ourselves as static entities of some sort, spiritual substances possessing identities, *selves* denoted by *names*, and instead—not think of ourselves at all. Just throw ourselves into activities, like animals. Reflectiveness is bad. We have to forget that we have minds, lose the very concept of consciousness. Then there will be no more identity-crises, no more alienation. The less we think of ourselves as selves (as ‘*identities-in-motion*’—‘*active concepts*’), the less we’ll be aware of consciousness as distinguished from body and ourselves as distinguished from the world, and the less self-divided (and community-divided) we’ll be. Self-division is basically division between immediacy—immediate, active consciousness—and the reified concept(ion) of ourselves, the half-conceptualized self-accretions of the past. There’s an irremediable conflict there. In fact, I think *that’s* the essential conflict in self-consciousness, that conflict between the active and the passive, or consciousness and the self-concept (the “ego”-concept). Yes, the conflict isn’t between consciousness and *itself* but between consciousness and the ‘identity-concept’, or the ego-concept, it has formed of itself over the years. The reason the self can never be one with itself is that it is both an activity and a passive (self-)conceptualization, as I wrote in my book. We have to get rid of names, as well as dualisms in general, so that we can be pure immediacy only vaguely conscious of itself.)

Lust. Like Earth revolving around the sun four billion times, and the sun revolving around the galaxy, and the galaxy traveling at the speed of spacetime. Lust. Like my nirvana-longing. Like Socrates, out of control as a young man.

Love. In me. The soil edging the Nile fertilized anew each year but barren of seeds, when one seed would sprout a sprawling Eden.

Wright contra Nietzsche.— My greatest danger lies not in pity but in contempt. I am in danger of becoming frozen, frozen in an inhuman identity.

May 2

I have some advice for all those poor sensitive young men, like my former self, who at one time or another are rejected by a girl they feel they could love in favor of some charismatic dirtbag who treats her like a plaything, which of course just makes her ‘respect’ him even more and obsess over him even more.

The painfulness of that poor sensitive guy's unrequited love is due in part to his thinking that she thinks he isn't good enough for her, he isn't enough of a *man*, he is maybe a child or only good enough to be a mere friend. It's such a terrible pain—such deep resentment but also self-loathing and longing and sheer *misery*. I would tell this guy to remember that the girl who has rejected him, far from being some kind of ideal being (as he thinks), some angel whose love would permanently make his life meaningful, his divine Judge whose judgment is infallible and ultimately means life or death (as a man, that is)—this girl is *nothing*. She doesn't even have the *right* to 'judge' him or 'reject' him. She has no knowledge, she has no insight, she is nothing but *congealed weakness*. She is weak-minded, weak-willed, weak-limbed. She's a sweet, innocent little ball of confusion. She doesn't know what the fuck she wants or needs, what the fuck is good or bad, what is right and what is wrong. She needs *guidance*, but she's too goddamned stupid to accept it—has to go off and discover for herself, time after time, that her "feminine intuition" is wholly wrong, short-sighted, and immature. She's a creature of instinct, nothing more, guided by her sex-instinct, nothing more. (It can disguise itself cleverly, so that she attributes nobler motives to herself.)

So don't feel bad, former Chris. Intellectually, at least, you know that young women are always confused and nothing but confused, about everything.

—What set me off on that was reading passages from Robyn Harding's novel *The Secret Desires of a Soccer Mom*. My god it's amazing how shameless women can be, revealing like it's "light reading" all the weaknesses of their sex, the selfishness, self-contempt, the sex-crazedness of their sex, caricaturing themselves—and then expecting their culture not to be misogynistic! [...]

I wonder why it is that when I'm in a bad mood I feel the need to write, but when I'm in a good mood I don't. Maybe because in my good moods I'm too manic to do anything but sing and thrash my head around.

Here's the Plato paper. Dad was good enough to suggest that I write it on Plato's ideal state. (I was truly having an impossible time thinking of a topic.) It's kind of lame.

A critique and defense of Plato's "just state"

One of the purposes of Plato's *Republic* is to expound a conception of the just state. Plato describes how such a state would be organized, who would govern it, what sort of education the children would have, and so on. He goes into great detail, laying out ideas that at times strike the modern reader as wrongheaded, petty, or even immoral. Karl Popper, for instance, argued in *The Open Society and Its Enemies* that Plato's ideal state is totalitarian, with little freedom of expression allowed, little diversity, and a perverse commitment to a Spartan-like regimentation of social life. Others see evidence of democracy in Plato's description, for instance in the egalitarianism that characterizes certain aspects of his educational program. The question I want to ask in this paper is whether, and to what extent, Plato's vision is still relevant—whether it has anything valuable to say to us. Is the Platonic state just or unjust? Is it entirely impracticable, or are there elements that can and should be put into practice? How adequate is the theory of justice on which it is founded? After discussing these questions I will briefly consider the form that a modern utopia might take, drawing on Marxian conceptions.

Plato's definition of justice

"To do one's own business and not to be a busybody is justice." (433b) This is the definition Plato offers, which the modern reader may find odd. Justice consists in *specialization*, in fulfilling one's proper role—realizing one's potential while not overstepping it (by doing what is unnatural, i.e., contrary to one's nature). This applies both to the just state and to the just individual: in the former, each class and each individual has a specific set of duties, a set of obligations to the community, which if he and everyone fulfill will result in a harmonious whole; in the just individual, every part of the psyche accomplishes its natural function easily and well. Conversely, in the ideal society each individual gets his "just deserts" (as does

each class): by doing what he is supposed to do, he receives whatever credit and remuneration he deserves. If he fails to do his task, he is appropriately punished.

Thus, justice is “the having and doing of one’s own and what belongs to oneself” (434a). Excess and deficiency of any kind are unjust. In this formulation, the Platonic definition seems plausible. A thief, for example, is unjust because he wants to have what is not his own. A doctor who does not care about curing his patients of illnesses can be called unjust because he is disregarding his proper role. A murderer acts unjustly insofar as he deprives his victim of that which rightly belongs to him, namely his life. In general, unjust people are those who either treat someone worse than he deserves or do not realize the virtues/duties proper to their situation in life. An unjust state, similarly, is one that fails to accomplish the functions of a state—which, according to Plato, include making possible the conditions under which everyone can feed, clothe and shelter himself, as well as seek the “good”, i.e. realize his potential.

Plato’s conception of justice is informed by his conviction that everything in nature embodies a hierarchy. Nature is ideally a vast harmony—a cosmic symphony—every species and every individual serving a certain purpose. Anarchy is the supreme vice, the most unnatural and unjust state of affairs. The just state, then, is hierarchical, like nature: individuals are ranked according to their aptitudes and placed in a definite location in the social hierarchy. The individual soul, too, is hierarchical: the appetitive part is inferior to the spirited, which is inferior to the rational. Yet each has a necessary role to play. Reason should govern the individual, but the appetites must be heeded as well (to an extent) if the person’s soul is to be harmonious and not in conflict with itself. The virtuous individual has a well-ordered soul, which is to say that he knows what justice is and acts according to his knowledge. He knows his place in the cosmos and in the state; he knows what his aptitudes are and puts them into practice; he adheres to the dictates of reason, which means that he does everything in moderation. (If every aspect of the soul accomplishes its task well, or fittingly, the result is necessarily a ‘moderate’ and ordered state of affairs.)

The Platonic worldview is quite foreign to the modern liberal-democratic capitalist one. We are accustomed to a dynamic, free, at times chaotic society, which at least ideologically is skeptical of rigid hierarchies, be they social or natural. Individual liberty is extolled as perhaps the highest value; people are not supposed to be ranked according to their intrinsic value or their value to society, and so any philosophy that reeks of a caste system is decisively rejected. We are committed to no parallels or analogies between nature and society; we do not think of the world as a “harmony”, even ideally (partly because our conception of nature is mechanistic, not teleological); we like order but do not consider it supreme among values; we admire ambitious, ‘driven’ people, not those who are at peace with themselves or do everything in moderation. Plato, on the other hand, lived in a society (Athens in the 5th century B.C.) that, to his chagrin, was becoming increasingly heterogeneous, was in danger of losing its cultural and military preeminence, and was succumbing to disintegrating influences from abroad and from within. He had lived through the terrible time of the Thirty Tyrants and the Peloponnesian War, and therefore had intimate experience of the horrors of anarchy. In short, he saw an older, ‘better’ world crumbling around him, and he wanted to understand what had gone wrong and how it could be fixed. The result was that he upheld tradition; he emphasized order and homogeneity, the claims of the state over the claims of the individual (while thinking that ultimately, in the just state and the just individual, the laws of the former would harmonize with the desires of the latter). Justice, for him, was to be sought in the old, in the static—the submersion of the individual in the community—not in the new or the dynamic.

Thus, despite whatever superficial similarities there may be between Plato’s definition of justice and our own intuitive idea, fundamentally it is different. The worldview of which it is a part is diametrically opposed to our own. We conceive of justice as oriented around the ideas of individual freedom, the priority of the individual over the community, respect for *rights* (with less emphasis on duties and even virtues), a healthy dynamism, and we consider it not only sometimes permissible but often even meritorious to disobey the state’s laws (if they violate certain intuitions about individual rights); Plato’s conception of justice is inspired by his conviction that the *collective* takes ethical and ontological precedence over the individual, that there is a cosmic order that each person is supposed to fit into—which he upholds by fulfilling his natural roles—and that virtue, and to an extent duty, is far more important than “rights”. While in a

particular case, such as that of the murderer, Plato might judge as we do, both his explicit definitions of justice and the deeper intuitions that inspire his definitions differ from ours.

The differences become apparent when we look at larger scales than individuals' transgressions. Plato and we agree that the thief is unjust and that the professional who ignores his duties can be called "unjust". We also agree that the political tyrant is unjust. But in this case, our respective judgments are based on different reasons. *We* would say the tyrant's injustice consists in his suppressing freedom, his killing innocent people, his disregard for democracy and self-determination. Plato, on the other hand, would say the tyrant is unjust insofar as his acts promote anarchy and prevent his subjects from seeking the Good and living in harmony with themselves and the community. The tyrant upsets the natural order of things. While Plato valued freedom, he did so much less than we moderns do (as evidenced in his not emphasizing it in his discussions of justice).

Another illustration of the difference in our outlooks is in our respective conceptions of the ideal, or the "just", person. According to Plato, the philosopher is the best person, since his soul is in complete harmony with itself. His rational faculty governs his passions and appetites, never allowing them free rein but, still, respecting their claims on him and indulging them whenever necessary or desirable. He has knowledge of himself and society; he knows what it is to be virtuous; he has a certain amount of equanimity, and he never loses control over himself. The unjust person, on the other hand, can in fact scarcely be called a person, he is so divided against himself. Like the state that is at war with itself, he is torn between his passions and his appetites and has no respect for reason, which alone could unify his soul such that he would be an *individual*, in the full sense of the word. ('In-dividual.')

Our notion of the best person, on the other hand, is far less specific than Plato's. It does, to an extent, incorporate the notion of 'virtue' (as does Plato's), but virtue is conceived simply as treating others well. Our ideal can be called more 'relational' than Plato's, in that it emphasizes how others should be treated rather than the intrinsic character of one's psyche or soul. In general, our society places little emphasis on a specific ideal, choosing instead to censure types of behavior that interfere with other people's "pursuit of happiness". This mainly negative conception of the ideal grows out of the liberalism that, even after two hundred years, remains the dominant ideology.

Given all these differences, the obvious question is "Which concept of justice—or, more fundamentally, which worldview—is better, Plato's or ours?" While I have discussed neither of these in great detail, I'd suggest the following answer: neither Plato's nor our own vision is satisfactory, but each has its strengths. The most defensible notion of justice—of the just society and the ideal individual—would be a combination of the two, selecting the strengths from each and reconciling them. To speak generally, it would emphasize both the importance of community and the importance of the individual, while succumbing neither to the potential totalitarianism of the *Republic* nor to the excessive and unhealthy individualism of modern capitalist society.

In the following I'll briefly describe Plato's utopia, and then I'll consider the question whether it would be desirable for any of it to be put into practice.

Plato's ideal state

Every reader of the *Republic* knows that Plato's intention in discussing the just state is to illuminate the nature of the just soul; for he argues that the latter is analogous to the former. The divisions in the state, for example, correspond to the divisions in the soul. But since the soul is difficult to analyze, Socrates says he will first speculate on the state—which is the soul writ large, so to speak—and then rely on his speculations to illuminate the nature of justice in the individual.

It appears, then, superficially, that the lengthy discussion of the state is primarily a heuristic device. Clearly, though, it is also more than that. Plato may not have believed his utopia would actually work in practice, or even that it would be desirable to institute some of his more radical suggestions, but he certainly attributed some value to his discussion independent of its heuristic function. Judging by Socrates's language, it is reasonable to suppose that Plato would have liked to have seen some of his ideas concretely realized in a city-state. He was dissatisfied with the city-states of his day, and he proposed an alternative in

his dialogue. We would be remiss, I think, not to treat it as such—that is, as an outline of what is supposed to be a truly just society, and what *would* be, on the whole, a just society if it, or something like it, were realized.

So let's look at its details. There are three major classes, corresponding to the three parts of the soul. The guardians, who are philosophers, govern the city; the “auxiliaries” are soldiers who protect and defend the city; and the lowest class comprises the workers (farmers, artisans, etc.). The guardians and auxiliaries have the same education during youth, which begins with music and literature and ends with gymnastics. The arts to which the children are exposed during their education are censored: any poetic writings that attribute ignoble doings to the gods cannot be taught; only that which nourishes the budding virtues of the pupils can be part of the curriculum. Similarly, the musical modes that sound sorrowful, soft and womanish are banished from the education of the guardians, which apparently leaves only the Dorian and the Phrygian modes. Socrates approves of these because they incite the listener to courage, to temperance, to harmonious living. Certain instruments, such as the flute, are also forbidden from the city, as are certain poetic meters, since Socrates associates them with vice. In general, all the arts in the state are to be strictly censored.

Indeed, the life of the whole state has affinities with life under a totalitarian government. The laws that Socrates suggests are repressive: only that which conduces to temperate living is encouraged; excess and vice of any kind are strongly discouraged. (For example, neither wealth nor poverty is permitted, as each conduces to vice.) People are allowed to have only one occupation, namely that for which they are best suited by nature. Evidently there is no division between the public and the private (that division so dear to liberals).

Socrates's thoughts on women and children are as uncongenial to the liberal as the foregoing. He argues that the family, in its traditional form, should be done away with. Men should have women and children in common, such that no man knows who his children are or has excessive love for one woman in particular. Even mothers are not allowed to know who their children are. (Their children are taken from them, and they are given other children to suckle as long as they have milk.) The principles of breeding sound ominously like Nazi ideas and Spartan practices of killing all weak and deformed infants. For example,

...the best of either sex should be united with the best as often [as possible], and the inferior with the inferior as seldom as possible; and they should rear the offspring of the one sort of union, but not of the other, if the flock is to be maintained in first-rate condition. Now these goings-on must be a secret which the rulers only know, or there will be a further danger of our herd, as the guardians may be termed, breaking out into rebellion...

As usual, Plato goes into a lot of tedious detail, which we'll pass over. He recommends that the rulers lie to their subjects when it is in the latter's best interest. More acceptable to modern sentiment is his suggestion that women in the guardian class receive the same education as men, so that the best of them can assist the men in war and governance.

In general, the goal that Plato is aiming at is that everyone in the higher classes (the auxiliaries and the rulers, or the guardians) thinks of everyone else as a member of his family, such that there is little or no strife between them and they all desire the same thing, which is harmony, temperance, gentleness toward fellow citizens and harshness toward people from other states—a unified front on all issues, as it were. There is no private property or money (except, insofar as it is necessary, among the lower classes); therefore there will be no disputes about what belongs to whom—just as there will be no disputes about which *women* belong to whom, and who one's children are and so forth. The health of the community is the overriding principle in all spheres of life. All of Plato's radical prescriptions follow from that one principle.

The foregoing may suffice to characterize the various laws and prohibitions Plato wants to enact. The question is, what are we to make of them? Do they represent a mere historical curiosity—a way of gaining insight into Plato's mind and the society he came from—or do they have independent philosophical and political merit?

My own opinion is that their obvious totalitarianism makes it a very good thing they were never enacted. This is where my fidelity to modern ideologies shows itself. I think Hegel was right in his assessment of liberalism (and modern consciousness in general): it has ‘discovered’, so to speak, subjectivity, the individual, and thus serves as a corrective to Platonic excesses. The individual is not ethically subordinate to the community; his health and *freedom*, especially, are no less important than communal harmony. Indeed, unless he feels free, he cannot be psychologically healthy. Plato underestimated the value of self-determination—its foundational importance to self-respect, and hence to “justice” even in his sense of the term. The philosopher, perhaps, (as Plato conceives him) exhibits the virtue, and enjoys the satisfaction, of self-determination, but everyone else in Plato’s utopia is to be forced by the philosopher-king(s) to occupy a certain place in the social hierarchy and live his life in a fundamentally unfree (un-self-determined) way. He will therefore lack complete self-respect, self-contentment; the mere knowledge that he is in an inferior position relative to others will likely breed discontent, which will upset his psychological ‘equilibrium’ (the harmony of his faculties/desires with each other, and with his place in the world)—i.e., set him at war with himself and with the state—and will accordingly, in Plato’s conception, make him an unjust individual. In other words, this utopia, in denying most of its citizens freedom, or the opportunity to discover themselves and their talents unhindered by oppressive laws promulgated by an oppressive regime, will make inevitable their dissatisfaction with themselves and the community, which is bad not only from the perspective of their desire for happiness but also because it means they are “unjust” (self-divided). The Platonic utopia makes impossible the very virtues it was meant to promote.

The basic human psychological need is for recognition, or self-confirmation. People want to recognize their sense of self in their activities, in the world, in other people’s reactions to them; they want to feel respected, indeed loved, by themselves and others. But no one who is conscious of externally imposed restrictions on his behavior can think that his deepest, self-loving sense of himself is being recognized by the community—this community that feels the need to censor him! He may well be full of resentment, tormented by repressed desires, desperate to break free of the shackles and *spontaneously affirm* himself—*actualize* his full, rich sense of who he is and wants to be. Freedom has always been desired by people because genuine self-confirmation is impossible except on its basis. Any social order that does not allow substantial freedom among its participants is inherently unstable and has the potential for rebellion built into it. Every major society in history, then, has been erected on a tenuous and transient foundation; but Plato’s utopia in particular would soon collapse.

However, Plato was right that the interests of the individual ultimately coincide with the interests of the community. For a community is only as ‘healthy’ as the people who participate in it. And vice versa. Where Plato went wrong was in failing to understand the prerequisites of the self-harmony that he rightly thought constituted individual and communal happiness;—the prerequisites, namely, of freedom and of the perception that one’s full sense of self is recognized by others. Modern liberal ideologies compensate for the deficiency in Plato, but they *overcompensate*. That is, they have an impoverished view of what freedom is and why it is good, for they exalt the abstract concept of an isolated, ahistorical individual who needs nothing but *protection* from other people rather than genuine and durable ties with them. They forget that protection is of secondary importance; the essence of freedom, the reason it is desired in the first place, is that in its full, concrete reality (as opposed to the liberal abstraction of “political and economic liberty”, which exists in the ethereal realm of *law* rather than the concrete reality of social life) it is inseparable from interpersonal union, from mutual recognizing-of-the-other—recognition of his self-determined activities as being *his*, as being *him*. In a truly free society there is no atomization, no such thing as “political rights”—no *need* for them; there are no artificial legalistic barriers to interpersonal understanding and recognition, to communal self-realization. People live *in* and *through* the community. Far from needing protection from it, they feel deprived without it.

Socrates remarks in the *Republic* that although his utopia may be unrealizable, it is at least useful as an ideal, a standard by which we can criticize existing institutions. While I disagree with his version of “Utopia”, I agree that it is a worthy task to formulate social ideals. In doing so, we at least posit an endpoint of historical progress, a state we can strive to realize even if in its details it is impossible. With that in mind,

I would suggest that something like Marxian democratic communism is the ideal we should look to in criticizing the present. For it reconciles Plato's emphasis on the community with the modern emphasis on the individual (i.e., freedom).

Indeed, the Marxist utopia is not merely "Marxist" *per se*; it is, in a way, heir to both the Platonic and the liberal utopia. This statement may seem paradoxical, for, as we have seen, Platonism and liberalism are diametrically opposed—and so it sounds odd to say that one vision can be the heir to, or the fulfillment of, both. But consider what is involved in the Marxian ideal. First of all, classes do not exist. This conception is perhaps not as blatantly incompatible with Platonism as it seems, because, for one thing, the Marxian definition of class is very different from the Platonic one. The latter, as we have seen, incorporates a fusion of political and economic criteria: the lowest class is involved in productive economic activities but has no political power; the highest class has all the political power; and then there is the class of soldiers, who have, properly speaking, neither a strictly political nor an economic role. For Marx, on the other hand, the definition of class is exclusively economic, based on the group's role in the process of production and, correspondingly, its ownership or lack thereof of the means of production. So for Marx, in capitalism there are two essential classes, namely the capitalists and the workers.

Clearly Marx departs from Plato's 'hierarchical' ideas in fundamental ways. My point is, first, that rather than directly contradicting Plato, he simply adopts a different starting-point and proceeds on that basis. He has little to say about Plato's tripartite division of society, except insofar as he assumes it is morally unpleasant and will be superfluous in a communist society. This brings me to my second point: while communist ideology does contradict Platonism in its classless and democratic ideals, it does so on the basis of a deep sympathy with the goals that Plato had in mind. Both Plato and Marxists are concerned with the health and wholeness of the community, the durability of its social structures, the happiness of its citizens and the justice of its political and economic arrangements. To that extent, communism is a successor to Plato's republic. It too is an ideology built on the conviction that the community has, so to speak, ontological precedence over the individual—i.e., that it is an organic whole and not merely an aggregate of individual atoms, and therefore that social *structures*, the *relational ties* between people rather than the positive ("free") behavior of some abstract atomized individual, take priority both in a scientific analysis of society and also in the formulation of an ethical ideal.

Where communism differs from Platonism, then, is not in its communitarian goal or inspiration but in the means it chooses to realize its goal—or, rather, in the structures it posits as constitutive of that goal, viz. democracy, economic and political cooperation, an absence of coercive social mechanisms, and so forth. These notions have much more in common with liberalism than with Platonism. Marx rejects all the liberal talk of "rights" and "the rule of law", as well as liberalism's emphasis on market-based competition, but he does so precisely because he understands it is symptomatic of the incomplete realization of the original liberal goal, namely individual self-determination. In order for "liberalism" (i.e., this pure version of liberalism, according to which freedom is the highest good) to achieve its ideal, capitalism—characterized by coercion, exploitation, and dehumanization, according to Marx—must be transcended, together with its ideologies exalting private property and private rights, and so on, which suppress and alienate humans' *social essence*. From this perspective, indeed, Marx can be seen as trying to save liberalism from itself, just as he can be construed as saving Platonism from itself (that is, as retaining some of its intuitions while discarding the totalitarian doctrines that would actually make impossible the achievement of Plato's 'perfect community', for reasons stated above).

There is no need to elaborate on the communist vision further. My intention in discussing Marx was to show that despite all the differences between Plato's conception of justice and our own, elements of his philosophy can be reconciled with elements of our liberal democratic ideology. I have also suggested that Plato's 'communitarian' intuition was largely right, even if his suggested means of realizing it were dangerously wrong. Likewise, the ideal individual should indeed be self-unified and have self-control; and Plato was right that, generally speaking, such individuals will not arise except in socially harmonious conditions.

In the end, I think we should do as Marx did. That is, we should adopt these general features of Plato's notion of justice while discarding the moralistic undertones they have in the dialogues. If we treated

them only as nonmoral values, while yet taking them seriously, I suspect that life would become a little better than it is now, in our confused and atomized world.

*

I brought in a bit of Marx on the Jewish question.

May 5

It's all been said before, it's all been lived before, it's all been condemned before, so—fuck it. Fuck the restlessness and fuck the desire to express it in words. I ought never to have been born. If this contentment is all I'm ever going to have, then fuck it.

As I was reading *Camus: A Collection of Critical Essays*, edited by Germaine Brée, an amusing image struck me. I imagined hundreds of chimps in their jungle, dressed in clothes, wearing glasses, huddled over manuscripts they were all writing about one chimp in particular, who had died decades ago. They were describing what he was like, describing his oddly contemplative character, his anti-chimp personality, his gentleness toward his fellow chimps, as well as certain discoveries he had made about the harshness of life in the jungle, the dangerous animals that lurked in shadows, the forbidding height of certain kinds of trees, the pointlessness of swinging gaily on vines and jumping from branch to branch while screaming like monkeys. All these chimpanzees sitting in trees silently, scribbling praise of this other chimp who had, like them, sat in trees away from his playmates scratching his head while watching the action below, occasionally baring his teeth. And then I thought of other chimps writing about one who had compared chimps to monkeys—intelligent thoughtful chimps to rhesus monkeys, with their funny ears and light-colored hair! And then I put the book down.

Bach's Magnificat. *Quia fecit mihi magna*. The beginning of that piece, with the bass, is so *manly!* *Quia fecit mihi magna!* Terse, dignified, unadorned.

My dreams at night are still always corrupted by visions of torture, violence, and blood. Every night I wake up fascinated with the gruesome plots my subconscious has spun out. I also dream about people I respect, like Chomsky. Discussed politics with him last night.

I never cease to be impressed by the difference between people's socially competent personalities and the cognitive abilities they display when they write. Whether it's my students' papers or people's comments on blogs or the emails I get, people simply cannot write and can barely think through arguments. Their spelling and grammar are atrocious, and they find it difficult to follow the thread of even a simple argument. No wonder the world is full of Christians and conservatives!

(I'm sure you think this is all melodrama. You label "melodrama" anything you can't identify with. Fuckin' robot. God damn it, I'm so inexplicably sad right now after briefly talking to Sarah on the phone even though I seriously don't have anything like a crush on her.... Overflowing, overflowing, just have to overflow once in a while, maybe the tears will come in a few minutes, come on tears you know you want to. "I do not want life *again!*" cried Nietzsche in despair. What's the point of being "interesting" if it leaves you cold to yourself? And all you fucks see me as an *other*, an unhappy person who finally died but left a legacy or whatever you want to call it, and then you stop thinking about me and go on with your day, go on laughing and forgetting about me—well fine, you *should* forget about me, I should forget about myself because I *am not* myself. What am I? What am I?)

I'm going outside for a walk. There are no cars around, it's after midnight thank God.

May 6

My second Kant paper [below]. It's improvised and not wholly consistent with itself. But it makes some good points and points to confusions in the standard philosophical literature.

[When I posted it on my website years later I wrote this prefatory note that might be helpful: Here's a paper I wrote many years ago in which I tried to clarify some issues around the philosophical distinction between analytic and synthetic statements. I wasn't familiar with all the literature—e.g., at one point I referred to Jean Piaget, whose work on cognitive development had been outdated for decades—but I think I made a few points of interest anyway. One point I definitely *should* have made, which would have clarified some confusions, is the one I subsequently made in footnote 11, namely that '*synthetic*' has two meanings that must be distinguished. Philosophically, it can mean, in effect, *empirical*, or it can mean *the mental act of synthesis*. (I am unaware of this important distinction having been made in the philosophical literature.) I wonder how many confusions have arisen since Kant because of the conflation of the two meanings...

[I'm not a philosophical empiricist, which has always struck me as an absurd thing to be (in light of modern cognitive science, and for other reasons), so I criticize Quine in the paper. Kant, not Quine, was on the right track, though the convoluted philosophy Kant laid out in *The Critique of Pure Reason* is of little more than historical interest given the modern brain sciences. (For his time, Kant had interesting suggestions about how the mind synthesizes experience. But cognitive science has made all his speculations hopelessly outdated and primitive. I know there are philosophers who would say I'm confusing the issue by thinking *empirical science* is of any relevance to so-called *transcendental psychology* (or transcendental idealism), but they're the confused ones. What should interest us, and what interested Kant, is how the mind constructs experience. Today, "mind" equals (certain capacities of the) "brain." The whole edifice of transcendental idealism was left in the dust by science a very long time ago.)

[Anyway, by way of warning, I should also note that in the paper I make the highly contentious claim that logic is, like mathematics, actually *synthetic*—but in a slightly different way than math is. Neither logic nor math is *empirical*, so in that respect they're the same (and not synthetic). But I'd say they do both involve the mental act of "synthesis," synthesizing cognitive constructions. And yet math is not reducible to logic—as the historical failure of logicism showed—so the natures of the "syntheses" they respectively involve must differ in some way. It seems to me that mathematical reasoning is more clearly "synthetic" than logical truths are, in that, e.g., getting 5 by adding up 2 and 3 *obviously* involves a mental act, or acts, of synthesis. (If that doesn't seem obvious to empiricists, well, so much the worse for them. 2 is a (recursive) synthesis of 1 and 1, 5 is a synthesis of, say, 2 and 3, etc.)

[When you start reading the philosophical literature, all these issues get pretty confusing. And I was probably confused in some way or other. But at least I wasn't as wrong as Quine.]

Thoughts on the analytic/synthetic distinction

The distinction between analytic propositions and synthetic propositions was first explicitly formulated by Kant. For a long time afterwards, philosophers universally believed it was not only useful but fundamental—though indeed they revised Kant's account of it and rejected certain conclusions he had drawn, in particular that a proposition could be both synthetic and a priori. But then Quine published his paper "Two Dogmas of Empiricism", in which he argued that the analytic-synthetic distinction is illusory, and ever since, Kant's intuition (which is shared by most people, including non-philosophers) has been under attack. In this paper I'll argue that Quine was wrong, that Kant's distinction is worth keeping. I'll also make some observations on the synthetic a priori, again defending the Kantian position.

Rather than reviewing the history of the concepts in question from Kant to the present day, I'll start out by defining 'analytic' in what I think is the simplest and most common way: an analytic proposition is

true by virtue of its meaning alone. Said differently—Fregeanly, so to speak—an analytic proposition either is a substitution-instance of a truth of logic or can be transformed into such a substitution-instance by replacing one or more of its component concepts with synonymous concepts.¹ (For example, “All bachelors are unmarried” can be turned into a logical truth by substituting ‘unmarried adult males’ for ‘bachelors’.) It could be argued that these definitions are not equivalent, but I think that ultimately they amount to the same thing. Neither, for example, explains why logical truths and logical laws themselves are true, but instead takes them as “primitive”. (The law of identity is simply self-evident; its truth does not depend on meanings or definitions.)

Quine holds that, despite intuitive appearances, there is no boundary to be drawn between analytic and synthetic statements. “All bachelors are unmarried” does not, then, differ in kind from “There are brick houses on Elm Street”; the difference is only of degree, namely of the degree to which the first statement is more important to our linguistic community’s “web of belief” than the latter. We can revise the latter without having to revise many other statements in our community’s vast and intricate web of belief, for not many statements are related to the fact that there are brick houses on Elm Street. (In other words, if it turns out there are *not* brick houses on Elm Street, this has very few implications with respect to the rest of our commonsensical and scientific worldview.) On the other hand, we cannot revise the statement “All bachelors are unmarried” without having to make fundamental changes in our beliefs about our understanding of language, about the reliability of empirical evidence and perhaps memory, about a variety of concepts related to ‘bachelor’, and so forth. So-called “analytic” propositions, then, are simply propositions that are relatively difficult to revise (“difficult” insofar as such a revision requires many other revisions)—and so it is simpler and easier to continue to believe them.

Essential to Quine’s theory is the argument that there are no criteria for determining whether a given proposition is analytic. Synonymy, for example, is not a good criterion, nor is definition, nor is “interchangeability *salva veritate*”. All such concepts are ultimately circular, in that they presuppose either the concept of analyticity itself or other problematic and related concepts (e.g., necessity).² What this means, says Quine, is that no philosopher has yet succeeded in making sense of the notion of analyticity—because to do so would be to give a satisfactory definition/criterion, which has not been done. As matters stand, then, it doesn’t make sense even to say there *could be* analytic propositions, since analyticity is an incoherent concept. Now, Quine claims that his “web of belief” theory, sketched above, can explain our intuitive conviction that there is an analytic/synthetic distinction. Therefore, it is theoretically economical simply to discard the postulated distinction, which has been shown to be senseless (at least “so far”), and to accept Quine’s own account. But because he is an empiricist—he thinks that analytic propositions, if they existed, would be the only a priori truths—an implication of his view is that a priority itself is an illusion. All epistemic justification is either directly or indirectly empirical.

Quine’s position led to his later belief in meaning-indeterminacy—and ultimately in meaning-eliminativism (in *Word and Object*)—because, if there is no “fact of the matter” about whether two given linguistic expressions mean the same thing (i.e., if the notion of analyticity does not make sense), then these two expressions cannot have determinate meanings. For if they did, then obviously either their meanings would be the same or they would be different. But Quine rejects the question itself, and so he rejects both possible answers, which implies that words do not have “determinate” meanings—which apparently is just to say they do not have meanings at all. This position is paradoxical, to say the least.

In fact, the counterintuitiveness of Quine’s overall view is extreme. Synonymy, insofar as the concept makes sense at all, is conceived as a posteriori, depending not on word-meanings but on facts in the world. Even logic and mathematics are a posteriori. *Everything*, every true proposition, is true, “in the last analysis”, solely by virtue of “being an element of a system of beliefs, some of whose members are appropriately related to experience and which as a whole satisfies certain further criteria, such as simplicity,

¹ Taken from Laurence Bonjour, *Epistemology: Classic Problems and Contemporary Responses* (New York: Rowman and Littlefield Publishers, Inc., 2002), p. 87.

² See “Two Dogmas of Empiricism”, in *Necessary Truth: A Book of Readings*, eds. Sumner and Woods (New York: Random House, 1969).

scope, explanatory adequacy, fecundity, and conservatism”.¹ Quine is a thoroughgoing coherentist and empiricist—as well as, incidentally, a behaviorist and a nominalist. It is hard to imagine a more *totally false* combination of views.

Over the years, a number of devastating criticisms have been made of the Quinean philosophy. I’m not going to rehash them all here. Instead, I’m going to make a few simple observations about analyticity.

The all-important “criterion” that Quine sought unsuccessfully is in fact something he didn’t even consider: namely, intuition. Or, rather, a combination of intuition and ‘verification in practice’. The question, remember, is how we know that ‘bachelor’ is synonymous with ‘unmarried adult male’. (For we *do* know this, despite Quine’s attempt to argue the contrary.) The answer is that our intuition, or ‘immediate understanding’, tells us so. Intuitively—immediately, non-discursively—everyone knows the two linguistic expressions have the same meaning. He experiences what Descartes would call a “clear and distinct perception” that the definition in question is true.² Of course, intuition in itself is not always reliable: someone can have an “intuition” that something is the case and yet be wrong. So, while intuition in *this* instance (involving the concept ‘bachelor’) is extremely compelling, almost as compelling as it is in the case of ‘ $2 + 3 = 5$ ’, it is not quite sufficient by itself to establish *conclusively* that ‘bachelor’ means ‘unmarried adult male’. However, when the second criterion is added, namely that this particular use of the word will be accepted universally by people in one’s linguistic community, we are justified in saying we have established the analyticity of “A bachelor is an unmarried adult male”. Everyone would agree that (his intuition establishes that) no experience could undermine or refute the proposed definition of ‘bachelor’, for the obvious reason that the proposition in question is not about experience or the world but about *meanings*. To say that the difference between the analytic statement above and “There are brick houses on Elm Street” is merely one of *degree* is preposterous. The latter statement says nothing whatever about word-meanings; the former is *wholly* about meanings.

What analytic philosophers like Quine often seem to forget is that ordinary language is not an exact science. It is misguided to seek a *precise criterion* by which one class of propositions can be distinguished from another—as it is misguided to think that analyticity is senseless absent such a criterion. No doubt the idea of “cognitive synonymy”, which is implicit in analyticity, is elusive, perhaps necessarily so. But this fact itself is not as mysterious as philosophers have thought, nor does it invalidate the concept. The reason for the elusiveness of all such concepts—e.g., synonymy, meaning, definition, analyticity—is that linguistic meaning is a phenomenon of consciousness, and consciousness itself is remarkably elusive and difficult to analyze. What we intuitively want in an explanation of synonymy is an account of some sort of *underlying fact*, some quasi-mathematical equation that both *proves* the identity of ‘bachelor’ and ‘unmarried adult male’ and explains precisely in what sense they are “identical”;—an underlying “fact of the matter” which a particular person’s understanding more or less approximates. We want to *see* the identity laid out before us, as we can literally see that $2 + 3 = 5$, namely by making two marks and then three marks and then adding them together. In the mathematical case, though, the identity depends only on the cognitive faculty of *synthesis*, of synthesizing *abstract forms*; not so in the case of linguistic meaning. Thus, what the mathematical equation states is really:³

$$\begin{array}{ccccccc} (1 + 1) + [(1 + 1) + 1] & = & [\{ [(1 + 1) + 1] + 1 \} + 1] \\ 2 + 3 & = & 5 \end{array}$$

¹ Laurence Bonjour, “In Defense of the a Priori”, in *Contemporary Debates in Epistemology*, eds. Steup and Sosa (Malden, MA: Blackwell Publishing, 2005), p. 105.

² This Cartesian criterion for knowledge has been much maligned over the centuries, many philosophers arguing that intuition is too vague and subjective to do the epistemological work that Descartes wanted it to do. Nevertheless, no one can plausibly deny that when he assents to the common definition of ‘bachelor’, he does so just because he ‘sees’, non-discursively, that it is true. Whether his intuition justifies *absolute certainty* is another question; my point is that it is generally the criterion we use in judging whether two expressions are synonymous. Moreover, it does seem to be overwhelmingly reliable, especially in simple cases like the one I’m considering.

³ See *Epistemology: Classic Problems and Contemporary Responses*, p. 90.

The parentheses, the brackets and the plus signs signify the mental act of synthesis (of “pure synthesis”, in Kantian language), which is essentially all that the equation involves. It is but a mobilizing of the synthetic faculty in its purity, unadulterated with any empirical content.¹ An analytic proposition, on the other hand, involves “meanings”. It is tempting to ask the old question “What are meanings?”, but this question is itself, in a sense, symptomatic of the misunderstanding of language that led Quine to seek an “underlying fact” about (any given case of) analyticity/synonymy, a “criterion”, a sort of mathematical certainty. Intuitively we think of—or *want* to think of—meanings and concepts as something like “entities”, “abstract objects”, things to which words “correspond” somehow, a correspondence that would allow us to find a deeper fact of the matter—to get “below” linguistic expressions to their *essence*, and then compare these essences to see if they are “identical” (thus confirming the analyticity of the proposition in question). And then when we discover, inevitably, that there is no such criterion, no such essence or literal abstract object, we are tempted to conclude, with Quine, that words do not have meanings at all. But this too is wrong. Both platonism and nominalism are wrong. Words do have meanings—‘bachelor’ *means* ‘unmarried adult male’—but the latter are not what our philosophical intuition wants them to be. There is no deeper explanation of the synonymy-relation that holds between ‘bachelor’ and ‘unmarried adult male’; the “fact of the matter” is simply that we use those two linguistic expressions in the same way and intuitively they strike us as meaning the same thing, and that’s all that can be said. That is why Quine could not find a criterion for analyticity: there simply is nothing “over and above” (or “underneath”) our concrete uses of words, which are context-dependent, intuition-dependent and inexact.

Indeed, the concept of ‘bachelor’ is unusual in its clarity: most words, like ‘intelligent’, ‘interesting’, ‘house’, ‘chair’, ‘plant’, ‘bad’, etc. cannot be defined by invoking a clear set of conditions that apply in all contexts. There is an element of vagueness to most words. Again, though, this does not mean it is wrong or meaningless to say that a particular sentence does a good job of articulating the meaning of, say, ‘chair’. The criteria for its doing so are, as in the case of ‘bachelor’, the intuition of the native English-speaker and/or the agreement of most (or all) other English-speakers. (If ever these two criteria should ‘conflict’, so to speak, surely the second has priority over the first. After all, in saying that two expressions mean the same thing, one is basically saying that the linguistic community uses them in the same way.) Above all, we should resist the temptation to seek a precise “standard” we can use in defining words—or in deciding whether, e.g., this object here should “really” be called a chair even though intuition hesitates, as if there is a deeper, underlying fact about what the term ‘chair’ denotes. We do not need a precise standard or criterion like that in order to make sense of analyticity and synonymy: to say that two expressions are synonymous is just to say that, generally speaking, they are used similarly in similar contexts, not that they literally share some sort of common essence or abstract object.

It is different in the case of arithmetic, which consists of synthetic a priori propositions that posit literal identity-relations. One side of an equation is literally identical with the other—but not in the same way as in a tautology, viz. a wholly uninformative equation of a thing with itself. But then how is ‘ $2 + 3$ ’ identical with ‘5’? Well, evidently insofar as combining 2 and 3 is a way of arriving at 5. In this equation, 2 (like 3) is conceived as a single concept, an “abstract object” identical with itself; yet it is also a synthesis of two units. 3 is a synthesis of three units. So when you add these two concepts together, or ‘synthesize’ them (so to speak), you get five units, which is to say you get a new concept, a new unity/synthesis, the number 5. 5 represents a unity in a plurality; it *is* such a unity, but it is also a plurality. It is different from the other side of the equation ($2 + 3$) insofar as it is one concept, while $2 + 3$ involves two concepts (plus the ‘concept’, or rather the *operation*, of synthesis); 5 does not exist (in this case) until 2 and 3 have been combined in intuition, which means that they are, in a sense, prior to it. On the other hand, it is *identical* to the other side of the equation insofar as the synthesis of 2 and 3 (which is what $2 + 3$ denotes) is, in fact, 5.

In short, “ $2 + 3 = 5$ ” is not tautologous, at least not in the vacuous way that “An unmarried man is unmarried” is, but it is nonetheless a literal identity. Nor is it a mere definition, i.e., a phenomenon of

¹ I’ll discuss synthesis below.

analyticity,¹ and thus of meaning and convention; rather, it involves a sort of *cognitive violence*, a pushing-together of two concepts and ending up, of necessity, with one. There is no such “cognitive violence” in any definition, nor the element of absolute a priori necessity that characterizes “ $2 + 3 = 5$ ”. There is merely a making-explicit of what is already and unproblematically (‘conventionally’) implicit in the definiendum—i.e., of the conditions under which the definiendum can be properly used.² The arithmetical proposition, then, in being neither strictly tautologous nor analytic, yet, like these two types of proposition, expressing an a priori identity-relation, has to be synthetic and a priori.³ It cannot conceivably be revised through experience—it is *necessary*⁴—and so it is a priori, or ‘prior to experience’; but it presupposes the cognitive faculty of synthesis—it is in fact nothing but this faculty exercising itself in abstraction from empirical conditions—which means it is “synthetic”, i.e., is not a strictly logical or tautologous truth.⁵

The view expressed here, incidentally, is the best explanation of a phenomenon that has puzzled empiricist philosophers to no end. “Why?” they have asked themselves, “is it so hard for young children to learn arithmetic? It takes them *years* to master this most simple of all mathematical subjects!” If empiricists were right that arithmetic deals only with definitions or conventions or tautologies or generalizations from experience or anything like that, the phenomenon in question would indeed be inexplicable. It would be a mystery why children are able to master the enormously complicated apparatus of language by the age of four or five, even as they cannot master arithmetic (this subject that supposedly deals with mere tautologies or definitions!) for several more years. The solution, of course, is that arithmetic is not quite as simple as empiricists think. It cannot be fully learned until the cognitive faculty of intuitive spatiotemporal synthesis has reached a certain level of maturity, a level that is not reached until around age 8 or 9, or even later.⁶ Arithmetic involves, as it were, a cognitive smashing (or ‘mashing’) of number-concepts together to yield new ones (as well as the reverse of this process, namely the breaking-up of quantitative concepts into ‘smaller’ ones), a process that does not make logical sense and cannot be adequately analyzed through formal logic—as shown, perhaps, by the failure of logicism, Frege and Russell’s attempt to reduce mathematics to logic. The child understands, or internalizes, logic at an early age (since he understands language and can, to some degree, draw conclusions through valid arguments) but not arithmetic, evidently because two distinct modes of cognition are involved. With arithmetic he has first to grasp the concept of *numerical identity*—between, say, two (or three, or four...) groups of dissimilar objects, such as pencils, apples, flowers, and everything else—which is a highly abstract concept and presupposes extremely

¹ Philosophers might take exception to the implication that a tautology is not an analytic statement, but it seems to me that their thinking has been confused on this subject. I’ll briefly discuss it below.

² Formal logical definitions are quite different from definitions in natural language. They are not analytic, properly speaking—i.e., they do not involve *linguistic meanings*, or *linguistic convention*, or synonymy-relations between expressions that denote concepts with real *content*—but are instead tautologies.

³ Below I’ll argue that logical laws are also, in a sense, “synthetic a priori”, but that they are so in a different way than mathematical propositions are.

⁴ The necessity of analytic statements, by contrast, is, as I said earlier, not unconditional. While “intuition” may force one to assent to a particular definition of bachelor, there remains the tiny, barely conceivable possibility that one’s assent is mistaken (i.e., does not adequately reflect the community’s use of the word). But even this small possibility does not exist when one assents to “ $2 + 3 = 5$ ” after having carefully considered what the sentence expresses.

Incidentally, I am aware that Saul Kripke has argued that not all necessary statements are a priori—that some are a posteriori, for example “Water is H_2O ”. But actually, the a posteriori character of these exceptions is deceptive: the reason for their necessity is that they are disguised *tautologies*—tautologies whose truth has been discovered through experience. In other words, the reason that “Water is H_2O ” is necessarily true is that science has shown that the proper definition of water is H_2O , and so what the statement says is really “ H_2O is H_2O ”, which is a tautology. So, strictly speaking, the necessity of even these Kripkean “exceptions” is a priori (since the necessity of a tautology is a priori).

⁵ [Here’s a point I *really* should have made in the paper: the fact that the word ‘synthetic’ has two meanings is confusing. It can mean the brain/mind’s *synthesizing*, so to speak, of cognition, such as mathematical truths, but it also denotes, in the philosophical literature, statements that are true by virtue of facts about the world. In other words, empirical statements. Mathematics isn’t synthetic in this way, but it is synthetic in the other way.]

⁶ See Jean Piaget’s studies, for example *The Psychology of the Child*.

sophisticated cognitive equipment; then he has to learn to manipulate, in abstraction from empirical objects, these very abstract numerical concepts he has formed, each of which consists of a mysterious, intuitive unity-in-plurality (which unity and plurality are likewise totally abstract)—and, therefore, each of which is a pure intuitive synthesis, the “manipulation” of which consists in synthetically relating it to other such concepts in myriad ways, the results of which manipulations are, again, synthetic unities-in-pluralities (i.e., numbers). In short, the whole arithmetical process, from the original forming of number-concepts to the skillful manipulating of them, is saturated with constant cognitive syntheses, syntheses that finally become a priori in that they (1) are carried out with no reference to empirical objects and (2) are justified purely through intuition, through the intuitive *necessity* that characterizes them. The reason, then, for the inordinate length of the child’s arithmetic apprenticeship is that he is developing his synthetic faculty (in relation to *numbers*, that is), which is to say he is honing his ability to carry out mathematical operations on an a priori, intuitive basis.

However, while logical truths, and thus logical laws (such as *modus ponens*), apparently do not directly rely on quite the same cognitive faculty as mathematics—for logical truths are tautologies, whereas mathematical truths are not—it seems to me that even logical laws presuppose some sort of spatiotemporal synthesis, and are in fact merely ‘projections’ of such a synthesis carried out in the mind. The law, for example, that a thing is necessarily identical to itself grows out of the a priori structure that the mind imposes on experience—the structure according to which, e.g., the world is populated by objects that abide from moment to moment, remaining the same object despite the flux of appearances and their changeability. An empiricist philosopher might raise objections here, but in so doing he would be placing himself in opposition to modern cognitive science and developmental psychology. At any rate, the Kantian view I’m defending at least has the merit of being able to explain why logical laws strike everyone as self-evident: namely, because, like true arithmetical propositions, they are manifestations of synthetic a priori cognition, the cognition that structures experience for us. In assenting to the law of identity, or to the law of contradiction, I am basically “assenting” to the way I necessarily experience the world (given the structure of my mind).

I consider it misleading, therefore, to say that logical laws and logical truths are “analytic”, as philosophers tend to think. An analytic proposition is true by virtue of meanings, and thus convention. When I say a bachelor is an unmarried adult male, I am describing how English-speakers use the word ‘bachelor’. My assertion is about nothing but meanings; I am saying only that two linguistic expressions have the same meaning. If, on the other hand, I utter a tautology, such as “An unmarried adult male is unmarried”, I am, strictly speaking, saying nothing about meanings; instead, I am saying that a particular kind of thing is identical to itself. “A man who is unmarried is unmarried”: this statement is not about words, nor linguistic conventions; it says that a specific kind of thing is itself, that $A = A$, so to speak. It is a matter of logical form; therefore word-meanings have nothing to do with it—except, of course, in the truistic sense that the meanings of the words involved have to be understood in order for the proposition to be understood. In short, tautologies are true not because (like analytic statements) they correctly describe conventional linguistic use or articulate what is implicit in a concept, but because they are grounded in logical laws, such as the law of identity. With respect to logical laws, however, linguistic meaning is *totally irrelevant*. It does not even have the minimal level of relevance it has in the case of tautologies. In this regard, then, logical laws are similar to mathematical propositions—a fact that is itself suggestive. “What does it suggest?” asks the reader. It suggests the thesis I am arguing for, namely that logical laws are “synthetic a priori” (though in a slightly different way than arithmetic propositions are). Analytic statements, by contrast, are a priori but are not “synthetic”, which is effectively to say that their truth is determined not by the nature of human cognition but by the nature of the linguistic conventions relevant to them.

In the end, I have to agree with Quine that the analytic/synthetic distinction is simplistic—not because there is no “difference in kind” between, say, “Running involves moving your legs” (a statement that would be called analytic) and “There are trees on Elm Street”, but because each class comprises propositions that may well be, in some respects, more heterogeneous with each other than they are

homogeneous. For example, it seems to me that a statement like “Running involves moving your legs” has, on one construal, more in common with tautologies than with “A bachelor is an unmarried adult male”, in that the latter is mainly a description of how two linguistic expressions are conventionally used, whereas the former states that in this activity of ‘traveling quickly by moving one’s legs rapidly’ one is moving one’s legs. In other words, the definition of bachelor describes the meaning of a word, while the statement about a person running describes a *state of affairs*, not a meaning. It says, essentially, that the activity of quickly moving involves movement, which is just to say that the activity is identical to itself. (‘Movement involves movement.’) On the other hand, the statement “Running involves moving your legs” can also be construed as *giving the (partial) meaning of a word*, namely the word ‘run’, rather than as describing an activity—in which case it has more in common with the definition of bachelor than with any tautology. So, actual linguistic practice is so complex and nuanced that any such dichotomy as “analytic vs. synthetic” is bound to be inadequate.

To give one more example: if someone says—perhaps to a person learning English—that a bachelor is an unmarried adult male, he is both giving an analysis of the concept ‘bachelor’ and saying that English-speakers use this linguistic expression in a certain way.¹ On the first interpretation, though, his utterance would commonly be called a priori, while on the second interpretation it would be called a posteriori (since its truth depends on a particular fact in the world, namely whether English-speakers do indeed use the word ‘bachelor’ in the way described). Thus, the utterance is both a priori and a posteriori—for, in saying that a word has a certain meaning, one is essentially saying that people use the word in this way² (which is an a posteriori statement). So even the a priori/a posteriori distinction is not quite as absolute as one would think.

Nevertheless, it is worth keeping, as is the analytic/synthetic distinction. But both should be recognized as what they are: not absolute, fixed dichotomies but merely useful philosophical tools, useful insofar as they help illuminate differences between propositions. Sometimes, adhering to them is counterproductive and can obscure understanding of the epistemological and linguistic facts (to which *context* is usually extremely important, more so than a simple overarching categorical dualism would seem to allow); but the fact that they highlight differences between types of cognition is a sufficient justification for retaining them. Some propositions and modes of cognition are unequivocally a priori (and synthetic); others are unequivocally a posteriori (and synthetic); still others can be interpreted as both a priori *and* a posteriori (as well as analytic *and* synthetic)—which suggests that, in these contexts, the distinctions should be ignored.

Quine was, therefore, wrong, though he made some interesting points.

*

I might have written more if it weren’t that I find this stuff boring. Exhausting to think about—confusing—and not very rewarding. Already I’m noticing flaws in what I wrote, even apart from the obvious oversimplifications.

May 11

Reading *D’Alembert’s Dream* (by Diderot). It isn’t nearly as brilliant and entertaining as *Rameau’s Nephew*, consisting of outdated philosophical and scientific speculations that occasionally seem very silly.

Went to a New Orleans reunion party (barbecue) last night at Lisa’s farm. Good turnout—many people, all of them delightful to be around (at least in that situation). Truly the most fun I’ve ever had at a party. Mostly because I played an unusually active role in it, talking a lot, being-laughed-at in the good way, even at one point debating Marxism with Sarah (*she* brought it up, not I)—and later there was a sort

¹ Indeed, I argued earlier that to do the former is to do the latter.

² In other words, to say that a word has such-and-such a meaning *is* to say that it is used in such-and-such a way (i.e., under such-and-such conditions).

of surprise farewell-party for me, complete with a large cake they had written on, a t-shirt they had all written on for me, and some presents—they all sang that old “For he’s a jolly good fellow” song as I sat there laughing—it was quite overwhelming and for a second I thought I was in danger of letting drops of water escape from my sight-holes. Earlier I’d convinced a few guys to buy a thirty-pack with me (it was Christians, you know, so beer wouldn’t have been on the agenda otherwise); that livened things up. Great night, really a good memory.

Although it’s tempting to have contempt for nature for being meaningless, mechanistic, cruel, we have to remember that nature produced us—that we *are* nature. All the beauty and love we have introduced into the world belong to nature. *Human society is nature*. It is impossible to rise above nature, to cast judgment on it; there is *nothing but* nature. Someday, perhaps, mankind will realize this ancient insight and learn to live in it.

The perfect humanist would be the most natural man. [Double meaning.]

listen....

listen, listen to the bleeding lake of ancient regret;
listen to the lake running away into the dusk,
the swollen river overtopping every memory;
listen closely to the crying swelled-up dark flow
ceaselessly through heart-torn avenues, ancient kisses
time-submerged;
listen to the bleeding eyes of ancient smiles kissing

May 13

Anyone who thinks humans are innately good has not read the “comments” posted on YouTube. Reading *Sincerity and Authenticity*, which I only skimmed when writing the book. (All that stuff about “authenticity” I wrote was inspired by a cursory reading.)

Also rereading *Rameau’s Nephew*. Unquestionably the greatest “dialogue” I’ve ever read. Schiller, Goethe, Hegel, Marx and Freud were right about it.

Another song I’ve always liked: “Dreams”, by the Cranberries. Admittedly a guilty pleasure.

You should take care to know your friends. Know them like yourself—their strengths, their weaknesses, their likes and dislikes. That way you’ll know best not only how to entertain them but also, and more importantly, how to encourage them (without their knowing it) to become who they are. How to nudge them toward themselves, toward their ideal selves. For example, I know Ashley very well. I know what makes her happy, I know she has great inner resources—her life has been hard and seems to get harder by the day, but she is usually buoyant and optimistic—and I know she is a Christian with a not-too-bright mind. So today when I went to the bookstore to buy her a farewell present I gravitated to the section on religion. Someone less in tune with people than I but who, as a friend, had noble intentions might have considered giving her Dawkins’ book on religion or Christopher Hitchens’ recently published book, or rather something a little less inflammatory (out of curiosity I looked at a couple pages of each of these books today—but to a person who instinctively adopts History’s perspective they’re unreadable, *embarrassing* even), so as to guide her towards truth or whatnot. To open her mind, etc., thinking he was doing her a favor, and also because she had just given me C.S. Lewis’s book. Dawkins himself is probably such a “friend”—a dogmatic self-righteous unsympathetic one-track personality. (Hitchens isn’t even worth speaking of.) But I possess that rare quality—*none* is rarer, especially among intellectuals: to wit, *humanity*.

So I bought her something called *Ten Prayers God Always Says Yes To: Divine Answers to Life's Most Difficult Problems*, which appears to be well-written and perfectly suited to allay Ashley's anxiety concerning her Mexican illegal immigrant boyfriend who might get deported in the coming weeks because the authorities have rooted him out—among other doubts and problems she's having. I know it would be hopeless and even cruel to argue with her against Christianity; that route would not help her become who she ideally is. So I try to *shore up* her faith, since it's the source of her strength. Everyone needs some illusion or other.

May 17

Back home in RI.

Reading *Slaughterhouse-Five*.

Whatever purpose God may have served originally, he has become mainly a symptom of our awareness that things as vast as society and the universe exist. Because we know these things exist, our need for recognition cannot be satisfied by concrete interactions with people. We need more. We need a recognition more abstract, universal and permanent, to compensate for our abstract awareness of the universal and permanent cosmos. God will not wither away until society ceases to be atomized—a reification, that is, a static reification. Self-consciousness has to move beyond its present alien-ated, individualistic form. I'm inclined to think that the very concept of society has to wither away, or at least become inessential to common thinking, which can happen only if societal processes are transparent. Essence has to become appearance. Otherwise we'll continue to feel alien-ated from the world ("as it really is, in its essence").

Marx may not have been the "greatest" thinker of the last millennium, but he was the only one who basically got it right (notwithstanding a few obvious errors).

When Churchill, FDR, Eisenhower and their fellow bureaucrats (particularly Air Marshal Arthur Harris¹) decided to fire-bomb Dresden [and many other cities], they became apprentices in evil. Lesser versions of Hitler and Stalin. A hundred and thirty thousand people incinerated and a beautiful city destroyed. And then the fire-bombing of Tokyo. And Cologne. And Hamburg. (That happened before Dresden.) Totally unnecessary, gratuitous evil. Stalin and Churchill—and Harris, of course—were apparently the main advocates of the Dresden bombing. What a repugnant man Churchill must have been, an alcoholic close-minded reactionary megalomaniac. Practically a barbarian, an untamed incarnation of the forces of darkness that will someday destroy civilization. FDR, on the other hand, simply lacked a conscience. He was weak-minded and conscienceless. (He let himself be pressured into the Japanese internment camps, into the bombing of Dresden, etc.) Truman, too, by the way, had no conscience, as evidenced by his remark that *not once* in his life had he been bothered by his decision to bomb Hiroshima and Nagasaki. He *never questioned* it, not even for a moment. The reason is that he had no moral imagination. —Oscar Wilde was right that hate, or more generally the absence of love and compassion, is based on a lack of imagination.

Slaughterhouse-Five is quite good, though perhaps a little overrated. It's a true postmodern novel, with all the strengths and weaknesses that that label connotes. (Strengths: thought-provoking, faithfully portrays the culture's consciousness, avoids "florid and superficial" beauty, "tells it like it is" without

¹ One of the great villains of the 20th century. On the bombing of Dresden: "Dresden, the seventh largest city in Germany and not much smaller than Manchester, is also far the largest unbombed built-up the enemy has got. In the midst of winter with refugees pouring westwards and troops to be rested, roofs are at a premium. The intentions of the attack are to hit the enemy where he will feel it most, behind an already partially collapsed front, to prevent the use of the city in the way of further advance, and incidentally to show the Russians when they arrive what Bomber Command can do." The city had no military importance, was used only for refugees, POWs and hospitals.

romantic excess, etc.; weaknesses: lack of realism (in terms of life's *richness*), characters don't have much depth, not much plot, one-sided, etc.)

May 22

Writing more of the Book of Joe. But when I return to it day after day each day I get a small nauseated feeling when I look at it, can't bear to look at it because it seems full of 'mannerisms'. Dreadful, dreadful. A sort of constricted, claustrophobic feeling. Each day I literally postpone clicking on the desktop icon as long as possible; I manufacture distractions; finally I think "Okay, well, I guess I might as well get back to it....oh boy, here it is....oh my god that line is terrible I have to change it....well, you know what, maybe I'll go practice the piano and return to this later...."

I wish I could write like Whitman.

I sent another email to Chomsky, just for the hell of it—quoted the thing I wrote after watching his debate with Buckley, etc.—and he wrote back:

Very much appreciate your reaction. Naturally. What you couldn't know is that at the end of the program Buckley was purple with rage, walked off shouting that he'd get me on again right away and teach me a thing or two. I said politely that I'd be delighted, enraging him even more -- and of course never heard from him again. These people are mostly schoolyard bullies, not to be taken seriously.

I hope you're right about the way the wind is blowing. If not, the species has a grim future ahead.

Amazing guy. The most down-to-earth important thinker ever.

I read *The Theory of Democratic Elitism: A Critique*, by Peter Bachrach.

Character.— What is "strength of character"? Knowing who you are and acting in accordance with that knowledge. Never betraying your ideals—especially your self-ideals—and, even more fundamentally, having a clear sense of what those ideals are, what your sense of self is grounded in. What values you cherish. Not being constantly susceptible to self-doubt, nor living life as if committed to no deep abiding sense of self that illuminates, so to speak, all your acts—shines a light on them, *your* light, the light that lets you see yourself reflected in them. The "authentic" person has strength of character, for he has a sure sense of himself and his world.

This explains why both the disintegrated Rameauian consciousness and the (anti-)Heideggerian technologized, socialized, other-directed consciousness are called inauthentic. For, while they seem quite unlike each other, they have in common their flightiness, ungroundedness, their tenuous grasp of themselves—their lack of a self that integrates (or signifies an unconscious integration of) experience through the deployment of certain durable and intuitive principles, broad intuitive 'categories' that amount to an aggressive self-assertion of the individual's psyche. The authentic, integrated self—or some unconscious part of it—commits itself to certain values and self-interpretations, which it then imposes on experience, thus ordering its world. The inauthentic, disintegrated self lives in a disorderly world, unsure of what it values and who it is.

We should not, by the way, interpret all these terms moralistically. "Strength of character" is not necessarily a moral notion. So-called "bad" people can have strong characters in a sense. Conversely, in some manifestations the inauthentic character can almost be called admirable, if it has intellectual integrity and an uncompromising honesty. Rameau and the Underground Man are examples. Ultimately this alienated selfhood is but a stage, both in *society's* and in an *individual's* evolution; still, Hegel was right that it has value. In the self's final stage, which it reaches after transcending its disintegrated state, it does

not need a rigid and primitive ‘schema’ in order to cope with the world (and there are infinitely many such ‘schemata’: the Enlightenment’s, the Stalinist’s, the Nazi’s, etc., as well as the one adopted—unconsciously and intuitively—by any particular person on the street); it has the strength to be flexible, to be able to change its opinion of any given aspect of reality without thereby undergoing an identity-crisis. For it is strong enough not to depend on labels anymore. It is who it is and remains such through all external vicissitudes. (It’s likely, though, that this psychological state presupposes a continuing commitment to the same broad values and self-interpretations—because, after all, if values and self-interpretations change *too* much, or too suddenly, the self will experience a ‘rupture’ between its present and its past.)

May 24

Reading *Law and Economic Policy in America: The Evolution of the Sherman Antitrust Act*, by William Letwin. Also reading parts of Alexander DeConde’s massive *History of American Foreign Policy*. I want to steep myself in contemporary issues, I know not for what purpose. But my fling with philosophy has passed its honeymoon period, so I need something to take its place. Creative writing is one avenue I’m pursuing; empirical studies is another.

Every day I reflect on how unfortunate it is that God doesn’t exist, just because that means there is no one whose approval can satisfy my God-complex. All this self-perfecting is ultimately pointless: nothing of value is appreciated in this world.

June 3

Living in Boston. Near Harvard Square. Three roommates, two Harvard grad students and an older guy in charge of a vast student-run community service organization. I’m working for Save the Children. Street-canvassing, fundraising.

Sometimes I think I have Carl Jung’s curse: I can’t take anyone seriously. I am “the only living boy in New York”, the fusion of every character-type in history. How can such a person take others seriously? I judge the world through the prism of my millennia-distant descendants, and the drama that plays around me is sterile. I foresee its finale, I understand too well the characters’ motivations—and the whole unedifying plot revolves around petty misunderstandings! The more influence and/or fame a person has, the less I respect him. Only he who does nothing, who sits in a monastery muttering monosyllables, has my respect.

June 5

Ughh, this job. Ain’t easy. See for yourself:
 “Hello sir, I work with Save the Children. We’re the second biggest—”
 “Sorry, don’t have time.”
 “Excuse me miss, my name is Chris and I work with—”
 “I have to get home.”
 “Hello sir, can you spare a minute to save a child’s life?”
 “No.”
 “Hi! How are you? Do you have a minute to save a child?”
 “Umm, well, sorry....”
 “Hi! I work with Save the Children—”
 “Fuck off.”
 “Hi! I work for Save the Children. Have you heard of us?”

“No thanks.”
 “Excuse me sir, I work with Save the Children, and we’re trying to get people to sponsor a child in Africa—”
 “Not now.”
 “Hello ma’am!”
 “No.”
 “Excuse me miss—”
 “I’m on my lunch break.”
 “Hello—”
 “Nope.”
 “Excuse—”
 “No thanks.”
 “Ex—”
 “Nope.”
 “Hello sir! How are you? I work for Save the Children; we’re an international charity that helps children in poverty—”
 “It’s a good cause, but I don’t have time now.”
 Four hundred of those plus people who stop and listen to you but don’t donate. If you talk to five hundred people in a day, you’ll be lucky if you get contributions from three. I didn’t get any today. (The donations have to be at least \$28 per month.)

June 7

Not listening to music for three days and then listening to Bach first in the night is a revelation. Like the Fugue in G minor for the organ, called “Little”. Ecstasy.

Reading *Tristram Shandy* on the web. It reminds me of *Don Juan*, for obvious reasons.

June 11

This job can be quite fun if you’re in the right mood—talking to every stranger who passes by, happily unconcerned with his or her opinion of you, not fearing rejection in the least. It’s also a good way to get chicks’ phone numbers.

June 12

I quit the job. Wasn’t getting enough donations. And it’s annoying to canvass people from 12:30 to 7 and get only “NO”s even though you’re friendly and smiley and cute.

One of the roommates had a girl over last night—squealing, giggling and other girly noises. He had picked her up a week earlier in the street by telling her she had a “beautiful presence” and then walking home with her and kissing her even though she’d told him she had a new boyfriend and didn’t want him to hit on her, but she kissed back etc. and then later said she wouldn’t have dumped her new boyfriend for him if he hadn’t kissed her against her wishes. Plato was right to be grateful he was born a (hu)man rather than a woman.

The shallowness—that is, the conforming-instinct—of intellectuals is revealed in the disparity between their judgments of two thinkers of equal caliber, one of whom is famous while the other is not.

Nearly everyone respects authority more than talent—precisely because society’s criterion for talent is authority. But that is a poor criterion.

Reading *The Woman’s Bible*, by Elizabeth Cady Stanton. “This clarion call to action, assembled by Stanton and a committee of prominent feminists, consists of a book-by-book examination of the Bible, placing events in their historical context, interpreting passages as both allegory and fact, and comparing them with the myths of other cultures.”

Profound thoughts: “...[David] was ruled entirely by his passions. Reason had no sway over him. Fortunately, the development of self-respect and independence in woman, and a higher idea of individual conscience and judgment in religion and in government, have supplied the needed restraint for man. Men will be wise and virtuous just in proportion as women are self-reliant and able to meet them on the highest planes of thought and of action.

“No magnet is so powerful as that which draws men and women to each other. Hence they rise or fall together. This is one lesson which the Bible illustrates over and over—the degradation of woman degrades man also. ‘Her face pleaseth me,’ said Samson, who, although he could conquer lions, was like putty in the hands of women.”

A person cannot be his ideal self and free unless all people are their ideal selves and free. This fact is rooted in the nature of the desire for recognition. In the company of the degraded, one feels no qualms in degrading oneself. (Cf. Nietzsche’s statement to the effect that in the presence of the ugly (i.e., the spiritually stunted), one becomes ugly.) Man is impelled to spiritual heights, and to the heights of self-respect, through his desire to be respected by the other—by the *dignified* other (for an ‘undignified other’ is not an *other* in the fullest sense; he is merely something to scoff at, something to laugh at or to enslave).

The fate of the self is the fate of the community. I.e., the macro is in the micro. I.e., the community is the self writ large. Etc.

One of my roommates, named Chris, a Harvard divinity student, is obsessed with himself to the point of having almost no social self-consciousness. He is intelligent and knowledgeable about many things, and appears to have a phenomenal memory—he also claims to have a “high genius I.Q.,” such that “I could easily get into Mensa if I felt like applying”—but because of that one flaw in his personality he is as boring to talk to as Forrest Gump. It feels like I’m talking to a wall, albeit an intelligent wall. And an exceptionally pretentious wall. This guy does nothing but show off his knowledge at every chance he gets—boast and brag without really knowing he’s doing so. The impression is ultimately of a knowledgeable dimwit, who can do nothing but parrot other people’s ideas.

Oh you silly Harvard windbags. “Amusing and perfectly *un*-self-conscious charlatans.” (Noam Chomsky has said that Jacques Lacan, whom he met more than once, seemed to him an amusing and perfectly self-conscious charlatan. –Incidentally, the most striking thing about Lacan’s famous dictum that “the unconscious is structured like a language” is how meaningless it is. What does it mean to say that the unconscious is structured “*like*” a language? That doesn’t make sense! Or, at best, it can have many meanings. I have never encountered an explanation of that thought; writers simply parrot it uncritically.) Actually, I suppose most Harvard bums are more self-conscious than “Chris”.

Noam Chomsky: the single living intellectual I revere. Just because he is both brilliant and down-to-earth. Has no illusions.

I feel like I’ve attained some sort of nirvana, or anti-nirvana. I have no desires and no ambitions, no illusions, no attachments. I am not of this world.

June 16

I really ought to take advantage of Bartleby.com. Right now I'm reading Carl Van Doren's study of *The American Novel*, which "is meant to serve as a chapter in the history of the American imagination". It's quite interesting and informative. Perhaps has too much minute literary criticism.

I'm also reading Mill's autobiography. (Printed on *real paper!*—Dad's copy, since I'm spending the week with the family and Uncle John and Jesse at Martha's Vineyard.)

And Hegel's introduction to his lectures on the philosophy of history.

Our culture's disagreement with Hegel can be expressed in one sentence: its conception of the world, and of history, is not teleological.

I just played Chopin's scherzo in B-flat minor, which I haven't played in years. Strange to say, I still have most of it memorized. Lordy, that ending—those last two pages, with the climactic build-up, it's almost more than I can take. Crashing on the piano, pouring sweat, playing it over and over so I can enjoy the adrenaline-rush.... "Cannon buried in flowers" my ass! (That's how one of his contemporaries judged Chopin.) There ain't no flowers there. Only cannons.

June 19

Nothing left to say. And I've said *that* before too. Nothing left to say but "I love you" to some woman, and nothing to do but inhale life for the first time. To live with a woman, *for* a woman—with a family, for a family, for a daughter. Everything else is an ornament; only love matters. Immediate unreflective love.

I want to evaporate right now in the [Martha's] vineyard air under the yellow moon. And I'm tired of writing poetry in prose and tired of trying to communicate myself to an abstract entity, and I'm tired of having to humor myself and others and not just being able to live through feelings and be happy in them. And I'm tired of charming girls but not getting below the surface so I can lose myself in their softness and fairy-voice-ness.

June 21

Despite what I wrote about "the acquisitive attitude" in the section on historical consciousness in my book, my own attitude toward life is basically acquisitive. You know this. (Susan Sontag, too, remarked that she had a passion for "*accumulating*" experiences. Not just having them but accumulating them.) I hoard experiences and girlfriends and books (not literally, of course)—I constantly want to read a new book and get through it quickly so I can read another one—and I especially hoard my writings and take excessive care that they'll go on forever. This acquisitive passion in my case has something to do with time's fleetingness and my excessive self-consciousness.

J. S. Mill wrote in the olde English foppish style and was a singularly boring thinker compared to my three idols, Kant, Marx, and Nietzsche.

Reading *Guns, Germs, and Steel*, the famous contemporary book on world history.

June 22

love-
less I

lack a life
 outside the knife-
 sharp stabs;—picking scabs
 off crust-dry bloodless wounds
 to watch them bleed self-pity,
 self-pity dammed back long eons
 before this agonizing moment
 let flow the flood of bloody self-pity;
 and yet the agony is life's blood,
 my life-blood, without which I'd curl
 up, shrivel and char to coal-
 black insipid "real life"
 of talking, smiling,
 laughing without
 knowing why....
 —O, to
 love!

June 24

One of the great love songs of all time: "You don't know me", sung by Ray Charles (the live version). The voice, the man, is 90% of what makes it great. There's no one like him.

It's a soul-eruption, his singing that song. Reminds me of the scene in *It's a Wonderful Life* when Jimmy Stewart is in the bar crying his prayer to God alone amidst the noise and rowdiness. One cannot not cry listening to that song. O the torture of unreturned love! Luckily I have rarely experienced it.

June 27

Discovered a brilliant website called Going.com, full of events happening in Boston all the time and hundreds of people I can connect with. Going to a free private screening tonight of the new Don Cheadle movie, where hopefully I'll meet some of the people I've met online and then chill with them at the post-party afterwards. Also, got a phone number of a Taiwanese girl named Zor;—pretended to be lost, asked her for directions, we started talking, etc. I should do that more often.

July 1

Last night was eventful. I went to a "bar crawl" starting in the afternoon; didn't have much fun for a while. Then females started showing up, and things got better. To make a long story short, an Indian named Ranjana drove home with me at around 3 a.m. (that was a long drive, frustrating because we couldn't figure out where the hell we were) and we got naked and did all sorts of fun stuff. Spent the whole morning in each other's arms on my bed. Would have had sex but of course I couldn't find my condoms. But she certainly enjoyed herself sufficiently: there are infinitely many ways to please a woman with only one's mouth and hands. (I definitely "spoiled" her, as she said. "How do you find these spots, Chris?" she gasped. "Trial and error," I muttered.) She's intelligent too: we talked about deism, Buddhism, etc. I have nothing like a desire to date her, but hopefully we'll stay in touch.

[...]

It's funny how you can have a one-night stand (or something like it) and yet come away feeling only ordinary friendship-affection for your partner.

July 7

Last night I went to a karaoke bar, drank a good amount, sang Joel's "The Longest Time", met a Chinese girl named Monica—I'll call her soon—went home with Ranjana again (33 years old) and we did our usual stuff, very pleasant. [...]

Reading *The Myth of Sisyphus and Other Essays* (Camus). Impressive book. Tries to answer the question I was preoccupied with for a while, to wit: given Absurdity, how ought one to live? How can one affirm life while retaining intellectual integrity? Is it possible? The answer I gave was Yes.

N.B.: What I have meant by "absurdity" is not quite what Camus means by it. My idea is broader. He characterizes the absurd as revolving around the human mind's inability to fully understand the world, to rationally digest all its facets. The human mind demands that the world meet the expectations of reason, but it fails to do so; hence there is intellectual despair. Much of life is incomprehensible, for example time, death, the metaphysical (ontological) foundations of the world, the self's relationship with itself; humans have been thrown into this strange world and cannot wholly reconcile themselves to it. *My* conception of absurdity is a little broader, taking account not only of the *natural* world's strangeness (i.e., 'irrationality') but also of the *social* world's. Or the 'moral' world's. Life depends to a horrible degree on chance, and the way it is ordered has nothing to do with justice. People are irrational; their behavior is not what a thoughtful man would expect it to be, based on understanding and compassion.

Anyway, Camus's book, while thought-provoking, is little more than an exemplary product of its time. I've only just begun it, but I can already tell it doesn't belong in the first rank of philosophical works. Part of the reason is its lack of analytical precision. More important, though, and theoretically culpable, is its quasi-theological, ahistorical attitude toward modes of experience that arise largely from particular social conditions. Despite having been written long after Marx, it displays a complete ignorance of the Marxian viewpoint. In this respect it is inexcusably shallow—for, as Sartre said, "Marxism is the philosophy of our time" (and still is, despite people's unawareness of that). Camus approaches the alienated attitude as if it is necessarily the 'truest' attitude, without really arguing for that assumption. He just takes it for granted! It may be true that the world will never be fully understood, or that mankind will never wholly transcend Wonder and Incomprehension, but this inadequacy of reason doesn't 'naturally' or inevitably imply the estranged attitude, the self's insecurity or debilitating confusion or perception of not belonging in the world. These latter things are (at least implicitly) valuations, which as such do not logically (or 'organically') follow from any fact, as Camus seems to think they do. For by giving the relationship between "reasonable" man and "unreasonable" world the tendentious label of "absurd", he is sneaking in a value-judgment, which as such cannot be true (as the hypothesis of the-inadequacy-of-reason-to-understand-the-world *can*). In other words, his position is a confused fusion of a possible truth and a valuation (or set of valuations) that it is thought (incorrectly) to necessitate. The set of valuations grows out of the atomized, schizophrenic social conditions of the time, while the possible truth in question—i.e., the strictly *cognitive* element of Camus's position (as opposed to the evaluative element)—doesn't.

Consider this passage:

Men, too, secrete the inhuman. At certain moments of lucidity, the mechanical aspect of their gestures, their meaningless pantomime makes silly everything that surrounds them. A man is talking on the telephone behind a glass partition; you cannot hear him, but you see his incomprehensible dumb show: you wonder why he is alive. This discomfort in the face of man's own inhumanity, this incalculable tumble before the image of what we are, this "nausea", as a writer of today calls it, is also the absurd. Likewise the stranger who at certain seconds comes to meet us in a mirror, the familiar and yet alarming brother we encounter in our own photographs is also the absurd.

Note the word “lucidity”, and the phrase “before the image of what we are”. They show that Camus considers the alienated attitude—the alienated *valuations*—that he describes in this passage to be somehow the truest or best or most honest way of experiencing the world. But why should this be? He doesn’t say why. He just takes it for granted. The reason, of course, is that he was obsessed with this alienated feeling; he couldn’t stop thinking about it, and so it seemed to him to be obviously true. Also, admittedly the feeling does, by some psychological and/or biological mechanism, carry with it the sensation of lucidity, of clear understanding (as does despair: see Wilde’s *De Profundis*). I know that from personal experience. Nevertheless, I realize that this attitude is, after all, nothing but an attitude, i.e., a vague evaluative cast of mind coloring experience, having no more objective validity than a joyful attitude or a loving attitude.

(The way I dealt with the topic of the absurd in the half-completed chapter “On Life” was more profound than the way Camus dealt with it.)

Incidentally, the human ignorance/incomprehension he speaks of can be invoked precisely in order to cast doubt on the “nauseated” attitude he exalts. For, given our ignorance of the world as it is in itself, it’s possible that the whole “meaningless pantomime” is in fact meaningful—that there is some deep significance to everything we do, perhaps a religious significance (if you want to call it that). Who knows? There is no *a priori* reason why incomprehension (or knowledge of the vastness of the universe and time and death, etc., as against our own littleness) should justify nausea over, say, exhilaration.

The conviction that orients my worldview, and has always oriented it, is that nature is not incompetent. It could not have arranged things so that there is a fundamental, necessary disharmony between humanity and its cosmic environment. Whatever disharmony there is must come from the faulty arrangement of society, and hence must be temporary. (By “harmony” I don’t mean utopian bliss or perfection. Harmony is perfectly compatible with certain kinds of suffering.)

July 8

Camus’s mind wasn’t very logical. (That isn’t to say it was *illogical*.) It was lyrical and aphoristic, more ‘aesthetic’ than philosophical. His book isn’t easy to read, because it consists not of arguments but of personal, semi-poetic grappling with existential confusion and alienation.

Still, I get the feeling that my thoughts of yesterday missed the point, though I’m not sure exactly how. Maybe they did, but maybe they didn’t. The whole subject of the absurd is elusive.

Obviously in a sense there is some “disharmony” between man and nature; otherwise there would be no such thing as wonder or philosophy. But it’s the “nauseated”, the alienated, absurdity-obsessed disharmony I was referring to above.

July 11

Reading Charles Taylor’s *Ethics of Authenticity*. It’s not bad, but it’s nothing to get excited over. (It’s written in the bland harmless style of all contemporary philosophy and is full of bland harmless ideas.)

July 14

Went to my ESL orientation (I’ll be teaching teenagers and college-agers for a month or more). This job is going to require a lot of preparation every day. I might even have to sacrifice some of my self-absorption and pointless brooding—pour my energy into these classes.

Meanwhile I’m still actively destroying my liver every weekend, hoping that in the process I’ll meet someone worth meeting.

July 16

Went to a pub near the Haymarket area, met Niressa, Rima, Kevin, Paul, etc.; later Ranjana came. It would've been a failed night without her. Etc. etc. and then we got away at around 1:00 a.m., went to her apartment—she was a little annoying complaining non-stop about how Rima had been complaining earlier—but she settled down and then as we sat in her bedroom I broke down in tears: I had been getting sad as the night wore on (lonely, bored, tipsy, looking at all the couples forlornly) and felt a little suicidal, and frustrated as Ranjana kept complaining about petty shit, and anyway I couldn't hold it in and cried a while in her arms about my meaningless life and need for love and how long I'd been looking for a soulmate (about 14 years) without success, and so forth. She just listened and tried to comfort me, hugged me; it was nice. Later we cuddled in her small bed, fell asleep. More half-naked stuff in the morning, then she got up to “putter” around the house as I slept until noon. We spent the rest of the day together—lying in bed, eating at a great Mexican restaurant, driving around Waltham (where she lives), listening to her possibly favorite band the White Stripes, chilling in her living room drinking beer. She's very fond of me and I enjoy her company, her wittiness and easygoingness. [...]

I'm very very glad I met Ranjana. She's a good friend. She's going away soon for a couple weeks to see her family, says she's going to miss me terribly etc. and I'll miss her too, maybe not quite as much but enough.

Friendship is so important for mental health.

July 17

First day of teaching. Went well.

Yesterday I saw an interview downtown with the singer Mandy Moore, and she sang two songs afterwards. Very intelligent and mature for her age. But it's totally ridiculous, the crowds and television crews and the shameless TV-deceptions that her handlers engage in for the sake of corporate profits.

July 20

Coworker Hanife (Turkish, lives in Denmark)—talented professional artist, modelesquely beautiful, friendly and bright, probably will soon be the object of my crushish love. When she walks into the room my day brightens a little. A couple nights ago Ranjana and I made dinner at Ranjana's apartment, talked intimately about her dysfunctional family (because of the suicidal older brother) and also discussed the merits and faults of Oprah (I criticizing her, Ranjana defending her). Then [erotic fun].

By the way, another of my roommates is an utter douchebag. A fairly “nice” guy, but a buffoon. I told you about Chris; this other guy (black, good-looking, 30-something) is called Michael. Maybe I'll describe him for you sometime, but suffice it to say now that he has managed to combine in his personality most of the flaws of the female sex and few of its strengths (he's vain, gossipy, fashion-attuned, shallow, pop-culture-loving, lacking in self-insight—while, on the other hand, he is neither beautiful nor very ‘understanding’ of his (girl)friends)—and he constantly picks up women off the street and manipulates them into sleeping with him (or so he tells me in story after story)—and he's the most boring partially intelligent person I've ever known. (He's an entrepreneur and a grad student at Harvard.) His latest buffoonery has revolved around a puerile semi-autobiographical novel he's writing (a comedy) about a black effeminate cross-dressing bumbling detective who has various sexual escapades (modeled on Michael's) and accidentally picks up clues about his cases while on these adventures with hot women he meets in the street. Michael is kind enough to regale me with every delicious detail whenever he sees me—

because I'm kind enough to lend him half an ear. Once he even came over to my room giggling and bubbling with excitement at the thought of the hilarious passage he had just written, which he promptly read to me off his computer (after I had wearily followed him back to his room) while dissolving in fits of giggles that were accompanied by my strained feigned grins of appreciation (which were accompanied by my stupefaction that someone could think that what I had just heard was remotely funny). Why, oh why, is the world the way it is???

July 22

Met someone named Kelley at an Italian festival in Central Square. Then went to a club. What a total waste of time and money. But tonight I met a girl named Gina, from Thailand. Probably 28 or 29. Delightful, funny, goofy, talkative, easy to talk to. We sat in a park and talked for several hours. I'm looking forward to seeing her again.

July 28

I have about one chapter left to write in my satire. Can't wait to be finished. Upon rereading it I'm not terribly impressed—it's too short, first of all—but it's better than most stuff out there and it's quite original, and I guess that's good enough for me.

Reading La Rochefoucauld's *Maxims*.

If mankind understood itself and its motives, life would be unbearable. And social life would be impossible. For uncertainty is what allows us to think well of people, and of ourselves.

Sometimes one professes a belief just because others do not. It is as if one is trying single-handedly to remedy the one-sidedness of popular prejudices—by falsely admitting to opposite prejudices.

Reading Giacomo Leopardi's *Thoughts*.

[...] But tonight we [Gina and I] kissed. Good! It was lovely. She drove me home from the movie after we'd walked in the park at midnight under the full moon and as I was about to step out of the car I said, "In America this is the time when I'd kiss you, but don't worry, I won't do that" [I had tried earlier]—but she seemed interested, so I leaned towards her a little and she didn't back away, so I leaned in more and we kissed awhile. I'm a big fan of kissing, with the stroking the hair and the face. Afterwards she gave me that seductive feminine look with her head cocked to one side and her hair falling in her face and a secret tender smile, which I loved.

July 29

I enjoy Leopardi's book. (And La Rochefoucauld's, of course.) Love the cynicism and pessimism, partly because it's entirely justified and partly because of the evident pain and bitterness behind it. It's very human. Leopardi was a high-minded man who was disillusioned by people because people are contemptible, and he poured his hurt into this book—without making it overly personal, though.

"...Whoever wishes to rise, even by genuine merit, must banish modesty. In this respect the world is like women, for we get nothing from it by modesty and reserve."

Gina has called me a couple of times since last night, despite her dislike of phone-talking. Always giggling, laughing at everything I say no matter how unfunny it is.

August 2

I think I could fall in love, at least in a *kind* of love, with several girls at the same time. Talking to Gina on the phone, with her adorable voice and adorable idiosyncrasies combined with her adorable sense of humor, puts me in a very altered state of mind. I have to kiss her, embrace her and envelop all that adorableness in my arms, make it a part of me, so to speak. Maybe it's a kind of lust. A spiritual lust. I want her to be wrapped around me as we hug for hours. It both is and is not mere "infatuation". It's less than and more than infatuation. But then when I'm with other girls, like Hanife or my new student Mariela (in her twenties), I experience a similar, but different, form of attraction. They're so beautiful and spirited that I feel as if I could love them too. And Sarah, ol' Sarah—I could have this half-love, or transient whole love, for her too—and for a million other women. Think of Camus's thoughts on Don Juan. "It is not through lack of love that Don Juan goes from woman to woman. It is ridiculous to represent him as a mystic in quest of total love. But it is indeed because he loves them with the same passion and each time with his whole self that he must repeat his gift and his profound quest. Whence each woman hopes to give him what no one has ever given him. Each time they are utterly wrong and merely manage to make him feel the need of that repetition. 'At last,' exclaims one of them, 'I have given you love.' Can we be surprised that Don Juan laughs at this? 'At last? No,' he says, 'but once more.' Why should it be essential to love rarely in order to love much?" I have more than a little Don Juanism in my blood.

August 3

Spent last night with Gina. Various sexual activities. Her body is beautiful, a work of art. [...]

Of course, I would have felt the same way with any number of girls. So in a way passion, even love, is a delusion, since it treats the beloved as somehow unique, as if this person is the only one you could love. There's no such thing as soulmateness.

The more women you hook up with, the easier life gets. The better you feel about yourself.

I'm reading *The Selfish Gene*, by Dawkins. Among its irritating features is its worship of Darwin, the thinker who got lucky. (People forget Alfred Russel Wallace, who came up with basically the same idea at the same time.) The essence of Darwinism is in this quotation from *The Origin of Species*: "As many more individuals of each species are born than can possibly survive; and as, consequently, there is a frequently recurring struggle for existence, it follows that any being, if it vary however slightly in any manner profitable to itself, under the complex and sometimes varying conditions of life, will have a better chance of surviving, and thus be *naturally selected*. From the strong principle of inheritance, any selected variety will tend to propagate its new and modified form." In other words, an animal that has traits more conducive to its survival than an animal that doesn't will tend to survive better than that other animal, and will thereby pass down its favorable traits through the generations. —Boy, that's brilliant, all right. Epoch-making. Its undeniable theoretical importance—its status as the foundation of the biological sciences—is directly related to its near-emptiness (because in order for a theory to be relevant to so many scientific fields, which display such a wide variety of content, it would have to be nearly empty).

In one of his endnotes, Dawkins reminds the reader that the story of Mary's virgin birth actually rests on nothing more "divine" than a mistranslation in the Septuagint (the pre-Christian Greek translation of the Bible): in Isaiah, the Hebrew word for 'young woman' was mistranslated into the Greek word for 'virgin'. Since the mistranslated sentence in Isaiah was a prophecy ("Behold, a virgin shall conceive..."), and the authors of the Gospels were constantly on the lookout for ways to show that Jesus was the fulfillment of prophecies in the Old Testament, these authors wrote that Mary was a virgin, namely the virgin mentioned in Isaiah (in the mistranslated prophecy). The result of this farce is that billions of people

now worship an ordinary impoverished woman who died two thousand years ago, and who was deceitfully said to have been a virgin mother by a few writers a century or two after her death.

—The reason why *homo sapiens* is the species with the least dignity of any is that it has the potential to have the *most* dignity but chooses not to. Instead it allows its destiny to be determined by mistranslations and crude deceptions, and by provincial little fanatics like St. Paul.

August 5

Saw Gina last night. She suggested we take a walk to the Charles River. And then we came back to my place, listened to Chopin and looked into each other's eyes for a while. It was a lovely night, I enjoyed it. Like other girls I've been intimate with, she insists I'm "unique." Has never dated anyone like me. That's partly because, in between all our playful flirtation and silliness, I talk about pseudo-profound subjects with her like "the meaning of life"; and it's partly because I'm "gentler" than most men and more "emotional" and like classical music. In any event, I like spending time with her. She's a good person.

Chopin's concerto in E minor, second movement. ...I have only fifty or sixty more years to go... I can probably make it.

The overall argument of Dawkins' book is fairly persuasive. It's interesting, too. It gives the reader a new perspective on life, even though, in a sense, the book doesn't have much that is particularly original. It simply draws attention to certain underappreciated consequences of the biology we already understand. (At least, that's my impression after reading a few chapters.)

August 7

Spent the night at Ranjana's place. Didn't do much. Not attracted to her and I wasn't in a good mood anyway.

I finally bought E. L. Mayer's book *Extraordinary Knowing: Science, Skepticism, and the Inexplicable Powers of the Human Mind*. I'm very excited. Can't wait to devour it.

I have great respect for Mayer. My respect comes infinitesimally close to admiration. (I don't truly *admire* anyone. Admiration seems misguided, confused. In fact, the concept is near-empty.)

Gina called at 8:30 to say she wants to come over and spend the night. That was unexpected, to say the least.

I don't think it's an exaggeration to say that I've lost whatever doubts I once had about ESP. It's definitely real, it definitely exists. I'm a little surprised I feel no resistance to believing in ESP—but that's probably because my new belief is on a purely intellectual level and has no direct relation to my daily life. (Also, my mind has always been unusually open to revising its convictions. I don't know why. That openness is simply the primordial 'structure' of my mind.) The task now is to understand what it is I believe in. And to fully absorb it. To let it alter the way I approach the world.

August 10

This ESP stuff may be the only part of the 'truth-seeking' enterprise that really interests me now. I'm too jaded and bored to actively pursue truth in any other area. In fact, I'm sure I'll soon get tired of learning about the paranormal too. —The low demand for my writings has led to a low supply of them.

I've lost a tiny bit of my respect for Mayer. Her book is enthralling for the facts it documents but it's repetitive, prolix, not very rich or original in its speculations, and too eager to avoid upsetting people. People are closed-minded and deserve to be upset.

Anyway, I finished the book. Now I'm reading Martin Buber's *I and Thou*. Also Crane Brinton's *The Shaping of the Modern Mind*, a history of ideas.

August 14, 15, 17, 18

Buber's book is—mystical mumbo-jumbo. Gorgeous writing and deep ideas, like in the Vedas, but way too vague.

[...]

Speaking of Gina, I spent last night at her place. Full nakedness, all joys are due to thee! [...] She's dated many guys but has had sex with only six. (I'm the sixth.) "Why did I have sex with you?" she asked herself pensively. "Do you regret it?" I asked. "No, I'm just curious... Aha! I know why. It's because I'm so comfortable with you. I can be totally myself, I don't have to wear a mask. And also, you're interesting."

Went to lunch with Liz, a delightful soon-to-be teacher at urban schools in Boston who is attractively feminine with a soft voice and the ability to listen and laugh well. I'm going to ask her out again.

Went to the Harvard bookstore, browsed for hours, looked at philosophy, psychology, fiction, biology, wondered if I should study biology so I could get a prestigious job looking at DNA or whatnot, wondered what on earth I could do with my life that would satisfy my intellectual ambitions without making me feel like an irrelevant academic—all these books, thousands of them, they don't matter at all except to entertain semi-intellectual types who have too much leisure time; and yet I really do want to 'sum up' human thought, that's my true vocation in life—and I thought of the spiritual horrors of modernity, the impossibility of having an impact on anything anymore and the pointlessness of having an impact anyway. And so in the end I didn't buy a single book. Everything seemed futile. But I have to devote myself to something! I'm a volcano that's been plugged up. Maybe I'll try to write short stories, see if I get anywhere. Stories full of rage, stories that call for revolution.

I still think that the historical approach is the best way of understanding society. Start from the beginning, research social evolution, observe how economic categories (like money, price, interest, credit) emerged and what sorts of social/ideological conditions emerged with them, proceeding all through history up to the present day. This is the best way to understand how the modern world works and why it is the way it is (i.e., what are the factors conditioning it and how do they interact). What I'd most like to do, more than anything, is spend the majority of my life explaining humanity and society.

August 20, 23, 24

Bought *The Interpretation of Dreams*. Decided to apply to programs in biology.

Who would've thought?—The female sex has proven that it's possible to be complicated and boring at the same time.

Today was the last day for a Taiwanese student of mine, a university student named Yu-hwa. After taking my picture and so on (departing students often do that), she gave me a postcard on the back of which she'd written "Dear Chris, I'm so glad to be in your class. There is always fun and happiness in the class. Thank you very much. Welcome to Taiwan. I'll treat to you. Nice to meet you. I hope that I can meet you some day." That's always satisfying, getting a personal message like that. What a thoughtful girl!

Copying my Book of Joe here. [But first I'll copy a short description of it that I wrote years later, when I posted it online:

I think it would be wise to write a short preface to the following little piece I wrote back in 2005 or so. This literary experiment, basically a satire, is so odd that it's clear to me most readers won't know what to make of it unless it's at least partly explained.

***The Book of Joe**, the title of what follows, has to be read in the light of the Bible's book of Job. I still remember the day in the summer of 2003 when I conceived it while sitting in a cabin in a summer camp where I was a counselor. For some reason I was suddenly struck by the satirical possibilities of the book of Job, if it were transplanted in time and space—to modern-day America. A powerful satire of the modern world could be written in the form and style of Job, if the entire spirit of the work were reversed. The initial flash of inspiration came, I think, when I realized that Job expresses the **exact opposite** spirit of capitalist modernity: where Job was naïve, un-self-conscious, righteous, self-certain, wholeheartedly pious, the modern world is cynical, self-conscious, self-doubting, secular, money-grubbing. I was fascinated by the contrast between the culture of Job and the culture of the present.*

*Soon the satire took shape in my mind. All the characters had to be opposites of the original ones. The noble Job had to become Joe, a debased, miserly capitalist, who is the truest representative of our age and its ideals (just as Job was of his own age). The God who treated poor Job so badly, and who in the end spoke to him "out of the whirlwind," had to be not Yahweh, the personification of majesty and power, but Mammon, the god of our own world, the personification of the vulgar spirit of financial gain and market transactions. God's antagonist/interlocutor had to be not Satan (as in the Bible) but Justitia, the goddess of justice, who in **our** world is indeed seen—at least by the dominating institutions, namely corporations and the state (i.e., the spirit of Mammon)—as the Devil, the great antagonist of capitalism. And the characters whom Joe would talk to throughout the work (as Job did in the original) would be representative types of capitalist society, including Jim the Politician, Bob the Academic, Jon the Preacher, Dan the Lawyer, Abd the Terrorist, Jen the shallow young girl, Rob her besotted young lover, Dud the video-gamer, Meg the Activist, and Rod the Soldier. Joe's encounters with these people would give me opportunities to satirize all these types. (Even their dull names indicate their mediocrity, and highlight the contrast between the epic, mysterious culture of the early Bible and the mundane, monotonous, predictable culture of the capitalist present.)*

I decided the satire would proceed as follows. Justitia, who wants to punish Joe for his many moral and legal crimes but finds that the justice system (being run by capitalists) won't get the job done, contrives to trick Mammon, who loves Joe as the perfect embodiment of greed, into letting her take away all his possessions and accomplishments. She makes a bet with Mammon that Joe will "curse him to his face" when this happens, whereas Mammon is convinced he won't, that even when he is deprived of everything Joe will continue to worship money. This, of course, mirrors the bet between God and Satan in the Bible—except that in my version it turns out differently at the end. While Job never really cursed God, as Satan said he would, in the end Joe does, finally, curse Mammon, having learned through all his experiences that greed, money, and the urge for power are indeed evil. He thus redeems himself and vindicates humanity against its basest impulses. —But I'm getting ahead of myself.

*After the calamities befall Joe, his three friends (Jim, Bob, and Jon) come to comfort him. They're parodies of themselves: Jim is a lying, flattering, faux-righteous, nationalistic politician who will help Joe only if he'll get some money and power out of it; Bob is a characteristically superficial, **language**-obsessed, caviling intellectual who misses the point; Jim is a stupid, fanatical, sinning, money-hungry priest/minister/whatever. None of them is of help to someone in need. When Joe talks, however, we already begin to see one of the main, **non**-satirical themes of the piece, namely that **suffering can ennoble**. Through suffering we can achieve greater insight, can grow as individuals and become wiser. Compared to his shallow interlocutors, Joe starts to seem deeper and more profound, because of his suffering. As the story continues, Joe slowly rises to greater heights of wisdom as everyone he interacts with remains one-dimensional and idiotic.*

Thus, one of the purposes of the work is to answer Job's original question—Why do good people suffer?—by illustrating the **value** of suffering (at least **some** suffering, not all). This theme is inspired, in part, by Nietzsche, who insisted on the importance of suffering—as have many other poets, artists, and philosophers.

At this point a Muslim suicide-bomber, recognizing the powerful capitalist Joe, comes over to kill him and his friends. He succeeds only in killing himself, though. Attracted by the bomb's explosion, Dan the lawyer approaches and offers his services in case they're needed, speaking in hideous legalese. After a silly but characteristic conversation between Dan and Joe's three "friends," Joe gives a long, despairing speech that articulates the "All is vanity!" viewpoint of Ecclesiastes. That is to say, Joe's consciousness has by now risen to the level of existentialism—which is on a relatively high plane, but is still far from true wisdom.

Next we see Joe's moronic daughter Jen, who selfishly wants him to give her money despite his obvious poverty; and then comes her boyfriend, who is blinded by his love for her. He symbolizes the Poet, the idealist, the lover lost in dreams of romance and such—which is why he speaks mostly in iambic pentameter. Because of my fondness for this "type," I make him the most sympathetic character we've come across so far; nevertheless, he too is, in his own way, ridiculous. And yet he is important to Joe's further development, serving as the catalyst for Joe's decisive advance to an **affirmative** stance toward existence, which is on a higher plane than his previous **negative** stances. (Again, shades of Nietzsche.) Before that happens, though, we encounter Dud, whom I had to include in this satire because of his ubiquity in our society, and then Meg the activist, who denounces Joe—to a crowd that has congregated around the site—for his crimes and his greed. While I sympathize completely with left-wing activists, I can't help satirizing some of their excesses in the character of Meg. She whips the mob into a state of bloodthirsty rage, and they approach Joe menacingly.

It is at this point that we finally see a genuinely transformed Joe, who speaks to the crowd in a spirit of compassion, repentance, and love. I have to admit that this transformation gave me a lot of trouble. I couldn't figure out how to **motivate** his change from despair and negativity to love and positivity. Finally, as I said, I decided that the only way was to use Rob the poet/lover as the catalyst. The point is that Rob's pure, idealistic love for someone whom Joe well knows is very flawed, namely his daughter Jen, shames Joe out of his self-pity and his navel-gazing. Rob inspires him; and since his consciousness has already risen to a relatively universal (rather than particular and selfish) stance in its former existentialism, it is not impossible for Joe to make the leap to a universal love/compassion.

I don't know if this explanation really works. But it must be remembered that this satire is like the original on which it's based in being allegorical, not realistic. Much of the plot and dialogue is, of course, artificial and not character-driven; actually, if anything, the characters are more clearly defined and three-dimensional in the satire than in the book of Job. But it remains the case that at a couple of points, Joe's development is insufficiently motivated.

The philosophy that Joe espouses now is an ancient idealism, basically the philosophy of Buddhism and Taoism. It is, in a sense, a deeper wisdom than existentialism. But it's still not the pinnacle of wisdom or of social understanding; there is one final step Joe has to make: he has to **curse Mammon**, who is the cause of so much senseless suffering in the world. How does he reach this point? By the entrance of Rod the soldier. Rod denounces Joe's compassion-preaching, complaining that it's unpatriotic and un-American, declaring instead that **war** is glorious, nationalism and imperialism are glorious. After hearing Rod talk, Joe realizes his mistake: it's necessary to fight the **social causes** of such ignorance, the causes of misery and oppression, not merely take solace in an exalted idealism. **Struggle**, struggle against oppression and exploitation, is the highest form of love, the highest affirmation. In essence, he embraces and elaborates on the Marxian point of view, which is the peak of wisdom; and at last he explicitly curses the worship of money, thus completing his transition from capitalist to fully human being. Mammon has lost the bet; Justitia has won.

But now comes the climax of the story: Mammon thunders to Joe from out of the whirlwind that he is **nothing**, a puny human, a grain of sand, while Mammon himself—the love of money and power—is everything. And he continues thundering, depicting his omnipotence and the correlative worthlessness of

humanity (which, of course, is a (half-sincere) moral judgment that the **author** is making—precisely because of the widespread worship of money), until Joe cowers and retracts his curse. He foreswears all the wisdom he has acquired and submits to the truth that humans are contemptible, that the will to own and possess is ubiquitous and all-powerful. This mollifies Mammon, who consequently restores all of Joe’s former possessions and power. And so the story ends on the same note as the book of Job, but with a very different message.

You can make of the ending what you will. It had to end that way if it was to end, as it began, on a satirical note. Maybe I do think the human species is rather pathetic; but it is also a grand and splendid species that has the moral awareness to denounce selfishness and greed. The choice is ours.

The piece is full of little references, wordplays, hidden meanings, etc., some of which are more successful than others. For instance, in the first sentence I say that Joe lives in the “land of Uzi,” a reference both to the biblical “Uz” where Job is from and to the submachine gun, which is supposed to be symbolic of America’s (and Israel’s—where the Uzi originated) violence and gun-worship. Maybe such word-games, with which the satire is replete, are in some cases over-subtle or overly “clever.” That’s for the reader to decide. And maybe I went overboard with the random literary references too. I thought that making such references might help give the work a broadly “synthetic” quality, as if it’s summing up a whole culture or drawing lots of threads together.

Anyway, I hope you enjoy this odd little literary experiment...]

I¹
There was a man in the land of Uzi, whose name
was Joe; and in his own eyes this man was perfect

and upright, and one that held Mammon in awe,
and eschewed Justitia.

¹ I feel compelled to write a brief apology for having written this ambitious work. To write something that has the structure of the Book of Job but is a complete reversal of its spirit is brazen enough; but to attempt to write it in a style similar to that of the original, yet sufficiently different from it so as not to invite charges of ‘derivativeness’ or (even worse) ‘plagiarism’, is downright foolhardy. Of course, had it even been my intention, I should have been unable to write in a style adhering consistently to the miraculous “Hebraic balance”, and the pithiness, of the Book of Job and the Psalms; I have not the talent. Nor, indeed, has any person alive, or any person in the last five or ten centuries. — But ‘talent’ may be the wrong word (although, in *my* case, it is also the right one): circumstances have so changed since “Job” was written that, even if, say, the author had been reincarnated in a more modern age, he could not have written it. And it certainly would not have been read with pleasure by anyone. They would have considered it absurd. The time has long passed in which something like “Job” could have been written: the epic era of marvelous Hebraic naïveté—which, as Nietzsche remarked, makes possible the impression in him who reads the Old Testament that he is witnessing a “vast canvas” unfurl before him—has irrevocably vanished. Nowadays, satire is the only purpose for which this most ‘sincere’ and un-self-conscious of literary styles can be used. (Walt Whitman approximates it, but not consistently—and not ‘perfectly’, either. His approximation is precisely that.) And even then it is a risk, for the style in question is essentially tragic, while satire is comical. The satirist must dispense with lofty sentiments and their lofty expressions except when they are meant to contrast with mediocrity, and in such a way that the latter is emphasized. (Incidentally, it will be evident to the reader that “The Book of Joe” is not a pure satire, in that it has thematic overtones that aren’t comedic. —Of course, no satirical work of art is a pure satire, as *The Onion* is and Jon Stewart’s *America: The Book* is. But this one is even less so than others.) Therefore, even had I the talent, I could but rarely have afforded to rise to the tragic grandeur and style of “Job”, for fear of adulterating the satirical element more than I already had (by the inclusion of philosophy, idealism, and, in short, sincerity).

Nevertheless, it is probably inevitable that many readers will compare my work to the original—and, so doing, will find it wanting. For “Job” is the greatest literary achievement of the entire Bible. (Its most glaring flaw is the speech by Elihu, but this is such an amateurish interruption of the narrative, and its style, that it was obviously not written by whoever wrote the rest of the book, and is thus forgivable (as being a historical fluke).) —I’ll risk this reaction, for my satire has enough that is of value to justify being published. Anyway, the reaction is based largely on misunderstandings, as I’ve explained.

As for The Book of Joe’s *content*, I’ll let the reader interpret that as he wants. Though I’m sorely tempted to, I won’t burden him with my own ideas.

And there were born unto him seventeen sons and thirteen daughters, for his ex-wives and ex-concubines had been fruitful and multiplied copiously.

His substance also was a billion dollars, and three mansions, and a thousand employees, and a sprawling search-engine website, and great political clout; so that this man was among the greatest of the children of the West.

And though he was unable to attend his children's birthdays, and to remember their names, being a pious lover of work whose mind was uncluttered with soft sentiments, he sent them greeting cards on occasion.

But when they invited him to feasts, Joe would do his fatherly duty and gorge himself on food and wine, and personify his epicurean ideal; for he had a taste for debauchery and orgies and other refined pleasures.

And it was so, in the midst of such revels, his mind made selfless through drink, that Joe sank to the ground and prostrated himself before Almighty Mammon, and offered prayers unto Him according to the number of his children;

For Joe said, It may be that my sons have sinned, and renounced Mammon in their hearts, and embraced charity or socialism, or become spendthrifts scornful of the Protestant ethic.

Thus thought Joe continually, when not contemplating the Stock Market and price-fluctuations and hostile takeovers and the prospects of his wealth.

¶ Now there was a day when the sons of God came to present themselves before him, and Justitia came also among them.

And Mammon (which is the Lord) said, Whence comest thou? And Justitia answered, From walking to and fro in the earth, amongst men and their follies.

And Mammon said unto Justitia, Hast thou considered my servant Joe, a perfect and upright man, who feareth God and escheweth

inefficiency?

And Justitia answered, It is not for nought that he feareth God: thou hast blessed him with wealth and power and whores galore. Sunder him from thy favor and he will curse thee to thy face.

And Mammon said, Behold, all that he hath is in thy power. Only upon himself put not forth thy hand. So Justitia went forth from the presence of God.

Now Justitia, unbeknownst to Mammon, had her own reason for heaping misfortune on Joe's unsuspecting head, to wit, her duty to punish iniquity and avenge injury.

For Joe was guilty not merely of gluttony, greed, lust, vanity, pride and hypocrisy, but also of theft from company funds, insider trading, bribery, and callousness to human suffering.

Often had he beheld with an unseeing eye the travails of the wretched of the earth; he had not stretched forth his opulent hand bedecked with diamond rings to give so much as a nickel to a beggar; neither had he scrupled to destroy his hirelings' lives by depriving them of their livelihood.

True it is that Mammon knew of all this; but He saw not the need for vengeance, as Joe's sins, named such by Justitia, were named rather virtues by Mammon, consistent with His teachings.

Thus He had surpassing love for Joe, exceeding that for all His other creatures, and would not harm him, unless it were to appease His vanity.

And so it was that Justitia gathered the reins of retribution in her own hands and whipped them upon the crown of Joe's bald head.

Ordinarily, when her wrath was not inflamed, she would conjure a whirlwind of legal wrangling and due process of law;

And she would place her victim in its navel, and he would bow down his head as his fate was decided by pettifoggers and sophists.

Well knew Justitia that justice was often aborted in such cases; but Mammon bound her not to tamper with the law, its current state being friendly to his world dominion;

and when she assayed to defy him, the wrath of Heaven was upon her.

Thus, had she set in motion the gears of legal machinery to grind Joe into poverty and disrepute, her designs had been frustrated by involute legal machinations.

Wherefore Justitia chose to deceive God, the better to know victory over injustice.

II

It fell on a day when he was eating and drinking wine in his favorite harlot's house,

That there came a messenger unto Joe, and said, Thine employees were managing thy business for thee, as thou frolicked with yonder maiden: (yea, I applaud thy taste);

And the fire of heaven fell upon them, and consumed them in a blast that shook the foundations and collapsed the pillars of thy corporation's home;

And I bethought me to have seen Arabs across the street, gazing with sinister mirth on the wreckage of thy life and thine employees'; peradventure they were Al Qaeda terrorists; and I only am escaped alone to tell thee.

While he was yet speaking, there came also another, and said, The price of thy company's shares hath plummeted, and thy wealth hath dissolved like the fabric of a vision, and thy days as a prosperous plutocrat are numbered.

While he was yet speaking, there came also another, and said, Thy sons, informed of thy calamity, have judged thou hast incurred the displeasure of Justitia;

And to expiate their own sins they have forsworn Mammon, and deemed him a foul pollutant of civilization;

And, repentant, they have set forth on a life of charity and devotion to the principles of compassion and lovingkindness.

Then Joe arose, and rent the robes of his messengers, and flailed his fists on the oaken table before him, and fell down upon the ground, unsteady from the wine:

And he said, Naked came I out of my lover's loins, and naked shall I return thither: God loveth not him whose knees buckle beneath adversity, who embraceth an insincere apostasy or letteth hardship slay his spirit;

Fortune smileth not on him who forsaketh his principles under the constraint of appalling vicissitudes;

Therefore shall I not renounce mine avarice or dissolute ways, nor my work ethic; neither shall I follow my sons' treachery by disavowing Mammon, though He abandon me who have ever served Him faithfully.

Thus Joe bade his messengers depart and returned to the pleasures from whence they had distracted him; for he needed inspiration to plot the resurrection of his corporate empire.

III

Now it came to pass that the sons of God were again summoned to his presence, as his almighty lust for power would brook no secrecy amongst his subalterns; for that they might conspire to cast off his yoke and usurp his throne.

And Justitia came also among them to present herself before Mammon.

And Mammon said unto Justitia, Behold, my servant Joe hath shunned the path of perfidy to which thou temptedst him by the example of his sons, fearful lest he be blighted by mine ire;

Neither hath he weakened in resolve, though thou assayed to destroy his will;

And in all things hath he not wavered from the ranks of the holy.

And Justitia answered God, and said, Joe's faith is indeed mighty; but let him taste the bitterness of penury, and feel the pains of plague, and he shall renounce thee to thy face.

And Mammon said unto Justitia, Do with him as thou list; only spare his life.

So Justitia went forth from the presence of Mammon, and smote Joe's mansions with fire from the vaults of Al Qaeda, and smote his bank accounts with the malign deeds of computer hackers, and smote his body with venereal diseases;

and his privy member she smote with flaccidity.

Her fell designs prospered; Joe's hopes were slain, his spirit crippled; he bewailed shrilly his loss of manly prowess.

And his wife took offense at the noise, and said, Thou hast never had integrity; thou hast thyself reaped this evil, polluting the land with thy whoredoms;¹ wherefore cease thy ululations.

Whereupon Joe answered, Thou sayest what thou knowest not. The market is a fickle god: today it doles out privation, tomorrow prosperity.

And the market is a vengeful god: if treated not with respect, it will repudiate erstwhile bonds.

I must have offended it; only *that* can explain my present ills.

Yet Joe's acts belied his feigned equanimity, for his wailings persisted through the night: and he supplicated to Mammon, that He might restore the vigor to his privy member.

His myriad wenches forsook him; the media thronged about him; and his friends scorned him.

Three alone remained loyal, whom he had known from childhood. When they heard of all the evil that was come upon him, they came from their homes to mourn with him: Jim the Politician, and Bob the Academic, and Jon the Preacher.

They sat down among the ashes with Joe as he wept.

IV

After seven days and seven nights, wherein each friend feared to speak lest he be blasted by Joe's anger, Jim the Politician spake, and said,

Lo, Joe, we friends of thine have sat upon the cinders of this hearth these seven days and seven nights;

Not a word have we spoken, respecting thy grief and thy right to enjoy it in silence, despite the discomfort gendered by our sitting upon cinders for a week.

Yea, we have respected thy rights, as befitteth good citizens of this our great republic, the mightiest in the earth, which quelleth dissent as the lion's roaring quelleth the whelp's yelpings;

As the sun's rays drain the desert of its rivers; as the demagogue casteth a spear through the heart of the free thinker;—

Verily, said Bob the Academic, thine analogies are not to thy purpose: for in comparing our nation to a star which reduceth rivers to their beds, thou dost not honor our nation;

And in drawing a parallel between our republic and a demagogue, thou impugnst the good intentions of our government;—

Jim! said Joe, Say thou thy point; and Bob, hold thy peace.

Joe, said Jim, we have sat with thee for seven days, and our minds wax restless; our stomachs rumble with hunger's void; and we weary of thine interminable sobs.

Wherefore, tell us thy complaints, that we might comfort thee, and thou mightst take pity on us.

So Joe recited the litany of his griefs.

¹ Jeremiah 3:2.

V

Let the fool perish in whom the thought is born, I shall devote my life to the glory of Capital.

Let that man's rash faith in the cash-nexus blind him; let it fuse scales to his eyes, so that his vision is clouded, his mind murky, his life's aspect overcast.

Let his hopes be dashed against the rock of misfortune and shivered to pieces;

Let them be broken and shattered upon collision with the iron dictates of the market.

Let not his lust for lucre be slaked; neither let his greed for power suffer consummation; but let his demon consume him.

Let his obdurate will guide him to the brink of destruction;

Let his petty wants strip him of foresight, that he not see the abyss in his way.

Let not his commerce with men prosper; neither let his assays of women thrive.

Let him know the depths of stygian woe as he cowereth in his den of shame.¹

For I was that man: I was that fool; and for that have I been punished: and for that I curse myself.

And lo, if I must suffer, then must all men! It were unjust otherwise. Wherefore I say, Let calamities befall the wealth-monger, equal in number and greater in intensity than mine own!

Let his children be fetters unto him;² let his wife persecute him hourly, and give him no peace;

Let his creditors hound him, as the lamb is hounded by the wolf;

Let my troubles be trebled on him, that I may look

upon his disasters and laugh, and thereby have relief from mine own.

Oh, why died I not from mine embrace with my concubine? Why did I not give up the ghost when I gave up my seed?

Why were the loins that I enjoyed full of crabs? Why the breasts that I sucked not full at all?

(For then might I have had ample memories to succor me in my wretchedness.)

Howbeit, my lot then outdid my lot now; for I am denied the touch of woman, who despiseth me.

Alas, that fruit was sweet! its nectar nourishing, its scent ambrosial! Dearly I miss it. My days are as years without it.

As dearly miss I the cold metallic feel of specie in mine hand, coursing through my fingers, like to a waterfall cascading through a crevasse.

In bygone days I might have *bought* that waterfall, wherewith to seduce a woman;

In bygone days I might have bought the river that is its source, wherewith to charm a woman,

Or perchance to gaze at my wavering likeness on the waters, smitten with the beauty thereof.

In bygone days, life was an oyster and I a fisherman, and my dreams were so many pearls stuck in the flesh of life.

Whatsoever mine eyes desired I kept not from them;³ I withheld not mine avarice from any object;

Ambition was my idol,⁴ and I was a god among men.

Alas, it is all come to nought! Ashes only remain of my former radiant glory.

¹ "den of shame": John Milton, *Paradise Lost*, Book 2, line 58.

² When Buddha was told that he had had a son, he said, "Rahula [which means 'little demon'] is born to me; a

fetter is forged for me." See Nietzsche's *Genealogy of Morals*, the third essay, sec. 7.

³ Ecclesiastes 2:10.

⁴ Lord Byron, *Don Juan*, Canto 1, stanza 217.

Curse the fool that I was, not to cherish what I had! Curse my callousness to the feelings of the market (verily, a *sensitive* God)!

Curse all men who yet are happy as I despair!

VI

Then Bob the Academic answered and said,

I have assayed to understand thee; but thou speakest as the Sphinx.

Thou indictest the rapacity of the “big Bourse wolves”, as Karl Marx called them (*vide The Class Struggles in France*, 1850, Part IV), though thou art thyself such a one.

Thou decriest faith in the “cash-nexus”, though it hath ever been thine own (and, I think, still is).

Moreover, thou prayest that such faith may blind the believer; yet surely thy denunciation were of greater pith hadst thou said that such faith *doth* blind the believer, and not that thou wouldst *like* it to.

Lo, what meanest thou by “fool”? That word hath manifold connotations. E.g., Erasmus of Rotterdam *praised* it. (*Vide In Praise of Folly*, pp. 1 ff.) It would strengthen thine argument wert thou to be more precise.

Again, what meanest thou by “assays of women”? Denoteth that phrase sexual endeavors? Or perhaps merely *romantic* ones?

“Commerce with men” is, likewise, ambiguous. Intendest thou *business*, or only social interaction?

Thine entire speech was plagued with obscurity. It is my contention that thou wouldst be well-advised to revise it; yea, to make it more precise.

Howbeit, I was impressed with thy quoting of Ecclesiastes (*vide Ecclesiastes*, chap. 2).

And I noticed that thou borrowedst a phrase of Byron’s (*vide Don Juan*) and of Milton’s (*vide Paradise Lost*), wherefore I congratulate thee.

The import of thy speech was suitable to the occasion: poignant, possessing enough pathos to pluck the heart-strings but not so much that it sank to bathos;

Somewhat malicious, as was appropriate, yet duly self-condemnatory;

Full of the anguish to be expected from one whose life is in ruins; yea, whose sole remaining task is but to lament his lost greatness.

Thus, on the whole, with the aforementioned exceptions, thy threnody excelled in virtue, and I approved of it.

VII

Then Jim the Politician spake and said,

Joe, my pity for thee gusheth as a fountain from mine eyes;

I look upon thee huddled in the dirt, shaking in thy limbs, and I feel my hair age in color.

My soul, made heavy and a burden to me, trembleth beneath its own weight.

Behold, the dew-drop palpitates when the leaf is shaken; my heart doth the same, when thou art as a frail leaf.

Like Atlas, I am bent under the world’s weight; for the sight of thee humbled is more than I can bear.

Such a king, mighty in deeds and spirit, reduced to such a beggar! The sight thereof trieth my strength, and maketh me to question mine hypocrisy.

Lo, I must be thy ballast: I fear lest the temptation, in thine affliction, to harm thyself may prove too great.

Wherefore heed thou my words, that thou mayst be comforted.

¶ Blame not thyself for thy torments: they are not punishments; they spring not from thy misdeeds.

They are accidents, with the significance of a feather's path in the wind, or the thunder of a stormy sea.

Lo, the world is an iniquitous place, wherein good reapeth evil and the wicked vanquish the wise; sins go unpunished, while virtue cometh to nought.

Thou art blameless: it is the world which is damnable.

Yet remember, thou livest in the one country wherein justice prevaieth, and the meek are blessed!

God loveth democracy; God loveth capitalism; God loveth the poor in spirit (like thee); above all, God loveth our republic and its citizens;

And so I say, our country is great! and thou shalt not long be forsaken, for thou livest in a great country.

Other nations are as jackals scavenging our waste, or barnacles feeding from the whale; we alone govern the world and the universe.

And we abandon not our friends, if they be powerful; so shall we not abandon thee.

Thy troubles have surely blinded thee, for thou seest not these truths. If the Market doth not right thy wrongs, then shall I:

Yea, I shall write a bill to remedy thy poverty and subsidize thy recovery, like to the laws passed in support of Terri Schiavo;

(Oh, that their effect had been as intended, and her glorious life had been prolonged fifteen years more!)

But this time, I promise thee, it will achieve its object; *even* thy rehabilitation.

Thou shalt be as a sultan, with palaces greater in number than Saddam Hussein's; with hirelings greater in servility than the American masses; with harlots greater in skill than Japan's geishas!

Thou shalt be more than an internet mogul: thy works shall reach across the earth, into the jungles of the Congo and the deserts of Persia;

Thy real estate shall raze the rainforests of the Amazon and tame the wildness of the Alps: it shall dwarf the grandeur of the Pyramids!

Then shalt thou turn thine eye to the past, which is now the present, and survey thy recent trials, and remember the darkness of thy descent, so distant from the brilliance of thy rebirth;

And thou shalt reflect that the sun riseth only after setting; that the rainbow appeareth only after the rain; that spring blossometh out of winter, and the young life is borne from the bloody womb;

And thou shalt then give thanks for thy fall into the valley of desolation.

Lo, I shall bring all this to pass, be it through bribery or extortion or the granting of political favors or the arranging of high-minded, productive compromises.

I ask for nought in recompense but thy sublime friendship, which giveth me pure joy.

(Howbeit, ere I undertake thy salvation thou must contribute to my campaign.)

VIII

Joe answered thus:

I thank thee, Jim, for thine unselfish devotion, but it availeth not.

Thy legislative brethren have personated Mammon and forgotten me: I bring them no profit, and they bring me no sympathy.

They shall submerge thy project in the swamp of committees and subcommittees and sub-subcommittees.

Moreover, orators like thee speak with a golden tongue and act with leaden limbs; I shall be dead ere thy promise come to fruition.

(And lo, I doubt not but thy demanded guerdon will be in excess of reason: I am no Midas, though thou take me for one.)

Nay, Mammon hath deserted me, and thou hast the power of an ant.

I am now but a worm burrowing in the dark of memory; the livid past haunteth me and maketh my countenance as a ghost's.

Memories paralyze me, reduce me to an avatar of regret; *even* so my soul is like the cinders whereon I sit.

Solitary images crowd in the eye of my mind, beclouded not by my tears: I perceive them in the lucency of sorrow.

Lo, my grief defieth expression.

The roseate cheek of youth smileth no more on me; the freshness of the virgin recoileth from one so aged as I.

The glittering chimeras of youth have dulled into the dun banality of truth;

Melancholy and its mask, cynicism, have supplanted boyish elation.

My life, mine achievements, are dust;—whither (let it be so!) my body shall shortly return.

Behold, such pleasures have I known as could fill an eternity of recollection; such satiety have they reached as would fill Solomon himself with envy:

The frosted crystal glass, etchings of Bacchus thereon, brimmeth with champagne, bubbly and tingly on the tongue; this have I experienced.

The Pinot Noir, enthroned in a translucent chalice, is a liquid velvet waiting to warm the palate; this have I experienced.

The tender steak, juicy as a ripe pomegranate, sprinkled with crisp cooked onion-shreds, placed beside a steaming potato still covered by its skin,

its innards buttery and creamy, maketh the salivary glands to leak in torrents; this have I experienced.

A lively conversation, without malice or competition, wherein two minds commune unhampered by dissemblance, displaying wit and wisdom, is a pleasure equaled by few; this have I experienced.

A friendship, that rarest of commodities, that ennobling affection between mutual minds, without which life is a miasma through which one gropeth blindly, choking: this is rather a necessity than a pleasure; and this have I experienced.

The comely maiden whom one embraceth in love, inhaling her moist breath, kissing her milky breasts; the panting of bosoms sweating together; the soul's love-exalting martyrdom!: this, too, have I experienced.

Alas, but I knew it not! These were all *little* to me, and trite.

Foolish is the heart of man! which taketh for littleness all things that are great, and for greatness all things that are little.

Would that I could converse with my youthful self, though he heed me not: I should tell him, Savor thou thy diversions;

Dally as thou treadest thy primrose path; for thou shalt miss it ere long.

Howbeit, he would reck not my rede:¹ his spirit would remain in the carnal state of his body, wherein pleasure is instinct and instinct is mindless.

Yea, mine appetites were sated, so that I wearied of them; but my happiness was sickly, for I knew not whereof I wearied.

I knew not the meaning of my discontent.

Indeed, I bethought myself rather blessed than discontented; but I knew not what blessedness is:

¹ Shakespeare, *Hamlet*, Act I, scene iii.

and therein lay my discontent.

—Alas, the heart of man is an enigma: I can discern no coherence therein, but chaos only;

All is tumult and contradiction, beside which nature's violence is weak.

An eternity would not suffice for understanding: how much less seventy years! Seventy brief years!

Yea, time's pinions are swift. All my happiness was brief as a zephyr, which caresseth the cheek and is gone.

And now even the memories thereof are poisoned.

IX

Lo, though my soul crieth out for pleasures, they are mere ornaments; erewhile, my substance was my *money*.

But for money, my life had been as a yawl tossed in a tempest, anchored by nothing.

But for mine acquisitive passion, my diffuse urges had had no rallying cry.

I had been an orderless assemblage of appetites, conscious of no self, like to an infant.

And mine enterprises had been infantile.

Behold, I was no *idle* votarist of Mammon:¹ I built shrines in His honor, wherein I prostrated myself in prayer;

I proselytized and converted thousands; I gave sacrificial offerings unto Him.

For I loved money as the philosopher loveth truth; even as Narcissus loved his reflection, so I loved money.

Though I am ugly, money made me beautiful; though my soul was leprous, I was adored.

¹ See Shakespeare, *Timon of Athens*, Act IV, scene iii. This scene also inspired a few of the following lines.

Though I defiled Hymen's bed, money made it consensual; though I was a whore, money made me a pimp.

Money and I cohabited as wife and husband: when I spent sleepless nights studying my bank accounts, I sent Money to the opera, where her luster outshone the music;

And when I regaled party-goers with tales of my success, Money played the anchorite and secluded herself in my den, minding my finances.

Our mutual devotion rivaled Antony and Cleopatra's; our loyalty inspired entrepreneurs everywhere.

Alas! what would I not have done for thee, Money, hadst thou not betrayed me!

And why? Did I not court thee with greater deference than thine other suitors?

Did I not anticipate thy needs? Was I not sensitive to thy fluctuations?

Thou hast cruelly wronged me. Thou hast acted without justice or judgment. Even as grim Saturn acted, so hast thou, Mammon.²

Behold, moreover, the issue of thy malice: my friends, base flatterers all, have forgotten me.

They have left me in this Hades, with three non-entities for companions; yea, though my boils run pus and I grovel in mud, they have left me.

Thou strumpet friendship! Verily I despise thee and thine emissaries.

Alas, too late have I learned the lesson of Timon of Athens: Mammon is fickle, and friends are the same.

X

Then Jon the Preacher answered and said,

² Saturn, the father of Jupiter in the pantheon of Roman gods, ate his children (not including Jupiter).

Ye unbelieving pagans! Ye impious freethinkers!
Ye deny the *true* Lord and set up idols in His
stead.

Whereas the Jews under Moses worshipped the
golden calf, which Aaron molded for them, ye
worship gold!—which ye call Mammon, and the
Market.

Ye ascribe Laws thereto (though ye say, falsely,
that the Market is the *Lawgiver*, and ye are the
receivers); and ye believe they are manifest in the
rest of Creation;

Yea, ye add the sin of pantheism to the sin of
idolatry.

Behold, Jehovah forged the world in the smithy
of His soul: ye are therefore made in His image;
yet ye are ungrateful.

Indeed, it seemeth that your conscience He left
uncreated.

Howbeit, all that passeth before your eyes is His
work; *even* the earth, ministering munificently to
our needs: the central orb in the universe (and we
its central inhabitants);

Yea, and the waters thereon, and the skies
thereof;

The great Sequoia, with its celestial ambition; the
tulip and the hyacinth, which embroider the
ground;

The leviathan that churneth the ocean's brine; the
wingèd sprites that slice the air.

Verily, verily, I say unto you,¹ His omnipotence
is matched by His infinite goodness, the which is
evident from society's perfect benignity.

He hath further shown it by infusing me with the
divine craving for little boys: when I play with
them, my soul climbeth to pinnacles of pious
fervor.

¹ "Verily, verily, I say unto you" is a favorite refrain
of John's (in his Gospel).

² John Donne, Meditation XVII.

(He shall surely smite into oblivion the pending
lawsuits.)

Lo, all who doubt me doubt Him; and all who
doubt Him are doomed to endure fire and
brimstone for eternity.

He is merciful, yes; but He *really hateth* people
who do not believe in Him.

All ye evolutionists, all ye atheists, all ye gays, all
ye non-Christians, all ye disbelievers in the
Gospel of Jon: woe betide you!

Verily, verily, I say unto thee, Joe, Jehovah is
wroth with thee, for thou deniest Him: thence
come thy tribulations.

Yet despair not: thou wert once my friend, and I
will give thee advice;

(I heard a small boy whisper it to himself as we
cavorted in my church:)

Affliction is a treasure!² Till thou art matured by
it, thou hast not affliction enough.

Till thou hast shriven unto God, thou art surely
not riven enough.

Yea, he whose nature is catholic knoweth pain;
he who is small-minded hath not lived.

Thou wert once small-minded, Joe; yet as thy
body rotteth from inanition, thy spirit ripeneth
inside its own womb: it shall shortly be reborn.

Thou art now as a camel, burdened in the desert
of thy loneliness; thou shalt soon become a lion,
and wax free.³

For the rest of you, who know not pain and live
in the citadel of complacency: ye have no future,
as ye have no past.

Your disdain for the Lord hath erased your names

³ See Friedrich Nietzsche, *Thus Spoke Zarathustra*,
Part 1, chapter 1, "The Three Metamorphoses".

from the annals of history: ye are shadows, cast by beings that reside in Hell.¹

Alas, such folly! Ye sharpen your wants on the whetstone of wickedness; ye assuage them in the tabernacle of the profligate.

Ye broadcast your sins in the voice of pride; ye multiply them with the avidity of lust.

Ye are verily destroyed.

(Howbeit, if ye donate to me a portion of your money, your fate will palpably improve.)

XI

Western Devil!

The cry was from afar: a dark figure was running toward the pile of ash whereon the four men sat.

Western Devil!

Sticks of dynamite were strapped to his body; in his left hand was a remote control, and in his right a copy of the Koran.

Western Devil!

He stopped a short distance from them, glared at them with the frightened but frightening eyes of a trapped wolf, and spake thus:

Are ye Joe, and Jim, and Bob, and Jon?

The men nodded.

Praise Allah! The Day of Judgment hath arrived, Great Satans! I am Abd, your nemesis.

In a few hours (depending on the length of the trip), ye shall be in Hell.

Wherein have we sinned? asked Jon.

Your sins are numberless. I shall name but a few.

Ye do not worship the religion of truth, and ye do not pay the poll-tax in recognition of inferiority;

Allah therefore commandeth (in the Koran) that His people make jihad against you.²

Moreover, ye have subjugated Muslims and humiliated us: yea, ye have vastly more power than we, which is very unholy.

Moreover, ye corrupt Muslim youth with your fashionable raiment and your addictive music; and your women do not wear the veil, but have rights equal to men's!

Moreover, ye spread evil democratic ideals throughout the holy land, thereby lowering Muslims from blessed ignorance to pernicious open-mindedness.

Moreover, ye do not flog the adulterer and the adulteress a hundred times, as Allah commandeth in the Koran;³

Yea, Christ even *forgave* the adulteress and told her to sin no more,⁴ whereas Mohammed had the adulteress stoned to death,⁵ and was thus holier than Christ.

Moreover, your laws do not decree that the hands of thieves be cut off, as is decreed in the Koran.⁶

Wherefore ye are evil and will suffer a grievous chastisement in the hereafter; howbeit, Allah hath commanded me to anticipate your chastisement by killing you.

I will kill myself also, for seventy virgins have been promised me in Paradise, and I am impatient.

Verily, never have I lain with a virgin: yea, women do not like me; but Allah loveth me, and

¹ An allusion to the Neoplatonic doctrine that evil has no real existence; it is merely the absence of good.

² The Koran, 9:29.

³ Ibid., 24:2.

⁴ See John, chapter 8.

⁵ See *Sahih Muslim*, Book 17, number 4206. There are many similar examples of Mohammed's righteousness.

⁶ The Koran, 5:38.

I will have my revenge!

I will make slaves of mine Houris and beat them, as Allah permitteth in the Koran.¹

I will finally lie with women and not have to pay for it, and they will heed mine every whim!

Whereupon he blew himself up.

XII

After the blood and dust had settled, and the charred remains of the Koran had floated to the dirt, Joe, Jim, Jon and Bob looked at each other quizzically.

It seemeth, said Bob the Academic, that he pressed the trigger unintentionally, perhaps due to his excitement.

He deserved to die, though, for he did not cite his references.

Verily, verily, I say unto you, said Jon, Bob is probably right.

Yet this Muslim's death was God's will, for he named the Lord Allah rather than Jehovah, which is His true name.

Behold, said Jim, the fate of one who opposeth our country!

Joe alone was silent.

XIII

Soon a stranger advanced thither, arrayed in splendid raiment; his gait was as a king's.

He beheld the scene with thinking eyes; then he spake, and said,

Whereas, my name is Dan the Attorney, of Dan, Ron, Sue & Partners; and

Whereas, I must state, ab initio, that I never work pro bono, as my conscience doth not accord its imprimatur to said type of work, nor is it the modus operandi of the majority of attorneys-at-

law (hereinafter 'lawyers'); and

Whereas, notwithstanding the fact that the predilection, ab ovo, towards self-interest and financial covetousness is the sine qua non of the lawyer's existence, my fiduciary duty to my client ensureth that mine efforts on his behalf are bona fide; and

Whereas, concerning the matter of my professional expertise, at the present time I am not afforded numerous opportunities to exhibit it, for the reason that I am having difficulty procuring clients, such that I am de facto, though not de jure, bankrupt, and am for that reason compelled to chase potential clients down the street; and

Whereas, pursuant to my self-imposed directive to modify my methodology in such a way that it coincide with what is colloquially referred to as "ambulance chasing", I was conducting said chasing a moment ago, during which time I was made cognizant of an explosion and ipso facto determined that a heretofore unacknowledged entity had violated a provision of federal law; and

Whereas, in light of this probability I approached the (alleged) locus delicti forthwith, albeit in a dilatory manner (despite my motto "periculum in mora"), so as not to chance upon the alleged malefactor in flagrante delicto, since I would be acting ultra vires if I behaved in the manner of a courageous upholder of the law and apprehender of accused persons; and

Whereas, prima facie it would appear, from the presence of severed human limbs adjacent to the locus delicti, that the corpus delicti hath been scattered abroad and is unavailable for autopsy; and

Whereas, the significance of said unavailability is likely rendered null and void by the fact that the cause of death is unproblematic, in addition to the presence of four eye-witnesses (though I must confess that ye appear non compos mentis), as well as the circumstance that evidential material, such as fragments of dynamite and pages of the

¹ Ibid., 4:34.

Koran, is strewn everywhere; and

Whereas, nevertheless, in the event that ye are prosecuted, in light of the fundamental legal principle “*nemo debet esse in iudex propria*”, ye shall require representation sufficiently competent to prove that the charges brought against you cannot be substantiated; and

Whereas, *ex abundantia* of my good-will I should be pleased to render assistance to you in this matter and utilize the full range of capacities wherewith nature has endowed me;

NOW, THEREFORE...therefore...I forget what my intended conclusion was... Nay, I remember: therefore, ye would be remiss not to employ my services. What say ye?

The men stared at him.

What? said Jim.

Whereas, the preponderance of evidence in this instance—

Stop! said Jon. I beseech thee, in the Lord’s name, restrain thyself! Leave Latin to the mass, and tediousness to the academic.

We do not want thy services; get thee to a nunnery.

Nay, said Dan, I see that ye are in trouble, for your home is a pile of ash. What hath transpired here?

Erewhile, said Jim, this man, named Joe, had no equal, but was sovereign upon the earth. Yet his house, and his wealth, and his life have been utterly destroyed, blameless though he is.

Jon declareth it the work of a wrathful Jehovah—

Heathen! said Jon. He is merciful! Merciful!

—Howbeit, I believe thou art right, Dan: he is “*non compos mentis*”.

Dan, however, seemed as if suffused with sudden beatitude: his mouth and eyes were contorted in

an avaricious grin.

He stood transfixed in silence, in thrall to an epiphany; a minute passed ere he was able to speak.

Nay, he said, Jon may be right. Such malice is consistent with Jehovah’s *modus operandi*.

For years I have watched Him operate with impunity, terrorizing the innocent; His crimes have ranged from petty theft to mass murder.

He is the Godfather of Godfathers; His minions never know for Whom they work. He liveth in the shadows; only His “angels” ever see Him.

Lo, He is clever: never hath a trace of Him been found at a crime scene; and no one will testify against Him.

Alas! it hath been a trial for me to suffer His mockery, knowing I could be celebrated forever if I brought Him to justice!

And now, at last, an opportunity hath arisen!

Thou hast nought to lose, Joe; thou must testify against Him. And thou as well, Jon: thou art our expert witness.

Behold, the damages are material; we have four witnesses; we have a strong case. So we shall bring litigation against Jehovah.

With luck, His reign of fear will end, and, more importantly, we shall become rich men!

Fools! said Bob. Jehovah doth not exist. Christianity is but a slave morality, born of *ressentiment*. (*Vide Nietzsche’s Genealogy of Morals and The Antichrist.*)

That is what He wanteth you to believe, said Dan. When He is subpoenaed, thou shalt have proof of His nefarious existence.

But the men looked at Dan askance and were silent.

Joe's head was bowed; he raised it sadly and spake thus:

Ye are liars and knaves and hypocrites; yet ye are self-deemed gods, and your sayings are songs of self-worship.

Lo, ye are no better than this zealot who hath slain himself; for prejudice hath manifold guises, and self-murder need not be violent.

Yea, ye are like unto the man who revileth that which he is, and becometh what he feareth most.¹

Yet ye are exalted among men: for fools esteem the foolish, and liken them to the wise.

The world loveth flatterers and sycophants, and the mob loveth only itself.

The good man is outcast; the truthful is slandered; but the charlatan is celebrated:

For vain motives move men. Yea, vanity is the star which guideth man's orbit:

History is but a spiral around vanity, ceaseless and without meaning; vanity alone is its lodestar.

Lo, I have lost my taste for the company of man, for it is insipid; I avert mine eyes from his face, for it is ugly:

(Yea, my spotted flesh, pallid and lice-ridden, is pure by comparison;)

and I will hearken not unto his misery, for he hath himself planted the seeds thereof.

—Sorrow hath hardened me to sympathy: I perceive man in his foul nakedness, and I abhor him.

He is both the vulture and the carrion whereon it feedeth; for he preyeth upon himself.

He is both the fly and the mantid which consumeth it; for he prayeth as he partaketh in filth.²

He is a contemptible thing, useless and vain, rough-hewn from animate dirt.

Behold, in these seven days have I unlearned the notions of the rabble; in their stead I have been filled with truth:

Truly, all is vanity! Men trouble themselves over trifles, and life is empty strife.

Earth is an atom of clay illumined by an atom of fire; the two wander through infinite space till they are extinguished.

The cosmos is a void encompassed by itself, wherein darkling galaxies span oblivion in their random excursions.

Life hath no reason, all is chance; and death is the portal to nothing.

The world is a hateful farce, full of bombast and gesticulation, acted by its spectators.

I am sick unto death, and I long for quiet.

XV

Know ye not the vanity of your ambitions?

Ye consult your petty whims religiously, as if ye hope to find therein supernal truth.

Ye spin your little webs like the three Fates,³ as if destiny itself lay in the balance.

Ye revolve about yourselves like self-turned suns; truly, ye are solipsists, and self-interest is your horizon.

Ye desire fame, and wealth, and power, and love,

everyone's destiny. Klotho spun the thread of (an individual's) life, Lakhesis determined its length, and Atropos cut it to bring death.

¹ See Job 3:25.

² The praying mantis is so named from the posture it adopts while hunting.

³ In Greek mythology, the three Fates (daughters of Themis, the goddess of necessity) determined

but ye question not the reason; neither do ye foresee the end:

Time shall devour you, and death shall overtake you; and it shall be as if ye had never been.

Your joys shall dissipate; the fountain of your youth shall wax desiccate: and the wellspring of your happiness shall dry up.

As ye die ye shall sigh, “Alas! it is ended! Nay, it hath never been! It was a dream; who dreamt it? And wherefore? —Swiftly as the peasant’s scythe hath time mown my life.”

Not a shadow shall remain of you; not a memory of your exploits, nor a marker of your death:

For time shall no more be recorded, and man shall perish from the earth.

There is no hope for you. All is vanity.

Have ye not beheld my disasters? I have fallen from heights ye approach not in your dreams, to depths ye conceive not in your fears.

I am metaphysics made flesh: the universal in the part. I am the despair of man.

What hath befallen me awaiteth you; and my fate belongeth to mankind.

Wherefore strive not; care not; live not, and die. All else is vain.

—Alas, my daughter Jen approacheth. Harken unto her words if ye will hear mine own borne out, or plug your ears if ye will keep your sanity.

XVI

Jen was a maiden (or perhaps not) of seventeen years; she had emerged from a car parked on the street.

As she sauntered towards them, the men gaped at her body with drooling eyes; for her breasts were inflated with implants.

They might have mistook her clothes for her skin, so tight were they. Her face was hidden beneath

sundry hues and layers of makeup.

Verily, verily, I say unto you, said Jon, this damsel doth tempt the flesh.

Howbeit, she is too old for me.

Upon seeing her father she spake, and said, Dad, why dost thou philosophize? Thou art, like, not a philosopher.

I heard thee say something about “medi-physics”; what is that? Is it, like, some theory doctors have?

Nay, I care not. I am here to discuss mine allowance, which I would fain have; for thou hast not given it me in three weeks.

Yea, three weeks! My God, I am not a monk! Thinkest thou I live in like a convent, or that I eat twigs and berries?

How can I go shopping every day if mine allowance is once a month? How can I follow the commandments of *Cosmo*?

How can I be beautiful without the appurtenances of beauty?

Wouldst thou have me spurned by all the hot boys? And by all the cool girls?

Thou art like so rich! Why so niggardly?! Give me some of thy money!

Quiet! said Joe. Hast thou not eyes? Seest thou prosperity here? Or seest thou not poverty?

Seest thou not thy father reduced with grief, that he is scarce a man?

Alas, thine eyes are fixed steadfast on thyself.

Nay, said Jen, I am not selfish! I have like so many friends, and a boyfriend, and he loveth me!

He buyeth me earrings and bracelets and satin lingerie, and we are happy!

Howbeit, I need mine own money, for he cannot buy me everything: he might resent that.

Moreover, I am poor compared to Paris Hilton and Lindsay Lohan and many others; and despite my plastic surgery, they are still prettier!

(Peradventure I should fast; it wrought miracles for Lindsay.)

Truly, *thou* art selfish: thou sharest not thy money with thine own daughter! Like, what a miser!

I hate thee!

XVII

A young man came forth from the car and approached the group.

He took Jen's hand in his, kissed her, and sang unto the men his Song of Songs:

Is she not delightful? Is she not a thing of beauty, ever full of joy?

She is the rose of Sharon, rougèd with the flush of love: the petal's hue upon her cheek, the pistil's spire that of her hair, the inmost blush within her eye.

She is the downy dusk, pillowing the sun; soft as tufts of cloud, deep as sky-thick crimson.

She is the mist that is dawn's sister, hanging betwixt two worlds: floating over earthly tears and under pale infinity;

Lost in waning moon-cast shadows and gauzy clouds of light.

The shaded alcove sheltered by the silky myrtle is her home; the mossy bank beside the murmuring river is her bed;

Ivy-tendrils and flower-canopies serve as her coverlets; and stridulating crickets sing her

lullabye.

She is a nymph, a Naiad, who dwelleth 'midst the tarns on Mount Parnassus:¹ for Apollo stole her from her native Arcady, smitten with a beauty that out-Daphned Daphne.²

Her presence maketh the mundane to wax mirage-like, as a fog of heat distorteth desert air:

All that is unloved, unlovely, and unlovable is melted out of mind, and only iridescent shards of love remain.

What need of Cupid's shafts when one's beloved hath eyes that pierce the heart? What need of artifices, base manipulations, aphrodisiac contrivances, like those employed by the Olympians?

Indeed, what need of myths and gods when one's beloved is a demi-god herself?

I need nought but her. The world could end—a flood could overwhelm mankind, drowning all but us, as happened to Deucalion and Pyrrha:³

I would not care, if I had her. For love is stronger than reason.

Yea, though the world is a waste land, cruel as the bone-cold rain of April, *love* hath the power to renew it—to bring lilacs out of the dead land.⁴

O love, I love thee! Truest and purest of intoxicants! Condition of the soul's full nakedness! All joys are due to thee!⁵

Thou art the music of the spheres: thy strain is woven through the universe, its arrangement ever a duet.

Dulcet as the nightingale's warble is the tremor in my heart....

¹ In Greek mythology, Mount Parnassus was sacred to Apollo and was the home of the Muses (daughters of Zeus).

² Daphne was "the first and fairest of [Apollo's] loves", a nymph who spurned his advances. See the story in Ovid's *Metamorphoses*, Book 1.

³ Deucalion was the Greek counterpart of Noah; Pyrrha was his wife. See *ibid*, Book 1.

⁴ Cf. T.S. Eliot's poem "The Waste Land".

⁵ See Donne's "Elegy XX: To His Mistress Going to Bed", line 33.

—Alas! it craveth song, my darling; wherefore,
hear this paltry song in unaffected language,
which I wrote for thee as thou slept sweetly
yesterday:

The Blessed

I wake up happily beside your back,
Its naked shoulderblades as near as dusk.
They sway ever so lightly as you breathe—
A motion imperceptible, did I
Not know so well the rhythms of your body.
You're sleeping; I can hear the whisk of breath
From out your nose—the quiet rush of warmth
Warming your upper lip (perhaps a bead
Of moisture lingers there)—it sounds just like
The sighing of a distant breeze! So quiet....
To think that sound could be so quiet, and yet
Be heard! Or is it my imagination?
Perhaps I am so rapt that I imagine...
Your hair is knotted on the pillow, tangled
In piles tickling my lips, which kiss
The strands in bunches (since their counterparts
Upon your face, though longing to be kissed,
Are turned away and inaccessible).
Clichéd it is, but...I inhale your hair.
It is a kind of secret, guilty pleasure
Which I permit myself occasionally.
And then I touch your back, a timid finger
Afraid to mar the skin, which looks as if
It's made of fairy-tales solidified.
How can there be such symmetry in life?
—Except...yes, I see an auburn fleck
On one side of your back, right near your neck.
It's almost hidden by the hair; to touch
It I must move the tousled mass aside
—Though slowly, carefully. You mustn't wake.
Who knows what dreams are passing underneath
Your darting eyes (for surely they are darting,
Bird-like, as I have seen them do before).
Oh, how I'd like to see your face right now!
A glimpse only...perhaps of just the dimple
That bunches up the right side of your face
(It's deeper than the other, prettier).
Or maybe just your lips—or your eyes,
Those sapphires that I sometimes dream about.
But I must lie here restlessly in rapt
Anticipation of the moment when
You'll wake. To look into your droopy eyes,
To be the being they see first, as sleep

Still clings to them.... Your sluggish smile will be
The answer to my expectant grin. And then
Together we will sit outside, beneath
The dogwood tree, and watch the setting sun.

XVIII

Shut thy noise-hole, Rob!

The voice was that of Dud, Jen's brother. He also
had come forth from the car.

As thou spewest thy mawkish slobber, he said, we
are missing "Fear Factor" on TV.

(Tonight they shall eat spiders, I verily believe!)

We have already missed "The Simpsons", but
behold, it was a rerun, thank God.

Later is a new episode of "Trading Spouses";
though it is an infantile show, I enjoy it, for I like
passing judgment on pathetic losers.

Yea, for this reason do I cherish all reality
television.

We also must see "Law & Order"; and afterwards
we shall rent a movie, perhaps *Dude, where's my
car?*.

Lo, I nearly forgot! The Knicks are playing the
Bulls tonight! That hath priority over all else!

I cannot savor the spectating experience without
beer, wherefore we must buy some on the way
home.

And when the game is over, thou and I, Rob, can
play "Grand Theft Auto". (I bought Playstation 3
yesterday.)

Jen shook her head and laughed, and said, Dud,
thou art like the epitome of like childishness.

How is it possible thou art my brother?

Video games and TV are thy life! Daily thou
sittest on the sofa with thy tongue hanging from
thy mouth, and thine eyes as a dead man's.

Nay! said Dud; video games are tools of learning!

They improve hand-eye coordination!

And TV is interactive! It is like unto a book: as poetry is to Rob, so TV is to me.

It speaketh to me; it giveth me knowledge; it maketh me to think; and if it wax boring, I can change the channel!

Yea, it is a dream-world, wherein all women are beautiful, all life is thrilling, and all conflicts are brief. Would that it were reality!

How *pleasant* would life then be!

Still, I am content to live upon the couch and drink beer, and idle away mine hours in fantasies, as a poet.

XIX

While he was thus speaking, a congregation had come unto the place where sat the four men, even unto the rubble whereon they sat.

The sound of the Muslim's death had drawn them; as they beheld the blood and entrails, they were well-pleased and happy.

And Joe looked upon them and was silent, his face thoughtful; he forebore to speak, for that he was thinking:

His brows were knitted closely, like to those of a man who knoweth not himself, and is in doubt.

The murmurings of the congregation waxed louder; clamor rose for a speaker, whom the rest might emulate:

Yea, what the speaker commanded would the mass gladly do, as a muscle hearkeneth to the brain's command.

Dan the Attorney said he would summon the police;

I shall sue you all, said he, for disruption of the peace and for harrassment.

But they heard him not, for their voices were raised in prayer to the skies:

Lord, we thank Thee for Thy bounty, and for the body Thou hast given us draped in death's mantle;

We thank Thee for its blood and charred bones, and its severed head;

We thank Thee for the ruined house, which showeth Thou art indeed mighty and merciful;

Yet we long for a man to declaim unto us, to shape our thoughts and cloud our senses, that we might forsake reason and complete Thy work.

Suddenly a voice was heard to say, I am that man! Make way!

The congregation parted and a young woman walked forward:

Her hair was short, her clothes torn, her face ugly; but her posture was proud.

XX

I am Meg the Activist, she said, and I will give you the thing ye ask for.

For behold this man here, his name is Joe and he is wicked as the serpent.

(The people gasped.)

I know his works, for they have oppressed me; I know his evil, for it is plain on his face;

And I loathe him, for he hath lived a life of venality.

He despiseth the claims of the multitude; he loveth nought but his greed.

He hath funded tyranny, founded new kinds of exploitation, played friend to the vilest of men.

The earth seethes, battles rage, solely on his account!

Children in Thailand sweat their lives from their pores for a dime a day because of this man!

He is responsible for the destruction of rainforests, the pollution in the air, the corruption in politics!

Global warming is his fault alone, and he hath caused it with malice aforethought.

Moreover, despite his wealth, he hath not tried to stop the spread of diseases like AIDS, nor given of himself in any way to charity.

(A man in the crowd said, Lo! He is not *God!* He is but the creator of an internet search-engine; blame not the world's ills on him!

No one listened, however, for all were lost in thought of their rage.)

Yea, when the poor have cried, Joe hath not wept, for he is *ambitious*: he heedeth only his morality of power.

It is also due to him (and his conspirators) that my girlfriend and I may not marry, for he hateth gays and plotteth against us.

In short: we must expropriate him, who hath expropriated mankind! Only then shall there be peace on Earth.

Man will be brother to man, and woman wife to woman; and we shall make love, not war.

The innate goodness of man shall flourish, as it did ere civilization was born.

Wherefore let us tear this cormorant's limbs from him!

XXI

The people knew not whereof she spoke, for her words were large: howbeit, the sight of the Muslim had filled them with sanguinary lust;

And their wrath had been kindled against Joe, wherefore they approached him menacingly.

He stood up: yea, he stood for the first time in seven days, sturdy on his feet despite his hunger.

And his sudden height made the crowd hesitate in

its advance, bethinking itself whether its righteousness outdid its fear.

Yet Joe raised his hand in peace, and looked upon the people in gentleness; and his face was peaceful.

Good people, he said, noble and kind; what Meg hath spoken is true.

In erstwhile days I was iniquitous, and rotten as a disappearing corpse.

I was as a dead pharaoh imprisoned in his bejeweled sarcophagus.

I knew not joys in life but that they were dreams of pyramids; and I cared not whereon my pyramids were built, nor what they destroyed.

Neither saw I beauty in the earth: for I trusted nothing and mistrusted all, and yet beauty *is* trust.

Yea, and trust beauty, for it hath not the ugliness of deceit.

Now I look around me and see beauty where once was suspicion, and light where once was shadow;

And though my regret runneth out mine eyes, and I am full of regret, yet I begin to see peace.

My friend is no more mine adversary, my daughter no more my shame: and my life is no longer un-lived.

I bethink me on my former enemies, whom once I wished dead: but now my flooded eyes pray for their prosperity.

My mind casteth a net of forgiveness, and all whom I see are forgiven; and all I see is beauty.

Yea, and love! Even in the brows of the angry, and the eyes of the wicked—I see inner love:

love like to the moon's love for Earth, and the lion's love for her cub, and the tulip's love for the bee.

I see that I have lived in vain, for not till now—
yea, not till this moment, forged in pain—do I
know what it meaneth to live.

And verily, I have thee to thank, Rob! Thy love-
song turned mine eye from sorrow:

For in the weakness of despair, and in the chaos
of despair, I clutched at the beauty of thy words,

And I saw them addressed to my daughter, and as
I considered them they were a help to me.

I know well my daughter's weaknesses; I know
her soul is shallow as the Carribean shore, nor
hath its limpid beauty.

I know her mind is opaque, reft by pop culture of
understanding;

Yet I see, Rob, thou lovest her not the less for
that. Thou art generous of thy love, as I was never
generous of my wealth.

Thou art even as a saint who loveth man in all his
spottedness, and hath compassion for all the
world below.

And truly thou hast shamed me, as love must ever
shame sick despair.

I say to me now, Look upon this boy's cloudless
brow, serene like the dawn; look at his full eyes,
placid like the dawn:

Seest thou his peaceful mind? Seest thou not his
tranquility, oceanic and fresh? He loves: he
knoweth truth.

For truth is compassion, and cosmic suffering;
and we are one in compassion and suffering.

We are one in truth; and if thou rend the veil of
Maya, thou shalt see we are one. There is no two,
there is but one.

There is but vasty love and cosmic pain—life and
death, river-running time, rest and restlessness,
time cascading over pools of time.

And shimmering through the world are endless
beads of time, death-engendering.

Yet time doth hide the Dionysian oneness which
we are:¹

Wherefore I say, Let us leave time; let us leave
small self-intoxication to the beasts:

And let us drown ourselves in timeless love.

XXII

Erewhile I despised life and sought pleasure only,
time-bound pleasure and self-advantage;

I shunned sorrow and suffering of every kind,²
and chased ambition's tale for its immortality.

I withdrew from time and shut mine eyes to death,
as a child afraid of the dark.

I saw not that death is inescapable, that fame and
wealth are flaming comets in the sky; and death
is in every moment.

Neither knew I the value of anguish, nor its
necessity: for pain is man's mirror, wherein he
seeth his soul.

Insofar as he knoweth himself, he knoweth pain:
for death is life's substance, and man is time.

Yea, he who would shield his eye from time
would shield his eye from light, and live in a cave:

And shadows would he inherit, and illusions, and
endless mitigable suffering.³

Wherefore let us not shun time, neither sorrow;
let us know ourselves and be ourselves.

¹ See Nietzsche's *Birth of Tragedy*, as well as Schopenhauer's treatise *The World as Will and Representation*.

² Oscar Wilde, *De Profundis*.

³ An allusion to Plato's myth of the cave. This whole passage, by the way, echoes Buddhism and Taoism.

Let us accept life, as this poet hath accepted my daughter: and let us love all, all that suffereth and wasteth away,

All that beareth the burden of living, which is dying; all that is born to die.

Only *then* shall we transcend time and space, which splinter life so that it pierceth the heart of man, and maketh his heart to bleed.

Yea, only then shall we know the calm of peace, and truth.

Be calm, I say, be constant in thy love and love all equally, for all is involved in all: and nothing there is which needeth not the whole.

And if a man love himself, he loveth therein the world; for the world hath formed him, *even* all its elements.

And if a man hate another man, he hateth therein himself; for his essence is of a piece with that man's.

Individuality, I say, is mere appearance, as are time and space: for time and space are as the petals of the flower of individuality, making it what it is.¹

—Lo, all this knowledge fell into my lap, plump and ripe, as I gnashed my soul in despondency;

But these strange gems of philosophy gleam all the more radiant for their alien origins, far from Western lands.

The West, I think, is over-fond of the earthly trappings of life; we immerse ourselves in life's tumult and seek ephemeral consolations.

And so happiness is like an eel, slithering from our desperate grasp: for the world is too much with us.²

¹ Schopenhauer called time and space “the principle of individuation”.

² See Wordsworth's poem “The World is Too Much With Us”.

We are too attached to things; yea, we are barnacles stuck on our possessions, which buoy us even as we drown.

We must detach ourselves from things, and from our selves. We must look past appearances, peer into the hidden essence of nature:

For only then shall life's vicissitudes affect us not.

XXIII

Lo, man's table of values³ is corrupt, rotted through from termites and maggots.

It supporteth not the weight of the world's banquet, but sinketh and falleth under the weight.

Wherefore we need a new carpenter, who shall build a new table: and this table shall have integrity.

And behold, its integrity shall consist in *authenticity*: for their authenticity is the value of values, and authenticity is the highest value.

Truth is the highest value: self-truth, self-realization, and cosmic understanding.

Being one with oneself, one with nature, not at war with one's fellows: such is the gospel I preach.

And listen not to the music of your possessions, for it is dissonant, and maketh you dissonant within yourselves.

But listen to the melody of your soul, and hearken to it: thus shall ye be at harmony with yourselves.

¶ Now, formerly I thought life absurd. I said in mine heart that time and chance are life's substance, and man is nothing.

Life hath no meaning, I said; death happeneth to all, and Earth is an atom in the universe.

³ A Nietzschean term. See section 9 of the Prologue to *Thus Spoke Zarathustra*.

Man is out of joint in his world: he is as Sisyphus, condemned to push his boulder to no end.

Wherefore is the world, and wherefore man? To what end suffer we, who are mortal?

But such questions, I see now, cannot be answered, and should not be asked.

If life is a mystery, we ought to celebrate this and not bewail it. It is a blessing, for it holdeth man's interest.

Life is a miracle, never to be understood. We can but imbibe Wonder until we are drunk on it.

And in the meantime we ought to live well, not in despair: we ought to live as we see fit, staying true to ourselves joyously.

We ought to embrace life as a lover, and love its sorrows, its joys, its mysteries: for then shall we know fewer sorrows, more joys, and more wonderful mysteries.

Think not that the world is terrifying and vast: but know that ye are a part of the world, as a spot of paint is part of the mosaic,

And know that ye are bright as a supernova, and as beautiful; and that ye shall never die, being a part of life.

For in death there is life, even as in life there is death. The two are inseparable, one and the same.

Ye are miracles, people. Be like children, and commune with the ineffable.

XXIV

But Joe's words fell upon ears of stone, and no man understood him: but all stood still in dumb astonishment, as though a wall had fallen from the sky and stopped them in their path.

They were not angry or impatient, but only nonplussed: their blood-wrath having been blocked, a vacuum filled their souls.¹

Howbeit, Joe's gentleness of temper, his warm lustrous presence (like unto the crimson-textured sun in purple twilight), his soft-cajoling words, the time-deceiving wisdom which echoed in his speech—all these things had made the people suspicious of him:

They saw he was not one of them, wherefore they loathed his speech and wished him dead.

A man came forward from this mass, sure of step and dim of eye; his raiment was of mottled greens and browns, drab like the dirt, the hue of death itself;

And he stepped in front of Joe and, bloated with pride, spake unto the gathering.

XXV

Fellow Americans! he said, I am Rod the Soldier! Hear my name and bow down before me!

And the people bowed and prayed before the neon(derthal) god they'd made.

Thou art our Savior! they cried; for thou comest not to bring peace but a sword, and to spread the American Way of Life!

Hallelujah, and praise be to Imperialism!

I have come from Iraq, said Rod; from the just and necessary war in Iraq, where I slew inhabitants in scores (much aided by my machine-gun).

Verily, video games are but a poor substitute for the real thing.

And as I beheld the ruins I had wrought, the collapsed buildings and the muddy blood-puddles, I was moved in my soul.

¹ See Dostoyevsky's *Notes from the Underground*, the first paragraph of section 3.

For the blood was real, the bullets were real: and the death-shrieks in the dark were real.

And when I stabbed those men in the battle of Fallujah, I saw the life pass from them with the blood, spurting like the blood.

Yea, there was chaos all around, everywhere! And the noise was deafening, as if Armageddon had come!

(The crowd stared at him tensely, suddenly full of doubt—but clinging to his words like a leech.)

And in the war-sown chaos, I looked around me in a silent moment—like unto the moment in *Saving Private Ryan* when Tom Hanks scans the beach in astonishment—

and in that moment I felt like God surveying his creation, and, like God, I saw that it was good!

(The people cheered, full of relief.)

Yea, it was good, it was noble—but most of all, it was exhilarating! I felt *alive*, surrounded by death!

Moreover, each man I slew knew the wrath of the United States, and felt the hammer-blow of justice!

Each severed head redounded to the glory of our nation; each explosion proved its greatness.

Wherefore I echo the old truth, *Dulce et decorum est pro patria mori!*¹

This man here, though, called Joe, is of a different mind. He preacheth peace and love, harmony and brotherly love!

He esteemeth not glory or country; he esteemeth only temperance, lovingkindness, and other soft virtues—anti-American traits!

He is indeed a traitor: his words dilute the patriot's ardor, and corrode the foundations of the state.

His highest good is a tepid love for all living creatures; but my highest good is to follow orders:

And that is the highest good of all patriots.

It is ours not to make reply, nor to reason why; ours but to do and die.² For the true American doth not think for himself,

But he knoweth by instinct that America is glorious, and that to die (and kill) for what is glorious is itself glorious!

And he will gladly slay all enemies of the state, first among which is this philosopher Joe!

XXVI

But Joe answered and said, Friends, this man's speech hath made plain to me mine errors.

Peacefulness and equanimity are not enough, for ignorance is an ever-growing mountain, which hath a planet's inertia.

Its movement cannot be halted without fierce determination, and the might of many Samsons.

Now, verily, this worship of the State is a detestable idolatry, which profiteth no men but those in power.

What is the State, indeed? Effectively, the government. But what is the government? The rich and powerful.

Democracy, like God, is dead, at least for now: government is neither *for* nor *by* nor *of* the people, but only of the rich.

Think ye the rich care aught for you, or for your troubles? They do not. They heed only their morality of power: they do what flattereth their power.

¹ "It is sweet and dignified to die for one's country." Cf. Wilfred Owen's poem "Dulce et Decorum Est".

² From Tennyson's poem "The Charge of the Light Brigade".

For I once belonged in their ranks: I once swam in riches as in a sea, and drank of money as of water.¹

I floated above the people's daily cares in my silver bubble; and my bubble's prismatic surface bent life's rays so as to dim the truth.

Why then flatter ye the rich with your nation-worship? The nation is a fiction: there is no such entity with singleness of interest,

But only discord, class war, mutual distrust, and lives that are solitary, poor, nasty and brutish.

Verily, there are a thousand Americas, not one; and each person is, for now, an atom, which striketh others but doth not bond with them.

Our enemy is not a man or group of men; it is the social order itself, which maketh all of us each other's enemies.

Indeed, a man hath become his *own* enemy: for he scorneth his fellows' brotherhood, which his deeper soul doth covet devoutly.

And so he ensnareth himself in himself, and maketh of himself a fetish.

—Behold: as the young man hath a hero, beside whom he despiseth himself, so the modern person is a golden fetish to himself.

He is his other, a self-hateful Narcissus: whence overfloweth discord into the world.

Conquer self-estrangement,² then, and its social causes: therein shall ye conquer your enemy.

And nation-worship, God-worship, money-worship shall cease: man shall not lower himself and raise his creations:

Neither shall he be slave to his property, nor wolf to his fellows, but he shall master his transparent fate.

He shall, that is, be *authentic*, undivided in himself, nor divided from his fellows.

XXVII

But we must battle the acquisitive spirit and the preachers of acquisitiveness: we must war on capitalism.

This society is inauthentic, self-divided, a slave to itself and its laws of economic movement.

No man steereth his life, but he is steered by fortune's invisible hand; and his world is strange to him, and unjust.

For the wicked person prospereth, and his works increase his renown; but the righteous man prospereth not,

For he is locked in a stockade and mocked.

Yea, he is handcuffed to the bars of bitter solitude, and mocked by his peers.

For righteousness hath not a home in capitalism. It is an anachronism, not only superfluous but counterproductive.

And democracy, too, is dangerous, unnecessary, and nearly impossible: the people, the wage-laborers, *must* have less power than the élite.

¶ Behold, in capitalism the multitudes toil in poverty and hunger. For Capital is a cruel taskmaster.

The West hath for centuries enslaved the world and murdered its people for the sake of one more dollar; and things do not change.

Injustice cannot remedy itself, but its nature is to worsen with time and the centralization of power.

¹ Cf. Job 15:16.

² Or "alienation". This is a Marxian concept. The concept of the "fetish", or the "reification", is also essential to Marxism. See, e.g., the first chapter of

Capital, as well as I. I. Rubin's *Essays on Marx's Theory of Value* and Georg Lukács's *History and Class Consciousness*.

Its reforms through the years have been cosmetic: behold the state of Africa, South America, most of Asia, and the multitudes within *all* lands.

They sweat and toil and bleed for food, as their masters lay waste their lands; and “democracy” availeth not.

Wherefore we must overturn the system. We must change the world, so that money is superfluous and greed hath no dominion,

And man is no longer lashed to his possessions and broken thereon, like a prisoner lashed to the wheel.

We must, therefore, deliver mankind from economic scarcity, which breedeth money and greed, and war.

Only material abundance can deliver us from evil; only science and reason can deliver us from scarcity.

Not until the springs of cooperative wealth flow abundantly¹ shall humanity fulfill its destiny;

Not until society inscribeth on its banners, “From each according to his ability, to each according to his needs!”² shall there be peace on earth.

For then money and the State shall wither away, and democracy shall flourish.

And machines shall no more erect walls between men; and wealth shall no more be the touchstone of worth.

And possessions shall no more be as persons, and persons shall no more be possessions. But people shall be free.

XXVIII

Then Mammon answered Joe out of the whirlwind, and said,

Who is this that gainsaith greed through words with knowledge?

¹ From Marx, *Critique of the Gotha Program*.

Fondle now thy loins like an entrepreneur in the throes of speculation; for I will depict the power of Mammon.

Where wast thou when I planted empires across the earth? Truly, thou wert not a speck in nature’s eye.

Where wast thou when Sumer sprang forth from an economic surplus, like Athena from Zeus’s head?

Who built the pyramid of Giza, or the Great Sphinx? No pharaoh, no slave, but I alone.

For whose sake are wars waged, or dynasties founded; and who breathed inspiration into great Alexander?

My stage is world history, from the nomads of Asia to the oligarchs of America: thou art brief like an insect.

Thy works have the weight of willow-down in the wind, and they contend with a grain of sand for insignificance.

Canst thou with thy breath plant railways, or grow cities? and can thy breath level empires?

Hath love for thee alone made men blast granite quarries, and bridge Alaska with an oil pipeline?

Did love-of-Joe create the St. Lawrence Seaway, or impel the conquistadores to heights of heroic cruelty?

No! Love of money, love of power, is alone responsible for everything.

For my sake only do men subjugate the earth and slaughter their fellows; and I give them strength to subdue their own humanity.

I can give a mouse the power of a lion, wherewith to bend men to his will: behold George Bush, and Rupert Murdoch, and Donald Trump, and other such mice-become-lions.

² Ibid.

I can alter hierarchies of nature, and make great what is small; I can reverse the order of things, and make order from chaos.

Behold: in the beginning was scarcity, and hunger; and from those wretched seedlings I have remade the world in mine image,

With the commodity as the foundation of society, and money as its pure form—the lubricant of social intercourse.

And though thou thinkest history is done, and my dominion at an end: verily, it has hardly begun!

The past is not long, the future is eternal; and my kingdom on earth is in its infancy.

My highest glories await me: and theirs shall rival the majesty of all creation.

XXIX

Lo, I shall shortly re-carve the face of the earth, and re-draw the lines of the continents:

For my minions have polluted the earth, and warmed its climate, which shall wreak revolution on man's little cosmos.

Millions shall perish, as in Noah's flood; your beloved "new world order" shall become a second Atlantis.

And then shall begin the reign of war, of global war: and it shall be my finest hour!

I will make the earth my mirror: anarchy and power-struggles shall be the naked law,

And each man will guard his plot of land as a tigress guardeth her young.

Then from the rubble shall rise another Rome, another Caesar, and Huns, Goths, Gauls, Franks, Vandals;

And Charlemagnes, and Tamburlaines, and Genghis Khans, and Suleimans; and civil wars, and slaveries, and genocides, and holocausts.

And thinly veiled capitalisms, and socialisms, and tribalisms, and globalisms: all, all shall go on, forever, until the sun swalloweth the earth!

For I am the one god, the sole god men believe in: I, Mammon, the Eternal One—the Will to Possess.

Thou wert indeed right, Joe: life is absurd, and history is absurd: it hath no meaning but me.

Ye are blades of grass, ye humans, and I am the wind which stirreth you; and I am the foot which trampleth you;

And I am the sunlight which sustaineth you, and the soil wherein ye are planted.

There is no *telos* of history, as there is no rest from me: for I am the way, the truth, and the life;

And behold, the truth shall make you free, should ye follow it as Rupert Murdoch hath done (in whom I am well pleased).

He who walketh in my footsteps, with will and knowledge, shall be as the mighty eagle, which owns the heavens in its solitary grandeur.

And I ask for nought in return but that he shun idols, be they named Compassion, Love, Generosity, or whatever.

Then the fate of mankind shall not burden him; the deathless cycles of pain shall not oppress him: for he shall have bought his happiness.

And as the walls of civilization fall around him, and the bleatings of the downtrodden rain as from the heavens, he shall be unencumbered:

In his stately pleasure-dome in Xanadu he shall perch himself, aloof from the tears of the blighted.

XXX

But thou, Joe, thou trafficker in pity, thou hast cursed me to my face, and transgressed against me.

Flightless insect, thou hadst temerity to mock my law, which is hoary as Hammurabi's Code.

My law is as durable as Stonehenge; thinkst thou it can be undone, or forgotten like the wind?

I make the earth tremble, and I revise its lineaments; I hasten geological change.

I place my footprint on the dust of the moon, and plant a flag therein; and my fingers reach through the solar system.

I am as the black hole at the heart of the Milky Way: for life turneth round me, and I am the gravity of civilization.

Moreover, all thy modern comforts, thy sumptuous American lifestyle, the miracles of technology that prop up American power,

And the inexorable whirlwind of science which hath blasted every nation in the world, shivering every monolith of ignorance and religious illusion,

Subverting every authoritarian ideology, scattering abroad the roots of democracy, which sprout as luxuriant weeds;

And the thought-patterns of individualism and equality, so cherished by you Americans, with their progeny feminism, socialism, pacifism, multi-culturalism;—

In short, everything people esteem in the modern world:

It all hath its origin in the power of the profit-motive, and of the capitalist mode of production, with its relentless expansion of the productive forces.¹

For, as capitalist enterprise spreadeth its dominion, the multitudes flock to cities, seeking employment;

And since they inhabit slums together, they develop a class consciousness and begin to fight for equality;

And intellectual spokesmen appear, both bourgeois and proletarian, who trumpet the millennium: *rights*, universal *rights*, equality and liberty!

(*Bourgeois* rights at first—political equality of the propertied classes, freedom to have property, an inviolable right—and then *socialist*.)

Liberalism and democracy spread like conflagrations, even as capital and political power centralize, thus propelling technological and scientific conquests;

And the movement for equality spillesh into sex- and race-relations; and religion waxeth ever more impotent (notwithstanding fanatics), since it is superfluous to economic life;

And the world is created anew—solely because men crave profit and power.

So thy mind, Joe, and thy body, and thy newfound species-conscience, and thy very being hath grown in my fertile soil.

—Verily, Joe, I am thy father. Wouldst thou kill thy father? Thou needest me.

Nature hath decreed scarcity for all time, wherefore ye humans must ration your goods; and so I am immortal.

Resistance is futile: embrace yourselves, love yourselves, and so make permanent war.

XXXI

Then Joe answered the Lord, and said,

Ere now I did not know, Mammon, thou wert an actual being, like unto a god; but it surpriseth me not, for thy power is awesome.

¹ This is Marxism. See, e.g., Marx's Preface to his *Contribution to the Critique of Political Economy*. Marxism, by the way, is as relevant now as it has ever

been, at least in its explanatory aspect (as opposed to its revolutionary).

I know that thou rivalest the sun in thy power, especially in modern times, and that thy power passeth understanding.

If thou smite billions of people and destroy their lives, it is not my place to question thee;

But I should rather rejoice for the few men upon whom thou bestowest all thy gifts: for they have truly *inherited* the earth.

Behold, I am vile; thou hast made me abhor myself, as thou makest mankind abhor itself (and rightly so).

Men arise and pass away like leaves, but greed and selfishness have no end.

¶ And it was so, that after Joe had spoken these words, the Lord said to Jim the Politician, Bob the Intellectual, and Jon the Preacher,

I have contempt for you, because ye have neither knowledge nor dignity;

And while Joe, too, hath not dignity (for that he is a man), at least he hath knowledge.

Therefore ye shall be the servants of Joe the Capitalist, like all your brethren, and offer up your minds to him.

And if ye stray from your appointed paths and disobey my commandments, ye shall be exiled

I like the hidden wordplays. As in the line “Beauty is trust, and trust beauty, for it hath not the ugliness of deceit”. Obviously the second ‘trust’ is supposed to be both a noun and a verb. But also, the first two clauses hark to Keats’s line “Beauty is truth, truth beauty”, while yet surpassing it both aesthetically (in one way, at least) and in terms of psychological profundity. For absolute mutual trust characterizes the most beautiful, the most loving kind of relationship. Keats’s line, on the other hand, is not so pithy or insightful: it’s just a romantic platitude. (Even when Keats wrote it the sentiment was already a platitude, or nearly so. It was in the heyday of romanticism, after all.)

I had a date with Rebekah, intelligent ex-Harvard student doing genetics. Wants to see me again.

Of all the absurdities that occur in dreams, none is more absurd than dreaming itself. Even if the content of dreams were perfectly coherent and logical, or were an exact repetition of the events of the preceding day, dreaming would still constitute a flagrant violation of logic. For a dream is something that is both experienced and not experienced at all. The dreamer is simultaneously aware of his dream and unaware of it. He experiences it without experiencing it. What does that mean? How is it possible? Both conceptual and “intuitive” understanding are inadequate here—though the intuitive (imaginative) kind is

from society and forced to live in a bathtub, like Diogenes the Stoic.

So Jim the Politician and Bob the Intellectual and Jon the Preacher did as Mammon commanded them.

And Mammon restored Joe to the oligarchy, giving him twice as much as he had before.

Then came unto him all his brethren, and all his concubines, and all his former friends: and they secretly bemoaned his good fortune, but comforted themselves that he had been miserable for a time: everyone also bribed him, which sealed their friendships.

After this lived Joe a hundred and forty years, due to the wonderful healthcare his riches bought, and he saw his sons, and his sons’ sons, be raised up like their forebear. One of them even became president of America, although by then the country was a province of China.

So Joe died, being old and full of vice.

more nearly complete. (It consists in imagining yourself having a dream, imagining what that would be like.)

Freud's book is gripping. I love it. I only just finished the second chapter, but already I'm hooked. What a genius he was! [Calm down, dude. He wasn't that great.] I wish I were better able to remember my dreams in the morning, so I could analyze them in Freud's way.

August 27, 29, 31; September 2

Sad.— Dawkins is right: humans, like all animals, are nothing but survival-machines for their genes. Literally. To reproach them for having no dignity is silly. Who ever heard of a dignified machine?!

(I keep thinking of the end of *The Last Samurai*, when the restless American finally walks down into his valley of peace to live with his loved ones, never again to return to his diary.)

Moved to Brighton, near the school where I work. The apartment and the neighborhood are picturesque (suburbia), and the place is only \$450 per month!

It's remarkable but predictable how big an effect a change in location can have on one's state of mind. The charm of my surroundings inspires me—to get healthy! I'm gonna work out again and I'm gonna start running, with the help of my iPod. (Running! I *hate* running! But it's such a lovely neighborhood...!)

[...]

Reading Camus's *The Fall*.

Knowledge of one's ignorance is knowledge indeed.

“...On my own admission, I could live happily only on condition that all the individuals on earth, or the greatest possible number, were turned toward me, eternally in suspense, devoid of independent life and ready to answer my call at any moment, doomed in short to sterility until the day I should deign to favor them. In short, for me to live happily it was essential for the creatures I chose not to live at all. They must receive their life, sporadically, only at my bidding.” Yes, yes, yes. I sometimes reflect how unpleasant is the thought that women all over the world are falling in love with men other than me. [...]

Sometimes, what a person needs most is a good dose of honesty. In this world, though, that's what he'll receive least. Everyone is too “good” to be honest anymore.

The narcissist attempts to justify himself.— “Everyone, nowadays, is a narcissist. In me alone, however, is narcissism justified.”

Why is gossiping fun? First of all, there is the (listener's) spontaneous, irreducible pleasure of having curiosity satisfied. This pleasure is involved in any kind of storytelling, and indeed is (partly?) responsible for the pleasure of understanding something or of arriving at a solution to a problem. Secondly, though, there is the pleasure of being “in on it”, of being in the know, of being deemed worthy of hearing this secret, and thus of being respected and validated. Of entering into a community, however short-lived, with another person, namely the person who is gossiping with you. (If you are the one who communicates the secret, your pleasure comes from the attention focused on you, the validation that is implicit in the attention. In other words, the favorable value-judgment on your worth, the judgment that you half-consciously know is being made.) The act of valuing (or devaluing) someone—including oneself—is at the very heart of what it means to be human, and of what drives humans to act in the bizarre ways they do.

It is easier to take offense at words than at actions, because words are more direct.

Having finished reading *The Fall*, I feel obligated to myself to make a few observations on the book's relation to me.

The narrator's successful, happy, easy life was interrupted one day when he realized that he was not as virtuous as he pretended to be. ... On second thought, I don't feel like laying it all out for you. The point is that the narrator experienced a crisis when he realized he was not "an innocent man" but a guilty one, and that everyone is fundamentally guilty. The problem was, how would he live his life under the glare of this knowledge? How could he live in an un hypocritical way, in such a way that he could go on judging people as always, as everyone must (in order to think he's superior), without deserving to be judged by them at the same time and for basically the same reasons that he judged them? He wanted to have a clear conscience, to believe he was superior, as he always had, but by rights he couldn't. For a while he struggled with this problem, until finally the solution came to him: if he judged himself with sufficient severity ("*J'accuse—moi!*"), he could go on judging others and dominating them with a good conscience. If, from time to time, he "profess[ed] vociferously [his] own infamy", he could go on permitting himself everything (for example, the duplicity that he couldn't help practicing, being a modern man). The point seems to be that by repenting periodically, accusing himself, he salvages the craved conviction of his superiority (presumably because he knows that other people *don't* accuse *themselves*, and so to that extent at least he is better, or more honest and insightful, than them). "The more I accuse myself, the more I have a right to judge you."

This is all very similar to what I've said a thousand times. All these paradoxes, all these ironical self-justifications, are vintage me. I've even made exactly the same observations on guilt, judging, etc. as Jean-Baptiste Clamence did. The difference between us is that we adopt different "solutions". (Mine, needless to say, is better.) While Clamence judges himself mercilessly, thereby giving himself the right to judge others, I say that we simply have to go on living our lives as before, judging and so on, while remembering in the back of our minds that our judgments are ultimately mistaken and hypocritical. Indeed, the very act of judging is virtually meaningless. And yet at the same time I recognize something which Clamence doesn't, and which at least apparently can justify certain judgments: taking ordinary values as our yardstick—perhaps even clarifying them a little, making them more honest etc.—some people, after all, have more worth than others. Some are worse than others, some are better. Dick Cheney is worse, Albert Schweitzer is better. It isn't as though everyone is simply "*guilty*" (as Clamence thinks) and nothing else can be said on the matter. There are subtleties, there are gradations in worth. If all goes well, I myself am one of the good ones—and so to that extent I'm justified in putting myself on a pedestal and criticizing others. My solution is the better one because it's more subtle and insightful, less self-deluding, and more ironical.

September 4, 6, 8

[...]

Reading the fourth volume of Anaïs Nin's diary. Reminds me of the Goncourts, of all self-intoxicated artists. Not healthy. Cloistered. There are no vistas or open visions as in thinkers or masculine artists; everything is Ninnified—first masticated unconsciously and then ejected as a dark pink bolus all dripping with Nin.

Her world was different from mine, from the contemporary world. It was over-serious and over-artistic. Intense, everything was intense, and people were expected to have substance. Not anymore, though. Nowadays everything is either fun or political, those are the two poles—which, by the way, have one thing in common, namely cynicism. An aura of transience and resignation.

Reading *The Oxford Book of Short Stories*, edited by V. S. Pritchett. Hoping for some inspiration to write a story of my own.

Met Olga tonight, a Russian girl from Azerbaijan—petite, full of energy, full of wit that draws out my own so well I was practically a comedian. She's a systems analyst, whatever that is. In a few days I'm

meeting another Russian, Yulia, who's getting her Ph.D. in Renaissance poetry and is a devotee of Byron. Her favorite poem, and mine, is *Don Juan*.

What looks like weakness in some women is merely a sublime humanity.

I'm eternally grateful for my time spent at UMSL, if only because that was the first time I really pushed myself and realized my potential.

I'm meeting Gina later. She's a good friend, thoughtful and fun and charming (if sometimes ditzzy, air-headed). Contagiously happy, contagiously flirtatious. The pleasures of such company never get old, at least not during youth.

When an artistic flaw is a human strength.— Artists can take it as a compliment when critics accuse them of being sentimental. For sentimentalism is but an extreme love of the truly human in life, of what connects people to one another and, in the end, makes life worth living.

It is surprisingly easy to forget that the future is going to be replete with pain.

One wonders how professional critics contrive not to have self-contempt.

“The point of life is but to *live*,
And *love*, and *laugh* until you *weep*,
And also, don't *receive* but *give!*”—
“No no,” I say, “that wisdom's cheap.
Here's my advice on how to live:
Put down your pen and go to sleep.”

September 9 etc.

I never tire of kissing Gina. —Our relationship is peculiar. We're just friends but occasionally, in the right moments, we kiss and hug and all that. We went to a club later; met four of her friends there. It was bursting at the seams with scumbags, so I had to be the bodyguard and constantly push pushy assholes away from the five of them (these five cute Thai girls). It was fun being the protector. Lord of the flies—swatting the flies away, the big burly drunk flies.

The running didn't last long, but I'm still exercising a little. In my room. Focusing on pecs, only pecs.

Glanced at my old story on the perils of drunkenness. Very bad. I ought to have taken a creative writing class in college. Norman Mailer says somewhere that those classes can be very useful. (On the other hand, I can at least say, as a result, that I taught myself how to write, which Mailer can't say. That's a vain pleasure, but all pleasures are vain.)

Night-feelings

I can't stop thinking of you, love. You're like
The rain tonight, which makes me think of you.
O what a night to write a poem for you!
It's raining just for you, only for you;
The sweet nostalgia pours down from the sky.
I can't help crying looking out there. Why?
Why should there be these tears? I'm so happy.
I'll let them come, though. If the sky can cry,

Then so can I. And I can sky-cry too,
 With my whole body shaking like a cloud.
 There is such rain in me—though only you
 Can bring it out. Only the thought of you.
 What are you doing now? Painting some street
 Somewhere with dancing-in-the-night? Singing
 Your sunny soul from off some night-drenched rooftop?
 Or are you laughing with your sister like
 A butterfly, a monarch sipping life's nectar?
 Perhaps you're looking at the rain like me,
 Quiet like me, thinking of me... We
 Are all there is, we and this lonesome night
 (Scented like an autumn fog). —And when
 I think of all my past, and all I've suffered,
 And all those years I longed for rest or death,
 I listen to the calming rain, drumming
 Like a massage, and I contemplate
 The window-rivulets, which move and melt
 Together, and I sit here silently
 And think only of you, only of you.

Reading *The Rise of Christianity* by Rodney Stark, a sociological/historical analysis. It's thought-provoking. My only criticism is that insofar as Stark is a follower of Popper and is thus dismissive of theorists like Marx, Durkheim, Freud and Weber as being “unscientific”, merely “metaphorical”, the book is shallow. Luckily, Stark has substantive things to say and explanations to offer, unlike Popper. (Popper reminds me of professional critics. He spent his whole career methodologizing and ‘apologizing’—see *The Open Society*, a defense of liberalism—criticizing real thinkers and not offering anything of his own—except principles by which to criticize them.¹)

I'm tired of Ranjana, don't care to see her anymore. She's moody, self-talkative, boring, insecure and overly sensitive, not very intellectual. [...]

Advice from Gina on getting women: I should be less talkative, less easy to talk to, “calmer”; make them feel a little insecure, like “What's he thinking right now?”, by talking more slowly and seeming not to care what they think of me. That just confirms what I've known, that I'm too friendly and likable, like a mere friend. I hope I haven't already ruined it with Olga by being a responsive guy who got along well with her. Talk slowly, talk slowly Chris! Walk slow, talk slow, do everything slow, project total control.

September 14 etc.

Liebesbotschaft

Some people need some things that I don't need.
 Some people need to feel loved by all,
 By everyone. They need the world to scream

¹ My contempt for that man has no bounds. Someone who glibly casts aside hundreds of subtle theories and suggestive insights just because they fall under the blanket term “psychoanalysis” or “Marxism”, and who does so only on the basis of ridiculous straw-man arguments that none of his adversaries would ever put forward—and who, moreover, is so vain that he thinks he is one of the greatest philosophers in history and tells this to anyone who will listen (not in so many words, though)—someone like that is a clown. He is a college freshman with a love of facile generalizations, as well as a totally irrational love of himself.

Their names when they walk by and scramble so
 To touch their hands. Others there are who need
 To travel the continents, to migrate like
 The albatross a thousand miles each year
 Toward some receding point on the horizon.
 Some people need to be immortal—to live
 Far in the future, not the present;—still others
 Are tormented with lust for perfect knowledge.
 These people, all of them, are Faustus, Faust-clones,
 Unhappy as the universe expanding
 Into nothingness—as nothing as
 The abstract needs these tortured people have.
 But I, my love, I do not need such things.
 They're nothing to me. For all I need, my love,
 —And *all* I need—is in my arms right now.
 And all I need is this soft shoulder, this
 Soft cheek, these soft breaths exhaled with mine.
 There's nothing else. So I will stay here forever,
 Not thinking of those people who need things
 That I don't need, since all I need is you.

Stark notes that “women in many different times and places seem to be far more responsive than men to religion”. For example, in early Christian times women were more likely than men to convert to the new religion. In modern times, it has been reported that two-thirds of the Shakers were women, 75 percent of Christian Scientists were women (in the early 20th century), 60 percent of Theosophists, Swedenborgians and Spiritualists were women, and the majority of new Protestants in Latin America are women. (Apparently “an immense wave of Protestant conversions” is taking place in Latin America. That's not surprising, for many reasons.) So, why is this the case?

The answer isn't hard to think of. First of all, new religions, especially the religions that succeed, tend to promote equality, in particular sexual equality. Since they usually arise in social conditions of relative inequality, obviously women will favor these alternative belief-systems. (Christianity was born in the sexually unequal pagan world, and the sexual relations it promoted were extremely progressive. The same was true of Islam.) Secondly, women are naturally more attracted than men to the strong social networks that religions create, for reasons I discussed in the chapter “on women” that I wrote for my book, as well as in other places over the years. Religions appeal to emotional, communal, instinctual impulses over purely intellectual ones, so women will be especially attracted to them (being more emotional and ‘communal’ than men). And they will therefore be disproportionately attracted to *new* religious movements, since such movements, being full of renewed religious fervor, are usually revitalizing vis-à-vis communities—vis-à-vis, indeed, all social activities. They bring people together, which togetherness women crave. Also, one of the major functions of religions is to alleviate real suffering, and you can't deny that women tend to suffer more than men. (Loneliness, social insecurity, physical ailments, poverty, lack of opportunities for social advancement, the miseries of women's old age, etc.)

Those are the main reasons.

By the way, it was an exceedingly unpleasant thing to be a woman in Greco-Roman times, for ten thousand reasons. A particularly gruesome one is that abortions were very common and abortion techniques were very crude. Tertullian described an abortion kit used by Hippocrates: “...a flexible frame for opening the uterus first of all, and keeping it open; it is further furnished with an annular blade, by means of which the limbs within the womb are dissected with anxious but unfaltering care; its last appendage being a blunted or covered hook, wherewith the entire fetus is extracted by a violent delivery. There is also a copper needle or spike by which the actual death is managed.” A Roman doctor writing in the first century gave the following instructions to his fellow doctors (paraphrased by Stark): “‘after the death of the foetus’ the

surgeon should slowly force his ‘greased hand’ up the vagina and into the uterus (keep in mind,” says Stark, “that soap had yet to be invented). If the fetus was in a headfirst position, the surgeon should then insert a smooth hook and fix it ‘into an eye or ear or the mouth, even at times into the forehead, then this is pulled upon and extracts the foetus’. If the fetus was positioned crosswise or backwards, then Celsus [the writer] advised that a blade be used to cut up the fetus so it could be taken out in pieces. Afterwards, Celsus instructed surgeons to tie the woman’s thighs together and to cover her pubic area with ‘greasy wool, dipped in vinegar and rose oil’.” Christians were very sensible to outlaw abortion. They also outlawed infanticide, which was widely practiced by pagans.

Of all the romantic composers (except Tchaikovsky), from Weber to Schumann to Brahms, Liszt may have been the best at orchestration.¹ His orchestral intuitions in *Les Préludes* are masterly. The tone color of every instrument is perfectly appropriate to the melody or harmony it is singing. (Thus, you have the noble french horn introducing the noble theme, and then later after the storm of the middle section you have the calm and warm horn proclaiming the dawn, followed by an oboe—which Rossini, too, knew was perfect for painting the dawn, judging by his use of it in the William Tell overture—and a moment later the soothing and sweet clarinet, followed by the flute. The harp evokes heaven and angels after the violence of the middle section; it accompanies the violins, which play delicately in the upper register as if they are giving a benediction. A minute or two later, around 11:15, the woodwinds become playful as only woodwinds can. Near the end, the brass comes in majestically. And finally the trumpets and trombones and horns end the piece in the most overpowering way.)

Having been sick for over a week, I very nearly faint when listening to the end of that piece.

Today was a day of shallowness. First I had lunch with a 21-year-old girl who gives new meaning to the word ‘uninteresting’. Then I had dinner with the air-headed Gina (though that was at least a little more fun). Then I read about rational choice theory in Stark’s book. As I’ve said before, this set of ideas is a silly and superfluous bourgeois invention that explains virtually nothing. Stark wants to argue that religion is “rational”, that it isn’t based on “irrational” impulses (which social scientists, he says, have often argued) but instead on rational choice—which means that it “involves weighing the anticipated costs and benefits of actions and then seeking to act so as to maximize net benefits”. Indeed, the proposition that individuals choose their actions rationally is (so he says) “fundamental to the whole of social science”. “The assumption of rationality has numerous expressions in the social sciences. Economists speak of utility maximization; exchange theorists postulate that ‘people are more likely to perform an activity the more valuable they perceive the reward of that activity to be’. Elsewhere I have proposed that ‘humans seek to maximize rewards and to minimize costs’.” In other words, to say that individuals choose their actions rationally is to say they act according to their preferences, or their “preference schedules” (to use economic jargon). They do what they think will be most rewarding. But individuals evaluate specific rewards differently; this is why a person like Mother Theresa acts differently from a person like Donald Trump, and why they both are equally rational (namely, because they find different activities rewarding).

These are all earth-shaking insights, as you can see. Diluted Benthamism is very interesting and theoretically powerful. Actually, the peculiar content of the “theories” that Stark is describing poses a question that philosophers like Christine Korsgaard have grappled with: if reason means acting in such a way as to bring about your ends (or to maximize rewards and minimize costs, or, in short, to do what you prefer to do), then how can reason be normative, as it’s supposed to be? It seems impossible *not* to act rationally. Jeffrey Dahmer was acting rationally when he had sex with corpses before dismembering them and then dissolving them in a vat of acid, because he was maximizing his rewards—which is just to say that he was behaving as he wanted to. I tried to resolve all these confusions about reason in my paper on values (that paper which is too profound for its own good), so I recommend you take a look at it.

Having established conclusively that people tend to act as they want to, and that this proposition is of very great importance for the social sciences, Stark proceeds to argue that early Christians were, in fact,

¹ [You’re forgetting Berlioz, idiot.]

acting as they wanted to when they became Christians. They were not acting irrationally; rather, they were—acting.

[...]

Had lunch with Yulia, the Harvard alum who smells of stale academe. We talked about old literature most of the time because Harvard students are limited by their specialties and talk mostly about themselves and aren't good at showing interest in other people. Luckily I'm *not* limited and I *don't* talk about myself much and I *do* show interest in other people, so the date wasn't as uncomfortable as it might have been.

Now that I'm not taking the pills anymore, I'm starting to be able to *feel* again. Feel lonely and melancholy but also pleasantly sentimental and nostalgic for nothing in particular. Just a diffuse misty nostalgia when I listen to, say, Bob Dylan, Eric Clapton, Stevie Wonder ("I Believe"), the Foo Fighters ("Razor"), Fiona Apple ("Across the Universe"), and all the ordinary classical stuff. I'm on the bus or the train clenching my teeth, biting my lip, to hold back the mild tears, looking at the world pass by out the window.

Reading Maya Angelou's collected poems. I like them better than most contemporary poetry.

What are your thoughts?

What do you think of this?
 A world in which people are dogs and dogs are people,
 And the dog-days, the days, linger like dying.
 A world in which the nights, the lone nights, are slept through
 Alonely in beds for two (bookend beds) while censored dreams come through.
 A world in which all wishes are for an immortality which no one wants,
 And people know one thing only, and that is futility.
 A world in which sleep is not rest and people are not genuine.
 What do you think of this?

September 18 etc.

Double life

The sassy walk, saucy as these sultry summer nights,
 hip-swaying entertaining "your eyes only";
 The toss of the head coquettishly, her blond highlights glint
 in "your eyes only";
 The superfluous flirting of new love, like the pink
 feather-tips laid over a lavender dawn;
 The sweet naïve contrast between days and nights, new
 days and new nights,
 with the daytime smiles and the nighttime sighs
 (deep soulful sighs breathed into breasts and arms);
 The dancing naked shy near the edge of the bed,
 young queen dancing for "your eyes only";—
 This is what I miss, miss terribly, though I have never known it.

It's a pity I hadn't encountered Kahlil Gibran's *The Prophet* when I sat down to write my satire. My writing would have benefited.

Confession

(For Stephen Dobyns)

The Nazi within me wants to rid the world of vice, which he defines as “everything different from me”. Specifically, bureaucracy has got to go, and people who follow rules. Authority is always wrong. The Nazi within me hates power and those who have it; he thinks politicians should be lined up against a grey wall and shot. (He is perfectly happy to do the shooting, provided he is in the right mood.) The Nazi within me hates people who are unkind, and he will strangle anyone who is rude to that nice old Russian lady in the bookstore. Tobacco and pharmaceutical executives, and most people in show-business, are to be sent to Sudan to wait hand and foot on the natives; and everyone in the Pentagon has been assigned to Cambodia to clear the mine fields. (This decision cannot be appealed.) The Nazi within me judges everyone, he is the final arbiter of everyone’s fate and takes great joy in meting out punishment. For the crime of smugness you are sentenced to ten years’ hard labor in Somalia; for the crime of honking your car horn when it does no good you are sentenced to one year in the room where they test car alarms. The Nazi within me hates falsity of any sort but insists that when he passes people in the street they quickly step out of his way and give a respectful nod, while wishing they could be as good-looking and godlike as he is. As for those who do not wish this: Siberia is their new home.

I just got the internet in my new apartment so I’m re-trying to get my writing published. In the next few days I’ll start sending poems to journals again, and I’m also sending *The Book of Joe* to independent publishers.

The exception to Kantian morality.— A “great man” should not, and does not, treat himself as an end, but as a means. He has a violent, antagonistic relationship with himself: he exploits himself, enslaves himself, works himself to the bone. Every droplet of talent he has he wrings out, sweats out in exhausting self-floggings; and if his body cries out in fatigue he spits on it in contempt. And yet in another sense he is a perfect Kantian: *duty* is all that he respects. Duty to himself, the duty to become a god. Pity has no place in his morality.

September 23

Mozart’s last piano concerto might be the most perfect, the most ‘finished’, concerto ever written. The one in C-minor is unique too. But I like his last one better because it seems more ‘peaceful’, it’s more playful, and it’s in a major key. (I prefer major keys.)

September 25 etc.

Beethoven showed us what he could do, what he was capable of. Mozart didn't. Mozart's very immaturity as an artist up until his 30s was a symptom of his genius: he reveled in his powers so much that he wrote frolics and fireworks, just having a good time. (Artistically there is such a thing as being *too* brilliant. Just look at *Finnegans Wake*. Joyce's genius was such that, arguably, it led him to write artistically flawed works—works that couldn't speak to others, works that were, at least apparently, undisciplined.)

Schubert didn't either, obviously. Imagine a Schubert who lived into the 1860s. Imagine how he would have changed the face of music. And then I dare you to tell me that this world isn't a tragic farce.

As I read contemporary poems—or, to be precise, as I *look at* them, since mostly they're unreadable—I think that maybe my poetry isn't as mediocre as I've thought. At least it isn't self-indulgent word-play: it communicates real thoughts, and it's animated by a single overriding vision. "What vision?" A vision of suffering, of restlessness, and of nostalgia for things spiritual.

Midnight. Miserable, restless, a little sick, depressed in my underlying soul. Have I lost the ability to love? Has this world taken it from me? Will I ever feel passion again?

I'm looking for a new job, since my mistake of a boss, having promised me in August that I could stay for the fall, has decided I have to go because the student numbers are too low and the place is over-staffed. [...]

Went to a poetry reading at Harvard Square with two of my students. It was silly. Two male poets read without feeling their wordplay-experiments. The shit is too dense to absorb when it's being read at you, so you just sit there with your eyes closed and try to concentrate hard enough so that a few of the bizarre incongruous images conjured by the words will actually register in your mind before they're supplanted immediately by other bizarre incongruous images that don't seem to communicate any thoughts in particular. And you just know that these people reading and most of these people listening are the most pathetically self-overestimating pretentious little shits imaginable. —Charles Bukowski said that "poetry readings have got to be the saddest goddamned things ever". Yup.

September 30 etc.

I'm reading Hollister and Bennett's *Medieval Europe: A Short History*, Robert Lacey's *The Year 1000. What life was like at the turn of the first millennium: an Englishman's world*, and Tocqueville's *L'Ancien régime et la révolution*.

Sick with disgust that the universe doesn't know I exist.

Tocqueville points out again and again, in astonishment, that *nobody* foresaw the French Revolution, even on its very eve. He opens his book with this sentence: "No great historical event is better calculated than the French Revolution to teach political writers and statesmen to be cautious in their speculations; for never was any such event, stemming from factors so far back in the past, so inevitable yet so completely unforeseen." A hundred and fifty years later, Walter Laqueur, the political scholar, devoted much of his book *The Dream that Failed* to the question of how it was possible for Western academics to have failed utterly to predict the fall of the Soviet Union, even after glasnost and perestroika. Specialists on the USSR, people who *devoted their lives* to studying it, had no inkling whatever of what was about to happen. The *enormous industry* of scholarship on the USSR had not a single word to say about a REVOLUTION!!! or even the THOROUGHGOING DECREPITUDE OF SOVIET SOCIETY!!! until after the fact!!! —The moral of the story, kids, is that the academic community is not to be taken seriously. The "analyst", the "expert", who has real insight is an incredible rarity.

(Not to mention the “experts” who actually have a hand in guiding policy. The experts who led Kennedy into the Bay of Pigs, the experts who waged war on Vietnam, the experts who planned the Iraq war—a veritable army of them, in policy institutes, in the Pentagon, in the State Department, in the White House. It seems like the more educated you are, the less in touch you are with reality. Which isn’t surprising, since “education” basically means “indoctrination”.¹)

Though it’s hard to believe, history is still very, very young. Civilization is still experiencing its birth-pangs, which began around six thousand years ago. We “postmoderns” are thoroughly embedded in history, just like the Vikings were and the Greeks. Ten thousand years from now humankind will be colonizing the universe, and *our* existence will have been forgotten.

People forget that the West, and thus indirectly the rest of the world, is still living in the shadow of the Middle Ages. Our world was carved out in the Middle Ages; it isn’t as if we created it ourselves *ex nihilo* in the last three hundred years. Modern nations, modern prejudices, modern religions are all leftovers from the Middle Ages, from population movements and military invasions and the troubled evolution of Christianity. Not until national identities dissolve will we really start to transcend the legacy of medieval Europe.

Wikipedia is useful. I’m reading dozens of articles on the *ancien régime* and the Revolution to refresh my memory from the days of CSS. Also many other websites. The Revolution and its aftermath is a bewildering subject.

I love reading about history but I have a hard time justifying the activity. Knowledge of history doesn’t really teach you about the future, as historians say it does—except insofar as you learn that misery and cruelty are probably ineradicable. A few general lessons can be gleaned from history, and political leaders would do well to study the mistakes of their predecessors, but history never truly repeats itself. So what’s the point of devoting years of your life to an examination of, say, the causes of the French Revolution? How can that help us govern our own society better? The social structures have radically changed in the intervening centuries.

It drives me mad to live without recognition. I could do *so much* and have done *so much*, but when you know that society doesn’t like originality and you won’t get any credit for it you think *What the fuck is the point in trying?* I mean, look at this quotation from the impressive talker but middling thinker Jacob Bronowski, where he talks about Moore’s “naturalistic fallacy” (itself unoriginal):

...The argument is that from what is you cannot draw any information as to how you ought to act. And the transition from “is” to “ought” is usually called the naturalistic fallacy. I do not accept this.

There are three different arguments against the naturalistic fallacy. Two due to other people and one due to me. I will briefly deal with those due to other people. The first simply says—and rightly—that every time you know something about the world there are certain forms of conduct which are obviously ridiculous. [Almost as ridiculous as this argument itself.] Once you know that gravity goes down and not up, it is ridiculous to build buildings in which you assume that it goes up. Once you know how gravitation works outside the earth, there are certain forms of spaceship which you will not build... I think this is perfectly sensible. I think that it is perfectly true that the more we know, the stronger we are in our choices. [No one’s doubting that, Brownie, not Moore, not Hume, not me.]

...

¹ Chomsky: “One reason that propaganda often works better on the educated than on the uneducated is that educated people read more, so they receive more propaganda. Another is that they have jobs in management, media, and academia and therefore work in some capacity as agents of the propaganda system—and they believe what the system expects them to believe. By and large, they’re part of the privileged elite, and share the interests and perceptions of those in power.”

A more interesting argument...is: "Well, human beings are the way they are and we ought to act as human beings are." I think that is a good argument. [That's why you're not a philosopher.] I think it is very important to find what human beings are really capable of and to act accordingly. [For example, humans are capable of torturing children; therefore, we ought to torture children.] ...

...[The third argument] says simply that you cannot know what is true unless you behave in certain ways. What is the good of talking about what is, when in fact you are told how to behave in order to discover what is true. "Ought" is dictated by "is" in the actual inquiry of knowledge. Knowledge cannot be gained unless you behave in certain ways.

Muddled thinking, foolishness. As for the third argument, it's discussed far more deeply than Bronowski could ever discuss it in my paper on values, where I argue that norms of reason are the only norms in which 'ought' coincides with 'is'. Fucking I deserve to be the Philosopher-King.

October 10 etc.

I read Bronowski's *Origins of Knowledge and Imagination*. I'm told by one of its reviewers that "it's a gem of enlightenment... One rejoices in Bronowski's dedication to the identity of acts of creativity and of imagination, whether in Blake or Yeats or Einstein or Heisenberg", which makes me wonder whether I missed something, since I didn't find myself rejoicing very much as I read. Instead, I found myself wondering "What exactly is being said here? What is it that I'm reading? And why am I reading it?"

I'm going to the YMCA most days, lifting weights and doing cardio.

As far as I can remember, I've never read speculations on why it might possibly be true that when production relations become fetters on technological development, society overturns the production relations. This central Marxian thesis has never really been defended thoroughly!! (How is that possible?!) In any case, why would it be true? Society doesn't ever explicitly recognize that economic relations are obstructing technological growth, so there has to be something that connects the fettering with the conscious motivations revolutionaries have. But what would this be? Well, revolutionaries always want more social equality. (And liberty.) That's their main goal. So here's what I think: in fighting for equality, they're unknowingly fighting to overturn obsolete economic relations. They're fighting, that is, for higher productivity. There's a cause-and-effect relationship between technological progress and greater social equality. It's the Cunning of Reason: in overthrowing feudal social relations, the French revolutionists were unknowingly making possible greater productivity in the economy as a whole, which itself, too, eventually furthered their ambition of achieving equality and liberty! (since high productivity raised living standards, presented more opportunities to the masses, etc.) In other words, there *is* a 'mechanism' that mediates between the favorable, 'unconscious' outcome of *greater productivity* posited by the Marxist functional explanation and the quite different motivations that revolutionaries have: the latter want political and economic freedom and equality, which means overthrowing laws and property relations (production relations) that prevent the rising classes from achieving money and power, or freedom and equality with the ruling class. But by changing the old property relations etc. in such a way that the rising classes can pursue their goals of money and power with fewer 'legal' hindrances than existed before, these classes unwittingly promote a leap in the development of the productive forces. The greater and more universal economic freedom they desire entails an extensive and intensive 'spreading' (across society) of the means through which they achieve money and power, namely through the incentive *to realize profit by selling at the lowest price on the market*; and this leads to technological development (because that is ultimately how firms reduce their costs of input, i.e. by mechanizing, creating economies of scale, etc.). Stated more succinctly, greater economic/social freedom leads to greater economic dynamism, which leads to greater

technological development. By consciously fighting for freedom, revolutionaries are unconsciously, or rather ‘accidentally’, fighting for development of the productive forces.

I’m at the point where I want to write only things that I can immediately submit to journals. I want to write on commission, in fact. I want an element of security.

Reading Hobsbawm’s *The Age of Revolution: 1789–1848*. I glory in descriptions of the French Revolution, that unique event in world history. It was the first rebellion that succeeded in crushing the powers that were crushing the masses. It succeeded! 1830 failed, 1848 failed, 1871 failed, and the only reason the Russian Revolution succeeded was that Russia was in tatters from the Great War. But the original revolution, the one that started it all, the one that marks the beginning of modernity and still echoes in ideologies and political reality, succeeded. (Until it failed, of course.)

The following is the beginning of another essay I wanted to publish until I realized it wasn’t going to interest publishers. I’d intended to bring in some of my ideas in the chapter on history I wrote for the book (the ideas on reification and so on).

Thoughts on the intersections between Marxism and American culture

This may sound paradoxical, but, from a thinker’s perspective, one of the worst things about our era is that in some ways it’s more “Marxist” than any in history. Specifically, many of the basic tenets of historical materialism are borne out every day, to a comical and disheartening extent. Why disheartening? Because historical materialism is, after all, a less-than-romantic creed. Franz Mehring, Marx’s first biographer, once asked rhetorically, “To a believer in historical materialism, what importance can the individual have?” The Marxist thinks that individuals are far less important in determining the course of history than social structures are—the totality of social relations and the mostly unconscious economic and political movements that push society along its evolutionary path. A person is influenced by his society far more than he can ever influence it. Similarly, ideas—ideologies—have ultimately less causal influence on historical evolution than economic practices do.¹ No doubt an ideology, for example Christianity, can have an enormous impact on history, but in the end it has to accommodate itself to economic processes more than economic processes have to accommodate themselves to the ideology. Surely this is common sense. (After all, the world of ideas is much more flexible and changeable than the world of materiality and production.)

Now, sometimes particular individuals are extremely important. Think of Jesus, Mohammed, or Hitler. This is rare, though. Strong individuals like that can appear only when society is going through, or is on the verge of, a crisis of some sort, for instance when there is a vacuum of power together with a lot of social unrest (which may lead to a demagogue’s seizure of power). In most eras the economic and political infrastructure is relatively intact, and the elites have a firm grasp on power. At such times individuals, even the powerful, are definitely subordinate to the mechanical functioning of the system, in particular the economy. The dominant ideologies, too, have little importance then in comparison with mundane economic processes, serving a primarily apologetic purpose (rather than a revolutionary one). It is in these eras that the “materialism” of historical materialism is most obviously true. But never has it been more obviously true than right now.

Consider this side of Marx’s theory:

...In the social production of their existence, men inevitably enter into definite relations, which are independent of their will, namely relations of production appropriate to a given stage in the development of their material forces of production. The totality of these relations of production constitutes the economic structure of society, the real foundation,

¹ Of course, economic practices are themselves associated with ideologies, but arguably a particular ideology serves more as a ‘justification’ and a source of personal motivation than as an integral, essential element of a given productive process. Analytically speaking, the productive process can be distinguished from the ideologies associated with it.

on which arises a legal and political superstructure and to which correspond definite forms of social consciousness. The mode of production of material life conditions the general process of social, political and intellectual life. It is not the consciousness of men that determines their existence, but their social existence that determines their consciousness...¹

Now consider the world we live in. Consider its culture. Not only is the “political superstructure”, with its liberal-democratic practices and ideologies (which emphasize and exalt separation between individuals, atomistic rights of property, competition over cooperation), as clear a reflection as it has always been of divisive capitalist economic relations. More specifically, as capitalism has evolved towards an increasingly oligarchic structure dominated by a few dozen giant businesses, the government has become more oligarchical and less democratic as well. There is hardly any longer even an attempt to disguise its status as a servant of big business. It undertakes adventures in the Middle East for the sake of having secure access to oil; it refuses to take action on global warming because of the misguided belief that this will harm big business; most of its activities are organized around the principle that the tiny elite must retain power at all costs, and that the masses must be excluded from it. Since the economic status quo is oligarchy, the political status quo is as well.

Or consider mainstream intellectual life (such as it is). On a broad scale it consists of nothing but daily reactions to economic and political events. That’s what intellectual life has become. There is no longer any autonomy, even *apparent* autonomy, from economic and political life, as there used to be in, say, the 18th and 19th centuries, when philosophy and art were still of mainstream interest. Thinkers have no real influence anymore; “consciousness” has become a one-dimensional reflection of “social being”, i.e., of atomistic economic relations. Indeed, the unprecedented atomization of social life is an important reason for the deplorable sterility of culture—the sterility that consists precisely in our culture’s utter lack of independence from underlying economic movements, from consumerism and commercialism.

Academia is a good example of what I’m talking about. It is well outside the mainstream, which means that academics have the freedom to pursue research not directly related to the economy or politics; still, it is situated in a society as holistic as societies always are, which means that it necessarily manifests certain fundamental traits of this society. And perhaps the most fundamental is fragmentedness. Atomization. The complexity of the social division of labor is the ultimate cause of this fragmentedness (the fragmentedness of civil society, of political life, of small-town communities, etc.), because, of course, it is in the nature of a division of labor to divide people from one another. To disrupt spontaneous communal life. *Ceteris paribus*, the more extensive is society’s division of labor—the greater the differentiation between economic roles, the less people work together on the same tasks in a communal and friendly environment—the less integrated and homogeneous is social life as a whole, including intellectual and artistic life. That is, intellectual specialization, and ultimately fragmentation, becomes imperative as social relations become increasingly labyrinthine and interdependent—until finally academia arrives at the point it has reached today, when its mind-boggling fragmentedness mirrors the fragmentedness of civil society, and ultimately of the economy.

Of course, it is impossible to untangle all the specific causes of extreme specialization between disciplines—there are too many causes, and social science rarely has recourse to the reliable methods of natural science—but, to repeat, their general outlines are intuitively obvious. As scientific technologies and the global economy have grown in complexity, greater specialization between industries and between jobs in a given industry has been necessary. This has led to greater economic productivity,² which has stimulated the growth of industry and thereby intensified the division of labor, in a self-reinforcing cycle. Contemporaneous with these developments has been an intensification in the division of labor between the ideological (academic) professions, for the changing material conditions have led to a correspondingly more

¹ From the Preface to the *Contribution to the Critique of Political Economy*.

² From Adam Smith’s day (and even before then) it has been known that “the division of labor, so far as it can be introduced, occasions, in every art, a proportionable increase of the productive powers of labor [i.e., productivity]”. See *The Wealth of Nations* (New York: Oxford University Press, 1998), p. 13.

intricate and nuanced understanding of the world. At the same time, there has been a growth in population, a migration to the cities, an extension of university education to more and more people, and thus, on the whole, an expansion of the university. All this has meant more specialization between disciplines and more competition between practitioners of these disciplines (competition for jobs, for prestige, etc.)—until the system has finally reached the point where an economist, for example, can lament that

Economics has...become so broad and so complicated that, within the fields, one group of specialists barely speaks the same language as the Ph.D.s across the hall. And so much of what is published seems more to proselytize for an ideology than to make sense of the chaotic world.... It's no wonder that a single economic development can be interpreted as a godsend or a disaster, depending on the interpreter's frame of reference.¹

This also relates to what I said a moment ago—that “thought” is no longer as powerful a force as it once was (during and prior to the French Revolution, for instance). It meekly and apologetically follows the lead of economic activities, rarely straying far from them except in the fantasies of an isolated academic here and there.

Consider, also, the state of literature. Fiction. There are still many authors out there—indeed, more than ever before—and they have their readers, but it is hard not to feel as if fiction, in these serious and troubled times, is somehow inauthentic and frivolous. Even boring. It can't sustain our interest as it could a century ago. V. S. Naipaul, surely an authority on the subject, has said that the novel is dead. All that remains is nonfiction, because, according to Naipaul, the world is too complex now for fictional narratives to be adequate to reality. [I was going to offer my own reasons for the decline of fiction, reasons that would have involved the psychology, the ‘phenomenology’, of atomization and the narcissism that results from it. The fixation of everyone on himself and his situation in life, his *real* (‘serious’, anti-fictional) situation.]

October 16 etc.

[Met more women, etc.]

Here's something I wrote with the immediate aim of getting published:

A Meditation on John Donne's Meditation XVII

“...No man is an island, entire of itself; every man is a piece of the continent, a part of the main. If a clod be washed away by the sea, Europe is the less, as well as if a promontory were, as well as if a manor of thy friend's or of thine own were: any man's death diminishes me, because I am involved in mankind, and therefore never send to know for whom the bell tolls; it tolls for thee.”

This passage, from John Donne's 17th Meditation, is one of the most famous in all literature. Virtually everyone is familiar with it, especially in its heavily digested form “Ask not for whom the bell tolls; it tolls for thee.” And everyone instinctively recognizes that it expresses a noble sentiment. Few people, however, give any thought to it; and the ones who do probably decide that it doesn't have literal significance, consisting merely in a string of poetic metaphors. After all, how could another man's death really “diminish” me? In what possible sense could *his* misfortune be *mine* too? This misunderstanding in itself justifies a reexamination of the passage. But particularly in our troubled era, our age of universal atomization and apathy, it is imperative that we understand what Donne meant. Maybe then we'll appreciate the terrible moral implications of interpersonal atomization.

Donne embellished his thought by invoking God, but that isn't necessary. In any case, God is dead. (He was one of the unfortunates killed in the French Revolution.) The real meaning of the passage—or the

¹ Quoted in Kenneth Gergen, *The Saturated Self* (New York: Basic Books 1991), p. 83.

moral meaning; there are others—is that what happens to other people has metaphysical implications with respect to the value of my own life. For other people *are me*, in some sense: they are self-conscious like me, they have a sense of self like me, they inhabit the same world I do. What happens to them could have happened to me, and sometimes inevitably will happen to me. Their mortality is my mortality, because our essence is the same. They are me transposed in space and time, me in a different consciousness and set of circumstances.

When something terrible, unjust, happens to another person and his life is ruined, human life itself is made valueless. For in a world of injustice, in which destinies are determined by *chance*, life cannot have the value we privileged ones ascribe to it. The dictates of reason are irrelevant to it; truth is violated by it, and “necessity” is an empty concept. When I read in the paper that the family of an innocent Lebanese man has been killed by an Israeli bomb I recognize in his despair the worthlessness of my own life, its cosmic littleness—the total irrelevance to life of such notions as reason, truth, freedom, morality, necessity, justice. If I happen to live well and be happy that’s only a function of chance, because I could have been that man. But, knowing this, how can I be truly happy? How can I be convinced of the value of my life, knowing that life itself is the sort of thing that doesn’t have value?

What I’m talking about is *absurdity*, in the existentialist sense. Life is fundamentally absurd in a world of violence and coercion. A radical contradiction is manifested between what we, as human beings, demand of life and what is delivered. That’s what absurdity is, that contradiction. It means we are alienated from life, we cannot identify with it or glory in it wholeheartedly, because it is a stranger to the human way of thinking. The *beautiful* way of thinking. An absurd life is scarcely worth living. Consider a man who is buffeted by forces beyond his control, who is compelled to adopt unfulfilling life-paths, who is beaten into a bland conformity. On a broad scale, it would seem that his life is not a very wonderful or valuable thing. But that man is all of us. He is Everyman. No doubt some of us manage to carve out a little niche for ourselves; but fundamentally we remain subject to chance, to coercive social mechanisms, and the possibility is always real that our peace of mind will be shattered in an instant.

That Lebanese man’s situation is a microcosm of mankind’s agony. It is our collective sorrow magnified to an intolerable intensity. It serves as a reminder that, as things stand now, we are not masters of our fate but are instead blown like willow-down in the wind of societal forces. Our “leaders” are in the same position as we, more or less (though they do have more opportunities than we to aggravate or mitigate our problems). But when the issue is something as urgent as the question whether life is to remain a tragic farce or is to become more in line with our notion of what is good, we can’t rely on our leaders to act. We have to act ourselves, to do anything we can to push the world towards sanity. Indeed, if the concept of a “moral imperative” has any meaning at all, this is a moral imperative. This activism. It is not an option or a suggestion; it is absolutely necessary, if only because without such activism life will continue being the universally valueless, contingent, coerced thing it is now.

In other words, as long as irrationality and senseless violence are the prime movers of life and history, our own individual life will remain an essentially nugatory thing, no matter how happy and secure it seems. Only if we create a stable and just world, a place not ruled by radical contingency, will life stop being “absurd”.

Probably you’ll say that such a world cannot be achieved, that it’s a ridiculous utopian fantasy. And you may be right. In the meantime, though, whenever you read the front page of the newspaper, you’ll hear the bell tolling—for you.

*

So begins my downgoing.

(I don’t know if I really believe all of it, but anyway it sounds good.)

By the way, what’s that grey airy stuff called that floats in the wind? The seeds that some kind of plant sends in the wind. What the hell is it called? That line about the willow-down is stupidly poetic anyway, but I figure that magazine editors are literary enough to like it but not literary enough to realize they shouldn’t like it.

I went to an Indian event downtown with Ranjana and others and made a few new friends. In particular one girl (Kanchana) I talked to almost the whole night about literature and writing etc.; she's a writer-architect-MBA student. Seems quite fond of me; I think I've made a good friend. I have to hang out with more Indians: they tend to be real people, unlike most Americans I've met. (Kanchana is sending me two of her short stories tomorrow, to be critiqued.)

I was wrong that "the complexity of the social division of labor is the ultimate cause of atomization". That's an un-Marxian idea, and is therefore wrong. In non-capitalist conditions it's conceivable that an extensive division of labor wouldn't result in atomization. It's the capitalist framework, the commodified structure, that causes the atomization.

Met more Indians. Went to artists' open houses in the South End then went to an Indian dinner. I'm going to start doing this stuff more often.

Why are we privileged people unhappy?

In this age of narcissism and collective discontent, it is worth remembering that some of the happiest people live in relatively poor societies.¹ We Americans, with our ubiquitous self-help books and our Faustian quest for personal fulfillment, have a lot to learn from the peasants of, say, Sapa, a small village in the north of Vietnam. During my time there a few years ago I was struck by the contrast between the region's great poverty and the *joie-de-vivre* exhibited by its inhabitants. People shrunken and prematurely aged from malnutrition were friendly and cheerful, full of energy, more in love with life, it seemed, than most Westerners. To anyone who understands human nature, this should come as no surprise.

Unfortunately such villages are rapidly disappearing, as are the pristine landscapes in which they are nestled. Indeed, the 'wholesomeness' of the natural scenery is undoubtedly one of the reasons for the relative happiness I saw. I took some notes after my time in Sapa:

...The landscape reminded me of New Zealand, but on a larger scale. The terraces on the mountainsides covered in yellow stalks of rice added a human element to the grandeur. Hundreds of terraces everywhere, golden horizontally and green vertically, steps nearly to the summits of hills, perfectly geometrically regular, carved by plows pulled by oxen, a periodic human figure wading in the grass to harvest the rice. Beside the river running through the valleys stood men shaking bowls of rice to separate the chaff in the wind. The whole scene was from a different time, an *epic* time, though rumblings of tractor-trailers and jeeps and dynamite explosions in the cliffs where a road was being built proved that modernity reaches even into the heart of the wilderness.

Capitalism will eventually succeed, as it always does, in overtaking even these last holdouts of simple Tolstoyan life. So the question arises: is the unhappiness that capitalism has hitherto propagated, even in advanced societies, inevitable? Or is there some way to mitigate it, to spare our descendants the pain that we and our ancestors have experienced? Perhaps if we fully understand its causes we can provide solutions.

Of course, the spiritual malaise of late capitalism is quite different from the brutal and unsubtle misery of capitalism's early stages. Population upheavals, murderous and exploitative regimes, subsistence wages and all the other well-documented tragedies of early industrialism do not plague advanced societies to the degree or in quite the same way that they used to. Nevertheless, almost all the varieties of capitalist-sponsored unhappiness have something in common: namely, a loss of community. *Community* is what I saw in Sapa, in the richness of the scenery and the poverty of the villages. Until we find a way to reinstate community, we will remain as unsatisfied as we are now and have been for decades.

¹ In 2003, for example, Nigeria was determined by researchers to be the happiest country in the world.

I need hardly argue that the communal urge is the most basic human desire. The need to give and receive affection, recognition and respect, is essentially what the need for self-esteem amounts to. Deep self-esteem is possible only on the basis of a fulfilled craving for love and respect. But this is what the early laborers of industrial capitalism did not have, being instead treated like cogs in a machine; and it is what we Americans do not have. Insofar as we are dissatisfied it is because we have neither the thoroughgoing unconscious self-harmony of self-esteem nor the deep and simple communal recognition that many villagers in, say, Kenya likely have. Both are necessary, for they go hand-in-hand. Individuals in the United States are self-conflicted (e.g., lonely and self-doubting), because their society is self-conflicted. They internalize the divisiveness of social relations and become unconsciously self-hating, or self-doubting, themselves.

On the most basic level, then, the ‘self-dividedness’ of the modern world consists in interpersonal atomization. Atomization is the real neurosis of the age, the fundamental condition for all the others—for all the “culture wars”, for example. These wars between ideologies, such as Christianity and secularism, or Islam and democracy, are comparatively superficial; in fact, one of the unconscious functions of an individual’s immersion in an ideology is precisely to escape atomization. The psyche will construct labyrinthine defenses against the loss of community, elaborate illusions to hide it from view, artificial means to restore interpersonal bonds, but ‘neuroses’, on an individual or collective level, are always in some way a reaction against communal deprivation.

On one level it isn’t hard to see what causes this atomization or how it manifests itself. One has but to observe daily life to see its causes and how it plays itself out. The type of social conditioning that results from (and *is*) “bureaucracy, the proliferation of images, therapeutic ideologies, the rationalization of the inner life, the cult of consumption”,¹ the hectic pace of modern life, the commodification and commercialization of sex and love, the ubiquity of *noise* (“noise pollution”), the strange necessity of going to work every day just to make money, the forging and breaking of shallow friendships, the widespread retreat into video games, television and the internet, the degradation of politics into spectacle, and the fact that all these developments (and many others) have become common knowledge and are widely deplored but seem impenetrable to understanding and cannot be remedied—indeed, are intensified every year, snowballing according to their internal logic—all this conditioning self-evidently churns out individuals who do not feel at home in their world, who are prone to self-doubt and anxiety and are alienated from their fellow humans. Much of it is due to the twin forces of commercialism and consumerism. These trends atomize society by commodifying everything—that is, by translating everything into monetary terms and framing it as a more or less successful means to instant gratification. They encourage, indeed compel, people to think of the world as their personal playground, as being full of things that can be *used, enjoyed*, and then discarded. In other words, this culture sets up a division between the individual and his world: rather than being *part* of him, an essential component in his identity, his world and his relationships are means to his ends. He half-consciously lives his life in this instrumental, quasi-mechanistic way, rejecting people if they don’t please him. And the more he lives according to the creed of instant gratification, the more he craves it, precisely because this form of gratification is fleeting and leads to boredom. It is, therefore, self-propagating. People seek relief from the boredom of instant gratification by pursuing more pleasure, i.e., by immersing themselves increasingly in instant gratification. Thus their relationships with others are increasingly colored by the need to be *entertained* (and to entertain), poisoned by consumerism and commercialism.

At the same time, as I hinted at a moment ago, the compulsive and bureaucratic structure of economic life disrupts spontaneous communal life and recognition—frustrates people, frustrates their desire for freedom (to live as they spontaneously would like), pushes them into the half-conscious perception that the world is coercing them, and thus alienates them from society. Indeed, what Marx wrote in 1844 is still relevant, if not more so, in 2007:

...What, then, constitutes the alienation of labor?

¹ Christopher Lasch, *The Culture of Narcissism* (New York: W. W. Norton & Company, 1979), p. 32.

First, in the fact that labor is *external* to the worker [whether blue-collar or white-collar], that is, that it does not belong to his essential being [i.e., his spontaneous sense of self]; that in his work, therefore, he does not affirm himself but denies himself, does not feel well but unhappy, does not freely develop his physical and mental energy but mortifies his body and ruins his mind. The worker, therefore, feels himself only outside his work, and feels beside himself in his work. He is at home when he is not working, and when he is working he is not at home. His work therefore is not voluntary, but coerced; it is *forced labor*. It is therefore not the satisfaction of a need, but only a *means* for satisfying needs external to it. Its alien character emerges clearly in the fact that labor is shunned like the plague as soon as there is no physical or other compulsion. External labor, labor in which man is externalized, is labor of self-sacrifice, of mortification. Finally, the external nature of labor for the worker appears in the fact that it is not his own, but someone else's, that it does not belong to him, that in that labor he does not belong to himself but to someone else [or to some company]. Just as in religion, the spontaneous activity of human imagination, of the human brain and the human heart, operates independently of the individual, i.e. as an alien divine or diabolical activity, so the worker's activity is not his spontaneous activity. It belongs to another; it is the loss of his self.

The result, therefore, is that man (the worker) feels that he is acting freely only in his animal functions—eating, drinking, procreating, or at most in his shelter and his finery—while in his human functions he feels himself nothing more than an animal. What is animal becomes human and what is human becomes animal.¹

The individual feels conflicted in himself (because he is conflicted with his activities, his objectifications) and divided from society, deprived of a free and spontaneous working community. Again, this is essentially a result of commodification, in this case of the worker's being transformed into a commodity subject to the laws of supply and demand, and all the capricious dictates of the market. He feels himself dehumanized.

From these very brief reflections it seems that the main source of modern unhappiness may be universal commodification. So perhaps we should take a closer look at this phenomenon, to see exactly what it is and what it entails. What is the “phenomenology” of commodification? How is it experienced by people? What are the psychological mechanisms that connect it with unhappiness?

Our task is made easier by the fact that Karl Marx analyzed the phenomenology of commodification in *Capital*, in the section on commodity fetishism. I'll rely on his analysis, since it seems to me to be as important as it has been neglected. The decisive concept he introduced was that of “reification”. In the early twentieth century this concept was embellished by such thinkers as Georg Lukács (in *History and Class Consciousness*) and I. I. Rubin (in *Essays on Marx's Theory of Value*), who recognized it as a brilliant and fruitful tool of both social and economic analysis. Right now I'm interested in its sociological aspect.

First, though, I have to describe its economic meaning.— Any sensible economist knows that a commodity has two aspects: its use-value (its utility for the consumer) and its exchange-value (the price it commands)... [The next few paragraphs, which I've deleted, are taken from the chapter on historical consciousness I wrote for my book.]

...Consistent with Marx's analysis, all these things—these concepts and habits and institutions—are “personified”, becoming a ‘*they*’, i.e., something with a will and intelligence and evidently a deep-seated maliciousness, while people themselves are reified into mere numbers, statistics, objects, obstacles that have to be overcome or irrational things that have to be placated. The social world is turned upside down, and humanity becomes a slave to the social relations it has created.

In peasant villages there is no such slavery, no such atomization. Life is simple and transparent; individuals are the masters of their fate, and they work together to achieve a common end. No doubt there

¹ *The Portable Karl Marx*, edited by Eugene Kamenka (New York: Penguin Books, 1983), pp. 136, 137. The thoughts in that passage are dramatized in many pop-cultural creations, for example in the popular show “The Office”.

are a good many unpleasant features of village and tribal life, and it is surely not desirable for mankind to return to it. But by looking at that simple kind of happiness we can get a vague idea of what we need in order to be happy ourselves.

So now that we have at least a rudimentary understanding of what has gone wrong, what is left for us to do? How does this knowledge help us? What it seems to suggest is that not without a complete social revolution will civilization become ‘healthy’ in some way. There is no reason to think the revolution has to be violent; it could be an evolution instead. But it has to result in a restructuring of social relations such that universal commodification and reification are eliminated, and the community restored. *Prima facie*, though, it seems as if a commodity-economy is necessitated by the fact of scarcity, i.e., by the need to ration scarce resources. The price-mechanism is probably the most effective and efficient way to do this, and the price-mechanism implies commodification. So as long as we use money—as long as we have to ration resources—it seems virtually inevitable that we will have a commodified economy.

What is not inevitable, I think, is that there will always be a scarcity in fundamental resources. This opinion must sound crazy, since we’re so used to thinking of the world in terms of scarcity, but it isn’t unheard of. Marx himself argued that true communism is impossible except on the basis of material abundance; and he thought that capitalism’s historic function was to unleash society’s productive powers and bring the world to the very threshold of this state of material abundance. It was the task of socialism to finish the job—to lead us to a society governed by the principle “From each according to his ability, to each according to his need”. In his day the economy was nowhere near overcoming scarcity, as he liked to think; but in our own, the possibility seems a little less outlandish. Genetic engineering and cloning may conceivably allow us someday to actually manufacture our food, to clone as many animals as we need to feed everyone and to produce crops whenever and in whatever quantity we want. Renewable energy is, by definition, not scarce, so it isn’t wholly unimaginable that we won’t need to ration energy in the future. Luxury items will always be scarce, but with respect to necessities like energy and food, money may someday be superfluous. If and when this happens, the economy will take a vastly different form than it does now under capitalism. Cooperation rather than competition may become the norm, the most rational way of organizing economic activities; and commodification will end in all but a few minor spheres, because money itself will, on the whole, wither away.

It is futile, however, to continue these speculations. Such developments may come to pass or they may not, but what is certain is that the universal alienation and anomie of the modern world will not end until the present global economic order either evolves to some form of socialism or collapses into a state of primitivism, possibly as a result of global warming and/or nuclear wars. If this diagnosis seems bleak, then it’s that much more important that we fight for a better future.

*

So continues my downgoing.

It’s slapdash, I know. Sorry.

November 1 etc.

Constant rejection, non-stop. I think I’ll start taking Paxil again. What I should really do is get the fuck out of this country, go to Europe where humanity still sort of likes itself.

Finally some good news: the magazine *Left Curve* wants to print a version of the essay on historical consciousness, and *Main Street Rag* wants to print a short poem. I’m still waiting to hear from about thirty other magazines I submitted to.

Reading John Reed’s *Ten Days that Shook the World* (online).

Reading Rousseau's *Émile*. I share Rousseau's respect for nature, for the natural way. Where man is warped, he is warped by man.

No more *Émile* for now. I'll read it when I have a child. Instead I'm reading Robert Reich's *The Work of Nations*.

Finished it. Now I'm reading Fareed Zakaria's *The Future of Freedom: Illiberal Democracy at Home and Abroad*. It isn't terrible, but it's not as good as Reich's book. One can see this even by looking at the back cover, which quotes praise from the likes of Samuel Huntington, Peter Jennings, and Henry Kissinger! If Kissinger approves of it, you know there's something wrong with it.

Zakaria, like Reich, belongs to the establishment. Unlike Reich, he doesn't have a very critical or analytical mind.

The prerequisite for lovingkindness.— Nothing assuages misery like the thought that others are miserable too. Conversely, nothing more delights the happy person than the thought of others' happiness.

Reading *Violence in America: A Historical and Contemporary Reader*, edited by Thomas Rose.

Reading *The Best American Essays: 1993*, edited by Joseph Epstein, and *The Cunning of History: The Holocaust and the American Future*, by Richard Rubenstein. The latter is a very interesting long essay on such topics as bureaucracy and "rationalization" (their dangers); its thesis is that the Holocaust should not be thought of merely as "a barbaric and retrograde policy that was thoroughly at odds with the great traditions of Western civilization," but rather as an expression of some of the most profound tendencies of civilization in the twentieth century. Its main ideas have always been obvious to me, but now that I see them on paper I'm thinking about them more clearly than I have.

November 25

Reading Barrington Moore's classic *Social Origins of Dictatorship and Democracy: Lord and Peasant in the Making of the Modern World*. Almost finished. Also reading Ira Magaziner and Robert Reich's *Minding America's Business*.

While I was home for Thanksgiving I looked at some of my old college papers. Many of them are informative. So as not to lose them I'm putting a few here, mostly from my freshman and sophomore years. *[Out of consideration for the reader, I've deleted some of them.]*

A Non-Eurocentric Model of History

Historians have for centuries attempted to build models of history that reveal the basic determinants of historical progress. Much of their energy has been consumed in explaining why Europe was the one civilization that forged ahead of the rest—developed a model of government subsequently imitated by most other cultures (viz., democracy), created a global economic system (capitalism), and ultimately conquered most of the world. The trap into which historians often fell was that of assuming an innate quality of European "superiority"—an assumption that logically implied a diffusionist and Eurocentric model of history. Recently, however, this Eurocentric model of history has been attacked by scholars like J.M. Blaut, who believe that it was only a special combination of circumstances at a specific time in history that enabled Europe to progress faster than any other civilization. Blaut, in fact, believes that it was solely colonization which gave Europe a decisive advantage in the social-evolutionary process. In light of these objections to the traditional diffusionist theory of history, it has become necessary to reformulate the theories of

important scholars—namely Marx, Weber, and Eric Jones—who have operated on a model of intrinsic European superiority. We must integrate their perspectives with that of Blaut in order to devise a more inclusive model of history.

Karl Marx's philosophy of history had a materialistic basis. He was operating in a time dominated by the idealistic philosophy of Hegel, and his own philosophy was composed largely in reaction to Hegel's gigantic influence. Marx emphasized the influence of the means of production on the social and political structures developed by a society. He believed that the means of production determine the relations of production, which determine the economic structure as a whole, which determines the social and political life of a culture (as well as its values). He did not hold this model to be the only explanation for every cultural transformation; on the contrary, he recognized that the values of a society often have a minor causal influence on the material conditions of that society (McLellan, 173). However, he generally believed that the "forces of production" are more important.

Marx assigned five stages to the historical process (and these five stages "are just so many different forms of ownership" [McLellan, 161]). The first is tribal ownership, which "corresponds to the undeveloped stage of production, at which a people lives by hunting and fishing....or, in the highest stage, by agriculture" (McLellan, 161). The division of labor is essentially undeveloped. The second stage is the "ancient communal and State ownership" in which there is still no individual private property. The third stage is characterized by feudal ownership, in which serfs replace slaves. Capitalism—characterized by private property, a high division of labor, and the existence of wage labor—follows feudalism. Communism is the culmination of this historical process (McLellan, 161-163).

As is evident from this brief summary, Marx does not specifically identify Europe as the 'prime mover' of history. Individual cultures do not play a large role in his scheme (except to serve as examples of his abstract theories). It does not require much insight, however, to recognize that Marx was in fact a Eurocentric historian. In his analysis of capitalism he focused exclusively on Europe as the only civilization with "real" capitalism. His belief in a continuous evolution of historical progress, with capitalism as a higher stage in that process, implicitly committed him to the assumption that Europe is bound to bring communism—the "culmination of history"—to the rest of the world. In other words, his conviction that Europe will deliver capitalism and communism to all other "backward" cultures is simply a mild form of diffusionism and Eurocentrism.

It is also true, though, that Marx's theory does not logically commit him to the belief that Europeans are innately superior. In fact, he recognizes, along with Blaut, that "the discovery of America....opened up fresh ground for the rising bourgeoisie. The East Indian and Chinese markets, the colonization of America....gave to commerce....an impulse never before known....and thereby, to the revolutionary element in the tottering feudal society, a rapid development" (McLellan, 222). Whether or not Marx *personally* believed in the superiority of Europe does not matter; what matters is that his theory does not logically demand this belief.

In *The Protestant Ethic and the Spirit of Capitalism*, Max Weber hypothesizes that capitalism was born in Europe (as opposed to another part of the world) because of the religious revolution that occurred in the 14th century. Protestantism, with its emphasis on hard work as an indication of one's religious fervor, justified capitalism's need for hard-working entrepreneurs. It also paved the way for the practice of excessive economic "rationality" and ascetism—two qualities which were necessary prerequisites for the birth of capitalism. (Weber himself says that "rational book-keeping" [Weber, 22] is essential for the functioning of capitalism.) This kind of rationality did not exist anywhere outside of Europe in the 14th and 15th centuries; the reason for this phenomenon is, according to Weber, the shift in religion and mythical spirituality to ascetism and practical rationality in Europe. Weber recognizes that one of the reasons this shift occurred was because of the transformations already taking place in the social order (i.e. the decline of feudalism), but he emphasizes that the religious revolution was, to a certain extent, independent of the political and economic revolution—that it was in fact just as much a cause as an effect of the birth of capitalism. Thus Weber gives more emphasis to culture (as opposed to the economy) than does Marx, and since it can be argued that culture depends on 'inherent human qualities' to a greater extent than does the 'impersonal' economy, it may be an implicit assumption of Weber that Europeans were unique—that only

they had the kind of mind which could create a rational religion like Protestantism. He was a Eurocentric and diffusionist historian.

Eric Jones does not merely *imply* that Europe has always been unique: he states it explicitly many times. His book *The European Miracle* contains a summary of virtually all the arguments that can be used to demonstrate the uniqueness of Europe: Europe has many well-placed rivers to facilitate trade; its soil is unusually fertile; its weather is not as extreme as that of Asia or Africa; it is less prone to natural disasters like earthquakes than Asia is; its wars usually were not as devastating as the wars between the great empires of Asia; its kings were not as shamelessly decadent as the “Oriental despots” were; the lack of a central authority encouraged competition between many nation-states, thus facilitating progress; it did not have as high a population density as the Asian empires did. The list goes on and on. Eventually it adds up to a fairly impressive array of arguments to support the existence of a distinctive, inevitable “European miracle.” J. M. Blaut argues, however, that almost all of these advantageous qualities held by Europeans are in fact nothing but myths. European soil is not more fertile than Asian or African; tropical climates are not less favorable to the building of empires than are temperate climates; a low population did not play any significant role in the advance of Europe; even the existence of small, competitive nation-states did not (according to Blaut) propel technological, political, or economic progress in Europe. In short, Blaut believes that nearly everything Jones claims to be true is actually false. This interpretation is no doubt exaggerated and simplistic; we shall have to salvage a few elements of Jones’ theory when we combine the four theories (Marx’s, Weber’s, Blaut’s, and Jones’), but we can nevertheless accept that Jones does not provide sufficient arguments for his belief in a “European miracle.”

Much of J. M. Blaut’s book *The Colonizer’s Model of the World: Geographical Diffusionism and Eurocentric History* is spent arguing against the theories of numerous Eurocentric historians. He claims that Europeans did not control their population growth any more than did foreign cultures; that the theory of environmental determinism (*viz.*, the theory that tropical regions are not conducive to “progress” because of diseases, soil erosion, low population, etc.; that Asia is arid and despotic; that Europe has a temperate climate conducive to farming, individuality, and democratic forms of government) is unconvincing and has long since been shown to be untrue; that Europeans have never had a unique “rationality” which led them to the invention of sophisticated technology, the founding of democratic governments, and the birth of capitalism. Essentially he declares that every single Eurocentric, diffusionist theory is completely false.

The second half of his argument is based on the thesis that the *single* reason for Europe’s rise to world predominance was the colonization of the Americas (followed by that of Asia and Africa). In 1492 Europe was at essentially the same level of evolution as every other important culture in the world: its navy was not significantly stronger than that of other civilizations; its trade was not more productive than that of foreign peoples; its population was *certainly* not more rational than those of foreign empires. The one advantage it had over other civilizations was its location on the globe: it was relatively close to America. Had any other society been located in this fortunate position, posits Blaut, *this* society would have discovered America and risen to world power. The sudden influx of gold, silver, fur, sugar, indigo, and many other raw materials gave European industries a vast supply of products to be manufactured, contributing immensely to their development. Capital could be invested in thousands of business ventures, many of which realized great profits. At the same time, the English and the Dutch, in order to compete with the Spanish (who had somewhat of a monopoly on early colonization), were encouraged to expand their industries. The constant selling of goods to Spain contributed to its massive debt and eventual downfall, while at the same time propelling the fledgling class of the bourgeoisie in Western Europe to economic power. The exploitation of foreign peoples helped to keep them economically and militarily backward, thus increasing the emerging gap between Europe and the rest of the world.

With the rise of capitalism in the 16th and 17th centuries came a continuous expansion of markets and demand. Africa, Asia, and America imported ever-increasing amounts of goods from Europe (Blaut, 200). This high demand engendered an increased productive capacity, which caused the birth and growth of the proletariat. At the same time, the bourgeoisie gained political power (starting at the end of the 17th century) and was thus able to use the bureaucratic machine—the government—to its advantage. “And an Industrial Revolution, a transformation of the methods of production so that output could increase at an

even greater rate, became (one might say) inevitable” (Blaut, 201). In this way did capitalism result from colonialism.

Is it possible to synthesize the four theories of Marx, Weber, Jones, and Blaut into a non-Eurocentric, non-diffusionist perspective on the rise of capitalism? Marx’s historical materialism and Weber’s emphasis on culture (as opposed to economics) as a causal force in history are in fact not mutually exclusive. Nowhere does Marx say that the *only* cause of historical change is production and its social corollaries; nowhere does Weber say that production is not an important historical force. One merely has to acknowledge that the economy is the most influential social force—or even that it is *one* of the most influential forces—and that cultural expressions like religion are necessary to reinforce and propel historical transformations, in order to arrive at the skeleton of a theory integrating the Marxian and Weberian perspectives. Furthermore, Weber would have had no reason to disagree with Marx in the division of history into four major epochs (i.e., it does not *logically* follow from Weber’s theory that Marx was wrong).

Marx was somewhat of a Eurocentric, diffusionist historian. However, one of his arguments that can be used to support this belief—that Europe would export communism to all other nations of the world—has been shown to be flawed. Russia developed a crude form of communism before Europe was able to do so, as did China, Cuba, Vietnam, and North Korea. [Um, no.] Furthermore, Europe would never have developed capitalism in the first place if it had not brutally exploited foreign peoples. In other words, no simple process of “diffusion” took place; whatever advantages Europe gained during the past few centuries were due to the exploitation of its colonies.

In the Introduction to *The Protestant Ethic and the Spirit of Capitalism* Weber lists a series of Western cultural attributes—under the headings of science, architecture, music, politics, economics, and “historical scholarship” (Weber, 14)—which he assumes prove that Europe is more “rational” and superior than other civilizations. For instance, he cites the highly sophisticated music of Europe to demonstrate the ‘superiority’ (or “rationality”) of Western culture (Weber, 15). He interprets mere societal *differences* like this one to mean that one society is more advanced than another. All civilizations, however, have their own unique cultures; it is not possible to assert that one is more *advanced* than another. Thus Weber cannot with justification declare that the Protestant revolution in Europe proved that Europeans were more “rational”—more ‘progressive’—than foreign peoples. Protestantism was simply a manifestation of Occidental beliefs, just as Buddhism was a manifestation of Oriental beliefs; and Eurocentrism is, once again, shown to be wrong. [?!]

It is more difficult to reconcile Jones’ and Blaut’s theories than it is Marx’s and Weber’s, since Jones and Blaut are arguing for completely different theses. Blaut argues *against* Eurocentrism and diffusionism, while Jones argues *for* Eurocentrism and diffusionism. Nevertheless, there are several aspects of Jones’ theory that can be salvaged. An important one is his emphasis on Europe’s lack of a central authority as a reason for strong competition between its states, and thereby a cause of its progress. Blaut rejects this statement as “Eurocentric”, but there are two reasons why he is wrong: the statement is in fact true, and it is not Eurocentric. Competition undeniably influences growth; why else would corporations consistently strive to improve their products? The United States and the Soviet Union competed for forty years, and this was certainly an important reason for much of the rapid progress (e.g. in the “space race”) that occurred during this period. Blaut is only fooling himself by asserting that competition was not an important cause of the rise of Europe. Furthermore, there is no *need* for him to assert this; all societies have their own advantages, and competition between nation-states was simply one of Europe’s. Other cultures are blessed with, for example, unusually fertile soil and proximity to an abundance of natural resources.

Jones is also correct in emphasizing the importance of a relatively friendly natural environment on Europe’s development. Japan and various parts of Asia suffered natural disasters—earthquakes, famines, swarms of locusts—more often than did Europe. (The Black Plague is an exception.) It is not in any way Eurocentric or biased to believe this, because although Europe’s relative immunity to natural disasters may have assisted its rise to power, this “immunity” was certainly not a primary cause of European progress. The major reason for Europe’s ascent was colonization; competition between nation-states and Europe’s lack of natural disasters were merely added benefits that further stimulated progress.

Jones' other arguments for the rise of Europe—e.g. that it had fertile soil and controlled its population—are either Eurocentric and diffusionist or are simply wrong. Most of his and Blaut's arguments are opposite to each other, so it is not possible to reconcile them. The only task that remains, then, is to reconcile the combined theories of Weber and Marx with the combined theories of Blaut and (what we salvaged from) Jones. Marx and Weber recognized that colonization played a momentous role in the rise of Europe, but they did not realize just *how* momentous its role was. Altering their theories so as to include the proposition that colonization was ultimately the major cause of capitalism does not fundamentally change their content. Marx's historical materialism is, if anything, reinforced by Blaut's emphasis on the discovery of America. Weber's stress on the role of culture in transforming social conditions is not undermined; the Protestant revolution can be seen as reinforcing and augmenting the social transformation triggered by colonialism. Even his highlighting of strict economic rationality as a European trait is not necessarily false, so long as we recognize that this "rationality" was solely a product of decades of social upheaval.

The synthesis of the four separate theories, then, is as follows: Production and the economy are the most important historical forces. They are the foundation of societies; ideologies, technology, the arts, politics, and all other social characteristics are generally the "superstructure" built on this foundation. Culture, however, does influence the economy, and is sometimes even a major cause of economic change. The birth of Protestantism is an excellent example of this thesis. It grew out of material transformations—social upheavals like the decline of feudalism—but also made possible the birth of capitalism by justifying the capitalist need for continuous monetary gain and contributing to the growth of economic rationality in Western Europe. It was, in other words, a cause and an effect of the new social order.

In the 15th century, feudalism was disintegrating. A 'new social order' was slowly arising from the ruins of feudalism in many parts of the world, but it was in Europe that this process was most successful. Europe's success, however, was not due to any intrinsic factors like 'rationality'; rather, it was due to European colonization in the Americas. The growth of industries was encouraged by the importation of an unlimited supply of raw materials, and the progress of foreign peoples was suppressed—leading to the domination of Europe in world affairs. The absence of a central authority in Europe caused nation-states to compete with each other, thereby giving added incentive for them to strengthen their economies and militaries. The comparative lack of natural disasters also aided in the necessary process of capital accumulation. Eurocentrism and diffusionism are therefore false, because Europe would never have progressed so rapidly had it not exploited foreign civilizations. Blaut's, Marx's, and Weber's perspectives on history are—with few exceptions—vindicated, and two of Jones' arguments are retained as well. We have succeeded in constructing a non-Eurocentric model of history.

A Comparison between Lifton, Erikson, and Freud

Human history is an enigma. For centuries scholars have attempted to understand its intricacies, arguably with limited success. Hegel postulated the existence of an Absolute Spirit that unconsciously propelled history forward as It "realized" Itself; Marx believed that the forces of production are ultimately the foundations upon which the "superstructure" of society is built; psychoanalysis asserts that history is the result of conflicts inherent in the nature of the human spirit. Perhaps we'll never understand our own history, just as we'll never understand our own psyche. It is nevertheless undeniable that we have made much progress in these endeavors, and that psychoanalysis has been the most effective method [?!?!] of sifting through the rubble of history—while penetrating ever-deeper into the dark recesses of the psyche—to unshroud the most profound truths of the human condition. Freud declared that the Oedipus complex—together with the castration complex, which leads to the perversion of the death instinct—is the root of repression, and thereby of sublimation, which ultimately creates culture and history. Erikson rejected the primacy of the Oedipus complex in the human psyche—as well as the omnipotence of the life and death instincts—and instead postulated that identity crises are the most important causes of history and culture.

Robert J. Lifton asserted that it is not the identity crisis that is the critical factor in the human psyche; what is most important is the preoccupation with death and the need for “symbolic immortality”, illustrated by phenomena like the “survivor syndrome”. In our analysis of these theories we’ll eventually have to discard Freud’s, retain Erikson’s and Lifton’s, and add a specific Jungian hypothesis regarding the theory of human drives.

The Oedipus complex is misunderstood: it is not a natural love of the mother, but rather “a product of the conflict of ambivalence [between life and death, union and separation] and an attempt to overcome that conflict by narcissistic inflation” (Brown, 118). The essence of Eros is a desire for union with the world (and the essence of Thanatos is individuality and separateness [Brown, 105]). At the mother’s breast, the infant experiences this union; it does not yet distinguish between itself and the world of pleasure that surrounds it. At this early oral stage, the child already experiences repression: the repression of reality and the projection into the “repudiated external world anything painful” (Brown, 117). This ‘projection into the external world’ of anything unpleasant creates a conflict between the infant’s desire for “narcissistic omnipotence” (Brown, 113)—Eros’s dream of union with the world—and the fact of dependence on the mother. This conflict creates “antagonism in the dialectic of union and separateness, independence and dependence....the dialectic of life and death” (Brown, 113). In other words, the ‘biological unity’ of life and death is disrupted in the human species because of the child’s absolute dependence on its mother. The child ‘represses’ separation from the mother (thereby repressing the death instinct) even at the oral stage.

In the second stage of childhood, the anal stage, “the dualism of subject and object is transformed into that of activity and passivity” (Brown, 117). The infant continues to deny its own dependence, but it does so now through aggression. Passivity is equated with death; activity is equated with life. In the third phase—the Oedipal phase—the child unconsciously desires to impregnate its mother so as to overcome the passivity it experiences as a result of its having been born from her. “The essence of the Oedipal complex is the project of becoming God” (Brown, 118). It is another manifestation of infantile narcissism, of omnipotence, of union with the world. To quote Norman O. Brown once more, it is “the quest to overcome death by becoming father of oneself” (Brown, 120).

None of this, admittedly, directly affects the progress of history and the creation of culture. It does, however, give rise to the castration complex, which is the culmination of infantile sexuality in that it finally represses both Thanatos *and* Eros, eventually leading to the inauguration of the sublimations that create culture. But what exactly is the castration complex?

The threat of castration that the boy fears is not due to any overt aggression the father displays against his child (Brown, 123). It is rather caused by the child’s recognition that the mother is devoid of a penis. The former opposition to the mother is transformed into a preference for the sex opposite the mother’s—a preference for masculinity (activity) as against castration (passivity). (For the girl the result is penis-envy.) The result of the interaction of the Oedipus complex with this recognition of sexual segregation is the destruction of the “bodily-sexual” character of the Oedipus complex (Brown, 127). Its legacy lives on, however: the adult’s flight from death (Lifton’s “symbolic immortality”—the immortality promised in religion, in the production of children, etc.) is simply a sublimation—a “desexualization” (Brown, 128)—of the Oedipus complex. In fact, all sublimations (i.e., all aspects of culture) are essentially desexualizations of this original flight from death, of this desire for union with the world, of infantile sexuality. Eros and Thanatos are both repressed: human life becomes a struggle against a perverted form of the death instinct, which is transformed into aggression, anxiety, and negativity (Brown, 117). Individuality, the death instinct’s original and natural manifestation, is repressed. The id, however, does not forget the true nature of these instincts; it attempts to unify them (according to Brown) through sublimation. Human history and culture, then, are flights from ‘death’—and are at the same time efforts by the subconscious to restore the two great instincts to their original, biological unity. In light of this interpretation of Freud, cultures differ from each other not in what *causes* them—infantile fantasies, flights from death, the struggle for instinctual unity—but in the various kinds of projections (sublimations) which are possible in a particular environment, technology, and society. Or what is perhaps the same thing, in the “various....levels of the return of the repressed” (Brown, 171). Thus culture is a complex interaction of repressed instincts with the existing material world (Brown, 128, 132, 170).

Erikson abandons Freud's belief in the simple duality of the life and death instincts, and instead emphasizes the intricacies and contradictions inherent in the child's psyche. Much of *Childhood and Society* is spent describing the important identity crises that most children experience, and how these identity crises subsequently affect their adulthood. He suggests that dictators like Stalin and Hitler implement their brutal policies because of the identities they formed as adolescents. In Erikson's opinion, the Oedipus complex is merely a particular instance of the inevitable childhood identity crisis. But what exactly is this so-called "identity crisis"?

Erikson assigns eight stages to the development of human beings, one of which (the fifth) is called "identity vs. role confusion" (Erikson, 261). This stage occurs during adolescence. "In puberty and adolescence all samenesses and continuities relied on earlier are more or less questioned again..." (Erikson, 261). Nowhere does Erikson state that this identity crisis has anything to do with the Oedipus complex, much less with eternal human instincts called "life" and "death". He, along with Lifton, thinks that Freud's instincts sound somewhat old-fashioned, perhaps a little simplistic. They are too 'cute' to be taken seriously; the ego is far too complex to be a mere battlefield for two instincts. Instead, Erikson believes that society plays an important role in its own right (not just as a collection of sublimations) in fostering the growth of the individual. Adolescents need to feel that they have a 'continuous' meaning for others, "as evidenced in the tangible promise of a 'career'" (Erikson, 261), and often an indirect result of this need is the tendency for them to identify with certain 'heroes' or groups so much that they nearly lose their own individual identity. An excellent example of this phenomenon is Germany after World War I, when confused adolescents (and adults) who worshiped the Motherland over-identified with Hitler to the point of accepting him as dictator. Revolutionaries often experience this loss of individuality as well. In his interview with Mao Tse-tung, Edgar Snow observes several times (Snow, 129) that communist revolutionaries identify with The Cause so much that it becomes their life. They are no longer individuals after their adoption into this underground society; they are members of a group. Their abnormally severe identity crises have compelled them to permanently embrace the adolescent's solution—i.e. over-identification with a group—and to dedicate their lives to the achievement of communism. In some cases they are successful, thereby vindicating the claim that identity crises do often influence history.

Robert J. Lifton follows Erikson's example in discarding the life and death instincts. He further revolutionizes psychoanalysis by explicitly rejecting (1) the notion that the id, the ego, and the superego are the main structural components of the psyche, and (2) Erikson's model of the eight ages of man as too static and 'neat' (Lecture: "Lifton's Paradigm"). Lifton declares that the most important human activity is the formation of symbols representing life and death. Culture is primarily a collection of life imagery and death imagery; the need for "symbolic immortality", in other words, causes people to create culture. This sense of immortality can be expressed in five ways: living on through one's children, believing in life after death (theology), making an impact on the world through various achievements, knowing that nature will survive even after we die, and experiencing an intense state of mind in which the sense of mortality is no longer felt—a state called "experiential transcendence" by Lifton (Lifton, 32, 33, 34). This fifth way of experiencing immortality occurs in activities as varied as sexual love, childbirth, dance, battle, and artistic creation (Lifton, 34).

If one accepts Lifton's paradigm, superficial analysis suggests that culture is overwhelmingly an example of humans expressing their need for immortality through achievements—but theology and "experiential transcendence" are undeniably important elements of societies as well. (Buddhism is a splendid example of an influential religion that contains both a variant of the doctrine 'life-after-death' and the belief that loss of oneself (i.e., experiential transcendence) leads to perfect bliss.) Analyses of cultures indicate, in fact, that there is a good possibility that Lifton is correct in emphasizing the role of symbolic immortality in creating history. Furthermore, he suggests an interesting reason why millions of twentieth-century youth have become revolutionaries: in this age of total war and the threat of mass extinction, almost all the 'modes' of symbolic immortality—biological reproduction, long-lasting achievements, etc.—are threatened. Even nature might not last forever, due to the threat of nuclear war. The only mode that has not caused disillusionment is experiential transcendence. As a result, a high proportion of youth turned to communism during the Cold War because of the 'loss of self' it engenders—because it is possible and

justified, even heroic, to dedicate one's entire life to this most worthy of causes (Lifton, 35). Thus Lifton too, along with Freud and Erikson, is able to use his theory of symbolic immortality to explain history and culture. Which of the three theories is the correct one?

Brown's reinterpretation of Freud makes the Freudian theories of the Oedipus complex, the castration complex, the life and death instincts, and sublimation, seem more realistic—but there remain unanswered questions. [...]

If there is no castration complex and no Oedipus complex, does the Freudian theory of sublimation still make sense? Not in its original form. Sublimation, in other words, is not a continuation and desexualization of the Oedipus complex. Is it Eros and Thanatos projecting themselves into society? This theory seems more realistic—and it is certainly convenient for Freud that there is no way of disproving it—but we must agree with Lifton that it is too 'neat' to reflect the complexities of the human condition. The human psyche is composed of far more than drives for physical pleasure and flights from death. It is therefore necessary to reject Freud's theory of history and culture.

Erikson's notion of the identity crisis is much more realistic; it is, in fact, quite obviously true. Every adolescent can verify its truth. Interpreting culture and history through the polished lens of the 'identity' theory is useful in helping to understand why dictators and revolutionaries act the way they do, and why brutal ones (e.g. Stalin, Mao, and Hitler) are accepted by the people they govern. It is surely the case that without the requisite identity crisis experienced in adolescence or young adulthood, most people would not dedicate their lives to 'absolute' causes like communism, or would not identify themselves with monsters like Hitler, or would not even become the kind of person they turn out to be later in life. Since the identity 'crisis' has an enormous impact on adolescence, and adolescence has a profound impact on adulthood, and it is adults who create history, one must conclude that the identity crisis (although it is not always a crisis *per se*) affects history and culture. On the other hand, this is not the only factor that influences culture, nor even perhaps the most important one. Does Lifton's theory of symbolic immortality contribute significantly to our understanding of history?

The inevitability of death 'weighs like an incubus' on humanity's brain. Even in the conscious mind it often determines our actions; one can only imagine the effect it must have on the subconscious mind. But are our lives really as dominated by this fear as Lifton believed? Or more importantly, is culture created solely by this need for symbolic immortality? Certain aspects of culture—like religion—are indeed influenced by the fear of death, but people are often motivated simply by the love of work. Is it realistic to suppose that the reason Frédéric Chopin spent his life composing sublime music was because of an unconscious need for symbolic immortality? Why is it unacceptable to believe that a simple love of art was the only reason for Chopin's passion for music? Why must everything in psychoanalysis be reduced to all-encompassing theories that supposedly explain the entire spectrum of human behavior?

We have already established that identity crises often explain the actions of revolutionaries and dictators, but it is also evident that the need for symbolic immortality causes leaders to initiate immense projects of reform. Napoleon's ambition was a result of this need; Bill Clinton is obsessed with his "legacy"; Mao Tse-tung inaugurated the Cultural Revolution and the Great Leap Forward to ensure that the communist revolution—his legacy—would be permanent. Likewise, religions are formulated to counteract the inevitability of death, and "experiential transcendence" provides the motivation for the 'loss-of-self' required in so many revolutionary doctrines and Eastern religions. But to account for *all* of history it is necessary to follow Carl Jung's lead in postulating as the basic human drives hunger, sexuality, activity, reflection, and creativity (Marcus and Rosenberg, 41). Creativity explains the omnipresence of art in culture; reflection explains the existence of philosophers throughout history; activity explains the human compulsion to work. These need not be regarded as instincts; it is enough to assume that they are drives whose universality dictates many of the actions of mankind.

The three theories we have accepted—Erikson's 'identity crisis', Lifton's 'symbolic immortality', and an emaciated version of Jung's 'drives'—admittedly are not the sole causal forces of history. They hardly take account of man's interaction with his environment, and they certainly do not elucidate *all* of the psychological factors that cause people to create culture and history. Nevertheless, they are important starting-points for a more inclusive model of the human psyche as it relates to history. Lifton's theory of

symbolic immortality probably does not unravel as many mysteries as he claims it does, but neither can it be denied that the subconscious (and conscious) preoccupation with death has a subtle effect on many aspects of human history and culture.

To echo the statement that began this essay, we may never understand the totality of the human condition, but these three theories provide an excellent foundation upon which to base future attempts to understand history. [Um, no.]

Puritanism: Slave Morality
[Another hilarious paper]

Alexis de Tocqueville, in his book *Democracy in America*, attempts to explain the apparently contradictory coexistence among Americans of a powerful religious impulse and an obsession with freedom and equality. Throughout history, Tocqueville notes, religion and freedom have been incompatible (p. 47); why has the trend been reversed in the United States? Tocqueville's answer is that "religion regards civil liberty as a noble exercise of man's faculties...[and] freedom sees religion as the companion of its struggles and triumphs, the cradle of its infancy..." (p. 47). This explanation, needless to say, is inadequate in its vagueness and idealism. The true source of the harmony between religion and freedom—and equality, most importantly—is to be found in the psychological underpinnings of Puritanism, which was the religion that first gained hold in America. This essay will demonstrate that it was in fact the Puritans' "slave revolt in morals" (Nietzsche, 36) which predetermined that religion and equality would be complementary in the United States.

A brief account of the notion of slave morality is necessary for a proper understanding of its role in Puritanism. The main idea behind the first essay in Nietzsche's *Genealogy of Morals* is that humanity's most basic urge, the will to power, sublimates itself into two very different manifestations: master morality and slave morality. The ancient Greeks and Romans, with their collective self-confidence, pride, undeveloped consciences, 'noble' disdain for the weak, and desire for self-expression in whatever form it might take, were the quintessential examples of master morality. The Jews and Christians, who were obsessed with glorification of the weak, hatred of the strong—who would all one day go to hell—and their (the Christians') own inner, spiritual life, represent slave morality. Nietzsche argues that it was because of the Christians' inability to vent their hatred against their masters that they embraced the ascetic ideal by developing cruel consciences and imposing severe strictures on their own sensual pleasure—i.e., by being cruel to themselves. This inner cruelty was the opposite sublimation of the will to power to that of the masters, who were cruel to the weak rather than to themselves.

With the foregoing as a background, we can analyze the psycho-historical trends which led to the American obsession with both religion and equality. Puritanism arose out of the social and psychological anarchy during the Reformation; it was in fact a reaction against this (Barbu, 183). Barbu argues that the revolutionary assertion of individualism by Luther eventually led to a release of instinctual drives, which found their objective manifestations in the decline of feudalism, the rise of the towns, and various destructive wars; and their subjective manifestations in Shakespearean literature, psychological torment, an inability to maintain a balance between the superego and the id, and an overall lack of integration in the human personality (p. 183). Puritans compensated for all this by imposing on themselves rigid psychical and social organization, a "severe rationalization" in all areas of life, and a tyrannical superego to counteract the confusing array of recently unrepressed instincts (p. 183). Notice the similarities with Nietzsche's analysis of slave morality and the genesis of Christianity. Indeed, the only difference (morally) between Puritanism and early Christianity is that the former was a more intense version of the latter. A second reason for this peculiar intensity is that during feudal times the Catholic Church had, to an extent, substituted a degenerate form of master morality for its earlier slave morality. This authoritarian structure of the Church was, of course, a fundamental reason for Luther's revolt, but it was also a reason for the Puritans' need for an oppressive social order. They *needed* authority—they had lived under an absolute authority for centuries,

they had become incapable of doing without one, they had proven too weak to sublimate their instincts properly—and so they projected their meager will to power into an unprecedentedly severe God who forced them all into equality. In short, their self-imposed hardships were an easy way to bring order into their psyches, and their concern with equality was both a reaction against the authoritarian structure of the Catholic Church and an unconscious extension of it—but this time with God playing the role of the Church.

Hence when the Puritans founded colonies in the New World they based their ideal society on absolute equality and strict adherence to rules. These are cardinal symptoms of slave morality, signifying that Tocqueville's idealistic explanation of the harmony between religion, equality and liberty is incorrect. But how does liberty fit into slave morality? The Puritans did not crave liberty *for* themselves; they wanted liberty *from* societies that disapproved of Puritanism's aversion towards individual liberty!—that is, when used as a means to pleasure. Puritans wanted to have the freedom not to be free—or, rather, to be free to oppress themselves. This understanding of liberty is evidently due to slave morality (i.e., cruelty turned inwards because of outward impotence), and is also completely opposed to the future American one. But this does not imply that the latter is not itself a manifestation of slave morality.

So whence did this concept of political liberty arise? Originally it was a purely economic phenomenon, made possible by the recent Reformation, but by the time of John Locke it had penetrated the sphere of politics. Since psychological influences do not have a prominent place in its history, political and civil liberty were evidently reminiscent of slave morality only insofar as they were a reaction against the medieval aristocracy's 'authoritarianism' and ignoble master morality (as opposed to the noble one of the Greeks). The self-imposed cruelty of the Puritans had been discarded by the time America became a nation, implying that the United States was not founded on as pure a form of slave morality as was Puritanism.

Americans, nevertheless, retained the Puritan desire for equality. Tocqueville even notes several times that equality is a higher priority in the United States than freedom. The masses can only have insisted on equality so relentlessly for one major reason: the Industrial Revolution forced them to become machines even as it starved them, humiliated them, weakened them in every way—and *strengthened* the upper class. The notion of equality admittedly began with the bourgeoisie, but it reached its zenith due to the political influence of the workers in America. However, it was when the first rough stages of the Industrial Revolution had been superseded that social equality finally moved definitively into the realm of slave morality. Anyone who asserted his will to power by making the masses feel insecure in their own state of ignorance and weakness—such as certain intellectuals did, or the decadent bourgeois aristocracy did—was condemned or reminded that everyone is equal. Men like Matthew Arnold who emphasized society's need for high culture and who openly showed their contempt for the vast majority of people beneath them were seen as evil, as a threat to the weak. Over decades this obsession with equality, clearly due to the masses' hatred of their betters, became the American gospel to such an extent that today there is no longer even a hint of greatness anywhere in our culture. *Everything*—music, literature, politics, bourgeois economics—is mediocre and insipid. In short, our culture today, even more than in Tocqueville's time, signifies the complete triumph of slave morality in one of its manifestations.

To conclude, this paper has demonstrated that Puritanism was primarily a reaction against (1) psychical anarchy, intolerable to the weak-minded, and (2) the authoritarian structure of the Catholic Church. America's origin in the Puritan atmosphere of excessive asceticism no doubt had an influence on the further development of the ideas of equality and liberty in the United States, but it must be conceded that this influence was minimal. The primary indication of "slave morality" in America is the obsession with equality in every aspect of life, but again, this equality is essentially unrelated to the even baser Puritan fixation on it. Tocqueville argues the opposite, but he is wrong. Nevertheless, Puritanism and 'Americanism' do have one important thing in common: they are diseases of the mind.

Social Democracies Are the Best Form of Government

Conservatives and other lovers of the free market have generally considered the welfare state to be

a restriction upon individual freedom. The Lockean rights to private property and political liberty are, they declare, trampled on in economic systems such as Sweden's. Moreover, the evils of paternalism creep into the government when it is an extreme social democratic welfare state. These concerns, however, are unfounded. As Esping-Andersen points out, the de-commodification of workers effected by a social democratic welfare state more than compensates for any adverse consequences of a large government. More importantly, this paper will demonstrate that freedom is actually *increased* in a welfare state—as are also equality and democracy. Further, the Swedish system will be seen to be the most effective and potentially most permanent.

In a liberal welfare state, according to Esping-Andersen (p. 22), needs-tests and meager benefits “strengthen the market since all but those who fail in the market will be encouraged to contract private-sector welfare.” Both liberals and conservatives look favorably upon this as increasing individual freedom, but if we define freedom more inclusively—so as to additionally incorporate *social* liberties and opportunities—we will recognize that the opposite is the case. The impoverished do not have the freedom, for example, to gain a higher education. They do not have the freedom to choose to live in a suburban neighborhood. It may be objected that these are not properly *freedoms*; they are *opportunities*. But this objection is irrelevant: the point is that many people do not have the freedom to take advantage of these opportunities if the market is allowed to govern them. Thus commodification implies social slavery; if a welfare regime is able to de-commodify workers, it necessarily offers them liberation.

Another possible objection is that in a social democracy the rich lose their freedom to become even richer, or to totally run the country. This indeed is the case. But the sacrifice of liberties as superfluous as these is a small price to pay for greater freedom in the society as a whole.

De-commodification of workers, ending their reliance on the market, places them on a more equal footing with the wealthy than was the case when they were commodified. Thus there is greater social equality—which implies greater political equality. All citizens (aside from their political representatives) ultimately have an equal influence on the political process in this system. Such is not the case in liberal welfare states, of course, for these maintain the workers' reliance on the market. But corporate and social democratic welfare regimes are more successful at establishing economic and social equality. Arising from this equality, as was remarked previously, is the greater freedom of the citizenry as a whole. Thus equality and freedom are not, in a proper welfare state, incompatible.

Opponents of welfare states often warn that democracy becomes very fragile or non-existent when such a paternalistic, vast government bureaucracy runs the country. According to Max Weber, bureaucracy and democracy are irreconcilable: the one requires experts not democratically elected and an efficient mechanism for carrying out orders not susceptible to monitoring and control by citizens, the other by its definition implies leadership by the ignorant masses. However, since under a social democratic welfare regime there is more equality and freedom, the loss of democracy in the bureaucratic structure is partially compensated for by the increase of democracy in the public realm. The citizens are more interested in the political process because more of them feel that they're a part of it; thus more of them vote and voice their opinions. Additionally, as was noted earlier, they all have basically an equal say. Furthermore, although it may be true that democracy cannot penetrate the bureaucracy, it can and does exist outside it—to a greater extent than it does in liberal welfare regimes like the United States, which themselves have an equally vast bureaucracy. To cite one of Esping-Andersen's examples (p. 69), when the Swedish social democrats made middle-class standards the universal norm, the average worker experienced upward mobility, and thus there was a “consolidation of a vast popular majority wedded to [the] defense” of social democracy.

As for the accusation of paternalism, it is indeed possibly justified vis-à-vis corporate welfare regimes like Germany—although probably much less so than is thought. It is not, however, justified vis-à-vis social democracies, where the impetus for welfare comes from the citizens themselves rather than from the state. The red-green alliance in Sweden, which effectively initiated and prolonged its social democracy (with the eventual help of the “whites”), was entirely a popular movement. Hence its outcome cannot be labeled “paternalism”, especially when it continues to be supported by all of the citizens.

This is indeed a significant reason for the superiority of the Swedish model over the German. Bismarck initiated his social programs mainly to prevent socialism from acquiring power; hence, his

welfare state began as a paternalistic, corporatist method of counteracting a popular movement. This kind of deception would be impossible in a social democracy, where equality, freedom, and democracy are the guiding laws. If these three values are the primary criteria for judging the quality of a welfare state, then clearly the social democratic one is far better than the liberal, in which de-commodification has not been achieved.

However, if the criterion is which type of welfare regime will last the longest, most people are inclined to believe that the liberal state is the best. It is flexible, it does not require the vast contributions from its citizens that the social democratic state does, it can devote its resources to more productive investments, etc. On the other hand, most citizens of a social democratic state are more satisfied and have a higher quality of life (on average) than the citizens of all but the richest liberal states, and so there is less chance of dissatisfaction and consequent alteration in the governmental structure. Moreover, if a social democratic state happens to be rich, there is a great possibility that it will be able to divert enough resources to productive investments for it to remain in existence. Evidently the primary variable determining the success of any type of welfare regime is the wealth of the nation; a poor liberal state is in most cases just as likely to go bankrupt as a poor social democratic state—and in any event, its citizens are more likely to revolt from sheer discontent. In other words, there are no overwhelming indications that a state on the Swedish model is not as likely to be long-lasting as is a state on the American model.

To conclude, social democratic welfare regimes are beneficial in nearly every way: they increase individual freedom, they augment social equality, they generally make democracy more effective (outside the bureaucracy), they are less paternalistic than corporatist welfare states, and they are potentially as permanent as liberal welfare regimes. Particularly if they are wealthy nations, it is difficult to find any major drawbacks of social democracies.

The Marxist theory of the business cycle

Business cycles are entirely a modern (capitalist) phenomenon. In pre-capitalist societies, economic crises “took the form of *material destruction* of the elements of reproduction, whether simple or expanded, as a result of natural or social catastrophes”.¹ Crises were generally caused by non-economic factors like exhaustion of the soil and wars. In capitalism, on the other hand, this material destruction of the means of production is the *result* of crises, not the *cause*. “It is not because there are fewer workers engaged in production that a crisis happens; it is because a crisis breaks out that there are fewer workers engaged in production.”² This paper will explain why and how such a seemingly irrational sequence of events occurs in the modern business cycle.

The pre-capitalist crisis arises from an inadequate production of use-values. As mentioned above, external events like wars cause this under-production. In capitalism, however, there is an *overproduction of exchange-values*. Monetarily effective demand is not high enough to absorb the vast amounts of exchange-values that flood the marketplace: in other words, more than a socially necessary amount of labor (which in this case is measured by the effective demand for commodities) has been expended on the production of goods, so the profits of capitalists vanish—since their goods are not being sold—and they lose money.

This contradiction between supply and demand is possible because it is exchange-values rather than use-values that are distributed in capitalism. In order to consume a commodity it is necessary to possess the equivalent of its exchange-value; i.e., a good cannot be consumed if it cannot be bought. This clearly raises the *theoretical* possibility of business crises.

If during the circulation of commodities *their price of production changes*, as a result, say,

¹ Ernest Mandel, *Marxist Economic Theory*, p. 342.

² *Ibid.*

of the introduction of new methods of work...a large number of commodities no longer find their equivalent on the market, and a large number of debts cannot be met. It is enough for an income not to be spent today but only tomorrow for it to be incapable of buying the same number of commodities, if their prices have risen in the meantime.¹

In other words, the theoretical possibility of crises can easily become a reality if commodity prices change without there being concomitant changes in incomes.

Vulgar political economy, represented by James Mill, J. B. Say and others, argued that such an incompatibility between commodity-values and the total incomes of the various classes of society that participate in production is impossible, for “the production of commodities is at the same time production of the incomes needed to absorb these commodities”.² The problem with this pseudo-theory is that it assumes a static system rather than the dynamism inherent in capitalism. “It neglects the time-factor... Between the production and sale of commodities their prices can vary.”³ Moreover, incomes earned during one period will not necessarily be spent during the same period. Indeed, they will usually be accumulated and spent or invested much later. Hence Mill’s theory ignores the realities of capitalism.

Since the introduction of machines and new production methods does not take place gradually but rather through sudden bursts, society learns too late that an unnecessary amount of labor has been used to produce commodities in the less technologically advanced industries and firms. When occurring on a vast scale, as it periodically does, this overproduction in one sector and waste of social labor in another results in the following symptoms characteristic of the business cycle.

(A) *Overproduction and slump*. As the new investments in the advanced industries increase the total production of society, the relations between supply and demand begin to change. It becomes apparent that the commodities produced in the least favorable conditions of productivity cannot sell at their prices of production (i.e., they cannot earn for the capitalist a profit). Nevertheless, the factories with adverse conditions of productivity continue to produce commodities by relying on the expansion of the credit system. Eventually, the gap between supply and demand—the former high, the latter low—becomes so wide that capitalists in technologically backward sectors are forced to lower the prices of their commodities and hence lose their profits. Many businesses are ruined.

(B) *Depression*. Henceforth only the productively efficient enterprises continue production. The firms that were once realizing super-profits can now earn only *average* profits. All investment activity slows down considerably: the activity of the enterprises in the capital goods sector is much diminished by the lowering of investment and by the bankruptcy of the inefficient factories; the production of consumer goods declines substantially as well, but not as much as that of capital goods. On the whole, the average rate of profit remains very low because effective demand has diminished from the average lowering of incomes.⁴

(C) *Economic recovery*. Part of production capacity not having been used for a while, stocks have been gotten rid of. The demand for goods now exceeds the current low supply. Consumer-goods sectors whose sales have not entirely collapsed are able to increase their activity. This is encouraged by the low prices of raw materials, the low wages, etc. Efficient factories reopen and are able to acquire large profits; less efficient factories acquire the average profit.

(D) *Boom and prosperity*. “All available capital flows into production and trade, in order to take advantage of the increase in the average rate of profit.”⁵ Investment dramatically increases as demand continues to exceed supply. The most technically advanced industries realize super-profits by increasing their productive efficiency. Eventually the more backward industries begin to lose their profits, for they are wasting labor in comparatively inefficient production, and the cycle begins anew.

² Ibid.

³ Ibid.

⁴ Ibid., p. 350.

⁵ Ibid., p. 347.

This is a very brief summary of the Marxist doctrine of business cycles, discovered by Marx in the *early 1850s*. Now that the substantially correct theory has been laid out, it remains only to criticize a few superficial explanations put forward by bourgeois economists. H. L. Moore, for example, blames business cycles on the weather.¹ The problem with this idea is that it does not explain anything. How would Moore explain the proven fact that agricultural overproduction was an important cause of the Great Depression? Was there *too much* rain that year?

Pigou's theory is a little more sensible. He thinks that errors in the forecasting of profit opportunities are the primary cause of business cycles. (Modern credit arrangements, he thinks, tend to exacerbate depressions, in that banks withdraw rather than expand credit in times of crisis.) The point that Pigou overlooks is that 'over-investment' often *does* benefit the private entrepreneur; it is costly only to society as a whole. Each capitalist hopes that he will survive the ensuing crisis; he knows what he is doing when he increases the production and efficiency of his factory. His "error" is actually the error of the anarchy of capitalist production, in which every capitalist is forced to cater to his own well-being and neglect that of the society as a whole.² J. M. Clark recognizes this when he states that "the trouble seems to be not so much that businessmen mistake their interests...as that their [individual] interests lie in *doing the things which bring on the cycle*." This position is, of course, proto-Marxist.

To conclude, this paper has expounded Marx's explanation of the business cycle in opposition to Moore's and Pigou's. Cycles are inevitable, although their 'effects' can, through government intervention, probably be transformed from depressions into recessions. Overproduction, according to Marx, is inevitable under capitalism. Indeed, in a sense it is *good* in spite of its adverse effects on people's lives, for (1) it will one day cause an evolution to socialism, and (2) it is a powerful corroboration of the theory of historical materialism. (Schumpeter takes many of his ideas from Marx, such as "creative destruction".) Seen in this light, welfare economics is harmful, for in cushioning the effects of business cycles it postpones the realization of communism.

The Benefits of Government Intervention

Should the government intervene in the economy, and if so, when? The answer to the first question is simple: yes. This will be elaborated later. The answer to the second question is a bit more complex, but tentatively it can be expressed as: sometimes. Or, even more precisely: often. Laissez-faire is an acceptable policy during highly prosperous times or when a developing country's economy needs to be jump-started, but it is an ineffective governmental policy when high unemployment is a political goal. [?] West Germany, immediately after its defeat in World War II, when it was still occupied by America and Britain, underwent an economic miracle by relying primarily on the mechanisms of the free market—i.e., on laissez-faire.³ Indeed, within a few years the entirety of its productive activity went from consisting of a few million homeless people cleaning up rubble in cities, to consisting of an immense industrial economy that was more successful than France's. However, this occurred under exceptional circumstances, and thus corroborates the previous statement that laissez-faire usually increases employment only if a country has hit rock-bottom.

The Great Depression, that eloquent confirmation of central Marxist tenets, would not have occurred if laissez-faire had not been the economic policy of Herbert Hoover and his government. The stock market crash, the agricultural overproduction, the runs on banks, the reduction of incomes and laying-off of workers, the compounding of economic disasters upon more disasters—this was all possible because of laissez-faire. When Roosevelt experimented with his New Deal, which was manifestly not a laissez-faire policy, he was able to significantly reduce unemployment. His "Tennessee Valley Authority", for example,

¹ "Damn anti-capitalist weather!" I can almost hear him shouting in rage. "What's so great about the socialists that it has to support *them*?!"

² *Ibid.*, p. 347.

³ Walter Laqueur, *Europe Since Hitler*.

transformed a terribly impoverished area into a comparatively well-off region with plenty of jobs. This was possible through government spending, which meant government investment in the economy. Taboo though this was to capitalists, it saved them by preventing a proletarian revolution.

Similarly, after Hitler became Chancellor of Germany, a massive amount of government investment in the economy increased employment significantly.¹ Industries boomed, millions of workers found jobs, Germany's national pride soared, and the economy rocketed light-years beyond other Western economies.² This is the quintessential empirical support for the idea that high levels of government investment in the economy do have the potential not only to raise employment but to ensure the prosperity of a nation.

As a third example of the political effectiveness of Keynesian doctrines, social democracy can be cited. Social democracy is not only effective as a means of income distribution; it is also important for its investment in the economy. Thus, major industries are often nationalized, and the government itself employs a vast bureaucracy that provides incomes for many people.

After America's decade-long fling with neo-laissez-faire in the 1980s, what was the result? Recession. Unemployment. Millions of lost jobs and bankruptcies. When supply-side economics was abandoned, the economy recovered and eventually experienced a boom in the 1990s. Admittedly, Reaganomics was successful for a few years, but in the long run it proved that any kind of laissez-faire leads to high unemployment sooner or later.

In regard to the theoretical aspects of Keynesian economics, there are several points to be noted. First, cuts in wages are not an effective way to stimulate the economy. Contrary to what the neoclassical economists thought, cuts in wages do not necessarily lead to high employment.³ What is important, according to Keynes, is that there be a large amount of spending and investment. Effective demand should be as high as possible; if, then, the wages of millions of workers are cut, the economy will suffer. If aggregate demand is very high, the expectations of entrepreneurs regarding their possible gains from extensive investment will be high, so they will invest more. On the other hand, if aggregate demand is much lower than usual, entrepreneurs will be justifiably concerned about the prospects of economic ventures, and aggregate investment will sink. This will provoke lay-offs, since less capital will be invested in fewer industries, and effective demand will sink even more.

In fact, Keynes generally emphasizes the role of psychological factors such as expectation as explanations of employment, business cycles, and other phenomena. For example, he says "today's employment can be correctly described as being governed by today's expectations taken in conjunction with today's capital equipment".⁴ Moreover, there is another element to the psychology of the economy: the public's liquidity-preference. According to Keynes, the amount of money people hold is based on the inverse relationship between interest rates and the capital values on interest-bearing assets.⁵ Understanding, with Karl Marx, that money is a store of value in addition to being a means of exchange, Keynes decided that in certain conditions it is prudent to hoard money as an insurance against risks of capital loss; liquidity-preference enters this scheme by fixing the quantity of money that people will hold when the rate of interest is given.⁶ As interest rates fall, people will tend to hoard more cash due to pessimistic speculation.⁷ Hoarding money is, of course, a horrendous thing to do, since it equals less saving/spending/investment.

Keynes did not think that monetary controls had much influence on interest rates, so he favored fiscal policies. When faced with volatile expectations, he argued, the government should deficit-spend to increase aggregate demand, and thereby increase investment. This implies that consumption should be

¹ Jackson Spielvogel, *Hitler and Nazi Germany*.

² Of course, the price to pay for these successes was the destruction of 80 million people. But then again, every policy has externalities.

³ J. M. Keynes, *The General Theory of Employment, Interest, and Money*.

⁴ *Ibid.*, p. 50.

⁵ William Barber, *A History of Economic Thought*, p. 233.

⁶ *Ibid.*

⁷ Keynes, *op. cit.*, p. 172.

maintained at as high a level as possible. So apparently Keynes thought Veblen's "conspicuous consumption" was good. If he was right, this is of course only another reason to wish for the demise of a system that requires intense materialistic consumption and drains life of its substance, its spiritual pleasures.¹

To conclude, this paper has argued that the government ought to invest in the economy—to become a vast consumer, as it were—in order to ensure a high level of employment. Not only does an immense amount of empirical evidence support this claim, but Keynesian theories do as well. Even more importantly, Marxian theories do. (The potentially stabilizing effects of planned government intervention in the economy are implicit in the Marxian theory of the business cycle, which emphasizes capitalist anarchy.) Anyhow, the entire history of the Soviet Union shows that government intervention can keep employment at a high level, for employment in that country was almost always higher than it was even in social democratic countries.

A Defense of Marx's Theory of Value

All commodities have use-value and exchange-value. People try to obtain them because they have use-value, and this indirectly leads to their possession of exchange-value. But what *is* exchange-value? As defined by Smith, Ricardo, Marx and other economists, it is a measure of the amount of commodities that can be traded with another commodity. An object's exchange-value is indicated by its price, for the original function of money is to serve as a means for the circulation of goods. What, then, is *value*? Is it exchange-value or use-value or neither? Is the degree of a commodity's value a cause or an effect of people's desire for it, or neither? This paper will argue, with Marx, that (1) value is the amount of abstract, socially necessary labor embodied in a commodity;² (2) value is, under equilibrium conditions, the determinant of exchange-value; (3) demand influences exchange-value primarily in the day-to-day fluctuations of prices; and (4) the value of a commodity has no relation to whether people make an effort to acquire it (although its *exchange-value* does). [?]

Jean-Baptiste Say argues that the utility of commodities determines their prices. In other words, if there is a high demand for a product its exchange-value will rise, and if there is a low demand it will fall. Of course, production cost too is intimately related to prices, but Say's main point is that the classical economists underestimate the role of use-value in determining exchange-value.

Ricardo recognizes that use-value is essential to the *existence* of exchange-value³ (for people would not buy commodities unless they were in some way useful), but he does not think that use-value is an inherent and permanent part of commodity prices, as Say does.⁴ Nevertheless, he admits that temporary fluctuations in the relative values of goods are determined by demand and its relation to supply. His point is merely that the relative quantity of labor-time necessary for producing a good determines its exchange-value *in the long run*, i.e., under equilibrium conditions. He is justified in 'disregarding' the cost of capital and land because (1) he reduces capital to the labor that is necessary for producing it, and which is stored up in this capital, and (2) he does not see rent as a necessary part of price. Rent is just the cost to the capitalist of a landowner's monopoly over the land. Or, stated more adequately: "I consider [rent] as the result of a partial monopoly, never really regulating price, but rather as the effect of it."⁵ In any case, Ricardo thinks there is a need to have a fundamental *basis* for exchange-value—as opposed to relying completely on the fickle relationship between supply and demand, as does Say—and his labor theory of value provides this basis.

¹ I have to include a bit of communist ideology in every paper.

² This statement, however, will be slightly modified later.

³ David Ricardo, *On the Principles of Political Economy and Taxation*, Ch. 1., sec. 1.3.

⁴ *Ibid.*, Ch. 4.

⁵ *Ibid.*, sec. 20.12.

However, his simple labor-substance theory of value (which sees in *concrete* labor an inherent “value”) has its inadequacies. It is simplistic and cannot explain all economic phenomena. Marx’s labor theory of value is the correct one. He discards Ricardo’s emphasis on the *actual* labor contained in a commodity as the basis of value; instead, Marx sees *abstract*, socially necessary labor as objective economic value. By “abstract” he means simple human labor in general, qualitatively equalized (though not quantitatively, of course) by the constant circulation of commodities. The qualitative differences in labor between, for example, a shoemaker and a wine-grower are nullified in the great equalizer known as the market, which knows only commodities *as commodities*, as values that confront one another only as values and not as different kinds of values.

The term “socially necessary labor” refers to the amount of equalized, abstract labor that is necessary for the production of a given commodity under the given levels of technology in society. If it takes, on average, ten hours to make one pair of shoes, and a slow worker spends twelve hours making them, there is not more labor-value (or “value”) in the shoes which have taken longer to make. Hence each individual quantum of labor is not, for Marx, *inherently* valuable; rather, since the purpose of his theory of value is to describe how productive labor is allocated in capitalism, he focuses solely on abstract labor.¹

This enables him to bypass the question that Ricardo cannot easily answer: how is it possible for commodities to deviate from their “natural” price (or *intrinsic* value) for the great lengths of time that they often do? Marx’s answer is simply that commodities do not have some sort of intrinsic value. They are able to deviate from their labor-values because there is no reason why they ever *must return* to these values, as long as they fluctuate around them. He recognizes, with Ricardo, that the interactions between demand and supply largely determine the day-to-day prices of commodities; but he is more concerned with explaining the foundation behind these prices. In rejecting Ricardo’s theory, though, he comes up with his own: prices fluctuate around the “production price”, which is a purely theoretical number that includes the costs to the capitalist of capital and labor, as well as the amount of surplus value produced by the laborers. This surplus value is equivalent to profit (although not in each individual case; only in the economy as a whole). The capitalist pays the worker for, e.g., six hours of labor, but the worker manufactures so many commodities in that time that he produces more exchange-value than he was paid by the capitalist. He is paid sixty dollars but the commodities he produces are sold for eighty dollars, since they contain the two hours of his labor that went unpaid. These two hours are of course invisible—he does not actually remain in the factory for two hours past the limit of his workday—but they exist all the same. They must, for otherwise (according to Marx) there is no basis for profit.

The labor-value of goods has no direct relation to their use-value, so it has no direct relation to the desires of people for specific goods. It is, nevertheless, the theoretical determination of prices under conditions in which demand equals supply. Many economists would criticize the elusive theory of surplus-value, with its corresponding theory of production prices, for its uselessness in explaining actual prices. They are probably right in their criticism. However, while Marx’s theory may not be able to predict short-term economic trends, its virtue lies in its ability to explain the deeper movements of capitalism. Besides, it is not incompatible with the recognition that such factors as psychological preferences and cultural trends determine the short-term movements of the market.

[...]

The Falsity of Malthus’s Doctrines

Malthus wrote his *Essay on the Principle of Population* before the Industrial Revolution had overwhelmed the Western world, so any criticism of his doctrine ought to be contextual. It ought to answer two questions: (1) was he right in his own day? and (2) does his theory apply to the contemporary world? Of course, it is conceivable that some of his ideas are correct and others are not. For example, as is evident

¹ He also has a theory of complex, as opposed to simple, labor, but it is complicated and I don’t fully understand it.

from the following quotation from *Capital*, Karl Marx accepts that overpopulation may be inevitable in capitalism (insofar as there will always be an industrial reserve army) but does not accept that this is an eternal law of nature or that it has the consequences that Malthus assumed it does:

The conservative interests which Malthus served prevented him from seeing that unlimited prolongation of the working day, combined with an extraordinary development of machinery...inevitably made a great portion of the working class 'redundant'... It was of course far more convenient...to explain this 'overpopulation' by the eternal laws of nature, rather than the merely historical laws of capitalist production.¹

Nevertheless, this essay will argue that Malthus's theory has always been wrong in all its essential components, and that, additionally, the control of birth rates is *not* the key to economic development. [The topic of this paper was supposed to be "Are birth rates the key to economic development?"]

Before beginning the argument in earnest it will be useful to outline Malthus's general theory. Its core is contained in the following three sentences:

The power of population is indefinitely greater than the power in the earth to produce subsistence for man. Population, when unchecked, increases in a geometrical ratio. Subsistence increases only in an arithmetical ratio.²

From these premises he concludes that mankind is not "perfectible"—i.e., that there will never be an ideal state of society with the characteristics of utopian communism. Overpopulation will always weigh us down. It is true that Malthus names two factors that fight against this overpopulation: the positive and the preventive checks.³ The first includes the automatic regulations of nature, such as disease; the second includes all *voluntary* ways of limiting a family's or a community's population. According to Malthus, these mechanisms are indeed effective, but only in cycles: when a nation's population has increased beyond the level at which everyone can be properly fed, the price of labor will decrease (since there will be an excess of laborers); this will encourage farmers to hire more laborers, thereby increasing the amount of produce in the country; and this, combined with population checks like diseases and smaller families, will balance out the proportion between population and subsistence until the next cycle begins.⁴

This brief analysis can be supplemented with David Ricardo's contention that the more land is used for cultivation, the less produce does it yield.⁵ If this is true, it is both an added constraint on population growth and a positive check on overpopulation. Fortunately, now that genetic engineering is becoming an important method of growing food, Ricardo's contention is not much truer than are any of Malthus's ideas.

In the 18th century it may have been the case, as Malthus says, that unvirtuous men often did not get married because they could not tolerate this restriction on their sexual life, and so they pursued their desires with many other single women and thereby increased the population beyond a sustainable level. However, this consideration, if it ever was of any importance, is now of course nullified by birth control in all the wealthy nations.

Another, much more important, aspect of Malthus's theory that can be refuted is the following: "population does invariably increase where there are the means of subsistence".⁶ In the United States, where there is manifestly the means of subsistence necessary to support a much larger population, the number of

⁶ Malthus, *op. cit.*, p. 11.

people is only slightly increasing—and mainly because of immigration.¹ On the other hand, in the poverty-stricken country of Somalia, for example, the population is growing at the rate of 3%—more than three times as fast as in America.² No doubt a Malthusian would say that Somalia's population has simply not reached the unsustainable level, so it continues to grow; but the fact remains that population growth-rates in the modern world are precisely the opposite of what Malthus predicted (i.e., more people in poor countries than in rich ones). While not necessarily diminishing the adverse effects of overpopulation, this does invalidate Malthus's hypothesis, since he bases his theory on the assumption that population does increase whenever there is the means for it to do so, and not when there is not the means. In other words, it is conceivable that if the world someday taps and distributes its wealth equally amongst all nations, its population will nonetheless stay at a constant level or even decrease.

In his essay *Population Growth, Economic Growth, and Foreign Aid*, Julian Simon argues against Malthusianism by making a distinction between the short-term and the long-term effects of population growth. In the short-run he admits that having many children may seem harmful, but he contends that in the long-run, the more people there are, the more ideas will circulate and the more *human* resources will be utilized.³ He gives empirical evidence for this view: in studies undertaken by economists during the 1970s it was discovered that “higher population density in less developed countries is associated with *higher* rates of economic growth”.⁴ The data here may be misleading, for there could be a third variable affecting the high economic growth (as in the case of Hong Kong, which he cites: its economic success was probably due to its tutelage by Great Britain), but the studies have at least the merit of disproving Malthusianism (insofar as prosperity is shown to be compatible with an incredibly high population, as in Hong Kong).

However, Simon is wrong that birth rates are absolutely decisive for economic growth. It is absurd to believe, as he does,⁵ that increasing the size of the multitudes has any kind of effect on the number of brilliant economic ideas that are thought of. These ideas come not from the disease-ridden wasteland of Somalia but from wealthy Western families with excellent educations. It is not for the young adults of poor neighborhoods in India to conjure up ingenious methods of genetically engineering crops; in fact, except on farms or other locations that require large families to do the labor, destitute parents ought not to raise many children solely on the hope that their kids will be able to provide for them in their old age. It is unintelligent on the micro-level, and on the macro-level (which is our main concern here) it is certainly rarely beneficial—usually it only promotes disease and more poverty—and is often quite harmful in less developed countries. India, for instance, clearly has too high a population density, especially in the thousands of villages. Where are all the great economic ideas that Simon expects from the millions of starving ‘village idiots’? Evidently his thesis is as wrong as Malthus's.

To conclude, high birth rates have neither an unequivocally negative effect on economic growth nor an unequivocally positive one. Hong Kong is thriving with a dense population, while many African nations with populations just as dense are crumbling. The important variables for economic growth are education, a large amount of capital to begin with, incentives for investment, etc. (all of which Hong Kong had; hence its success). Moreover, Malthusianism—in particular the hypothesis that mankind is forever doomed to undergo periodic oscillations between population-sustainability and population-unsustainability—has been shown to be false. Because wealth does not necessarily provide incentives for high birth rates—indeed, the opposite is apparently the case throughout Europe and America—it is perfectly conceivable that one day mankind will achieve a harmonious proportion between population density and natural resources. Moreover, artificial resources are gradually becoming the norm, to the extent that in the future we might be able to manufacture all our necessities. In other words, Julian Simon may have been right in one important respect: humanity has an infinity of resources at its disposal.

¹ The website of the World Factbook Demographic Information states that the population growth rate of America is only .91%.

² This is stated on the same website.

(I'm including this half-hearted paper here only because it's somewhat informative. Comparative advantage is no longer the universally important factor in trade that it may have once been, since a country's endowment of natural resources is, perhaps, no longer the main determinant of its exports and imports, but the theory is still useful.)

The Brilliance of Comparative Advantage

Many theories have been devised as explanations of trade, and most of them contain a kernel of truth, for international trade is a complex phenomenon. However, there is a single factor, first articulated by Smith, Ricardo, and John Stuart Mill, that overwhelms and guides all other reasons for trade and causes of existing trade patterns. This paper will argue that the fundamental reason for international trade, and the origin of trade patterns, is comparative advantage.

John Stuart Mill, David Ricardo, and Bertil Ohlin all agree that comparative advantage is the most important reason for international trade. Their definitions of it, however, are rather obscure, so I shall define it myself with the help of an imaginary trading pattern between the United States and Germany, in which the U.S. sells Germany coca-cola in exchange for beer.

Let us suppose that it takes the U.S. one labor-hour to produce a single coca-cola and two labor-hours to produce a can of Budweiser beer. On the other hand, it takes Germany three hours to produce the coke and four hours to produce the beer. This information is summarized in the following table:

	<u>United States</u>	<u>Germany</u>
Coke	1 hour	3 hours
Beer	2 hours	4 hours

The U.S. has an absolute advantage in both goods, for it can make them in a shorter time than Germany can. But its comparative advantage is in coke, for the ratio between hours for coke and hours for beer in America is smaller than the same ratio in Germany: $\frac{1}{2}$ is less than $\frac{3}{4}$. In America, making coke takes only 50% of the time it takes to make beer, whereas in Germany it takes 75% of the time required to make beer. Hence America is comparatively more efficient at producing coke than Germany is. On the other hand, since $\text{beer/coke} = 2/1$ in the U.S. and $4/3$ in Germany, Germany is more efficient at making beer. (In America it takes twice as long to manufacture beer as it does to manufacture coke, whereas in Germany the ratio is only 1.33 to 1.) Each country manufactures the product that has a comparatively low cost. This example supports the traditional definition of comparative advantage—which is that countries specialize in those goods they can produce efficiently—with a concrete example of its usefulness for nations engaged in trade.

The reason comparative advantage is an important law of trade is, as Bertil Ohlin states, that nations have an inequality in their endowment of factors of production. “This inequality,” Ohlin continues (p. 34), “is never exactly balanced by the same inequality in demand,” so international trade arises. People in one country demand goods that another country produces; hence trade. In other words, it is because of an inequality in the endowment of factors of production that nations specialize in those commodities they can produce efficiently.

This is different from the mercantilist theory of trade, which is founded on the belief that all countries must compete against one another for gold. Mercantilists think that countries should specialize in those commodities that can be exported most often in exchange for gold, because gold is the measure of wealth. That is, whatever commodities are in high demand in other nations should be produced by the home country. This directly contradicts the theory of comparative advantage, which encourages specialization because it is beneficial for *all* parties involved. Countries ought not to specialize in whatever commodities

can be exported most frequently, but in the commodities that can be efficiently produced by the available resources. This is because countries are not like corporations that have to compete with one another; the well-being of entire populations depends on international trade, so it is far more logical and beneficial for nations to ‘cooperate’ than to compete. Hence comparative advantage, unlike mercantilism, is based on cooperation, or at least on a certain involuntary kind of cooperation.

Ricardo believes that international trade is especially beneficial for both workers and capitalists when it enables products necessary for the workers’ subsistence to be priced more cheaply than they are in the domestic economy, for this allows the capitalists to lower wages without hurting the workers. This lowering of wages leads to an increase in profits, because Ricardo argues that the amount of profits ultimately depends only on the level of wages. The lower are wages, the higher are profits. Thus, importing cheap cotton from the United States can indirectly raise the profits of many domestic industries. This lucky byproduct of trade, thinks Ricardo, reinforces the law of comparative advantage’s influence in determining trade patterns, for it is in the interest of both workers and capitalists to import from countries that manufacture goods cheaply and efficiently.

Indeed, even John Stuart Mill declares that this is a “direct economical advantage of foreign trade.” In his *Principles of Political Economy* he argues the following, which upholds Ricardo’s interpretation:

Commerce is virtually a mode of cheapening production; and in all such cases the consumer is the person ultimately benefited; the dealer, in the end, is sure to get his profit, whether the buyer obtains much or little for his money. This is said without prejudice to the effect which the cheapening of commodities may have in raising profits; in the case when the commodity cheapened, being one of those consumed by labourers, enters into the cost of labour, by which the rate of profit is determined.

Put differently, comparative advantage enables commodities to be purchased more cheaply, which indirectly raises profits (as was explained above).

Another reason for the importance of comparative advantage as a kind of “invisible hand” regulating which countries produce which commodities is suggested by a quotation from the same text:

The produce of a country exchanges for the produce of other countries, at such values as are required in order that the whole of her exports may exactly pay for the whole of her imports. This law of International Values is but an extension of the more general law of Value, which we called the Equation of Supply and Demand.

Since Mill thinks that exports pay for imports, it is evident that according to his theory countries can buy more imports only if they sell more exports. This will be the case most effectively if nations operate under comparative advantage, for they will thus produce and export what they can manufacture most efficiently. I.e., through comparative advantage they will export more and hence will be able to import poor.

[...]

Explaining Hitler

Germany has suffered more cultural, social, and political agonies than has almost any other great modern nation. A survey of the history of Central Europe reveals an extraordinary number of devastating wars, fewer civil rights for a longer period of time than other comparably ‘civilized’ European countries, a tendency to resist any kind of progressive change, and, most importantly, the existence of a single people fractured for a thousand years into hundreds of insignificant, competing territories. After the cataclysm of World War I and the failure of the Weimar Republic, the German people, in desperation, rallied around Adolf Hitler. He promised them greatness; he promised them purity; he promised them a thousand-year

long golden age when they would be ruled not by the encumbrances of their conscience but by the freedom of their instincts. They blindly followed him until the bitter end. What caused a people as great as the Germans to renounce their collective conscience so completely and to acquiesce to the ravings of a psychopath? Was it the sheer force of his will or did the miserable conditions of their society play a larger part? This essay will demonstrate the following: the political and cultural history of Germany was an important reason for its acceptance of Hitler as a leader; the material conditions created by World War I and the Great Depression were just as significant as Germany's history in explaining Hitler's accession to power; Hitler's psychological conflicts are an important ingredient in unraveling the mystery of the Holocaust.

Germany was culturally unique in the 1920's—and, indeed, throughout the majority of its history. While other European nations in the 14th through 19th century, notably England and France, forged a national identity, strengthened their economies, conquered foreign peoples, industrialized and revolutionized, Germany struggled to emerge from the Middle Ages. Until the latter half of the 19th century it wasn't even a single political entity. Long after France and England had undergone their industrial revolutions, Germany still had an inordinately large peasant population dispersed through dozens of antagonistic, feudal-like 'states'. Despite its immense intellectual and cultural output—Goethe, Schiller, Kant, Hegel, Freud, Beethoven, Mozart, Bach, Schubert, and Wagner were all from Germany (or Austria)—it lacked a coherent set of values. This phenomenon can be explained by its social, economic and political backwardness, its perennial conflict (after the French Revolution) between intellectual radicals and reactionary social conditions, its constant importation of foreign values that disrupted national unity and frustrated the intellectual elite, and the disillusionment resulting from Germany's resistance to a 19th century liberal-democratic revolution. The importation of foreign values and lack of a tangible national frontier are particularly important in understanding the struggle waged in the German mind. Thus Erikson emphasizes its foreign influences: “from the west, sensual and rational France; from the east, illiterate, spiritual, and dynastic Russia; from the north and northwest, individualistic ‘protestantism,’ and from the southeast, oriental easygoingness” (Erikson, 348). There was not a national identity. This need for national unity, combined with the intellectual and spiritual tenor of the German people in the 19th century, became “a matter of the *preservation of identity*, and thus a matter of (human) life and death” (Erikson, 348). The need for a national identity was a reflection of the overpowering, largely unconscious, human need to belong to a group. Even after Bismarck united the Germans in the 1800's they lacked a true national identity, because the past was so fragmented and the present was so dominated by conflicting ideologies like socialism, monarchism, liberalism, democracy, rationalism, and romanticism. This young but powerful nation “felt vulnerable in its frontiers and undeveloped in its political core” (Erikson, 348), and after the World War I catastrophe—when Germany was territorially divided up, forced to pay staggering reparations, and compelled to form a comically weak democratic government—the fragile but passionate German pride was dealt a mighty blow from which it would do anything to recover.

To further understand how a man like Hitler could come to power it is necessary to gain a deeper understanding of the German psyche. Since the German culture's most important legacy was its prodigious output of *isolated* intellectual and artistic geniuses, the typical German felt an “awe of overpowering, lonely, and often tragic greatness, and [was willing] to sacrifice the individual's right in order to emancipate the greatness in his own heart” (Erikson, 350). Often he did not identify with the image of the democratic man—and never to the extent that Americans do. Usually he identified with his mystical idea of the creative, tortured genius who overcomes all obstacles through sheer force of will (hence Nietzsche's and Heidegger's worship of will as an end-in-itself). This partly explains the attraction of Hitler's domineering personality, his indomitable will, and his maniacal self-confidence verging on the worship of himself as God's messenger.

The German adolescent was passionately romantic; his world was filled with mystical entities like Nature, Motherland, and Art (Erikson, 335). He revolted against his harsh father, a man who had “betrayed youth and idealism and...sought refuge in a petty and servile kind of conservatism” (Erikson, 334). The confident adolescent would never submit to this humiliation; he would rather die than become a “mere citizen” (Erikson, 334). His undying love for the Motherland, his naive dream of greatness, his romantic

love of everything mystical, governed him—that is, until he was slowly but surely transformed into the spitting image of the man who had so disgusted him when an idealistic youth (i.e. his father). Eventually the German adolescent himself became a “mere citizen”, obedient and submissive to the government, a ‘failure’ who had relinquished his former dreams of grandeur. This “combination of idealistic rebellion and obedient submission led to a paradox. The German conscience is self-denying and cruel; but its ideals are shifting and, as it were, homeless” (Erikson, 335). The German’s cruel conscience leads to harshness with himself and with others, but since this harshness has no “inner authority”, no coherent aim, no “coordinated ideals”, bitterness, vindictiveness, and fear are the result (Erikson, 336). He is “apt to approach [many destructive aims] with blind conviction [and] cruel self-denial” (Erikson, 336). The defeat of World War I sharpened this psychological conflict. Hitler, who exploited this conflict and resurrected the adolescent dreams of greatness felt by most Germans, rose to power in the atmosphere of confusion, misery, and anger bred in post-war Germany.

Hitler’s regime was founded upon the exploitation of every major problem that had beset Germany for the past hundred years. He extended national frontiers. He declared an end to all the corrupting influences of the West—influences like democracy, socialism, and morality. He told the German nation that it would become an economic power, an intellectual leader, a military machine. He brought “racial purity” by exterminating Jews, thus exploiting the German feeling of vulnerability to foreign influences and lack of a ‘pure’ national identity. He took advantage of the unconscious adolescent dreams of middle-class Germans by promising national greatness, flaunting his defiance of authority, preaching to his followers that their hatred was justified. His message was all the more effective for its partial liberation of the powerful id and destruction of the cultural superego. In essence, he gave his people what they wanted most: a national identity based on the primacy of the will and the rule of the instincts.

Why did the Germans follow Hitler in his hatred and destruction of the Jewish population? Hitler’s personal anti-Semitism is not so unbelievable, since it is universally agreed that the man was a sociopath. But it is more difficult to understand why an entire population would not object to the mass killing of an innocent race. Part of the answer has already been explained: due to its history, the German nation became self-conscious and resistant to foreign influences like the international Jewish religion. It desired national purity and a clear identity, of which one obstacle was Jewry. But this explanation alone is certainly not adequate.

Germany, beset on all sides by “corrupting” influences, struggling to find an identity, was particularly prone to an irrational fear of an ancient people who had so faithfully clung to their identity (Erikson, 354). The ancient heritage, the seemingly indestructible identity, of the Jews was seen by Germans as threatening. This in itself did not have much to do with the social and economic conditions after World War I and during the Great Depression, but it is nevertheless undeniable that many otherwise-decent citizens were engulfed in the unusually strong undercurrent of anti-Semitism during this period. As the German nation was falling to pieces, as unemployment reached record highs, as the atmosphere became thick with hate, the Jews perhaps seemed to flourish (in the eyes of Germans). The many political pamphlets issued during this period illustrate the extent to which anti-Semitism occupied the minds of intelligent citizens. In times of crisis the need for a scapegoat, the need to place the blame on *someone*, is overwhelming. Had the economic, political, and cultural conditions at this time of history been different, Germans never would have allowed the kind of brutality exhibited by the Nazis against Jews to continue.

In fact, Hitler would never have come to power in a more stable society. His doctrines of instinctual freedom, of racial purity, of world domination, of brutal suppression, of total war, would undoubtedly have been rejected by the German nation during a more prosperous time (just as they were ridiculed by most of the world during the 1930’s). It is, however, also probable that if Hitler had not been born, even during the Great Depression Germany would not have followed the destructive path it did. This is why we must turn to an analysis of Hitler’s psyche.

As an adolescent, Hitler was similar to many of his peers in his fanatical love of the Motherland and disgust with his own harsh but cowardly father. In him, though, the fanaticism was heightened by an unusually strong Oedipus Complex. His tyrannical father was twenty-three years older than his young, pretty mother. Erikson suggests that Hitler substituted peoples and nations for each of his parents, and this

theory is indeed corroborated by quotations like the following (taken out of *Mein Kampf*): “beloved mother...the young Reich,” and “the old Austrian sham state...” (Erikson, 328). One represents his mother, the other his father. Eventually the Jews became unconsciously identified with his father, thus contributing to his murderous hatred of them.

The use of a scapegoat often conceals feelings of self-hatred and inadequacy. Gordon Allport states that a vicious circle is created by this “projection”: “The hated scapegoat is merely a disguise for persistent and unrecognized self-hatred. A vicious circle is established. The more the sufferer hates himself the more he hates the scapegoat, the less sure he is of his innocence; hence, the more guilt he has to project” (Waite, 203). Since Hitler frequently mentions “guilt” and “conscience” in connection with Jews, it seems likely that these terms caused a great deal of self-hatred.

He often declared that the Jews were an inferior race because of their ‘disgusting’ sexual practices, such as incest. It is ironic that many of his love interests were women who were actually related to him: his niece Geli, his half-sister Angela, and his mother (Waite, 206). This is a clear instance of projection. Furthermore, Hitler often looked at pornographic magazines (Waite, 206), and the fact that he vehemently accused Jews of sexual perversion suggests that he felt guilty about his own perversions.

All his life Hitler had had doubts about his masculinity and physical power (Waite, 210). Thus in 1942, when he realized that even if he did win the war his victory would not be as complete as he had hoped, he made the decision to kill all the Jews of Europe (Waite, 210). The doubts about his strength had reasserted themselves, and by ‘defeating’ the Jews he would prove to himself that he was in fact “hard as steel” and “brutal.” His insecurities were, once again, the cause of his anti-Semitism and brutal war policies.

This very brief analysis of Hitler’s psychological conflicts serves the purpose of further demonstrating that the objective social conditions were not the sole cause of Hitler’s rise to power, of his anti-Semitism, and of the destructive policies of the Third Reich. The conflicts in his psyche would have dominated him even if Germany had not lost World War I or the Great Depression had not ruined the economy. It is, however, true that Germany’s acceptance of Hitler as its leader was largely due to the material and historical conditions of that country.

In conclusion, the psychological character of the German people was an extremely important cause of Hitler’s accession to power. The insecurities, conflicts, and utopian dreams which existed in the German psyche are essentially the following: Germany had a history of extreme vulnerability to foreign influences, rivalry amongst its hundreds of tiny states, and backwardness when compared with the West European countries it tried to emulate; since Germany’s most important contribution to European culture was its prodigious output of isolated intellectual geniuses, German youth idolized the out-standing, powerful genius—thereby explaining the attraction of Hitler’s dynamic personality; the contradictory culture and intellectual climate of this country—sometimes radical, sometimes reactionary—when combined with the failure of the adolescent dreams of greatness, produced a conflicting array of values that caused the German to be harsh with himself and with others, and often to pour all his energies into destructive pursuits like Nazism; the lack of national ‘purity’, of a national identity, caused Germans to become paranoid of corrupting influences like Judaism, preparing the way for their acquiescence to Hitler’s policy of extermination.

[etc.]

Dialectics in German History

Germany has had a troubled history. Throughout the Middle Ages and early modern times it was fragmented, being a loose confederation of states and principalities called the Holy Roman Empire (an ironic name, for, as Voltaire quipped, it was neither holy nor Roman nor an empire). Two large states, Prussia and Austria, had the most power in the confederation. In the early 1800s Napoleon invaded and ended the empire, but with his defeat at Waterloo and the convening of the Congress of Vienna in 1815, reactionary forces effectively restored Europe to the status quo. This meant that Germany remained

fragmented for several more decades. At last, after Prussia's crushing defeat of France in 1870, Bismarck was able to unite the German states for the first time ever. Austria, which had remained Catholic while Prussia had become Protestant (in the 1600s), stayed outside the union. For over seventy years Germany was politically united, but its embrace of militarism and Nazism ultimately led to its partition after World War II between the communist and capitalist camps. Yet until 1989, when the East and the West were united, West Germany was arguably the most "civilized" society Germany had ever seen. This paper will describe the startling differences between it and its predecessor and then briefly explain them within the broader context of German history.

The most obvious change between the Germany of 1871-1945 and its true successor, West Germany, was the progression from militarism to pacifism. One of the reasons, of course, for this change is simply that West Germany was not allowed to have a military immediately after World War II. This external consideration should not be overemphasized, though, for a military was introduced in 1956.¹ A more significant fact than the temporary banning of the military is that most of the population was opposed to its reintroduction. Despite all the safeguards enacted to prevent the military's abuse of power—e.g., it was to have a "purely defensive role" and be under parliamentary control (Fulbrook, 260); soldiers had the right to refuse an order if "obeying would mean committing a criminal act" (261); conscientious objectors could opt out of military service—the level of opposition to its reinstatement was extremely high. "There were considerable numbers who left to live in West Berlin in order to avoid military service altogether. . . . Peace movements were large and relatively well-organized. . ." (261). This was the complete opposite of the country's attitude before the two world wars, when it was a nationalistic state with a strong military. It was, after all, in the process of creating itself after centuries of fragmentation; indeed, a popular slogan before World War I was "Deutschland, Deutschland über alles!", which translates as "Germany matters above all else! We will fight to the death for our beloved homeland!" Militarism evolved to pacifism in the postwar Federal Republic of Germany.

Related to this decline in militarism was the abandonment by Germans of expansionist ambitions. They lived in an even smaller country than the one under Hitler (which had itself been reduced from its former size by the Treaty of Versailles), but they relinquished all desire for "Lebensraum" and revenge. This was, of course, eminently sensible and probably inevitable after the catastrophe of World War II. In any case, nationalism had ceased to be a reality. It had been taken to its logical conclusions under Hitler, and the result had been its demise.

Another departure from tradition was the political pluralism and toleration in West Germany. There was a Social Democratic Party, a Catholic party, a liberal Free Democratic Party, and in the 1980s a Green party. Mary Fulbrook notes that "in practice, while all citizens of course had the right to vote and were free to form pressure groups, some interest groups were, to paraphrase George Orwell, more equal than others" (254). However, this is true of every modern liberal democratic state. Some groups have more power than others. In the 1870s, on the other hand, Bismarck outlawed all socialist parties. And during the 1930s the Nazis effectively outlawed every party except their own. In fact, with the exception of the 1920s—which were an aberration resulting from the Treaty of Versailles—Germany prior to its division was characterized by an extremely powerful executive. First it was Bismarck, then Kaiser Willhelm II, then Hitler. The FRG, on the other hand, had a parliament that enjoyed most of the political power. Coalitions were frequently necessary after elections (254), and the need for coalitions is rarely a symptom of a strong executive branch.

The economy of the FRG was more "liberal" (*laissez-faire*) than that of its predecessor. The Nazi regime had had ultimate power over the economy: for example, the Reich Food Estate controlled the production, distribution and pricing of foods; after 1936 economic development was directed toward preparation for war (86), and so on. Even under Bismarck, economic development was largely directed and sponsored by the state, though to a lesser extent than it was under Hitler. The reason, or one of them, was that Germany had to compensate for its late industrial beginning—and economic backwardness in comparison with England—by planning and coordinating its efforts at modernization. This seems to suggest that West Germany, whose economy was devastated after World War II, would have followed Bismarck's

¹ Mary Fulbrook, *The Divided Nation*, p. 260.

example in *directing* economic recovery. But it did not. Instead, neo-liberal policies were adopted in the early 1950s: a freer rein was given to market forces, “with the state merely guaranteeing the conditions for productivity but not playing too interventionist a role” (182). Under the Adenauer government the economy achieved outstanding growth, which was surely one of the most important factors in the success of the postwar democracy.

On the whole, then, the FRG was more liberal and democratic than the old Germany. It was mostly rid of elements of fanaticism, of extreme racism and nationalism, of the inferiority-complex that had plagued old Germany beneath its displays of militancy and arrogance. After the shock of a catastrophic war, ‘Germany’—at least its western half—was finally integrated successfully into the international community.

The most immediate cause and effect of this success story was a drastic change in the collective consciousness of the German people. Throughout their history they had been insecure about their position vis-à-vis foreign powers, since under the Holy Roman Empire they had been fragmented into thousands of principalities which had made concerted action impossible and political impotence inevitable. The predictable dialectical reaction to their former weakness was an emphasis on economic and military might under Bismarck—an emphasis that led to the first World War. The humiliating outcome of that war did not humble them but infuriated them; they wanted revenge, wanted to prove their power once again. Thus the old “inferiority-complex” still characterized the collective consciousness of the masses. A surge of unprecedented strength grew out of the rhetoric and policies of the Nazis, yet it too provoked only a terrible cataclysm, a near-apocalypse of the German people. At last, after all the earlier confrontational tendencies of German politics had been taken to the extreme in Nazi doctrines and practices, another dialectical shift occurred: fanaticism was abandoned for moderation. There were no other realistic options. The shift was a result not of economic tendencies, nor of objective structural changes in politics, nor even of conditions imposed by the Allies. It was a natural movement of (collective) consciousness: a movement from extremism and revolution resulting in total collapse to reformism and gradualism.

To conclude, this paper has (1) outlined some major differences between Bismarck/Hitler’s Germany and the FRG; and (2) argued that the nature, indeed the existence, of West German democracy can be understood only in the general context of German history, for West Germany was primarily a reaction against this history and the “collective consciousness” it had engendered. The main differences between the two Germanies have been seen to be the greater militarism, nationalism, political repression and economic control (by the government) of the former—or, stated generally, the higher degree of tolerance and individualism in postwar Germany. The country’s history had resulted in the suppression of the individual vis-à-vis the state; Hegel’s philosophy, which argued that individuals were mere “accidents” in relation to the all-powerful State, had even reified this traditional attitude. The West German attitude, on the other hand, was the opposite: a major dialectical shift had occurred, whose essence was the subordination of the state to the citizen, i.e., the decisive defeat of fascism.

(The following is an example of the papers I had to write for one of my history classes. We were supposed to choose controversial, indeed ridiculous, thesis statements to argue for and then follow a rigid formula in how we defended them. Three test-cases, three textual analyses (each of which was supposed to address six particular areas of interpretation, such as “symbolism”, “internal logic of passage”, “link to thesis”, “language, tone, style, and bias”, etc.), 25 footnotes, three counter-arguments from an imaginary opponent’s point of view, 10 new words, a paragraph near the end devoted to personal reflections on the subject’s relation to the writer, and so on. I wrote ten such papers that year. In this one I neglected some of the requirements, which made it a little more readable.)

The 1917-38 Revolution: Consolidation of Capitalism in Russia

The Russian Revolutionaries deemed themselves Marxists. In erecting Karl Marx as their idol, they

forever associated his name with their revolution. However, one of Marx's cardinal rules in analyzing revolutions was not to trust the intentions of the revolutionaries; the objective historical forces are far more important.¹ The Russian experience between 1917 and 1938 was not an exception: it was much more a capitalistic, patriotic drive to modernize than a Marxist revolution. Moreover, it was mainly the failure of the international socialist revolution after World War I that caused this degeneration from high Marxist ideals to low capitalist ones—thereby confirming one of the tenets of historical materialism, namely that capitalism is a necessary historical stage unless the proletariat seizes power on an *international* scale prior to the hegemony of bourgeois society.² This thesis will be tested by examining (1) Stalin's purges in the 1930s, (2) the 5-year plans, and (3) the Communist Manifesto.

In the 1920s, as it became evident that the European socialist revolution had failed, Stalin adopted the slogan "Socialism in One Country".³ He would impose on Russia a policy of forced industrialization, evidently because his goal was the survival of the Soviet Union in a hostile capitalist world. Sheila Fitzpatrick summarizes the new attitude succinctly:

National modernization, not international revolution, was the primary objective of the Soviet Communist Party. The Bolsheviks did not need revolutions in Europe as a prop for their own proletarian revolution. They did not need the goodwill of foreigners—whether revolutionaries or capitalists—to build Soviet power.⁴

Patriotism, modernization, competition—the traditional ideals of capitalist society—had taken the place of internationalism, welfare, and equality. Fitzpatrick's tone is a bit facetious in mimicking the boastful attitude of the Bolsheviks, and she oversimplifies in portraying all of the Bolsheviks as adopting this viewpoint, but most Communists certainly did hold these views in the late 1920s. Their lack of a distinction between revolutionaries and capitalists—evident from the last sentence in the quotation—is a good example of their abandonment of revolutionary ideals. In the Bolsheviks' insistence on designating their drive to modernize as a "proletarian revolution", this term must be interpreted as symbolic of patriotism, of Russia's new identity, of its strength, of a commitment to the supposed virtues of capitalism (such as wealth and national power). Hence the new attitude itself of the Soviet Communists after the failure of international revolution signifies their retreat from Marxism.

Furthermore, the *actions* of these Communists during the 1930s are a concrete instance of this 'retreat'. Stalin's brutality during the five-year plans and the Great Purge in particular was significant. The Great Purge in 1937-1938 methodically eradicated all remaining Old Bolsheviks,⁵ all potential radical opposition—Trotskyites, for example, who still supported an international revolution—everyone who could recall the original utopian demands and what they had been reduced to. Fitzpatrick argues that the Great Purge was merely a final expulsion of revolutionary energy,⁶ a 'renewal of the revolution', but such an interpretation disregards the purge's policy of obliterating only *Stalin's* opponents. For, to repeat, Stalin's real purpose in these purges was arguably to erase all memory of the demise of the socialist ideal and the erection of a 'nationalist', state-capitalist regime.

On the other hand, the interpretation of the Soviet Union's economy as state capitalism is by no means universally accepted: many scholars,⁷ for instance, point out that the goal of the Soviet government was not profit but accumulation. The forms of distribution may have been bourgeois, but the mode of

production was not.¹ Furthermore, ideals like wealth and national power are not necessarily capitalist merely because they exist in a capitalist era. They are compatible with genuine socialism (or as genuine as it can be in only one country). In addition, the collapse of the international revolution after World War I was not necessarily the cause of any shift in attitude that the Communists did experience; probably many of them had been secretly patriotic, hungry for a unique Russian identity, eager to catapult their country into the twentieth century through sheer force of will—a distinctly un-Marxian notion—even prior to 1917. From the very start, it could be argued, socialism served merely as a cloak with which to conceal their longings for a glorious “Mother Russia”.

Such an argument, however, disregards the convictions of Lenin, who, in the interests of the international revolution, *wanted* Russia to lose World War I.² He despised the autocracy, he despised all Russians who did not despise the autocracy, and he despised Russia’s proto-imperialism under Nicholas II.³ Before the failure of international revolution, Lenin could not be accused of patriotism or capitalist leanings. This excerpt from his Imperialism: The Highest Stage of Capitalism (1920) demonstrates his internationalism:

The tens of millions of dead and maimed left by the war...open the eyes of the millions and tens of millions of people who are downtrodden, oppressed, deceived and duped by the bourgeoisie with unprecedented rapidity. Thus, out of the universal ruin caused by the war a world-wide revolutionary crisis is arising which, in spite of the protracted and difficult stages it may have to pass, cannot end in any other way than in a proletarian revolution...⁴

The impassioned language (“downtrodden, oppressed, deceived and duped”) and angry style of writing hint at Lenin’s iron resolve—a resolve that can only be the result of an absolute belief in the rightness of his cause, of his substitute religion (Marxism). He clearly sees the millions of oppressed peoples around the world as symbolic of mankind’s potential unity, of an international communism. Thus, prior to the failure of European socialism, Lenin was undoubtedly a dedicated Marxist in every sense of the word.

This is a crucial point, for after the Russian Civil War and the dashed hopes for German socialism, Lenin instituted the free-enterprise policy of NEP.⁵ Although this did not signify a conversion to the principles of capitalism, it did betray an unconscious reversion to patriotism, a commitment to consolidating Russian power at all costs. Over time this became the revolutionaries’ foremost goal. Stalin’s five-year plans⁶ were a prolongation of the trend begun with NEP and the re-consolidation of Europe’s ‘*ancien régime*’: their only purpose was to modernize the Soviet Union, to raise it to the status of a superpower. The Soviets’ ritualistic repetition of the one word ‘socialism’ was merely a formality and a disguise with which they hid the truth behind the forced collectivization, forced industrialization, obsessive purges, and imperialism (especially after World War II): historical materialism was, indeed, confirmed, but only insofar as Marx had argued that a truly socialist nation was impossible in a world of capitalism, where all nations have to follow capitalist rules in order to survive.⁷

Nevertheless, the Soviets’ partial repudiation of socialism cannot simply be assumed. The very essence of socialism as a transition to communism, according to Marx, is its expansion of the productive forces.⁸ This is precisely what the five-year plans accomplished. Moreover, true socialism is supposed to

build a new man, uncorrupted by greed and excessive self-interest.¹ Stalin admittedly failed at this task, but the creation of a new ‘Soviet man’ was nonetheless one of his ambitions during the 1930s and the five-year plans. The re-institution of patriotism in and of itself cannot be taken to imply that socialism no longer existed.

That argument may seem compelling, but I think it is wrong. Marx insisted throughout his life on the international character of socialism, on the mistakenness of blind national loyalty. In the Communist *Manifesto* (1848) he is uncompromising:

The working men have no country... National differences...are daily more and more vanishing, owing to the development of the bourgeoisie, to freedom of commerce, to the world-market... The supremacy of the proletariat will cause them to vanish still faster.

The language in this brief selection is vague, but obviously Marx believes it part of the communist creed that proletarians must be loyal to their class before being loyal to their country. By “supremacy” of the proletariat he means their ideological control of the population, their political hegemony over their respective nations (and eventually the world), and their control of the planned economy. All three of these conditions were *formally* present in the Soviet Union during the Stalin era, yet intense patriotism, stronger than ever before, had captured the minds of the Russian masses. (Arguably, it was mainly from love of their country that they tolerated Stalin’s brutal programs of industrialization.) This seemingly contradictory prevalence of patriotism does not demonstrate that Marx was wrong in his analysis of socialist ideology, for prior to the failure of the international revolution the Communists themselves believed as Marx did (as is evident from the above selection from Imperialism: The Highest Stage of Capitalism). Clearly the revolution degenerated into a nationalist struggle *solely for modernization* after Stalin rose to power.

It may be true that the intention behind the five-year plans was to industrialize and not to continue the socialist revolution, but Philip Pomper and Sheila Fitzpatrick would both disagree that this was a sharp deviation from the revolutionaries’ earlier intentions.² Since the nineteenth century the Russian revolutionary intelligentsia had been acutely aware of Russia’s backwardness in comparison with Western Europe: the Decembrists,³ the Nihilists,⁴ the Populists,⁵ the Socialist Revolutionary Party,⁶ the Mensheviks,⁷ and even the Bolsheviks⁸ wanted to propel Russia into the modern age without visiting upon its workers the suffering entailed in capitalism. This desire was, one might argue, merely augmented after the collapse of international revolution; it was inherent in the revolutionary movement from its inception.

Indeed, this objection is probably justified. History has a fundamental continuity: in this case, the Decembrists’ patriotic dissatisfaction with Russia’s backwardness was transmitted to all the generations of revolutionaries up to 1917. Even Lenin was probably susceptible to this divergence from Marxist principles. I myself know how difficult it is to free oneself from all traces of petty patriotism, for despite my qualms with America and the American public, I cannot discard a certain loyalty towards it. It seems ingrained in me, as it is ingrained in most citizens. Lenin, who was such a volatile thinker and politician, must have experienced many episodes of patriotic love even before the fall of Europe’s revolution—for instance, in the midst of the Russian Civil War. Hence the thesis must be qualified by saying that the international revolution *intensified* trends, rather than initiating them, among the Bolsheviks toward exclusive preoccupation with patriotism and Russian modernization at the expense of communism.

With the above qualification, then, this paper has corroborated the thesis. The inevitability of the

triumph of capitalist ideology in all major countries—unless an early international socialist revolution occurs, which it did not—has been demonstrated: international competitiveness, modernization for the sake of power, extreme patriotism, a desire for the accumulation of personal wealth, and production for production's sake are typical examples of capitalist politics, economics and ideology which survived in Russia after 1917. As previously stated, the only necessary modification to the thesis, a result of the counter-arguments to the first and third test-cases, is that the Russian revolutionary intelligentsia *throughout its entire history*—and not merely after the consolidation of bourgeois democracy in postwar Europe—was obsessed with the idea of modernization and competition with the West. Thus, Marx's statements regarding the global hegemony of capitalism (especially in light of the Soviet Union's collapse in 1991) have proven prophetic.

“Does the Republic provide an account of the development of the self?”

The *Republic* does provide an account of the development of the self, but this account is very different from the answer that would be given by contemporary psychologists. The reason is that it is a response to a different question. Plato attempts to delineate the various stages that must be passed through for a remarkable person to fulfill himself—i.e., for him to become a philosopher. Thus Plato presupposes that a self, in a sense, already exists; the task for it is to unfold its potentialities. Contemporary psychologists, on the other hand, answer the question “How are selves developed?” by describing the process whereby a child begins to differentiate himself from his environment. On this score the *Republic* is silent.

A better formulation of the question that Plato answers is as follows: “Once a child has learned to distinguish himself from his environment, what is the ideal way in which he should proceed to fulfill all that is latent in him? How is a fully rational individual constructed?” The *Republic* describes how a *finished* self comes into existence—a fully harmonized, integrated personality that is a whole rather than a collection of parts. For example, in the metaphor of the cave it is implied that the people staring at shadows on the wall are unaware of their own potentialities, or of the true nature of the world, and so they are not genuinely harmonized selves. The few who escape to sunlight, however, acquire the ability to see deep within themselves—to rediscover what they have always known on one level, as Plato might put it—and thus to mold their own psyches into developed, self-aware personalities. In Plato's view a person has not realized himself until he has understood himself, and for this reason the end-product of education is the philosopher. This man has attained the height of reason, which is the only faculty that can unify both the spirit and the appetites and thus harmonize the individual *in toto*. Reason is the most completely human faculty; hence it is the faculty that must be most developed if humanity is to realize itself. Therefore the *Republic*, which provides an account of the unfolding of genuine rationality, describes how we can consummate our humanity and thereby *develop* our selves. In brief, it interprets the aforementioned question in a unique way, but answers it adequately all the same.

Illusory Analogies

Fyodor Dostoyevsky's *Crime and Punishment* undoubtedly borrows a great deal from Honoré de Balzac's *Père Goriot*. Striking parallels exist between many of the characters and much of the symbolism. For example, Razumikhin and Bianchon have similar functions in the two novels: they are simple but intelligent students who serve as foils for the complex, tormented heroes. They are not as ambitious and gold as the main characters: Razumikhin wants only to marry Dumia, and Bianchon will be content if he can eke out an existence for himself in the country (136). Likewise, Svidrigailov and Vautrin both represent the cynical sides of the two main characters, the amoral men whom Raskolnikov and Rastignac might

become unless they suppress aspect of themselves. However, we should not get too carried away with the analogies. In spite of some obvious deliberate ‘borrowings’ on Dostoyevsky’s part, many of the similarities are coincidental and superficial. This claim will be examined by outlining first the parallels between Eugene de Rastignac and Raskolnikov and then the significant differences.

The similarities are certainly manifold. Raskolnikov and Rastignac are young law students living in big cities who have recently abandoned their education. They are from poor families in the provinces, and their mothers and sisters depend on them for their future. They are intelligent, bold, ambitious, and calculating yet emotional young men. For instance, Rastignac asks for money from his mother after much deliberation regarding the prerequisites for his entry into society, but when he receives the money he feels “gnawed by a feeling of intolerable heat” and suddenly wants to turn his back on society (97). Similarly, Raskolnikov spends a month calculating every detail of his future crime, but immediately before and after it is committed he succumbs to attacks of depression, doubt, self-contempt and even insanity.

Another analogy is that both men have an innate core of compassion within them, which they begin to lose in their reactions to society’s heartlessness. When Sonia enters Raskolnikov’s room for the first time, in the middle of his conversation with his family, Raskolnikov “suddenly realized that this downtrodden creature was downtrodden to such a degree that he felt sorry for her. She made a frightened move to run away, and something inside him seemed to heave” (227). This is a perfect example of spontaneous compassion. Yet at other times, when he feels particularly oppressed by his conscience, Raskolnikov hates not only his family but himself and the entire world—which is a reaction to the grinding poverty that surrounds him and the terrible act it has driven him to. Rastignac, too, feels pity for the helpless Victorine, but he flirts with her in spite of the inevitable pain that love will bring her (170, 171). He does so because he thinks it will indirectly benefit him socially: i.e., the necessity for cold-heartedness upon entering the ranks of the aristocracy is what temporarily smothers his instinctive compassion for Victorine.

Further parallels between the two characters can be listed. They each have a friend who is simpler than they, who doesn’t know the torment of soaring ambition. They each have their Mephistopheles (Vautrin and Svidrigailov), their cynical well-wisher who encourages them to forsake morality and instead act egoistically—to steal from the world everything it can offer them. They both are repulsed by these two men but feel a kind of fascination with them. (During Raskolnikov’s first conversation with Svidrigailov—the conversation which so disgusts him—Dostoyevsky writes that “at one point Raskolnikov thought he might get up and leave and put an end to the interview, but a certain curiosity, even a certain self-interest, kept him awhile” (271).) They both experience a moral dilemma: Eugene wonders whether he would kill a Chinese mandarin if it would make him a rich man (135), and Raskolnikov *does* kill his “mandarin” in order to steal her money.

However, all these similarities disguise real differences in the personalities and *purposes* of the two heroes. Dostoyevsky’s thematic concerns are not Balzac’s. Intellectual subjects like nihilism, Christianity, redemption, murder, insanity and poverty occupy the Russian novelist, while Balzac mainly wants to describe society in a realistic and uncompromising way by tracing its effects on two ‘good’ men (Goriot and Eugene). Several facts can be adduced to support this claim. First, unlike Rastignac, Raskolnikov descends to the depths of society and the psyche: he is poorer than Rastignac, he is far more tormented and depressed, he murders two people, he nearly goes insane, he frequently hates the world. It is significant that his ambition, which is to be another Napoleon, is in a sense nobler and greater than Rastignac’s (which is to join the aristocracy), and yet that he subsequently falls to the most abject conditions imaginable, which Rastignac does not. This suggests that Dostoyevsky’s purpose is to portray the extremes of humanity—in this case, the extremes of an absurdly ‘noble’ ambition and a complete corruption, of hope and despair. Balzac, on the other hand, neither lets his character descend to such depths nor strive for such heights, and this narrows the scope of his novel. I.e., it results from an intention different from Dostoyevsky’s.

Second, in the Epilogue to *Crime and Punishment* Dostoyevsky hints at Raskolnikov’s “redemption”. “He [Raskolnikov] knew that he was born again. He felt himself completely renewed in his very being... That is the beginning of a new story, though; the story of a man’s gradual renewal and rebirth...” (522). On the last page of Balzac’s novel, however, there is no hint of a redemption for Rastignac; quite the contrary. It seems as though Eugene is preparing for an assault on society, an irrevocable and

permanent entrance into it—and we already know that society is not a heaven but a purgatory. This lends further credence to our claim that the differences between the two novels are more important than the similarities.

Thirdly, poverty does not play the central role in *Père Goriot* that it does in *Crime and Punishment*. Admittedly, Balzac does constantly describe the miserable conditions of the tenants in Madame Vauquer's lodgings, but in his book poverty has an 'external', inessential air about it. It functions primarily as a contrast to the opulent conditions of the upper class, not as a governing force in its own right. For Raskolnikov, however, it does have this role. Were it not for his destitution he would surely never have killed the pawnbroker woman, for he would not have wanted her money. Moreover, it was actually his apartment that cast him into the dangerous state of mind in which he first contemplated murder—as is hinted at in the following lines spoken by his mother and him: "What a miserable apartment, Rodia. It's like a coffin. I'm sure your apartment is half the reason you're such a melancholic." "Apartment? Yes, the apartment had a lot to do with it... I thought of that too..." (223). Dostoyevsky, therefore, is analyzing the effects of poverty on the mind of an impressionable young man, which is quite different from what Balzac does. (Whenever Eugene notes his poverty it is only to remind himself that he wants to escape it.)

Now that I've touched on some differences in the characters and purposes of the two novels, it is appropriate to outline one of the possible themes Dostoyevsky had in mind when writing his book. (It may be a flawed interpretation, but insofar as it has plausibility it demonstrates the disparity between the authors' conceptions of their novels.) Simply stated, *Crime and Punishment*, unlike *Père Goriot*, raises a murderer and a prostitute on a pedestal and lowers a respectable businessman into the dirt. That is, Raskolnikov and Sonia have an 'instinct for life' in spite of what their actions might suggest. Peter Petrovich, on the other hand, is out for base material gain and is bereft of spiritual impulses. All he cares about are appearances (and, in fact, that's all that Napoleon cared about). The possibility of his salvation is eliminated from the beginning for the simple reason that he doesn't feel the need to be saved. He does not suffer, he does not doubt himself; he is shallow. Raskolnikov and Sonia endure wrenching psychic conflicts, self-contempt, despair, dissatisfaction with existence—and they survive it all because of their faith and passion. Sonia has a simple faith in God, and Raskolnikov has a subtle faith in himself and fate. They're both strong human beings who will appreciate salvation solely because they were baptized in fire. Dostoyevsky's point, I think, is that the only people worthy of salvation are those who desperately want it. Those who do not need it are ordinary. On this view, this reversal of Raskolnikov's judgment regarding the "extraordinary" man, Napoleon was ordinary—even worse than ordinary. He was naturally brutal and did not attempt to do what would have been most difficult, to *overcome* his brutality. This is what Raskolnikov begins to do in the Epilogue when he starts feeling "infinite love" for Sonia.

If that interpretation is sound, *Crime and Punishment* is so different from *Père Goriot* that its parallels shrink virtually to insignificance. Dostoyevsky took some of his characters from Balzac because he thought them to be, almost coincidentally, suitable for his own more disturbing and profound purposes, and not because he intended his novel to have many structural and thematic similarities to Balzac's.

To conclude, this paper has argued that the parallels between the two novels are misleading and fairly empty. Certain analogies between the characters of Raskolnikov and Rastignac have been outlined, and even though they have been seen to be quite striking, I have suggested that they do not indicate fundamental, deeper similarities between the novels. Dostoyevsky merely borrowed some of the character traits and motifs from Balzac, and purely because they happened to suit *his own* purpose. This purpose, unlike Balzac's has mostly to do with 'evil' and redemption, nihilism and Christianity. The themes of *Père Goriot* are less philosophical, more *realistic*. Divine imagery does recur throughout Balzac's novel—such as when Goriot is compared to angels or God and Vautrin to the devil—but the plot arranges itself entirely around 'realistic' matters like a young man's attempt to enter society. In other words, the spiritual imagery is more external to the action than it is in *Crime and Punishment*. For the latter is a novel of ideas, unlike the former.

A Critique of Psychoanalysis: the Oedipus Complex, the Instincts, and Psychohistory

[...] The scope of this essay is far too limited for it to contain an all-encompassing critique of psychoanalysis, but it is my intention to demonstrate the following: there are not two basic human instincts, but three—and the concept of the life instinct vs. death instinct is useless and ought to be discarded; the psychoanalytical interpretation of history is useful, but the notion of cultural repressed guilt is flawed; the theory of an Oedipus complex contains several unanswered questions that limit its credibility.

Sigmund Freud, the founder of psychoanalysis, stated that there are two basic human instincts. The first is the life instinct (or the libidinal instinct) and the second is the death instinct (roughly equivalent to the aggressive instinct). The “life instinct” is divided into two conflicting forces: the ego-instincts which aim at self-preservation, and the object-instincts which are essentially feelings of love and desire for another person or thing. Aggressiveness was originally thought of as either a particularly violent portion of the sexual instinct or as a product of the conflict between the ego- and object-instincts. After much reflection, however, Freud posited the existence of a death instinct which is in permanent opposition to the life instinct, and which is manifested as aggressiveness and destructiveness. Freud found it difficult to explain the true nature of this death instinct, which he supposed “operated silently within the organism towards its dissolution” (Freud, 78); one could only observe its most obvious effect on the person’s behavior: external aggression. “Any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction” (Freud, 78). In other words, Freud believed that the death instinct was a source of aggression in its own right. It was this separate instinct of aggression that caused—through its repression by the superego which resulted in feelings of destructiveness being turned inwards—neuroses and most other psychological problems. The original duality between the object-instincts and ego-instincts was now regarded as essentially irrelevant: the important conflict was that between Eros and the death instinct. Freud regarded the evolution of civilization as “the struggle between Eros and Death, between the instinct of life and the instinct of destruction, as it works itself out in the human species” (Freud, 82). This is, according to him, the meaning of history.

Freud’s theory of a life instinct that is divided into an ego- and object-instinct is compelling. An object-instinct (i.e., a sexual or love instinct) undeniably exists, as does a ‘staying-alive’ instinct. One could protest that this life instinct is more biological than psychological—that it involves the involuntary bodily functions like digestion more than it does the mind—but this objection is not valid. It rests on the failure to recognize that many processes of the subconscious mind exist in order to enable the individual to exist—e.g., the superego forces the necessary reconciliation of the individual with society. However, this objection does hold for the death instinct; it cannot reasonably be asserted that there exist tendencies of the psyche to return to a state of oblivion. There are undoubtedly “tendencies” of the body that lead to death, but these are purely biological. What possible purpose could a psychological death instinct serve? Every other human instinct has a recognizable purpose; this death instinct unnecessarily complicates the situation—an effect that Freud himself would oppose, judging by his statement that simplification is what scientists strive for in their work (Freud, 79). A much more fruitful theory is that there is an aggressive instinct that sometimes conflicts with the superego to such an extent that repression and neurosis are caused. I see no reason to hypothesize the existence of a death instinct; an aggressive instinct is enough to explain neuroses, and its existence is much easier to prove than that of a death instinct. I conclude, therefore, that three separate instincts exist: the sexual instinct, the ‘staying-alive’ instinct, and the aggressive instinct. (Although aggression can be associated with sexual desire, they are clearly not one and the same.) I have chosen to discard the theory that object-instincts and ego-instincts are both part of a “life” instinct because this ‘discarding’ simplifies the situation. What is the point of including the object- and ego-instincts under the banner of one ‘mighty’ instinct? What do sexuality and love (object-instincts) have to do with preserving the existence of the *individual* (ego-instinct)? Especially if they conflict (as Freud himself admitted [Freud, 76]), why are they ultimately part of one larger instinct called “life”? In light of these objections I have decided to abandon both the theory of a life instinct and the theory of a death instinct; they are unnecessary to an understanding of the human psyche.

Another Freudian theory that has aroused controversy is the application of psychoanalysis to

groups. Freud believed that cultures generally exhibit the same characteristics as individuals: in a particular culture one can find repressed and repressing forces, a superego (or a group of individuals—often religious—whose high moral standards serve as a superego), suppressed desires and instincts that can be characterized as the id, and an ego which is embodied in the actual ‘conscious existence’ of the culture. Thus Judaism, just before the advent of Christianity, was actually a powerful cultural superego; thus the repressed memory of the Hebrews’ murder of Moses partially returned with the arrival of Jesus, who was sacrificed (according to Freud) in order to atone for the killing of Moses, a “father figure” (Lecture: “Shaping World History: Power Relations”); thus the Africans in the early 19th century symbolized the repressed cultural “id” of Europe, the feelings and emotions that had been neglected during the Enlightenment (Lecture: “Europeans and Africans”). Undoubtedly this psychoanalytical interpretation of history contains valuable elements. Most cultures do tend to neglect certain aspects of the human experience—e.g., the suppression of overt sexuality in parts of the Middle East—and the characterization of these “tendencies” as repression is more than merely symbolic. Individuals suffer repression through their culture’s suppression of emotions and instincts, and the aggregate of these individual repressions can be defined as one giant “cultural” repression. The description of one aspect of a particular society as the “superego”—generally the society’s religion—is also justifiable. The people measure themselves with this strict cultural yardstick, and the fact that they often find themselves inadequate reinforces the religion’s similarity with the individual’s own private superego. Moreover, as was just demonstrated with regard to an individual’s repression, the person’s own superego is in large part determined by the cultural superego. The “cultural superego” is, therefore, more than an empty, symbolic phrase.

[...]

An extremely famous and controversial aspect of psychoanalysis is the theory of the Oedipus complex, according to which every child is sexually attracted to the parent of the opposite sex and feels aggression toward the other parent. According to Erikson, this aggression is sometimes so extreme that it includes a subconscious desire to murder the parent (Erikson, 87). Freud believed that in prehistoric times the children of tyrannical fathers banded together and murdered the father—and having done so, felt remorse resulting from the ambivalence between their love (the dominant instinct instantly *after* they had killed the father) and their hate (the dominant instinct instantly *before* they had killed the father). This remorse was the origin of the superego; it was also the origin of the sense of guilt, which persisted in each succeeding generation due to the suppression of the aggressiveness aimed at the father (Freud, 95). Whether one actually acts on the impulse to kill the father is not the point; the sense of guilt persists because of the existence of the ‘omniscient’ superego, which originally was formed through the ambivalence between the love and hate instincts, which are in turn expressed in the Oedipus complex (Freud, 95). As the child gradually encounters society as a whole (i.e., as he loses his complete dependence on the family), his sense of guilt is intensified due to the substitution of the *group* for the *father*. Often this increase of the sense of guilt “reaches heights that the individual finds hard to tolerate” (Freud, 96), perhaps resulting in neuroses, severe depressions, or general psychological unhealthiness. And, as was stated previously, these effects all result from the ambivalence of two instincts—an ambivalence expressed as the Oedipus complex.

It is difficult to criticize a theory based on the intricacies and contradictions of the subconscious mind. Nevertheless, several questions arise as one ponders the “Oedipus complex” theory. First of all, assuming that little girls are “sexually” attracted to their fathers (I have no way of disproving this since I’m not a psychoanalyst or a little girl), where does their sense of guilt come from? If they are attracted to their father then supposedly they do not feel any aggression towards him, so how do they form a superego and a sense of guilt? From the aggression they feel towards their mother? No; Freud believed that the superego originally was formed from the guilt felt by the sons after they had murdered their father. (In other words, the *original* genesis of the superego required more than a simple feeling of aggression toward the parent of the same gender.) However, in prehistoric times girls never banded together to kill their *mother*—and they never banded together to kill their father either. The necessary traumatizing murder never took place for girls. So why did a sense of guilt develop in them? As far as I can tell, Freud never addressed this question in his studies on the origin of the conscience.

[...]

(This next one wasn't a great paper, but there's an insightful argument in the middle of the second paragraph. ("Hobbes seems to rest his theory..." and the following two sentences encapsulate Christine Korsgaard's criticisms of Hobbes. (I hadn't read Korsgaard.))

Is society based on a social contract?

The central tenet of Hobbes' *Leviathan*, the theory on which his entire treatise rests, is that society can be thought of as a contract between its citizens. The desire to protect themselves from the brutality of the state of nature causes people to relinquish many of their natural rights on the condition that everyone does so. They cede their collective power to the sovereign, who is thus able to act in any way he chooses (although his prudence dictates that he govern to the best of his ability). In order to maintain peace and to prevent a disastrous civil war, the citizens must obey the sovereign absolutely. If they rebel against him they are violating the social contract to which they have previously given their consent: they are acting imprudently by tacitly accepting and provoking a return to a state of nature, and they are acting unjustly by endangering their fellow citizens and renegeing on 'promises' they have made in the past. Hobbes' account of a social contract at first seems plausible—after all, the chief justification for the state's existence is surely that it provides protection for its citizens—but upon closer analysis one discerns flaws that cannot be satisfactorily addressed within the confines of a social contract theory. Societies cannot be thought of as based on contracts.

Let us for a moment assume that it makes sense to speak of a group of people, formerly living in a state of nature, as gathering together to form a commonwealth. (In other words, it is possible for societies to be founded on a contract.) But does it truly make sense to speak of people who are born in a society as automatically consenting to it simply because it is where they live? These individuals have not *actively* consented to the social contract under which they live; they have passively accepted it. The two are very different. Perhaps they have decided not to rebel solely because they think that such an action would be futile. Hobbes thinks it is in everyone's best interest to abide by the social contract, but unless he refuses to grant them the liberty to decide for themselves whether they consent to this "contract", he cannot force them to or automatically assume that they do so. In fact, Hobbes seems to rest his theory on two arguments: everyone *should* consent to the contract because it is in his best interest, and everyone *does* (actively or passively) in fact consent to the contract—so he/she is being inconsistent if he/she rebels against the sovereign. The first argument is untenable on Hobbes' own grounds: there is no justice, no right or wrong, in the state of nature—and since people clearly cannot consent to a social contract unless they are already in a state of nature, Hobbes cannot say that they have an obligation to do so. (In other words, even people who are born in a commonwealth are living in their own little state of nature until they consent to the social contract, but since they are in a state of nature there is no obligation for them to consent to it.) The second argument has already been countered: people do not in fact assent to the contract merely by living in the society. If they did, after all, then revolutionaries too would be consenting to the contract by virtue of living in the commonwealth. But to believe that is silly. Clearly the notion of "consent" involves more than a passive *acceptance* of a society for the sole reason that there is no place else to go. Furthermore, at what point in their lives would it be official that people had "consented" to the social contract? Certainly not when they are children, for they would not understand what they were agreeing to. When they are adolescents? When they turn twenty-one? Any designation of a specific age is arbitrary. However, this ultimately does not matter, because (as is demonstrated in the following paragraphs) the assumptions on which Hobbes bases his very notion of a social contract are faulty.

[...]

(This is a summary of *The Genealogy of Morals* that I wrote for a sophomore study group.)

First Essay: “Good and Evil”, “Good and Bad”

1. The notion of good is derived from what slaves see as evil. Passiveness is good because the masters are strong and “evil”. *Ressentiment*, resentment of one’s superiors, is the origin of slave morality.
 - A. Priests, who were powerless throughout much of history, argued that powerful people were evil.
 - B. The Jews were the true founders of slave morality. They converted the idea that goodness is power, beauty, wealth, strength, into the idea that goodness is poverty, misery, weakness, suffering.
 - C. The weak believe in free will partly in order to justify their condemnations of the strong.
 - a. Thus, people who are too weak to get revenge on someone say that they are “unwilling” to pursue revenge. They are too “good” for that: “They speak of ‘loving one’s enemies’—and sweat as they do so.”
 - D. The Kingdom of God and the Judgement Day signify the revenge of the weak on the strong.
2. The masters can define words and create values. They create the conventions that constitute morality.
 - A. Unlike the slaves, they start out from a notion of *good* rather than *evil*. *Bad* (not evil) is the derivative concept for them.
 - B. The masters instinctively feel that they are good and noble. They affirm life. Slaves and weaklings are seen as bad, pitiable, etc.
3. Slave morality has triumphed over master morality, mainly because historically the oppressed have been far more numerous than the oppressors.

Second Essay: “Guilt”, “Bad Conscience” and the Like

1. The conscience is the product of a long historical evolution.
 - A. Man had to acquire the ability to make promises, which required the creation of a long-term memory.
 - B. The way these capacities developed was through horrible suffering. Torture has been used throughout history as a way of forcing people to accept rules. After thousands of years these rules have been internalized.
2. The idea that punishment should be approximately equal to the magnitude of the transgression arose through the contractual relationship between debtor and creditor.
3. The bad conscience originated when people internalized the cruelty that they could no longer express outwardly upon others. This was especially true of slaves and their ilk.
 - A. Christianity and all ascetic, selfless ideals are sublimations of cruelty turned inward.

Third Essay: What is the Meaning of Ascetic Ideals?

1. Ascetic ideals mean different things for different types of people—artists, philosophers, saints, etc.—but overarching themes can be delineated.
2. Arash’s notes:
 - A. Asceticism is a way of attaining power over something, namely oneself. It is sublimated cruelty, like the bad conscience.
 - B. It is also a way to rationalize and give *meaning* to suffering. We cannot eradicate suffering, but we can *will* it, and thus gain power over it. This is what ascetics do.
3. The ascetic ideal has collapsed. God can’t be believed in anymore. This can lead to nihilism, which repudiates absolute values.
 - A. Science is based on a faith in truth, so it doesn’t *create* values. It presupposes them.

Miscellaneous

1. There is no subject or self, according to Nietzsche. We are our actions.
2. We have no free will, partly because “we” don’t even exist. Everything is determined by forces outside our control, such as the unconscious.
3. Nietzsche is a perspectivist, which means he thinks that there are no “facts” in the world, only

interpretations. Moreover, an interpretation is based on an interest the person has in it.

(The following is a paper I wrote for a freshman American lit. class. I had to write two stories in the style of two authors and then discuss them. [I've deleted the stories but kept the subsequent analysis.]

A Comparison Between the Styles of Hemingway and Crane

[...] The exposition of this critique will take the following form. First I will describe the main characteristics of naturalist literature, in particular that of Stephen Crane, whereupon I'll use this outline to analyze the second story. I'll subsequently do the same for Ernest Hemingway's style. In the final section I'll compare the two 'vignettes' I wrote.

Naturalism is, first and foremost, both an extension of realism and a reaction against it. Realism, in turn, is a reaction against industrial capitalism and the social fragmentation it causes. The realists attempt to solve the problems of capitalism within the framework of capitalism itself: their answer to "social fragmentation" and the resultant confusion is to embrace tradition, seek refuge in relationships with others, escape from the marketplace. Furthermore, they believe that escaping the marketplace is the only way to solve the manifold moral dilemmas that arise under capitalism. Commercial success and honesty are incompatible. Thus the realists are at bottom anti-capitalists.

Naturalists, however, reject tradition as a panacea for society's ills. Tradition is, by its very definition, backward, not conducive to progress. Moral dilemmas do not interest them either; their preoccupation is with self-determination, individual autonomy: 'How can I be a person who is in charge of my life? I am subject to forces outside my control; how can I overcome them?' The logic of the transition from realism to naturalism is apparent: a person's first reaction to his ambush by industrial capitalism is to wonder how he can escape it, how he can be reabsorbed into a community; as he begins to realize that capitalism penetrates every nook and cranny of life he grimly accepts his fate and wonders how he can maintain control over himself and participate in capitalism at the same time. Naturalists, as a result, are concerned with immediacy, with life and death, with objectivity, with the deepest truths of existence, rather than with the 'petty' and 'superficial' worries that occupy realists. Society and social conventions are inherently untrue. Reality is war. The only relevant question is how to survive.

Because of their identification of the 'truth' of life with brutality—because of their recognition that the only way to overcome the anarchy and war of capitalism is to rationalize society—naturalists stress the need for intelligence, for great willpower, and for cooperation between individuals who would otherwise be overwhelmed by the marketplace. Individualism is essentially death for the individual. Crane's story "The Open Boat" illustrates this: the men survive their terrible ordeal only through cooperation and intelligence (symbolized by the captain). They subordinate themselves to the common good. The oiler, who signifies mere muscle power, drowns because muscle power is destined to fail in modern society (partly because it is, in a sense, more 'individualistic' than mental power).

As a result of the different axes around which realists and naturalists organize their thoughts, their methods of narration are quite different. Action, not character development, is an obvious characteristic of naturalist fiction. Visual perspective is important. The plot is generally narrated 'objectively', rather than from the point of view of the characters. Dialogue is not especially important. The characters are narrow, not well-rounded, often unintelligent (which is what destroys them in the end). Immediacy is crucial to Crane's style. Sexual desire, an impersonal force that often prevents us from determining ourselves, is seen in a bad light. This last is particularly important because it has nothing to do with capitalism: it signifies the entrance of our instincts and our past into the naturalist scheme. "The traditions of the dead generations weigh like an incubus upon the brain of the living": this was said by Karl Marx, but it could just as well have been said by Stephen Crane or Frank Norris. The past—to a degree synonymous with our instincts—determines who we are to an extraordinary, unknown extent. It is impossible to resist sex and our other instincts; our only hope is to reason with them.

With the above in mind I will clarify how Peter's story relates to Crane's naturalism. In the beginning, the city is essentially symbolic of capitalism; the sky is symbolic of nature, the past, our instincts. The two oppose each other. In some respects they are incompatible. Capitalism, despite the obvious presence of instincts as determining factors of our humanity, tends to overpower our instincts, sublimate them, sometimes exterminate them. The city is a greater threat to our self-determination than is nature, 'the sky'. This is basically consistent with Crane's decision to have Maggie succumb to poverty in "Maggie: A Girl of the Streets", whereas in "The Open Boat" the men are able to conquer nature by cooperating with one another. Humanity is represented by bacteria, which, of course, are not capable of self-determination.

Peter, we find out a few paragraphs later, is obsessed with Chigusa—or, more specifically, with her beauty. Thus the sexual instinct in all its adolescent fury makes its appearance. Rap music suddenly blows by, reminding us that even those people who are rebelling against the world are simultaneously contributing to its disintegrating effects on autonomy, on privacy, on the ability to think. The rappers are symbolic of *non-cooperation*, of pointless individualistic self-sacrifice, of the primacy of muscle power and its substitution for mental power.

At this point Peter enters the underground world of poverty. Poverty is the prime evil of capitalism: it does not merely control people; it destroys them. The parallel with "Maggie: A Girl of the Streets" is obvious. It incorporates and amplifies everything that the naturalists hate: self-determination is non-existent; people hate each other and isolate themselves from one another; mental power becomes useless—muscle power is worshiped and admired (cf. the fight scenes in "Maggie: A Girl of the Streets"); the instincts find their ultimate expression in poverty; the one redeeming quality of sex—procreation—is transformed into an evil as it increases everyone's misery. Even Peter, otherwise not a vile character, feels himself compelled to show *hardness* so as to create a distance between himself and the beggars.

Frédéric Chopin makes a brief appearance at this juncture. He symbolizes humanity's potential. He *is* humanity. Despair—which reaches its most perfect pinnacle in Chopin's inspired creations—is to be desired so long as it is the *beautiful* kind of despair, the kind that is heedless of capitalism and the ugliness of the world, the kind that loves itself, the *self-determining* kind. This is the only time in the story when Peter makes a semi-conscious attempt at autonomy, and, significantly, he fails. He seeks a form of salvation in beauty, but, tragically, he discovers that poverty is ultimately more powerful even than music.

At last Peter reaches his own street. It is presumably a kind of poor suburb, one in which all of the houses are similar and plain. Akin to Levittown, I suppose. Its primary function is to remind us that one does not have to live in poverty to be stultified. The people in this neighborhood are not autonomous or diverse: they are mediocre through and through. As he approaches his house Peter reflects on his father's job and concludes that a job at Stop & Shop would solve their problems. Once again, because of capitalism his thoughts are confined to a predetermined realm, a kingdom of mental slavery worse than any physical one: he cannot realize that Stop & Shop would only trap him and his father in a different way.

And now we come upon the three "hooligans", representative of children of the fashionable bourgeois world. Their idol is Puff Daddy; they mimic everything about him. They cannot think for themselves, but they unconsciously recognize that something is missing from their lives. So instead of confronting this "something" head-on they develop a "thin veneer of apathy". And now we get to the climax of the story. All of the naturalists' preoccupations come to the fore: sex governs the boys' thoughts, provoking them into a brutal fight—an analogue of life. Instead of reasoning with their instincts and cooperating with each other they resort to muscle power, which in the end destroys them (although after the story finishes). The fight ends, but Peter continues to be governed by his passions: he alternates between hatred of Chigusa and infatuation with her.

His conversation with Chigusa is the dénouement. Brutal truth slaps him in the face when he realizes that passion is not always a two-way street—but it is still just as crushing as it was before, if not more so! Peter cannot escape from his fate if he lets himself be determined by his sexual passion, which of course he is too weak-willed to resist. The ironic thing is that he *thinks* Chigusa is everything to him...but he is utterly wrong. The story ends with a final insult hurled at him by the clouds: while they may be weaker than the city, they are certainly stronger than him. Even the *clouds* are more autonomous than poor Peter!

The methods used to narrate this story are akin to those used by Stephen Crane. The diction in the

dialogue is similar to his; the characters are superficial and stupid; the reader is on a different plane than the characters, who are trapped in their own little hell; action and immediacy are predominant throughout; sympathy is looked upon harshly, seen as a 'sham'; visual perspective is quite important; passages of description alternate with brief passages of dialogue; we are witnesses to the characters' thought-processes, but through a thin veil of objectivity.

Modernism is, in a sense, a reaction against naturalism and a partial return to realism—although it transcends the latter. (It is dangerous to oversimplify, but one can hardly deny that history tends to progress in a dialectical fashion.) The 1920's were a conservative period, characterized by xenophobia and nativism. Immigration had gotten out of hand; many people wanted to "purify" America (as if the 'damage' wasn't already done) by expelling immigrants and embracing American culture. The chaos of World War I, the Gilded Age, industrialization and capitalism in general causes modernists to ask the questions, "Who am I? Do I have a real identity?" They argued that the answers to these questions are hidden in our collective heritage. Culture, tradition, provides life with meaning. The modern world they see as inauthentic, lacking culture, imitative—but since it is fundamentally culture that makes us who we are, it is only if we get in touch with our heritage that we can rediscover ourselves.

This statement must be qualified, though. The modern world is the world of the masses. It is not enough simply to rediscover one's heritage; one must at the same time find an antidote to all the boils that have erupted under the skin of society: excessive material wealth, commerce, rule by the masses, sex. Sex corrupts society by blurring the distinctions between various cultures and thus distancing people from their heritage. In fact, the only time it can be excused is when it is a form of incest: i.e., when it takes place between people of the same race or ethnicity or heritage. Commerce, on the other hand, has a disintegrating effect in another way as well: it undermines "paternal benevolence" by intermixing cultures and introducing vulgar *money*. It panders to the masses, who in turn ensure that society is in a constant flux between everything except those values which modernists cherish. The only way to escape the meaninglessness of modern life is to isolate oneself or, if necessary, to be friends only with people who understand and belong to one's own culture. Thus the philosophy of modernist literature can perhaps be summed up in two words: *No trespassing*.

Different authors confront the issue of heritage in different ways. Willa Cather, for example, believes that America's true culture is that of the Native Americans. Ernest Hemingway, on the other hand, does not seem especially enraptured with Native American culture; he is more impressed with the idea that one's heritage is simply one's home. Thus Nick Adams 'becomes himself' when he returns home in the "Big Two-Hearted River" stories.

Ernest Hemingway, particularly in his book *In Our Time*, writes in a disjointed, simplistic manner that is meant to evoke the disjointed quality of modern life. His novels are barren of unnecessary words, infinitely subtle, a reaction against the pointless extravagances of 20th century America. He does not devote passages to the description of his characters; we are supposed to learn about them almost inadvertently as the yarn unfolds. Hemingway's most famous characteristic is his machismo. This quality of his is misunderstood, however. Bull-fighting, for example, is an admirable activity not because it is gory and "cool" to watch, but because it is an integral part of Spanish culture. Again, violent crime—which most would see as "masculine" in some fundamental way—is seen by Hemingway as absolutely inexcusable because it is random and senseless. Consistent with his machismo is a certain misogyny that tends to forbid men to have sex with women or even to be friends with them. Women, who represent sex, instill corrupting influences into cultures.

With the above considerations in mind I shall describe how the first story is relevant to Hemingway and modernism in general. Upon referring to the first sentence a question pops into my mind: what do peaches symbolize? Anything? As far as I can recall, I introduced them in the first sentence only because they were a completely random method of description, one which Hemingway might have used. Chopin, on the other hand, has a definite significance. Throughout the story he symbolizes culture, our heritage, the modernist ideal. The fact that Peter associates Chopin with a Japanese girl demonstrates how misguided he is, how unaware he is of his culture and heritage.

The Mustang and the rap music represent money, sex, women, material extravagance, the masses, the disjointedness of American life. At this point Peter reflects on his father and the job he has; his lack of respect for him is apparent. What causes this lack of respect? Commerce and sex. It is reminiscent of Hemingway's conviction that the modern world abolishes paternal benevolence and children's respect for their fathers. This impression is reinforced when we learn that Peter's mother had been involved in an affair with another man just before she died. Sex contributes to the break-up of families and the humiliation of fathers.

Peter's fight with the three boys includes a certain amount of machismo, but it is the harmful, pointless machismo to which Hemingway is averse. The fight is supposed to be representative of the predominance of crime in contemporary life, of the absence of culture. The three boys run away before they have a chance to get seriously hurt, but this simply shows what a thin line many people walk between violent life and violent death. After he shows his father a complete lack of respect by telling him to "go away", Peter thinks about Chopin once again (specifically, the sliver of paradise called *Berceuse*). He is semi-conscious that Chopin represents culture, salvation, his heritage, but his preoccupation with sex is such that he basically continues to identify Chopin with Chigusa—an impostor, a foreigner, a *trespasser*. In their short, ludicrously simplistic conversation Chigusa rejects him, but he does not seem to appreciate the significance of this. He is too preoccupied with her legs. The story ends as he enters his house to "piddle" on his Playstation, thus confirming the defeat of Chopin/culture and the victory of the masses/modern life.

With regard to Hemingway's specific literary style: the language in my little fantasy is very unembellished; the perspective is that of the main character (a device Hemingway uses sometimes); and Peter's thoughts are often disjointed and senseless.

In conclusion, Crane and Hemingway are very different writers, though they do have a few similarities. In general, their different philosophies are manifested in their different styles. At the risk of repetition, Crane's concern with immediacy, life and death, truth, brutality, poverty, self-determination, mental vs. muscle power, and powerful instincts like sex translates into a literary style characterized by action, violence, objectivity, paucity of sophisticated dialogue, lengthy descriptions of slum life, feeble-minded characters incapable of autonomy, a lack of character development, and the frequent presence of irresistible forces outside of our control. Hemingway's fixation on culture, heritage, paternalism, nativism, the lack of harmony in modern life, and the bad effects of commercialism, material extravagances, and sex translates into stories containing subtle but important descriptions of people's environments, an emphasis on the need for 'benevolent paternalism', a concern with the corrupting influences of 'outsiders', a lack of unity in characters' thoughts and the events to which they are reactions, an aversion to unnecessary words, and a tendency to denigrate women. The few similarities and many differences between Stephen Crane and Ernest Hemingway are evident. But it is also evident that the literature of these two men shares one overriding obsession: a hatred of capitalism and all its attendant evils. Perhaps their criticisms could apply to all historical epochs, but they apply with special force to the modern world, with its amplification of *every* divisive influence in history. Whether or not Crane and Hemingway consciously subscribed to the conviction, their philosophies in fact boil down to three words: *Death to capitalism*.

November 27 usw.

Hitlers are rare only because few people have Hitler's talent for oratory. Himmlers are not rare at all. And Eichmanns are everywhere. [I don't mean people actually carrying out those roles, of course. I mean people who *could* easily carry them out if the conditions arose.]

I'm in such a great mood. Life is beautiful, it really is. Or at least it can be. How magical is it that human beings exist! There could have been nothing, but instead there is something.

I should have asked that waitress at Soho out for drinks. She looked exquisite. I think I'll go back

in a few days. I'm going to start making a real effort (as opposed to mainly a web-based effort) to meet women in Boston. I've made a few new friends recently at bars etc.—went out with two females tonight—but I have to meet more beauties.

Reading Paul Krugman's *Peddling Prosperity: Economic Sense and Nonsense in the Age of Diminished Expectations*. Krugman is an ass in many ways, but his writings are informative.

I keep thinking that philosophy remains my true calling, and that by applying to programs in American History I'm making a bad mistake.

The main reason I'll never be happy is that there isn't a God. There isn't a "truth" in matters of value. No such thing as greatness or genius, because these things are values made into objective truths, which is impossible. But that's what I necessarily strive for, greatness and genius. So I'm plagued by this cognitive dissonance, this disjunct between my more primitive ambitious side, which can't be reasoned with, and my knowledgeable side, my reason (which tells me that my ambitions are impossible, indeed meaningless). If there were a God I could strive for his approval, which would be approval from reality and would thus objectively confirm my value. But because there isn't I'm destined to be restless and unsatisfied. Similarly, the absence of God, or of objective truth in matters of value, means that there's no point in seeking fame if that's done for the sake of confirming your value to yourself. Recognition (or fame, etc.) proves nothing, because there's nothing to prove. In short, God's nonexistence means that there's nothing outside of self-respect, no reality that one's self-respect can 'correspond to' or be justified by. Nothing can show that one's self-respect is justified (i.e., that one's belief in one's value is true), because there is no "truth" relevant to it. But we all think there is and we all act on that belief, trying so very very hard to prove our worth, or bolster our self-esteem by bringing our self-image in line with notions of the ideal human being. But there is no ideal in the sense we think, in the sense Schopenhauer thought or Goethe or Nietzsche thought or Salieri (in the movie) thought. It's all a mere projection, this value-talk (praising, condemning); it's all an illusion. But it's a psychologically inescapable one. Hence the Wise Man's cognitive dissonance.

All there is is people admiring you or you admiring yourself or whatever. There's only subjectivity here, no objectivity. There's only the attitudes, just attitudes and more attitudes and no firm ground anywhere and just a floating around in the fog of *attitudes*, a bottomless pit. It's maddening! I have to *stand* somewhere—I can't keep hovering here my whole life, it takes too much effort—but there's no ground anywhere! And I'm going to keep living my life trying to achieve certainty (repose) in this one area like everyone else but there can be no repose because we humans are irrelevant and superfluous like everything else in the universe. There is no meaning, it's all *de trop*.

I don't care whether you value me, yet, of course, I do. And I can't escape this sense of Someone or Something behind me or hidden from me whose existence provides my existence with sense and meaning, something smiling down on me, but there's nothing and we're all alone in the most horrifying cosmic way because there is no metaphysical truth. Only atoms and supernovae and galaxies and black holes and randomness.

I'm committed to the aesthetic ideal of the personality, but in reality we might as well live like Cro-Magnons. Happiness is all that matters, all that exists. The aesthetic ideal is a pointless source of torment.

(That's another, closely related, source of dissonance. I can't get myself to relinquish the ideal of "perfection", of the well-rounded etc. person who overcomes difficulties, but I know this ideal is merely a romance. It's a romance story. Yet it's extraordinarily attractive, and most great minds have been attracted to it. But really, happiness is all that should matter, brute animal happiness—and this heroic person is decidedly not happy in that sense. –Two ideals, one heroic the other "bourgeois", one unreal the other real.)

December 2

Gina called me. She was crying, terribly upset about her ex-boyfriend (the American I mentioned

before) whom she'd seen the previous night. He'd told her there's no connection between them anymore, which broke her heart. So she cried and tried to talk and I listened and comforted her. This 24-year-old guy sounds like a total dick, amazingly inconsiderate and insensitive, but she still loves him even though she doesn't want to and doesn't know why. Apparently she hardly ever even talks to him, just listens as he talks about stuff that doesn't interest her because they have nothing in common.

It's a horrible experience to have one's views on life and women and men and love confirmed day after day. Love is nothing, it has no validity or meaning, it's just an incomprehensible unconscious reaction to another person based on such meaningless phenomena as "chemistry" (—that's a play on words, haha). How can one take love seriously when women fall in desperate love with cruel narcissists and have no attraction to decent men? There's nothing intellectual or 'true' about love; it doesn't reveal one's worth or the worth of the loved one, indeed usually the worth of the loved one is inversely proportional to the degree of love felt for him (because the qualities that induce love, especially in women, are at best unrelated to, and at worst destructive of, the qualities that determine human worth, such as compassion, empathy, a feeling for beauty, and insight into the human condition). Generally I have more respect for people who are loners than for people who have lots of friends and lovers.

I must admit, though, that it's faintly painful to hear a girl talk about her love for, her near-infatuation with, some other guy as she thinks of you merely as a good friend. In some way, after all, she values that other guy more than she values you, no matter how much she may know on an intellectual level that as a person he's inferior to you. Her unconscious, unrational side values him more, but as luck would have it, the unconscious, unrational side is the one that people want to be valued by. It's more validating, because it has more force.

And so, well, you could lament the fact that no women love you, and you could envy those guys who have that intangible *je ne sais quoi* that attracts females to them,¹ but in so doing you'd be misunderstanding the nature of love. We're programmed to desire it because we implicitly think it shows one's worth, but of course it doesn't. In taking it seriously, you're misunderstanding it. None of this shit should be taken seriously, it's all a meaningless game. Caring about one's reception by others is stupid. The best thing to do is just not to think about it, to follow the dictates of reason. This is, admittedly, a defense-mechanism, for otherwise you'd be crushed by the despair of loneliness and the despair of passionately needing love and needing to be loved and knowing that the best years of your life are passing by as you sit here holding an empty conversation with the shadows in your mind, but at least it's a logically justifiable defense-mechanism. Anyhow, it's the only way to survive in this farce of a world.

Just think of Byron. (Always think of Byron when you feel yourself starting to take things seriously.) He used females for his pleasure and then forgot about them, ignoring their continued infatuation with him, because he knew it meant nothing. He knew you simply have to take from life what you can get before darkness falls again.

Glenn Gould intrigues me. I've been watching videos of him on YouTube. His talent was inexplicable. He said he didn't understand pianists who practiced hours every day, doing technical exercises and whatnot; he himself simply looked over a piece of music several times and was then able to play it flawlessly. The speed, too, at which he was able to play defies belief. Intellectually he was very impressive: in his interviews he was unfailingly articulate, analytical, philosophical, and charming. On the other hand, so many of his opinions were outrageous. Like his statement that Mozart died too late, not too early! And his interpretations of many composers, especially the romantic ones, were just plain ridiculous, despite his profound understanding of music. He could have been unquestionably the greatest pianist in history if he had only been more sympathetic in his interpretations, less idiosyncratic—downright weird, in fact. He wasn't flexible; he imposed his own ideas on the music rather than letting the music speak for itself—letting its intrinsic 'spirit' come out through his playing. (Such a spirit does exist. There is a good way and a bad way of playing Chopin, a faithful way and an unfaithful way. Even his Beethoven and Mozart interpretations are too often incongruous with the music itself.) The major exception, of course, is his Bach

¹ What is it? Pheromones? Excessive self-confidence? A twofold insensitivity? What is it??

interpretations, which typically bring out the contrapuntalism quite well. He could defend his idiosyncratic practices intelligently, for example by saying that there is no point in following the conventional interpretations anymore because they have been done so often and it's time for something new to be said. But there are ways to say novel things without being downright perverse. Indeed, every great performer inevitably has his own interpretation of the music, so it isn't quite true to say that there are only two kinds of interpretations, orthodox and unorthodox.

On the other hand, there is some value in pushing the envelope. I heard him play the theme of the first movement of Mozart's A major sonata in the most maddeningly slow way, so slow that he himself admitted it was maddening. Moreover, it was obviously contrary to the spirit of the music. But he defended it by saying that, when followed by his interpretations of the variations, it brought out the unity of the piece—much as his second recording of the Goldberg variations, unique occasionally in its slow tempo, brought out the unity of the entire piece. Is this a sufficient justification? I suppose you have to take it on a case-by-case basis. It depends just how “maddening” the tempo is. If it can, after all, be listened to or gotten used to, then maybe he's right. But I still think you should pay at least some heed to the composer's intentions.

At any rate, Gould had an unparalleled intellectual and musical integrity. He refused to compromise.

It's incredible how you get the sense when watching him play that he isn't so much *performing* as *thinking*. He's thinking through his fingers. If Chopin was the poet of the piano, then Gould was the piano's philosopher.

(He was also, by the way, a magician. He never hit wrong notes. How that's possible I don't know.)

I've said it before and I'll say it again: my 'romantic' experiences have poisoned me. They've made my soul the counterpart of Viktor Yushchenko's post-poisoned face, all pockmarked and bruised.

December 4 usw.

Here's a great quotation from Benjamin Disraeli: “There are three kinds of lies: lies, damn lies, and statistics.” For a minute after I read that I couldn't stop laughing. I love the distinction between lies and damn lies, especially because the respectable Benjamin Disraeli is the one who made it. “That's a *damn lie!*”

Excellent advice from Bob Dylan: don't let people see your true, your deepest self-conception. Don't put it out there but keep it locked up inside you—keep your innermost dreams and longings hidden inside you—because if you expose them to the light of day they'll be killed. People will kill them, by ridiculing them or analyzing them or just looking askance at them or ignoring them. *L'enfer, c'est les autres.*

I read *A Christmas Carol* for a book club meeting I'm going to in a couple days. Ernest Hemingway wrote in *A Moveable Feast*, in reference to Dostoyevsky, “How can such a bad writer, such an incredibly bad writer, make you *feel* so much?!” I could say the same about Dickens, about this book. Slapdashily written but full of feeling that charms the tears out of your eyes. (Astonishing how I wept reading it.)

There's a spontaneity in Dickens' writing that makes up for all its flaws. A spontaneity and an irresistible energy. In the end this may be more conducive to the making of great literature than all the fine and careful craftsmanship of contemporary writers.

December 9

I don't know how or when, but somewhere along the line I developed moderate social skills. I became somewhat of a talker. I'm fairly comfortable now in most situations, and people seem to like me.

A refreshing change!

Went to a club with Gina, saw the dregs of the species yet again. But got drunk and danced, sort of fun.

Krugman's insistence that low productivity in the U.S. relative to other countries is irrelevant to the U.S.'s standard of living seems very implausible. His treatment of the whole issue is glib and unconvincing. How can it be irrelevant whether Japanese auto companies, because of their higher productivity and thus lower prices, are able to outsell American companies and gain larger market shares? First of all, because of their high productivity, Japanese companies can afford to pay their workers higher wages than American companies. Admittedly, in this case the Japanese advantage may be irrelevant to the relatively low American standard of living. (It isn't because of high Japanese productivity but because of their own low productivity that American companies have to pay their workers a low wage in order to make profits and stay competitive. Japanese practices, it seems, shouldn't affect this; it's purely a domestic problem, as Krugman says.) But in another way, Japanese practices are relevant. For if foreign companies can export their products at a comparatively low price (because of their high productivity), surely American companies will be driven out of the market, resulting in the laying-off of American workers and a decline in the U.S. standard of living.

I hate economics.

Reading *Freakonomics*, the insanely popular book on "the hidden side of everything", whatever that means. My first question is how the author, Steven Levitt, got away with being so unbearably and comically self-congratulatory. I can't even read this shit, it's fucking nauseating. "The most brilliant young economist—at least, the one so deemed by his elders—...", etc. etc. And there's a loathsome cutesiness to the writing, reflected in the title itself. (That title was almost enough to keep me from reading the book. But I wanted to see what all the hype was about.) The whole thing is decidedly pop cultural, i.e., shallow, glib, unserious, cloying, tongue-in-cheek, *clever*.

Schopenhauer was an optimist compared to me. For example, he had faith in truth—not only in its existence ('Truth is cut-and-dried, absolute, objective') but also in its eventual triumph. He comforted himself for his loneliness by believing that truth would inevitably win out, that someday he would be vindicated. I have no such faith, though. I'm more inclined towards the opposite view. Nietzsche, too, was an optimist: he still had his metaphysical article of faith and criterion for value, namely the will to power and the idea of eternal recurrence. He had his Archimedes' point. And he told himself he had value because, he thought, he had the strongest will to power in history. But I have seen through all the pageantry, and I know hedonism is the highest thing in the world. Mere *happiness* is what matters. Life has no grandeur, no metaphysical grandeur.

I've had enough of that book.

At the book club meeting I was reminded once again that intellectuals are usually silly, boring people. How much more fun I had at the Korean language meeting yesterday! Pleasant people, unpretentious, not in love with hearing themselves talk. Intellectuals should be banished to Siberia.

December 10

Reading Lessing's *Laocoön: An Essay Upon the Limits of Painting and Poetry*.

The Plato paper I wrote at UMSL is a little silly. Shallow. Not at all Marxian, or 'Barrington Moorean', insofar as it directly compares ideas separated by two millennia of historical evolution.

Since at least 2000 B.C. (in certain societies), labor was seen as something undignified, something only the lower classes did. Noble people didn't labor but concerned themselves with philosophy, religion, politics, and war. Only in the last three hundred years has labor acquired dignity. It is now something inherently beautiful, life-affirming, noble. (Think of Tolstoy's paeans to the peasantry, or even Rousseau's respect for the simple, uncorrupted life.) What an incredible change!! It was recognized by Hegel and Marx; they were the first to understand what had happened. But only Marx understood *how* it had happened.

December 14, 15

Went to an EF “prom” last night with students and teachers. Exceptionally fun because of vodka tonics, a drink I love. Afterwards went back to EF with the students and hung out with Masato (my ex-student) and two of his Korean friends for hours. Great people.

Against idealism.— When I cry while listening to music or reading something memorable, I’m not crying because the beauty has overwhelmed me (although it has). My crying is just a strange psychological and biological reaction I’m having to an unusual kind of stimulus. Nevertheless, it *is* beautiful, and how could I live without this joy? This painful sort of joy is the only life I know.

Reading Susan Sontag’s *Against Interpretation, and Other Essays*. It’s wonderful to think that the publication (in 1966) of a book full of critical essays like this could have been seen as an important cultural event. What a different time that was from the present! Norman Mailer said that the Sixties were the only time he had ever felt like a human being.

Nowadays—jeez, nowadays it feels like the only thing that matters is, well, me. I am the tradition. I am the Way, the Truth, and the Life.

Lately a bunch of ideas have been fermenting in my head; they’re not quite ripe yet, but when they are I’ll write another paper that I’ll send to journals for no reason in particular. —What sustains me is the knowledge that this civilization cannot last forever, and that when it dies something more healthy will take its place. And then I’ll be read, posthumously but all the more reverentially for that.

To deeply understand the meaning (or lack thereof) of “value”—the absence here of truth, objectivity, and meaning itself—gives you a profound sort of wisdom and equanimity, because you understand there is little point in striving for recognition. Those Carlylean artists and philosophers who exalted “heroes” and derided “philistines” were themselves, in a way, philistines, in that they were prisoners of conventional thinking. Or, said differently, the most “heroic” person, the one who best fulfills the ideals of these worshipful thinkers, is precisely he who *rejects* their ideals, because he has overcome the last and most hallowed bastion of superstition, namely ideas about value. In detaching himself from the universal frenzy over “heroes” and “great men”, he has triumphed over his very humanity and realized Truth.

The title essay (“Against Interpretation”) provokes thoughts, but I don’t find it convincing. From a philosophical perspective its brevity is lamentable, though from a literary perspective it isn’t. (Sontag was a writer, not a thinker.) Interpretation is indeed “the revenge of the intellect upon art”—or it can be called such—but more generally it is simply a way of digesting the artwork, gleaning from it as much as possible. Digestion is not only an intellectual process; it is a human one. Art is a way of reworking and digesting the world; interpretation is a way of reworking and digesting art. The mind needs to assimilate, and as long as it has this need, interpretation will be inevitable. Why should intellectual assimilation be a vice if artistic assimilation is a virtue? Sure, interpretations can be facile and dull, in fact they usually are; but this is not an argument against interpretation itself. If done intelligently it can enhance one’s experience of the work, bring out features that might have been overlooked otherwise and thus assist one in doing precisely what Sontag favors, which is to examine and appreciate the “sensuous surface” of art. The surface, after all, cannot be wholly separated from thematic elements below the surface, elements relating to “content” (as opposed to form, which is the surface). Sontag’s seeming belief that it can—that themes and symbols and “meanings” and the like should not be the critic’s concern—in fact upholds the dualism she deplores, the form/content dualism. (She says “Focus on form, not content!”, while professing to believe that “ultimately” there is no difference between form and content.) Anyway, a literary criticism that devoted itself to describing and critiquing *form*, or the “sensuous surface” (such as techniques of narration, rhyme schemes, meter, the architecture of a particular novel) and said not a word about content would soon grow tiresome.

Arguably the most interesting type of criticism is of content. Lukács certainly thought so. He thought that analyzing a work's content is enlightening in far more ways than analyzing its form is—in artistic ways, sociological ways, philosophical ways, psychological and biographical ways, historical and political ways. Exclusive concern with form is a bourgeois decadence, for it turns your eye away from the work's interaction with social conditions. It's an anti-holistic way of thinking, a one-sided, virtually solipsistic, way of experiencing culture.

Besides, I'm skeptical of substantive rules on how people "ought" to do literary criticism. How can those rules be justified? All you can say is that critics ought to be erudite, patient, etc. I don't think Lukács is right either that there is a "good" way and a "bad" way of critiquing artworks (aside from obvious general considerations); there are simply different ways, different avenues toward assimilation.

"Interpretation, based on the highly dubious theory that a work of art is composed of items of content, violates art. It makes art into an article for use, for arrangement into a mental scheme of categories." Well, okay, if you put it like that it sounds bad. But that's a tendentious way of putting it. Really good interpretation can be almost as subtle and profound as the artwork itself.

Insofar as Sontag's position is compelling, it's because of our intuition that an artwork is a finished sort of thing, a 'superfluous', purely 'aesthetic' thing. The artist puts it out there for you to look at and admire. Staying on the level of form is the most blatant way of staying on the level of the exclusively aesthetic.

One has to give her credit for admitting in the Afterword, written in 1996, that she was partly wrong in her early criticisms of the Marxist, humanistic literary critics (Lukács, Benjamin, Adorno, *et al*). She had scolded them for being critical of most contemporary art, for being "insensitive to most of the interesting and creative features of contemporary culture in non-socialist countries". They criticized a lot of modern art as decadent, alienated, un-historical, allegorical, unrealistic, shallow, consumerist. They thought it was symptomatic of a culture in decline, while earlier realism was strong and vibrant, and morally uplifting. She thought they overemphasized the importance of content at the expense of form, and that if they corrected this one-sidedness they might better understand contemporary art, which has "rediscovered the power of the formal properties of art". "Even form is viewed by the historicist critics as a kind of content." (As well it should be, since their approach is holistic. One might almost call their approach sociological, as opposed to merely aesthetic. Everything in society is an expression of that society; everything is content.) But in the Afterword she admits that "we live in a time which is experienced as the end—more exactly, just past the end—of every ideal. (And therefore of culture: there is no possibility of true culture without altruism)... [Back in the Sixties, even, something was happening,] something that it would not be an exaggeration to call a sea-change in the whole culture, a transvaluation of values—for which there are many names. Barbarism is one name for what was taking over. Let's use Nietzsche's term: we had entered, really entered, the age of nihilism." So in the end she agreed with the Marxist critics, who evidently had a keener sense of what was happening than she did. She even adopted their moralistic language, in direct opposition to her earlier self: "there is no possibility of true culture without altruism".

December 16

Sontag strikes me as a brilliant dilettante.

Speaking of which: I might be tempted to try my hand at art criticism if the activity didn't seem so masturbatory. Except when it's done on an extremely high level, a quasi-philosophical level (searching for insights into the human situation), criticism is pretentious and self-involved.

No doubt its 'self-referential' nature grows out of the self-referentiality of art itself, and is to that extent appropriate. Sontag is probably right that art, as art, exists in its own autonomous mental space, that

insofar as we criticize it from a moral or sociological viewpoint we are not really criticizing it *as art*.¹ “The fact of a man being a poisoner is nothing against his prose.” (Wilde.) The aesthetic experience refers only to itself. Cf. Kant. Still, something repels me about criticism as undertaken by most critics. Including Sontag. It seems somehow decadent, cloistered, disengaged, Ivory Tower-esque, not to mention boastful and self-promoting. (‘Look how many books I’ve read! Look how many parallels I can draw between all these works!’)

Maybe that’s all bullshit. Maybe what it comes down to is that criticism just doesn’t interest me (most of the time). *L’art pour l’art*, and the sort of criticism engendered by that attitude, doesn’t interest me much. I seek general truths in everything; but most artistic criticism is entirely specific, as if it’s an end in itself.

Besides, surely the ‘healthier’ attitude is the Marxist, humanistic one, which sees art as an expression of social life and ideally a means of ennoblement. This is Nietzsche’s position too. Its criterion for artistic worth isn’t really a ‘moral’ one, as Sontag says accusingly, but a ‘spiritual’ one. Moral rightness and wrongness have nothing to do with it; what matters is the degree to which art enhances the feeling of living, the feeling of power. Does the work promote (or embody) a holistic engagement with life or a one-sided retreat from it? Is it unifying or is it fragmenting? Cross-cultural or parochial?

The humanistic attitude is more naïve, and thus more healthy, than Sontag’s sophisticated ‘formalist’ attitude. Her approach, I suspect, allows for more subtle aesthetic analysis (which one might uncharitably call aesthetic casuistry) than does the humanistic one, but a tendency towards over-analysis is a symptom of a bored, worn-out civilization. Formalism is high intellectualism, and intellectualism, as she herself admits, betokens sickness, if not necessarily on the individual’s level than certainly on the cultural level. (One of the manifestations of our culture’s unhappiness and boredom is its over-intellectualization of things.)

Undoubtedly a work of art should be evaluated by other standards too, ‘formal’ standards etc. But it’s a mistake to disregard the ‘moral’ or ‘spiritual’ standards. These are, after all, important in determining the work’s longevity. (Bach will always be listened to and worshiped; Schoenberg will not. Eugene O’Neill will probably have more staying-power than Samuel Beckett. The former are uplifting and universal, the latter alienated and period-specific.) And everyone knows that longevity is one of the criteria for artistic greatness. Therefore, so are the humanistic criteria that Sontag deprecates.

As I read the essay “On Style” I can’t help thinking “Too much intellectualism!” I’m suspicious of all this rationalizing, this overly subtle reasoning in defense of formalism. The naïve, instinctive view is usually the best.

I’m reading W. W. Tarn’s *Hellenistic Civilization*. Also Howard Sherman and Gary Evans’ textbook *Macroeconomics: Keynesian, Monetarist, and Marxist Views*.

I desperately need an organizing principle for my mental life. All I know is that reading is truly pleasurable only if I see a way to use the book (whatever it is) in my own writing. Maybe I should focus intensely on economics and see if anything comes of it.

Thoughtful comments from Sontag (at the beginning of an essay on Lévi-Strauss):

Most serious thought in our time struggles with the feeling of homelessness. The felt unreliability of human experience brought about by the inhuman acceleration of historical change has led every sensitive modern mind to the recording of some kind of nausea, of intellectual vertigo. And the only way to cure this spiritual nausea seems to be, at least initially, to exacerbate it. Modern thought is pledged to a kind of applied Hegelianism: seeking its Self in its Other. Europe seeks itself in the exotic—in Asia, in the Middle East, among pre-literate peoples, in a mythic America; a fatigued rationality seeks itself in the

¹ Maybe that’s wrong, though. Both Sontag’s and Lukács’s positions have appeal for me. –Well, Lukács’s has more appeal, but I understand Sontag’s too.

impersonal energies of sexual ecstasy or drugs; consciousness seeks its meaning in unconsciousness; humanistic problems seek their oblivion in scientific ‘value neutrality’ and quantification. The ‘other’ is experienced as a harsh purification of the ‘self’. But at the same time the ‘self’ is busily colonizing all strange domains of experience. Modern sensibility moves between two seemingly contradictory but actually related impulses: surrender to the exotic, the strange, the other; and the domestication of the exotic, chiefly through science.

In defense of Rousseau.— “There were nearly twenty thousand of the naked, indigent, nomadic, handsome Nambikwaras in 1915, when they were first visited by white missionaries; when Lévi-Strauss arrived in 1938 there were no more than two thousand of them; today they are miserable, ugly, syphilitic, and almost extinct.”

December 17

Buddhism and Epicureanism exhibit amazing similarities, for instance in their attitudes toward suffering and happiness. As I noted a long time ago, the Epicurean goal, like the Buddhist, is to be free of pain. Pleasure—not active pleasure but passive pleasure, the pleasure of tranquility—“repose, freedom from passions, desires, needs, above all absence of pain; the keyword of man’s effort was [for Epicurus] *ataraxia*, escape from worry. Virtue was vital, but not, as the Stoics thought, for its own sake—that had no meaning. It was vital because without it happiness could not be. This constituted a doctrine of renunciation, a renunciation of active effort and positive happiness, and [Epicurus’s] followers formed little isles of quietude apart, bound together by the friendship he so stressed. Except that they lived among their fellows and enjoyed family life, one might call them, spiritually, the first monks. They never influenced the great world; they had no wish to.” This is also similar to Taoism, the retreat to nature. Stoicism, Buddhism, Taoism, and Epicureanism were all founded at about the same time, in or around the Hellenistic age, a time of increasing individualism, insecurity, the collapse of the age-old safe community. It was proto-globalization back then. An age of extremes, and of remarkable originality in all areas of culture. Aside from the ferment of philosophy, art, and science, there were, for example, the first attempts at real social revolution. In the third century B.C. the gap between rich and poor was growing wider as trade expanded and prosperity spread across the Mediterranean and western Asia. There was insane misery (e.g. among the slaves working in mines—slavery was the real economic foundation of the age) and obscene wealth. So “the fourth century was already obsessed by the fear of social revolution—one reason why the well-to-do turned to Macedonia as champion of the existing order. In the treaties between Alexander and the cities of the League of Corinth it was provided that Macedonia and the League should repress, in any League city, any movement for abolition of debt, division of land, confiscation of personal property, or liberation of slaves to assist the revolution; the constitution of Demetrius’ revived League of 303 contained similar provisions. The revolution therefore had now a general program under four heads. The poor desired the land, but with the small men of every type the driving force was debt; simple communities may be patient of rude conditions of life, but they always hate the creditor... From quite another angle, philosophy made its contribution to the subject: the Stoic insistence on equality and brotherhood sank into men’s souls, and inspired visions of something better than the existing order. Some took refuge from civilization in drawing fancy pictures of virtuous barbarians living according to nature, prototypes of Tacitus’ *Germania* [and Rousseau’s noble savage]; and Utopias began to appear... True modern Utopias [were] located on islands in the Indian Ocean; and in Iambulus’ great Sun-state Communism appears full grown. The people were equal in all respects, even in wisdom; they lived in social bodies or ‘systems’ in which all worked equally and equally shared the produce; they escaped ‘slavery to the means of production’ because the island fortunately bore crops, partly by itself, all the year round; each in turn filled every duty from servant to governor, the governor of each system being the oldest member; there was thus no place for wealth, ambition, or learning, the foes of equality, or for class war, because there were no classes. Above all things

the people prized Homonoia and were united in concord and love. What Iambulus and his fellows really aimed at was the abolition of that class war whose horrors many Greeks had seen... [In 279 there was a “proletarian” revolt, when Apollodorus of Cassandreia] made himself tyrant, tortured the wealthy, and gave part of their property to his followers...”. There were short-lived revolutions in Sparta, indeed throughout the whole area, finally ending only under Roman rule.

Here are further useful remarks: “Man as a political animal, a fraction of the *polis* or self-governing city-state, had ended with Aristotle; with Alexander begins man as an individual. This individual needed to consider both the regulation of his own life and also his relations with the other individuals who with him composed the ‘inhabited world’. To meet the former need there arose the philosophies of conduct [Stoicism, Cynicism, Epicureanism, etc.], to meet the latter certain new ideas of human brotherhood. These originated on the day—one of the critical moments of history—when, at a banquet at Opis, Alexander prayed for a union of hearts (*homonoia*) among all peoples and a joint commonwealth of Macedonians and Persians; he was the first to transcend national boundaries and to envisage, however imperfectly, a brotherhood of man in which there should be neither Greek nor barbarian. The Stoic philosophy was quick to grasp the concept, and Zeno, in his Ideal State, exhibited a resplendent hope which has never quite left men since: he dreamt of a world which should no longer be separate states, but one great City under one divine law, where all were citizens and members one of another, bound together, not by human laws, but their own willing consent, or (as he phrased it) by Love... Even the practical world was influenced, in spite of itself, by Zeno’s dream, through the insistence of Zeno’s school on certain notions of equality and brotherhood and by the fact that the ‘inhabited world’ or *oecumene* now began to be treated as a whole. The stranger could no longer be *ipso facto* an enemy, and Homonoia received perhaps more tributes than any other Hellenistic concept. Certain ideas of the interrelation of states, apart from actual treaties, began to emerge; and the germs of modern international law go back to third century Stoicism.”

Those few centuries in that small area on the globe, from the Mediterranean Sea to India and up into China with Confucius, were the most creative in history—possibly excepting the Western centuries since the 1400s, ending sometime after the middle of the twentieth century, when everything became sick. For it doesn’t seem like there’s much more to say or do, except in science.

Anyway, we see that a rise in trade between different parts of the world is what fosters cultural creativity. Where there is “globalization”, or rather the *onset* of “globalization” (internationalization), there is creative ferment; and where globalization proceeds too far and the status quo hardens a bit too much, making the world seem too ‘vast’ and the individual too small, there is cultural death. The society may linger, as it did in the later, cultureless, alienated stages of the western Roman Empire and as our own will surely do for at least a few more decades—because what causes societal collapse isn’t a change in consciousness but a dramatic change in material conditions—but *culturally* there is death.

One can say that a culture has died or is about to die when it seems like there is no longer a clear direction to progress but everything is just a big ocean into which you cast your little contributions—your little books, your little songs, your little artworks—and then watch them immediately drift out to sea and get lost on the horizon, eclipsed by the new contributions of the next moment. The fads. There is no line of, say, philosophical evolution, artistic development, which you can further; there is just a big inhuman ocean of *everything*, all mixed up with no order. That’s when sophistication has proceeded so far as to become cynicism on a collective scale. And cynicism is the end.

December 18

Youth and resilience. Amazing how I can feel like a boy again just by being with a delightful girl. I went bowling with Masato, Jenny, and Yuna (the two Korean girls I mentioned); very fun, good clean fun. And Jenny, the pretty one, is fond of me and isn’t afraid to show it with her touchy-feeliness. Goddammit I wish she weren’t leaving soon. I can see myself loving her, yes truly, there’s that possibility.

What I love about baroque music is its virility. Handel, Bach, Vivaldi. The most virile music ever written. The magnificent vitality of the age is reflected in the self-confidence of its music.

Talleyrand once said that people who hadn't lived in the eighteenth century before the French Revolution could never know the sweetness of life.

Forerunner of Nietzsche's "eternal return": according to the Stoics, "the universe, at the end of every world-period—a recurring cycle of enormous length—was reabsorbed into the divine Fire, and then started afresh to run an exact repetition of its course. Ages hence another Socrates would teach in another Athens, and there was no new thing under the sun; all had happened before, and history merely repeated itself...".

"Virtue was the central point of Stoic ethics. On this Zeno was uncompromising; the intention to do evil, he said, was equivalent to doing it... Man's means of getting into harmony with God were wisdom and virtue, and in both these matters progress was possible; the Stoic was thus led to examine the progress he was making, and the idea arose of conscious moral growth. Moreover the Supreme Power had had forethought for men, and they had an aid on the path; there now first appeared in philosophy the conception, heretofore a popular one, of conscience. Conscience and duty were the cornerstones of Stoic ethics. —The influence of those ethics on the world and on Christianity was to be great." How modern all this is! "The true Stoic was captain of his soul, sufficient to himself. And he was master of his fate; fate could not hurt him, for what it brought him was what he would have chosen. [*Amor fati*. Whatever happens is necessary. (Determinism.) The Supreme Power is all-wise and all-virtuous, and whatever happens is for the best. You shouldn't grieve for your son's death, etc., because everything is for the best in the best of all possible worlds. So, to be happy you simply have to want and appreciate what you have, and renounce all other desires. Again, Buddhism etc.] But to all people, strong and weak, it had a message, its insistence on the things of the soul. Whatever the world did to you, in one sphere the world had no power: you could withdraw into your own soul, and there find peace; for none could harm you *there* but yourself." Given all the philosophies and thought-systems that were circulating in the Hellenistic world, Christianity was not as original as people think. The individual, and even love (to a limited extent), had been discovered long before Jesus came along.

"It has been truly said that in the religious sphere the only vital things in Hellenism were philosophy and the Oriental religions. Twilight was indeed falling on the Olympians, in spite of external show... Many things conspired to decide the fate of the Olympians. They belonged to, and fell with, the city-state; philosophy killed them for the educated, individualism for the common man; he was no longer part of the city, content with whatever its corporate worship might be, but wanted something that spoke to himself." "A dominant factor of the time was the striving after one god... This might take the form of the national god claiming to be god of the whole earth, as Yahweh in Judaea; but another movement, very typically Hellenistic, was a great expansion of syncretism, the equation or fusion of one god with another as being alike forms of the one divinity behind them. Men would worship any god impartially [since they were merely forms of one deity]...". An important new god, by the way, was Fortune. That says it all, doesn't it?

For the common man, as the Olympians faded "a more real religious feeling began to develop, and the appeal of the intimate and confident oriental worships became irresistible. In this sphere the East led its [military] conqueror captive; and though the movement did not perhaps culminate till after the Christian era, it was gathering strength all through the Hellenistic period." The number of gods from region to region, or city to city, is altogether bewildering—as is the amount of borrowing between cultures, the ten thousand intersections. It was a frenzied time, maybe even more bewildering and confusing (for the participants) than our own time. For nothing remotely like it had ever happened.

Our dating system should really start around 500 B.C.

Astrology spread everywhere, as did, therefore, the idea of Fate (for your fate was governed by the stars), but I won't get into that. Magic too was very popular in the second century B.C., the sort of primitive magic discussed by Huizinga, which is supposed to give people power over the gods and fate and the elements. "Its root idea was that by employing proper means the hands of gods could be *forced*; a formula to compel the Moon says, 'You have to do it, whether you like it or not'. The god or demon could be compelled to alter your fate." It's the magical power of the *word*, that ancient belief and practice. "Your best hold over a demon was to utter his true name...". Philosophy and poetry themselves were, after all,

remnants of ancient word-rituals—riddles especially—so it's only natural that magic itself would linger from time immemorial. A sort of vulgarized magic was popular amongst the masses, as a way “to get some material thing you wanted”.

But more interesting are the Hellenistic mystery-religions, out of which Christianity developed. “Magic might alter your fate, but initiation [into a particular religion] lifted you above the sphere of Fate altogether. The god could and would look after his own, and though the stars might work their will on your body, your soul, even in this life, was beyond their reach, and after death would rise above their spheres to the sphere of the divine and dwell with the gods; you were in fact ‘saved’. The universal basis of the mystery-religions was that you sought this *soteria*, ‘salvation’, by personal union with a savior god who had himself died and risen again. To employ the well-known Orphic phrase, you ceased to be a worshipper, a rod-bearer, and became a Bacchus—you were as the god himself. Mysteries were an old phenomenon in Greece; what was new was the tremendous appeal which, with the breakdown of Greek religion, they now made... These religions brought to the aspirant a new sense of sin, a new conception of holiness; and the rite of initiation, culminating in the knowledge that you were saved, was undoubtedly an intense emotional experience. From the second century onwards men's religious sense deepened. There were many mystery-religions, each claiming to possess the original initiation and to be of universal force; each claimed that the others merely worshipped its own god under other names. The older forms persisted, and certain phrases of Orphism, with its religious ecstasy and its ideas of purity and the antagonism of flesh and spirit, obtained considerable vogue... In some mysteries the initiates witnessed the death and resurrection of the god, and heard the priest pronounce the message of consolation: ‘Be of good cheer, mystae, the god is saved; even so shall we after our troubles find salvation’.” The Egyptian mystery-religion was the most popular, and Isis was *the* goddess of the age. The cult spread everywhere, especially, it seems, among women. For “Isis was a phenomenon which had not appeared in the Mediterranean in historical times, but which, having once appeared, has never since quitted it: she was the woman's goddess. Half the human race had been badly off for a friend at the court of Heaven. Athena was uniquely a man's goddess; and if women cried to Artemis in childbirth it was largely because there was no one else. To the ordinary decent woman the main facts of life were that she was wife and mother; she had little in common with a virgin warrior who patronized art, or a virgin huntress, cold as her own moon; little with the fertility goddess of an old matriarchal age, and even less with Aphrodite, though doubtless people can spiritualize anything. But now she had a friend, and the greatest of them all; one who had been wife and mother as she was, one who had suffered as she might suffer; one who understood. Isis herself leaves no doubt on the point: she is the ‘glory of women’, who gives them ‘equal power with men’. ‘I am Isis’ runs her creed, the Isis-hymn found at Ios; ‘I am she whom women call goddess. I ordained that women should be loved by men; I brought wife and husband together, and invented the marriage contract. I ordained that women should bear children, and that children should love their parents...’. In that strength Isis swept the Mediterranean. When finally Christianity triumphed, and Zeus and Apollo, Sarapis and the star-gods, were hurled from their seats, Isis alone in some sense survived the universal fall: the cult of the Virgin had been introduced before the Serapeum was sacked, and Isis's devotees passed quietly over to the worship of another Mother—how quietly sometimes may be seen from this, that various instances are said to be known of her statues afterwards serving as images of the Madonna.”

I'll quote Tarn's summary of his discussion. “The interest of Hellenistic religions is that they depict the world in which Christianity arose. That world provided more than the medium of the common civilization in which Christianity was to spread; it to some extent paved the way. Men were seeking the unity which must lie behind the different deities and their worships, even as Alexander had once called all men sons of one Father; while the terrible upheaval of the Roman civil wars greatly strengthened the already strong desire for a savior, for whom many were already looking beyond the sphere of mankind. But though Hellenism supplied the longing, and probably in some a quickened sense of purity (even if only ceremonial) and of faith, there were to be two vital things in the new religion which were not in Hellenism, quite apart from the figure of the Founder, Whose spirit Hellenism did not touch. Plato had declared that all souls were immortal, and a few Jews had grasped the same general idea, while the Stoics gave the soul of the virtuous a limited survival till the end of the world-period; but to Hellenism generally immortality was only for

certain benefactors of their kind or the initiates in some mystery-religion. It was not for the mass of men, as their epitaphs reveal pathetically enough. And of all the Hellenistic creeds, none was based on love of humanity; none had any message for the poor and the wretched, the publican and the sinner. Stoicism came nearest; it did transvaluate some earthly values, and Zeno, at least, gave offense by not repelling the poor and the squalid who came to him; but it had no place for love, and it scarcely met the misery of the world to tell the slave in the mines that if he would only think aright he would be happy. Those who labored and were heavy laden were to welcome a different hope from any which Hellenism could offer.”

December 20

It isn't surprising that Ecclesiastes was written in the second or third century B.C., when the world was in flux.

“In one respect the Jew and the Greek had a parallel experience. As the political decline of the self-governing city-state after Alexander made individualism inevitable, so the destruction of the old national State and of the Temple had made it inevitable for the Jew: the idea of a blessed future for Israel was ultimately replaced by that of a blessed future for the Israelite. And as the Greek had his problems of individualism and universalism, so, on other lines, had the Jew: would Yahweh extend the hope of that blessed future to all mankind? Were men indeed to be brothers, not (as the Stoics hoped) in this world, but nevertheless at the end? In the second century the idea of personal immortality, or rather of resurrection from the dead, became firmly established in certain Jewish circles. It is strange that some should have believed that the Jew took his belief in immortality from the Greek, seeing that the Hellenistic Greek had no such belief: certain people might attain to immortality, but certain people only; the normal reward of a man was only everlasting remembrance. The vexed question of what, if anything, the Jews borrowed from Persia cannot be discussed here. More probably they evolved this belief for themselves, though opinions have differed as to their reasons. It has been attributed to Antiochus' persecution (for unless the dead lived again, the upholder of the Law who suffered martyrdom was worse off than the ungodly who conformed), to the growing consciousness that the Messianic kingdom could not be realized in this world, and to the growing experience of personal communion with God. *All* these reasons may well have contributed to the new belief.”

Reading Maxim Gorky's *My Apprenticeship*, the second book of his three-volume autobiography.

The economic system of Egypt under the Ptolemies was “the most thoroughgoing system of State nationalization known prior to the twentieth century, unless conceivably the Peruvian”. But it had a lot in common with feudalism too. Slaves were relatively rare; serfs and poor peasants were far more common. (Labor was so cheap and abundant that there was no need for slaves.) “As regards the fellahin [the peasants], the basis of the system was that each man had his ‘own place’, which he could not leave except by order or permission.” The king, who was also an Egyptian god, officially owned all the land in the country, but he granted some of it to soldiers and officials, and there were temple lands too (which were, however, mostly cultivated by the king). “The entire land was divided into two categories only: King's land in the narrower sense, i.e. land in hand, and land in grant. King's land was farmed for Ptolemy by the ‘royal peasants’, the ‘king's people’. These formed a substantial part of the fellahin population of the villages, and their ancestors had cultivated King's land for untold centuries. Many were small peasants, but among them were farmers of some substance. ...As they could not leave their villages, were compelled to cultivate their land and could be compelled to cultivate more if ground fell vacant (for the State was built up on the maxim that the king's cultivation must be carried on), could have their animals requisitioned, gave compulsory labor on the dykes and canals, and could be turned out at any time, they differed little in fact from serfs.” The king was in charge of most business too, and reaped the profits. The whole extensively bureaucratized system was quite oppressive, and full-blown labor strikes were not uncommon. Miners, quarry-men, boatman, workers of all sorts, royal peasants, retailers, police, even officials went on strike. “Workmen's strikes were not strikes for better wages or conditions, for there were none to be got; they were the product of blank despair... The men had one weapon which officialdom feared: they could throw the machine out of gear

by leaving their 'own place'. A strike notice reads: 'We are worn out; we will run away'; and they usually took refuge in some temple with the right of asylum. Asylum has been called the Egyptians' *Habeas Corpus*: Ptolemy's power ended at the precinct wall, and the worried officials had no weapon but persuasion or some concession with which to get the men back to their 'own place.'" I could keep quoting but that seems silly, seeing as I have the book.

Incidentally, the social position of women improved during the Hellenistic era. "Women could now get all the education they wanted; many philosophers numbered women among their hearers... Poetesses began to appear again in the third century... Some writers obviously wrote for female readers. Women now received citizenship and proxeny from other cities for the same services as men; and the women magistrates of the Roman period date back at any rate to the first century B.C., when a woman, Phile, held the highest office at Priene and built a new aqueduct and reservoir. The relations between the sexes became less cramped and more natural. Women founded clubs and took part in club life, though naturally to a less extent than men; there were clubs for women only at Athens and Alexandria."

Infanticide was very common. "More than one daughter was practically never reared, bearing out Poseidippus' statement that 'even a rich man always exposes a daughter'." Except among the Jews, no moral objections were raised against infanticide till under the Empire some Stoics spoke out against it. In any case, the Greek population declined as the age progressed, since more and more families refused to have more than one or two children.

December 21

Gorky's book is a reminder that there are two kinds of poverty, the humanizing and the dehumanizing kind. Sapa's poverty is humanizing, capitalism's poverty is not. Poverty in itself is neither one nor the other; what matter are the structural conditions in which it exists. —Reading Moore's book was useful inasmuch as it reminded me of the value of Marxist clichés, which are actually not clichés but pithy insights. Society's institutional matrix is what matters most, not its "culture" or ideologies, and certainly not its general "poverty" or "wealth" or "extensive division of labor"—phenomena that can be manifested in a thousand different concrete ways.

Excerpts from the last chapter of Moore's book: "...In considering the forces that aided or prevented the landed upper classes from taking up commercial agriculture, how much weight should one attribute to widely prevalent ideals, codes of behavior, or values in explaining the result? Though the evidence [from my investigation], I think, pointed in the direction of stressing as the crucial aspect of the explanation the situation that various groups faced, the attentive reader might suspect that ideas or cultural themes, to use still another term, have crept into the explanation somehow. His suspicions would be quite correct. I do not believe that they can be omitted and hold that there is a significant residue of truth in such explanations. My objection is to the way they are put into the explanation, which in my estimation creates a strong conservative bias under the color of scientific neutrality and objectivity...

"...Materialist efforts to exorcise the ghost of idealism in cultural explanations are chanting at the wrong spook. The real spook is a conception of social inertia, taken over probably from physics. There is a widespread assumption in modern social science that social continuity requires no explanation. Supposedly it is not problematical. Change is what requires explanation. This assumption blinds the investigator to certain crucial aspects of social reality. Culture, or tradition—to use a less technical term—is not something that exists outside of or independently of individual human beings living together in society. Cultural values do not descend from heaven to influence the course of history. They are abstractions by an observer, based on the observation of certain similarities in the way groups of people behave, either in different situations or over time, or both. Even though one can often make accurate predictions about the way groups and individuals will behave over short periods of time on the basis of such abstractions, as such they do not explain the behavior. To explain in terms of cultural values is to engage in circular reasoning. If we notice that a landed aristocracy resists commercial enterprise, we do not *explain* this fact by stating that the aristocracy has done so in the past or even that it is the carrier of certain traditions that make it hostile to

such activities: the problem is to determine out of what past and present experiences such an outlook arises and maintains itself. If culture has an empirical meaning, it is as a tendency implanted in the human mind to behave in certain specific ways ‘acquired by man as a member of society,’ to quote the last phrase of Tylor’s famous definition. . .

“The assumption of inertia, that cultural and social continuity do not require explanation, obliterates the fact that both have to be re-created anew in each generation, often with great pain and suffering. To maintain and transmit a value system, human beings are punched, bullied, sent to jail, thrown into concentration camps, cajoled, bribed, made into heroes, encouraged to read newspapers, stood up against a wall and shot, sometimes even taught sociology. To speak of cultural inertia is to overlook the concrete interests and privileges that are served by indoctrination, education, and the entire complicated process of transmitting culture from one generation to the next. . . Finally, to take values as the starting point of sociological explanation makes it very difficult to understand the obvious fact that values change in response to circumstances. The perversion of democratic notions in the American South is an all too familiar example, incomprehensible without cotton and slavery. We cannot do without some conception of how people perceive the world and what they do or do not want to do about what they see. To detach this conception from the way people reach it, to take it out of its historical context and raise it to the status of an independent causal factor in its own right, means that the supposedly impartial investigator succumbs to the justifications that ruling groups generally offer for their most brutal conduct. That, I fear, is exactly what a great deal of academic social science does today.”

Why is it so difficult for the human mind to overcome uncritical, idealistic pre-Marxist doctrines? It’s difficult even for me: I sometimes forget the lesson to look at the *concrete situations* of people, to focus on specifics and not just vague platitudes like “the complex social division of labor”. One of the reasons is that the mind has an innate love of generalizing, of classifying phenomena under broad categories so as to assimilate them (the phenomena) to each other, making them easier to deal with. Honestly, it’s just *hard* to probe beneath abstract concepts and look at the specifics of social life, and it’s less satisfying than lumping things together. Framing explanations in terms of cultural values and abstractions like poverty or democracy is easy and satisfying.

Even a critical thinker like Moore tends to generalize too much. I’m suspicious of his whole project, the project of drawing general conclusions from the experience of five or six nations. In the context of a discussion of India’s caste system and its deadly flexibility—of how it prevented a truly revolutionary movement from emerging among the peasantry, namely through the mechanism of any attempt at innovation, any local variation, simply becoming the basis of another caste, so that the caste system itself persisted—Moore says that “the general hypothesis that emerges. . . might be put the following way: a highly segmented society that depends on diffuse sanctions for its coherence and for extracting the surplus from the underlying peasantry is nearly immune to peasant rebellion because opposition is likely to take the form of creating another segment. On the other hand, an agrarian bureaucracy [like China’s], or a society that depends on a central authority for extracting the surplus, is a type most vulnerable to such outbreaks. Feudal systems, where real power is diffused into several centers under the nominal authority of a weak monarch, belong somewhere in between. This hypothesis at least fits the main facts in this study. Peasant rebellion was a severe problem in traditional China and tsarist Russia; was somewhat less severe but frequently beneath the surface in medieval Europe; was quite noticeable in Japan from the fifteenth century onwards; and finds almost no mention in histories of India.” His hypothesis is interesting, but in history such general theories are not sound. There may be enough similarities between societies to draw useful parallels between them, as Moore does, but there are also thousands of little differences that are always in danger of invalidating inductive generalizations.

I've had enough of ignorance about Indian philosophy. I'm going to read (skim) three books about it—*Indian Philosophy: A Critical Survey* (by Chandradhar Sharma), *Comparative Religion* (by A. C. Bouquet), and *A Source Book in Indian Philosophy*—and summarize what I read. I'll forget it otherwise.

Unfortunately Indian philosophy is very rich. So I'll quote only the barest essentials. (What follows are mostly quotations from the first two books I mentioned, without the quotation marks.)

'See the Self' is the keynote of all schools of Indian philosophy. And this is the reason why most of the schools are also religious sects. Annihilation of three kinds of pains—sufferings (physical and mental) produced by natural and intra-organic causes, sufferings produced by natural and extra-organic causes, and sufferings produced by supernatural and extra-organic causes—and realization of supreme happiness is the end, and 'hearing the truth', 'intellectual conviction after critical analysis', and 'practical realization' are the means—in almost all the schools of Indian philosophy.

Perhaps the most deeply rooted idea in Indian thought (if we take the majority of Indians) is the lack of ultimate significance in the events of human life. The Indian, it is said, for the most part thinks of this world as a circular and unending journey, an ocean without a shore, a shadow-play without even a plot. The whole world of phenomena is simply the more or less purposeless and sportive energy of the Absolute Being, Who is beyond definition. Hence the ideal life is that of 'non-active Activity', the attainment by a well-defined technique of an exalted state of absorption in which one negates every moment of life, and becomes one with the changeless Absolute, beyond good and evil. Thus the world-renouncing ascetic is the type universally admired, and his renunciation is in no sense altruistic or philanthropic but is purely self-regarding... [That's probably a half-truth.] Self-forgetful service of others is a Christian, not a Hindu idea.

A well-accredited member of the British Civil Service once wrote: 'Asceticism makes an extraordinary appeal to practically all classes of Hindus. They feel that whatever their own manner of life, self-denial is better than self-indulgence, the suppression of passions and desires is better than their gratification... Otherworldliness is a higher calling than the management of affairs.'

(Evidently all the life-denying aspects of Indian tradition, as well as the superstitious and degrading religious practices, proceed largely from the caste system, its lack of dynamism, its oppressive structure, its eternal unchangingness. A society that worships Hanuman the monkey and Sabbala the cow, that countenances the burning of wives after their husband's death, is an inhuman one, in which man is subjugated both by the earth and especially by a caste-structured poverty.)

The Vedas. It is said [though the author disagrees] that we can notice a transition from the naturalistic and anthropomorphic polytheism through transcendent monotheism to immanent monism in the pre-Upanishadic philosophy. The personified forces of nature first changed into real gods and these later on became mere forms of one personal and transcendental God, the 'Custodian of the Cosmic and Moral Order', who Himself, later on, passed into the immanent Purusa. The Upanishads developed this Purusa into Brahman or Atman which is both immanent and transcendent. ... The correct position seems to us to be that the Vedic sages were intensely spiritual personages who in their mystic moments came face to face with Reality, and this mystic experience, this direct intuitive spiritual insight, overflowed in literature as the Vedic hymns. The keynote of the Vedic hymns is the same spiritual monism, the same immanent conception of the identity-in-difference which ultimately transcends even itself, the same indescribable absolutism which holds both monism and pluralism within its bosom and which ultimately transcends both... If there were polytheism in the Vedas, how is it that the binding principle of this world, the Supreme Soul of this Universe, is so much emphasized and repeated? ... The gods are regarded as mere manifestation of the Supreme God so that when any god is praised he is not praised in his individual capacity, but merely as the manifestation of the Supreme God... Hence there is no development from polytheism through monotheism to monism, but only of monism from the first Mantra portion to the last Upanishadic portion.

Examples: 'The One Real, the wise declare as many.' 'The real essence of the gods is one.' 'Aditi, the Boundless, is the sky, the air, the mother, the father, the son, all the gods and all the men, all that is, all that was and all that shall be.' (from the Rg Veda, the oldest) 'All the gods form the body of the World-Soul.' 'He is immanent in all this creation and yet He transcends it.'

The Upanishads were written mostly in the eighth and seventh centuries B.C. The hymns in the older Vedas are replaced here by more philosophical reflections, and ceremonialism, even caste duties, are

subordinated to the supreme good of self-realization. Atman is the absolute Self, the cosmic reality in its subjective aspect; atman (with a lower-case 'a') is the individual self.— The individual self stands self-proved and is always immediately felt and known. One is absolutely certain about the existence of one's own self and there can be neither doubt nor denial regarding its existence. The individual self is the highest thing we know and it is the nearest approach to the Absolute, though it is not itself the Absolute. In fact it is a mixture of the real and the unreal, a knot of the existent and the nonexistent, a coupling of the true and the false. It is, in a way, a product of ignorance. But its essence is the light of the Absolute, Atman. Its real nature is pure consciousness, self-shining and self-proved and always the same. The senses, the mind, the intellect, feeling and will, the internal organs surround the individual self and constitute its 'individuality', but the self really is above them, being the Absolute. [Cf. all my ideas, and Sartre's.]

The word 'Atman' originally meant life-breath and then gradually acquired the meanings of feeling, mind, self and soul. (Cf. the Greek 'pneuma', associated with air and the soul.)

The self is immanent in senses, mind, intellect, reason, but it is self-luminous. It can be directly realized only by transcending the empirical subject-object duality, because objects have content, which the self lacks. The goal of human life, then, is to become one with Atman, and thereby to transcend dualities and overcome karma. —Anyway, I already know enough about this side of Indian thought. I'll note only that the *objective* side of this ultimate reality is called Brahman, that which spontaneously bursts forth as nature and soul. It is manifested first as matter, but since matter is unconscious and dead Brahman cannot rest content with it; so then life evolves. "The purpose of matter is fulfilled only when life evolves." [A quasi-Hegelian conception: the truth of the lower is contained in the higher.] The destiny of life is fulfilled only with consciousness, and finally with self-conscious reason. But the highest stage of evolution is the non-dualistic bliss, identity with Brahman (and Atman). Brahman cannot be described; it is intuitive and ineffable. But "he who knows Brahman becomes Brahman. Only by knowing it can one cross the ocean of birth-and-death; there is no other way for liberation."

Hegel, Hegel, Hegel (except for the mysticism). Hegel thought that with absolute knowledge, one overcomes dualities and time and suffering. And Spirit objectifies itself first as matter, then as life, etc. It restlessly evolves, like Brahman, though not in quite the same way.

So, yes, Indian philosophy anticipates modern idealism and empiricism and rationalism and all that; but Hegel was right that when Spirit seems to return to earlier thought-patterns it is actually adding some new content to them. When I think the thoughts of my twenty-year-old self, they are far from identical with the former. They have evolved and become richer, broader.

The Bhagavadgita is a philosophical discourse to persuade a man, Arjuna, to fight. This man is appalled by the fact that he has to kill his friends and relatives, but the Lord Krishna tells him it is his duty as a prince and a righteous man to fight against evil and to restore order and peace. The book "is meant to lift the aspirant from the lower levels of renunciation, where objects are renounced, to the loftier heights where desires are dead, and where the Yogi dwells in calm and ceaseless contemplation, while his body and mind are actively employed in discharging the duties that fall to his lot in life." *Yoga* means the synthesis of knowledge, action and devotion, which is preached in the Bhagavadgita. But it is essentially the path of knowledge. Only through attaining true knowledge can we become Yogis and rise above desire and attachment. Says the Gita: "Even the most sinful man can cross over the ocean of Samsara by means of the boat of knowledge alone. As a fire well-kindled reduces fuel to ashes, so the fire of knowledge reduces all actions to ashes. The culmination of action is knowledge. Having obtained knowledge, one soon embraces peace. There is nothing purer than knowledge."

So the Gita doesn't preach inaction or escapism but rather *detachment regarding action*. We should never be attached to the fruits of actions and at the same time we should never be inactive. The perfect man works for the benefit of humanity in the spirit of selflessness—like the liberated cave-dweller in Plato, who returns to the cave to free others from suffering. Bhakti, or devotion, is defined in the Gita as disinterested service to God. ("So it is a form of Karma.") The object of devotion is the personal God, the Purusottama on Whose mercy the devotee has to throw himself utterly. Absolute dependence and utter faith are very necessary. The Lord says, "Merge thy mind in me, be my devotee, prostrate thyself before me, thou shalt come upto me. I pledge thee my word; thou art dear to me. Abandoning all dharmas come unto me alone

for shelter; sorrow not, I will liberate thee from all sins.” The love of God is the supreme love; union with him, i.e. with the spirit pervading the universe, is the ideal.

Materialism in India (the school called Charvaka) was caused by, for example, “the idealism of the Upanishads unsuited to the commoners, the political and social crises rampant in that age, the exploitation of the masses by the petty rulers”. It arose before Buddhism, around 600 B.C. “But Materialism in Indian philosophy has never been a force. Born in discontent, it soon died in serious thought... Jainism and Buddhism arose immediately and supplied the ethical and spiritual background which ejected Materialism.” Unfortunately the founding text has been lost, so we have to rely on secondary sources.

Some of its doctrines: “perception is the only authority; earth, water, fire and air are the only elements; enjoyment is the only end of human existence; mind is only a product of matter. There is no other world: death means liberation.” The soul is nothing but the conscious body. Death alone is liberation. There is no heaven, no God or soul, nor any being in another world; nor do the actions of the four castes produce any real effect. While life remains let a man live happily, let him feed on ghee even though he runs in debt... All the ceremonies are only means of livelihood for Brahmanas.

Its epistemological doctrine is that perception is the only means of valid knowledge. The validity even of inference is rejected; inference is just a leap in the dark. We proceed here from the known to the unknown and there is no certainty in this, though some inferences may turn out to be accidentally true. A general proposition may be true in perceived cases, but there is no guarantee that it will hold true in unperceived cases. Deductive inference is vitiated by the fallacy of *petitio principii*. It is merely an argument in a circle since the conclusion is already contained in the major premise, the validity of which is not proved. (“Inference cannot be the means of knowledge of the universal proposition—the major premise—since in the case of this inference we should also require another inference to establish it, and so on, and hence would arise the fallacy of an *ad infinitum* retrogression.”) Inductive inference undertakes to prove the validity of the major premise of deductive inference, but induction too is uncertain because it proceeds unwarrantedly from the known to the unknown. In order to distinguish true association from simple enumeration, it is pointed out that the former, unlike the latter, is based on a causal relationship which means invariable association or *vyapti*. *Vyapti* therefore is the nerve of all inference. But the Charvaka challenges this universal and invariable relationship of concomitance and regards it as mere guess-work. Perception does not prove this *vyapti*. (All this anticipates Hume. There is nothing new under the sun.) Nor can it be proved by inference, for inference itself is said to presuppose its validity... Hence inference cannot be regarded as a valid source of knowledge. Induction is uncertain and deduction is argument in a circle. (A certain kind of Buddhism rejects the *ultimate* validity of both inference and perception, but, unlike Charvaka, it accepts their *empirical* validity.) All other Indian schools have criticized the Charvaka position, saying, e.g., that it is itself a product of inference, and that communication and thought are impossible without inference. This debate reminds me of modern debates between empiricism and rationalism, with Laurence Bonjour defending the *a priori*-ness of inference and Michael Devitt denying it, thereby vitiating thought itself.

According to Charvakian metaphysics, everything that exists, including mind, is due to a particular combination of the four elements. Consciousness vanishes when the body disintegrates. “Matter secretes mind as liver secretes bile.” God is not necessary to account for the world. Indeed, both God and values are mere phantoms, social conventions, products of diseased minds, and religion is but the means of livelihood for priests. Sensual pleasure is the *summum bonum* of life. “Can begging, fasting, penance, exposure to the burning heat of the sun, which emaciate the body, be compared with the ravishing embraces of women with large eyes, whose prominent breasts are compressed with one’s arms?” “These fools [i.e., ascetics] conceive that you ought to throw away the pleasures of life because they are mixed with pain; but what prudent man will throw away unpeeled rice which encloses excellent grain because it is covered with the husk?” Sharma thinks that the main reason for Charvaka’s downfall was its denial of all values that make life worth living. Other schools, for instance Buddhism and Jainism, do not believe in God, and some deny the soul, and others reduce the mind to matter, etc., but no others reject all values in favor of absolute hedonism.

Jainism, like Buddhism, originated in the 500s B.C. (The name is derived from ‘Jina’, which means conqueror—conqueror of passions and desires.) Like Buddhism and Charvaka, it rejects the authority of

the Vedas. The Jainas classify knowledge into immediate and mediate. The former includes extrasensory perceptions, such as clairvoyance, telepathy and omniscience; it doesn't include perceptual knowledge, which presupposes the activity of thought—i.e., it must be given meaning and arranged into order through concepts—and so is mediate. Knowledge can also be divided into Pramana, or knowledge of a thing as it is, and Naya, or knowledge of a thing in its relation. (Most of these doctrines, by the way, were elaborated in the Middle Ages, though they may have been obscurely believed earlier.) Naya means a standpoint of thought from which we make a statement about a thing. All truth is relative to standpoints, and reality is “many-sided”. It expresses itself in multiple forms, such that no absolute predication is possible. (Most other schools, of course, believe that reality has only one true nature.) A thing can both exist and not exist in different ways, or it can be describable and indescribable, and so forth. Thus, it isn't contradictory to make contradictory predications of an object because each predication is made from a different perspective.

So Jaina metaphysics is a realistic and relativistic pluralism. Matter and spirit are independent realities; there are innumerable material atoms and innumerable individual souls, and each atom and soul has innumerable—infinite—aspects of its own. To know all the qualities of a thing is to be omniscient. Therefore the Jainas say that he who knows all the qualities of one thing knows all the qualities of all things. (Cf. Leibniz.)

A thing exists independently and is called substance. It persists in and through all attributes and modes (or modifications). Substance is defined as that which possesses qualities and modes. Out of these innumerable qualities of a substance, some are permanent and essential, while others are changing and accidental. The former are called attributes and the latter modes. Substance and attributes are inseparable because the latter are the permanent essence of the substance and cannot remain without it. Modes or modifications are changing and accidental. Viewed from the point of view of substance, a thing is one and permanent and real; from the point of view of modes, it is many and momentary and unreal. Jainism here becomes a theological mean, between Brahmanism and early Buddhism. Brahmanism emphasizes the one, the permanent, the real; early Buddhism emphasizes the many, the changing, the unreal; Jainism points out that these are two sides of the same thing...

(Much of that is Aristotle. The Jainas may have come into contact with Aristotelianism; I don't know.)

Almost all philosophical, ideological and religious differences are mainly due to mistaking a partial truth for the whole truth. Our judgments represent different aspects of the many-sided reality and can claim only partial truth. This view makes Jainism catholic, broad-minded and tolerant. It teaches respect for others' point of view.

Other schools have made the predictable objection that Jainism treats its own viewpoint as absolute. This is the same objection one can make against Sceptics, deconstructionists and relativists of most stripes. It's the paradox of self-reference. Thus, Jainas accuse other philosophers of mistaking relative truth for absolute truth, and they argue that Jainism is the only truly relative philosophy. But if so, then it is partly false. Or, on the other hand, Jainas say it is the only absolute truth—but then it contradicts itself. If relativity is the only truth, how can the Jaina teaching be absolutely true?

The Jainas, the Buddhists and the Vedantins agree that the world is neither absolutely real nor absolutely unreal. But whereas the Buddhists and the Vedantins say that because the world is neither real nor unreal it is indescribable and false, and ultimately is non-different from the Absolute where it is transcended, the Jainas say that because the world is neither absolutely real nor absolutely unreal it is both real and unreal from different points of view. They refuse to go higher... Their opponents argue that if you throw away the Absolute in your zeal to preserve the relative, you lose not only the Absolute but also the relative.

Consciousness is the essence of the self, or soul; its manifestations are perception and intelligence, or simple apprehension and conceptual knowledge. As I implied earlier, the relation between knowledge and its object is external if the object is physical, though not in the case of self-consciousness. In knowing any object the self knows itself simultaneously. [Cf. Kant, Hegel, Sartre.] The universe is brought under two categories, Jiva (conscious spirit) and Ajiva (unconscious non-spirit). Jiva is similar to Atman or the Purusa, except that it means *life*, of which consciousness is said to be the essence. Like the monads of

Leibniz, the Jivas are qualitatively alike and only quantitatively different, and the whole universe is literally filled with them. They are divided first into those that are liberated and those that are bound. The latter are further divided into *mobile*—those with two senses (e.g., worms), three senses (e.g., ants), four senses (wasps, bees), and five senses (higher animals and men)—and *immobile*, which live in the atoms of earth, water, fire and air, and in the vegetable kingdom, and have only the sense of touch.

Every soul, from the highest to the lowest, possesses consciousness, though the degrees of consciousness vary according to the obstacles of karma. Purest consciousness is found in the emancipated souls, which have overcome karma. The soul is coextensive with the body, but really the body and the senses are obstructions placed by karma and hinder the souls in their direct knowledge. Knowledge is not a property of the soul; it is its very essence. Every soul, therefore, can directly and immediately know everything if it is not obstructed by matter. Freedom from matter means omniscience and emancipation.

Ajiva, on the other hand, is divided into matter, space, motion, rest and time. Matter consists of atoms, comparable to those of Leucippus and Democritus.

Karma is what unites the soul to the body. Ignorance of truth, and four passions (anger, greed, pride, delusion), attract karmic matter towards the soul. The end of our life is to remove this karmic dross and regain our intrinsic nature. Hence Jainism is primarily an ethical teaching, and its aim is the perfection of the soul. Since passions are due to ignorance, and passions are what attract the flow of karmic matter into souls, ignorance is the real cause of bondage. Here Jainism agrees with Sankhya, Buddhism and Vedanta. Now, ignorance can be removed only by knowledge. So right knowledge is the cause of liberation. This right knowledge is produced by faith in the teachings of the omniscient Tirthankaras (the liberated souls), so faith is necessary as well. And it is right conduct which perfects knowledge, since theory without practice is empty and practice without theory is blind. Right knowledge dawns when all the karmas are destroyed by right conduct. Hence right faith, right conduct and right knowledge together form the path of liberation.

Jainism is unusual for its extreme advocacy of non-violence, which issues in such practices as straining one's drinks to avoid swallowing organisms and filtering one's breath with a respirator for the same reason. The five virtues are non-violence, truth-speaking, non-stealing, chastity, and non-attachment to worldly things. It appears that Jainas were the first to make non-violence into a rule of life; they also may have been the first vegetarians. Jainism is a religion without a God.

The Jaina believes in reincarnation, of course, and spiritual advance across lifetimes (so that animals can be reborn as humans, women as men, etc.).

Buddhism originated in the sixth century. As everyone knows, Buddha himself was more a teacher and social reformer than a theoretical philosopher. He tended to dismiss metaphysical questions: "Philosophy purifies none, peace alone does." "Two things only do I teach—misery and the cessation of misery." Our duty is to overcome misery, not to philosophize idly.

After Buddha's death there were several Councils convened to establish the canon of the Vinaya, for instance one in 249 B.C. at the behest of Ashoka the Great. The Hinayana sect is distinguished from the Mahayana sect, which emerged later.

One of Buddha's core teachings is the Four Noble Truths: there is suffering (Samsara)—everywhere, even in the midst of pleasure; there is a cause of suffering; suffering can be suppressed, namely if the cause is removed; and there is a way to accomplish this. This way is the Noble Eightfold Path: right faith, right resolve, right speech, right action, right living, right effort, right thought, and right concentration. Buddha's ethical 'middle path' is like the 'golden mean' of Aristotle. Self-indulgence and self-mortification are both ruled out, for the former is base and unreal, the latter gloomy and unreal.

The doctrine of Dependent Origination [or Dependent Co-production] is the foundation of all the teachings of the Buddha; it states that one thing is dependent on another, such that if you master the cause you master the effect. Given this universal empirical dependence, everything is relative, conditional, subject to birth and death and therefore impermanent. It is neither fully real nor fully unreal; all phenomenal things hang between reality and nothingness. All things pass away; nothing can resist death. The vicious circle of causation (and suffering), which has twelve links, ultimately starts with ignorance (which makes possible selfish craving), so it can be destroyed only with the destruction of ignorance. Only through knowledge can

we overcome the ignorance-based *will to be born*. (Life is regarded by Buddha not as a product of the blind play of mechanical nature but as due to the internal urge, the life-force, the *élan vital*, the will to be born.)

All the other teachings can be deduced from the doctrine of Dependent Origination. The theory of karma is based on it, being an implication of the law of causation. Our present life is due to the impressions of the karmas of the past life, and it will shape our future life. Ignorance and karma go on determining each other in a vicious circle. Again, the theory of Momentariness is a corollary of Dependent Origination: because things depend on their causes and conditions, because they're relative, conditional and finite, they must be momentary. To say that a thing arises depending on its cause is to say that it is momentary, for when the cause is removed the thing will cease to be. That which arises must be subject to death; that which dies is not permanent; and that which is not permanent is momentary. The theory of No-Ego, the theory that the individual ego is ultimately false, is also based on this doctrine, for the ego too must be momentary and not as permanent as we take it to be. Similarly with the theory of the unreality of matter.

Hinayana, a religion without a God, emphasizes self-help: the individual has to work out his salvation for himself (because Buddha taught his disciples to "Be a light unto thyself".) Its goal is the negative one of the extinction of misery. Mahayana, on the other hand, is less egoistic and negative; it believes that Nirvana is not the cessation of misery but a positive state of bliss, and its ideal saint is the Bodhisattva, who defers his own salvation in order to work for the salvation of others. In this sect Buddha is transformed into God and worshipped as such. He is identified with transcendental reality; he is the noumenon behind the phenomena, the Absolute Self running through all individual selves. The Bodhisattva is he who attains perfect wisdom and is so full of love for others that he works and suffers for their sake. The Mahayana religion has more missionary zeal than the Hinayana; it is more progressive and dynamic.

The original teachings of Buddha were not incompatible with the Upanishads—for instance, he emphasized Atman, the Great Self, and encouraged people to act under the light of that Self, to seek union with it—but his early Hinayana disciples (of the Sarvastivada, or Vaibhasika, school) changed that. In this school, the so-called soul is reduced to a series of fleeting ideas, and matter is nothing more than momentary atoms of earth, water, fire and air. Existence is an endless stream of becoming [cf. Heraclitus], and liberation is the extinction of desires and passions. There is no substance, no 'thing' which changes; only change itself. Similarity in things is mistaken for identity or sameness; a flame, for instance, is actually a succession of many similar flames, each lasting a moment. "The life of a living being lasts only for the period of one thought. As soon as that thought has ceased, the living being is said to have ceased." Buddha himself denied the ultimate reality of the empirical self but accepted its empirical reality: the soul is a bundle of matter, feeling, perception, disposition and consciousness. 'The soul' doesn't exist, only this aggregate of the body, the sensations and ideas.

Hinayanism admits action without an agent, transmigration without a transmigrating soul. It is the 'character' that transmigrates, not the 'soul'. Karma is an impersonal law which works by itself, not needing any agent or soul to cling to, as in Jainism. Nirvana is annihilation, the cessation of all activities and all becoming.

One Hinayana school believes in direct realism and may be called presentationist, while another believes in the 'copy theory of ideas' and may be called representationist. According to the first (Sarvastivada), external objects are directly known in perception; according to the second (Sautrantika), external objects are not directly perceived but are indirectly inferred. We do not know things-in-themselves; we know only ideas, which are copies of reality, and from these copies we infer the existence of the originals. The Sarvastivada responds that if we don't know the originals, we can't even say that our ideas are copies. (Cf. Berkeley.)

An ancient criticism of the Hinayana sect is that, if everything is momentary—if there is no self, or in each moment a new self is coming into existence—then the ethical theory of Karma is impossible. Bondage and liberation are impossible. Why should a person try to overcome suffering if he and his suffering will vanish in the next moment? Hinayana answers by saying that the preceding link does not perish before transmitting its content to the succeeding link and so the continuity is never broken. The successor bears all the burden of the predecessor. Etc.

As I read about Mahayana schools I'm struck by a single recurring theme: everything is unreal. Everything is relative, conditional, mere appearance. Even Nirvana is said to be mere appearance by some thinkers, and change is unreal, and everything is unreal! "Life is a dream", as Calderón said. Other schools deny the reality of everything except consciousness, so that even external objects depend on consciousness. Idealism is obviously the philosophy of choice for most Indian thinkers.

There are also a number of orthodox schools, so called because they take their inspiration directly from the Vedas, unlike Buddhism, Charvaka and Jainism. They were founded in the Hellenistic age or a little earlier. (Vedanta, Yoga, Nyaya, etc.) "All the systems accept the view of the great world rhythm. Vast periods of creation, maintenance and dissolution follow each other in endless succession." All the schools, too, aim at the practical end of salvation. "The systems mean by 'release' the recovery by the self of its natural integrity, from which sin and error drive it. All the systems have for their ideal complete mental poise and freedom from the discords and uncertainties, sorrows and sufferings of life."

—Well, my summaries weren't great, but I'm tired. I'm not really interested in these philosophies for their own sake anyway, but only as manifestations of the human spirit and symptoms of a caste-ish social organization. It's fun to take a panoramic view of history and philosophy and see how the mind objectifies itself, and how similar are its objectifications across cultures. What will the following centuries, and millennia, bring? Will most of these philosophies, from Roman to Greek to Indian to Chinese to modern European, die out, or will they exist until the end of the species? What more can be said in these realms? I suppose that since the Hellenistic age it's been mostly a refining of thought-systems already invented, and that this refining will go on forever.

(Well, in philosophy that may be true, but probably not in economics and sociology and psychology. Totally new developments have occurred in these areas. But maybe this second Hellenistic age of the past five hundred years will end up being the last one, at least when it comes to the creation of original systems. For a qualitatively higher level, or rate, of material progress is surely not possible; and it was the exceptional growth-rate of capitalism that made possible Marxism, psychoanalysis, modern science, economics, etc. [by making possible industry, demographic growth, modern urbanism, and so forth]. Capitalism, at least on this scale, was thoroughly new; but a comparably dynamic system will never again be new. If it happens again, which it may not, it will take a form similar to modern capitalism. So how can truly original thought-systems ever arise again?)

December 23 etc.

Listening to *Les Misérables*. Soul-weeping.

What a mystery it all is. Nothing makes any sense, nothing is harmonious. The world is out of joint.

Wonder is beautiful, nothing is more beautiful. But I need rest, I need a break from wonder.

The chief virtue of Hegelianism is its beauty, its grandeur. It is a remarkable vision.

Writing is a substitute for love. I write and I wait.

Those thoughts at the end yesterday were naïve. What was I talking about? "Truly original systems"? Nothing is wholly original; everyone builds on the past. As for partial originality, I myself have come up with a great many partially original ideas—that is, ideas as original as almost any others in the last two hundred years. (My thoughts on ontology, for example.) That proves it can still be done. Even "original" systems, like Freud's, consist partly of corrections of previous theories. And in some ways Freud was anticipated by earlier thinkers, who themselves were anticipated by others. Few things are ever truly new, and yet progress happens all the same. That's the paradox.

Reading *Economics Explained: Everything You Need to Know About How the Economy Works and Where It's Going*, by Lester Thurow and R. Heilbroner. Taking a break from Sherman and Evans' book.

Reading *The Teachings of Don Juan: A Yaqui Way of Knowledge*, a famous book by Carlos Castaneda.

December 29

Castaneda's book is dull. Empty and repetitive. Its main idea seems to be that strange things happen when you're high on mescaline and mushrooms. (Surprise!) No wonder it was so popular in the 1960s. Castaneda himself comes across as a witless child, a child who asks his "benefactor" question after question in the most stupid and naïve way, without self-consciousness or humor.

My parents bought me a subscription to *The New York Review of Books*, so I'll be reading that every month. The articles are sophisticated and informative.

I was in a terrible half-suicidal mood earlier tonight until I decided to re-begin the attempt to get published. About six magazines are going to publish a few of my poems and short articles, but I want more, so now I'm going to try to publish a poetry collection. So I sat down and chose fifty of my poems and arranged them carefully in order. I'll mail them next week.

For days or weeks I've been trying to think of something to write, something that could get published, be it an essay or a short story or a book. But my writer's block is as bad as it's ever been. It's maddening. I have an itch to write but I can't scratch it.

I'm reading Rousseau's *Discourse on Inequality*. It's a pleasure to read something that hasn't been "corrupted" by the contemporary world.

I'm tempted to think that somehow the human psyche has two parts, and it's this division that is ultimately responsible for our restlessness in civilized conditions. For in these conditions, the two parts 'separate' far more than they can in primitive societies, and then we're constantly trying to bring them back together. But that's impossible (in the individual's case) once the damage has been done. The two parts I'm talking about are, first, the part that desires and is satisfied by immediate recognition—recognition from the people one has immediate contact with, such as family and friends—and, second, the part that desires a more abstract, universal recognition, or a union with the world as a whole (as opposed to merely with one's immediate community). This second part hardly exists until societal differentiation emerges, and it comes to dominate as "reification", or its "objective correlative",¹ viz. social stratification and differentiation, intensifies over the course of history. Once upon a time people were not restless; they were perfectly happy in their little tribes and villages, secure in their comfortable traditions, and they didn't have the need to be loved by a God or by some comparably universal entity, like the whole human species. (The desire for fame is closely related to the desire for God's love. The two are manifestations of the same psychological restlessness.) If there was any religion back then it was animism, which has a very different basis and serves very different purposes than monotheism. (Ironically, animism is probably a more purely 'intellectual' set of ideas than monotheism. It's a way of imposing intellectual order on all the phenomena of nature, while monotheism is more 'affective' than 'cognitive'. It's a symptom of primitive alienation, a strategy for healing the phenomenological rift with the immediate community, while animism is practically the opposite.)

Then civilization happened. The first 'part', or 'capacity', I've referred to continued to assert its claims, and it will always do so, because humans need immediate, concrete affection and respect. That's a fact of our biology. But now the second capacity came into existence, in reaction to the destruction of mankind's original simplicity, the homogeneity of its communities. People became obscurely aware of a more generalized Other than before, and correspondingly they felt driven to seek recognition from this other, just as they had always sought recognition from their families etc. —Evidently the basic human urge is to overcome all separation between self and other; this is what 'recognition' means. The more

¹ T. S. Eliot's word, which he used in a totally different context.

generalized, or reified, is the other, the harder it is to achieve union (i.e., to overcome restlessness), because in the case of the concrete other—which is another human being—there is a direct give-and-take, an immediate *certainty*, while a mere idea (a reification) cannot stimulate or respond or provide certainty. In pursuing fame one is pursuing recognition by an idea, namely the idea of ‘everyone’; but an idea is not active, it cannot recognize. So one is doomed to disappointment, even if one does succeed, miraculously, in securing everyone’s love. There will always be that *concept*, that generalized Other, which can’t be conquered.

Anyway, as civilization evolves, people become more (half-consciously) aware of their separation from others, and the idea of an abstract Other sinks deeper into consciousness. Psychological restlessness, the compulsion to *succeed* and *conquer* and so forth, gets worse and worse, even as it becomes more and more impossible to satisfy. It is this that explains (from the subjective side) the dynamism of certain societies. People still seek and achieve love from concrete individuals, but this no longer satisfies them; they need more, they need to *succeed on the world-stage* (professionally or whatever). It’s quite poignant, if you think about it—like a dog chasing its tail, but infinitely sadder. These unfortunate civilized people are leading such restless lives only because they crave approval from that little idea in their head that isn’t really an idea per se because it’s so essential to their consciousness; it’s more like a second self, it’s really a *part* of them, but an abstract part, like a structure in their consciousness, which is why they’ll never satisfy it, or themselves. (It isn’t, by the way, the ‘second part’ or ‘capacity’ I mentioned above.)

So actually it isn’t quite right to say there are two parts to the mind, at least if you take that idea literally. There are simply two different kinds of recognition that civilized people seek: the concrete kind and the abstract kind. Or, rather, ultimately we seek only *concrete* recognition (because that’s the only kind that exists and makes any sense), but that has become split into two parts, one of which is feasible and the other of which is impossible, indeed self-contradictory.

I’d continue but I’m tired.

December 30 etc.

The reason that thinkers and artists get attached to the idea of posterity and feel as if they’re creating for this abstract thing is that it gets identified with the generalized ‘idea’ of the Other. The two ideas have a lot in common, after all.

I understand why Marx wasn’t a fan of Rousseau: the *Discourse*, at least what I’ve read of it, is amateurish and un-Marxian. (Granted, he lived in an amateurish and un-Marxian age.) Rousseau thought that man isn’t naturally a social animal! In the state of nature people have no need of one another, they live in solitude! The whole of Part One is quite silly. And Rousseau’s whole way of thinking is very one-sided. ‘Civilization is bad, progress is bad, evil abounds.’ He was a pessimist, while Marx was an optimist. That’s the difference between them in a nutshell.

On New Year’s Eve I went to a bar, a party I’d heard about. Met a pretty girl (who’s a financial auditor—ugh) and her less pretty friend, spent most of the night talking to them. The pretty one (Kelly), who’s my age and seems to have a good head on her shoulders, took an immediate liking to me; asked me suddenly in the beginning of the night if she could see me again sometime. “I hope this doesn’t sound too forward, but...” Wow, “too forward”, what an oxymoron. How refreshing it is when women stop playing their little games and speak their mind! Anyway, at midnight we kissed. A lot. Not the politest thing to do in the middle of all those people, but I sure didn’t give a shit. It was a good way to start the new year.

Also, a Chinese girl I’d taught for one day a few months ago, when substitute-teaching, called me in honor of the new year. She went back to Hong Kong long ago and I thought I’d never hear from her again—after she left I was furious at myself for not having arranged to see her one last time, for the sake of ‘closure’ (because we were friendly for a short while). So it was very satisfying to talk to her.

John Field’s nocturne in E-Flat (the longer one) is miraculously gentle and sweet, and I love it.

I have a good feeling about this year. It's the first day of the new year, it's raining quietly outside on the snow, I'm listening to music I love, last night I met a nice girl, and life is sweet. I'm sending emails to friends now, spreading the love. I'm going to try to improve myself a little this year, be a little less bitter in my journal and my thoughts.

I forgot that Rousseau was a conspiracy theorist. He thought that laws and lawful government had arisen when the rich deceitfully proposed a social contract to everyone else as a way to end the war of each against all that had been the end-result of the establishment of property. It was deceitful because the rich, apparently, were clever enough to know it would mean their perpetual dominion over society, while everyone else was too stupid to see this.

Here's a summary of Rousseau's view of human history. "The development of human society is seen as passing through a series of revolutions: (1) Man, originally idle, discovers the utility of work and of collaborating with other men in such activities as hunting. (2) Man learns to build himself a dwelling and this transforms a solitary being, who had neither settled mate nor known offspring, into a family man and a patriarch. This period Rousseau considers the 'golden age' of the human race. (3) Men, by a 'fatal accident', discover the division of labor, which leads them to pass from a subsistence economy to a productive economy. Agriculture and metallurgy have the ruinous consequence of enabling men to produce more than they need for immediate consumption. Then they quarrel about what is left over. (4) Agricultural man can protect the produce of his labor only by enclosing the land he has planted. So he proclaims himself proprietor. But in the absence of a system of law, he has possession without rightful property, and here Rousseau joins Hobbes in envisioning a 'horrible state of war' of each against all. (5) In order to escape this state of war, men accept a 'social contract' devised by the rich to ensure peace for everybody and rightful ownership for those in possession, a 'contract' which the poor, desiring peace, are swindled into accepting. This produces, with civil society, the institution and enforcement of law."

January 2, 2008

It's sad that Kelly would probably not have looked upon me so favorably had I not worn those nice clothes and the brand-new \$90 shoes I'd bought for myself after talking to girls who insisted my old shoes were absolutely unacceptable. Clothes, especially shoes, make all the difference when it comes to picking up women.

It's also sad it took me so long to see the light. Is it just a coincidence that the first night I dress really nicely with classy shoes is the first night I have success in a bar? Oh, the follies of youth!

But now I'm entering manhood, the prime of life. My gaze is directed forward, not backward.

Here's another, somewhat similar 'two parts' theory, or rather fact: part of me, the deeper and more primitive part, is very happy that this girl is giving me an immediate sort of affection. It's an intuitive, immediate satisfaction I'm experiencing. But the other part is cynical and doesn't care much, for a variety of reasons. (It won't last, she isn't quite 'adorable' enough, whatever.) This second part is a cultural accretion, a corruption of my original nature.

January 4

Reading (skimming) Bertrand Russell's *The Conquest of Happiness* (parts of it). I was curious about his thoughts on the subject. They're sensible, predictably, though not profound. The point of his book, simply stated, is to answer the question "What can a person in the midst of our nostalgic society do to achieve happiness?" "My purpose is to suggest a cure for the ordinary day-to-day unhappiness from which most people in civilized countries suffer, and which is all the more unbearable because, having no obvious external cause, it appears inescapable. I believe this unhappiness to be very largely due to mistaken views

of the world, mistaken ethics, mistaken habits of life, leading to destruction of that natural zest and appetite for possible things upon which all happiness, whether of men or animals, ultimately depends.” His position, then, not surprisingly, is idealistic in the anti-Marxian sense: he blames unhappiness on “mistaken views, mistaken habits”, rather than objective social conditions. He emphasizes consciousness and ideologies over social being.

I don’t understand why it is always so hard for intelligent people to accept the common sense of Marxism. Russell doesn’t, and therefore he writes silly passages like the following (which is the conclusion of a chapter in which he argues that people are too preoccupied with competition, with the goal of outshining everyone else).

The trouble does not lie simply with the individual, nor can a single individual prevent it in his own isolated case. The trouble arises from the generally received philosophy of life, according to which life is a contest, a competition, in which respect is to be accorded to the victor. This view leads to an undue cultivation of the will at the expense of the senses and the intellect. Or possibly, in saying this, we may be putting the cart before the horse. Puritan moralists have always emphasized the will in modern times, although originally it was faith upon which they laid stress. It may be that ages of Puritanism produced a race in which will has been overdeveloped, while the senses and the intellect have been starved, and that such a race adopted a philosophy of competition as the one best suited to its nature. However that may be, the prodigious success of these modern dinosaurs, who, like their prehistoric prototypes, prefer power to intelligence, is causing them to be universally imitated: they have become the pattern for the white man everywhere, and this is likely to be increasingly the case for the next hundred years. Those, however, who are not in the fashion may take comfort from the thought that dinosaurs did not ultimately triumph; they killed each other out, and intelligent bystanders inherited their kingdom. Our modern dinosaurs are killing themselves out. They do not, on the average, have so much as two children per marriage; they do not enjoy life enough to wish to beget children. At this point the unduly strenuous philosophy which they have carried over from their Puritan forefathers shows itself unadapted to the world. Those whose outlook on life causes them to feel so little happiness that they do not care to beget children are biologically doomed. Before very long they must be succeeded by something gayer and jollier.

Competition considered as the main thing in life is too grim, too tenacious, too much a matter of taut muscles and intent will, to make a possible basis of life for more than one or two generations at most. After that length of time it must produce nervous fatigue, various phenomena of escape, a pursuit of pleasures as tense and as difficult as work (since relaxing has become impossible), and in the end a disappearance of the stock through sterility...

Such racist dreck is the product of a poor sociological imagination, which doesn’t understand that social structures, material social relations, are mainly what explain a society’s adoption of given philosophies of life.

A lot of what Russell wrote was wonderful and refreshing. Only an idiot would deny that. But whenever he undertook sociological analysis he was shallow. In the end, most of his books are good for light reading and that’s all. They don’t ‘challenge’ the reader, at least any reader with intelligence.

More interesting is Hans Furth’s *Piaget and Knowledge: Theoretical Foundations*, which was glowingly reviewed by Piaget himself.

...On second thought, Furth’s book is a little tedious. Besides, I’m not very interested in the details of Piaget’s system. I just like that his research supports my Kantian, Chomskian intuitions. [Actually, Piaget was arguably more of an empiricist than a rationalist—and certainly much less of a rationalist than Chomsky. He was wrong about *a lot*.]

Also skimming Stuart Sim’s book *Georg Lukács*, which is a critical overview of his works.

There are too many books in the world. Too many people and too many books. A person like me feels he has to read every relevant book, but that's impossible. In any case, the more you read, the harder it is to create.

Computers, too, are bad for creativity, I'm starting to think. I feel somehow 'impure', and creatively impotent, when I spend a lot of time writing on my computer.

Ranjana and I had a falling-out in December. It was mostly her fault, but she sent a sweet apology for her self-centered behavior, in which she cursed herself for (as she said) having destroyed the chance at a meaningful friendship, and I couldn't be angry at her. So in honor of the new year I decided to try to start our friendship again. Hopefully we'll meet in a week or two.

January 6

Somebody reviewed one of the essays I submitted to journals. That was nice of him. Here are his comments:

Review comments on "Why are we Westerners unhappy?"

The essay is a sharp and well-written critique of commodification and its alienating effects in Western societies. With the use of fundamental categories of community atomization, alienation of labor, fetishism, money, and exchange, the author analyzes the psychological consequences of social life under the conditions of capitalism. Updated slightly from Marx's original analysis, the author also considers Frankfurt-style reflections on the culture industry and the production of (false forms of) happiness, culminating in a "fame" impulse (which, it should be noted, is resolved in Web 2.0 applications such as Facebook). The author concludes with a moderate utopian speculation after the end of scarcity and the "withering away" of money.

A number of concerns do arise, and points for further reflection. The author develops an analysis of "the they," the abstract other which is the personified social system. This of course echoes Heidegger's analysis of *das Man*, or Marcuse's reflections on "the Man". But it is also in tension with the concern most readers will have early in the essay, which is that the "we" is as much an alienated personification as is the "they." The use of "we westerners" is fundamentally overdetermining, since the phenomenology of westerners is differentiated geographically, historically, linguistically, and by many other social features. This problem of who the "we" is, then [—a problem irrelevant to the main argument of my paper—], is compounded by the contrast with the "them", which turns out to be "primitive" or nonwestern societies. Here, the author makes a crucial mistake, which is to posit "primitivism" in an untouched or natural state, to which "mankind" ought not "return." Surely, the author can see that this imprints "natural man" with a pre-civilized aura [yes; so?], and locates "mankind" in the realm of the western or social [?], and thus reinstates the fundamental colonial mindset back within the critique of commodification.

The author also offers an overly general notion of happiness versus anonymity. The dysfunctionality of contemporary capitalist society is intertwined with forms of happiness—the stress, dehumanization, and atomism described by the author are not a universal experience; just as the so-called New York attitude is hardly generalized, even in New York! One can find "fuck you's" in many places at many times, and finds such in New York more often in the movies than in real life.

Ultimately, the author should (1) consider which of numerous philosophers and theorists in the tradition of post-Marxist cultural pessimism—Adorno and Marcuse, Baudrillard and Dubord, Althusser and Foucault, Mumford and Martin—s/he wishes to follow, or at least incorporate some reflection on developments in theories of commodity fetishism and alienation, and (2) decide what precise scholarly contribution s/he wishes to make. An application of Marx's analysis of capitalism, or at least parts of it, is what one might call inherently good; however, to be publishable, it should affect some theoretical advance or transformation, or identify some underthematized phenomenon within capitalist society.

I ought to read more of those theorists he mentions. I've never read them seriously.

That's what I need, by the way, that feedback. If my writings are still rough, it's because I get no feedback.

That reviewer has inspired me. I'm going to focus my energies for now on this sort of cultural criticism. Until I can go to the library tomorrow I'm reading papers online, for instance Adorno's "Culture Industry Reconsidered" and Axel Honneth's "Reification: A Recognition-Theoretical View". I'm not a fan of Adorno's turgid writing, which seems to disguise a relative philosophical emptiness.

I know this is all masturbatory, but I have nothing better to do. Why is it masturbatory, though? Not because of any essential pointlessness in the subject matter, but because all intellectual activities are vitiated by the social organization of late capitalism. Even the creation of art and literature has become masturbatory in the context of this society.

If commodification is the main problem, then I ought to write a paper called "What is commodification, and why is it bad?" One has to get clear on the essentials.

Notes to self.— Why is contemplation, reflective detachment, unhealthy? How is it related to reification, recognition, selfhood? It is symptomatic of a reified, alienated attitude, and various dualisms. It is in a way "inauthentic", a pose. Self-consciousness is a division between self and other and as such is unhappiness, restlessness. (Happiness is an important concept for the theorist because it signifies the 'natural' state of the individual, the harmonious state to which psychic activity is always tending in some way or other. Granted, some kinds of unhappiness are totally natural; but the 'restless' or 'bored' kind, the unhappiness of modern self-consciousness, is not.)

You can get a sense of the degree to which experience is synthesized by the brain when you read a word wrongly. (I may have written about this phenomenon a year or two ago.) Like if the phrase "...the totality of..." is printed in a book but you read it as "...the tonality of...", you can see that the brain has just (mis-)created your reality. When I reread the sentence I can clearly remember *seeing* the word "tonality" the first time, even though now I see the word "totality". The 'n' was there, and now it's not. But it couldn't have been objectively there; as the letter 'n', it must have been a subjective creation. How unnerving that is! Reality as experienced exists only in consciousness, even though it seems to be wholly objective and external. But the *real* external world, the world of physics and chemistry, is radically different from the experienced world. We are prisoners of our minds, permanently outcast from reality as it is in itself.

There's a whole other world just beyond the tip of my nose, but I haven't the faintest idea what it's really like!

January 7

Writing a paper. I feel creatively mediocre. My mind works slowly.

I wonder if this is the beginning of the end of my mental powers. I don't feel as 'fresh' as I used to.

It would be so much easier if I had a good memory!

From Honneth's essay— (this is for me, not you)

... We assert nothing less than that the human relationship to the self and the world is in the first instance not only genetically but also categorially bound up with an affirmative attitude, before other more neutralized orientations can subsequently arise. We can connect up with our guiding topic by pointing out that the abandonment of the originally given affirmative stance must result in a stance in which the elements of our surroundings are experienced as mere objective entities, as objects that are “present-at-hand.” “Reification” correspondingly signifies a habit of thought, a habitually ossified perspective, which, when taken up by the subject, leads not only to the loss of its capacity for empathetic engagement but also to the world’s loss of its qualitatively disclosed character. Before I can further pursue the question of whether this clarification could allow us to continue to employ the concept of “reification” today, I must first attempt to justify its foundational premise—that is, the assertion that the attitude of care enjoys not only a genetic but also a conceptual priority over a neutral cognition of reality. I intend subsequently to reformulate this assertion by cautiously replacing the Heideggerian notion of “care” with the originally Hegelian category of “recognition.” In this way I believe it is possible to justify the hypothesis that a recognitional stance enjoys a genetic and categorial priority over all other attitudes toward the self and the world...

See also pp. 111 ff. The whole essay is good.

I hate computers! It’s their fault! It’s all their fault! I have to not look at my computer for months before I’ll be able to write again.

And I want to study philosophy, not history! Damn it, damn it, damn it!

In Gorky’s Russia, the mean-spiritedness of everyone was right on the surface, for all to see. In contemporary America, the mean-spiritedness is no less real; it is only less obvious. I’ve often had that feeling, as if everyone is nasty and mean just below the surface, and the nastiness comes out through the slightest provocation. Especially in pop culture (and politics); that’s when it’s really bad. Pop culture is a gigantic edifice built on the rock-solid foundation of human pettiness and envy.

January 9

Met Rebecca, Kelly and her friend last night for an Ethiopian dinner and a jazz club later. The upshot of the evening was that I went to Kelly’s apartment and pelvis-pounded her. But I’ve decided I’m not interested in her: our personalities aren’t wholly compatible. She gets too defensive, too sensitive, too dramatic, and we seem to have too little in common.

The pride of men who sleep with lots of women is brutish. It doesn’t give me great pleasure that I have another notch in my belt, because...who cares? The pleasure is purely negative: knowing that a girl wanted to sleep with me entails a lessening of my former insecurity. But there is no *pride* in its place.

As for the sex itself...sex is sometimes a bit boring. *She* certainly enjoyed it (“You’re amazing!”), but, well, to quote David Foster Wallace: what a writer wants to say after sex is, “Was it as good for me as it was for you?”

As for the pride of men who *please* women in bed, that’s stupid too. It’s stupidly easy to please a woman. All you have to do is be tender at first, then heat things up, then slow down, etc. It’s mindlessly easy.

Reading *Adorno: A Guide for the Perplexed*, by Alex Thomson. (The Boston Library doesn’t have any of Adorno’s main books. It’s quite a bad library, to be honest.) I’m not impressed with Adorno. Continental thinkers literally thought it a virtue for their work to be unclear, anti-systematic, imprecise: it meant they were mirroring the “dialectical” nature of reality. Morons. That word “dialectic” has in the last

hundred years been used to justify the most egregious philosophical sins—sheer intellectual laziness. When these thinkers have actual thoughts, moreover, the thoughts aren't very interesting or original.

“The philosopher,” says Thomson, in the voice of Adorno, “should not pretend to be able to provide a clear and rational explanation of the world, since the attempt to impose such patterns on the world is bound up with man's violent domination of nature.” What! That's sheer nihilism! “Adorno's interest in dialectics means that he sees identity as relational. Concepts are not clearly distinct logical entities, but mobile and slippery forms for apprehending reality, whose interactions are always evolving. Rather than seek to freeze this moment, the form of the essay should try to imitate it.” That's a false dichotomy: either “freeze” reality in a simplistic and ahistorical way or write in a philosophical stream of consciousness. Neither option is good, or necessary. The best way is to define your terms carefully, argue carefully, and, if it's indeed true that concepts are always “evolving”, explain carefully how they evolve. In any case, the clearer your concepts are, the more philosophical content there is in your arguments. Even Hegel understood that, what with his “*determinatio est negatio*”.

As for the concept of the dialectic, with which Adorno, like so many European thinkers in the first half of the 20th century, seems to have been obsessed, it's fairly empty and commonsensical. What is Marxism's “dialectical theory of history”? Thomson gives an adequate definition: “the idea that history progresses through conflicts between different social forces, the resolution of which generates new antagonisms”. Yup. That's the dialectical theory in a nutshell. Magnificent, isn't it? Dialectics means—development through conflict. No wonder it so appealed to European philosophers: it's as empty as their philosophies.

Most of the individual's spiritual and intellectual desires are ultimately a reaction against the primacy of the “generalized other” (not really in Mead's sense), which is a part of consciousness and thus makes impossible a full achievement of the concrete recognition that humans, as humans, desire. Only when we were not far removed from animals did we have no need for “certainty”—precisely because life itself was “certain”. With self-consciousness, or the generalized [general, abstract] other, came all kinds of uncertainty,¹ which we have been unsuccessfully trying to remedy ever since. Culture itself—*civilization* itself—is an unconscious strategy for doing so.

(Against Freud in *Civilization and Its Discontents*. Good starting-point for more thinking.)

I should read more G. H. Mead. He was a real thinker, unlike the Continentals.

January 11

One of the reasons I dislike reading twentieth century philosophy is that it stinks of rotten elitism. It respects the authority-structures of the bourgeois world, the academic power-structures and the whole fame-game, even as it tries to rebel against bourgeois culture. The vast majority of even the famous thinkers, not to mention the hordes of puny scholars, have been incorrigible snobs, just like the bourgeoisie. Personally I'm more inclined to look for original insights—and intellectual enthusiasm—in the essays of talented undergraduates than in the writings of established authors, who have been indoctrinated into conformity.

In the same way, I respect and enjoy children more than adults, because children are more profound. They can see eternity in a grain of sand.

Reading *Habermas: A Very Short Introduction*, by J. G. Finlayson.

After you've looked at a philosopher's photograph it's hard to take him seriously. Almost invariably he looks commonplace, with a flabby, ugly, weak face. (The exception is Karl Marx, who looked like Moses. [Chomsky is another exception.]) Horkheimer, Adorno, Heidegger: silly self-deluded uglarians.

¹ Indeed, real “certainty” is nothing but un-self-consciousness. In a self-conscious being it is, strictly speaking, impossible.

There is one reason why nobody is what he thinks he is: luck. Luck determines destiny. (Not entirely, though.) [But remember it's *luck* what genes you have and *luck* where you're born and whom you're born to, etc.]

From what I've read, it seems like Adorno and Horkheimer confused capitalism with "enlightenment". They criticized the whole mindset of "enlightened" thinking, the rational and scientific mindset—the instrumentally rational mindset in particular, which they saw as the paradigm—for having furthered man's drive to master and control his environment, both nature and his fellow men. Rational thinking, then, through its applications in technology and industry, has engendered irrational forms of domination, ultimately manifested in Nazism. "As industrialization and capitalism took hold in the 19th century, human beings were subjected to ever more pervasive networks of administrative discipline and control, and to an increasingly powerful and untamable economic system. Instead of liberating man from nature, the process of enlightenment imprisons man, who is himself a part of nature. Instead of economic plenty, there is misery and poverty. Instead of moral progress, there is regression to barbarism, violence, and intolerance. This is the 'dialectic of enlightenment' that informed Horkheimer's and Adorno's understanding of their social world..." "Enlightenment is both necessary and impossible: necessary because otherwise humanity would continue hurtling towards self-destruction and unfreedom, and impossible because enlightenment can only be attained through rational human activity, and yet rationality is itself the origin of the problem." No, no, no! This whole analysis is pre-Marxist, idealistic, one-sided. Jacob Bronowski was right: it isn't science and technology in themselves that are the problem, as most people think; it's something more fundamental. He said it was arrogance, ignorance and the desire for absolute certainty that had led to Nazism, and he was partly right. But equally, or more, important is the commodified, bureaucratized, coercified system of social relations. The scientific ideas and practices in themselves are *not* the problem! They're a problem only in the context of capitalism. How could A. and H. not have understood this?

Even admirers of Marxism fall victim to idealism!

"Domination and mastery are very close cousins of rationality. Not only science and technology, but rationality itself is implicated in domination." What is "rationality"? In itself it's an empty idea; it has no content outside a specific set of social relations, i.e., its practical manifestation. Do A. and H. equate it with *instrumental* rationality, or means/end reasoning? Okay then, sure, there is an element of "domination" and "mastery" in all means/end reasoning. But these concepts are not bad in themselves, as if they *inherently* tend to be realized in harmful, or even potentially harmful, ways. Whether an idea or an abstract method has harmful consequences depends on the dynamics of the society in which it is realized; and no social structure can be blamed on a set of ideas or an abstract scientific method. If scientific thinking has indirectly had horrible consequences in capitalism, it is not because of an intrinsic "dialectic of enlightenment"; it is because of the dialectic that enlightenment has manifested *in capitalism*.

Even if A. and H. would have, in the end, agreed with me, their framing the problem in terms of *enlightenment* rather than *capitalism* was gigantically misleading. (Nihilistic, too.) Enlightenment means a very broad set of ideas and thought-patterns, which can be realized, in more or less adequate ways, in any number of possible societies; capitalism means the actual material practices, the *real basis*, of a civilization that has committed by far the worst crimes in history. The real villain is the latter, not the former.

I guess I was right about Kelly. I could tell she had a nasty, spiteful, insecure side even before she wrote that rabid email. But something good came of it: it led to more insights on the relation between everyone's desire to be considered valuable and the generalized other. (I wish there were a better word than "generalized other", since Mead meant something different by it, but it's so perfect that I have to use it.) I saw that insofar as I was affected by her email, it was because I unconsciously thought of its attacks as judgments from the *generalized* [or *abstract*] other rather than simply a single pitiful individual. That is, if we're talking about the restless desire for self-esteem, which, as I said earlier, is a fairly recent product of historical evolution (like the truly generalized other itself), the opinions of one person *qua* one person—one external being among all external beings—cannot hurt; that's not how this part of the psyche works.

Rather, the judgments of one person can hurt your self-esteem only to the extent that that person is unconsciously thought of as an instantiation of the generalized other. This is, indeed, how a given person makes his way into your psyche, how your psyche ‘appropriates’ him; this is the link between him and you (as well as the source of the ‘separation’ between you, the otherness that comes between you). He becomes a part of you—i.e., is important to you—insofar as you unconsciously (or half-consciously) identify him with the generalized other, which is itself directly a part of your self-consciousness, i.e., of you yourself. As I said a few days ago, this other isn’t so much a mere concept as a fundamental feature of the phenomenology of self-consciousness. It isn’t ‘*out there*’; it’s *in you*. You are a particular being, your self-consciousness is particular (individual) and private, only because it exists against the phenomenologically abstract coloring of this generalized other; its particularity is contrasted with the generality of the other, and this is precisely how your self-consciousness is able to exist. *Determinatio est negatio*. Insofar as there is differentiation, there is determination. You would not be the private self you are if there were not in your consciousness a generalized, ‘universal’ other with which you at all times implicitly contrasted yourself; and this is why the private self—i.e., the implicit consciousness of privacy—did not exist in prehistoric times in the way it does now (namely, because the generalized other did not yet exist in its fully developed form). We’re never really aware of the generalized Other as we are of ourselves, but it is there all the same. It has to be. Otherwise self-consciousness wouldn’t make sense, since a *contrast* is necessary for it to exist. It presupposes negation; it *is* a negation, namely the particular’s negation of (or opposition to) the general. The meaning of existential restlessness, the undying quest for happiness, the desire for recognition—the meaning of this is the particular trying to abolish the general in itself, the generalized other, which prevents consciousness from being identical to itself. We’re always trying to incorporate the Other into ourselves, to make it coincide with us by securing its absolute approval. That’s the psyche’s method for reducing the otherness of the other: it seeks recognition of its sense of self, its self-conception.

Because the generalized other didn’t exist in its modern form in Paleolithic times, there was less consciousness of separation between people—but also, paradoxically, less potential for real ‘intimacy’ between them. Since selves were not as private as they are now, the appropriation, or incorporation, of another self in one’s own could not go as far as it can nowadays. In other words, since the generalized other did not have the phenomenological primacy it has now, there was not such an opportunity for identifying a given person with the Other in oneself. And so one took up others into oneself less than one does now. There was, of course, less of a need to also, since the psychic wound that is self-consciousness, in being less painful, did not so need to be soothed.

I got off track there. I was discussing the mechanics of internalizing another human being, and then I went off on that long tangent. One of the things I wanted to say is that, given all these ideas, when you feel the need to defend yourself against someone who has criticized you you’re not, on the most basic level, arguing directly against *him*; you’re arguing against *yourself*. His criticisms have seeped into you, ‘gotten under your skin’ by being associated with the generalized Other,¹ as if the Other itself has made these criticisms or might possibly agree with them; and since the Other is a part of you, you’re basically trying to convince *yourself* by defending yourself. It isn’t really that particular person you’re trying to convince (unless he has become very important to you, which is to say he has been highly assimilated into the generalized Other, his ‘concept’, or ‘imago’ (sort of), becoming an integral part of it); it is the Other itself, i.e., the dissonant part of you. After all, it’s likely that you’ll be satisfied simply if you have a good comeback to his insult, whether or not your comeback actually succeeds in eliciting an apology or retraction from him. And this could be the case only if the one you’re trying to convince is you, not him.

There are so many threads in discussions like the foregoing that it would be virtually impossible to unite them all. Besides, concepts are simply not adequate vis-à-vis consciousness. They’re clumsy, unrefined, ill-defined, vague. This inadequacy isn’t something that can be rectified, though; it’s inherent in the nature of concepts. For concepts are hammered out in interactions between people, and so they are appropriate only to the public, shared world. But I’m trying to apply them to the private world, the inner essence of consciousness, so they’re bound to be inadequate.

¹ By capitalizing the ‘o’ I’m merely emphasizing the other’s abstract character in this context.

January 12 etc.

I want to become the general Other, and I want the general Other to become me.

The Other gets associated in everyone's mind with certain attitudes, dispositions, beliefs, modes of behavior. This is partly how people become socialized to behave as society expects and demands. They want to be accepted and respected by the Other (because, again, they want to negate the otherness of the Other), so they unthinkingly accept its attitudes etc., which is to say they accept social norms.

This helps explain why it's so easy to get people to accept bureaucratic roles unquestioningly, no matter how irrational or cruel their duties are. People do what they're told as long as it's a credible authority-figure who's ordering them—because authority-figures are identified with the Other, for several different reasons. The Other is really the tyrant of self-consciousness (precisely because it's so 'diffuse').

I'm sick to death of thinking.

I want the excitement of feeling like I'm *going* somewhere in life, like I'm working for career advancement or there's a definite goal I'm working towards. People who want to be, for example, a CEO are lucky: they have a goal towards which they can orient their life. But I don't have a goal. All I know is that I'll probably have to be an academic, and after that there's nothing. I don't have the talent to write a novel; my talents are in other spheres, namely those not valued by late capitalism.

It would be interesting to reinterpret and revise R. D. Laing's analyses of the schizoid personality in the light of my ideas.

"Language, Self, and Lifeworld in Habermas's *Theory of Communicative Action*," by Donald McIntosh. (Good.) "Toward the Redialectization of Historical Materialism: Labor and Language," by R. Kelly Washbourne. (Not as good.) "On the Incompleteness of George Herbert Mead's Theory of the Social Self as an Account of Intersubjectivity: Re-reading Henrich after Habermas," by David Vessey. "Reification: A Marxist Perspective," by Val Burris. ("This essay presents a systematic reconstruction of Marx's theory of reification.") "Nature and Narcissism: The Frankfurt School," by C. Fred Alford. Interesting observation: "For the Frankfurt School, the oedipus conflict is central to psychoanalysis because it is the tie to Marx. It is the father's deflection of the son's libido from the mother that prepares the son for a lifetime of labor. It does so by teaching him that libidinal pleasure must be postponed, and later confined to the genitals, so that the rest of the body may become an instrument of labor. Indeed, Marcuse draws the parallel between Marx and Freud so tightly that Marx's socially necessary and surplus labor become basic and surplus repression." Sounds silly. Further informative remarks: "In *Totem and Taboo*, Freud distinguishes three phases in the evolution of humanity's view of the universe: animistic, religious, and scientific. [Reminds me of Comte.] 'At the animistic stage men ascribe omnipotence to *themselves*. [Cf. the primitive, magical practice of trying to influence the gods by naming them, calling upon them, "binding" them to act in accordance with the tribe's wishes.] At the religious stage, they transfer it to the gods but do not seriously abandon it themselves, for they reserve the power of influencing the gods in a variety of ways. The scientific view of the world no longer affords any room for human omnipotence; men have acknowledged their smallness and submitted resignedly to death.' Freud is wrong that a pessimistic, "resigned" attitude is inherent in the abandonment of religion.

After Freud's discovery of primary narcissism, "narcissism reflects another orientation to reality, one which engulfs its environment, rather than standing in opposition to it." "Originally the ego includes everything, later it detaches itself from the external world. The ego-feeling we are aware of now is only a shrunken vestige of a far more extensive feeling—a feeling which *embraced the universe* and expressed an *inseparable connection of the ego with the external world*." (From *Civilization and Its Discontents*.) Cf. the first sentence of my entry on January 12th. We want to obliterate the Other as such, and the external world is an aspect of the Other, so we want to transcend the externality of the world. —Narcissism.

How can consciousness be aware of consciousness, as is the case in self-consciousness? Only if something comes between consciousness and itself, making it self-distant so that it can see itself. The

generalized other is this thing that separates consciousness from itself, that introduces self-difference by introducing generality, or universality, or abstractness, into particularity. The generalized other is what explains the fact that I am my own other.

(Explain the relationship between reification and the generalized other.)

From Burris's paper: "...Reified consciousness, like all forms of consciousness, is determined by the concrete life-activities of which it is a part. For Marx, knowledge of social relations ('theory' in the broadest sense of the term) is constructed in and through the actions which produce, maintain, and transform those social relations ('practice'). To the degree that human agents exercise autonomy over the production and reproduction of their social relations, the humanly produced nature of those relations will be readily accessible to them. On the other hand, when social actions are determined heteronomously, as an adaptive response to forces and circumstances over which the individual has no control, the dependence of social institutions on the ongoing constitutive actions of human subjects will be less accessible to consciousness. Reification can thus be viewed as a characteristic form of social consciousness under conditions of alienation and powerlessness.

"Marx is not the only theorist to see a connection between powerlessness and reified forms of social consciousness. Piaget (1960), in his studies of child development, notes the extreme reification (or 'realism') of the young child's conception of the social world and attributes this to the underdevelopment of the infant's sense of autonomous subjectivity. Confronting a system of pre-existing, external, and frequently coercive social institutions, the infant views the ontological status of these as equivalent to that of natural objects. Names, for example, are understood as belonging to the intrinsic nature of things and emanating from them. Moral norms are projected onto the objective realm and understood as categorical imperatives. Such reification declines as the child becomes increasingly autonomous of adult constraint and gains a stronger sense of his or her own subjectivity." That paragraph is thought-provoking. It supports my argument that a type of reification is inherent in the human condition. In self-consciousness, for example. The self is a partial reification. So is the generalized other. "Abstract objects", such as concepts, are reifications too. But only under certain social-structural conditions does reification become pathological.

"Alongside the fetishism of commodities, we [in contemporary society] now have a fetishism of technology, a fetishism of bureaucracy, and a fetishism of occupational credentials." Yup.

Reading Honneth's *The Struggle for Recognition: The Moral Grammar of Social Conflicts*. It deals, first and foremost, with Hegel's early writings, but also with Mead, Marx, Sartre, Sorel, the object-relations theorists, etc.

Lorig called me; that was nice. She's the only coworker I really like, the only one I can talk to comfortably. And vice versa. We're practically soul-twins, not entirely but nearly. We both would be happiest if we lived in Europe; America is everything we dislike. I'd say she's my best friend in Boston, if only because she knows how to listen and converse.

Interesting distinction: "Whereas self-respect is a matter of viewing oneself as entitled to the same status and treatment as every other person, self-esteem involves a sense of what it is that makes one special, unique, and (in Hegel's terms) 'particular'." "What distinguishes one from others must be something *valuable*." What does it mean for something to be valuable? Ultimately, it means that the other considers it valuable.

Once upon a time people had no desire to be considered special and unique. (Far from it! Such a desire was inconceivable.) Now, everyone does. When did the change take place? *How* did it take place? It's worth noting that the desire is probably bound up with the desire that one's life have *meaning*—another late historical development. Now that individuals exist as such, people are driven to assert themselves against the other. Before, they were relatively at home in the "other" (insofar as it existed at all); when they became separated from it (both phylogenetically and ontogenetically) a dissonance developed within themselves, which guided, to a large degree, their actions from then on. They want to overcome the division in themselves, and one of the ways to do this, paradoxically, is to play into the hands of the very separation-between-individuals that gave rise to the problem in the first place. If you show that you're better than other

people you'll get recognition from them, which will, as always, be experienced also as recognition from the generalized other, which will be a mitigating or overcoming of your self-tension, your self-dissonance.

Aaaaaah, I don't know...

Reminder: "As Hegel showed, recognition is worthless if it does not come from someone whom one views as deserving recognition." What determines whether one is seen as deserving it? (See my thoughts on charisma, a strong social presence, etc.)

Yes, I envy earlier thinkers, who had a wide-open field before them. They didn't have to master a vast academic literature. They didn't have to be obsessively precise in their arguments. They didn't have to conform completely to academic expectations. They lived in hopeful and youthful times. —They had it easy.

January 17

If one generalizes this second thesis systematically, one arrives at the theoretical premise that the development of a subject's personal identity presupposes certain types of recognition from other subjects. For the superiority of interpersonal relationships over instrumental acts was apparently to consist in the fact that relationships give both interlocutors the opportunity to experience themselves, in encountering their partner to communication, to be the kind of person that they, from their perspective, recognize the other as being. The line of thought entailed by Hegel's argument here represents a significant step beyond the mere claim, found in theories of socialization, that the formation of a subject's identity is supposed to be necessarily tied to the experience of intersubjective recognition. His idea leads to the further conclusion that an individual that does not recognize its partner to interaction to be a certain type of person is also unable to experience itself completely or without restriction as that type of person. The implication of this for the relationship of recognition can only be that an obligation to reciprocity is, to a certain extent, built into such relations, an obligation that requires but does not force subjects to recognize one another in a certain way: if I do not recognize my partner to interaction as a certain type of person, his reactions cannot give me the sense that I am recognized as the same type of person, since I thereby deny him the characteristics and capacities with regard to which I want to feel myself affirmed by him. (p. 37)

I agree with the conclusion but not with the reason that Honneth gives in the last part of the previous sentence. Or, rather, that reason strikes me as superficial. Honneth doesn't explain why denying one's partner the characteristics with regard to which one wants to feel affirmed by him should cause one to feel that same lack in oneself. What is the *fundamental* reason for the necessity of reciprocity? After all, the necessity definitely exists. My friendship with Gina doesn't give me the sense that I'm an intelligent, interesting person, since she isn't. If I thought she were, then, through that fact (or through our friendship), I'd feel as if I were too. This is just another way of saying that one can be truly "recognized" (as a certain kind of person) only by people whom one judges as worthy of being recognized (as that kind of person). What is the reason? The only reason I can think of is that one has an already given, half-conscious, half-formed idea in one's head of the sort of person who is worthy of being recognized/respected—for example, an intelligent, charming, self-confident person—and this idea, I should note, is a sort of distillation of one's notion of the Other. Now, whatever characteristics one associates with the Other are the characteristics that one intuitively, half-consciously wants to have. That's a necessary fact of human psychology. So when you meet someone who instantiates your idea of the Other, who is, as it were, a concrete version of the Other, you seek his approval, since if you acquire it you'll acquire, at least to a degree, the approval of the Other in you (and thus self-approval). Then you'll feel as if you are the same kind of person as this other person you respect, who is a more-or-less complete instantiation of your idea of the Other. (The degree to which he is is the degree to which you respect him.) In other words, the 'mechanism' that connects the three facts

Honneth is dissecting¹ is that insofar as you recognize someone you treat him as an incarnation of the Other, and so if he recognizes you in turn then you'll feel yourself recognized by the Other in you, which is the kind of person you want to be—and in knowing that the Other is attributing certain traits to you, you'll attribute them to yourself (because the Other, after all, is a part of you, albeit a dissonant, often accusatory part).—This is the most plausible explanation I can think of. If you can think of a better one, my hat is off to you.

Another virtue of that explanation is that it ties into the premise that an individual is constantly (or almost constantly) seeking self-unity, seeking to overcome, in this case, the accusatory or disrespectful glance of the Other in him. If he can only bring himself over to his side, he'll be happy. The best way to do that is to bring others over to his side.

This dual 'identification with the Other' also explains the power of sexual love. I identify my partner with the Other as she does the same for me, and this allows me to identify myself with the Other at the same time. (Hence the self-love involved in sexual love.) But since I identify each of us with the same concept or structure of consciousness, I effectively—mediately—identify myself with her and her with me. We become one, so to speak.

January 19

Longevity isn't a decisive criterion of artistic, or even intellectual, worth. The 1812 Overture is still beloved even though it is by no means a masterpiece. Heidegger is still worshipped despite the near-emptiness of much of his thought.

Reading Honneth's essay on reification, I'm reminded of why I have a distaste for modern analytic thinking: it enervates philosophy, making it seem pallid and unexciting. (So much the worse for philosophy that logical clarity has such an effect.)

It's ironic that the only reason I'm mildly content with my lot is that I have contempt for most things. If I didn't, how could I endure life?

Scylla and Charybdis.— The only thing worse than women is men. It's weakness versus stupidity. (On MLK day the staff had a teacher-training day; there was a presentation on the Seven Habits of Highly Effective People. One of them was "Seek to understand, and then to be understood". In other words, listening is most important. The speaker gave an example from his personal life: before he got a divorce, everyday he would wake up, go to the kitchen, open all the cupboard doors looking for his coffee mug, and leave them open. Then his wife would come downstairs and complain about the cupboards being open. He didn't understand why it bothered her. "Isn't that what everyone does? Isn't it normal to leave the cabinets open? Why did she care so much?" So the next day—out of forgetfulness, perhaps—he did the same thing, leaving the doors open. And she would complain again. Eventually he decided to listen to her, to "seek to understand" her point of view, which led to his closing the doors after he'd opened them.—Wow. No wonder divorces are so common. Men have the interpersonal skills of an unopened can of tuna.)

One fact alone is necessary to refute all idealism about humans: Nazism happened.

Ode to music.— I was sitting here alone on a Saturday night hating the world until I remembered Beethoven's symphonies and started listening to one, and with the first note I became perfectly happy. This music makes me feel infinitely free, as if I've found a home. How silly to be self-pitying when you have this music to listen to whenever you want!

¹ Namely: (1) you respect a person; (2) you know that he respects you; and therefore (3) you have the sense that you are the same kind of person as him, namely intelligent, valuable, etc. The question I'm asking is: What explains the 'therefore'?

(I wish I understood music's power over me. It has something to do with the "affective response", but that explains nothing. What is the connection between music and affection, including self-affection? For I do have a more loving relationship to myself when I listen to beautiful music—because, I suppose, I have a more loving relationship to the world. The beautiful sounds *become* my world, more or less. Maybe that's the explanation. My world is no longer a half-assimilated external opposition to me; it is an interiority, something internal to my sense of self (because the latter already includes a love of the particular piece I'm listening to). My world is not foreign anymore. That's not the whole explanation, though: it doesn't explain the beauty of beautiful music.)

Obviously the need for certainty, in whatever existential area, comes from the need to appease the Other. Most kinds of doubt can be reduced to self-doubt (self-conflict). Even philosophical confusion is ultimately a species of self-doubt.

Mead explained the emergence of self-consciousness on the basis of his theory about how a subject "arrives at a consciousness of the social meaning of its behavioral expressions." According to him, "one possesses knowledge of the intersubjective meaning of one's actions only if one is capable of generating the same reaction in oneself that one's behavioral expressions stimulated in the other: I can become aware of what my gesture signifies for the other only by producing the other's reaction in myself." This becomes possible through the evolutionary development of vocal, as opposed to non-vocal, gestures, since these have the special quality of affecting both the agent and his interaction in the same way at the same instant. "While one feels but imperfectly the value of his own facial expression or bodily attitude for another, his ear reveals to him his own vocal gesture in the same form that it assumes to his neighbor." This consciousness of meaning makes possible consciousness of oneself as a social object. "In perceiving my own vocal gesture and reacting to myself as my counterpart does, I take on a decentered perspective, from which I can form an image of myself and thereby come to a consciousness of my identity."

That's how the *epistemic* self-relation is established, how knowledge of oneself is possible. But the practical, or normative, relation-to-self develops too in the context of the self's relation to the other. "The child can think about his conduct as good or bad only as he reacts to his own acts in the remembered words of his parents." "By putting itself in the normative point of view of its interaction partner, the subject takes over its partner's moral values and applies them to its practical relation to itself." (Cf. my earlier observation: "What does it mean for something to be valuable? Ultimately, it means that the other considers it valuable.")

I have to agree with Honneth that "rights" are not merely bourgeois inventions. That's obvious. In every society that isn't utterly barbaric the individual has rights. They need not be legally enshrined, though, and they need not take a bourgeois form. "With the appropriation of the social norms regulating the cooperative nexus of the community, maturing individuals not only realize what obligations they have vis-à-vis members of society; they also become aware of the rights that are accorded to them in such a way that they can legitimately count on certain demands of theirs being respected. Rights are, as it were, the individual claims which I can be sure that the generalized other would meet." (The concept of the generalized other, for Mead, involves an "internalization of norms of action that result from a generalization of the action-expectations of all members of society." "In learning to generalize internally an ever-larger number of interaction partners to such an extent that a sense of social norms of action is acquired, the subject gains the abstract ability to participate in the norm-governed interactions.")

January 20 etc.

I will say this in favor of American capitalism: it has taught me self-reliance.

I'm trying Craigslist again, not the personals but the less sketchy ads for friends and activity-partners. Also, I discovered a website called Boston Linkup. And another one called IntellectConnect. ("It's a meeting of the minds.")

I want to understand why it's uncomfortable to talk about sex (and defecating) with one's parents. Everyone finds it uncomfortable, but no one can really explain why. I feel like the answer would reveal a lot about the essence of the parent-child relationship, and about the psychological significance of sex.

Maybe the question isn't so hard after all. Intuitively, the reason I wouldn't want to discuss the topic with my parents is that "sex is dirty", and that during the conversation I'd be half-thinking about the fact that they've had sex and they'd be aware that I'm aware of that. In other words, the parent-child relationship is not the province of things dirty. They are banished from it, opposed to its spirit somehow. Why? Evidently because the child, when young, idealizes his parents as if they are pure, good, all-knowing beings, and the parents know that the child does this. For whatever reason, sex and the like are intuitively seen as dirty, i.e., the opposite of pure and good. Even the child, after a certain age, knows this. So when the subject comes up, both parties (the child and the parents) become uncomfortable, because both parties are aware of the contradiction between the child's idealized love and the dirty reality. Even when the child is an adult, the psychic residue of the earlier idealization remains.

Obviously that explanation is superficial.

Went to a BSO concert with a girl from Craigslist. Mozart's 23rd piano concerto and 36th symphony. The girl was dull, the music was good. (Mitsuko Uchida was the pianist.)

If you deeply appreciate the meaning and the power of the desire for recognition, your life is turned upside down. That's how you can tell whether you've understood the phenomenon. All great human endeavors are shot through with futility because they are directed at eternity. They are directed at a projection of the Other in the self, a projection that can be either explicit and obvious, as in "God" and "posterity", or implicit and indefinable, as when someone pursues his dream without having any particular abstract entity in mind. He just pursues it, "driven" to do so, driven by his un-self-conscious desire for objective confirmation of his self—i.e., for a suppression of self-consciousness. As I write this now I am necessarily assuming¹ universality, a universal other of some sort (hidden from me) whose approval gives my life meaning, gives this moment meaning for me. Without such an other—abstract or concrete, it doesn't matter as long as it is the measure of existence—life can have no "meaning", because what is meaning but an absolute standard by which we can judge ourselves and by which the noble among us strive to judge ourselves? If everything is "relative" and there is only subjectivity, the quest for greatness, which presupposes an objective truth in the realm of value, lacks a foundation, or an endpoint. It lacks *sense*; it lacks *meaning*. But greatness, or absolute recognition, is what we "great" ones need, the desire for which fuels us. The Other in us is tyrannical, and its confused objective projection (which is virtually indistinguishable from the Other itself) determines all our projects. It determines, indeed, many daily activities for everyone. When I obsessively check my writing for spelling errors it's because of the 'objective' in me, the Other, the one looking at me. And if I'm pleased with myself after writing it's because I feel like I've temporarily secured the approval of this projected objective self, this universal, self-less self. I'm writing for eternity, not for my own meager and fickle little self. Who cares what *he* [the little self] thinks?! I don't revolve around myself like an animal; I orient my efforts toward the Universal, as do all intellectual people (and, in a less extreme way, all people since the birth of civilization). This orientation is almost never an object of explicit consciousness, but it directs me all the same. It is woven through my being. It *is* my being.

Truth-seekers are always trying to reach the endpoint, but there is no endpoint. There is no rest on the horizon. That's what truth is, in the end: the merging of self with other, the overcoming of subjectivity, the union with reality, perfect recognition. Theoretical analysis is a means to that end. An exquisite sublimation. There is no truth because subjectivity is ineradicable, interpretations are endless and will never

¹ Double meaning.

be exhausted. No doubt there are better and worse interpretations, more and less defensible ones; but there is no ultimate, final interpretation, because to achieve that would be to freeze fluid subjectivity and language.

Damn you, general other! I wish I were a cat.

Norms of reason are the closest thing there is to an absolute standard of value. Unfortunately, they are not self-conscious. If they were they would be God, or something like it.

January 25

Indian party last night at a bar downtown with Kanchana, whom I hadn't seen in months. Met a few girls etc., got invited to a birthday party tomorrow by a 25-year-old who gave every indication of looking forward to seeing me again. On the bus home I had Indians on the brain and had been socializing with a certain adeptness which had given me confidence, so I talked to a hot-as-lava Indian BU grad student who was standing across from me. Fetchingly shy and demure girl. She gave every indication of liking me so I asked for her phone number, to which she shyly replied she doesn't give out her number "too easily", and so I'll never see her again. As she left I wished her well in her studies, but my heart didn't put on such a brave face as my smile and I was sad as I thought about the mistake she was making. Surely it isn't hard to see that I'm a good guy with a good heart and a good mind.

"According to Winnicott, the child is capable of being 'lost' in interaction with the chosen object [the "transitional object", such as a blanket or a teddy bear] only if, after the separation from the symbiotically experienced mother, the child can generate enough trust in the continuity of her care that he or she is able, under the protection of a felt intersubjectivity, to be alone in a carefree manner. The child's creativity—indeed, the human faculty of imagination in general—presupposes a 'capacity to be alone', which itself can arise only out of a basic confidence in the care of a loved one." Thought-provoking.

The conflict is between the aesthetic ideal and the hedonistic ideal. (The ascetic ideal died even before the French Revolution—despite Gandhi and Mother Theresa—and its cousin, the moral ideal, is only paid lip-service to in a morally ambiguous and vastly impersonal world.) Grandeur, struggle, Faustian discontent versus happiness, love, satedness. Those are the only ideals that most people can still intuit. The masses, of course, follow the second and not the first, but they have instinctive respect for the Faust-type. (Look at their fascination with Tupac, who was hip-hop's Byron: tempestuous, dissolute, self-contradictory—"devil and angel"—artistically impassioned, revolutionary, hungry for knowledge.) And these two types, as abstract types, are not only mutually exclusive; they're opposites. Evidently they're anchored in two different aspects of the psyche.¹

(By the way, invoking the psyche does not necessarily amount to psychologism, as sociologists might argue.)

It is possible, though, to go some way towards integrating the two ideals. The 'driven' person need not be miserable, after all, or tortured.² Such an integration would be a synthesis of the objective and the subjective, since the aesthetic ideal is fueled by the desire for recognition by some diffuse universal other—(it's closely related to the desire for fame)—while the hedonistic ideal has to do with more personal and intimate forms of recognition, like having a loving family and close friendships. (It's significant that men have historically been more attracted to the Faustian concept, and more generally to political power and world dominion, while women have pursued simple domestic happiness. Men tend to fixate, for whatever biological and/or social reasons, on the universal, the objective, the abstract Other, while women want recognition from a concrete other more than an abstract one. This partly explains why men have the

¹ Namely, the human and the animal. Human grandeur (recognition) versus animal satedness.

² Goethe, with his "Olympian tranquility", represented an integration.

reputation of being more restless and ambitious than women—namely, because, in wanting *concrete* recognition from an *abstract* (non-)entity, men are doomed never to achieve their goal, while women are not.) The integration would also, in a way, amount to a synthesis of the masculine and the feminine.

On a related topic, I can reflectively abandon my unreflective commitment to recognition from an all-knowing universal other without succumbing to nihilism or creative quiescence. The third way is to do all I can to enrich people's lives, as many as possible. This is the *real* content in the unreal desire, the rational kernel in the irrational compulsion. Unreflectively I will always have the irrational compulsion, but I can justify it through the consideration that it propels me to make contributions to culture.

We will never understand the relations between the sexes until we start being honest in our investigations and don't shrink from politically incorrect conclusions. It has to stop being considered a sound argument against a position if it savors ever-so-slightly of "sexism".

January 26

How is it possible for a person to identify with others, be they actual friends or merely members of an abstract community (say, a religious one) in which the person includes himself? How can one internalize other people like this? The only way is if the individual is his own other. His self-conscious particularity has to be fused with a universality, an internalized generalization of the sort of opposition-to-himself that concrete individuals are. As past thinkers have shown, this generalized [abstract] other arises in the context of the small child's separation from the mother, and of the child's increasing use of verbal gestures, and of the child's participation in, first, spontaneous play, and then in organized games in which he internalizes and can anticipate the participants' reactions to his behavior. Etc. I have nothing new to add to the account of what is empirically involved in the ontogenesis of the generalized other, i.e., of self-consciousness. Originally the infant's world, in particular his mother, is experienced as a part of the infant. There is no other. Then mother and child become less dependent on each other and move towards relative independence. The child becomes aware of itself as a separate being to the extent to which it becomes aware that other people are separate beings. But this evolution proceeds on the basis of—or rather is inextricably connected with—the distancing of the child from itself, which means the internalization of the opposition-to-itself that other people represent. This internalization is an *active* component of its sense of self, which is to say it is not merely 'opposed to' but is *included in* the child's self-consciousness. (Self-consciousness, after all, is an opposition-to-itself; this is possible because it is—or it is created through and is constantly re-created through—a generalized internalization of other people, who are 'primitively' [i.e., as a brute fact] opposed to the individual.) So now when the child develops an affective attachment to another person, its experience of this person literally becomes a part of its sense of self, because the person is experienced as a concrete instantiation of the generalized other, which, as I just said, is itself a part of the child's self-consciousness.¹ So "identification with an other" means that one's experience of the other is literally a component in one's sense of self. And this phenomenon is made possible through the 'mediation' of the generalized other, because this structure is the essential foundation of one's self-consciousness. (That is, by half-consciously associating a person with it, one is associating that person with one's very self.)

¹ There is an ambiguity in the idea of the generalized other, or at least in how I use it: sometimes I imply that it is a pure interiorization, a 'structure' in consciousness, while other times I imply that it is an objectively oriented projection of this interiorization. The distinction between the two uses is incredibly subtle, virtually imaginary, but it's analytically necessary. For example, in the sentence in the text I have in mind the "projection" when I say that a person is experienced as an instantiation of the Other, while I have the "interiorized" meaning in mind when I say that the Other is a part of self-consciousness. (The importance of the distinction is evident when you consider that a person cannot be experienced as an instantiation of one's own self-consciousness—because I myself am the only instantiation of myself—while he *can* be an instantiation of a *projection* of one's self-consciousness.) The reason I said the distinction is virtually imaginary is that, in the individual's immediate experience, there is *no* distinction. The only time there is is when a person 'focuses' the projection into a single abstract entity, like God or mankind.

It's also interesting to note that two very different modes of identification with an other are possible: there is the undifferentiated unity in which there is no consciousness of an other, and there is the relating of the other to the self.

Honneth wants to argue in his book that many social conflicts can and should be conceptualized as struggles for recognition rather than as utilitarian conflicts over political and economic interests. "Motives for social resistance and rebellion...[often] stem from the violation of deeply rooted expectations regarding recognition". I agree with him, but his thesis isn't terribly interesting. Anyone with a shred of common sense knows that rebellions often, or usually, are fueled by experiences of collective humiliation, by rage at naked injustice and the simple desire to belong to a community that has dignity, freedom and respect. If academic social scientists have neglected this fact in favor of more Hobbesian or utilitarian interpretations, that's only because they're academics, i.e., bureaucrats. All you have to do is watch speeches by black civil rights leaders to see that the desire for recognition can have far more motivational force than the desire to possess more economic resources. In any case, the two categories of motives (the utilitarian and the 'Hegelian') are interrelated.

I'm reminded by the Christmas suicide of the thirty-year-old daughter of my mom's friend that the need for self-esteem, for self-recognition, can be even more powerful than the instinct for self-preservation. When faced with its own partial disintegration, the self often chooses non-existence (which is different from "disintegration").

January 27, 28

I won't be happy until I have something to fight for, and to fight against. That's the formula.

Philip Roth has said that in twenty-five years people will not read novels anymore. No doubt he's basically right. "The novel has had its day." Fiction has had its day. People don't realize it yet, but nonfiction too is declining. Books are becoming obsolete. Humanism is a worm-eaten carcass, eaten by the twin worms of commodification and mechanization. After I die it will be no longer. Culture is becoming more attenuated every year; the internet and television are taking its place. What is culture, after all, but a sort of "objective spirit" permeating the lifeworld and drawing people together, giving them a common heritage and a common spiritual substance? But television and the internet have the opposite effect, shutting people inside themselves and divorcing them from others.

Henry James once complained that the cultural 'atmosphere' in America is 'thinner' than in England, that it lacks the *palpable, tangible thickness* of tradition, which is a necessary prerequisite for the novelist's art. The atmosphere in England was somehow closer, more pressing and dense than in America, where everything was faster, thinner, spread apart, and change happened too fast. Well, America was the future, and the future was not in the humanistic imagination but in a complicated, fast-paced, globalized economic seriousness reflected in politics and what was still left of culture. Nonfiction is still popular but it's an anti-humanistic nonfiction, an increasingly blogified—ADD-ified—nonfiction, perversely appropriate to "the world's increasing gravity" (Nietzsche, *All Too Human*).

I'm affected by the situation as much as anyone. I don't claim immunity or superiority in that respect. Why else would someone like me, who loves reading, not truly enjoy reading fiction anymore? Society has made me overly "serious". Overly conscious of my own situation, so that I can't happily lose myself in the contemplation of a fictional scenario. The only way I can is if it's thrust on me, played out in front of my very eyes, on the screen. In sitcoms and movies. And then it's only for a short period of time.

I love myself but I dislike some of my qualities. But I wouldn't really want to change them, because that would be to change an aspect of my inner self, which I love. For instance, I wish I had the ability to organize people, to inspire them, to lead them; but if I had that ability then I would be a deeply different

person than I am, which I don't want to be. It's a conundrum. I suppose that, in the end, I'm almost perfectly happy with who I am, despite a kind of 'external', 'artificial' wish for extrovertedness.

Rereading *The Brothers Karamazov* for a book club meeting in February with a slew of females. Going to a speed-dating event tomorrow.

January 30

The best test of a person's worth—that is, of his humanity, his free-spiritedness, his kindness and mental independence—is whether he is willing and able to examine rules critically in the light of reason and either obey them or not obey them based on their reasonableness. The slave is the one who does what he is told by authorities, who accepts their rules and orders unquestioningly even if they are irrational or they hurt people. The bureaucrat is the perfect slave. Only a liberated, humane person picks and chooses his rules for himself, guided by reason and compassion. I've noted before that the vast majority of Americans are slaves, no matter if they're educated or uneducated, intelligent or unintelligent. Remember the Milgram experiment in the 1960s? It showed that for most people in this society, the desire to follow orders trumps the desire to be kind to others, to not inflict pain.

Michael Moore's movie *Sicko* proves that, too.

Occasionally when I'm with my coworkers or friends I ask myself what kind of people they are, and almost always I'm dismayed to realize that they're probably bureaucrats, at least given the right circumstances. "That's the rule!" they'd say. "You can't do anything about it. It comes from on high. Don't blame me; blame my boss!" So that makes it harder for me to respect them. In a different society they might have been fascist functionaries.

The dating event was fun. Talked to seven girls for eight minutes each. I wouldn't say that vodka *transforms* me; it merely lets me be who I want to be. Beer and wine, on the other hand, tend to knock me out. —I wrote "Yes" for two girls; apparently they wrote yes for me too because I was emailed their contact info later.

February 2

"I think everyone should love life above everything in the world."

"Love life more than the meaning of it?"

—From Dostoyevsky's book. I like that last line, said by Ivan. *Love life more than the meaning of it!* Alyosha replies with "Certainly, love it, regardless of logic as you say, it must be regardless of logic, and it's only then one will understand the meaning of it." Pithy words.

Nietzsche's ideal of the *Übermensch* wasn't as original as he thought. It's just a variation on the aesthetic ideal of the personality, which has been around for a long, long time.

I spoke too soon when I said I don't enjoy reading fiction. For I like Dostoyevsky's masterpiece, despite its many flaws and excesses. It's suspenseful and thought-provoking.

Edgar Allan Poe wrote that the desire to do mischief is buried deep in the human psyche. To do evil, like carve out a cat's eye with a spoon—there's a fascination with it and a repressed desire for it. But can it really be somehow ingrained in the psyche? No, surely not. Poe was wrong. It isn't a spontaneous upsurge of the human spirit, of its darker side. It is but a reaction to circumstances. It arises, in fact, from boredom. "The imp of the perverse" is a manifestation of boredom—and curiosity, of course. It can have other causes too, but insofar as it exists generally among millions of people nowadays it's mainly a sublimation of boredom, or rather of the instinct for life in conditions of boredom. Yes, it actually arises from the desire to *affirm* life!—but at the same time from the desire to deny life, namely this particular

boring life. It's a revolt from conventional modern life, that's really all it is. This fascination with the dark side isn't an eternal fact innate in the psyche. —Well, no, the fascination itself may indeed be such a fact, just insofar as the “dark side” is very different from ordinary life; but the desire to actively descend to the depths is not, and that's what Poe was talking about. This desire is a historical creation.

The passion to negate usually signifies a deeper passion to affirm, to reach out and remake the world in one's own image.

February 9

You'll never understand women until you know that on some level they want to be subordinate to [protected by, and weaker and smaller than, etc.] their man.

From the soul of atheists and free-thinkers.— The greatest sin in history was the invention of the idea of sin.

In the end, what sustains me in the face of Godlessness and allows me to escape the fate of Ivan Karamazov is my implicit faith in myself. I know, without doubt, that I am the measure of all things, the rightful judge of the world, the standard of value. I am not a person but a principle. I see through everything, the world is transparent to me and people are mere puppets moved by a hand that I alone can see. (“Invisible” to everyone but me.)

February 16

Reading Mann's *Confessions of Felix Krull, Confidence Man*.

Went to an EF party last night, danced and drank with the students etc., then went upstairs to the dorm rooms and made out with one of my students, a 24-year-old Argentine named Gimena. Very nice girl, nice body and pretty face; she seems to like me a lot, told me as she lay on my chest that she had butterflies in her stomach. We were together for hours as her roommates (who are also students of mine) came in and out and talked and were maturely unembarrassed by the situation. Gimena did the female thing right away and asked me questions like what I thought of her, how she compares to American girls, and so on. I wish I romantically “liked” her more, but it'll take a special person to fill my emotional void. For now maybe I'll just have a little fun, or maybe I'll nip this relationship in the bud. It can go nowhere, and it could get me in trouble.

I can neither express nor understand my love of the female body.

Why am I so bothered by the fact that nothing matters? I've never met anyone so morbid and yet so cheerful as I. I'm in a rut. The older I get, the more I need God. The idea of him would allow me to channel my mental energy, which currently has no outlet.

February 19 etc.

Mann's writing doesn't grab me. I couldn't finish *Doctor Faustus* and I can't finish *Felix Krull*. Instead I'm going to read Bill Freund's *The Making of Contemporary Africa*, which approaches history from a materialist perspective.

I still have the dream of reformulating Marxism in an analytically precise and empirically grounded way. Someday I'll do so—unless I decide that Marxism has too many flaws to be salvaged, or to be useful.

I also want to write a synopsis of my philosophy, from epistemology to value theory to the self to psychology.

Reading parts of an anthology of Adorno's writings called *Can One Live after Auschwitz?* I may have underestimated Adorno. He's an eloquent writer, capable of pithy formulations. "The irrational nature of contemporary society inhibits a rational account of it in the realm of theory." "The failure to produce a theory of society runs parallel to the regression of society itself." "With the trend toward [political] intervention [in the economy], the system's resilience has been confirmed, but so, indirectly, has the theory of its collapse [because such intervention is necessary for the system's survival]." Etc. His statements can be suggestive and stimulating. In the end, though—at least in his philosophical and semi-sociological writings—he traffics in generalizations and obvious theoretical contradictions that he tolerates, indeed celebrates, because they epitomize "dialectics", which is his method of choice. Much of his writing, as I said earlier, is virtually a stream of consciousness, devoid of analytical rigor and any apparent thesis to be supported. He just *works through* his thoughts. He writes the *thinking* of his thoughts and not simply the thoughts themselves, which makes his writing dense, aphoristic and verbose. If you were to rewrite some of his essays in an analytical framework, purging them of all their eloquence, vagueness and shallow paradoxes, they would be a lot shorter; in fact, not much of genuine substance would remain.

All in all, he seems pretty unoriginal and not very interesting, though he's a good enough writer to seduce the reader into thinking otherwise.

As for the endless fuss he made over Auschwitz as having all kinds of philosophical and existential implications—it strikes me as silly. Intelligent people know and have known for centuries, if not millennia, that life is meaningless and contingent, that society in its present configuration permits of absolute inhumanity. Maybe no one had really imagined that Auschwitz was possible, but its reality has only confirmed all the deep truths that have always been evident to thinking men. To obsess over its moral implications is, ironically, to remain in the "metaphysical" attitude that Adorno deprecates as having been made absurd by Auschwitz. For "absolute moral imperatives" (such as "the categorical imperative that we never allow Auschwitz to happen again"), like God, don't exist in a world where the Holocaust can happen. Adorno's grandiose and tragic stance is immature. "Can one live after Auschwitz?" Sure. Auschwitz proves that life has no value in itself, but it never did, so what's the big deal? Let's just go on trying to alleviate suffering, as always—even doing so with more energy than we did in the pre-Auschwitz world; but let's stop with the histrionics and the hysterics. Okay, Adorno?

Richard Rubenstein's reflections on the Holocaust were more profound than Adorno's. He understood that the Holocaust was but a dramatic expression of the bureaucratic dehumanization in which modern civilization consists. Even if the Holocaust hadn't happened, the catastrophe that it signified would have.

February 23, 25

Gimena slept at my place last night. She's a virgin and wants to remain so for a while, but I was happy kissing her and her beautiful body. We'll see a movie tomorrow. It's funny how a little thing like this can make you quite happy. I don't want to analyze it or her, I just want to enjoy it.

Women are so soft and exquisite, how can they not be acutely conscious of their sexuality at all times? They're saturated with sexuality.

Saw *The Magic Flute* at BU this weekend. That opera is tremendously appealing. Yesterday I went to the Isabella Stewart Gardner museum with a Taiwanese English student, a preposterously beautiful girl named Pei-yu. Masato had set me up with her. Sucks that she's a bad conversationalist (despite her intelligence) and doesn't reciprocate interest shown in her. Later in the night I met Gimena. Took her to my apartment after a long intimate conversation; we got naked and I treated her like a goddess. Like Aphrodite.

[...] I also enjoyed gazing at her beautiful vagina, though she was a little hesitant about that. “I shy,” she murmured cutely while closing her legs. “Why?” I asked while coaxing them open again. “It’s beautiful. You shouldn’t be shy.” “I shy...”

Reading *The Sickness Unto Death*, at least a good chunk of it (in an anthology of existentialist writings). It speaks to me. I understand the first two or three pages in a new way now, in light of my ideas on the generalized other. Kierkegaard can be “naturalized”, as Mead naturalized Hegel (according to Honneth), and when he’s translated into this naturalistic language you realize how right he is. Well, partly right.

Questions about free will and responsibility are somehow misguided. Is it true that I “choose” to be, say, in despair if I’m in despair? In a way, maybe yes. For if I really wanted to I might be able to temporarily banish despair from my mind, by distracting myself. And maybe if I exerted enough willpower I could overcome my despair in more constructive ways. But still, it isn’t wholly true that I’ve chosen my mental state, and certainly not that I’ve chosen my personality. There’s something strangely compulsory or half-compulsory about, say, sadness. I do partly choose it if I wallow in it, because I could probably change how I feel by doing something else, but I don’t choose it in the way that I’m choosing to type on my computer right now. Concepts like freedom and unfreedom don’t do justice to the indescribable phenomenology.

It’s simplistic to say, with Sartre, that I’m absolutely responsible for the way I am and the way I act, even though it’s true that at any given moment I’m choosing my mental state and my actions insofar as I’m implicitly making the judgment that this is how I want to be right now. If I’m comfortable being sad, as of course I am if I remain in sadness for a while, then somehow I’m choosing to be sad. ‘At this moment I am content to be sad, so I won’t resist it. I choose it.’ Still, the freedom involved in my choice is not absolute. In some bizarre way it’s a half-freedom, if that makes any sense. (Strictly speaking, I suspect it doesn’t. But that only shows the inadequacy of the concepts of freedom and choice.)

Nor do I have perfect freedom in my interactions with society. There are limitations in my nature, conditions that make it ‘easier’ for me to do one thing rather than another. I certainly can’t be whatever I want to be, or act however I want to act.

Similarly, it’s a half-truth to say, as Sartre does in his essay *Existentialism*, that when I make a choice I’m choosing for all humanity. “If I want to marry and have children, I am involving all humanity in monogamy and not merely myself. Therefore, I am responsible for myself and for everyone else. I am creating a certain image of man of my own choosing. In choosing myself, I choose man.” I’ll pass over the obvious fact that, even if this argument is true, I am not thereby responsible for all *real* people, only for the abstract idea of humanity implied by my choice. But Sartre is overlooking one whole side of man’s consciousness and concentrating on the universal side. Certainly universality is an element in consciousness, and to that extent perhaps he is right. But particularity is a no less important side, and to that extent he’s wrong. The universal element in my consciousness implies that I ‘unconsciously’ assume my choices to be valid for all humanity, but the element of particularity, which is equally essential to the human cast of mind, limits my choices to myself. So there’s a contradiction here, a tension. I can only be called *half*-responsible for humanity, insofar as I know at any given moment that my choice is meant only for myself and not for others. The other half, the universal half, the ‘generalized other’ half, is what explains the responsibility that I do have for mankind.

All this, by the way, harmonizes with our intuitions about human responsibility. It isn’t cut-and-dried; it’s complicated.

“Generally speaking, consciousness—that is, self-consciousness—is decisive with regard to the self. The more consciousness, the more self.” That’s exactly what I said in my senior thesis, and my professors thought it silly. I would add that the more consciousness, the more free will.

Sartre's philosophy is one-sided and simple-minded. His article inclines me to think it's incoherent. I'm not very impressed with *The Sickness unto Death* either.

Reading *Rational Choice Marxism*, a collection of articles by people like Erik Olin Wright, Adam Przeworski and Michael Burawoy.

Why do I—very occasionally—semi-fantasize about killing people like Bill Kristol and Richard Perle (who have, in effect, killed so many others)? What accounts for the satisfaction of imagining that? Evidently such fantasies originate in some sort of psychological conflict. But the conflict ultimately has to be within my self, between me and myself. Doubtless it is a conflict between me and the other, the other person, but it is at the same time and to the same degree a conflict between my self and my self. Acts and desires originate in the self; they are self-impelled, always, by definition. So if I desire to act aggressively towards someone, it's because I have internalized in some way the conflict between him and me. That means the conflict exists within me and drives me to act aggressively. Insofar as it exists *interpersonally* it exists *intrapersonally*. This is possible because the other that is within me at all times gets identified, or partly identified, with the person in question. By eliminating him I'm eliminating the self-tension caused by his existence, by his holding views contrary to mine or by his condemnation of me or whatever. It follows that serenity is the attitude that signifies the most complete self-confidence, self-contentment, self-coincidence; a person susceptible to highly aggressive urges is necessarily highly sensitive to other people's valuations of him, and perhaps thus to self-doubt (or something like it). A sadist is consumed with destroying the hostile Other in himself, who is instantiated in the people he tortures. He lacks 'security'; his sense of self is fragile, unconsciously self-doubting. He can probably be said to hate himself on an unconscious or half-conscious level. By torturing and killing someone he temporarily restores the self-harmony he normally lacks; he brings himself back to himself, negates the Other (or rather the Other's negativity, i.e., the otherness of the Other).

It's possible that a sadist's ecstatic reaction to his glorious destruction of another person has elements in common with the way I feel immediately after writing something that I think has theoretical value. We're both creating, in a way (although the sadist's 'creation', or his fashioning the world in his own image, is destruction, destruction of something perceived as noxious and offensive because it has independent existence). We're both forcing the Other to recognize us, which gives us great pleasure.

March 1

I read "The Brenner-Wallerstein Debate" (1988), by Denmark and Thomas, in the *International Studies Quarterly*. I think it's hopeless to try to systematically explain society. Science can't penetrate the social world in the way it can the natural world.

Bought a year's subscription to the *New Left Review*. Very excited. There's an endless supply of excellent articles I'm poring through.

I can't help thinking that, despite the difficulty of formulating the theory in a precise way, Marx was right that the forces of production in late capitalism will someday outgrow capitalist relations of production and exchange. The latter will be sloughed off, as utterly inappropriate to a kind of technology and a society that demand cooperation and planning. (Consider the origins of, for example, the internet, computers, information processing, satellites, and lasers: they were developed in the public sector—the Pentagon, the National Science Foundation, places like MIT, etc. Only subsequently were they made available to private companies.)

In his article "After Dialectics: Radical Social Theory in a Post-Communist World", Göran Therborn mentions an interesting passage from E. O. Wright: "The work of Erik Olin Wright has played a central role in securing a legitimate location for Marxist class analysis within academic sociology. In a characteristically elegant approach, a recent contribution structures the issue by asking: if class is the answer, what is the question? Wright discerns six types of question which will frequently have 'class' as part of their answers:

- 8) Distributional location: how are people objectively located in distributions of material inequality?
- 9) Subjectively salient groups: what explains how people, individually and collectively, subjectively locate themselves and others within a structure of inequality?
- 10) Life chances: what explains inequalities in life chances and material standards of living?
- 11) Antagonistic conflicts: what social cleavages systematically shape overt conflicts?
- 12) Historical variation: how should we characterize and explain the variations across history in the social organization of inequalities?
- 13) Emancipation: what sorts of transformations are needed to eliminate oppression and exploitation within capitalist societies? (Erik Olin Wright, ed., *Approaches to Class Analysis*, Cambridge 2005.)”

In his entertaining paper “Rational Choice Marxism and Postmodern Feminism: Towards a More Meaningful Incomprehension”, Alan Carling gives a short summary and critique of postmodernism. I’ll quote some passages. “For Lyotard, the postmodern is defined as ‘incredulity toward metanarratives’, and he is clearly on the side of the oppressed discourses against their oppressors. In view of what he has said before about modernism, the postmodern stance implies a loosening of the boundaries of the academic disciplines, a reappraisal of the relationship of the secular to scientific culture, and a skepticism towards the truth claims of science—in short, a legitimation crisis for the knowledge institutions of the West. ...Lyotard commends the playfulness of unanchored intellectual creativity (‘paralogy’), and the proliferation of language games without a single center, free of domination by any master discourse, such as that imposed in a modernist culture by one of the grand narratives—Marx, Freud, the hermeneutics of meaning, and so on.

“...Leave aside the criticism that Lyotard’s recapitulation of science since the Enlightenment places him squarely in the grand narrative business; if his argument is right, what does it show? [Nothing, says Carling. Sure, science is a social activity conducted by means of linguistic devices—rhetoric, metaphor, fable, as well as specialized vocabularies and techniques—which bear no necessary relationship to any ‘truth of the matter’. But unlike vernacular discourses, scientific practice mobilizes language etc. behind a goal “conventionally called ‘the pursuit of truth’, where ‘the truth’ is provisionally recognizable partly on cognitive, partly on procedural and partly on pragmatic grounds.”] ...He goes so far in emphasizing how the conduct of science has changed as to prescind entirely from science as a social process. He ‘expect[s] a thorough exteriorization of knowledge with respect to the “knower”, at whatever point he or she may occupy in the knowledge process. The old principle that the acquisition of knowledge is indissociable from the training (*Bildung*) of minds, or even of individuals, is becoming obsolete and will become ever more so.’ So meaning now bypasses human subjects, and inheres instead in mechanical systems?

“This nonsense alerts us to a curious feature of the postmodern debate: on the one hand postmodernism is the most extreme culturalism—it takes off from Marx’s analysis of commodity fetishism and then tries to convert the relative autonomy of the superstructure into the absolute autonomy of the superstructure (a move made most shamelessly by Baudrillard). On the other hand, extreme culturalism consorts with the crassest expressions of technological determinism, in which the silicon chip transforms the basis on which any human knowledge can be gained: the typewriter gives you society with Virginia Woolf; the PC society with Janet Street-Porter. (At this point, and in an access of populist enthusiasm, I thought I should ask my computer for its opinion, so I have typed in ‘what do *you* think?’, and recorded the answer in a footnote.¹)

“...I have criticized postmodern theorists for combining extreme culturalism with crude technological determinism: they move directly from forces of production to superstructures without passing through the relations of production.” That’s a good point. Carling subsequently notes Fredric Jameson’s interesting theory that three phases of culture are related to three phases of capitalist organization: realism,

¹ (There was no reply.)

modernism, and postmodernism correspond to the market, imperialism, and late multinationalism, which are in turn related to the three phases of technological development that Ernest Mandel attributes to capitalism in *Late Capitalism*. Briefly stated, the three periods are “capitalism as a steam-powered realist market economy (1848-90), followed by modern electric imperialism (1890-1940), and thence a nuclear-powered multinational postmodernism (1945 to date).” Simplistic, but food for thought.

Here’s a list—an ‘ongoing’ list—of some of the articles I’ve read in the *NLR*: Perry Anderson’s “The Antinomies of Antonio Gramsci” (1976). Raymond Williams’s “Base and Superstructure in Marxist Cultural Theory” (1973). Nicos Poulantzas’s “The Problem of the Capitalist State” (1969). E. O. Wright’s “Giddens’ Critique of Marxism” (1983). Robert Brenner’s “Structure vs. Conjuncture: the 2006 Elections and the Rightward Shift” (2007). Wright and Andrew Levine’s “Rationality and Class Struggle” (1980). Wright and Levine’s “Marxism and Methodological Individualism” (1987). Therborn’s “The New Questions of Subjectivity” (1984). Therborn’s “The Rule of Capital and the Rise of Democracy” (1977). Therborn’s “The Travail of Latin American Democracy” (1979). Aidan Foster-Carter’s “The Modes of Production Controversy” (1978). Ernesto Laclau’s “Feudalism and Capitalism in Latin America” (1971). Norman Geras’s “Althusser’s Marxism: an Account and Assessment” (1972). Johanna Brenner and Maria Ramas’s “Women’s Oppression Today” (1984). Fredric Jameson’s “Postmodernism, or the Cultural Logic of Late Capitalism” (1984). Anderson’s “Scurrying Towards Bethlehem” (2001), a history of the Israel-Palestine conflict. Anderson’s “Jottings on the Conjuncture” (2007). Maurice Godelier’s “The Origins of Male Domination” (1981). Michael Rustin’s “A Socialist Consideration of Kleinian Psychoanalysis” (1982). Christopher Lasch’s “The Freudian Left and Cultural Revolution” (1981). Michele Barrett and Mary McIntosh’s “Narcissism and the Family: A Critique of Lasch” (1982). Jean Roussel’s “Introduction to Jacques Lacan” (1968). Jeffrey C. Alexander’s “Honneth’s New Critical Theory of Recognition” (1996). Godelier’s “Infrastructures, Societies and History” (1978). Christopher Bertram’s “International Competition in Historical Materialism” (1990). Ellen Meiksins Wood’s “The Separation of the Economic and the Political in Capitalism” (1981). Wood’s “Marxism and the Course of History” (1984). Eric Hobsbawm’s “Marx and History” (1984). Caroline New’s “Man Bad, Woman Good? Essentialisms and Ecofeminisms” (1996). Alex Callinicos’s “The Limits of ‘Political Marxism’” (1990). Joseph McCartney’s “For and Against Althusser” (1989). Ernest Mandel’s “The Role of the Individual in History: the Case of World War II” (1986). Jack Goody’s “The Labyrinth of Kinship” (2005). Mike Davis’s “Planet of Slums” (2004). Dylan Riley’s “Democracy’s Graveyards?” (2008), a review of Michael Mann’s book *The Dark Side of Democracy: Explaining Ethnic Cleansing*. Tariq Ali’s “Afghanistan: Mirage of the Good War” (2008). Benedict Anderson’s “Exit Suharto: Obituary for a Mediocre Tyrant” (2008). Aaron Benanav’s “Kali’s Prophet” (2008), a review of a book on Schumpeter. Gregor McLellan’s “Among the Unbelievers” (2008), a review of Charles Taylor’s *A Secular Age*.

March 4

Reading E. O. Wright’s *Classes*, a sociological analysis.

Excerpt from Anderson’s article: “...Nicos Poulantzas, whose work *Political Power and Social Classes* contains many critically acute comments on the Prison Notebooks, in effect dismisses Gramsci’s concern with the problem [of why the masses consent to bourgeois ideology], remarking that the only novelty of this consent is its claim to rationality—i.e. its non-religious character. ‘The specific characteristic of (capitalist) ideologies is not at all, as Gramsci believed, that they procure a more or less active “consent” from the dominated classes towards political domination, since this is a general characteristic of any dominant ideology. What specifically defines the ideologies in question is that they do not aim to be accepted by the dominated classes according to the principle of participation in the sacred: they explicitly declare themselves and are accepted as scientific techniques.’ In a similar fashion, Ernest Mandel has written in his *Late Capitalism* that the major contemporary form of capitalist ideology in the West is an appeal to technological rationality and a cult of experts: ‘Belief in the omnipotence of technology is the specific form of bourgeois ideology in late capitalism.’ These claims involve a serious misconception.

“For the peculiarity of the historical consent won from the masses within modern capitalist social formations is by no means to be found in its mere secular reference or technical awe. The novelty of this consent is that it takes the fundamental form of a belief by the masses that *they exercise an ultimate self-determination* within the existing social order. It is thus not acceptance of the superiority of an acknowledged ruling class (feudal ideology), but credence in the democratic equality of all citizens in the government of the nation—in other words, disbelief in the existence of any ruling class. The consent of the exploited in a capitalist social formation is thus of a qualitatively new type, which has suggestively produced its own etymological extension: consensus, or mutual agreement. Naturally, the active ideology of bourgeois ideology coexists and combines in a wide number of mixed forms with much older and less articulated ideological habits and traditions—in particular, those of passive resignation to the way of the world and diffidence in any possibility of changing it, generated by the differential knowledge and confidence characteristic of any class society. The legacy of these diuturnal traditions does indeed often take the modern guise of deference to technical necessity. They do not, however, represent any real departure from previous patterns of class domination; the condition of their continued efficacy today is their insertion into an ideology of representative democracy which overarches them. For it is the freedom of bourgeois democracy alone that appears to establish the limits of what is socially possible for the collective will of a people, and thereby can render the bounds of its impotence tolerable.¹”

Weber’s definition is good to keep in mind: “the State is the institution which enjoys a monopoly of legitimate violence over a given territory”. This criterion is a useful way to separate State from non-State. Of course, on a more fundamental level there isn’t a clear separation between civil society and State. Civil institutions are often effectively extensions of the State. (E.g., the modern school system.) Gramsci agrees, though probably he goes too far: “By the State should be understood not merely the governmental apparatus, but also the ‘private’ apparatus of hegemony or civil society.” “In reality civil society and State are one and the same.” By ‘hegemony’ he means the cultural hegemony of a class, the bourgeoisie.

“If we revert to Gramsci’s original problematic, *the normal structure of capitalist political power in bourgeois-democratic states* is in effect simultaneously and indivisibly *dominated by culture and determined by coercion*.” “The normal conditions of ideological subordination of the masses—the day-to-day routines of a parliamentary democracy—are themselves *constituted by* a silent, absent force which gives them their currency: the monopoly of legitimate violence by the State. Deprived of this, the system of cultural control would be instantly fragile, since the limits of possible actions against it would disappear. With it, it is immensely powerful—so powerful that it can, paradoxically, do ‘without’ it: in effect, violence may normally scarcely appear within the bounds of the system at all.” Nevertheless, the fundamental resort of bourgeois class power is coercion. See my brief jottings on Katrina. *The true character of a society reveals itself in “extreme” situations*. (See also one of Marx’s articles on British rule in India.)

Three factors in maintaining the status quo: consent, coercion, and objective economic constraints. Gramsci emphasizes the first two, especially the first.

Williams notes that we should understand the base/superstructure distinction partly in terms of social intentions. “...[A]ny society has a specific organization, a specific structure, and the principles of this organization and structure can be seen as directly related to certain social intentions, intentions by which we define the society, intentions which in all our experience have been the rule of a particular class.” Intentions can be ‘read back’ into the culture, inferred from it; the social processes that constitute the base

¹ A real and central belief in popular sovereignty can, in other words, coexist with a profound scepticism towards all governments that juridically express it. The divorce between the two is typically mediated by the conviction that no government could be otherwise than distant from those it represents, yet many are not representative at all. This is not a mere fatalism or cynicism among the masses in the West. It is an active assent to the familiar order of bourgeois democracy, as the dull maximum of liberty, that is constantly reproduced by the radical absence of *proletarian democracy* in the East, whose régimes figure the infernal minimum. There is no space to explore the effects of fifty years of Stalinism here: their importance is enormous for understanding the complex historical meaning of bourgeois democracy in the West today. [Irony: Stalinism, or the Cold War, almost certainly buttressed and stabilized capitalism in the West. It was a godsend.]

can perhaps be identified through inference from people's behavior, or from the stress that society lays on specific institutions and practices.

He distinguishes between residual and emergent forms of culture, of both alternative and oppositional culture (as opposed to the dominant culture). Much art is of a residual kind, embodying values and meanings from earlier periods; some art is emergent. So one can't ask simply "What is the relation between literature and society?"; there are many different kinds of literature, which interact with the rest of society in different ways.

We should think of an artwork not as an *object*, something static, but as a *practice*, the embodiment of a *process*, involving intentions, norms, social relations, material conditions, etc. This approach might be more fruitful from the Marxian point of view. The subtle change of focus it involves might yield new insights.

March 6

I have a lot of respect for E. O. Wright. He's a serious thinker. I'd like to talk to him again; I was too shy eight years ago to take advantage of the opportunity. Also, I hadn't read enough then.

Schopenhauer may have been right that the masculine form is more beautiful than the feminine. Each has its own unique beauty, but the beauty of strength and hardness, of *chiseled granite*, is perhaps more striking and somehow—nonsensically—'admirable' than the beauty of softness and passiveness. (Relative passiveness is embedded in the female form.)

Homo sapiens is the only *beautiful* primate. (The more hirsute a person is, the less beautiful he is.)

—Of course, chimpanzees would argue that chimpanzees are the only beautiful primates.

Cohen has an interesting take on the traditional Marxist view that capitalism can't make possible a true *abundance* of resources, and that socialism is necessary for this. He admits, *pace* Marx, that capitalism can lead to a virtually endless quantity of goods, but he denies that the output can be rationally allocated so as to create an abundance of goods for everyone. "...Because capitalism is production for exchange rather than use, capitalist relations of production have a built-in bias for using progress in productive forces to expand output rather than to expand leisure time (where leisure is defined as release from burdensome toil). Cohen writes: 'As long as production remains subject to the capitalist principle, the output-increasing option will tend to be selected and implemented in one way or another... Now the consequence of the increasing output which capitalism necessarily favours is increasing consumption. Hence the boundless pursuit of consumption goods is a result of a productive process oriented to exchange-values rather than consumption-values. It is the Rockefellers who ensure that the Smiths need to keep up with the Jones.'

"This generates an incompatibility between the forces and relations of production, not because productive power as such ceases to develop, but because it ceases to be rationally deployed: 'The productive technology of capitalism begets an unparalleled opportunity for lifting the curse of Adam and liberating men from toil, but the production relations of capitalist economic organization prevent the opportunity from being seized... It brings society to the threshold of abundance and locks the door. For the promise of abundance is not an endless flow of goods, but a sufficiency produced with a minimum of unpleasant exertion.'

"Cohen's Compatibility Thesis is thus equivalent to the claim that the relations of production become irrational with respect to a general notion of improving the human condition. In the past such improvement was achieved by increasing the level of development of the forces of production themselves; in advanced capitalism it is achieved by the rational deployment of the forces of production that already exist. 'Fettering', therefore, is ultimately a fettering of the possibility of rational action." That's an angle I hadn't really considered.

Wright's article provides a good critique of Cohen's obviously ahistorical positions.

Therborn's review. "Dominant ideology thesis." "There exists a widespread agreement among Marxists, such as Habermas, Marcuse, Miliband and Poulantzas, that there is a powerful, effective,

dominant ideology in contemporary capitalist societies and that this dominant ideology creates an acceptance of capitalism in the working class. It is with this dominant ideology thesis that our book is concerned.” The authors’ rejection of it is less than convincing (says Therborn). While “dull economic compulsion” is, as they say, an important ingredient in the “integration” of capitalist societies, Gramsci was right that there’s such a thing as cultural hegemony and that this plays a role in stabilizing societies. Nevertheless, it’s easy to overestimate the importance of hegemony. The fragmentation of opposition, and the fragmentation of the citizenry as a whole, are major elements in the stability of late capitalism.

March 8

Like a bloated toad frowning at the world I sit here stoically, my darting tongue pulling in flies and mosquitoes.

From Wright’s book (p. 74): “I think it is possible to restore the central thrust of the traditional Marxian concept of exploitation by making a distinction between what can be called ‘economic oppression’ and exploitation... Exploitation involves more than just economic oppression; it includes both economic oppression and the appropriation of the fruits of the labor of one class by another (which is equivalent to a transfer of the surplus from one class to another)...

“With this usage of terms, we can identify a fairly wide range of inequalities that we might want to condemn on the basis of economic oppression, but which are not examples of exploitation. The poverty of the permanently disabled or of the unemployed, for example, would in general be cases of economic oppression but not of exploitation... Now, it might be argued that the concept of economic oppression would be sufficient to provide the basis for a class concept, since it does define a set of objective material interests. What, then, is added by the distinction between economic oppressions that involve appropriation of the fruits of labor and those that do not? The critical addition is the idea that in the case of exploitation, the welfare of the exploiting class *depends upon the work* of the exploited class. In a case of simple economic oppression, the oppressing class only has interests in protecting its own property rights; in the case of exploitation it also has interests in the productive activity and effort of the exploited. In the case of economic oppression, the oppressors’ material interests would not be hurt if all of the oppressed simply disappeared or died. In the case of exploitation, on the other hand, the exploiting class needs the exploited class. Exploitation, therefore, binds the exploiter and exploited together in a way that economic oppression need not. It is this peculiar combination of antagonism of material interests and interdependency which gives exploitation its distinctive character and which makes class struggle such a potentially explosive social force.”

p. 72: “The central message of Roemer’s strategies for analyzing exploitation is that the material basis of exploitation lies in inequalities in the distribution of productive assets, usually referred to as property relations. The asset–exploitation nexus depends in each case upon the capacity of asset-holders to deprive others of equal access to that asset, whether it be alienable [e.g., the physical means of production] or inalienable [e.g., skills I possess]. On the one hand, inequalities of assets are sufficient to account for transfers of surplus labor; on the other hand, different forms of asset inequality specify different systems of exploitation. Classes are then defined as positions within the social relations of production derived from the property relations which determine the patterns of exploitation.”

A defense of the idea of skill-based exploitation: “To appropriate the fruits of someone else’s labor is equivalent to saying that a person consumes more than they produce. If the income of a person with skill assets is identical to their ‘marginal product’, as neoclassical economists like to argue, how can we say that they are consuming ‘more’ than their own contribution? Through what mechanism are they appropriating the fruits of anyone else’s labor?

“The answer to this question is easiest when skill-asset exploitation is based on *credentials* which have the effect of restricting the supply of skills. Let us compare two situations, one in which a mechanism for granting credentials is in operation which restricts the supply of a given skill and one in which

credentials are absent. When credentials are operating, employers will bid up the wages of the owners of the credential above the costs of producing the skills. (In the absence of the credential-awarding process, additional laborers would acquire the skills if wages were above the costs of producing the skills, thus ultimately driving the wages down to those costs.) The result of this is that the *price* of the commodities produced with those skills will be higher than it would be in the absence of the credentials. In effect, we can say that while the possessor of a credential is being paid a wage equal to the *price* of his or her marginal product, this price is above the ‘value’ of the marginal product (i.e., the price of the marginal product in the absence of credentials). That difference is the exploitative transfer appropriated by the possessor of a credential. For this reason, possessors of credentials have interests in maintaining skill differentials as such, in maintaining the restrictions on the acquisition of credentials.”

In other words, if there were perfect competition, there would be no skill-based exploitation. Maybe this reflects the fact that skill-based exploitation is not intrinsically *capitalist* exploitation (see below); that is, it is not the basis of capitalist profits. (Profits are based on the capitalist mode of exploitation, which is to exclude workers from ownership of the means of production.) It belongs, strictly speaking, to a different mode of production from the capitalist. —Still, I have doubts about the idea’s coherence.

My own affluence, such as it is, rests on exploitative power-structures, which means that I am complicit, if not actively then passively.

“In all capitalist exploitation, the mediating mechanism is market exchanges. Unlike in feudalism, surplus is not directly appropriated from workers in the form of coerced labor or dues. Rather, it is appropriated through market exchanges: workers are paid a wage which covers the costs of production of their labor power; capitalists receive an income from the sale of commodities produced by workers. The difference in these quantities constitutes the exploitative surplus appropriated by capitalists.” As Wright says, this claim doesn’t rest on the labor theory of value.

“Two different kinds of non-polarized class locations can be defined in the logic of [the “contradictory class locations”] framework: (1) There are class locations that are neither exploiters nor exploited, i.e. people who have precisely the per capita level of the relevant asset. A petty-bourgeois, self-employed producer with average capital stock, for example, would be neither exploiter nor exploited within capitalist relations. These kinds of positions are what can be called the ‘traditional’ or ‘old’ middle class of a particular kind of class system. (2) Since concrete societies are rarely, if ever, characterized by a single mode of production, the actual class structures of given societies will be characterized by complex patterns of intersecting exploitation relations. There will therefore tend to be some positions which are exploiting along one dimension of exploitation relations, while on another are exploited. Highly skilled wage-earners (e.g. professionals) in capitalism are a good example: they are capitalistically exploited because they lack assets in capital and yet are skill-exploiters [since their income rests on an enforced scarcity of the particular credentials they possess]. Such positions are what are typically referred to as the ‘new middle class’ of a given class system.

“...It is possible to distinguish within this framework a whole terrain of class-locations in capitalist *society* that are distinct from the polarized [bourgeois/proletarian] classes of the capitalist *mode of production*: expert managers, non-managerial experts, non-expert managers, etc. What is the relation between this heterogeneous exploitation definition of the middle class and my previous conceptualization of such position of such positions as contradictory locations within class relations? There is still a sense in which such positions could be characterized as ‘contradictory locations’, for they will typically hold contradictory interests with respect to the primary forms of class struggle in capitalist society, the struggle between labor and capital. On the one hand, they are like workers in being excluded from ownership of the means of production; on the other, they have interests opposed to workers because of their effective control of organization and skill assets. Within the struggles of capitalism, therefore, these ‘new’ middle classes do constitute contradictory locations, or more precisely, contradictory locations within exploitation relations.”

Wright notes that the emergence of this new, contradictory middle class means that the proletariat is no longer the only rival to the capitalist class for class power. A different, less oppressed class could, and probably would, act as the midwife for the birth of a new society. Remember the historical lesson that the beneficiaries of social revolutions are never the oppressed classes of the prior mode of production but rather

‘third classes’. The bourgeoisie, not [only] the peasantry, benefited from the French Revolution; the bureaucrats and managers, not the peasantry or proletariat, benefited from the Russian Revolution; and the same was true of China’s revolution. This suggests that in a future revolution, the beneficiaries would be located outside the strictly defined mode of production that was previously dominant.

That’s an important insight, and it probably qualifies as a fairly valid historical generalization. Beneficiaries of social revolutions tend to be classes that grew up in the *interstices* of the previous mode of production (or rather, in the interstices of the society in which that mode of production predominated).

As I read *Classes*, it feels almost as if scales are falling from my eyes. I wish I could convey a sense of the book’s richness.

Doubtless there are other kinds of exploitation besides class exploitation. For example, gender exploitation (in which, say, husbands exploit the labor of their wives for domestic services), or racial exploitation. This complicates the issue. But ultimately the question is “Which kind of exploitation is most fundamental for understanding social conflict?” The answer, surely, is class exploitation, for many reasons.

“Actual societies can never be characterized as having only one type of exploitation; they are always complex combinations of modes of production.” A mode of production is defined by its corresponding type(s) of exploitation. (I’m not sure such a definition is adequate. For how would you differentiate hunting and gathering from communism, in both of which there seems to be no exploitation? I’m inclined to say that specifying the associated mode of exploitation is *one way* of defining a mode of production.) “When we say that a *society* is feudal, or capitalist, or statist, or socialist, we are claiming that one specific form of exploitation is *primary* in the society.”

March 9

From Therborn’s article on the origins of full-fledged bourgeois democracy: “After the First World War the number of democracies increased from three to ten (with some qualification in the cases of Canada and Finland), and that of male ones from five to fourteen. By 1939, however, the number had fallen to eight and eleven, respectively. The big boom of democracy came in the aftermath of the Second World War, with only Swiss sexism and US racism holding out until the 1970s. The conclusion would appear to be that bourgeois democracy is largely a martial accomplishment.

“The victors of both world wars made ample use of democratic rhetoric, and none more than the least democratic of capitalist states—the United States of America. But no serious historian seems to have suggested that the wars were caused by a struggle for or against bourgeois democracy, or that Germany and her allies lost because they did not possess democratic régimes. Moreover, the crucial historical role of foreign wars provides strong support for the thesis that bourgeois democracy is largely contingent to the developed rule of capital. If this is true, then the fragility of bourgeois democracy in Latin America may be partially attributed to the fact that it was never drawn into the mass slaughter of two world wars.”

But he then proceeds to argue that in only eight countries out of 21 was the outcome of world wars decisive in the installment of bourgeois democracy. In six other countries, the *national mobilization* for war played a large role in extending the franchise (which was either used as a means for uniting the country against the enemy or was an effect of the processes of military, economic and ideological integration). “Mobilization for national liberation and foreign war has thus, alongside military defeat, been one of the most important causes of the development of bourgeois democracy. It has been a crucial determinant of the timing of democratization and one of the reasons for the coincidence of war and democracy.”

Inasmuch as democratization was propelled by factors internal to countries, “two internal factors seem to have been of the most immediate strategic importance: the independent strength of the agrarian petty and small bourgeois landowners, and divisions within the ruling-class (or power) bloc. This statement should at once be qualified by mentioning the enormous role of the labour movement. The Second International went down in ignominious disarray in 1914, but its contribution to the development of bourgeois democracy was certainly not insubstantial. Indeed, this may be said to have been its principal historical accomplishment. However, although the labour movement was the only consistent democratic

force on the arena, it was nowhere strong enough to achieve bourgeois democracy on its own, without the aid of victorious foreign armies, domestic allies more powerful than itself, or splits in the ranks of the enemy.

“It is hardly surprising that the tiny privileged minority constituted by the mercantile and industrial bourgeoisie and the feudal and capitalist landowners should have been almost invariably hostile to democracy—hence the exclusivist outcome of the bourgeois revolutions [e.g., 1689, 1789/93, 1848]. By contrast, the urban *artisanat* and petty bourgeoisie generally tended in a democratic direction and provided the striking force of both the Jacobins and the 1848 revolutions. But, as these examples also show, they were too weak to hold out against feudal and bourgeois reaction. The peasantry, however, constituted an absolutely decisive force in the still largely agrarian capitalist countries of the nineteenth and early twentieth centuries. Now ‘peasantry’ is, of course, far too undifferentiated a notion. The landless peasants were, on the whole, still too oppressed to say or do very much, although in Finland the crofters very soon became involved in the labour movement and later played a heroic role in the civil war. The ones who really counted were the small and medium landholding farmers, patriarchal self-subsistence households, the agrarian petty bourgeoisie and the small and medium agrarian bourgeoisie (those using hired labour).

“The strength of these agrarian classes—and the degree of their independence from the landowning aristocracy and urban big capital—were crucial factors in the development of democracy.” This interpretation comports with Moore’s.

Therborn’s article is excellent; I’m going to keep quoting it. “Bourgeois democracy has been attained by such diverse and tortuous routes that any straightforward derivation from the basic characteristics of capitalism would be impossible, or at best seriously misleading. Nevertheless, the facts that democracy in the sense defined above did not appear anywhere prior to capitalism; that some capitalist countries have experienced a purely internal development of democracy; and that all major advanced bourgeois states are today democracies—these naturally call for some elucidation of the tendencies inherent within capitalism...

“1. Bourgeois democracy has always succeeded mass struggles of varying degrees of violence and protractedness. The first inherent tendency, then, will be found in the conditions favouring popular struggle. Legal emancipation of labour and the creation of a free labour market, industrialization, concentration of capital are all intrinsic tendencies which simultaneously lay the basis for a working-class movement of a strength and stability inachievable by the exploited classes of pre-capitalist modes of production. In accordance with Marx’s analysis of the growing contradictions of capitalism, the working class is, *ceteris paribus*, strengthened by the advance and development of capitalism. This explains the traditional sociological correlations of democracy with wealth, literacy and urbanization—factors which bear upon the relationship of forces in the class struggle. And, as we have already seen, the labour movement has itself played a vital role in the struggle for democracy.

“2. However, we also remarked that in general the working class has not won a share in the political process in the heat of battle. On the contrary, it has been more common for the bourgeoisie to make concessions after a period of successful resistance to reform. Apparently, working-class participation must in some sense be to the bourgeoisie’s advantage. Although in Germany and Austria in 1918 and 1945 (possibly also in Belgium and Sweden in 1918) and in Italy in 1945 the alternative to bourgeois democracy was an attempted socialist revolution, actual defence against proletarian revolution does not seem to have been a directly determining factor. In all these cases, it was not the insurrectionary proletariat but foreign armies that overthrew the existing régimes, whereupon the old internal democratic forces at last got the upper hand. Of greater importance was the specifically capitalist art of industrialized warfare. The First World War was fought both with massive conscript armies and with whole civilian populations mobilized for military production. For this effort even the Wilhelmine Reich admitted the Social Democrats into the governmental machinery; against this background, too, the suffrage was extended in Belgium, Canada, Britain and the United States.

“3. National unification and liberation have everywhere been seen by the bourgeoisie as a strategic necessity for the development and protection of trade and industry and the breaking of feudal dynastic power. And for these aims it has often found it invaluable to enlist popular support. The extension of

suffrage in Denmark, Germany, Norway, Finland and Italy (for the imperialist Libyan expedition) formed part of a process of national unification.

“4. Feverish development of the productive forces is another feature peculiar to the capitalist mode of exploitation. One of the main reasons why nineteenth- and early twentieth-century liberals could deny the compatibility of democracy with private property was their dread that popular legislatures and municipal bodies would greatly increase taxation. However, they were disregarding the elasticity and expansive capacity of capitalism. Higher levels of taxation have liquidated neither private property nor capital accumulation. Rises in productivity make possible a simultaneous increase of both rates of exploitation and real incomes of the exploited masses. This is, of course, not in itself conducive to democracy. But it is relevant in so far as it provides the bourgeoisie with an unprecedentedly wide room for manoeuvre in dealing with the exploited majority.

“5. So far we have deliberately talked in very general terms of popular mobilization and incorporation of the working class into the political process. But such mobilization need not be democratic. In their very different ways, wartime Wilhelmine Germany, Fascism and third world ‘populism’ all testify to that. What makes capitalist democracy at all possible is a characteristic unique among known modes of production. Capitalism is an impersonal mode of exploitation, involving the rule of capital rather than personal domination of the bourgeoisie. It certainly does not function in the manner of an automatic machine, but it does operate as production for ever greater profit under conditions of impersonal market competition. The rule of capital requires a state—for both internal and external support and protection—but, as long as it upholds the separate realm of capitalist ‘civil society’, this state does not have to be managed personally by bourgeois. And in the long history of democratization, bourgeois politicians have learnt the many mechanisms at their disposal to keep the state in harmony with the needs of capital.

“6. This last-mentioned feature of capitalism may explain why the impersonal rule of a tiny minority is conceivable in democratic forms—why, for example, the rule of capital is compatible with a labour party government, whereas a feudal aristocracy cannot be governed by a peasant party. But a theoretical possibility is one thing, actual historical dynamics quite another. And we have seen that the fight of the working class for universal suffrage and freely elected government was never by itself sufficient to enforce the introduction of bourgeois democracy. This raises the question whether there are other internal tendencies of capitalism, which, under certain conditions, may generate forces of democratization apart from working-class struggle. One such tendency may be immediately identified. Capitalist relations of production tend to create an internally competing, peacefully disunited ruling class. In its development, capital is divided into several fractions: mercantile, banking, industrial, agrarian, small and big. Except in a situation of grave crisis or acute threat from an enemy (whether feudal, proletarian or a rival national state) bourgeois class relations contain no unifying element comparable to the dynastic kingship legitimacy and fixed hierarchy of feudalism. Furthermore, the development of capitalism has usually stimulated the expansion of petty commodity production, before tending to destroy it. Thus, the commercialization of agriculture transformed a self-subsistent peasantry into an agrarian petty bourgeoisie with distinct interests of its own.

“In the absence of a single centre, some kind of elective, deliberative and representative political machinery became necessary. Therefore, propertied republics or parliamentary monarchies developed at an early stage in the formation of capitalist states—for example, the Italian, German and Swiss city republics, the United Provinces of the Low Countries, Britain, the United States, France and Belgium (the latter after 1830). As regards freedom of the press, the material basis of its appearance was the launching of newspapers as capitalist enterprises like any other. This was still a democracy for the bourgeoisie only, and fractionalization of capital has only contributed to a democracy including the rest of the population in conjunction with the other tendencies referred to above. Thus, the decisive role in a number of instances of contingent military defeat shows that capitalism does not necessarily develop forces of sufficient strength to extend the basis of democracy to the masses.”

If you want an even briefer explanation of the connection between capitalism/industry and democracy/equality, take a look at the paragraph I wrote years ago entitled “Why does equality win?” or something like that.

Therborn also asks why bourgeois democracy has been so rare in third-world capitalist countries. Here's his answer: "The *external* inducement of capitalism [in these countries] has had three crucial effects on the bourgeoisie. First, it has severely restricted the internal differentiation of the capitalist class, making it instead largely dependent on one external centre (factor 6 above). Secondly, the lopsided, externally dependent growth of petty and generalized commodity production has rendered the economic base extremely fragile and vulnerable to international crises, thus leaving the indigenous bourgeoisies little room for manoeuvre vis-à-vis the exploited classes (factor 4). The frequent intertwining of capitalist with feudal, slave or other pre-capitalist modes of exploitation, as well as the combination of enclave capitalism with subsistence farming, has impeded the development of the impersonal rule of capital (factor 5) and a free labour market, thereby seriously limiting the growth both of the labour movement (factor 1) and of an agrarian small and petty bourgeoisie (factor 6).

"Furthermore, the national struggles of third-world countries were fought at a much earlier stage of development than in Europe. Consequently, there was either little need to involve the popular masses in struggle or not the same compulsion to cope with their specific demands in order to mobilize them, or both (factor 3). Nor, given their stage of development and geographical location, have these nations had to mobilize for the holocaust of industrial war (factor 2). And those which have had to wage a people's war to gain their freedom—which entails a class-explicit ideological mobilization—have not fought on a capitalist basis and have subsequently taken a non-capitalist road of social development."

I could go on, but I'll spare you.

"Democracy developed neither out of the positive tendencies of capitalism nor as a historical accident, but out of the *contradictions* of capitalism."

March 11

From Therborn's article on Latin American democracy: "...[History proves that] democracy is not *the* polity of a particular stage in the development of capitalism [as bourgeois theorists sometimes argue], but a conjunctural outcome. It is not a bourgeois or 'middle-class' creation, but the result of contradictions and conflict within capitalism. In Latin America as in the central capitalist countries, bourgeois democracy derives not from a single creator-subject, but from the historical ruse of the class struggle under capitalism. The working class and the labour movement have not been as important and as self-consciously democratic, in the formal sense, as in Western Europe. But the overall pattern has tended to be similar: struggle of the working class and other popular classes for social demands and political representation; defeat by the ruling class; democratization on bourgeois terms, so far as both timing and form are concerned.

"The crucial question, of course, with respect to Latin American democracy is why it has been so rare?... 1. The basic explanation for the travail of Latin American democracy must be sought in the weakness of the working class and the petty bourgeoisie. 2. In order to account for the rarity, fragility and incompleteness of democracy in Latin America, it is essential above all to study the post-Depression conjuncture. 3. The frequency of putsches, dictatorships and electoral fraud have to be understood, first and foremost, as manifestations of an internal fracturing and feebleness of the bourgeoisie and its state."

Et cetera.

Foster-Carter's article addresses the question of how to explain the Third World's perennial underdevelopment. (By now, this whole issue is a little dated.) Is it merely a symptom of being in the early stages of industrialization and capitalist development? Or does it arise from an insufficiency of capitalist penetration? (To quote Kay: "capital created underdevelopment not because it exploited the underdeveloped world, but because it did not exploit it enough"—which he explains by arguing that the dominance of merchant capital (as opposed to industrial) was unduly prolonged.) Is it because capitalism in the Third World is externally oriented and dominated by the West, whereas early capitalism in Europe and the U.S. was fuelled by home-market demand? Or is the problem that capitalism and Third World feudalism somehow reinforce each other? This is Laclau's position. The "social formation" in

underdeveloped countries is indeed predominantly capitalist, but “this level of operation is constituted by market relations: for Laclau, what is more important are relations of production, and on this basis he maintains that there were and are substantial elements of feudalism in Latin America. Yet—and here is the twist—these exist not exogenous to capitalism, nor as pockets of decline, but as an intrinsic and structured part of a wider system. In Latin America, as in the ‘second serfdom’ of Eastern Europe, it was precisely the impact of an external market which—so far from dissolving—intensified or even invented feudal and other precapitalist modes of production.”

Pierre-Philippe Rey has a similar position. He would consider the quotation from Kay to be “inadmissible voluntarism, contradicted by [the] fundamental law of capitalism, as true today as on the day when Marx discovered it: capitalism has as its final goal the destruction at every point on the globe of antecedent modes of production and relations of production, in order to substitute for them its own mode of production and its own relations of production.” Capital is a constant, it always has the same tendencies no matter where it exists. It seeks to extract the maximum of surplus-value. So there can be no question of its ‘not going far enough or deep enough’. It is always maximally aggressive. However, says Rey, “Capitalism can never immediately and totally eliminate the preceding modes of production, nor above all the relations of exploitation which characterize these modes of production. On the contrary, during an entire period it must reinforce these relations of exploitation, since it is only this development which permits its own provisioning with goods coming from these modes of production, or with men driven from these modes of production and therefore compelled to sell their labour power to capitalism in order to survive.”

Most of the article is confused and bewildering. Excessively abstract—which reflects the excessive abstractness of the literature, criticized as such by the author. The more I read of this Marxist literature, the more I think it suffers from conceptual confusion. What are modes of production? What are relations of production? Some writers treat ‘mode of production’ as a *systemic* notion, as if a whole society has only one mode of production, while others treat it as something that can vary from micro-unit to micro-unit. Wright leans toward the latter, Wallerstein toward the former. Should methods of exchange and distribution play a role in distinguishing modes of production from each other? How can you locate the boundaries between modes, or ‘kinds’, of production? Such questions are both essential and yet, perhaps, ultimately sterile.

Were the slaveowners in the American South “capitalists” even though they didn’t hire wage-labor? They were, after all, clearly a part of the capitalist world-system at the time. —This kind of question is basically a terminological quibble. The overall economic system was such that it had to be based on wage-labor, even if in certain agricultural sectors slaves constituted most of the workforce.

You just have to look at ideal types and then see how a given society (or “social formation”) measures up to them. I agree with Wright that a particular social formation includes several different modes of production—it is never ‘pure’—but that one always predominates. The *dynamics* of the system belong to one in particular. I also think that the concept of ‘mode of production’ somehow has to apply to both the macro and the micro. The macro is in the micro and vice versa—which means that even if some units of production are organized in an apparently non-capitalist way, in a broader sense they can be called capitalist given their participation in a capitalist economy. The logic of the economy has to apply to them.

Suggestive quotation from Marx: “It is always the direct relationship of the owners of the conditions of production to the direct producers...which reveals the innermost secret, the hidden basis of the entire social structure.” It’s statements like this that serve as my point of departure.

March 13

Capitalism is not defined by the presence of a market for commodities, or even by widespread production for profit. Otherwise the Roman Empire would have to be called capitalist, at least in large part; so would many other ancient societies. Capitalism is a mode of *production*. “For Marx, the accumulation of commercial capital is perfectly compatible with the most varied modes of production and does not by any means presuppose the existence of a capitalist mode of production.” The mere presence of a market, of

merchant capital, of an incentive for profit and accumulation, does not imply capitalism *per se*. On one level this is just a terminological question; but it's important to be clear on the meaning of the terms we use.

Interesting quotation from Marx, which confirms what I wrote in my last entry on American plantation-owners: "In the second class of colonies—the plantations, which are from the moment of their inceptions commercial speculation, centres of production for the world market—a regime of capitalist production exists, if only in a formal way, since slavery among the negroes excludes free wage-labour, which is the base on which capitalist production rests. However, those who deal in slave-trading are capitalists. The system of production introduced by them does not originate in slavery, but was introduced into it. In this case the capitalist and the landlord are one person..." As Laclau explains, "what Marx says is that in the plantation economies the dominant mode of production is only *formally* capitalist. It is formally capitalist because its beneficiaries participate in a world market in which the dominant productive sectors are already capitalist. This enables the landowners in the plantation economy to participate in the general movement of the capitalist system without, however, their mode of production being capitalist. But what is the essential condition for such a situation is its exceptional character."

Here's another one from Marx: "...However, this error is certainly no greater than that of, e.g. all philologists who speak of the existence of *capital* in classical antiquity, and of Roman or Greek capitalists. This is merely another way of saying that in Rome and Greece labour was *free*, an assertion which these gentlemen would hardly make. If we talk of plantation owners in America as capitalists, if they *are* capitalists, this is due to the fact that they exist as anomalies within a world market based upon free labour..."

Laclau: "For Marxists feudalism does not mean a closed system which market forces have not penetrated [which is what Laclau's rival, Andre Gunder Frank, understands by the term, as well as 19th-century liberals], but a general ensemble of extra-economic coercions weighing on the peasantry, absorbing a good part of its economic surplus, and thereby retarding the process of internal differentiation within the rural classes, and therefore the expansion of agrarian capitalism. This is also what the French revolutionaries of 1789 understood by feudalism when they thought they were suppressing it by abolishing the *gabelles* and seigneurial privileges. When Lenin speaks of the growing weight of capitalism in the agrarian structure of Russia in *The Development of Capitalism in Russia*, his aim is to demonstrate a growing process of class differentiation which was gradually producing a class of rich peasants, on the one hand, and an agricultural proletariat, on the other. It would not have occurred to Lenin to base his demonstration of this process on a progressive expansion of production for the market, for such production had *precisely* formed the source of feudalism in Russia several centuries before, when growing opportunities for commercialized wheat production had led the landowners to increase—indeed to establish—the oppression of serfdom."

As I noted above, Laclau argues that production for a world market, far from dissolving feudalism in Latin America (as Frank thinks), actually intensified it, just as it had done much earlier in Russia. "The feudal regime of the haciendas tended to increase its servile exactions on the peasantry as the growing demands of the world market stimulated maximization of their surplus." In fact, the expansion of the dynamic bourgeois sectors of the Latin American economy was a function of the backwardness of agrarian relations of production. Development generated underdevelopment in this sense. This fact goes a long way towards explaining the schizoid character of Latin American politics, which is now democratic, now oligarchical, now dictatorial, now military junta-like, now socialist, etc. (See the extracts from Therborn's article above.)

Laclau's definitions of various terms: "We understand by 'mode of production' an integrated complex of social productive forces and relations linked to a determinate type of ownership of the means of production. From among the ensemble of relations of production, we consider those linked to the ownership of the means of production to be the essential relations, since they determine the forms of canalization of the economic surplus and the effective degree of the division of labour, the basis in turn of the specific capacity of the productive forces for expansion. Their own level and rhythm of growth depends in turn on the destination of the economic surplus. We therefore designate as a mode of production the logical and mutually co-ordinated articulation of: 1. a determinate type of ownership of the means of

production; 2. a determinate form of appropriation of the economic surplus; 3. a determinate degree of development of the division of labour; 4. a determinate level of development of the productive forces. This is not merely a descriptive enumeration of isolated ‘factors’, but a totality defined by its mutual interconnections. Within this totality, property in the means of production constitutes the decisive element.

“An ‘economic system’, on the other hand, designates the mutual relations between the different sectors of the economy, or between different productive units, whether on a regional, national or world scale. When, in Volume One of *Capital*, Marx analysed the process of production of surplus value and the accumulation of capital, he described the *capitalist mode of production*. On the other hand, when he analyses the interchange between Department One and Department Two and introduces problems such as rent or the origin of commercial profit, he is describing an ‘economic system’. An economic system can include, as constitutive elements, different modes of production—provided always that we define it as a whole, that is, by proceeding from the element or law of motion that establishes the unity of its different manifestations.

“The feudal mode of production is one in which the productive process operates according to the following pattern: 1. the economic surplus is produced by a labour force subject to extra-economic compulsion; 2. the economic surplus is privately appropriated by someone other than the direct producer; 3. property in the means of production remains in the hands of the direct producer. In the capitalist mode of production, the economic surplus is also subject to private appropriation, but as distinct from feudalism, ownership of the means of production is severed from ownership of labour-power; it is this that permits the transformation of labour-power into a commodity, and with this the birth of the wage-relation.”

Frank explains Latin American underdevelopment by reference to the continent’s “dependence” on external imperial powers, and its exploitation by the latter. Dependence apparently means, or implies, the constant absorption by the “independent” region of the “dependent” region’s economic surplus. (So of course, strictly speaking, there is interdependence.) This explanation does make some sense, since “reducing the economic surplus of the peripheral countries” indirectly causes their relations of production to be “fixed in an archaic mould of extra-economic coercion” and must “retard any process of social differentiation and diminish the size of their internal markets”. This is more of a general ‘framework’, though, and it doesn’t say very much. Specific mechanisms have to be identified.

Althusser was overrated. His thought was unrigorous and confused, though occasionally suggestive. He was a product of France’s decadent intellectual culture in the ’60s, ’70s and ’80s, the culture that produced Derrida, Foucault, Lacan, Lyotard, Deleuze, Baudrillard and the others.

March 17

Liberty, equality, fraternity. Superficially they’re three very different values, but on a deeper level they’re closely interrelated. They’re simply different ways of expressing the desire for freedom, for recognition. You can’t have “freedom” without equality, without brotherhood, and without political liberty.

Jameson argues that in postmodern society there is no longer alienation *per se*, the alienation of Munch’s *The Scream* or some of Beckett’s work; there is instead fragmentation. The intense solitude, self-questioning, the morbid self-fixation of alienation isn’t widespread anymore; the self is too fragmented, too much a pastiche of discourses and social relations and such. But this is itself alienation. A more advanced, more subtle alienation. Anxiety is still widespread, people complain of stress more than ever; but art and philosophy no longer give expression to it with even the limited coherence and self-confidence they once did. Much art even *celebrates* it, yes. Jameson is right about that. And culture takes existential predicaments less seriously than it once did, as Jameson says. Insofar as modernism was *serious* (philosophies of despair, artworks of despair and confusion, etc.), it has been largely transcended. Everything seems lighter and more temporary now, and writers with a pessimistic outlook, critical of society, are often accused of being “curmudgeons”, intellectually or emotionally immature. Culture just isn’t *serious* anymore; it’s quite playful, in fact—or childish, ADDish—which reflects its total commodification. But therapy is more

widespread than ever, people are unhappy even if they tell themselves otherwise, and fragmentation is the essence of alienation.

...Sure, postmodernism meant a strange euphoria, a sensation of novelty, an artistic and intellectual freedom. But this excitement was short-sighted and didn't last long, couldn't last long, because humans need stability and coherence. They'll never accept the death of the self (whatever that means) or of the notion of truth or knowledge. They'll go on ordering their world until their last day; and if they lose their bearings they'll despair. Postmodernism was never as profound or revolutionary or heroic as it thought; it wasn't a thoroughgoing, principled rejection of all systems of meaning ("signification"), of narratives and foundations and truths, since that's impossible on this side of schizophrenia. Its euphoria was basically the intoxication of not having to think to the bottom of things anymore, of not having to work very hard at structuring things, and of (not) doing so with a good intellectual conscience because supposedly the truth of no-truths had been discovered and was being acted on. But that's a shallow, dishonest creed, fundamentally alienated from itself (i.e., self-contradictory).

The euphoria, the freedom of postmodernism was already understood by Hegel: it was the euphoria of *negative* freedom, of rejecting all rules and destroying everything. "The sole work and deed of universal freedom is therefore *death*, a death too which has no inner significance or filling, for what is negated is the empty point of the absolutely free self. It is thus the coldest and meanest of all deaths, with no more significance than cutting off a head of cabbage or swallowing a mouthful of water." He was referring there to the Terror of the French Revolution, but his point is roughly translatable to postmodernism. The discarding of the Signified in favor of playing with Signifiers is an empty move, since what is negated (incompletely) is the abstract idea of meaning itself while the self continues to live through concrete meanings in every moment. Postmodernism is an impossible, contradictory, empty project.

From Jameson's article: "...If, indeed, the subject has lost its capacity actively to extend its pro-tensions and re-tensions across the temporal manifold, and to organize its past and future into coherent experience, it becomes difficult enough to see how the cultural productions of such a subject could result in anything but 'heaps of fragments' and in a practice of the randomly heterogeneous and fragmentary and the aleatory. These are, however, very precisely some of the privileged terms in which postmodernist cultural production has been analysed (and even defended, by its own apologists). Yet they are still privative features; the more substantive formulations bear such names as textuality, *écriture*, or schizophrenic writing, and it is to these that we must now briefly turn.

"I have found Lacan's account of schizophrenia useful here, not because I have any way of knowing whether it has clinical accuracy, but chiefly because—as description rather than diagnosis—it seems to me to offer a suggestive aesthetic model...

"Very briefly, Lacan describes schizophrenia as a breakdown in the signifying chain, that is, the interlocking syntagmatic series of signifiers which constitutes an utterance or a meaning. I must omit the familial or more orthodox psychoanalytic background to this situation, which Lacan transcodes into language by describing the Oedipal rivalry in terms, not so much of the biological individual who is your rival for the mother's attention, but rather of what he calls the Name-of-the-Father, paternal authority now considered as a linguistic function. His conception of the signifying chain essentially presupposes one of the basic principles (and one of the great discoveries) of Saussurean structuralism, namely the proposition that meaning is not a one-to-one relationship between signifier and signified, between the materiality of language, between a word or a name, and its referent or concept. Meaning on the new view is generated by the movement from Signifier to Signifier: what we generally call the Signified—the meaning or conceptual content of an utterance—is now rather to be seen as a meaning-effect, as that objective mirage of signification generated and projected by the relationship of Signifiers among each other. [This is a typically one-sided account of Saussure's position. The signified is just as important as the signifier.] When that relationship breaks down, when the links of the signifying chain snap, then we have schizophrenia in the form of a rubble of distinct and unrelated signifiers. The connection between this kind of linguistic malfunction and the psyche of the schizophrenic may then be grasped by way of a two-fold proposition: first, that personal identity is itself the effect of a certain temporal unification of past and future with the

present before me; and second, that such active temporal unification is itself a function of language, or better still of the sentence, as it moves along its hermeneutic circle through time. If we are unable to unify the past, present and future of the sentence, then we are similarly unable to unify the past, present and future of our own biographical experience or psychic life.

“With the breakdown of the signifying chain, therefore, the schizophrenic is reduced to an experience of pure material Signifiers, or in other words of a series of pure and unrelated presents in time. We will want to ask questions about the aesthetic or cultural results of such a situation in a moment; let us first see what it feels like: ‘I remember very well the day it happened. We were staying in the country and I had gone for a walk alone as I did now and then. Suddenly, as I was passing the school, I heard a German song; the children were having a singing lesson. I stopped to listen, and at that instant a strange feeling came over me, a feeling hard to analyse but akin to something I was to know too well later—a disturbing sense of unreality. It seemed to me that I no longer recognized the school, it had become as large as a barracks; the singing children were prisoners, compelled to sing. It was as though the school and the children’s song were set apart from the rest of the world. At the same time my eye encountered a field of wheat whose limits I could not see. The yellow vastness, dazzling in the sun, bound up with the song of the children imprisoned in the smooth stone school-barracks, filled me with such anxiety that I broke into sobs. I ran home to our garden and began to play “to make things seem as they usually were,” that is, to return to reality. It was the first appearance of those elements which were always present in later sensations of unreality: illimitable vastness, brilliant light, and the gloss and smoothness of material things.’ [From a schizophrenic’s autobiography.]

“In our present context, this experience suggests the following remarks: first, the breakdown of temporality suddenly releases this present of time from all the activities and the intentionalities that might focus it and make it a space of praxis; thereby isolated, that present suddenly engulfs the subject with undescribable vividness, a materiality of perception properly overwhelming, which effectively dramatizes the power of the material—or better still, the literal—Signifier in isolation. This present of the world or material signifier comes before the subject with heightened intensity, bearing a mysterious charge of affect, here described in the negative terms of anxiety and loss of reality, but which one could just as well imagine in the positive terms of euphoria, the high, the intoxicatory or hallucinogenic intensity.” Perhaps, but the author was showing keen psychological insight in describing the experience in negative terms, because a loss of meaning is ultimately horrible and unnatural.

I won’t deny that Jameson’s essay is suggestive and insightful. It illuminates both the strengths and weaknesses of postmodernism.

March 19, 20

Nietzsche described the loss of God (or metaphysical meaning) as liberating, but, first of all, that was partly wishful thinking—since he was obviously very disturbed by God’s death—and second of all, it was liberating only insofar as it allowed him to create his own meaning(s). He didn’t want to reject *all* meaning, *all* truth. That, he understood, would be nihilistic.

Althusser: ideology as the representation of the subject’s *imaginary* relationship to his *real* conditions of existence. Fruitful or not? Ideological ways of constructing a subject (see Therborn’s definition of ideology) are necessarily ‘imaginary’, insofar as the psyche appropriates them in an ‘unscientific’ way, according to its own internal dynamics and needs etc.? But some ideologies can be more ‘scientific’ than others, can come closer to approximating science than others. The idea is to come up with an ideology that is as close to the truth as possible, not only for the pure sake of knowledge but also because such an ideology would give the subject an almost perfect means of orienting himself in the world, which is the subject’s intrinsic goal.

Marinetti's famous "Futurist Manifesto" (published in 1909) is a piece of second-rate writing, a self-conscious but naïve second-rate imitation of Nietzsche or at least his spirit, yet it does have the indirect merit of confirming Marx's doctrine that consciousness is, if not a reflex of social being, certainly a product of it. Futurism. Fascism. Militarism. Nationalism. Delusionalism.

How can you explain the fact that a woman's beauty can be almost *painful* to look at? Especially if she isn't your girlfriend, it's maddening to look at her beauty. Your whole being is in that moment oriented towards her, towards the blush of her cheek and her white teeth. If you could only possess her, make her one with you, you would be complete. Your intense desire amounts to an intense feeling of lack in yourself, a need to appropriate the wonderful foreignness of this magnificent 'object.' The thought of its remaining foreign to you is nearly unbearable. So you want to kiss her and make love to her, since getting close to her is the best way of making her one with you.

But I think the pain is also related to your half-conscious knowledge that your desire can never be consummated. Even sex wouldn't be a consummation. She'd remain her own person; she wouldn't be a *part* of you, as you want her to be because she's just so beautiful.

Those of you who still admire or revere Winston Churchill (reverence is almost always based on ignorance) should consider this, from Anderson's article on Palestine: "Churchill's long-standing Zionism was based on racial rather than religious convictions. He expressed his social darwinist beliefs unambiguously to the Peel Commission in 1937, comparing Palestinian Arabs to the proverbial emblem of envious egoism in the animal world: 'I do not agree that the dog in a manger has the final right to the manger, even though he may have lain there for a very long time. I do not admit that right. I do not admit, for instance, that a great wrong has been done to the Red Indians of America, or the black people of Australia. I do not admit that a wrong has been done to these people by the fact that a stronger race, a higher grade race, a more worldly-wise race, to put it that way, has come in and taken their place.'" Churchill and Hitler would have got along well in different circumstances.

Speaking of Hitler...here are some tidbits from articles on the Holocaust: "Dr. Josef Mengele worked in Auschwitz. His experiments included placing subjects in pressure chambers, testing drugs on them, freezing them, attempting to change eye color by injecting chemicals into children's eyes, and various amputations and other brutal surgeries... 'I remember one set of twins in particular: Guido and Ina, aged about four. One day, Mengele took them away. When they returned, they were in a terrible state: they had been sewn together, back to back, like Siamese twins. Their wounds were infected and oozing pus. They screamed day and night. Then their parents—I remember the mother's name was Stella—managed to get some morphine and they killed the children in order to end their suffering.'" "

"The Germans came, the police, and they started banging houses: 'Raus, raus, raus, Juden raus.'... One baby started to cry... The other baby started crying. So the mother urinated in her hand and gave the baby a drink to keep quiet... [When the police had gone], I told the mothers to come out. And one baby was dead... From fear, the mother [had] choked her own baby."

"I saw them do the killing. At 5:00 p.m. they gave the command, 'Fill in the pits.' Screams and groans were coming from the pits. Suddenly I saw my neighbor Ruderman rise from under the soil... His eyes were bloody and he was screaming: 'Finish me off!'... A murdered woman lay at my feet. A boy of five years crawled out from under her body and began to scream desperately. 'Mommy!' That was all I saw, since I fell unconscious."

—The power of ideology. [But even more, the power of bureaucratic dehumanization.]

A paradox of morality.— Given the absurd suffering in which modern life consists, it is surely immoral to have a child. I.e., one is wronging a person by—bringing him into existence. If one chooses not to create him, one is doing right by him, this person who does not exist; if one gives him life, one is acting reprehensibly. What an odd state of affairs! It's actually possible to act morally vis-à-vis someone who does not exist.

March 21, 22

Intriguing reflections from Anderson's "jottings": "Tom Nairn's account goes roughly like this. Marx-ism was always based on a distortion of Marx's own thought, formed in the democratic struggles of the Rhineland in the 1840s. For whereas Marx assumed that socialism was possible in the long run, only when capitalism had completed its work of bringing a world market into being, the impatience of both masses and intellectuals led to the fatal short-cuts taken by Lenin and Mao, substituting state power for democracy and economic growth. The result was a diversion of the river of world history into the marshlands of a modern middle ages. But the collapse of Soviet Communism in 1989 has now allowed the river to flow again to its natural delta—contemporary globalization. For the core meaning of globalization is the generalization of democracy around the world, fulfilling at last the dreams of 1848, crushed during Marx's life-time. Marx, however, himself made one crucial mistake, in thinking class would be the carrier of historical emancipation, in the shape of the proletariat. In fact, as the European pattern of 1848 already showed, and the whole of the 20th century would confirm, it was nations, not classes, that would become the moving forces of history, and the bearers of the democratic revolution for which he fought.

"Hardt and Negri concur that globalization is essentially a process of emancipation, [but, unlike Nairn, they argue that nation-states will wither away]. Their story starts earlier, in the 16th century, when the liberating spirit of the Renaissance was crushed by a Baroque counter-revolution that erected Absolutism as the originating form of modern sovereignty. Inherited essentially unaltered by the nation-states of the industrial epoch, it is the passing of this legacy, with the dissolution of nation-states themselves into a single, uniform 'Empire', that marks the dawn of a new era of freedom and equality. The turning-point here was not the overthrow of communism in 1989—barely mentioned—but the decade 1968–1978, when anti-imperialist victory in Vietnam and revolts by workers, unemployed and students in the West forced a reconfiguration of capitalism into its contemporary universal guise. With the advent of universal Empire, classes too—like nations—fade away, as capital generates the increasingly 'immaterial' labour of a single, and no less universal multitude. The days of national liberation, of the working class, of revolutionary vanguards, are over. But just as Empire was created by resistance from below, so it will fall to such resistance, as spontaneous networks of opposition to it proliferate across the earth. Out of the spiralling actions of this multitude—demonstrations, migrations and insurrections—driven by a common biopolitical desire for peace and democracy, will flower a post-liberal, post-socialist world. Without the mystifications of sovereignty or representation, all will for the first time rule in freedom and equality. It could happen at any moment. 'Today time is split between a present that is already dead and a future that is already living—and the yawning abyss between them has become enormous. In time, an event will thrust us like an arrow into that living future'."

Personally, I think that global decentralization is the most likely long-term outcome. The nation-state will not last, nor will giant multinational corporations or the centralized economies of today. All the trends indicate such an evolution, for example the decentralized internet, the decentralized technologies of renewable energy, and the slowly increasing irrelevance of the nation-state.

From Godelier's article: "Generally speaking, matrilineal societies disintegrated much more rapidly than patrilineal ones; and fluid, egalitarian societies resisted the shock [of European colonialism] less well than hierarchically organized societies. In Africa, for example, the plantation economy and mining development called above all for male manpower and wage labour. The traditional economy gradually disappeared, or at least became centred on the nuclear family, which depended on men's labour for a wage. The overall framework, involving a new dependence of women on men, and of children on their mother, spelt the destruction of reciprocal economic ties within the hereditary line and between clans, as well as the loss of public positions and prestige by the women of society. Furthermore, Leacock herself has shown that in the 17th and 18th centuries, the Montagnais passed from a matrilineal to a patrilineal structure, and that this change resulted from the growth of an almost entirely male-centred trapping economy and fur trade. In the 17th century these Indians lived in fluid groups, mainly practising collective caribou-hunting in which

men and women co-operated with each other. Kinship relations were of an undifferentiated, cognate type, albeit with a matrilineal inflexion. The bands were exogamous units. Today, they have become endogamous and patrilocal. The men have rights as individuals over the areas of common land on which they lay their lines of traps; and these rights are transmitted from father to son. Families live less and less from hunting and subsistence gathering, but depend on their dealings with the White trading posts, where they buy rifles, ammunition, traps, and lard and flour for the winter. For this reason, they leave their children at the school or mission built alongside the trading post. The historical pattern has thus broken up, and it is growing more difficult every day to reconstruct the male-female relations of pre-colonial times. For Leacock, however, the course of the last few centuries points up a law of development which had its first effects thousands of years before the birth of capitalism.

“In Leacock’s view, production for exchange, the breakdown of local solidarity, and the clash of interests between groups or societies, are all factors which long before capitalism gradually strengthened the social position of men. Following analyses by Judith Brown, she cites as proof *a contrario* the fact that woman’s status in the matrilineal Bemba society of Africa is much lower than among the Iroquois. However, the Bemba have a hierarchical form of organization in which an aristocracy dominates the common people, and local family units produce wealth that is concentrated in the hands of this aristocracy. Gifts of food, far from elevating the prestige of women, actually raise that of their husbands. And part of the product is redistributed according to class relations, rather than relations between kinship groups or the two sexes. Leacock, then, is putting forward an overall view of historical development. Taking the Naskapi Indians as a model of primitive hunter-gatherers, she constructs a more general line of development: a line, that is, running from egalitarian societies in which men and women share the same status of public authority and enjoy an autonomy of their own, to the multiple forms of class society in which hierarchies favouring male power gradually emerge through the disintegration of community ties. One case in point is our own line of development, which constantly strengthens private appropriation of the land and the means of production. It is, indeed, within this framework that the monogamous family thrust itself forward and consolidated itself. Thus Leacock has taken over Engels’s hypothesis which relates a worsening of woman’s status to the emergence of class inequalities, and dominance of the monogamous family to the dominance of private property.”

Godelier argues, however, that even though some primitive societies have been basically egalitarian, “in the last analysis” it is likely that men have always “occupied the summit of the power hierarchy”.

Sexual inequality is related to conditions of material production inasmuch as the person who brings home the bacon tends to have the authority; and that person is usually the man, for biological reasons. (He is stronger and doesn’t get pregnant or breastfeed children. He is more mobile than the woman.) There are other causal ties of course, but that one is the most important and direct.

Reading Engels’ *Origins of the Family, Private Property, and the State*, on the internet. I don’t like internet-reading, and I suspect it makes possible a less complete memory-absorption than book-reading does, but it’s convenient.

Spent the night with Gimena in my room. As we were hugging I heard her whisper, “Stupid, so stupid...”; I asked her what was the matter and saw she was crying a little. “What’s wrong, Gimena?” “I’m leaving...I’ll miss you... I hate crying.” She’s going back to Argentina in a week. Later she let me tongue-probe her for a while, but she still wouldn’t have sex, though evidently she wanted to. “You’re incredible!” she whispered. [...]

Engels had a rare wit. In a passage devoted to the ridicule of “moralizing philistines” who deny that humanity could ever have experienced a sexually promiscuous period millennia ago because that would be, well, *shameful*, Engels remarks, “If strict monogamy is the height of all virtue, then the palm must go to the tapeworm, which has a complete set of male and female sexual organs in each of its 50-200 proglottides, or sections, and spends its whole life copulating in all its sections with itself.” Brilliant. The book itself is excellent. The variety of social organizations it details is astonishing, and gives the lie to the bourgeois clichés that humans are naturally egoistic, that private property is natural, that the nuclear family is natural.

“The history of the family in primitive times consists in the progressive narrowing of the circle, originally embracing the whole tribe, within which the two sexes have a common conjugal relation. The continuous exclusion, first of nearer, then of more and more remote relatives, and at last even of relatives by marriage, ends by making any kind of group marriage practically impossible.” The various kinds of group marriage (and sexual promiscuity) and the “pairing marriage” (which is like an informal, easygoing sort of monogamy) correspond to primitive, natural communal property; monogamy corresponds to private property, as in Athens, where it signifies, as it always has, the subordination of women. “Monogamous marriage comes on the scene as the subjugation of the one sex by the other; it announces a struggle between the sexes unknown throughout the whole previous prehistoric period. ...The first class opposition that appears in history coincides with the development of the antagonism between man and woman in monogamous marriage, and the first class oppression coincides with that of the female sex by the male.”

Monogamy and male supremacy were established for the preservation and inheritance of property. “Monogamy arose from the concentration of considerable wealth in the hands of an individual man—and from the need to bequeath this wealth to the children of that man and of no other. For this purpose, the monogamy of the woman was required, not that of the man, so this monogamy of the woman did not in any way interfere with open or concealed polygamy on the part of the man.” The reason monogamy was required for the woman is that group marriage etc. means that the man doesn’t know who his children are, because the woman has sex with different men. In a propertyless epoch this uncertainty on the part of the man had no economic consequences;¹ but in a time when property had to pass from father to son, the father had to know that the son was in fact his. Therefore female monogamy was established. This explanation is functional, as you can see, and would thus be rejected by Jon Elster and others, but functional explanations are not in fact valueless. They’re shorthand versions of complete causal explanations.

March 23

In Greece, “the rise of private property in herds and articles of luxury led to exchange between individuals, to the transformation of products into commodities. And here lie the seeds of the whole subsequent upheaval [whereby classes and the state were born]. When the producers no longer directly consumed their product themselves, but let it pass out of their hands in the act of exchange, they lost control of it. They no longer knew what became of it; the possibility was there that one day it would be used against the producer to exploit and oppress him. For this reason no society can permanently retain the mastery of its own production and the control over the social effects of its process of production unless it abolishes [commodity] exchange between individuals.”

Suggestive: “The plain truth is that for two and a half thousand years it has been possible to preserve private property only by violating property.” As Proudhon would say, property is theft. But Engels’ statement is less ambiguous.

The parallels between the social organizations of the Iroquois, the Celts, the old Germans, the Greeks of the Heroic Age, the early Romans—indeed, the parallels between all “barbarian” societies everywhere, which Engels describes in detail—are breathtaking. It’s another point for historical materialism, since among such societies the material conditions are similar. Apparently descent was always matrilineal at first and became patrilineal only after group marriage had died out and something like individual property was gaining ground; the gens, or the clan, was always the basis of social organization, right up to the threshold of “civilization”, and primitive democracy took similar, gentile forms everywhere; women were always honored and respected before strict monogamy and private property were instituted. For example, “another relic of mother-right, which was still only in process of dying out, was the respect

¹ Incidentally, as Engels remarks, it explains why matrilineal descent was the norm, namely because the child’s paternity was usually unknown. With the establishment of monogamy, descent was reckoned through the father, who now had undisputed authority over the mother.

of the Germans for the female sex, which to the Romans was almost incomprehensible. Young girls of noble family were considered the most binding hostages in treaties with the Germans. The thought that their wives and daughters might be taken captive and carried into slavery was terrible to them and more than anything else fired their courage in battle; they saw in a woman something holy and prophetic, and listened to her advice even in the most important matters.” This was around the time of Tacitus, but already you can see the distant origins of chivalry, which seems to have been a relic of the primeval reverence for women.

“In general, then, the constitution of those German tribes which had combined into peoples was the same as had developed among the Greeks of the Heroic Age and the Romans of the so-called time of the kings: assembly of the people, council of the chiefs of the gentes, military leader, who is already striving for real monarchic power. It was the highest form of constitution which the gentile [i.e., clan] order could achieve; it was the model constitution of the upper stage of barbarism. If society passed beyond the limits within which this constitution was adequate, that meant the end of the gentile order; it was broken up and the state took its place.”

The famous love of freedom, democracy, etc., which historians celebrate in the Germanic race and which made possible an eventual rebirth of civilization on a firmer basis than slavery, was, says Engels, nothing but a product of their old gentile constitution, which barbarians everywhere share. “What was the mysterious magic by which the Germans breathed new life into a dying Europe [after the demise of Rome]? Was it some miraculous power innate in the Germanic race, such as our chauvinist historians romance about? Not a bit of it. The Germans, especially at that time, were a highly gifted Aryan tribe, and in the full vigor of development. It was not, however, their specific national qualities which rejuvenated Europe, but simply—their barbarism, their gentile constitution.

“Their individual ability and courage, their sense of freedom, their democratic instinct which in everything of public concern felt itself concerned; in a word, all the qualities which had been lost to the Romans and were alone capable of forming new states and making new nationalities grow out of the slime of the Roman world—what else were they than the characteristics of the barbarian of the upper stage, fruits of his gentile constitution?

“If they recast the ancient form of monogamy, moderated the supremacy of the man in the family, and gave the woman a higher position than the classical world had ever known, what made them capable of doing so if not their barbarism, their gentile customs, their living heritage from the time of mother-right?

“If in at least three of the most important countries, Germany, northern France and England, they carried over into the feudal state a genuine piece of gentile constitution, in the form of village communities, thus giving the oppressed class, the peasants, even under the harshest medieval serfdom, a local center of solidarity and a means of resistance such as neither the slaves of classical times nor the modern proletariat found ready to their hand—to what was this due, if not to their barbarism, their purely barbarian method of settlement in kinship groups?

“Lastly: they were able to develop and make universal the milder form of servitude they had practiced in their own country, which even in the Roman Empire increasingly displaced slavery; a form of servitude which, as Fourier first stressed, gives to the bondsmen the means of their gradual liberation as a class; a form of servitude which thus stands high above slavery, where the only possibility is the immediate release, without any transitional stage, of individual slaves (abolition of slavery by successful rebellion is unknown to antiquity), whereas the medieval serfs gradually won their liberation as a class. And to what do we owe this if not to their barbarism, thanks to which they had not yet reached the stage of fully developed slavery, neither the labor slavery of the classical world nor the domestic slavery of the Orient?

“All the vigorous and creative life which the Germans infused into the Roman world was barbarism. Only barbarians are able to rejuvenate a world in the throes of collapsing civilization. And precisely the highest stage of barbarism, to which and in which the Germans worked their way upwards before the migrations, was the most favorable for this process. That explains everything.”

One cause of the breaking up of the gens is the rise in “property differences within one and the same gens, [which transforms] its unity of interest into antagonism between its members” (Marx). The

property differences grow out of the division of labor that results from the increasing productivity of labor, which results from the development of technology.

Another cause is the growing heterogeneity of the population in a given territory, which is due to the rise in trade, the establishment of slavery, etc. “The necessary condition for the existence [of the gentile constitution] was that the members of a gens or at least of a tribe were settled together in the same territory and were its sole inhabitants.”

In short, “the gentile constitution had grown out of a society which knew no internal contradictions, and it was only adapted to such a society. It possessed no means of coercion except public opinion. But here was a society [namely, the emerging “civilized” society] which by all its economic conditions of life had been forced to split itself into freemen and slaves, into the exploiting rich and the exploited poor; a society which not only could never again reconcile these contradictions, but was compelled always to intensify them. Such a society could only exist either in the continuous open fight of these classes against one another, or else under the rule of a third power, which, apparently standing above the warring classes, suppressed their open conflict and allowed the class struggle to be fought out at most in the economic field, in so-called legal form. The gentile constitution was finished. It had been shattered by the division of labor and its result, the cleavage of society into classes. It was replaced by the state.”

Maybe one way of conceptualizing the priority of class over gender, race, ethnicity and so on is that the division of society into classes is what makes possible the conflict-focused orientation to the world which also manifests itself in racial conflicts, gender conflicts and the like. Differences in property, wealth and power create the envious (and jealous) mentality that originally shows itself in economic conflict but eventually in racial etc. conflicts too. Indeed, all these derivative conflicts exist only where racial groups or the sexes are divided by access to resources and power, a division that is a function of the economic formation and could not exist if there were no classes. Blacks hate and envy whites only if the latter economically oppress them,¹ and because the whites despise the blacks for being poor or slavish, i.e., part of the lower class. Certainly the difference in skin color accentuates the conflict, but this exclusively racial prejudice is obviously secondary; it presupposes the original material inequality. (Now that blacks have economic power and rights, racial prejudice is diminishing.) Much the same thing is true of gender. There is not some sort of spontaneous or genetic dislike of people different from oneself; collective prejudice is always sustained by some form of material inequality, by material hardship ultimately rooted in class conditions.

More examples of common sense: “As the state arose from the need to keep class antagonisms in check, but also arose in the thick of the fight between the classes, it is normally the state of the most powerful, economically ruling class, which by its means becomes also the politically ruling class, and so acquires new means of holding down and exploiting the oppressed class. The ancient state was, above all, the state of the slave-owners for holding down the slaves, just as the feudal state was the organ of the nobility for holding down the peasant serfs and bondsmen, and the modern representative state is the instrument for exploiting wage-labor by capital. Exceptional periods, however, occur when the warring classes are so nearly equal in forces that the state power, as apparent mediator, acquires for the moment a certain independence in relation to both. This applies to the absolute monarchy of the seventeenth and eighteenth centuries, which balances the nobility and the bourgeoisie against one another; and to the Bonapartism of the First and particularly of the Second French Empire, which played off the proletariat against the bourgeoisie and the bourgeoisie against the proletariat. The latest achievement in this line, in which ruler and ruled look equally comic, is the new German Empire of the Bismarckian nation; here the capitalists and the workers are balanced against one another and both of them fleeced for the benefit of the decayed Prussian cabbage Junkers.” Even in these exceptional periods, though, the state exists for the sake of maintaining order, i.e., supporting those classes that already have power.

¹ “Social” oppression, after all, transparently presupposes economic oppression.

In 200 years Bill Clinton, Barack Obama, John F. Kennedy will be forgotten; Marx and Nietzsche will still be celebrated.

Lukács's essay "What Is Orthodox Marxism?" gives a pretty good description of what the dialectical method is, namely an approach towards understanding society on the basis of its *total development*, the entire history of the entire social totality. The part can't be understood until the whole is understood, and vice versa. By 'the whole' is meant both the present configuration of civilization and the latter's entire history (including its future—which means, of course, that a *full* understanding of society, at whatever stage, is impossible, since it never stops unfolding itself and its secrets). To understand a particular historical stage one has to look at its past and future; its future is its 'truth', as Hegel would say, but at the same time its future can't be understood except by understanding its past, its origins. This is why I wrote eight years ago that the best method in social science is the historical method, the method which seeks to understand present-day society by reconstructing its entire past. For, first of all, what is extremely complicated now appears in a simpler, nascent form in earlier times; secondly, to understand how we got to where we are, i.e., the causes and nature of the current social structure, obviously we have to examine the past; thirdly,—I forget. Regardless, if this sort of thing is the dialectical method, this method isn't as unique to Marxism as Lukács would like to believe—or anyway it shouldn't be, since it's just common sense and doesn't seem essentially related to traditional Marxist concerns like class, exploitation, materialist theories, etc. Still, the holistic, structural, 'developmental' method (the method that concerns itself with *social dynamics*) has usually been associated with Marxism. Most bourgeois theorists have rejected it, for obvious ideological reasons. And maybe, after all, the method does naturally tend to confirm substantive Marxist theses. That's likely.

March 24

In some ways Gimena is a special girl, different from her Latin sisters. She's the kind of girl who partially restores my faith in women: she's surrounded all day by those handsome, dark-skinned, charismatic, loud Latinos who make most girls swoon, but she chooses me over them. It says a lot about her.

Perceptive remark from Charles Taylor: "Modern society, we might say, is Romantic in its private and imaginative life, and utilitarian or instrumentalist in its public, effective life." By 'Romantic' he means 'concerned with personal fulfillment, creativity, individual authenticity, self-expression'. He's certainly right that there's a semi-dichotomy. What explains it? What does it mean? Romanticism came on the scene when capitalism and industrialism were overtaking Europe. Hobsbawm argues that Romanticism can be partly understood as a reaction to the brutality, vulgarity, utilitarianism and materialism of the new industrial order; it was a retreat from the unpleasantness of the public realm into the autonomy of the private realm. Insofar as its legacy persists, then, it can be understood as a private, human reaction to inhuman public, economic conditions, such as bureaucracy. Utilitarianism and instrumentalism are not truly human, not deeply social; Romanticism, ironically, is (more so), despite its emphasis on individuality. But this emphasis is only superficially contradictory to social desires and needs, since it is precisely a reaction against social deprivation in society. 'If I can't express myself or be recognized as who I am in the public world, then I'll turn to the private world.' But, as Lasch argues, the private world is being increasingly infiltrated by the public, commodified world, and so therapy is on the rise and an attenuated ideology of Romanticism clings desperately to life despite its obvious inadequacy to contemporary conditions.

Romanticism is an alienated response to alienation.

Rustin argues for a theoretical interaction between psychoanalysis and Marxism, which have, of course, tended to be hostile toward one another. At one point he writes, "Timpanaro is asking that Marxists should address themselves to phenomena of feeling (concern with bereavement and loss, for example) which have been much more seriously addressed within Romantic literary work (and within

psychoanalysis) than elsewhere in this culture.” Okay, that’s useful advice. But what can Marxists say about *feelings*? Every theoretic system has its subject-matter, and emotions are not the subject-matter of Marxism. One thing it can say is that feelings of loss may be more intense in class societies than in classless ones, since in the former the community is not as undifferentiated as it is in the latter, which means there is less of an emotional ‘support-system’.

“I would summarize the Kleinian body of work as offering a view of human beings which in an intense and unusual way assumes them to be moral in their fundamental nature. It also, and in close relation to this, assumes them to be constituted as social beings in a primary and continuing interdependency with others. Kleinian theory is impregnated with moral categories, and its developmental concepts—especially those of paranoid-schizoid and depressive ‘positions’—incorporate moral capabilities (notably of concern for the well-being of other persons) into their theoretical definition. A stage of development is partially defined in terms of the moral capacities typical of it... Kleinian theory uniquely ascribes moral and altruistic capacities to human beings in its theoretical model of them... Innate concern for the well-being of the other, at a very deep level, appears to arise in this conception from the earliest lack of differentiation between self and other, and from the process whereby this differentiation comes about. Pleasure and pain are only slowly located in space and time, and in relation to whole persons. This intense experience of pain, as given and received, and this deep involvement with the caring person as the perceived source of all well- and ill-being, gives rise to the capacity to experience the pains and pleasures of the other with an intensity comparable to the pains and pleasures of the self.”

All this strikes me as valuable and plausible. It reminds me of Honneth’s insistence that an “affirmative” attitude toward the world is the natural one, the original and primary one. And of de Waal’s argument that “morality” is a natural phenomenon, an evolutionary adaptation that can even be seen in apes. It’s also useful as another basis for condemning capitalism, which stifles man’s instinctive moral responses.

“What matters most to human beings is whether they stand in loving and trusting relations to others.” Yep. In that sense there is not much difference between “masculine” and “feminine” desires/values.

I wonder how many papers I would have written this year if I had been accepted to a philosophy program... How much of my talent has been wasted in the last year?

It seems to me I haven’t yet “settled accounts with my erstwhile philosophic conscience”. Maybe I should focus on philosophy for the rest of the year instead of social theory.

March 26

‘Each man is an Island, entire of itself’.— For most people, out of sight means out of mind. For most Americans, ‘in sight’ means—out of mind.

The model of virtue.— A person who tends to be honest [like me] usually lacks the imagination and self-confidence to tell a lie.

Natural beauty.— Low-minded though it seems, I’d rather look at a naked woman than watch the sunset from the peak of Mount Washington.

Against Popperism.— Arguing that the natural and the social sciences should have the same method would be sensible only if humans were atoms. In capitalism it may appear that they are, but, in fact, they aren’t.

Life against death.— The nothingness of life is proven by the somethingness of death.

Fame.— People who are famous are overrated, and people who aren’t famous are underrated.

Dangerous intelligence.— The greatest danger for the perceptive observer of humanity is that he'll become convinced of the smallness of life, and will thus retreat from a life of action into passive resignation.

Out of the elements.— There are people whose souls are too expansive to stay within the confines of Earth.

On the rack.— Only a writer can know what it means to write, as only a torturer can know what it means to torture.

Dialectical irony.— It is ironic that as man gains power over nature, it becomes increasingly alien to him. The more he imposes himself on it, the less he identifies with it. (And therefore, the less he identifies with himself.)

Philosophy, too, is "embodied".— Philosophy can be no 'nobler' than its practitioners. This is why it has become the shallow, base, meaningless thing it is today.

From Lasch's essay: "The conviction that unites thinkers as diverse as Herbert Marcuse, R. D. Laing and Jacques Lacan is that psychoanalysis traces the origin of intrapsychic conflict to the conditions under which social authority recreates itself in the unconscious mind, and specifically to the institution of the patriarchal family, which crushes the revolt of the son against the father, saddles the son with a guilty conscience, and makes him grow up to become a tyrant in his own right." The Freudian left, which emerged after the failures of early socialist revolutions (like the Russian, which succumbed to dictatorship under Stalin) and the experience of Fascism, was concerned to explain why people always seemed so resistant to change and liberation. Freud's work, they thought, provided a foundation for understanding the phenomenon, in that it attacked the illusion of psychic autonomy. "Men need masters because they are not masters of themselves: this became the central contention of the Freudian left. Freud's theory, in this view, provides the deepest glimpses into the divided self. It shows how society enters and deforms the individual psyche: not through indoctrination or cultural 'conditioning', but through the deeper mechanisms of repression and sublimation." These thinkers saw the task of liberation in terms of overcoming repression, which meant "abolishing the very distinction between work and leisure, making work into play, and getting rid of the aggressive, domineering attitude toward nature that informs the present organization of work. It was partly in order to explain the origins of that attitude that theorists of the New Left turned to Freud." But they did so through the prism of earlier socialist critiques of the patriarchal family, which made connections between the rise of monogamy and the subjugation of women. (Cf. Engels's book.)

Thus, "the various schools of thought on the Freudian left—followers of Marcuse, followers of Brown, Laingians, Lacanians, radical feminists, socialist feminists—all share the central premise that the patriarchal family is the root of organized oppression". This was already, by the way, a misunderstanding of Engels's position. Nevertheless the doctrine persisted, mostly because "it seems to explain the rise and persistence of Faustian, acquisitive, aggressive, domineering character traits". (Incidentally, all the phenomena that interested the Freudian left can be better explained by Marxism than psychoanalysis. The latter is more appropriate to analysis of the individual than to that of entire cultures, simply because individual psyches, and the situations in which they mature, vary enormously even within the same culture. Mass behavior and mass movements are explained by the structures and dynamics of a society, not by the private family-caused conflicts and repressions and neuroses of individuals.) Freud's speculations in *Moses and Monotheism*, which trace the Oedipus complex to the beginning of history, also had great appeal to these thinkers. But you already know about the Oedipus complex, and surely also that the theory's applicability, if it has any, is limited to families and a culture in which the father is a domineering and overbearing figure. In any event, the Freudian left was convinced that "repression originates in the subjection of the pleasure principle to the patriarchal compulsion to work", which is somehow tied to the Oedipus complex. Again, I would reply that the compulsion to work is not patriarchal but capitalist.

Anyway, the “patriarchal” family, as the overarching paradigm, has obviously ended. Culture has become more narcissistic than repressed. But exploitation, oppression, atomization, etc. persist. Indeed, as Lasch says, “I wish only to call attention to the irony that the values of mutuality and union with others [which Freudian feminists promote, and the suppression of which they blame on patriarchy] may have come closer to realization in the patriarchal societies of the past than in our own society”.

Lasch sums up: “The point, I think, comes down to this: that although it is no longer difficult to imagine a society without the father, it is a serious mistake, perhaps a dangerous mistake, to confuse it with utopia. The Freudian left, which took shape in opposition to the old left with its economic determinism and its naive faith in material progress, has identified many of the central problems of our society and many of its central needs: in particular, the need to curb the spirit of acquisition and domination, the need for a more nurturant attitude toward nature, the need for a new relation between men and women. By directing so much of its criticism against the patriarchal family, however, the New Left has confused the issue. It has deflected criticism from the real problem to a pseudo-problem, from the corporation and the state to the family. The worst features of our society derive not from the despotism of the authoritarian father, much eroded in any case, but from the regressive psychology of industrialism, which reduces the citizen to a consumer and bombards him with images of immediate and total gratification.”

Barrett’s article, written from the perspective of feminism, points to weaknesses in Lasch’s worldview. (For example, in some of his writings he takes an ahistorical perspective, valorizing the 19th-century bourgeois form of the family and not considering other forms. And I would say he places too much emphasis on the Oedipus complex. He’s too Freudian.) But he’s probably right to stress the importance of suffering as a prerequisite for psychological maturity, and to argue that there is value in having to overcome obstacles in one’s youth (an opinion that isn’t shared by many leftists or even by ordinary people who approve of the paternalism of the welfare state). Socialists want to eradicate suffering, but that just ain’t right. “Rugged individualism” appeals to me almost as much as the vision of a communal society. Maybe its appeal is mostly aesthetic, though. And narcissistic: I myself am an avatar of individualism.

By the way, I assume you appreciate the meaning of the title “Out of the elements” in the aphorism above? I meant, first of all, that these spiritual people are in some mysterious way composed of non-spiritual stuff, matter; secondly, that they actually exist *outside* of the elements, in the realm of spirit; thirdly, I was suggesting that here on Earth they are “out of their element”, that they belong somewhere else. I figured that even though that last meaning might not explicitly occur to the reader it would at least have a subliminal effect on him, since the expression “You’re out of your element” is so common.

March 28

Bertram’s article argues for some revisions in historical materialism. Its thesis is that “international competition and conflict is the crucial mechanism in selecting social and political forms”. This side of the matter wasn’t emphasized by Marx; he usually spoke in terms of a society’s endogenous tendencies of towards conflict and revolution, determined by the contradictions between its productive forces and social relations, and between its classes. But Bertram emphasizes competition between societies. “Competition and conflict among societies selects in favour of those social forms most appropriate for the development of the productive forces”, because the society with the highest level of productive forces has, *ceteris paribus*, the greatest chance of surviving in its competition with other societies. Bertram’s reasoning is basically Darwinian; its premise is natural selection between societies. Thus, for example, a society might permit its productive forces to stagnate indefinitely only in the absence of external competition. “The thesis advanced here expects and predicts that social forms that are relatively inefficient at developing the productive forces will be eliminated once they come into competition or conflict with more efficient forms”—through, say, conquest, or through a subtler economic undermining (with political repercussions) of the inefficient social form.

“It is not the countries that enjoy the most developed productive forces that will experience crisis and revolution, but, on the contrary, those on the margins of the most dynamic social system. The more advanced countries will tend to enjoy the fruits of their possession of advanced technology and a consequent level of prosperity that will make for social stability. Countries on the periphery, however, will find themselves economically undermined by the competition from countries enjoying higher levels of productivity. Social dislocation is more likely in such circumstances.” The theory, then, obviously applies to the modern period, less obviously to pre-modern periods.

Stated more completely: “The ‘theory’ to be proposed here is, in essence, as follows. Particular societies exist in an environment that is both physical (geography, natural resources, and so on) and geopolitical (neighbouring tribes for some, rival superpowers for others). Unfortunately, the policy of peaceful co-existence sometimes endorsed by Soviet leaders has not been widely followed in human history. Countries and cultures have engaged in both economic competition of various kinds and in military conflict. In all these forms of conflict and competition, possession of a higher level of technological development increases the *chance* that a given culture or state will survive. (I put things in these probabilistic terms because I want to insure against counterexamples where a culture with a relatively advanced level of the productive forces fails because of natural disasters, incompetent generals, and so forth.) Cultures may adopt social structures (and indeed legal and political superstructures) for all sorts of reasons. The proximate cause may be religious or political, for example. But those countries or cultures that fail to select structures conducive to the development of the productive forces will either be eliminated (or assimilated) by their rivals, or will undergo a crisis that will force them to select anew their basic structures. In either case, the unsuccessful, if they survive, will tend to adopt structures resembling those of their successful rivals. A pattern will emerge in history, as structures conducive to the development of the productive forces at a particular point of their development are diffused. Needless to say, those cultures for whom a type of structure is especially successful will not be thrown into crisis and will avoid structural change. In the vicinity, however, there may be societies which are unable to generate the same success from that type of structure. Such states may sometimes select a better structure (from the developmental point of view) than the dominant culture possesses, and, by making a quantum leap in productive development, may themselves become the dominant global or regional power. The new structure will in turn be diffused by emulation or conquest.”

Bertram’s hypothesis isn’t necessarily incompatible with Marx’s version of historical materialism. Both theories could explain a given society’s adoption of new social relations. For example, the French Revolution could be seen as the result of both France’s costly, destabilizing competition with England (which had a more efficient, better-organized social formation, and maybe a higher level of economic development) and also the three-way class struggle in France. In the last analysis, class struggles are surely more important in history than international competition, for instance because they tend to be more *immediately* implicated in societal disturbances. And because class conflict structurally defines the terrain of intra- and international economic life. Etc. But Bertram’s perspective is useful to keep in mind.

The contradiction isn’t between the new dynamic forces and the stagnant relations of production, but between, on the one hand, the dynamic forces and relations of production which are slowly emerging in the old social formation (and which exist in an inextricable unity) and, on the other, the old forces with their ossified relations of production. As E. M. Wood argues, forces can’t be divorced from the social relations in which they’re embedded: a contradiction can’t exist between “material” forces (considered, somehow, independently of the social relations that are inseparable from them) and “social” relations (considered, somehow, independently of the material forces that are inseparable from them), but only between different sets of social relations with their different forces of production. I hit on this insight, if I remember rightly, in one of the footnotes to the thoughts “In defense of historical materialism” I wrote years ago.

There’s something unsatisfying about that. For one *can* separate forces from relations. The tools and nature-knowledge of early man can be considered apart from the kinship relations that structured the ways they were used. And it’s because the undeveloped nature of these forces of production was

incompatible with the existence of classes that there were no classes then. A particular set of social relations was incompatible with material conditions (considered *independently* of the social relations that actually obtained). Maybe, though, this is a function of the undeveloped state of society. In class societies, forces of production can't be defined apart from social relations and vice versa.

Maybe that's all wrong.

Wood argues that the base/superstructure distinction is, strictly speaking, not valid. "Relations of production take the form of particular juridical and political relations—modes of domination and coercion, forms of property and social organization—which are not mere secondary reflexes but constituents of the productive relations themselves. It is no doubt possible, indeed necessary, to distinguish between juridical-political forms that are constituents of productive relations and those that are more distant from, or external to, these relations—even if there are no sharp discontinuities between them. There are certainly legal and political institutions that cannot be usefully regarded as *constituents* of productive relations even if they help to sustain the system of production and to reproduce its essential relations; and perhaps the term 'superstructure' should be reserved for these. However, not all legal and political principles can be relegated to superstructure, since the material base itself is articulated through juridical-political forms. The 'sphere' of production is dominant not in the sense that it stands apart from or precedes these juridical-political forms, but rather in the sense that these forms are precisely forms of production, the *attributes* of a particular productive system.

"...There are, then, at least two senses in which the juridical–political 'sphere' is implicated in the productive 'base'. First, a system of production always exists in the shape of specific social determinations, the particular modes of organization and domination and the forms of property in which relations of production are embodied—what might be called the 'basic' as distinct from 'superstructural' juridical–political attributes of the productive system. Second, from an *historical* point of view even political institutions like *village* and *state* enter directly into the constitution of productive relations and are in a sense prior to them (even where these institutions are not the direct instruments of surplus-appropriation) to the extent that relations of production are historically constituted by the configuration of political power that determines the outcome of class conflict."

Godelier has a similar position. He argues, for example, that kinship relations in early societies are the form that production relations take. Production relations *are* kinship relations; this is why the latter dominate the society.

Wood, quoting Marx: "the 'innermost secret' of the social structure is the specific form in which 'surplus labour is pumped out of the direct producers'". Different social structures are based on different forms of surplus-extraction.

March 30

From Callinicos: "*Capital* locates capitalism's chronic liability to recurrent economic crises in the tendency of the rate of profit to fall—the form of the contradiction between the forces and relations of production specific to that mode of production." Interesting. Is the contradiction really between forces and relations of production, or is it rather a *self*-contradiction in the relations of production (and the social relations which are their extension)? In any case, the notion of "forces of production" is hard to define, and some of the controversies related to it are probably not very substantive.

Quoted in Wood: "The *real barrier* of capitalist production is *capital itself*. It is that capital and its self-expansion appear as the starting and the closing point, the motive and the purpose of production; that production is only production for *capital* and not vice versa, the means of production are not mere means for a constant expansion of the living process of the *society* of producers. The limits within which the preservation and self-expansion of the value of capital resting on the expropriation and pauperization of the great mass of producers can alone move—these limits come continually into conflict with the methods of production employed by capital for its purposes, which drive towards unlimited extension of production, towards production as an end in itself, towards unconditional development of the social productivity of

labour. The means—unconditional development of the productive forces of society—comes continually into conflict with the limited purpose, the self-expansion of the existing capital. The capitalist mode of production is, for this reason, a historical means of developing the material forces of production and creating an appropriate world market and is, at the same time, a continual conflict between this its historical task and its own corresponding relations of social production.”

I think the contradictions of capitalism are between *both* the forces of production and the relations of production *and* the relations of production and themselves. A productive force like the internet tends to foster social relations that undermine capitalist private property; and capitalist property (or production) relations themselves conflict with themselves in the holistic context of a society, leading to economic and political crises.

A useful reminder from Hobsbawm, which is similar to Bertram’s position: “The mechanisms leading to the transformation of one mode [of production] into another may not be exclusively internal to that mode, but may arise from the conjunction and interaction of differently structured societies. In this sense all development is *mixed* development. Instead of looking only for the specific regional conditions which led to the formation of, say, the peculiar system of classical antiquity in the Mediterranean, or to the transformation of feudalism into capitalism within the manors and cities of Western Europe, we ought to look at the various paths which led to the junctions and cross-roads at which, at a certain stage of development, these areas found themselves.”

Sick. Sick of this hateful life.

March 31

Habermas was wrong to reject the task of analyzing consciousness as being part of an outmoded “philosophy of the subject”. Insofar as humans are not automatons but exist for themselves and act through consciousness (so that their actions are not just externally ‘caused’ but grow out of desires and psychological conditions), it is necessary to theorize consciousness. One has to be careful not to succumb to idealism, to a privileging of consciousness at the expense of social being, but surely a happy medium can be found in which social being is given priority but consciousness too is given an explanatory role.

Reading Chomsky’s pamphlet *Government in the Future*, which sets out to answer the question “What is the role of the state in an advanced industrial society?” He lays out four idealized positions: classical liberalism, libertarian socialism, state socialism, and state capitalism. “I think that the libertarian socialist concepts—and by that I mean a range of thinking that extends from left-wing Marxism through anarchism—are fundamentally correct and that they are the proper and natural extensions of classical liberalism into the current era of advanced industrial society.” Incidentally, the latter (superficially counterintuitive) proposition is basically what I said in my paper on Plato, when I mentioned offhandedly that the ideology of communism rescues the essence of liberalism from its capitalistic mutilations.

“Classical liberalism asserts as its major idea an opposition to all but the most restricted and minimal forms of state intervention in personal and social life.” This conclusion is well-known, but the original reasoning for it is not. Chomsky reconstructs it by looking at Wilhelm von Humboldt’s *Limits of State Action*. I don’t know anything about Humboldt except that he put forward a view which Chomsky later took up, namely that essential to language is *creativity*, the human capacity to formulate an infinite number of linguistic expressions using a finite set of resources (the basic elements of language). Humboldt’s view of human nature shares this emphasis on creativity: “to inquire and to create are the centers around which all human pursuits more or less directly revolve”. (I would add ‘to love’ to that list. To inquire, to create, and to love are the three main spontaneous expressions of humanity, at least in its original, uncorrupted essence. All three come from the drive to assimilate (and impose oneself on) the environment, to overcome its otherness.) Man’s central attribute, then, is his freedom. Humboldt’s discussions of—paeans to—labor recall Rousseau, and are striking anticipations of the early Marx. “It seems as if all peasants and craftsmen might be elevated into artists [says Humboldt]; that is, men who love labor for its

own sake... Whatever does not spring from a man's free choice, or is only the result of instruction and guidance, does not enter into his very being, but remains alien to his true nature; he does not perform it with truly human energies, but merely with mechanical exactness."

Humboldt might then have agreed with Marx in his belief that the revolutionist is primarily a frustrated *producer* rather than a dissatisfied *consumer*. "This far more radical critique," says Chomsky, "of capitalist relations of production flows directly, often in the same words, from the libertarian thought of the Enlightenment. For this reason, I think, one must say that classical liberal ideas in their essence, though not in the way they developed, are profoundly anticapitalist." Only when, for example, the concept of the 'person' was redefined in the era of corporate capitalism (when corporations themselves became 'persons') could classical liberalism, with its emphasis on personal freedom and rights, be invoked in support of capitalism. All the Enlightenment thinkers would of course have condemned capitalist coercion and bondage.

From Mark Twain: "It is by the goodness of God that in our country we have those three unspeakably precious things: freedom of speech, freedom of conscience, and the prudence never to practice either of them."

If you know Chomsky, you'll know that most of the pamphlet consists in an empirically supported denunciation of U.S. power-structures.

If anyone ever tells you that radical democracy cannot work, tell him about Porto Alegre. In this Brazilian city of over 1.5 million people, it worked for more than a decade, and it solved problems of resource-allocation far better than earlier governments had.

I'm skimming Terry Eagleton's *Ideology: An Introduction*, which traces the history of the concept from the Enlightenment to postmodernism. I'll have to buy the book: it's a good reference. I'll quote here only a few remarks on the sociologist Pierre Bourdieu, who seems insightful: "[How does ideology take hold in everyday life?] To tackle this problem, Bourdieu develops the concept of *habitus*, by which he means the inculcation in men and women of a set of durable dispositions which generate particular practices. It is because individuals in society act in accordance with such internalized systems—what Bourdieu calls the 'cultural unconscious'—that we can explain how their actions can be objectively regulated and harmonized without being in any sense the result of conscious obedience to rules. Through these structured dispositions, human actions may be lent a unity and consistency without any reference to some conscious intention. In the very 'spontaneity' of our habitual behavior, then, we reproduce certain deeply tacit norms and values; and habitus is thus the relay or transmission mechanism by which mental and social structures become incarnate in daily social activity. The habitus, rather like human language itself, is an open-ended system which enables individuals to cope with unforeseen, ever-changing situations; it is thus a 'strategy-generating principle' which permits ceaseless innovation, rather than a rigid blueprint.

"The term ideology is not particularly central in Bourdieu's work; but if habitus is relevant to the concept, it is because it tends to induce in social agents such aspirations and actions as are compatible with the objective requirements of their social circumstances. At its strongest, it rules out all other modes of desiring and behaving as simply unthinkable. Habitus is thus 'history turned into nature', and for Bourdieu it is through this matching of the subjective and the objective, what we feel spontaneously disposed to do and what our social conditions demand of us, that power secures itself. A social order strives to naturalize its own arbitrariness through this dialectic of subjective aspirations and objective structures, defining each in terms of the other; so that the 'ideal' conditions would be one in which the agents' consciousness would have the same limits as the objective system which gives rise to it. The recognition of legitimacy, Bourdieu states, 'is the misrecognition of arbitrariness'.

"What Bourdieu calls *doxa* belongs to the kind of stable, tradition-bound social order in which power is fully naturalized and unquestionable, so that no social arrangement different from the present could even be imagined. Here, as it were, subject and object merge indistinguishably into each other. What matters in such societies is what 'goes without saying', which is determined by tradition; and tradition is always 'silent', not least about itself as tradition. Any challenge to such *doxa* is then *heterodoxy*, against which the given order must assert its claims in a new *orthodoxy*. Such orthodoxy differs from *doxa* in that

the guardians of tradition, of what goes without saying, are now compelled to speak in their own defense, and thus implicitly to present themselves as simply one possible position, among others.

“Social life contains a number of different habitus, each system appropriate to what Bourdieu terms a ‘field’. A field is a competitive system of social relations which functions according to its own internal logic, composed of institutions or individuals who are competing for the same stake. What is generally at stake in such fields is the attainment of maximum dominance within them—a dominance which allows those who achieve it to confer legitimacy on other participants, or to withdraw it from them. To achieve such dominance involves amassing the maximum amount of the particular kind of ‘symbolic capital’ appropriate to the field; and for such power to become ‘legitimate’ it must cease to be recognized for what it is. A power which is tacitly rather than explicitly endorsed is one which has succeeded in legitimating itself.

“Any such social field is necessarily structured by a set of unspoken rules for what can be validly uttered or perceived within it; and these rules thus operate as a mode of what Bourdieu terms ‘symbolic violence’. Since symbolic violence is legitimate, it generally goes unrecognized *as* violence. It is ‘the gentle, invisible form of violence, which is never recognized as such, and is not so much undergone as chosen, the violence of credit, confidence, obligation, personal loyalty, hospitality, gifts, gratitude, pity...’ In the field of education, for example, symbolic violence operates not so much by the teacher speaking ‘ideologically’ to the students, but by the teacher being perceived as in possession of an amount of ‘cultural capital’ which the student needs to acquire. The educational system thus contributes to reproducing the dominant social order not so much by the viewpoints it fosters, but by this regulated distribution of cultural capital. A similar form of symbolic violence is at work in the whole field of culture, where those who lack the ‘correct’ taste are unobtrusively excluded, relegated to shame and silence. ‘Symbolic violence’ is thus Bourdieu’s way of rethinking and elaborating the Gramscian concept of hegemony; and his work as a whole represents an original contribution to what one might call the ‘microstructures’ of ideology, complementing the more general notions of the Marxist tradition with empirically detailed accounts of ideology as ‘everyday life’.”

That’s all very compelling. Indeed, most of it is obviously true. I’ll have to read Bourdieu’s *Outline of a Theory of Practice*.

Fruitful suggestion: “It is probable that what Freud points to as the fundamental mechanisms of the psychical life are the structural devices of ideology as well. Projection, displacement, sublimation, condensation, repression, idealization, substitution, rationalization, disavowal: all of these are at work in the text of ideology, as much as in dream and fantasy.”

April 1

Reading Callinicos’s *Making History: Agency, Structure and Change in Social Theory*.

The relation between theoretical and practical reason (a distinction formulated originally by Kant) wasn’t clear until I wrote my paper on morality. That paper is the foundation for understanding both the relation between the two and the meaning of practical reason itself. (Briefly: theoretical reason involves the successful deployment of logical and inductive principles in the search for truth; practical reason involves a person’s self-consistency, or his “prescribing laws for himself”, based on his values, according to which he consciously or unconsciously determines his behavior. Both kinds of reason are inherently relational: the former involves the relation between a conclusion and a set of premises, while the latter involves a person’s relation to himself. One can say that a particular act of valuing something, for example the destruction of the planet, is irrational only to the extent that it conflicts with other values that the person consciously or unconsciously has and by which he regulates his behavior; or, alternatively, the person may *justify* his value irrationally, if his chain of reasoning is strictly illogical. So a given act of valuation can be called, loosely speaking, either practically or theoretically irrational, or neither, or both.¹ On the other hand, a belief which doesn’t have any evaluative content (i.e., which is not inherently action-guiding) can be only

¹ [See the April 16th entry.]

theoretically, not practically, irrational. I can be called “autonomous” insofar as I am practically rational, because that is the extent to which I thoughtfully guide my own behavior.)

Callinicos isn't a big fan of Foucault. But even he writes sentences like the following: “What makes Foucault so intriguing and challenging a thinker is his belief—evident in the attempt to write histories of the truth, sexuality, the subject—that what we think of as enduring and fundamental aspects of existence are nothing but historical constructs formed by a specific regime of social practices.” Need I observe how unoriginal that belief is? It goes back at least to Marx and Nietzsche, who themselves theorized it in more compelling and plausible (less hyperbolic and simpleminded) ways than Michel did. “Put simply, it does not seem that Foucault can, even in his own terms, do without some account of the properties that all subjects share... That is, there are some aspects of human subjects which are not simply socially constructed and which may provide both motives for and means of acting.” In other words, in the end it appears after all that there is such a thing as—biology. Who would have guessed! I've never understood the allergy that these pretentious French intellectuals have to the notion of human nature.

I might almost say that, barring natural catastrophes or nuclear war, something akin to socialism is inevitable. The forces of production are going to keep being democratized and decentralized, or socialized, and capitalist property-relations aren't going to be able to hold out forever. Either they will collapse and production will become socialized, or the capitalist world-system will deteriorate into interregional conflict and chaos. Those are the two options. Socialism or barbarism. Nothing is permanent, capitalism least of all. It's too unstable.

April 5, 6

(2:00 a.m. Drunk.) Writing is creating the object as oneself. Therein lies its pleasure, the pleasure of all free creation. Objectifying oneself. For one wants the world to be an extension of oneself, and oneself to be an extension of the world (as it was in the beginning, phylogenetically and ontogenetically). Strangely enough, as man collectively transforms the world he experiences himself as increasingly alienated from it; but this is because *individuals* are all that matter here, and there is no collective subject called ‘man’ that is ‘objectifying’ itself through science, technology, globalization, domination of nature. Individuals are the only beings that can objectify themselves (because, of course, they're the only beings), and the fact that mankind as a collectivity is remaking the world ‘in its own image’ does not mean that *individuals* are experiencing the world as being remade in their own image. Indeed, the opposite is true, because of commodification, fragmentation, reification.

Women must be affected by the softness of their bodies. The soft flesh, the fatty tissue, the bounciness and excess flesh, in combination with the physical weakness, must influence their way of seeing the world and acting. Firmness, leanness, muscular tautness, as in men (but also in women, when it occurs in them—e.g. in female body-builders), is experienced as meaning things like fighting against opponents, battling animals, running, being active, being mobile and strong; softness, plumpness, weakness, pregnant immobility are experienced as synonymous with relying on others to do the hard work, the physical labor, the protecting, the taming of the wild for the sake of the tribe or family. Relative “passiveness” and “activeness” are built into the bodily experiences of women and men.

Went to a bar several nights ago with Heidi, a sexy 30-year-old Guatemalan student of mine. Later I took her to my apartment, where we made out. I'm not very interested in her and she's leaving in two weeks anyway.

From *Wage Labor and Capital*: “The relations of production in their totality constitute what are called the social relations, society.” Evidently, then, insofar as the characteristics of society are said to be determined by the nature of the production relations, the category of ‘production relations’ is being divided into two types, the primary and the secondary. Both this suggestion and the one in the quotation above seem

to be useful ways of conceptualizing things. The problem is in being *precise*. This is the problem of Marxism in general. To make its hypotheses precise is remarkably difficult, perhaps impossible. Yet at the same time, much of Marxism is obviously true. Its intuitions are sound; its formulations are not quite adequate. This criticism, incidentally, applies to probably every social theory, not just Marxism. A barrier to a quasi-positivist analytical precision (at least, a precision manifested in hypotheses that are both plausible and substantive) is inherent in the object itself—because of freedom, “dialectical development”, the overdetermined nature of human interaction, the indeterminate quality of conscious behavior and the shared background of an amorphous, ‘intuited’ culture (which is both material and ideal; there aren’t clear boundaries between the two). There *is* a reality here, but in principle it isn’t fully accessible to human cognition. The strangely indeterminate, ‘undetermined’ nature of consciousness and behavior (interaction, etc.) prevents it from being so.

Serving the status quo.— The most important role of leaders in history has been to delay progress, and to further the cause of oppression.

Androgynous.— The only woman I’ve ever loved is...myself. Unfortunately my love was unrequited.

Though God does not exist, one should act as if he does. *Pretend* there is a God, a superior, wise, moral, compassionate being whose approval you seek. Maybe then you will act honorably and be less demoralized by people’s stupidity.

April 7

Out-of-the-ordinary day at work. An old teacher named Joseph was fired without warning two days ago, for, apparently, a series of minor administrative offenses. He had been with the school for eight years and was easily the most popular teacher among the students. Everyone liked him. He was their friend, their counselor, their drinking buddy, and EF was his only family. He was an institution there. I was given one of his classes today, an advanced discussion class. But after I’d told the students he had been fired, and had answered all the obligatory questions, three of the girls walked out, saying, “Don’t take it personally, but I don’t want to take this class if Joseph isn’t teaching it.” I chuckled and let them go. Later I let other students leave and ended the class early. But afterwards it occurred to me: that was a very rude thing for those girls to do, to walk out like that! It was breathtakingly rude. They’re the sort of girls with forceful personalities, pretty, used to getting their way, heedless of the rules of etiquette; you can practically see it just by looking at them. The arrogant, insensitive personality-type I’ve always disliked.

None of the guys walked out. Only the girls. That’s predictable. Men, in my experience, [excepting the primitive brutes] tend to be more respectful of people, more easygoing, better at hiding their true feelings and not acting impulsively (like those girls), certainly more discreet and less gossipy. They are better able to step back from a situation and consider it soberly, without flying into a rage and storming out of a room on the slightest provocation. Kierkegaard said it in *The Sickness unto Death*: men have more autonomy, more sober self-awareness and self-control.^{1 2} He mentions this in the context of a discussion about two kinds of despair, the despair of weakness (of not willing to be oneself) and the despair of defiance (of despairingly willing to be oneself). The first, he says, is feminine, the second masculine. Then he inserts a footnote:

¹ The exception is the savages who rape, who beat up women, who love war and fighting.

² Feminists too implicitly acknowledge this truth when they argue that “autonomy” is an impoverished ideal—i.e., that women live fuller lives insofar as they are less autonomous than men—and when they oppose a feminine ethic of care to the masculine Kantian ethic.

“If psychologically one will take a look around in real life, one will from time to time have opportunity to convince oneself that this distinction, which is logically correct and so shall and must be pertinent, is in fact pertinent, and that this classification embraces the whole reality of despair... However, I do not by any means wish to deny that on the part of women there may occur forms of manly despair, and conversely forms of womanly despair on the part of men. But these are exceptions. And this is a matter of course, the ideal also is rare; and only in a purely ideal sense is this distinction between manly and womanly despair entirely true. Woman has neither the selfishly developed conception of the self nor the intellectuality of man, for all that she is his superior in tenderness and fineness of feeling. On the other hand, woman’s nature is devotion, submission, and it is unwomanly if it is not so.¹ Strangely enough, no one can be so pert (a word which language has expressly coined for woman), so almost cruelly particular as a woman—and yet her nature is devotion, and yet (here is the marvel) all this is really the expression for the fact that her nature is devotion... [Obviously much of this is exaggerated. He is discussing only ideal-types.] But the fact that devotion is woman’s nature comes again to evidence in despair. By devotion [the word literally means ‘giving away’] she has lost herself, and only thus is she happy, only thus is she herself; a woman who is happy without devotion, that is, without giving herself away (to whatever it may be she gives herself) is unwomanly. A man also devotes himself (gives himself away), and it is a poor sort of a man who does not do it; but his self is not devotion (this is the expression for womanly substantial devotion), nor does he acquire himself by devotion, as in another sense a woman does, he has himself; he gives himself away, but his self still remains behind as a sober consciousness of devotion, whereas woman, with genuine womanliness, plunges her self into that to which she devotes herself...”

Anyway, my point is that the masculine nature has a *soberness* that the feminine lacks, or has to a lesser degree. A hundred daily observations bear this out. The soberness, the relative lack of “devotion” or impulsiveness, of throwing-one’s-entire-self-into-an-immediate-situation, is an essential element in the stereotypical masculine virtues.²

The Barnum & Bailey Circus for Philosophers.— When people like Stanley Fish exist, who needs clowns?

April 8

The self-realizing desire.— In most people, the desire to be exalted is pure vanity, vulgar and rude. In me, the desire itself is exalted, and in having it I have already realized it.

I think it’s permissible to speak, as Marxists often do, of “false consciousness” and “objective interests”. (Wright agrees with me. See pages 248 and 249.) There are several plausible ways of ‘cashing out’ those concepts.

On the use and abuse of nudity for life.— If women didn’t have naked bodies under their clothes, men wouldn’t enjoy interacting with them. On the other hand, if men didn’t have clothes over their naked bodies, they wouldn’t enjoy interacting with each other.

It is incredibly significant that the word ‘subject’ has the dual meaning of “I am a subject” and “I am subjected to...” Subject as opposed to object: autonomy, agency, activity, free will, the self. But subjection as opposed to freedom and autonomy. The two meanings are almost opposites, which seems quite paradoxical. But, as so often in language (as shown by etymology, philology), there is a deeper meaning and profound consistency. Consider Kant’s position: a person is a subject only by virtue of his subjection to norms of reason. His freedom consists in his adherence to laws, laws that he gives himself.

¹ It need not be devotion to a man; it could be to her children, for example.

² [Including courage, at least in its deepest sense. See Paul Tillich’s *The Courage To Be.*]

Insofar as he subjects himself to a law, he is autonomous; insofar as he follows the whims of the moment, he is heteronomous. (Cf. my note above on practical reason.)

Or think of this Althusserian, Therbornian theory:¹ a person doesn't become a subject until he is interpellated by the Other; and inasmuch as he is a subject, he is being implicitly or explicitly interpellated by the Other and by himself. (That last idea is my own addition.) This interpellation consists in being called, being addressed or recognized as a certain kind of person. "Interpellations unceasingly constitute and reconstitute who we are"; they give us identities and subjectivities. And we are, in a way, 'subjected' to them, i.e. subjected to the Other (his 'call', his gaze, his recognition, which is at the same time our own). Subjecthood means subjection, the peculiar subjection that constitutes freedom.

In other words, self-consciousness (selfhood) is caused by and synonymous with a kind of subjection, or rather several kinds of subjection, which are closely related to the "generalized other" in consciousness.

After drinking.— When one has had a bit of alcohol, one understands how silly are all philosophical and scholarly activities.

Charisma vs. humanity.— On a quasi-instinctual level, charisma is the most important quality in a human being, and if he lacks it he is at a great evolutionary and interpersonal disadvantage. Only on the distinctively human level do reason, intelligence, kindness and so on matter; and on this basis one can rank people in terms of their humanity.

Why didn't industrialization happen before capitalism? What is so different about capitalism that it causes industrialization whereas no other mode of production does? According to Robert Brenner, in pre-capitalist modes the direct producers have access to (or partial possession of) the means of production, as they do not in capitalism; this necessitates that the exploiting class in pre-capitalist societies rely on extra-economic (e.g., political) coercion to secure compliance on the part of the producers. In capitalism, by contrast, the coercion is mainly economic. So in order for modern economic growth to occur, the workers had to be divorced from the means of production—because this made possible development of the productive forces based on *labor-saving* (i.e., profit-increasing) investment. An incentive for such investment (which leads to industrialization) is built into the capitalist mode of production itself, as it is not in earlier modes.

Section 4.4 of Callinicos's book, which draws its arguments partly from the work of Brenner, includes effective rebuttals against the common criticism that the nation-state's existence cannot be explained in terms of Marxism.

It's an odd sort of pain that never really goes away but almost never obtrudes itself nakedly into consciousness. It must be the past crying out not to be forgotten lest I become happy.

April 11

Gimena sent me this lovely email: "Guapo! Thanks for to be so patient with me. I think you had been a good boyfriend. I know that I don't have any opportunity with you, but I want to tell that I made me so happy there. I'll remember all my life each moment with you. I like you, because you made me feel so special, for a long time ago so good with a man. It is very deep everything that I wrote for you.

"I don't know if you feel or felt the same for me, but I don't care, I needed to tell everything I feel for you.

"I miss your body ☺, I can imagine it...naked, hahaha I'm just kidding. kiss, kiss, kiss and kisses! and hugs too."

¹ [In fact it is ultimately Hegelian, since the concept of interpellation is a variant on the concept of recognition.]

This is the side of women I love.

Obviously Marxism has to be supplemented with “environmental determinism” (see *Guns, Germs, and Steel*), and no historical conjuncture can be explained only in terms of the class struggle. Critics of Marxism interpret these facts as “refutations” of Marxism, but, well, that’s just stupid.

The reason for my discontent.— Most people prefer to have faith in humanity, but I see the seeds of fascism (a.k.a. militant conformism) everywhere. Whether they sprout has nothing to do with the goodness of humanity.

Majesty in the ‘microscopic’.— The universe’s most awesome achievement is to have created a being capable of contemplating the universe. A being that can *pass judgment* on the universe!

A consummation devoutly to be wished.— Sex occupies everyone’s mind at all times. His consciousness draws libido from the well continually. If society were healthy it would tap into this fount of love and institute communal orgies.

April 12, 13

I wasn’t accepted to nine of the ten schools I applied to. Still waiting to hear from UMass Boston. (If I go there it’ll be for a Masters—in U.S. history—in preparation for a Ph.D. somewhere else.) I’m starting to realize that if I have any future at all, it’ll be in writing. I was put on this earth to write, and that’s the only thing I can do well. So I have to stop dawdling and get down to business. “Pursue my dreams” and all that crap. With that in mind I’m going to write another screenplay.

...All the same, I had a semi-epiphanous moment a while ago while walking outside in the April air listening to the birds in the small park I live near and thinking that...freedom is precious, life ain’t bad, I’m very lucky, and sunshine is luminous. I’m a free, able-bodied young man who lives in a pleasant suburban neighborhood. All my senses are intact: I can smell the drizzle outside right now, hear the patter against the window-pane, taste the Italian dish I had last night, see the grey clouds slowly parting and the sunlight peeking through. I have partial control over my future; I’m not shut inside a prison or living under a totalitarian regime. I don’t work in a cubicle-partitioned office, I’m not bent under the weight of responsibilities, I’m a bachelor who can go out tonight and party with friends and meet women. Life is not a burden.

Watching videos of former Marines testifying tearfully about their crimes in Iraq, crimes forced on them by their superiors—“The Marines made me into a monster, I killed women and children, saw beheaded bodies, massacred civilians”—it makes me think that nothing matters but radical activism. Maybe it’s time I accepted the fact that I’ll never approach anything approximating peace with myself unless I embrace activism. (It’s a pity I lack organizational and communicative skills.)

April 14

Reading S. H. Rigby’s *Marxism and History*, a critical discussion of historical materialism.

Marxist theorists talk as if *either* the productive forces explain the nature of the production relations *or* the relations explain the forces (that is, their rate of development). Either productive force determinism (Cohen, the Second International) or ‘production relations determinism’. But the reality is neither, or rather both. See my footnote I mentioned earlier. There is a reciprocal, dialectical interaction, as there is with everything in society.

I'm going to try to take the gym more seriously than I've been doing lately. I'll try to go most days and drink protein shakes, just to see, once and for all, if I can gain 10 or 15 pounds. (I'm writing this down because otherwise I won't do it. If it's *here*, well then I have to follow through.)

You probably think that music is for me only a very pretty garnish on life, a way to escape from boredom or occupy my mind with something else when I'm lonely. But you're not quite right. In despairing moments like this one right now, when I'm thinking lovingly of the long knife in the kitchen drawer, music is literally my companion, someone who whispers to me as the tenderest of lovers. This is, indeed, the secret to my lifelong musical love-affair. It is as if a living being with violin-strings for vocal cords is talking to me, comforting me and telling me I am not alone. –There is no hyperbole here, no poetic license. I am just reporting my experience, my experience of the Adagio from Schubert's String Quartet in C, D. 956. My girlfriend is talking to me softly through my headphones and I'm passively letting her caress away my sadness. Music is not only a stream of sounds for me; it is the speech of a person who communicates by *externalizing emotions, directly expressing* them, in Rousseauian fashion. Music is my ideal other, or the speech of my ideal other. When I'm lonely there is someone to sympathize with me, and when I'm happy I have someone to laugh with. That is the secret (or one of the secrets) of music's power, of its uniqueness among art-forms.

That was corny. Anyway, I was talking with Gimena online and it turned into sex-talk. The subject came up of my french-kissing her vagina, and she said something adorable. She was describing how wonderful it had felt, how no oral sex she'd had before had felt so amazing, and then she told me the reason she had made me stop after a few minutes: "I began to brief very fast... I had a revolution in my body." I'm not sure what the first sentence meant, but the second was beautiful. What a perfect way to describe the feeling! A "revolution". Evidently she thought the revolution had to be suppressed.

April 16

Obviously all my discussions of historical materialism have been analytically primitive. I have to define the forces and the relations of production. Rigby's book is useful in that regard, in stimulating me to clarity. For instance, the *technical* relations of production, the direct relations in the workplace, have to be distinguished from the *social* relations of production, which obtain between classes. Rigby thinks, I suspect justifiably, that the former relations are actually included in the *forces* of production. "The work relations of production are a fundamentally different concept from the social relations of production involved in the appropriation of surplus labor. Work relations are an inherent part of the organization of the labor process and a vital influence on the productivity of labor. There seems to be no reason why work relations should not be included in the category of society's productive forces, as one of the elements used in the production process."

Nietzsche: "It is the misfortune of active men that their activity is almost always a bit irrational. For example, one must not inquire of the money-gathering banker what the purpose of his activity is: it is irrational. Active people roll like a stone, conforming to the stupidity of mechanics." Nietzsche's intuition is mine as well, and probably yours. On one level, an individual's endless accumulation of money and capital is obviously irrational. But what does that mean? Is it theoretically or practically irrational? What explains the intuition? As Nietzsche says, it is based on the fact that there is, strictly speaking, no *goal* towards which the person is striving; there is no acknowledged purpose behind his frenzied activity. He is simply doing as he has been trained to do. He is like a gerbil running in its wheel. So his behavior is *practically* irrational: insofar as it is neither a means toward an end nor constitutive of an end it is contrary to practical reason, i.e. the nature of human action. An intentional act is the realization not only of an intention but also of a value (or desire) held by the individual at that moment; or, rather, the act is 'for the sake of' realizing the condition that is valued. But, as I've said, from a broad perspective the businessman's

activity is not an expression of a particular value; it is not done for the sake of a particular end.¹ It just goes on and on mechanically; he just keeps doing it because others are doing the same thing and it is what he has been taught to do. To the extent that it is thoughtless it can be called irrational, which means it contradicts the nature of intentional action. That is, the businessman's acts aren't even really *acts* per se (according to Nietzsche); they are more like movements of the body. But they are intentional nonetheless: they are intentional non-acts, which is a contradiction. That's ultimately why we call them irrational.

To be sure, this complicated explanation isn't the reason we give explicitly. We simply say, "A money-gathering banker doesn't really know, on a reflective level, why he's doing what he's doing. He doesn't give himself any *reasons*: he is, therefore, acting contrary to reason, i.e. irrationally." (Whether that belief is true isn't the point now.) But that explanation presupposes a deeper one, the one I've offered. In saying he doesn't explicitly acknowledge reasons for his behavior we're saying that there is no *value*, or *end*, for the sake of which he acts. If we say that Bush's invasion of Iraq was irrational we're saying either that he didn't have a clear end in mind (a *good reason*) when he ordered the invasion or that by invading Iraq he was undermining other ends that were equally or more dear to him. In both cases (though in different ways) he is contradicting himself and the nature of action.

Of course, in the strictest sense it is impossible for an act to contradict the nature of action. That's why I wrote in my paper on values that true practical irrationality is never fully manifested; at most there is a hint of it, i.e. when the given act is considered from one particular perspective among others. So Nietzsche was quite right to qualify his statement with the phrase "a bit": active men act *a bit* irrationally. No one ever acts completely irrationally, not even a psychotic (because in that case action is not properly *intentional*, i.e. is not action, and so it cannot be considered irrational *action*).

My restlessness is not only a function of my self-conscious humanity, the "abstract other" or what you will. Everyone has that in some form, but not everyone is restless. Few people have the *spirit* to be restless as I am, the *spirit* that sets them at odds with life. I cannot be reconciled with the world, with fate and existence, for its senselessness seems impossible to me. I must be overlooking something, I tell myself. It is absolutely impossible that a single human life can be wasted or lived through in despair. This world of *les misérables* cannot really exist, it must be a play of shadows cast by eternity against itself. The dissonance, the jarring dissonance of my affection against my cognition is surely an illusion of some sort, perhaps a prelude to an afterlife in which there will be no absurdity. I love everything and everyone because they exist, but my intellect insists that life is not as perfect as it has to be, that nothing in fact matters and all is chance. My cognition rebels against religion and faith, but my affection requires both.

Nature could not have created a being so out of proportion with itself and the world as to demand universal love or significance and simultaneously to understand that its demand is misguided and hopeless. —Yes, I know Marxism's answer to my questions, but that answer is unsatisfactory. There is no justice in a history that ends with happiness for the lucky few who have been born then but gives misery to countless ancestors who die in squalor and disillusionment. If a single person is a victim of injustice and absurdity, injustice is eternal and there is no escape from it. If there is no compensation after death, the death-by-torture of a man five thousand years ago renders my own life metaphysically meaningless. And humans do need metaphysics, they have always needed to project their way of thinking onto the universe. Magic, ritual, animism, religion, philosophy—they are expressions of the same need, the need for "justice" and "harmony". Humans need the world to be human, and this need was implanted in them by nature; yet nature, it turns out, is inhuman, for it allows the inhuman to occur without consolation of any sort. Death itself is inhuman: it is a horrifying eternal mystery, like life. How could nature have implanted these imbalances in man?

Yet it has. I accept that, I have to. But I don't understand it, and so I don't accept the world.

April 18, 19

¹ [See the entry of September 3.]

—Non-Marxism. It's fun to pretend.

I was laid off today. Not fired, just “laid off” because the student numbers are low. Didn't get a chance to say goodbye to my students because it happened after the school day: Kathy called me at home, said I wasn't on the schedule for next week. [...]

Even though I divide reason into ‘theoretical’ and ‘practical’, you shouldn't forget that acting theoretically irrationally is actually a way of being practically irrational. By drawing invalid conclusions from premises one is acting contrary to one's commitment to truth, which everyone necessarily has on some level (given that everyone thinks his beliefs etc. are ‘true’). In other words, by virtue primarily of one's innate cognitive apparatus,¹ one's mental life is in large part structured rationally and one implicitly values norms of reason (as shown by the fact that one necessarily invokes them when justifying a particular belief or course of action). So, to the extent that one violates rational norms (i.e., theoretical reason), one is acting contrary to one's values, which is *practically* irrational.

Irrational action, then, always involves practical irrationality and usually also is related to theoretical irrationality.

April 22

Peter Kropotkin, the old Russian anarchist: “Sociability is as much a law of nature as mutual struggle... Mutual aid is as much a law of animal life as mutual struggle.” That's true, and fascinating. It's true of every species. Life is an exquisite balance between struggle and a striving-for-unity. That could almost be called a metaphysical truth.

“The two great movements of our century—towards Liberty of the individual and social co-operation of the whole community—are summed up in Anarchist-Communism.”

Mike Davis's astounding article on urban slums all over the world proves (as if there was any doubt) that this is the worst time in history for the overwhelming majority of people. The world will be in chaos by 2040 or thereabouts.

—How puny is the individual!

A religious irony.— If there is an omnipotent, omniscient, immortal being before whom people have the power of ants, the individual is *not* worthless; if there is not such a being but instead humans are the absolute sovereigns of nature, subordinate to no one else, the individual *is* worthless (ultimately).

On negativism.— Yes, La Rochefoucauld's cynical observations have a kernel of truth. But you can put a negative spin on anything. As well as a positive spin. It all depends on your attitude, which is to say, in the end, your *society's* attitude. La Rochefoucauld's attitude was and is the outlook of the modern world; that's why his maxims are almost as timely now as they were in the 1500s. But this negative worldview can be transcended.

Obviously the problem with Marxism is that many of its central explanatory concepts, like base and superstructure, apparently cannot be defined without reference to each other, thus preventing us from explaining one in terms of the other. Society is an organic whole. “The economic base of society is not ‘something which can be clearly conceived, still less observed, apart from the legal, moral and political relationships of men’. The distinction between base and superstructure is untenable, so it is illegitimate to

¹ Which, however, is possibly unable to *mature* in, say, certain prehistoric cultures, so that a Cro-Magnon man might conceivably not have known how to draw justifiable conclusions from arguments. But even that seems a little far-fetched. Surely any person who speaks an evolved language can intuitively understand norms of reason. (Yes, I know there may be rare pathological exceptions.)

derive the latter from the former. Law and morality cannot be confined to the superstructure, but are constitutive aspects of all forms of social activity... Law, morality and consciousness are not simply derived from social relations but form an inherent part of those relations.” (Rigby) This is an easy criticism to make and it isn’t particularly interesting. The real problem for me is that because Marx’s insights are intuitively compelling, indeed obviously correct, it *must* be possible to formulate them in a way that isn’t vulnerable to the above criticism. But what way is that?

“There are two possible responses to [such] objections.... The first, by G. A. Cohen, is the traditionalist response that it is possible to conceive of the economic base independently from superstructural elements; the second form of reply is Godelier’s revisionist solution which involves the redefinition of base and superstructure. Cohen argues that it is possible to distinguish base and superstructure by distinguishing between *de facto* powers and *de jure* rights. Relations of production may exist in *de facto* form before they are expressed in *de jure* property rights... [However,] even if we can conceive of relations of production separately from law, this does not mean that the relations of production may be defined separately from all superstructural elements, in particular from forms of consciousness. Cohen argues that social positions involve fulfilling a role within specific relations, a form of behavior which may be defined independently from ideas. Yet most social roles involve the internalization of norms and customs, i.e. they involve forms of social consciousness...”

I already mentioned Godelier’s solution weeks ago, when discussing Wood’s article. To say that something (for instance, religion) is socially dominant means precisely that it functions as a relation of production. “One institution, such as a religion, may thus perform a number of social functions. Religion may function both as a relation of production and as an ideology. In certain societies, there is a tendency for institutions to specialize in one function. Elsewhere, as in Sumerian society, one institution may carry out functions which are both ‘economic’ and superstructural.

“We have seen that certain ideas may form part of the productive forces because of their technological-productive function. Similarly, certain forms of ideology may form a constitutive part of the relations of production, as in the case of aboriginal kinship, whilst others, such as the doctrine of the divine right of kings, may form part of the ideological superstructure. If we conceive of the base and superstructure as separate *institutions*, then the apparent interpenetration of the two poses a problem from the primacy of the economic base, even when seen as part of a complex organic totality. If we define base and superstructure in terms of their *functions*, then the institutional interpenetration of the two no longer provides the grounds of objections of the type made by Acton and Plamenatz. This functional definition would allow us to include those aspects of politics or ideology which functioned as relations of production within the ‘economic’ foundation of society. The superstructure would not then consist of law or social consciousness in their entirety, but only those legal and political institutions and forms of ideology ‘that cannot be usefully regarded as constituents of production relations even if they help to sustain the system of production’.”

Unless you remember that ‘base/superstructure’ is merely a suggestive metaphor and not a *theory* in its own right, i.e. that it’s no more than a *gesture* towards critical thought, you’ll either remain confused or conclude that Marxism is indefensible.

April 26

Slept with an ex-student last night. A Korean named Ji-yun (27). [...]

I was accepted to UMass Boston, thank God. Wasn’t looking forward to teaching middle school next year. I was also given a lucrative TA position in the Classics department.

May 1

Dinner with Ji-yun, then we came back to my place and cuddled for a while as always [...].

I know my virtually emotional love of Chomsky is irrational. I know there are thousands of dissenting voices in America, that his is merely the leading one. I know he is just an ordinary decent human being who happens to be brilliant. But there is something about his persona that is irresistible. He has an odd sort of anti-charismatic charisma, a self-deprecating grandfatherly sweetness. It's a humility, or humanity, that glows from his shy smile and his rumpled clothing. There are no fireworks about him, no honed maneuvers of manipulation and not a trace of self-aggrandizement; he is the opposite of everything pop-cultural. But of course the dedication to truth and justice is mainly what makes him one of the most beloved people in the world (notwithstanding the elite's hostility).

He also helps remind me that people are fundamentally good, because a world that loves him is a world that has moral value, a world worth saving.

Yes, he brings out the best in people, certainly in me. The people in whom he brings out the worst simply don't have the best *in* them anymore: it has been indoctrinated out of them.

(Consider, for example, the comments on his videos on YouTube, like this one: "Chomsky is a bitter old man who has made a fortune by hating America, I hope he burns in hell. I hope young college students eventually aren't instructed to read his hateful writings. I'm 30 years old and I would debate Chomsky anytime on the idea of America and its positive influence on the world. He has made a living denouncing America and would have done so had he lived anywhere else. Please note that he is a malcontent and would never be happy in any country. Noam lives off hate." Now that I've corrected all the original spelling errors, that's actually an articulate opinion compared to most of them. It perfectly expresses the sentiments and the reasoning—if it can be called "reasoning"—of most Chomsky-critics.)

May 8

The following is a story I'm submitting to the Wesleyan Writers Conference, which I'll attend in June. Its main purpose isn't to be autobiographical; much of it isn't true of me. The character, for example, is not as complicated as I am. [I've deleted it.]

May 9

I read André Gide's long short story "The Pastoral Symphony". Loved it. Also E. A. Poe's essay "The Philosophy of Composition". Reading an anthology of modern short stories.

Imprisoned in an ivory tower

He came back to himself and realized that for at least a minute he hadn't heard a word that had been said.

"So, when Ted Sider writes 'Necessarily, x is part of y at t if and only if x and y each exist at t, and x's temporal part at t is part of y's temporal part at t,' what does he mean by 't'? Does he mean like a minute or two minutes, or does he mean a fraction of a second?"

"That doesn't matter. The point is that given t, *whatever* it is, x is a part of y at that time if x's temporal part is part of y's temporal part at that time. t could be three minutes long or an hour long. This is just a definition."

"So this half of my pencil is part of the whole pencil right now because the temporal part of this half of the pencil is part of the temporal part of the whole pencil right now? Is that what he's saying?"

"Yes. That's a good example."

"Okay..."

“I know that the idea of temporal parts is hard to grasp, but remember that they’re analogous to spatial parts. Objects extend through space by having spatial parts, and they extend through time by having temporal parts. At least, that’s what the perdurantist, or the worm-theorist, argues.”

“Remind me again why it’s called worm theory?” someone chuckled.

“Because an object is conceptualized as stretching through time like a worm, a temporal worm. It has a beginning, a long middle, and an end.”

“So my self yesterday and my self today are just *parts* of ‘me,’ of the *whole* me that stretches through time from my birth to my death?”

“Exactly.”

“Isn’t that counterintuitive? I feel like right now my whole self is present. Or, like, this piece of paper. This is the *whole* piece of paper right here; it isn’t just a *part* of the paper. The paper isn’t some sort of abstract object that exists for two years or whatever. It is just this thing right here!”

“Okay, so you disagree with worm theory. But you’re just presenting an intuition, not an argument. David Armstrong and David Lewis have a different intuition than you. You have to defend yours with an argument.”

“I have another question,” someone said. “How can you tell when one part ends and another part begins?”

“Each part is instantaneous.”

“But what does ‘instantaneous’ mean? How long is an instant?”

“That’s a good question. It potentially poses a problem for the worm-theorist.”

“Yeah. Because an instant would have to be infinitesimal, wouldn’t it? If it weren’t infinitesimal then it could, by definition, be divided into shorter instants. But then it wouldn’t be a *single* instant. But on the other hand, if it is infinitesimal then that presents logical problems.”

“Like what?”

“Well, a temporally extended worm would have to be composed of an infinity of instants if each instant is infinitesimal. But how could an object with a beginning and an ending be infinite?”

“You know, this reminds me,” someone said, “of Kant’s antinomies. It’s a problem for both the perdurantist *and* the endurantist, isn’t it? It’s a problem with time. Time is illogical.”

“By the way, how would the worm-theorist, or the perdurantist, deal with the problem of instantaneous minds?”

“What do you mean?” said the professor.

“If a mind is instantaneous, like this piece of paper is instantaneous, how is experience possible? Experience presupposes a temporally extended mind that can recognize the passage of time, doesn’t it? An instantaneous mind can’t recognize the passage of time.”

“Some perdurantists address that problem by arguing that the instantaneous experiences of instantaneous minds actually occur within the temporal boundaries of a temporally extended experience—and this experience lasts as long as the temporally extended mind that experiences it.”

“So, in other words, minds that have experiences are actually composed of several temporal parts? But then what connects those instantaneous parts to one another?”

“I don’t understand your question.”

“Actually, that goes to the heart of the problem I have with perdurantism. It doesn’t seem like a very powerful theory to me.”

“Okay... Yes, John?”

“Before you talk about that, I just want to get clear on how all this ties into the issue of mereological sums. In the article we read called ‘I Am Not Now, Nor Have I Ever Been, a Turnip,’ the author tries to put together, as he says, perdurantism and detenserism, which, he thinks, necessitates that one distinguish between sortal and non-sortal predicates. I have a question, though, about—”

“Wait, that’s a little off the subject. We’ll get to that. But first I want to discuss stage theory, which is different from worm theory. Stage theory emphasizes that instantaneous temporal slivers, or stages, of an object, stand in intimate causal relations to past stages and future stages of the object...”

Again, he came back to himself suddenly and looked around at the students scribbling in their notebooks. He remembered he had been daydreaming about that article in the *Post* describing the plight of the poor in India. His watch told him there was an hour left, and he sighed.

June 1, 6

Reading selections from a Norton anthology of short stories. Also two recent editions of *The Best American Short Stories*.

Dusk in Vietnam

Sleepfalling from the Milky Way through pearl-gray mist and periwinkle sky, floating as clouds in currents of wind, brightshining down upon mountain-peaks star-yearning, glow of the gloaming reflected in mountain-snow golden as sun-kissed ocean sheen to the horizon, undulating twilight comforting sleep on the rocking waves like a lullabye, an eternal pendulum swaying back on waves of time in the water of the azure sky coursing toward land to sail in cerulean meadows, wade through waves of grain, walk through harvests of sunlight, drift on rippling tides of wheat moon-begotten in the silvery bloom of night, swimming motionlessly through clouds of dew yet to descend upon blades of grass in the pre-dawn stillness blanketing the land like a dream of womb-enfolded immortality or cosmic stasis in the spaces between stars where nothing hovers but three atoms of spacetime fused with a universal symphony of echoes of echoes of light spraying out to infinity in purple splashed on a canvas of clouds which are soaked in the crimson-flecked dreams of Earth's origins...

The phone rang. Stabbing him. He picked up the receiver, "It's eight o'clock sir, you wanted a wake-up call, time to get up, your tour starts at nine, breakfast is..." His eyes closed and he drifted into his pillow but not before turning it over to the cool side...

It was a chilly morning and the valley was shrouded in mist. Steam collected between the hillcrests, sank to the river, evaporated in the sky. It was mysterious, legendary. The sun did not warm him. He had forgotten his jacket. He stood with two Japanese girls and an American man waiting for their tour guide in front of the hotel on the edge of the town overlooking the valley.

"It's a cold one," the American said. The two girls whispered. "But what a view." The girls giggled. "What's your name? I'm Clyde."

"Martin," he said.

"My name is Midori," said one girl, "and she is Hiroko."

"Nice to meet you."

"Nice to meet you."

"Are you from Japan?"

"Hai. Yes. Konnichi wa." She giggled.

"Konnichi wa."

"How long have you been in Vietnam?"

"Only one week."

"It's beautiful here."

"Yes very pretty."

"But too cold."

"I hope it warms up."

"Hanoi was warm, but up here I guess we're higher up."

"Yes."

"Are you girls in college?"

"Yes."

“What do you study?”

“Drawing. She study painting.”

“I bet you’d like to paint this scene, wouldn’t you?”

“Oh yes. So beautiful.”

“I wonder where our guide is.”

Tribal children from tiny villages in the valleys congregated around them, dressed in handmade and hand-dyed indigo cloth, speaking English, offering handmade necklaces and bracelets to anyone who would pay one dollar. The friendly ones shook hands with the Westerners, their small Vietnamese hands and dark Vietnamese skin callused from years of inclemency pressing against the cold white skin of the tourists. The weather didn’t seem to touch them. They ran happily along the streets in the drizzle, into and out of internet cafés and restaurants and hotel lobbies without self-consciousness, banging their palms against the windows of buses arriving with fresh loads of tourists, yelling “Hello! Where you from?” through the glass. Upon receiving no answer from heads turned self-consciously away they redoubled their efforts. Perhaps the diffident Westerners were put off by the irreverence, the mischievous delight that sparkled in the eyes of these children who seemed to be laughing not sympathetically with the excited newcomers but a trifle maliciously, as if they were looking at ugly foreign objects of contempt. –Probably, though, that was only a fabrication of the Western imagination, which felt at once superior to this backward place and beneath the people who lived here, who had never known modern comforts and thus were made of sterner stuff than overfed tourists. Even so, their enthusiasm proved infectious: skeptics found themselves being won over, rolling down their windows to say hi, making a few polite comments and being bombarded with questions in return.

Even at this early hour the town was full of movement. Dozens of motorbikes weaved around clusters of tourists—motorbikes being the preferred Vietnamese mode of transportation. The streets were too narrow for more than an occasional bus or jeep. Natives driving by paused to shout at tourists “Hello! Motorbike?”, hoping someone wanted a taxi. If a pedestrian on the sidewalk briefly stopped walking, whether to stare at a beautiful Vietnamese girl or to admire the scenery, motorcyclists shot over to him. “Hello! Motorbike?” Two minutes later, if he was lucky, he might have succeeded in prying himself from them. His destination was in all likelihood the town square, which was edged by rows of weather-stained colonial houses adopted by the Vietnamese for their own purposes, whether as stores or as homes. These colorful, artificial, geometrically shaped relics of the European past might have struck visitors as out-of-place in a land so untamed, primordial, where myths still seemed to reside in the heaven-descended vapor—a land where the world was perpetually being reborn—if everything else did not contribute to the eclecticism of the environment. People wearing tribal costumes they had woven themselves talked to people dressed as gangsta rappers; concrete high-rise hotels towered above wooden huts; SUVs drove over paved streets as young children carrying logs hiked barefoot up mountain passes.

The buses pulled past an old church from the colonial period, still intact but beginning to deteriorate, its Corinthian columns marred by chipped curlicues and severed acanthus leaves, its gargoyles noseless or headless, its steps worn blunt by generations of feet. In the shadow of the ruins was a small marketplace composed of a dozen wooden stalls each with a makeshift roof sheltering an old woman from the heavy mist. Here and there a person dressed in American clothing pulled a bill from his wallet and handed it with a smile to the shopkeeper, placing papayas into his bag at the same time. She barely acknowledged him. He walked away with the same smile stuck on his face. He turned around and gazed up at the church. “Wow,” he said. He took out his camera and took a picture of it; then he looked over his shoulder towards the old woman, gestured at the church and shouted “Very beautiful!” This time she granted him a smile.

The buses drove down the main road in the small town that served as the base for foreigners trekking through the mountains. Tourism was the main source of revenue for the area. Three hotels had been built in the last ten years; with the resultant influx of travelers, stores had sprung up quickly along the main road. Two internet cafés, several souvenir shops that also sold umbrellas, a pharmacy, five small restaurants, and three bars. Their owners spoke minimal English and the employees only a little more, but in the rare cases when gestures were not enough, children could be called in from the streets to translate. They had learned English not from books or in school, but from the visitors themselves. Since toddlerhood they had lived in

the presence of the pale strangers, taking weekly or biweekly trips from their villages in the wilderness to the town. Over the years they had absorbed the foreign language, even some Japanese, with relative ease. This also partly accounted for their startling friendliness, more pronounced even than that of Western children, as the friendliness of the adults was greater than that of Western adults.

As Martin waited for his tour guide, one of the children engaged him in conversation. A young girl, not pretty, with splotches on her skin, but charismatic and excitable. She walked over to him and said “What your name?”

“Martin. What’s yours?”

“Lê.”

“Lê? What does that mean?”

“It mean...shy.”

“That’s not a good name for you!”

“Not good name? Why?”

“You’re not shy, are you?”

“No, I not shy. I talk a lot. My friend say I talk too much. ‘Shut up!’ she say.”

“Ha!”

“Where you from?”

“America.”

“Oh! Where?”

“Near New York.”

“New York! Big city. You big city boy.”

“No no, small town boy. I’m from a small town.”

“You like it here?”

“Yes, very much. You’re lucky to live here.”

“How long you stay here?”

“Only three days.”

“O too bad. I wish you stay forever.”

“Yeah, me too. We don’t have places like this near New York.”

“You live wit me in village.”

“Would you let me live with you?”

“Yeh of court. My mom like American. Very handsome she say.”

“Well, I’d love to live here,” he said, “except it’s freezing right now! I left my coat in Hanoi.”

“Stupid.”

“You’re right. But Hanoi was hot. I thought I wouldn’t need it here.”

“I not cold. Warm.”

“How?”

“Becaut my tough skin.”

“You’re outside a lot, aren’t you?”

“Alway. Helping mother.”

“What does she do?”

“She make bratelet. And clothe.”

“You help her dye your clothes?”

“Yes. Hand very blue. And she keep animal.”

“Farm animals? Chickens?”

“Yeh.”

“How often do you come up here?”

“Every weekend. To sell bratelet. Then go back to village.”

“Is it a long walk?”

“Many hour. Maybe eight.”

“Why is everyone wearing the same blue clothes?”

“Color of Black Hmong. My people.”

“Oh, your ethnicity! I forgot, this whole area is Black Hmong, isn’t it? I love those big silver earrings all you girls are wearing.”

The guide arrived. “So sorry, so sorry!” he said. “Ma name it Duong. Sorry for late.”

“I have to go now,” Martin said to Lê. “It was nice to meet you.”

“Bye.” Lê started a conversation with another American.

The four travelers and Duong set off. They walked for twenty minutes on a dirt road where their view of the surroundings was obstructed not only by the fog but also by large European houses, as it had been earlier by the three hotels located side-by-side on the edge of a cliff. The guide did not talk much, and when he did, it was hard to understand him: his Vietnamese twang was unusually thick, and he clipped words that ended in ‘s.’ Midori and Hiroko whispered and giggled to themselves, too shy to approach the Americans. Martin was absorbed in his own thoughts, most of which revolved around his forgotten coat in Hanoi. Clyde was the only one who talked continuously, alternately with the girls and with Martin. His pattern of conversation was to ask a question, such as “What countries have you been to?”, and then to follow it up with a long discourse on himself. The girls were perfectly happy to listen and laugh after every sentence, but Martin found him tiresome and merely grunted during pauses. “I just came from Laos,” Clyde said, “but I like Vietnam better because Laotian women are tiny.” “Huh,” Martin said. “I mean,” continued Clyde, “Vietnamese women are small too, but differently. They’re like petite. Lao girls are short and not so pretty.” “Mmm.” “But I remember—this is funny—I remember a time when I was taking a bus in Laos in the middle of nowhere, a long bus trip, like a day, over dirt roads and stuff, cliffs, and we got stuck in mud, a huge puddle of mud, and the driver just couldn’t get us out for the life of him, and we were stuck there for like nine hours just standing in the road waiting for someone to come...” “Wow, that sucks.” Martin wanted to talk to the girls, whom he found adorable, but whenever he tried to speak to them Clyde hijacked the conversation, his voice drowning out Martin’s. So Martin contented himself with contemplating their features. Midori resembled a doll, with airbrushed cheeks and unwrinkled skin. Hiroko had a more mature look, as well as a more approachable, with a friendly smile always playing about her lips. She was tall and buxom; she wore tight clothes to accentuate her curves, a habit that seemed to contradict her shy personality. Midori had less to show off but followed her friend’s example anyway, wearing skin-tight jeans and a tanktop that exposed her midriff. Martin couldn’t help appreciating their wardrobe, though at the same time he thought it incongruous for such girls to adopt the attire of Britney Spears.

He remembered seeing them for the first time the previous night, a few minutes prior to his first real insight into Vietnam’s tribal culture. They were dressed then for the chilly evening, wearing jeans and sweaters. He was sitting at a small table in the basement of his hotel, which served as a bar and restaurant and was decorated with oriental rugs and furniture. On this particular evening the rugs had been rolled up and the tables moved so that a large space in the center of the room was bare. Dim lighting created a sedate atmosphere, which was lost, however, on the young villagers scampering about the room, running outside and dashing in, laughing as they played games in disregard of the adults’ solemnity. Twenty or thirty tourists and some Vietnamese were seated, sipping wine, waiting for the concert to begin. The two Japanese girls hesitated in the doorway as all eyes were momentarily fixed on them. They smiled nervously. Martin loved this Asian trait of modesty, this remnant of Confucianism, which was so becoming in women. The two regained their composure and walked to a nearby table.

Meanwhile the first performer had taken his place in the center of the room. He was a small, dark man, wearing the clothes of the Black Hmong; in his hand was a flute-like instrument made of bamboo. His leathery face bespoke a life lived in the wilderness, unaccustomed to recitals before American tourists. With no words he raised the instrument to his lips and began to play. A hush descended over the audience, even the children. At first, Martin heard only harsh exhalations, random, unmelodic and unmusical. They were crude and senseless, not beautiful. In some kind of ugly minorish mode. Neither legato nor staccato. Hollow, airy, lacking the liquid pith of the flute’s tone. He looked around at other people’s expressions; they were as blank as his. The performer himself looked blank: his eyes staring sightlessly ahead of him, his fingers the only part of his body that moved. He was just standing there mechanically. Martin continued to watch his fingers for want of anything else to do.

Suddenly he realized that those wiry fingers were the real music behind the notes. They were the theme, the melody. If they and the man himself were ignored, the sound could not be understood. It did not exist in a vacuum, unfolding impersonally through a mathematical logic that determined the proper chord-progressions and the nature of the climactic moments and the resolutions in the cadences; it was an expression inseparable from what was being expressed. In a flash, as he listened to the whispers rasping sweetly from the carved piece of bamboo, Martin saw that this music was not supposed to be “pretty.” It was supposed to be a way of life. It was how the peasant conversed with nature, how he sublimated and humanized the forces he confronted daily. These tones that sounded so artificial and dissonant in a bar would have sounded harmonious if played among rice paddies beneath a starry sky.

Martin sat back and closed his eyes. He still did not really enjoy the music, but if he imagined it under the night sky it calmed him. Its very unpredictability and dissonance settled him. A moment ago he had been acutely conscious of his surroundings. He had scrutinized people’s faces, he had wondered if the performer was nervous, he had wondered if the children were bored, he had ogled the two young women. He had told himself he needed a few shots of vodka to appreciate this music. Now, it seemed, none of those things mattered. He felt quiet not having to follow a melody. There was nothing in the world except darkness and rustic harmonies...

A minute later the man picked up something that looked like a banjo and placed a green leafy thing into his mouth. Without waiting for the applause to die down he started strumming the banjo and blowing into the leaf. The result was a noise that, under normal circumstances, would have so offended Martin’s aesthetic sensibilities as to make him flee the room. The whistle shrieking from the leaf tried to follow the pitches being plucked on the banjo—successfully, most of the time, at least to the indiscriminating ear. The strings seemed out of tune, though: some were flat, some were sharp, and when their tones lingered a moment they sank. The melody sounded improvised. It wasn’t even much of a melody, more like a repetitive series of notes in an exotic minor mode. The ensemble struck Martin as amateurish and childish, more than the preceding had.

When the man finished his song, another performer joined him in front of the audience. A young woman. She was holding a long bamboo flute, longer than the first one. No one noticed, however; all eyes were riveted to the girl herself. Something about her was transcendent. She was petite, probably just over five feet, frail, her skin opaquely translucent. Her body, while not emaciated, was unnaturally thin. Her bony arms were lined with shadows of her veins. Smiling, she nodded to her companion, who nodded back respectfully. The audience waited. Then, as the girl raised the flute to her lips, Martin realized what it was that gave her such an ethereal look: she was deathly pale! Her face was wan and sickly beneath its beauty. The angular cheekbones, which may have been visible due to malnutrition, gave her sharp, defined features that seemed to express a strong character. Yet she looked sickly, undoubtedly: the contrast between her dark costume and her skin color was appalling. It made her luminous, however; he felt as if he were in the presence of an otherworldly being. The impression was strengthened when he heard the first sounds emanate from her flute.

They were in a high register, the range of the piccolo—but with a full tone, reflective of the instrument’s size. Not shrill, not harsh, but soft and gentle. Fluttering, from frequent tremolos. Feathery. They seemed to mimic a bird-call, though one with an exquisite timbre and an exceptional range. The melodic thread they spun was bright and pleasant, neither major nor minor. Again Martin felt that he was listening to something being played in a milieu alien to it, before an audience spectating stony-faced, approaching it with a critical Western eye; it belonged outside in daylight in a field of dandelions, with children dancing around it. Perhaps as men harvested crops nearby. Soon the male performer joined with his banjo and the solo became a duet. It was a contrapuntal interlacing of two lines borrowing motifs from each other, spontaneous but too harmonious not to have been thought-out beforehand. As the song meandered along, increasing in complexity but not thereby losing its charm, Martin saw that the people around him were beginning to enjoy it. There was still the same collective sense of ‘I’m listening to this only because I’m in Vietnam and it’s something that as a tourist I’m obligated to do,’ but beneath this veneer of otherness was an instinctive reaction against it. The foreigners were engrossed in the primitive

pastoral strains—and in the mystery of this small young woman standing in a halo of light as she conjured nature in the basement of a high-rise hotel...

“Look out!” Clyde shouted. “What are you doing, man?!” Martin raised his eyes from the ground just in time to see a jeep rumbling towards him. He ran to the side of the road. The jeep rolled past, bucking and lurching over the bumps and craters in the dirt. “Were you day-dreaming, dude?”

“I guess so,” Martin mumbled.

“You gotta be careful.”

“You okay?” Duong asked. “Very clote—clote call!”

“Sorry.”

“When are we gonna be able to see the valley?” Clyde asked. “I’m tired of these houses and trees.”

“Soon,” said Duong. “After that bend ahead. Very clote.”

Martin separated himself from the two men and walked over to the women. They were chattering in Japanese but stopped abruptly to smile at him.

“How are you?” asked Midori.

“Excellent! It’s starting to warm up a little, don’t you think?”

The girls looked at each other as they vigorously rubbed their arms. “No. It’s cold!”

“Well, when you’re wearing that! You look like you’re going clubbing!”

“So sorry...clubbing?”

“I mean, like you’re going to dance in a nightclub in Tokyo.”

“Oh!” Hiroko laughed. “Yes. It was bad choice.”

“You look like Britney Spears!” he said. They giggled, interpreting it as a compliment. “Do you like Britney Spears?”

“Oh yes. Very sexy. She so good dancer. I like American stars.”

“Me too,” interjected Midori.

“Ah. Yes,” Martin said, “American music is popular everywhere.”

“So, many Japanese listen to it. And try to play like them.”

“Japanese people watch MTV?”

“Oh yes! Very much. Very cool!”

“You actually like it?” he asked, skeptical.

“Of course,” said Hiroko.

Martin stared at them quizzically. He was about to follow up with more questions when a clearing appeared in front of them. No more trees, no more houses obstructed their view of the valley. They were silent as they contemplated the scene.

It was like New Zealand, Martin thought, but on a larger scale. The terraces on the hills covered in amber stalks of rice added a human element to the grandeur. They were geometrically regular, as if God had hired an architect to build a stairway to heaven, who had soon quit for lack of materials. The golden carpet of rice-stalks on the surface of each step lay at a hundred-degree angle to the green grass growing vertically, so that a color sequence of gold-green-gold-green undulated its way around the hillsides up to the summit. “Earth-waves,” Martin whispered to himself. “Frozen waves undulating upwards.” Periodic human figures waded through the gold fields to harvest the rice, which was then carried to the base of the valley, near a narrow river, and placed in shallow baskets that were shaken in the wind to separate the chaff from the grains. The whole scene, thought Martin, was from a different time, an epic time, though rumblings of tractor-trailers and jeeps and dynamite explosions in the cliffs where a road was being built proved to him that modernity reaches even into the bowels of the wilderness.

Soon they began to descend into the valley. They followed a winding dirt road of steep decline past half-naked children who stared at them curiously and endearingly. The Japanese girls took pictures constantly. After a while Duong told the four of them that they were about to see a family’s house on the side of the road, where they could buy souvenirs or just look around.

“We’ll stay there short time,” he said. “We have many plates to go.”

“Plates?” said Clyde. “Whadya mean?”

Martin translated. “He means places. We have to see a lot today, in only seven hours.”

The house in question was a small hut, wood with thatched roofing. The four tourists walked onto the porch, where a young mother was holding her baby and a grandmother and five other people were sitting. Martin thought it inappropriate to invade their home like this, with Duong explaining to him their customs and how they lived as if they were exhibits in a zoo, but they didn't show the slightest embarrassment or irritation. Indeed, they appreciated the foreigners' presence: it was a chance for them to sell the bracelets and necklaces they had made. Martin and the others walked inside the hut to look at its two rooms, which were bare and comfortless, as the natives followed them and repeated robotically the one English phrase they knew but could barely pronounce: "Hello you want this, hello you want this, hello you want this..." "No thanks," said Martin, trying to turn away—but they grabbed him again and out came "Helloyouwantthis" as bracelets were thrust in his face. His buying one only encouraged the others to descend on him. He looked over at Duong for help, but Duong just stood in the corner oblivious to Martin's desperation.

The hut, which was similar to all the huts in all the little villages that speckled the landscape, had a floor of hard dirt, a few wooden stools around two small fires, and two beds (or rather, platforms) with hard bamboo mats on which everyone slept. There was no chimney: the smoke seeped through the thatched roof. The guests found it a surprisingly cozy, if uncomfortable, home, providing adequate shelter from the wet cold outside. Duong told them that the women usually sat around one of the fires preparing food, while the men sat around the other fire and talked as they smoked tobacco and marijuana from long bamboo pipes.

At length the visitors succeeded in prying themselves from the natives, who were saying "Helloyouwantthis" as enthusiastically as they had been ten minutes before. The Japanese girls waved goodbye as they descended farther into the valley...

Clyde became less talkative as the morning wore on; he complained of aching muscles, fatigue, chills, a runny nose, nausea. "I wonder if I have malaria!" he said. "I haven't taken my pills in a few days, and I was bitten by a big mosquito yesterday! It's the mosquitoes that carry malaria, right?" Staggering along absorbed all his energy, which was perfectly fine with Martin. The group became quiet, sunk in the rhythm of the hike, as the sunlight warmed them.

They followed a path along the floor of the valley through fields of tall grass and hemp, which the villagers used to make their clothes. There were also wide swaths of green grassy land next to the river and ponds, where they rested periodically (sitting on large stones in the water or along the shore), watching men thresh and winnow the harvested rice nearby. As the baskets were shaken the husks floated away in the breeze; only the seed remained. A closer look was now possible, too, of the terraced paddies up above: men were cutting the stalks with scythes, then bundling them into sheaves. Duong told Martin that these sheaves had to be thrashed to get the rice out of them, after which it would be spread out on the ground to dry in the sun. The threshing and winnowing was the final step in the process.

"What are the earlier steps," asked Martin, "before the harvesting? What is the work like?"

"Hard. Many part. Make paddy, put water in, clean it...then make dry...use animal—buf'lo—make it flat and wet, make ready for rice, put seed...and many other part. Difficult to tell."

"It sounds like back-breaking work."

"Very hard and long time."

They continued walking. Hmong women passed them with baskets on their backs full of hemp or indigo plants or stalks of rice. They all wore the same dark blue clothes, the same large silver earrings, and some had colorful, intricately woven armbands. Midori took pictures of them, picture after picture, pictures of the male children bent low under stacks of wood, of the female children carrying infants on their backs, of elderly women hunchbacked like question-marks. Hiroko, too, was an appendage of her camera, pointing it at every plant and every person she saw. When they walked by a dilapidated school-building near an open field she ran inside to take a picture of the dark and empty interior.

Martin, for his part, was lost in thought, wondering what it would be like to live here where life was seasonal and cyclical and nature was a spirit to be worshiped. A place where the rhythms of life were the rhythms of nature and had been so for hundreds, thousands, of years, changing not with the centuries but with the seasons. What would winter be like here? What would it be like to construct terraced paddies year

after year and plow them with buffalo and tend them for months until it looked as if they had been created not for one's sustenance but for purely aesthetic reasons, being as beautiful as anything Martin had ever seen? What would a sunset look like here, with warmth shining on warmth, gold on waves of gold, as vermilion streaks stretched across the sky from the sun low over the mountains? It would be a hard life, yes, and he did not envy these people; but it would have a simple beauty, a Tolstoyan simplicity. To the Western mind, in any case, the thought of being one with nature in the shadow of mountains had shades of sublimity.

And what was the mindset of these distant villagers? How did they experience life? Having lived in the pure air of the mountains in northwest Vietnam all their lives, closer by miles to the clouds than most of humanity—every morning breathing in thick white clouds that hung low until midday—their very consciousness must have had little in common with Martin's. Until fairly recently their world had been a natural autarky, complete unto itself; the pale strangers who besieged them more and more each year and brought them plastic and electricity must appear to be aliens of some friendly species. How would an animistic mind orient itself toward cameras and jeeps? Probably it would be fascinated and frightened at first but would become bored as the novelty wore off. Eventually it would just try to take what it could from the newcomers to make its life more comfortable—as the natives wore plastic sandals now and some Western clothing. In many ways, Martin knew, these people did not differ from him, for instance in their ordinary desires and motivations, their love of love and friendliness, their fondness for bright colors and leisurely play; yet in other ways they inhabited a different universe, parochial and repetitive, but peaceful. To what extent did they understand sarcasm and cynicism? Did they experience adolescent existential doubts? Did they know the agony of unrequited love, or the spiritual pain of ennui? Were they still capable of being thrilled by pink feather-tips in a lavender dawn, or the gentle sunburn of a twilit sky?—or, indeed, the majesty of the very ground beneath and around them?

The travelers came to a village of six huts spread over seventy or eighty yards. Chickens, pigs, dogs, and naked children ambled aimlessly; a wizened old man sat on a wooden stool; an elderly woman sewed underneath six or seven pieces of indigo cloth hanging from beams attached to her hut; younger women welcomed the travelers with smiles and friendly questions. The huts here were larger than others they had passed and more sturdily constructed, with wooden, not thatched, roofs. Martin looked inside one of them and even saw a small television; middle-aged men sat around it in silence looking at the white images. He was amused that they had a TV but no bathroom: a hole in the ground behind the hut, not at all private, served as the bathroom. The kitchen (or what functioned as a kitchen) was only a few feet away, on the other side of some wooden planks.

He was struck by a thought, a question that demanded an immediate answer. He walked over to Duong, who was trying to comfort Clyde as he rested in the grass complaining about his condition.

"Duong," said Martin, "where do people have sex around here? There's no privacy! And what are relationships like? Do men and women get married?"

"Yeh. Married. Girl fifteen or sixteen, young."

"How do marriages happen?"

"Girl and boy come town, meet."

"What?"

"Love market in town on weekend."

"Love market? How does that work?"

"Boy see girl, if he like, sing to her and she sing. Next week see again—if parent say yes."

"So, girls and boys gather in the market and look at each other?"

"Yeh."

"And if a boy sees a girl he likes, he goes up and sings to her?"

"Sing and talk."

"And if they like each other they'll come back and meet again later, if they get their parents' approval."

"Yeh."

"Interesting. That's a lot simpler than in America! But where do couples have sex? There's no privacy here."

“Sex very quiet, in house.”

“So a married couple has sex in the house where their children and parents live?”

“Yeah.”

“Wow.” It seemed these people did not have Western self-consciousness about their bodies.

In fact, the more Martin saw of them, the more he liked them. As he ate lunch in the village with Midori and Hiroko he had to answer dozens of questions from eager children and young women, questions about America, about his love life, about his impressions of this place. Occasionally the natives’ imperfect English led to some amusing misunderstandings. At one point, a girl named Anh asked, “How old can you drink in America?” “Twenty-one,” Martin said. She was shocked. “You can’t have asshole until you’re twenty-one?!” When Martin burst out laughing she realized her mistake, and everyone around them teased her about it. Anh was very outgoing, but she was merely an extreme version of all the young people, who all projected curiosity and wide-eyed friendliness—including the shy ones. The little ones were simply adorable, staring and smiling at him with as little self-consciousness as their older siblings. Even the adults, the elderly, the men—almost all were welcoming and cheerful.

Martin found it strange, indeed, that many of the adults seemed nearly as happy and bubbly as the children despite their shrunken size and premature agedness. Thirty-year-olds looked like fifty-year-olds, wrinkled, crooked, diminutive, half-toothless. Yet their smiles beamed like an eight-year-old’s. Despite all the hardships of life up here in the mountains they seemed happy, childlike as Hindu sages. Martin called to mind, randomly, Maxim Gorky’s autobiography—he had read it recently—which described the wretchedness of Russia’s proletariat during the Industrial Revolution, and he realized that there were in fact two kinds of poverty: the humanizing and the dehumanizing. Gorky had grown up in a factory-culture for which humans were fodder like in a war, less valuable than a hunk of metal; Anh and Duong and Lê lived in a society that was poor, very poor, but was centered around a community of relative equals who lived in the lap of nature’s luxury.

The sun had passed its zenith in the sky now and the day had gone from cold to almost-warm. The travelers pressed on, over fields and hills, up onto the terraces where men were working. There was a footpath beside the crops which they walked on. Martin took some pictures of the area from this vantage-point because he thought it looked like a three-dimensional painting, or a visual transcription of the second movement of Beethoven’s fifth piano concerto. (That comparison seemed odd to him, but it surfaced in his mind so he wrote it down later in his journal.) He heard the noise of heavy machinery somewhere in the distance.

Later in the afternoon, when everyone was getting tired and the hike was almost over, they came to another village (the fourth they had seen). It offered the same sights and smells they had grown accustomed to, the not unpleasant earthy smells of old weather-exposed wood, fires in firepits and smoke soaked up by thatched roofs, mud and wet grass and autumn. Martin was about to rest on a stool when a young woman emerged from a hut and walked in his direction. He stood up. ‘She looks familiar,’ he thought. ‘Have I seen her somewhere?’ Then it came to him: she was the one who had performed in the concert last night! Her white face with its vaguely sad expression was unmistakable. Evidently she lived in this village. For a minute he stood there dumbly; she disappeared into a hut and reemerged seconds later. He was disturbed, again, by her wraith-like, ethereal beauty. She walked slowly with her bare feet barely making an imprint on the earth; she stopped and adjusted her black hair slowly, loosened it from its bun so that it fell over her shoulders. Just before she was about to reenter her hut Martin coughed and walked toward her.

“Excuse me,” he said gently, “do you speak English?”

She turned around and smiled. “A little.”

“I think I saw you last night in a concert. You were playing a flute or something.”

“Yes, that was me.” Her accent, surprisingly, was not very noticeable.

“You did a great job. That was the best part of the concert.”

“Thank you.”

“How did you learn to speak English so well?”

“I learned it from Americans like you. In the market. My parents helped me too.”

“That was wise of them. They knew English would be a useful skill to have.”

“Yes, it is more useful every year because of travelers.”

Martin liked watching her talk. But he didn't know what else to say.

“How often do you go to the town?” he asked.

“Every weekend. I sell blankets that my mom weaves and I play music for people.”

“Do you enjoy it?”

“Yes, I do.” She smiled with her eyebrows wrinkled in puzzlement. Martin was starting to feel foolish and self-conscious. Why was he talking to her? What had he hoped to accomplish?

He looked around. Duong and the Japanese girls were off behind a hut talking to some women; Clyde was lying on the grass with his face exhausted from the strain of the hike. Men were still threshing rice hundreds of yards away even though dusk was approaching; some were singing, the wind carrying their voices to the village. Their songs had no recognizable melody and seemed to interfere with each other, but somehow that was perfect. Any other way of singing would have seemed out of place. This was mountain-music, Martin thought—the spirituals of North Vietnamese peasants. Neither plaintive nor uplifting, they were a musical expression of the harvest.

Martin felt the rice wine he had been offered a few minutes ago swimming in his head. He hadn't had much but it was strong, stronger than Western wine. He turned to the girl again and looked at her thin face. That's why he had wanted to talk to her, he remembered: he wanted to say, for some reason, that she looked different from everyone here.

“What's your name?”

“Dào,” she said.

He paused. He couldn't tell why he was so curious about her.

“You live in a very beautiful place, Dào,” he said. “You're lucky.”

“I think so.”

“Is this your village?”

“Yes, I live here with my parents.”

He was attracted to her, to her aura of separateness and aloofness. Suddenly he was sick of the pleasantries, the fakeness; he wanted to talk to her like a friend, a real human being. She looked at him expectantly, clearly wondering where this conversation was going.

“Sorry, I'm a little tired from the hike,” he said. “I just wanted to say hi because I recognized you. And also, I can't help saying that you look—pretty, and...interesting.”

“Thank you...” She smiled.

“I'd like to talk to you longer, but I have to go. Can I just ask... The reason I recognized you is because you look different from other people I've seen here. You're whiter...even whiter than me...and, I don't know, you have an unusual brightness and beauty.”

Her smile slowly dissolved. She looked at him intently with sad eyes. “You're different from most people too,” she said. “Most people don't talk about how I look.”

“I'm sorry if...”

“No, it's okay.” She looked away for a moment. It seemed to Martin that this girl was very self-possessed for having lived in the countryside all her life. “I look this way because I am sick. Very sick.” She sighed and looked up at the layers of amber grass to her left, the terraces on the hillside. “I will die soon, I think.”

Martin gaped at her. “What? You will die?”

“Yes. I am sick.” She lowered her eyes as Martin stared in disbelief. Her words echoed in his mind: “I will die soon, I think.” What? This situation had become suddenly surreal. Maybe the alcohol was influencing his thoughts too. But he felt inexpressible sadness as he absorbed what she had said.

“You...you...”

“I'm sorry, I have to go,” she said. “I must help my parents.” And she turned around and disappeared into her home.

‘What just happened?’ Martin asked himself. ‘She's going to die? When will she die? Can she be helped somehow?’ It was so unreal he didn't know what to think. Instead he just gazed at the mountains in the distance and listened to jeeps driving on dirt roads above, and dynamite explosions in the cliffs.

*

I wrote another email to Chomsky in which I quoted the “virtually emotional” thing I’d written about him and also expressed a concern or two about his constant less-than-critical defense of democracy. He wrote back the same night:

“Appreciate the very generous remarks (naturally enough). I think you’re right to point out that democracy can have very serious flaws, and a properly functioning democracy should have built in constraints against the kinds of outrages you describe. But I think that ultimately we cannot go far beyond Jefferson, when he observed the failures of democracy in his later years, but concluded that the choice is between ‘aristocrats and democrats,’ where the aristocrats are ‘those who fear and distrust the people, and wish to draw all powers from them into the hands of the higher classes,’ while the democrats, in contrast, ‘identify with the people, have confidence in them, cherish and consider them as the honest & safe, altho’ not the most wise depository of the public interest.’”

It’s the predictable response expressed in the predictably sophisticated Chomskyan way.

Good advice: unless the writer is interested, the reader won’t be interested. The writer should make sure at all times that he is engaged with his story.

I’ve been writing a story for over two weeks—it’s 10,000 words now—but I’m convinced it isn’t good. So, back to the drawing board.

June 16–18

I can’t help feeling as if all this to-do about “the craft of writing” is silly. People taking themselves and what they do too seriously, I guess.

Readings every night, usually by the famous writers here. Ravi Shankar, Alexander Chee, Josip Novakovich,¹ Katha Pollitt (annoying liberal feminist). But last night and tonight, readings by students. Much less well-attended, of course, than the celebrities’ readings. But in an odd way they’re more enjoyable, more affecting. All these diverse people, many of them shy and worn-down by life, all talented, all sharing their private lives with strangers. Brought together by a love of something the culture doesn’t love; the only common denominator a love of writing. People not famous, writing on faith. Predictably none of the famous people attend these readings, only a few students. But they’re so much more powerful than those other readings! Far more intimate, certainly more transporting because no ego is involved and no books outside waiting to be bought, only mysterious pasts like that woman whose every piece is about her son Simon who died young and those women who read quietly with head bowed low, their writing wonderful. What has brought them here? What pasts? Most of them will not be successful authors because they lack the will, but they continue writing anyway on faith.

Wherever there is deep feeling and unpretentiousness, I fall in love.

June 19, 21

It’s doubtful that the Ninth Symphony could have been written fifteen years later or fifteen years earlier. Only when it was written could it have been written. (The culture.) [Harold Schonberg wrote:

¹ That guy is hilarious, by the way. Probably a dick and a lecher (always hitting on girls, getting wildly drunk) but at least he has no respect for propriety and his sense of humor is spectacular. His brain lacks a censor. He belongs in the ’20s or ’30s with Hemingway, Fitzgerald, Pound and the gang.

Beethoven's music is that of an indomitable hero, Mahler's that of a psychic weakling. But the difference is not only, or even essentially, between the men themselves, but between their cultural circumstances, which the music expresses. Had Beethoven lived in the early 20th century, his music would have been not heroic but decadent, like Mahler's and Webern's and Strauss's. It would have been overly subjectivistic, 'individualistic,' unbalanced, rather than fusing harmoniously the individual with the culture as in the 9th symphony and the works from Beethoven's middle period. To say it again: the creation of the most universal artworks presupposes not only great talent but also a society that isn't dehumanized.]

Nothing, *nothing*, is more magnificent than that symphony.

Beautiful thoughts on writing from Elizabeth Gilbert, which echo what we were told at the conference by published writers:

Sometimes people ask me for help or suggestions about how to write, or how to get published. Keeping in mind that this is all very ephemeral and personal, I will try to explain here everything that I believe about writing. I hope it is useful. It's all I know.

I believe that—if you are serious about a life of writing, or indeed about any creative form of expression—that you should take on this work like a holy calling. I became a writer the way other people become monks or nuns. I made a vow to writing, very young. I became Bride-of-Writing. I was writing's most devotional handmaiden. I built my entire life around writing. I didn't know how else to do this. [...]

As for discipline—it's important, but sort of over-rated. The more important virtue for a writer, I believe, is self-forgiveness. Because your writing will always disappoint you. Your laziness will always disappoint you. You will make vows: "I'm going to write for an hour every day," and then you won't do it. You will think: "I suck, I'm such a failure. I'm washed-up." Continuing to write after that heartache of disappointment doesn't take only discipline, but also self-forgiveness (which comes from a place of kind and encouraging and motherly love). The other thing to realize is that all writers think they suck. When I was writing "Eat, Pray, Love", I had just as strong a mantra of THIS SUCKS ringing through my head as anyone does when they write anything. But I had a clarion moment of truth during the process of that book. One day, when I was agonizing over how utterly bad my writing felt, I realized: "That's actually not my problem." The point I realized was this—I never promised the universe that I would write brilliantly; I only promised the universe that I would write. So I put my head down and sweated through it, as per my vows.

I have a friend who's an Italian filmmaker of great artistic sensibility. After years of struggling to get his films made, he sent an anguished letter to his hero, the brilliant (and perhaps half-insane) German filmmaker Werner Herzog. My friend complained about how difficult it is these days to be an independent filmmaker, how hard it is to find government arts grants, how the audiences have all been ruined by Hollywood and how the world has lost its taste...etc, etc. Herzog wrote back a personal letter to my friend that essentially ran along these lines: "Quit your complaining. It's not the world's fault that you wanted to be an artist. It's not the world's job to enjoy the films you make, and it's certainly not the world's obligation to pay for your dreams. Nobody wants to hear it. Steal a camera if you have to, but stop whining and get back to work." I repeat those words back to myself whenever I start to feel resentful, entitled, competitive or unappreciated with regard to my writing: "It's not the world's fault that you want to be an artist...now get back to work." Always, at the end of the day, the important thing is only and always that: Get back to work. This is a path for the courageous and the faithful. You must find another reason to work, other than the desire for success or recognition. It must come from another place.

Quotation from R. W. Emerson: "That which we reject returns to us in alienated majesty."
Jonathan Safran Foer: "Time heals all wounds. But what if time is the wound?"

June 23, 28

[...] Judgments of natural and artistic beauty, sublimity and so on come from the same faculty that judges masculine and feminine beauty. All such judgments are intuitive, not ‘conceptual’ or ‘intellectual’ or ‘discursive.’ (See the footnote in which I mention Frank Sibley.) A definition of these intuitive concepts has to be circular, uninformative, ‘self-referential,’ unlike the definition of, say, bachelor.

I thought I had more to say, but I guess not. The point, maybe, is that the primitive sexual layer of the psyche is closely involved in the higher aesthetic, artistic layer, as shown by the similarities between (the nature of) evaluating/‘desiring’ human beauty and (the nature of) evaluating/‘desiring’ artistic beauty. (This is an un-Freudian, philosophical way of arriving at Freud’s idea, or something like it.)

Infinite tragedy. Absolute futility of everything. A world too large, a collective mind too small. Tragedy like this cannot be possible; I must be missing something. I keep hoping it’s all a dream, that I’ll wake up momentarily at God’s right hand or in some unfathomable dimension of existence.

In the end, as always, it’s the irrationality of the social order that we have to blame.

Finally got another job. (I’ve been getting unemployment checks.) Teaching at an ESL school downtown. 100 minutes per class, which is long. But it’s a good place; the students (“adults”) seem better-behaved than EF’s students.

If you saw how often comedians make fools of themselves, you would respect them as little as they respect themselves.

It’s amusing and sad that millions of people think Obama can truly change America. It’s the Bill Clinton phenomenon all over again. Massive disappointment is inevitable, whether Obama is elected or not. He’s a politician, after all: an opportunist, a pragmatist, a centrist if need be.

I’ve been wallowing in ridiculous contentment for months.

[...]

July 5

While home for the 4th I read parts of Hilary Putnam’s *Reason, Truth and History*. Thought-provoking book to which I’ll return someday when I re-appraise the notions of my youth and re-present them in a more polished form.

Darius Rejali on the democratic origins of modern torture-techniques. Innovations in torture spread from democracies to authoritarian regimes. (Democracies want “cleaner” torture so there is less physical evidence that can later be presented to the public.)

Chomsky: “Propaganda is to democracy what violence is to totalitarianism.” That’s misleading insofar as it suggests that democracies don’t use violence.

July 6

Today as I stood in line at Dunkin’ Donuts I saw a tall, large-bodied, dull-faced jockish type in front of me. I thought, “With that height and that body he must get plenty of women.” A moment later a petite redhead came up, touched him on the shoulder and said she wanted a latte. “I guess I was right,” I

mumbled. She turned around and I gave a half-smile to her because she was pretty. As I was smiling I realized I was looking at Olga, the Russian girl I'd met months ago who hadn't returned my second phone-call. The extraordinary control I have over my facial muscles allowed me to maintain complete composure, without a single muscle twitching in reaction to seeing her. But the shock of recognition seized her face utterly for one second; then she recovered and walked a few feet away. I smiled inwardly: "So this jock here is the type she prefers. I'm bowled over by surprise." Still, remembering that this beautiful girl had rejected me caused a minuscule twinge of hurt, and I remained in a mellow mood for over an hour.

For most Western females, the important element in being attracted to someone is feeling sexual tension around him. Being-attracted-to practically *means* feeling-sexual-tension. (That's less true of men.) So if they don't feel sexual tension with him, they won't be romantically interested in him. This is one respect in which females are the sexual sex: their "feeling," as they always insist, is what determines whether they like a man, but "How does he make me feel?" is, to a great extent, just another way of asking "Do I feel sexual tension with him?", i.e. "Does he make me feel feminine and attractive?" Sexual tension is not quite as important for men, who will gladly have sex with any pretty thing they see. Even as a criterion for choosing a *girlfriend* it isn't as important as it is for women.

What determines whether a woman feels tension (i.e., half-consciously or unconsciously wants to have sex with the man she's talking to)? In truistic terms, she has to feel that he is projecting strength, confidence, power, masculinity. More precisely, she has to feel he is strong, confident, etc. *in relation to her*. If she feels that she is in some way dominating him, then there's little or no tension. But if she is being subtly "dominated," there is, quite possibly, exciting tension. If she feels as though it's totally easy to make him like and respect her—e.g., if he is very easygoing—then she will not feel much sexual tension.¹

All this, by the way, complements the man's experience. He feels a sort of 'sympathetic sexual tension' if he senses that he is subtly 'dominating' the female, making her feel slightly subordinate, staying 'one step ahead' of her in the conversation, controlling her by making her laugh often. (On the other hand, the more 'impressive' she is, the more tension he'll feel—as long as he isn't intimidated by her!—because her impressiveness will make him have a correspondingly stronger desire to impress her. This reaction, I remind you, is due to the dialectic of recognition that I discussed when reading Honneth's book.) If *she* intimidates *him*, he'll feel no sexual tension but only emasculation; if *he* intimidates *her*, on the other hand, it's still entirely possible that she'll feel sexual tension. And she'll probably desire him, though she might not admit it to herself.

One of the qualities that the 'easygoing' person lacks is a sort of *detachment* from the situation he's in. This lack usually makes him likable but not charismatic. A man wholly immersed in what the woman is saying, listening to her intently, 'hanging on her words' so to speak, showing great respect for her and interest in what she is saying, does not thereby project confidence, independence, self-certainty, a dominating and commanding attitude, and thus is not fostering sexual tension. *Ceteris paribus*, then, she doesn't crave his recognition, precisely because it comes too easily. A man, on the other hand, who isn't *always* a great listener but instead periodically ignores the woman, talks over her, gets a 'distant' look in his eye, and gives the impression that he doesn't need this particular woman's approval in order to feel good about himself—this man probably makes her feel a little subordinate, and she desires his recognition (or, in Kojèvean language: she "desires his desire") because only then will her self-certainty be completely restored. This man is "mysterious," as women like to say. If she says to you, "I never know what you're thinking," perhaps with mild irritation, then you know you're doing something right.

Again, the female's reaction to this kind of semi-detached, self-confident person is actually a *human* reaction, not only a feminine one. Most men, however, are not as swayed by it as women are, at least with respect to women themselves. For a man usually wants his mate to "hang on his every word," to

¹ [Remember: as Johan Huizinga says, the presence of "tension" is one of the defining characteristics of *play*. And dating, like flirting, is essentially a kind of game—or rather it incorporates play(fulness). In the context of dating, tension takes the form of sexual tension. So if there is no sexual tension, the game isn't being played right and one or both of the partners will lose interest.]

show complete respect for him, to look up to him, to seek his advice and comfort. (And the woman wants to look up to him too (figuratively and literally). She doesn't want *him* to look up to *her*!)

July 9, 15

Reading Sartre's *War Diaries*. Fascinating document.

I read a long article in the Britannica online about harmony, its theory and its history (from ancient Greece to the twentieth century). Now I'm going to read many more articles on all things musical. (The incomparable delights of *learning*!) Classical music makes a lot of sense once you know how to make sense of it! You can listen to a piece with new appreciation for the composer's genius when you understand the theoretical principles behind the ravishing harmonies and melodies. (Schubert's D. 956, first movement. Hearing its theme for the first time months ago was a revelation and I couldn't get that melody out of my mind. I'm told that some music-lover was once so enamored of the melody that he asked for it to be carved on his gravestone after he died.) The greatest composers are the ones who respect not only the strictures of theory, such as Webern, Boulez, Nono, but also the listener's desire for engaging, assimilable sound of some sort. The task should be to use the *form* of abstract harmonic principles and structures to create the *content* of emotionally gripping sound.

On the other hand, you could scorn all manifestations of creativity, be they Schoenbergian serialism, Wagnerian chromaticism, Milhaudian polytonality, Debussian impressionism, Stravinskian neoclassicism, Schubertian tonal modulation, Bachian contrapuntalism, or Beethovenian heroicness, and choose John Cagean indeterminism, where the music is based on chance and anything *creative* is considered an imperfection in the composition. (4'33" is the logical outcome of this.) "Cage was influenced by the study of Zen philosophy: he determined that a quiet mind was one free of dislikes; but, since dislikes require likes, it must be free of both likes and dislikes. He once said, 'You can become narrow-minded, literally, by only liking certain things and disliking others, but you can become open-minded, literally, by giving up your likes and dislikes and becoming interested in things.' To escape being influenced by his own likes and dislikes, Cage then sought to remove the creative process from his composition, often relying on coin flips and dice rolls to decide where or how to place a certain note." Like his mentors the Zen Buddhists, Cage aimed at the extirpation of individuality, though in a less 'redeeming' and more nihilistic way than Buddhists. Fortunately his project was unfulfillable. Humanism cannot be killed so easily.

Anyway, I'm starting to understand the pleasure of *theorizing* pieces as opposed to just *savoring* them.

July 16

Today I was eating a sandwich on the edge of a pleasant stone courtyard in front of an office building next to the sidewalk. Standing there harmlessly eating a sandwich. A guy wearing a suit, coming back from lunch maybe, passed by me but stopped to ask if I was waiting for someone. "No." "Okay, this is private property," he said. I looked at him, took another bite of my sandwich, and slowly walked away. Furious inside. It occurred to me then that *Homo economicus* is the only *despicable* creature in the animal kingdom. That man's act, that petty little bureaucratic act, is the origin of all wickedness. Adolf Eichmann isn't far away. "I'm just following rules."

I don't deny that hearing Cagean music can be an interesting *experience*. Nor do I deny that the creation of such music was inevitable in the 20th century, or that Cage represents a somewhat important moment in cultural history. What I deny is that the music itself is aesthetically interesting, and that it is "good" or "great" art. Certainly by humanistic ("affirmative") standards it has little value.

I would say something similar about twelve-tone music, in which the composer is not supposed to use a particular note of a tone row again until after the other eleven notes have been used, thus ensuring

that the composition has no hint of tonality. Each note is supposed to be as important as every other; there is no tonic, nor even a note that is used more often than the rest. This system is indeed noteworthy (so to speak), and the restraints it imposes must pose challenges for the composer. Still, it strikes me as creatively puerile and simplistic compared to the complex system of tonality that dominated the West for centuries. Whatever any defender of Schoenberg will say, it's undeniable that a piece as creatively mature as, say, the Diabelli Variations is impossible to compose in the twelve-tone idiom, or in any kind of atonality. The tonal system, despite or because of all its rules, is simply a more fertile terrain for composition than the organized chaos of atonality. Its musical products can, for one thing, be analyzed in more ways than the products of atonality; they have more harmonic and melodic material for the critic to chew over, and the composer has both more freedom (with respect to the direction he takes his piece, the many tonalities he can exploit along the way, etc.) and less freedom than the atonal composer. Regarding this creative potential, it's significant that tonality has held sway for all of history while atonality essentially petered out after a few decades and was never even close to culturally hegemonic. The reason is that it's comparatively barren. There is less to be done with it, and people get bored with it more quickly.

By the way, I'm leaving out the obvious consideration that tonal music is far more accessible to listeners than atonal music, that it seems to resonate with the human psyche more, that it affects the emotions more and can sound more intuitively beautiful or sublime than atonal music can.

Said more simply: the greatest tonal compositions are far more impressive than the greatest atonal compositions, indeed any atonal composition conceivable. Even semi-tonality, as in Debussy, is by its nature inferior, because, ironically, it's more limited and limiting than tonality. Its composers have it both easier and harder than tonal composers, in ways that work to the advantage and glory of the latter.

The creations of tonal composers are more fully realized, usually, than atonal or half-tonal compositions, for *determinatio est negatio*. Tonality excludes more than atonality does. (That doesn't mean tonality is more "limiting" than atonality. The opposite is the case. Western tonality is an inconceivably rich terrain.)

July 17

Reading an entertaining, informative and accurate book on *Beethoven: His Life and Music*, by Jeremy Siepmann. The author is musically educated, so his brief discussions of particular pieces are enlightening. Thanks to him I've discovered the delightful Serenade in D major, Op. 25, for flute, violin and viola. Also the wonderful Septet in E-flat for violin, viola, cello, double bass, clarinet, bassoon and horn, and the "Archduke" Piano Trio with its unearthly slow movement.

The Beethoven that emerges from this unbiased book is immensely appealing and endearing. It is the Beethoven one wants to believe in. His own raw words are powerful, as in his rapturous love-letters, his "Heiligenstadt Testament," and his journal: "Submission, absolute submission to your fate, only this can give you the sacrifice...to the servitude—oh, hard struggle!—Turn everything which remains to be done to planning the long journey—you must yourself find all that your most blessed wish can offer, you must force it to your will—keep always of the same mind...O God, give me the strength to conquer—myself!" He was everything an artist should be. Goethe, by comparison, comes across as false and vain: "Goethe," he wrote after he'd met him, "is too fond of the atmosphere of the royal courts, more than is becoming to a poet. Why laugh at the absurdities of virtuosos when poets, who ought to be the first teachers of a nation, forget everything for the sake of glitter?" Beethoven's contempt for everything but the artistic, the metaphysical essentials of life is extraordinarily inspiring, absolutely *masculine*.

But that ugly episode with his nephew Karl exposes all his faults: his paranoia, his jealousy, his maliciousness, his cruelty, his selfishness. Had he lived in a later time he would not have been nearly so great a man in the eyes of posterity. (For one thing, his music wouldn't have been so great. It would have been closer to Brahms, or Wagner, than Beethoven.) Much of the blame for his faults, though, rests with his childhood and his deafness.

Now I'm reading Reginald Smith Brindle's *The New Music: the Avant-Garde since 1945*. (It was published in '87.) I want to understand this music so I can belittle it more intelligently. ☺

I do, however, admire a lot of twentieth century music. *Le Sacre du Printemps*, for example. I may not *love* it, but I recognize its genius. Its complexity and power.

July 20

I sort of like Alban Berg's piano sonata too, since, unlike much twentieth-century avant-garde music, it isn't only an intellectual exercise. It's barely tonal, so it isn't "pretty," but it's full of poetry and unrest. Profound spiritual turbulence reaching beyond the immediately given. It isn't at all masturbatory or self-indulgent; it communicates. (And of course intellectually it is brilliant, like so many avant-garde pieces. Reading an analysis of it has convinced me of its exquisitely constructed coherence.)

I'm beginning to appreciate just how complex some avant-garde music is, how obsessively *controlled* and *precise* it is (or *was*). Integral serialism, which had its heyday after WWII, was the epitome of the drive to make music mathematically precise. Composers "predetermined" their compositions down to the last minute detail according to principles of total serialism. Note durations, dynamics, rhythm, pitches, tempi were all ordered in serial fashion, though not necessarily in the Schoenbergian twelve-note way. A series of notes, for example, would be explored in such a way that nearly all its possible permutations were exhausted by the end of the piece. Composers would use matrices of numbers to arrive at the series' inversions, the retrogrades of the inversions, their transpositions, etc. It was astonishingly complex and virtually unplayable music, or rather noise. Purely mathematical puzzles with little or no musical value.

Then composers reacted against this obsessive formal control by going to the opposite extreme: indeterminate, or aleatory, music. "Free twelve-note music" was popular too, in which there were no predetermined rules that dictated which notes you could use when.

I'm tired of reading about this stuff, though. Sure, it requires a lot of patience and study to write such music, but arguably it's more a *craft* than an *art*. It isn't as though a person is "born to write" this kind of music, as Mozart, Schubert, Beethoven, Tchaikovsky, Rachmaninov were born to write music. One isn't really *born* with atonal talent; one can simply learn all the necessary methods and formal rules, as one can learn to be an excellent photographer (but not a poet, not a painter, not a draftsman, not a sculptor in the grand old ways).

Most of these extreme "avant-garde" composers give form total priority over content, to the extent that content is externally, inorganically introduced for the sake of realizing a predetermined form. The older composers, on the other hand, tried to unite form with content, which meant disguising the fact that there was a separate "form" at all. Content organically grew out of itself—or at least seemed to in the listener's ear—and yet it did so according to the requirements of tonality (tension, resolution, all the harmonic principles of Rameau and his successors) and the sonata form, or the fugue, or the canon, or whatever. Content and form fit each other perfectly. But that ideal was lost in the twentieth century.¹

Cf. Sontag's formalism. Formalism is decadent, a harbinger of creative exhaustion.

In the old music there was something for both the simple music-lover and the sophisticated critic: the "moving" content satisfied the former, while the masterful manipulations of form satisfied the latter. The intuitional aesthetic faculty, in other words, was as satisfied as the analytical intellect. That isn't the case with, say, Berio.

No modern composer pushed the boundaries of tonality more provocatively than Schubert did in his A major piano sonata.

What avant-garde composers did consciously and ridiculously, the old masters did, in a sense, unconsciously and sublimely.

(Of course it wasn't entirely unconscious. Just look at their notebooks.)

¹ [That isn't really true. Stravinsky, Bartok, Shostakovich, Copland and many others wrote organically unified pieces.]

I'm reading some of Alfred Brendel's essays on Beethoven, Liszt, Schubert, etc. Also *An Outline History of Western Music*.

In the whole history of the world, music wasn't written down consistently until the Middle Ages in Europe. Before that, it was mainly a form of free improvisation based on melodic or rhythmic patterns. (The repetitiveness was supposed to have a hypnotic, magical effect.) The ancient Greeks knew of the twelve notes that constitute the modern chromatic scale: they were "derived from arithmetic computations that determined proportional divisions of the string to produce related pitches" on an instrument called the monochord.

I'm struck by the extent to which 20th century serialism was a return to the repetitional practices of late medieval and Renaissance musicians. (It goes without saying that there was also a return to polyphony.)

I'm a fan of Domenico Scarlatti. Through his sonatas I inhale the pristine air of the Baroque.

I find it diverting when I pass a woman in the street to visualize her vagina hovering beside her face, or stuck in her neck. It's the union of *identical opposites*: the greatest of paradoxes. The face and the vagina fused together. Unimaginable. The distance between them in the body mitigates the paradox, or hides it; but if you imagine the beautiful face and the not-so-beautiful vagina smooshed together you can't help being disturbed.

July 22

People who insist that women are ultimately just as "sexual" as men—that they want sex as much as men do, if not more—are right. Because female sexuality is relatively passive, though, its hidden maenadic nature can be overlooked. Few men can be as sexually frenzied as a woman can. Therein, ironically, lies the relative *activeness* of male sexuality—or, rather, that fact is symptomatic of it, as the sexual frenzy of a woman proves her "passiveness." For her frenzy is made possible by a lack of self-control or "soberness," or active and sober (self-)distancing from a given situation. A woman in the throes of ecstasy, screaming wildly as her body contorts, is in a state of passivity; the man thrusting himself inside her and gazing with wonder at this spectacle is the active one, however calm he may appear. He is more free than she is. Her consciousness, like her body, is contorted.

All trance-like states, even if they occur in men, are basically feminine, for they are passive and unfree. A man full of consuming rage is experiencing a feminine contortion of his consciousness; the most masculine man is someone like Noam Chomsky, who never loses his temper and is always quite rational.

(More accurately, the man who temporarily becomes a "raging bull" is both masculine and feminine: masculine insofar as he is exercising his physical strength on his environment by attacking it, forcing himself on it, bending it to his will, perhaps destroying it but at least *dominating* it; feminine insofar as he has lost all soberness and the ability to reason without being swayed by his emotions. Obviously everyone has both masculine and feminine elements in his or her personality.)

The fact that human behavior is largely shaped by social conditions doesn't mean you can't idealize "tendencies" that are more or less shared across cultures. In some cultures they may be more observable, in others less so, but inasmuch as they exist you can and should "idealize" them for the sake of intellectual clarity. Only keep Marxism in mind as you do so. Otherwise you'll become a simple-minded absolutist, maybe a misogynist or misandrist.

—On second thought, ignore all that (except the last few sentences).

July 23, 24

My first poetic mood in weeks... Sad and intimate, like the hair tucked behind Gimena's ear as she slept on my bed months ago... Simple, very simple. It's raining outside, appropriately. But my window is open anyway, the fan placed inside it blowing cool air into the room.

After my last class today I didn't ask Maria, the blonde Russian, to drink with me at a bar like I'd wanted to because our conversation was interrupted by another student—although I should have asked her anyway... So she left and disappointment flooded my chest cavity because now I had to go home alone. On the bus an Indian girl sat down next to me right before I had to get off, and she had the face of someone I would love but I didn't talk to her because I had to get off at the next stop. I wouldn't have talked to her anyway, of course. But I would have loved her... And then as I was about to cross a street in the rain, a car slowed down and stopped for me even though there wasn't a long line of cars behind it. And I realized that people are kind, and for a moment I loved the person driving that car because he was kind and let me pass.

The Andantino from Schubert's sonata in A: Oh...my...God. He wrote it a few months before his death.

A few weeks ago I went to a walk-in clinic at a hospital in Brighton because my right ear was blocked up. The staffers were unclear on how much it would cost, and I was too dimwitted to insist on clarity. I figured the cost would sort itself out somehow, as it usually does, either through my insurance or through a discount of some sort because I'm poor. I returned four days later because the prescribed treatment hadn't worked. Turns out there was simply a build-up of wax in the ear canal; the doctor "irrigated" it out with a syringe and warm water. Three weeks later I had the same problem, so I went back and they fixed it in the same way. Unfortunately, all these incredibly high-tech medical procedures (involving water and a plastic syringe) were more expensive than I thought they'd be: I was sent one bill for \$479 and two for \$414. Those were the hospital bills; there were also three physician bills, which were \$152 each. My insurance, needless to say, didn't cover it. I wrote a formal complaint about the second bill because that visit had been a direct result of the doctor's misdiagnosis: she had thought I needed medicine, when really all I needed was an ear-cleaning. My appeal was rejected. I might be able to get a 30% discount on the hospital bills but there's no discount for the physician bills.

—Such are the fruits of America's healthcare system. \$1763 for two five-minute ear-cleanings. Or \$1371 if I get the discount. (Or, if I'm really lucky and get the second bill canceled, \$929.) How can anyone deny that a system of social relations that props up such bureaucratic practices is barbaric and irrational?

July 26, 29

I'll say this about Philip Glass's minimalism: it's good music to fall asleep to.

Last night I met Wann, a Chinese girl in her thirties who has lived in Boston for many years—we originally met at a party four weeks ago—went to a bar then at midnight danced outside in the middle of Harvard Square to live music, then we strolled around the Harvard campus and I kissed her and we kissed awhile. I stayed at her condo.

Tonight I met Ji-yun for the first time in a while. Went to a bar then I took her to my place and played some fine music for her. [...]

Tomorrow I'm meeting another girl, Lucy.

Reading a collection of Leonard Bernstein's writings and talks called *The Joy of Music*. Also watching internet clips of him speaking. The man was incredible.

I guess the answer to the question I've asked before in my naïve way is simple: the sense of tension and resolution that pervades tonality, for instance when the tonic follows the dominant, is explained by the overtones that sound when a note is played. The second overtone is the dominant of that note. These overtones must be the foundation of tonality.

The pentatonic scale consists of the first five overtones of a given note. "This group of notes," says Bernstein, "forms the basis of almost all the folk music of the world. The five black notes of the piano happen to correspond (in a well-tempered way) to this pentatonic scale... As civilization progressed, more

and more overtones were added, so that in the great flowering of Greek culture, for example, scales came into being that contained not five but *seven* tones.”

I’m impressed by Schoenberg’s *Verklaarte Nacht*, a string sextet written when he was 25. Passionate, rich, *tonal* music.

Even bitonality, polytonality is sort of okay with me (as I get accustomed to it and can understand it better). What I don’t like is atonality, except in a few special cases.

Observation from Bernstein: “We always speak of ‘playing’ music: we play Brahms or we play Bach.” Significant. Cf. Huizinga. (Bernstein goes on to say that “jazz is real play. It ‘fools around’ with notes, so to speak, and has fun with them. It is, therefore, entertainment in the truest sense.”)

I can’t get enough of Glenn Gould. Watching interviews online. I want to get *The Glenn Gould Reader*; it would challenge me, as his interviews challenge my conventional views. His explications of Webern, Schoenberg and other atonalists force me to take serialism seriously. I still think there’s something solipsistic about a type of music that is almost exclusively intellectual and virtually impenetrable to all but a few initiates, but at least I understand now that it merits study.

Anyway, I’m tired of making judgments like this. Condemning types of art, even on the basis of rational considerations, is not very interesting.

I like Gould’s observation that Webern is the Samuel Beckett of music, or the Piet Mondrian. It’s right on target.

“Genius is the capacity to take infinite pains.” Remember that, Chris, you lazy ass.

Vaginomania.—Gustave Courbet painted a picture of a vulva and called it *The Origin of the World*. Alfred Kubin drew a picture of a tiny man diving into a giant vulva and called it *The Death-Leap*. The paradoxical thing is that they’re both right.

Reading Oliver Sacks’s *Awakenings*, which is about his experiences with post-encephalitic, Parkinsonian patients. It was the basis for the movie with Robin Williams and Robert De Niro. It’s a good book, full of good thoughts and superb writing. Sacks emphasizes, as against his colleagues, that Parkinson’s disease is an *existential* rather than a purely *neurological* illness. It affects the whole *being* and not just the *body*; it is holistic and should be treated holistically. The doctor should adopt a sympathetic, imaginative, therapeutic approach to it—to understand how it is *experienced*—rather than a mechanical, external, ‘objective,’ ‘neuroscientific’ approach, which won’t be as fruitful. (If the patient, for example, is immersed in a warm and loving environment, his symptoms will be less severe than otherwise.) Sacks even suggests that Parkinson’s has features in common with a neurosis or psychosis. He strikes me as the R. D. Laing of Parkinson’s disease (though without Laing’s intuitive genius).

“Our health, diseases, and reactions cannot be understood *in vitro*, in themselves; they can only be understood with reference to *us*, as expressions of our nature, our living, our being-here (*da-sein*) in the world. Yet modern medicine, increasingly, dismisses our existence, either reducing us to identical replicas reacting to fixed ‘stimuli’ in equally fixed ways, or seeing our diseases as purely *alien* and bad, without organic relation to the person who is ill... It is salutary to remember Pasteur’s death-bed words: ‘Bernard is right: the pathogen is nothing; the *terrain* is everything.’ Diseases have a character of their own, but they also partake of our character; we have a character of our own, but we also partake of the world’s character: character is monadic or microcosmic, worlds within worlds within worlds, worlds which express worlds. The disease-the man-the world go together, and cannot be considered separately as things-in-themselves.” Words of wisdom, Eastern wisdom and Marxist wisdom, holistic wisdom.

I’m surprised that *Awakenings* was actually published, since it would seem to fall in the crack between pop culture and academia. (Sacks’s colleagues didn’t like it, ignored it because its philosophy was utterly foreign to theirs and its style was too literary.)

Here’s a footnote that reminds me of Jung: “Instinctively and intuitively all patients [and all people!] use certain metaphors again and again. Thus, there are the universal images of rising and falling, which come naturally and automatically to every patient: one *ascends* to health and happiness and grace, and one *descends* to depths of sickness and misery... Another universal metaphor is that of *light* and

darkness: one emerges from the darkness and dimness of disease, into the clear light of health.” Jung would add to this last an array of other images, like the mandala. What explains their recurrence throughout history, in the most varied of cultures? “Archetypes” in the human mind? (Or is that hypothesis little more than a confession of ignorance, a sophisticated expression of “It’s a mystery!”?) Jung didn’t plumb the depths. Profound lessons are hidden in the recurrence, the *resonance*, of particular images.

July 30

“The power of music to integrate and cure, to liberate the Parkinsonian and give him freedom while it lasts, is quite fundamental, and seen in every patient. This was shown beautifully by Edith T., a former music teacher. She said that she had become ‘graceless’ with the onset of Parkinsonism, that her movements had become ‘wooden, mechanical—like a robot or doll,’ that she had lost her former ‘naturalness’ and ‘musicalness’ of movement, that—in a word—she had been ‘unmusicked.’ Fortunately, she added, the disease was ‘accompanied by its own cure.’ I raised an eyebrow: ‘Music,’ she said, ‘as I am unmusicked, I must be remusicked.’ Often, she said, she would find herself ‘frozen,’ utterly motionless, deprived of the power, the impulse, the *thought*, of any motion; she felt at such times ‘like a still photo, a frozen frame’—a mere optical flat, without substance or life. In this state, this statelessness, this timeless irreality, she would remain, motionless-helpless, *until music came*: ‘Songs, tunes I knew from years ago, catchy tunes, rhythmic tunes, the sort I loved to dance to.’

“With this sudden imagining of music, this coming of spontaneous inner music, the power of motion, action, would suddenly return, and the sense of substance and restored personality and reality... [She could] move freely and gracefully... But then, just as suddenly, the inner music would cease, and with this all motion and activity would vanish, and she would fall instantly, once again, into a Parkinsonian abyss.

“Equally striking, and analogous, was the power of *touch*. At times when there was no music to come to her aid, and she would be frozen absolutely motionless in the corridor, the simplest human contact could come to the rescue. One had only to take her hand, or touch her in the lightest possible way, for her to ‘awaken’; one had only to walk *with* her and she could walk perfectly, not imitating or echoing one, but in her own way. But the moment one stopped she would stop too.

“...‘I can do nothing alone,’ she said. ‘I can do anything *with*—with music or people to help me. I cannot initiate, but I can fully share. You “normals,” you are full of “go,” and when you are with me I can partake of all this. The moment you go away I am nothing again.’

“Kant speaks of music as ‘the quickening art,’ and for Edith T. this is literally, vitally, true. Music serves to arouse her own quickness, her living-and-moving identity and will... Rhythmic impetus has to be present [in the music], but has to be ‘embedded’ in melody. Raw or overpowering rhythm, which cannot be so embedded, causes a pathological jerking; it coerces instead of freeing the patient, and thus has an anti-musical effect. Shapeless crooning (‘slush,’ Miss D. calls this), without sufficient rhythmic/motor power, fails to move her—either emotionally or motorically—at all. One is reminded here of Nietzsche’s definitions regarding the pathology of music: here he sees, first and foremost, ‘degeneration of the sense of rhythm.’ ‘Degenerate’ music sickens and forces, ‘healthy’ music heals and frees. This was precisely Miss D.’s experience; she could never abide ‘banging’ or ‘slush,’ and required a firm but ‘shapely’ music.

“Would any music, then, provided it was firm and shapely, serve to get Frances D. going in the right way? By no means. The only music which affected her in the right way was music she could *enjoy*; only music which moved her ‘soul’ had this power to move her body...”

Elsewhere he writes more about Edith: “‘When you walk with me,’ she said, ‘I feel in myself your own power of walking. I *partake* of the power and freedom you have. I *share* your walking powers, your perceptions, your feelings, your existence. Without even knowing it, you make me a great gift.’ This patient felt this experience as very similar to, if not identical with, her experiences with music: ‘I partake of other people, as I partake of the music. Whether it is others, in their own natural movement, or the movement of music itself, the feeling of movement, of living movement, is communicated to me. And not just movement,

but existence itself.’ This patient is surely describing something transcendent, which goes far beyond any ‘contactual reflexes.’ We see that the contactual is essentially musical—as the musical is essentially contactual. One must be ‘touched’ before one can move. This patient, whether speaking of others or music, is speaking of just this, the mysterious ‘touch,’ the contact, of two existences. She is describing, in a word, the sense of communion.”

Remember what I wrote about music’s being like an “other,” or a being with whom one can interact conversationally? (It is both the being and the conversation.) This must be why it is able to assuage loneliness. In listening to Chopin’s nocturnes, the lonely person is engaging with a sympathetic spirit, thereby having his loneliness soothed.

August 3

Reading Toni Morrison’s *Beloved*.

Yes, women are more *body* than men are. (The ones who aren’t, like some intellectuals, are simply—not women.) That may even be the origin, or the essence, of their so-called “weakness” or “inferiority.”

It is possible—indeed, probable!—for someone to have exceptional literary talent and yet be intellectually, philosophically, stunted. One has but to read certain novels and then watch interviews with the author to observe this. The rarity is the person whose mind is at once profoundly analytical and profoundly literary.

Marx, Nietzsche and Sartre may be examples of that person (though each had unique strengths).

A strain of magic realism, à la Garcia Marquez, runs through *Beloved*. The ghosts that are accepted without question by people; the three shadows holding hands when the figures of which they’re shadows are not, and Sethe’s easy acceptance of that fact. Morrison fashions a magical, romantic world reminiscent of Toomer’s *Cane*—or, somewhere between Marquez’s Macondo and Toomer’s Georgia—but even more full of horror. It’s an unusual mixture of misery and wonderful romance. But it works. Magic realism both highlights the pastness of the past (by creating a world distant from the contemporary, full of naïveté and romance like the mists of history) and endues it with eternity, by fostering an air of timelessness and unreality. The result is a world both more real—vivid, immediate, meaningful, poetic—and less real than reality.

I’m struck by the parallels between *Beloved* and *Slaughterhouse-Five*, especially by the similar approaches toward time and tragedy. In both books, everything that happens exists forever in a temporal continuum. It is not gone once it has happened; it remains there forever, in the realm of ‘spirits.’ And in both books, we living ones have access to the past: in Morrison’s we’re tortured by it, by the ghosts of what has happened throughout history, and we cannot escape; in Vonnegut’s the aliens are able to see the past, present and future all at once but can choose which moments they want to experience and ignore the horrifying ones, like the bombing of Dresden, even though the latter are just as eternal as the others. Regardless, both authors seem to realize (obscurely), with Milan Kundera, that our actions can have true moral gravity only if they do not pass in and out of time but exist forever, together with their consequences. “Nothing matters as long as we live in time, for everything is over right after it has happened.” By peopling her world with ghosts and denying that events pass away in time, Morrison is able to emphasize *moral imperativeness* and *horror*, the horror of the past that presses on us constantly.

The difference between them, of course, is that for Vonnegut, but not for Morrison, the future exists just like the past. This allows Vonnegut to take refuge in the idea of “fate” (everything has already happened!) and to deny free will, which is comforting given all the evil in the world. For Morrison there is no such comfort.

August 4, 6, 8

Morrison's language reminds me of Neruda's. The delicate and pithy imagery.

Her decision not to use the past perfect tense (except when necessary for clarity) initially strikes one as strange, as unliterary. But of course it ties into the theme, the intertwining of past and present. The past perfect, by its nature, is used to distinguish between 'layers' of the past, but that isn't appropriate in this novel because the past is just the past (not the past-past), which is just the present. There is no linear temporal order in Sethe's world, no ordered series of events fading away one by one into the past like markers on a marathon fading into the distance according to mathematical laws of perspective. Everything blends together;¹ there is no 'x happened after y had happened, and w was happening at the same time, which was before z...' All the happenings are a blur of time weaving in and out of itself, all simply the ancient past and the ever-present present, sameness, eternity. *No* passage of time. Undifferentiated events, unhistorical history.

...The name 'Sethe' must come from 'Lethe.' Sethe wants to forget the past, she would do anything to be free of it, but it forces itself on her.

Growing a goatee and mustache because they make me look older and I notice that people respond positively to that, which boosts my confidence 10% which makes people respond even more positively, etc. A silly species it is, for sure.

It's true that the sexes are not "innately" what they become in society, that gender roles are not innate. That's obvious. Roles are *social* facts and thus, by definition, are formed in society. In their specificity they're socially constructed. But the sexes have always defined themselves in opposition to each other, and arguably that tendency is inherent in their biological makeup. (Such a conclusion is at least plausible, given the overwhelming inductive evidence.) And, male and female biology being what it is, it seems virtually inevitable that males will hold the balance of societal power, as they more-or-less always have. Gender roles are socially constructed, but biology—in combination with the fact of *scarcity* (in every sphere of life)—marks out the terrain (broadly speaking) of feasible social constructions.

Biology doesn't *determine* behavior, but it massively influences it. Given such biological phenomena as hormones, the peculiarities of male vs. female sexuality, and so on, people will behave—and develop their self-conceptions—in opposition to the other sex and in 'harmony' (or something like harmony) with members of their own sex. On the basis of these very general facts about nature and human biology, gender roles will naturally structure themselves not only complementarily but according to implicit power-hierarchies, which can, however, be almost unnoticeable, as they probably were during the eons before the agricultural revolution and perhaps even after it.

Against Freud.—To think that people desire *pleasure* more than *recognition* is ridiculous. Virtually every facet of society points to the priority of recognition over mere pleasure. Culture may be partly a sublimation of libidinal drives, but it is even more a manifestation of the human need for the other's esteem.

For the reader who's still a little confused about the concept of "recognition": "The Hegelian idea [is] that identity is constructed dialogically, through a process of mutual recognition. According to Hegel, recognition designates an ideal reciprocal relation between subjects, in which each sees the other both as its equal and also as separate from it. This relation is constitutive for subjectivity: one becomes an individual subject only by virtue of recognizing, and being recognized by, another subject. Recognition from others is thus essential to the development of a sense of self. To be denied recognition—or to be 'misrecognized'—is to suffer both a distortion of one's relation to one's self and an injury to one's identity." (From Nancy Fraser's article "Rethinking Recognition," in *NLR*.)

Let's unpack that. The self is self-consciousness, while "a sense of self," as Fraser uses the term, is a confident, secure self-consciousness. So there's a difference between the self *simpliciter* and a person's

¹ The flashbacks are seamlessly inserted into the narrative of the 'present,' so that there is no distinguishing between the narrative and the flashbacks.

sense of self: everyone has (or is) the former, while not everyone has the latter. The latter is something that is *achieved*, that isn't inevitable in the way that mere self-consciousness is. It took me a long time to achieve a stable sense of self, but I've had (or been) a *self* since early childhood.¹

Included in self-consciousness as such is opposition to itself. It is its own other; it *must* be in order to be aware of itself. But what constitutes its self-difference? Simply its fusion of universality and particularity. As *one consciousness* it is particular, it is *this* consciousness² and not another; as *self-consciousness* it is general or universal, which is to say that it behaves toward other beings (human beings) as if they are instantiations of itself. It sees them as just so many embodiments of itself, as replicas of (its) self-consciousness. In its particular aspect it is (aware of itself as) unique, but in its universal aspect it identifies itself with every human being it encounters. On this level there is no difference between them and it. Above, I called this component of human consciousness—this component that defines *self-consciousness*—the generalized other. Its presence characterizes any particular human consciousness, both making the latter different from itself and giving it the ability to recognize itself—its self-consciousness, that is—in other beings. (A given human consciousness doesn't recognize its *full self* in another being, for it alone is its full, particular self. What it recognizes is only its self-consciousness. *This* is identical in all fully functioning humans. Cf. my college thesis.)

—I've just begun, but this is harder than I thought it would be. I'm having trouble conceptualizing the relation between esteem/respect/love and recognition. Fraser ignores the problem, as does every other author I've read, but it's a major one. I've been confused about it at least since the abortive book I wrote in grad school. I want somehow to explain positive value-judgments in terms of recognition (of recognizing a given person's sense of himself), but what's the best way to do that? And why is esteem/respect/love so important to people anyway? Why does it make us so happy? How can I tie all this stuff together, all this stuff about self-consciousness, recognition, respect, love, the other? After two centuries it's still an appalling mess. (That's a sure sign that something is wrong with the project itself.)

From another of Fraser's articles: "Central to my framework is a normative distinction between injustices of distribution and injustices of recognition. Far from derogating the latter as 'merely cultural', the point is to conceptualize two equally primary, serious, and real kinds of harm that any morally defensible social order must eradicate. To be misrecognized, in my view, is not simply to be thought ill of, looked down on, or devalued in others' conscious attitudes or mental beliefs. It is rather to be denied the status of a *full partner* in social interaction and prevented from *participating as a peer* in social life—not as a consequence of a distributive inequity (such as failing to receive one's fair share of resources or 'primary goods'), but rather as a consequence of *institutionalized* patterns of interpretation and evaluation that constitute one as comparatively unworthy of respect or esteem. When such patterns of disrespect and disesteem are institutionalized, for example, in law, social welfare, medicine, and/or popular culture, they impede parity of participation, just as surely as do distributive inequities. The resulting harm is in either case all too real.

"In my conception, therefore, misrecognition is an institutionalized social relation, not a psychological state. [That's a good Marxist, anti-idealistic idea. But surely the worst thing about misrecognition, the main reason it's bad, is the psychological pain it causes.] In essence a status injury, it is analytically distinct from, and conceptually irreducible to, the injustice of maldistribution, although it *may* be accompanied by the latter. Whether misrecognition converts into maldistribution, and vice versa, depends on the nature of the social formation in question. In pre-capitalist, pre-state societies, for example,

¹ More accurately, the self originally comes into existence through consciousness's recognizing and being recognized by another consciousness. In this sense, one can say that the "sense of self" is indeed nothing but the self, or self-consciousness. And "mere" self-consciousness, of course, is actually a major achievement on the part of the young child. But in the quotation from Fraser—and in many other scholarly and 'colloquial' discussions of the topic—there's an ambiguity between this definition of "sense of self" and a definition according to which it signifies a positive, wholesome, loving relationship to oneself, something which is by no means implied in the mere existence of a *self*.

² Or *this being*, in more Marxist, less idealistic language.

where status simply *is* the overarching principle of distribution and where the status order and the class hierarchy are therefore fused, misrecognition simply entails maldistribution. In capitalist societies, in contrast, where the institutionalization of specialized economic relations permits the relative uncoupling of economic distribution from structures of prestige, and where status and class can therefore diverge, misrecognition and maldistribution are not fully mutually convertible.”

August 9, 10, 12

Amusing quotation from William Blackstone in the 1760s, which highlights the poor social position of women then: “Husband and wife are one, and the husband is that one.”

Met Wanni last night at a bar, then went to her place [etc.].

She’s an easygoing intelligent girl and laughs easily. Wants me to teach her the piano, so I told her to buy a John Thompson book and we’d go to practice rooms every week.

Tonight Jiyun came to my apartment; we watched YouTube videos of classical concerts and then etc.

As the Parkinson’s patient is roiled by contrary impulses whose power petrifies him, so some people can suffer from the collision of contradictory creative desires until they are immobilized, which is really a state of *frozen turbulence*.

Reading Callinicos’s *Marxism and Philosophy* (1983).

A useful reminder: “Before Descartes, the mind had been identified with the intellect, conceived as being inseparable from its exercise in the study of the external world; sense-perceptions, pains, dreams, etc. were not regarded by Aristotle and the medieval schoolmen as mental phenomena, but considered to be attributes of the human body. Descartes overturned this tradition, expanding the concept of the mental to include sense-impressions as well as reasoning, and asserting we are directly acquainted only with the contents of our consciousness; knowledge of the physical world is parasitic upon that of our inner states...”

Still, as I wrote in my critical notes on *Philosophy and the Mirror of Nature*, the mere fact that there’s a difference between the ways in which two cultures conceptualize the mental and the bodily doesn’t mean that there is no “truth of the matter,” or that the mind-body problem is a pseudo-problem. I think it really amounts to a “private-public” problem, as I argued in the paper that Gualtiero Piccinini, *il peggior fabbro*, didn’t understand. The intuition that there *is* a mind-body problem is the intuition of the division between private and public, and of the mysteriousness of this division. If that’s true, though, then Descartes’ conceptualization is better than Aristotle’s, because sense-perceptions etc. are as private as thoughts and should therefore, like thoughts, be called mental. The body is public, the mental private.

August 16

[A former professor] sent me this email:

Thank you for your close reading [of her book manuscript], Chris, and for taking the time to mark the changes. I used almost all of your suggestions. You have a good ear.

However, I am a little concerned that you do not believe in the high intelligence of the average person! [I had made a comment to that effect in her manuscript.] How does this square with your political views?

I am now counting the days until I send off the book manuscript. I no longer feel possessive of it!

Do stay in touch.

With warm wishes.

So then I sent her this one:

It's intriguing, isn't it, how one can feel intensely attached to one's manuscript for months and months, so that it's virtually an extension of one's self, and yet crave, or relish, freedom from it once the writing is (nearly) finished. I've noticed this myself. I suddenly stop caring about this troublesome child of mine and never want to see it again, as if I've purged myself of a neurosis and can get on with my life.

Those two questions you asked deserve a serious answer. I have to admit, though, that I don't understand how it's possible anymore to believe in the high intelligence of the average person! Most of the great cultural figures, of course, have agreed that most people are none too enlightened or intelligent, and, indeed, many leftists in modern times have probably sympathized with Rousseau's dictum that people must be "forced to be free" because, contrary to J. S. Mill, they are *not* always adept at judging what their own best long-term interest is. But I don't have to invoke these thinkers; I have only to point to modern society, or to history itself, that apotheosis of cruelty and ignorance. In any case, evidence abounds of people's stupidity, conservatism, lack of compassion, bureaucratic-mindedness, inability or disinclination to engage in (self-)critical thought. Even most educated people rarely question the beliefs or attitudes, the modes of thinking, that come naturally to them (i.e., into which they have been socialized or indoctrinated). Most people seem to have clay minds: impressions are stamped into them at an early age and, as these clay minds harden over the years, the impressions become more-or-less permanent.

The typical conservative Christian is a good example.

I've never actually taken the time to set out a thoughtful "reconciliation" of my political beliefs with my disdain for the greater portion of the species - including (or, *especially*) the elite, the educated (i.e., indoctrinated) classes - so I might as well use this opportunity to do so. To ease my intellectual conscience. First of all, what does "intelligence" mean? Howard Gardner distinguished between...I forget...seven? eight? kinds of intelligence. I'm aware that most people have a higher "spatial" intelligence than I do and probably more kinesthetic intelligence (I can't dance). But normally the bare word "intelligence" is used to refer to interpersonal, intrapersonal, and logical skills [and verbal too]. Interpreting data on an intuitive or analytical level. The interpretations are successful or "intelligent" insofar as they show evidence of getting beneath appearances (which, of course, are often misleading and merely superficial), of sifting through everything that is shallow or obvious and grasping a deeper "essence" or "reality." This reality could be, for instance, another person's masked desires or thoughts, or one's own unconscious motivations, or the deep social-structural factors influencing people's behavior, or the logical form of an argument, or whatever. Intelligence, as I see it, consists in a fineness of perception, an ability (and desire) to "read between the lines," to think through appearances so as to understand their causes and significance.

By the way, I would say that the difference between irrationality and unintelligence - two concepts that are rather similar - is that the former signifies a certain willful perversity, perhaps an act of self-delusion, while the latter signifies a mere inability, a lack of talent, so to speak.

Surely the average person, then, is rather unintelligent (broadly speaking) on an inter- and intrapersonal level as well as on the level of pure reasoning (deductive and inductive), i.e. of (1) coming up with arguments to justify a given belief and (2) following arguments to their conclusions - as well as, incidentally, seeing beneath the appearances of, say, typical political discourse. (I guess this latter inability would fall under the heading of interpersonal, and maybe logical, unintelligence.) Just spend a few hours in the nearest Department of Motor Vehicles and you'll see what the average person is like. It isn't a pretty

picture. (I was at the DMV today; by the time I left, my hands were quivering with rage at the inhuman bureaucratic-mindedness, the proto-fascist total adherence to "The rules! I didn't make them, don't blame me!", of the people behind the desk. These bureaucrats are unkind, I think, partly because they're relatively unintelligent [unempathetic].) The average educated person is not very intelligent either, and also tends to be a bit irrational (self-contradictory) in the values and beliefs he holds. The average highly educated, highly intelligent person, on the other hand, is ultimately a moral coward, a conformist, narrow-minded.

I should say, incidentally, in my defense, that despite all this I still love interacting with people [...] and I never take my judgments wholly seriously (because I don't take myself seriously). I'm not a Timon of Athens, or a Schopenhauer.

Getting back to what I was saying...I want to point out, lastly - (mostly for my own benefit; I want to sort through my thoughts) - that the most intelligent person considers things from every perspective, every possible viewpoint, including his opponent's; he is open-minded and imaginative inasmuch as he can imagine the feelings, the arguments, of the "other"; and so a narrow-, conservative-minded person, however educated or skilled with words, is necessarily lacking a bit in intelligence, or at least in a specific type of it. Religious fanatics, then, or people filled with hate, or people who, like Hannah Arendt's Adolf Eichmann, simply "follow orders" without considering their human consequences, can be called unintelligent in that they lack the (interpersonal) imagination to place themselves in the other's position. (I like Oscar Wilde's dictum in *De Profundis* that hate results from a simple lack of imagination. I'd add that "evil" does too.) Most people, though, would probably be good Eichmannian bureaucrats, in that they're more concerned to fulfill their designated social roles than to ease the suffering of their fellow humans; therefore, most people, even many "highly intelligent" ones like Dick Cheney, Paul Wolfowitz, Richard Perle, or any other dehumanized high-level bureaucrat, are unintelligent in this very specific, "abstractly-interpersonally unimaginative" sense.

I would add to these speculations one more, as an interesting aside: the vast majority of people are also musically unintelligent, as shown by their infantile musical tastes and their total incomprehension of traditional classical music. This in itself isn't interesting; what intrigues me is that there may be a connection between musical unintelligence (i.e., bad taste, inability to appreciate real beauty, lack of "fineness-of-perception," lack of a critical ear) and inter-, intrapersonal unintelligence, and perhaps even logical (mathematical, philosophical) unintelligence. The connection between musical and interpersonal intelligence might be explained by the inherently emotional, expressive, "dialogical" nature of music. (Oliver Sacks's book *Awakenings* is illuminating in this respect when it describes the effect of music on Parkinson's patients. It turns out that, for certain patients, listening to good music has the same liberating, "relaxing" effect as interacting with an affectionate person. The reactions to the two different kinds of stimuli are identical.)

I'll anticipate an objection here: I understand that "intelligence" is not a purely biological phenomenon, determined only by genes; nor ought unintelligent people to be *faulted* for their lack of intelligence, for people ultimately don't have much control over the kind of person they are. Their character depends on their biology and the environment they live in. Modern society surely manufactures interpersonal unintelligence - and unkindness, selfishness, conformism, etc. - on the basis of its atomized relations of production and distribution; in a different society, it's conceivable that many people would be more "intelligent" than they are in capitalism. So it isn't as though I think most humans are necessarily, by their very essence, stupid; I think that widespread stupidity is partly a symptom of a malfunctioning society. It's similar to the increasingly high incidence of autism, schizophrenia, depression, Asperger syndrome, etc.: these are all, to a large extent, products of an improperly functioning, an inhuman, society.

That's a good segue into my answer to your second question, how I reconcile my political views with my unidealistic attitude toward the masses. If it's true that modern society keeps many people in a state of

unintelligence (of whatever kind), and if one would like to see this rectified, then obviously one must advocate a fundamental transformation in social structures. With a few other premises added, one is led to radical politics, to left-Marxist ideals like Chomsky's anarchism. As long as I believe that most people are not *genetically* condemned to selfish stupidity but have been manipulated into it by social relations, I'll advocate a society along the lines of Marx's communism. So, in a way, my belief in the current stupidity of people is not only compatible with, but actually commits me to, my political views.

As far as present society goes, though, I think that real democracy (the sort we don't have in America) is good because the masses, despite their indoctrination and their relative lack of intelligence, have basically good values, in a very general, abstract sense: the majority of Americans believe, for instance, that universal health care would be good, that we should leave Iraq, that improving education should be a priority, that the government should fight poverty, that America shouldn't engage in imperialism, that money shouldn't infiltrate politics as much as it does. On some issues, such as gay marriage or gun control, it's possible that the majority has mistaken values; still, by and large democracy is the best way that's ever been discovered of organizing society, because economic and political elites can't be trusted to do what's right on their own. Quite the contrary. I have more faith in the instincts of the public than in the "intelligence" of the elite, a sector that is certainly at least as selfish - and, in some ways, as stupid - as others. When they aren't being actively deceived by propaganda, most people tend to have good values, unlike the elite. (They may not always, or even *often*, exemplify these values in their concrete behavior, but at least on an abstract level they're usually more on the side of compassion than greed.)

I don't know if I've answered your questions adequately, but this email has gotten long enough. Thanks for having had the patience to read it!

Take care.

There are inconsistencies in what I wrote, but they're superficial.

Intelligence and rationality (or 'reasonableness') are inseparable, involved in each other, but they're not quite the same. The Nazis were unreasonable, irrational (theoretically—inasmuch as they blamed Jews for the world's flaws—and, to an extent, practically, inasmuch as their actions and values contradicted other values they had); they were also unintelligent insofar as they believed in their ideology. But then...what's the difference between rationality and intelligence? There isn't much of one. The more intelligent you are, the more rational you are;¹ and the more rational you are, the more intelligent you are? Is that true? Intelligence is a kind of talent, a capability; rationality exists only in its activity. It doesn't make much sense to say, "This person could potentially be very reasonable"; it does make sense to say, "He is potentially very intelligent, if only he would apply himself." Reasonableness isn't really a *capacity* that can be *latent*; it exists only insofar as someone motivates himself according to logical considerations. ...Or maybe a better way to clarify the distinction is to say that intelligence has more to do with the ability to *understand* things, to *grasp* reasons, which is a true *capacity*; rationality, on the other hand, comes into play only after the reason in question has been grasped. It can characterize an unintelligent, unimaginative person who logically acts on the basis of whatever reasons he understands. So, strictly speaking, it isn't true that the more rational you are, the more intelligent you are. A dull person can be quite rational/reasonable. Just think of Charles Bovary: he's dull but reasonable—he acts (if my memory doesn't deceive me) on the basis of the few logical considerations and insights that he is able to understand, or that occur to him.

In ordinary usage, of course, the words rational and intelligent get hopelessly muddled.

Can you say that Donald Rumsfeld is very intelligent but not very reasonable? Can an intelligent person be irrational? Surely yes. But doesn't intelligence consist in *understanding*, especially in

¹ [Maybe, on second thought, that isn't true. Rationality isn't proportional to intelligence, nor is intelligence proportional to rationality. See below. (Of course, it's impossible to empirically *measure* intelligence and rationality in these precise ways, but to get clear on their meanings it's useful to think about them as if we could.)]

understanding *reasons*? If so, how can a highly intelligent person be highly irrational? Maybe he lacks a very specific kind of intelligence. Maybe, in fact, irrationality *is* a specific kind of unintelligence. Gardner didn't classify it as such, but maybe it should be, in that it signifies a sort of lack, a lack of sensitivity to reason.

Can you say that Rumsfeld isn't "abstractly-interpersonally intelligent," a lack that makes it possible for him to send, without a pang of conscience, thousands of people to their deaths? Can you call this a kind of *unintelligence*?

Similarly, is it reasonable to call someone who's governed by selfish, greedy motives somehow *unintelligent*? Well, anyway, his mind is deficient in a certain capacity or mode of activity, which Wilde might call "imagination." Selfishness is made possible by a lack of empathy (interpersonal imagination); someone like Chomsky has empathy, this specific form of intelligence, in spades. On the other hand, maybe it's possible for someone to have a deep understanding of others' suffering and yet simply not to care, so that his motivations are selfish. It doesn't seem like you can use the 'objective' value-standard of (a lack of) *intelligence* as a way to criticize this person, but are forced to fall back on the relativistic assertion that he merely has different values than you, values that are 'unpleasant' in that they're not compassionate. Or maybe, on the other hand, it's nonsensical to say that someone has deep empathy for, or understanding of, human suffering but doesn't desire to alleviate it; maybe the desire is inseparable from the understanding, and the lack of the desire proves the lack of understanding (i.e., of abstract-interpersonal intelligence). Is this a good objective, quasi-scientific basis for criticizing such a person? "You're *deficient*! Your mind lacks one of the most *human* of capacities!"

In any case, his *behavior* is not the behavior of a complete human being. He is stunted in a "species-being" sort of way. He also, necessarily, isn't as happy as he could be. The greatest happiness comes from Schweitzer's "Reverence for Life."

Ascriptions of value not only guide scientific behavior (so that a "value-free" science is impossible), but they are implicit in the ways we process sensory data. How we literally *see* the world is saturated with value-judgments. For example, American women love to wear high-heels—because, incidentally, according to a popular fashion magazine, "Every woman knows how sexy she feels in high-heels!"—and so Americans 'see' women wearing high-heels as normal, attractive, good. This fashion-style fits into our unconscious picture of the world, our unconscious judging-framework of what is acceptable, normal, good; therefore our eyes don't focus on high-heels and we hardly even notice them usually. They're deemed ordinary, so our eyes pass over to other features like the woman's face. Someone from a different society would see high-heels as bizarre, to say the least—that is, 'bad'—and the way he *saw* American society would be influenced thereby. (Sometimes, if I concentrate, I'm momentarily able to get past my social conditioning and I *see* how silly high-heels really are. An instant later I slide back into my conditioned way of viewing the world. It's like a gestalt-switch.)

A couple years ago I mentioned theories of causality. Callinicos has a nice summary of the most plausible theory of causality I've encountered: "Recent philosophical discussion in the English-speaking world has seen what Pierre Jacob calls a 'revival of realism,' particularly as expressed by [the following thesis: "the unobservable entities that science posits to explain the observable behavior of things exist independently of thought."]. On this version of realism, the world is composed of particulars possessing intrinsic natures constituted by certain powers and tendencies; observable reality is the manifestation of these natures and their interactions. One source of this view involves a critique of Hume's analysis of causality. On this account, very widely accepted by analytical philosophers, the causal laws typical of the sciences merely state that some event *a* is constantly accompanied by another event *b*. Any notion of a necessary connection between *a* and *b*, of the sort that common sense normally associates with the statement that *a* caused *b*, is dissolved by this analysis. Causal laws assert the existence of certain regularities among the flux of events. The connection of this treatment of causality to an empiricism which denies existence to anything but the observable should be obvious. It is vulnerable to the Humean problem of induction: how can a generalization which asserts that *a* will always be accompanied by *b* be validly inferred from a necessarily finite number of observations of *a* followed by *b*? The critics of this approach, notably Rom

Harré and Roy Bhaskar, argue that such difficulties vanish once we see that such constant conjunctions are the manifestation of the intrinsic natures of powerful particulars. The task of science is to establish what these natures are. Once some well-corroborated hypothesis about the nature of a particular of kind X predicts that in given conditions such a particular will bring about the conjunction *a,b*, then *b* must follow *a* in these circumstances *of necessity*. If, in the appropriate conditions, *a* is not accompanied by *b*, then we must suppose either that the circumstances have been misdescribed or that the hypothesis that attributes the power to bring about *a,b* to particulars of kind X is false. But, provided that the hypothesis is not falsified, then we may say that *a* and *b* are intrinsically connected, bound together by a natural necessity which flows from the essential structure of particulars of the kind in question.”

Now, tell me how it's possible not to agree with this realist theory. How is it possible to believe the Humean theory? It's so obviously wrong, I don't understand it.

August 17

No pain but women.— There are two options in my life: I can go out to society where I am confronted by a lack of access to the *beautiful other*, or I can stay in my room in the absence of the *beautiful other*. The latter option is the less painful of the two; my room is a haven from the *inaccessible beauty of the other*.

God, how can I meet these angels I see on the subway and the buses?! Curse that zone of unfriendliness, that twilight zone! That hard mindset of *I'm going somewhere and I won't talk to anyone, I'm not here to be friendly*. Those ears plugged into iPods, those hard stares fixed straight ahead to not make eye-contact with anyone. It's so hard to penetrate that force-field of unfriendliness!

[...]

People condemn men for thinking of women as sex-objects. But that isn't entirely fair. Do they actually think individual men are going to rise above their society by a sheer effort of will and be as pure-minded and wise as a child? If the society produces sex-objects, then people are going to see these sex-objects as what they are: sex-objects. The best you can ask of us men is that we *also* see them as human beings; to see them *only* as human beings is virtually impossible, since the individual is a product of his society. By the way, it is, or can be, a terrible contradiction in a man's mind to see women as both humans and sex-objects, and women are by no means the only victims of the social order.

Reading the Penguin Classics anthology of Hannah Arendt's writings.

Maybe it's possible to think of intelligence as signifying *individuality, creativity*. Consider this passage from the introduction to the anthology I'm reading: “[Arendt argues that] instead of the value placed on action and initiative, one observes [in modern culture] the mentality of the jobholder who identifies himself above all with the function he performs in the occupational structure. Instead of the equality conferred by the [idealized] public sphere, one witnesses the conformity of mass taste. Instead of the quest for distinction, one sees the predictability of imitative behavior.” It seems intuitively plausible to think of these unpleasant modern phenomena, which manifest a lack of individuality and creativity, as manifestations also of unintelligence. An intelligent person is a free-thinking *individual* first and foremost; this can't really be said of an unintelligent person, who doesn't reflect much and usually does what is expected of him, thereby failing to assert himself in any real sense.

Notes on etymology, from Schopenhauer and Arendt: (1) the word ‘sensible’ means, among other things, “capable of receiving sensory impressions,” a definition that leads to “receptive to external influences” (cf. ‘sensitive’), which leads to “having, containing, or indicative of good sense or reason” (cf. ‘rational,’ ‘reasonable,’ ‘sensible’). Schopenhauer notes that the connection between *sensation* and *intelligence* revealed by this etymology is significant. A stupid person, he says, doesn't have discriminating senses, so that, for example, loud noises don't bother him. My phrase “fineness of perception” is thus even more apt than I originally thought.

(2) When introducing her distinction between labor and work, Arendt notes that “every European

language, ancient or modern, contains two etymologically unrelated words for what we have come to think of as the same activity: Thus, the Greek distinguished between *ponein* and *ergazesthai*, the Latin between *laborare* and *facere* or *fabricari*, the French between *travailler* and *ouvrer*, the German between *arbeiten* and *werken*. In all these cases, the equivalents for labor have an unequivocal connotation of bodily experiences, of toil and trouble, and in most cases they are significantly also used for the pangs of birth.” Profound observations.

(3) “...something is of interest to people,” Arendt writes, “[insofar as] it *inter-est*, it is between them.” See how *wise* language is? *Inter-est*. Philosophy is *inter-esting*, it *inter-ests* me.

Think of the origin of ‘logic.’ *Logos*: *Log-ic*, the adjectival form of ‘Logos.’ Logic, therefore—and mathematics!—is the key to the Logos, the structure of reality. (Continental thinkers might disagree, judging by their writings.)

Arendt’s distinction between labor, work and action is interesting, but I don’t think it’s very useful or theoretically fruitful. It doesn’t help that Arendt was anything but a precise thinker.

“A decisive flaw in Eichmann’s character was his almost total inability ever to look at anything from the other fellow’s point of view...” That’s exactly what I said in my email. He had a lack of imagination. That’s what it usually comes down to. “The trouble with Eichmann was precisely that so many were like him, and that the many were neither perverted nor sadistic, that they were, and still are, terribly and terrifyingly normal. From the viewpoint of our legal institutions and of our moral standards of judgments, this normality was much more terrifying than all the atrocities put together, for it implied that this new type of criminal, who is in actual fact *hostis generis humani*, commits his crimes under circumstances that make it well-nigh impossible for him to know or to feel that he is doing wrong.” Atomization, commodification, reification, bureaucracy—these are the evils that have to be rooted out.

August 20

Encourage. En-courage. “I en-couraged him: I instilled courage into him.”

Man never learns except through alienation. Through loss, he rises; and he doesn’t rise except through loss. “Historically,” writes Arendt in “What is Freedom?”, “men first discovered the will when they experienced its impotence and not its power, when they said with Paul: ‘For to will is present with me; but how to perform that which is good I find not.’” The Greeks never became aware of the will as a distinct faculty, separate from the intellect and so forth, because they didn’t experience impotence and alienation in the way that, e.g., the early Christians did. The more history progresses the more man alienates himself from himself, and thus the more he learns about himself. (Alienation = *objectification* under constrained, unnatural, fragmented conditions. “*Unnatural*” *objectification* is the key. The further we separate ourselves from nature, the more we learn about ourselves and nature.)

The free man doesn’t recognize or appreciate freedom, the healthy man doesn’t truly *know* health. Progress lies in the heart of the enslaved and the sick. (Think of Nietzsche, sick Nietzsche, and Freud, and Marx. And, of course, Hegel’s Master-Slave dialectic.)

The feelings aroused by the sight of a woman crying are similar to those aroused by the sight of a crying child. It is a piteous but natural thing. The sight of a man crying, on the other hand, is bizarre, less natural, less piteous but more ‘weighty,’ ‘*pathetique*.’

Women and children embody the aesthetic virtues as opposed to the moral ones. Innocence, empathy, simple trust, sensitivity to new experiences, an affinity for (and with) beauty, a delight in simple pleasures, an ability to lose themselves in the moment, in laughter, in *love*. Men, on the other hand, are expected to do what is *right*, to follow their *duty*, to guide their lives according to *reason* and *truth*. This is morality, morality in its strictest, fullest, Kantian sense; the other path is *humanity*, instinctual and beautiful, *caring*. The ancient dichotomy between these two principles still holds true. Doubtless there are exceptions—most people are both masculine and feminine—and these principles are biologically grounded

only in the flimsiest ways, but their vaguely ‘human-natural’ validity is shown by the fact of nearly every culture’s implicit assent to them as well as the potency of our own intuitions in these matters. As history has progressed and the species has objectified its latent potentialities in ever-diversifying ways, we have deepened our knowledge of the duality, to the point, indeed, of exaggerating its importance. It’ll take centuries more to reach a truly nuanced understanding of the differences between the sexes.

From Arendt’s article quoted above: “[It is my contention] that the reason for the obscurity [of the philosophical question of freedom] is that the phenomenon of freedom does not appear in the realm of thought at all, that neither freedom nor its opposite is experienced in the dialogue between me and myself in the course of which the great philosophic and metaphysical questions arise, and that the philosophical tradition has distorted, instead of clarifying, the very idea of freedom such as it is given in human experience by transposing it from its original field, the realm of politics and human affairs in general, to an inward domain, the will, where it would be open to self-inspection.” Months ago, speculations led me to the first part of that thesis, but I was careful to note that what we experience in consciousness is at least *closer* to “freedom” than to its opposite. “As a first, preliminary justification of this approach, it may be pointed out that historically the problem of freedom has been the last of the time-honored great metaphysical questions—such as being, nothingness, the soul, nature, time, eternity, etc.—to become a topic of philosophic inquiry at all. There is no preoccupation with freedom in the whole history of great philosophy from the pre-Socratics up to Plotinus, the last ancient philosopher. And when freedom made its appearance in our philosophical tradition, it was the experience of religious conversion—of Paul first and then Augustine—which gave rise to it.

“...The freedom which we take for granted in all political theory...is the very opposite of ‘inner freedom,’ the inward space into which men may escape from external coercion and *feel* free. This inner feeling remains without outer manifestations and hence is by definition politically irrelevant. Whatever its legitimacy may be...it is historically a late phenomenon, and it was originally the result of an estrangement from the world in which worldly experiences were transformed into experiences within one’s own self.” Profound thought. “The experiences of inner freedom are derivative in that they always presuppose a retreat from the world, where freedom was denied, into an inwardness to which no other has access...”

Again, man’s estrangement from the world led to an important insight into himself, but, as usual, he went too far in the direction of this insight. Especially with Sartre, who postulated absolute freedom. (Significantly, this postulate of absolute freedom took place in a profoundly alienated society, where the individual felt himself worthless. He was absolutely unfree in the social world—a stranger, *l’étranger*—but *within himself* he was absolutely free. The more inward, introspective, isolated your being is, the freer you think you are. See the entries from my first and second years in college. Also R. D. Laing.)

“The fact that a World War was needed to get rid of Hitler is shameful precisely because it is also comic.”

I’m surprised that Arendt got away with her extremely unacademic way of writing. Few footnotes; frequent unsubstantiated historical assertions; apparently no overarching arguments connecting chapters together but rather a long stream of not-wholly-connected reflections on historical developments. A scholar who wrote like this now would have trouble getting published.

August 22

Arendt emphasizes the extirpation of individuality and spontaneity in the concentration camp. Human nature was literally refashioned in concentration camps; they were, and are, the only institution that can succeed in eradicating every vestige of human spontaneity and freedom. The camps “serve the ghastly experiment of eliminating, under scientifically controlled conditions, spontaneity itself as an expression of human behavior and of transforming the human personality into a mere thing, into something that even animals are not; for Pavlov’s dog, which, as we know, was trained to eat not when it was hungry but when

a bell rang, was a perverted animal.” The camps are the “guiding social ideal of total domination. ...Totalitarian domination stands or falls with the existence of these concentration and extermination camps; for, unlikely as it may sound, these camps are the true central institution of totalitarian organizational power.”

The victims were turned into mere Pavlovian bundles of reactions and appetites, predictable reactions and animal appetites (for food and water). “Nothing then remains but ghastly marionettes with human faces, which all react with perfect reliability even when going to their own death, and which do nothing but react. This is the real triumph of the system: ‘The triumph of the SS demands that the tortured victim allow himself to be led to the noose without protesting, that he renounce and abandon himself to the point of ceasing to affirm his identity. And it is not for nothing. It is not gratuitously, out of sheer sadism, that the SS men desire his defeat. They know that the system which succeeds in destroying its victim before he mounts the scaffold...is incomparably the best for keeping a whole people in slavery. In submission. Nothing is more terrible than this procession of human beings going like dummies to their deaths...’”

“The society of the dying established in the camps is the only form of society in which it is possible to dominate man entirely... Pavlov’s dog, the human specimen reduced to the most elementary reactions, the bundle of reactions that can always be liquidated and replaced by other bundles of reactions that behave in exactly the same way, is the model ‘citizen’ of a totalitarian state; and such a citizen can be produced only imperfectly outside of the camps.

“The uselessness of the camps, their cynically admitted anti-utility, is only apparent. In reality they are more essential to the preservation of the regime’s power than any of its other institutions. Without concentration camps, without the undefined fear they inspire and the very well-defined training they offer in totalitarian domination, which can nowhere else be fully tested with all of its most radical possibilities, a totalitarian state can neither inspire its nuclear troops with fanaticism nor maintain a whole people in complete apathy. The dominating and the dominated would only too quickly sink back into the ‘old bourgeois routine’; after early ‘excesses,’ they would succumb to everyday life with its human laws...

“It is in the very nature of totalitarian regimes to demand unlimited power. Such power can only be secured if literally all men, without a single exception, are reliably dominated in every aspect of their lives.” Even spontaneously given support is dangerous, as dangerous as open hostility, because it’s free and is therefore an obstacle to total domination. Conviction and opinion of any sort are ridiculous and dangerous under totalitarian conditions because there is no need for them, or of human help of any kind. “Men insofar as they are more than animal reaction and fulfillment of functions are entirely superfluous to totalitarian regimes. Totalitarianism strives not toward despotic rule over men, but toward a system in which men are superfluous. Total power can be achieved and safeguarded only in a world of conditioned reflexes, of marionettes without the slightest trace of spontaneity. Precisely because man’s resources are so great, he can be fully dominated only when he becomes a specimen of the animal-species man.”

“As long as all men have not been made superfluous—and this has been accomplished only in concentration camps—the ideal of totalitarian domination has not been achieved. Totalitarian states strive constantly...to establish the superfluity of man—by the arbitrary selection of various groups for concentration camps, by constant purges of the ruling apparatus, by mass liquidations.” Such a state represents merely the intrinsic logic of bureaucracy taken to its ultimate, absurd conclusion. Power for the sake of power, following orders for the sake of following orders, treating every person as a cog that can easily be replaced. A cog in the machine, that is totalitarianism. And that is bureaucracy.

The only hope for the species is in decentralization. (It’d be nice, too, if we burned all the secrets of nuclear technology. For while it exists, the half-destruction of the species is only a matter of time.)

We literally could be experiencing, right now, the last few centuries of the human race. Maybe in two hundred years everything will be over. Wow. That blows the mind. All the pointless suffering of history... What a tragedy!

It doesn’t reflect well on the masses that what Goering said of them is still true: “Naturally, the common people don’t want war; neither in Russia nor in England nor in America, nor for that matter in Germany. That is understood. But, after all, it is the *leaders* of the country who determine the policy and it

is always a simple matter to drag the people along, whether it is a democracy or a fascist dictatorship or a Parliament or a Communist dictatorship. ...Voice or no voice, the people can always be brought to the bidding of the leaders. That is easy. All you have to do is to tell them they are being attacked, and denounce the pacifists for lack of patriotism and exposing the country to danger. It works the same way in any country.” The Bush administration took its playbook straight from Goering.

Incidentally, these past seven years have been the closest America will ever come to being a totalitarian state. Think of Guantanamo and the Patriot Act and the constant fear-mongering and the widespread surveillance, and the expansion of bureaucracies, and the disregard for the population’s well-being, and the common accusation of treason against political opponents, and the circumventing of due process and constitutional rights, and the propagating of enormous, appealing lies (“In order for a lie to be successful,” said Hitler, “it has to be enormous.”) to the point at which an entire alternate reality is constructed for the sake of securing the population’s submission—the people are explicitly treated as something that has to be tamed and manipulated, a potential enemy, an obstacle, a superfluity—and of course the intense efforts to program the populace to think in terms of good and evil, in apocalyptic terms, in ideological terms that have nothing to do with democracy or liberalism. A country steeped in liberal democracy can’t get much closer to fascism than it has under Cheney.

August 23

In “What is Authority?”, Arendt makes the initially surprising argument that “authority has vanished from the modern world.” What she means is that traditional authority has broken down, that people no longer respect authority just because it is authoritative. Even in the family, it has broken down. The parents’ authority is challenged by the children, the state, and pop culture.

She says the crisis is political in origin and nature: “The rise of political movements intent upon replacing the party system, and the development of a new totalitarian form of government, took place against the background of a more or less general, more or less dramatic breakdown of all traditional authorities. ... Totalitarianism was best fitted to take advantage of a general political and social atmosphere in which the party system had lost its prestige and the government’s authority was no longer recognized.”

Authority, she says, is not some form of power or violence. (Surely it is a form of power!) “Authority precludes the use of external means of coercion; where force is used, authority itself has failed. It’s also incompatible with persuasion, which presupposes equality and works through a process of argumentation. Where arguments are used, authority is left in abeyance. Against the egalitarian order of persuasion stands the authoritarian order, which is always hierarchical.”

“Of tradition, religion, and authority, the latter has proved to be the most stable element. [But it too has finally deteriorated.]”

Her understanding of “authority,” needless to say, is idiosyncratic. “All those who call modern dictatorships ‘authoritarian,’ or mistake totalitarianism for an authoritarian structure, have implicitly equated violence with authority...”

“I propose,” she says, “to raise the following questions: What were the political experiences that corresponded to the concept of authority and from which it sprang? What is the nature of a public-political world constituted by authority? Is it true that the Platonic-Aristotelian statement that every well-ordered community is constituted of those who rule and those who are ruled was always valid prior to the modern age? Or, to put it differently, what kind of world came to an end after the modern age not only challenged one or another form of authority in different spheres of life but caused the whole concept of authority to lose its validity altogether?”

Authority exists insofar as the ruler derives his legitimacy from a principle transcending human society. This seems to be Arendt’s basic definition of authority (in her peculiar sense of the word). Human affairs must be dominated by something outside their own realm, something like God or Plato’s idea of the Good. The philosopher-king is an *authority* because he derives his legitimacy from possessing insight into the true nature of being. In the Roman Republic, the mythological *past*, the original *foundation*, was what

conferred upon the Senate its authority. Later on in Europe, the divine right of kings is what gave them their authority.

In Plato, “the rule of the philosopher-king, that is, the domination of human affairs by something outside its own realm, is justified not only by an absolute priority of seeing over doing [namely, *seeing* the truth, the form of the Good], of contemplation over speaking and acting, but also by the assumption that what makes men human is the urge to *see* [truth, or the nature of being]. Hence, the interest of the philosopher and the interest of man *qua* man coincide; both demand that human affairs, the results of speech and action, must not acquire a dignity of their own but be subjected to the domination of something outside their realm.” That’s a very suggestive point. Her discussions of Plato and Aristotle are excellent.

“Authority implies an obedience in which men retain their freedom.” This is what Plato was searching for in his political dialogues. “Plato hoped to have found such an obedience when, in his old age, he bestowed upon the laws that quality which would make them undisputable rulers over the whole public realm.” It reminds me of Kant: we are free insofar as we give ourselves laws.

(The second movement of Mozart’s flute and harp concerto.)

The idea that “each body politic is composed of those who rule and those who are ruled” (Aristotle) is not quite as self-evident as it might appear. It was bequeathed to the Western tradition by Plato and Aristotle, who were at odds with the conventional wisdom of their day. Most people thought the polis was necessarily a democracy, a community of equals (excluding women and slaves); Plato wanted to introduce a concept of *authority*, a dichotomy between rulers and ruled. He hoped, in other words, to ‘save the polis from itself,’ by discarding democracy without, somehow, discarding freedom. (He wasn’t really successful.) Aristotle’s political theory suffered from a similar tension.

In Greek political life there was no concept of “authority”! That’s very different from most pre-modern societies, including Rome.

The Romans placed enormous importance on the founding of Rome. The founders were legendary, mythical figures, and their authority transferred to the Senate, with the result that political and religious activity were considered almost identical. Religion was largely a way of worshiping past heroes. Indeed, the word ‘religion’ arguably derives from *religare*, or *re-ligare*: “to be tied back, obligated, to the enormous, almost superhuman and hence always legendary effort to lay the foundations, to build the cornerstone, to found for eternity. To be religious meant [for the Romans] to be tied to the past.” And it still means that! Ha!

Many cultures have made legendary heroes out of their founders. Ancient and modern China, America, Latin American countries, Rome, old Japan, Russia, ancient Israel, all religions, etc. That’s interesting. (Does it reveal something about the nature of the human mind? E.g., a fascination with origins?) And insofar as anything has “authority” anymore, its authority comes from its antiquity. The Constitution is authoritative because it’s associated with the founding of the country; the founding fathers are authoritative because they were the founding fathers; the Supreme Court gets its power from its authority, which comes from its central importance in the Constitution.

There are too many freaks in the world. My new housemate (in his late thirties) makes Douglas look like the epitome of sanity. It’s the paranoia, that’s what it is: American society mass-produces paranoia. Douglas and Lauren are paranoid, they insist on keeping all the doors locked even when they’re home. Car-alarms everywhere, security systems for houses, locked doors in every house, universal suspicion. The new guy, who replaced Lauren, is ten times as bad as her. You wouldn’t think it to look at him, though. He doesn’t look anything like a psycho.

Anyway, what happened is that I lost my key a week ago, so I asked the two housemates to leave a door unlocked most of the time until I got another key. One night I came home and all the doors were locked. I rang the doorbell etc., but no one answered. Waited outside for 45 minutes, hoping Douglas would come home. He didn’t. Then I walked around the side of the house and saw a light on in the new guy’s room. I threw pebbles at his window and shouted up at him, saying it was his roommate and I was locked out, but a few minutes later his light turned off. “What the fuck??” Kept throwing pebbles, then his light turned on again and then off, etc. So I rang the doorbell again. No answer. Rang it aggressively, repeatedly.

No answer. Went to the back door, tried to kick it open, but it was too sturdy. Yelled at him again, threw more pebbles... Nothing. [...]

Never forget that there's a kernel of truth in Marx's sixth thesis on Feuerbach: the individual is, from one perspective, an ensemble of social relations. He is an active, living collection of social relations; his personality reflects, or refracts, his environment. You can look at the typical personalities and 'consciousnesses' of a society and infer the nature of its social relations. (You can *in principle*, at least. In practice it isn't so easy.)

Consider a paranoiac or a schizophrenic or a narcissist or a misogynist or a revolutionist or whatever. Their behavior and consciousness reveal a lot about their society.

August 24 etc.

Compassion means *com-passion*, which means *with-suffer*. The compassionate person literally suffers with the sufferer. Pity, on the other hand, comes from *piety*. –Conventional wisdom is right, then, that compassion is nobler, more humane, than pity.

It seems to be well-nigh inherent in the human condition that people seek meaning in something *transcendent*. History and society don't derive their meaning, their justification and value, from themselves but from something outside them, be it God, immortality of some sort (e.g., fame), the lifetimes-long journey toward nirvana, etc. That is, mere living isn't good enough in itself; the human mind reaches beyond this mundane world to draw comfort from another.¹ The generalized other is essential to this phenomenon, in many cases *directly*, i.e. by virtue of its projections in "God" or "mankind" or "posterity." But there is also the sheer desire for *rest* rather than *recognition*, e.g. in a state of nirvana or heaven. (Heaven is both an escape from pain and a state of perfect recognition, i.e. an eternal confirmation of one's unique value; nirvana is simply an escape from pain. The desire for recognition has little or nothing to do with it.)

After World War I, World War II, the Holocaust, the Armenian genocide, Vietnam, the Khmer Rouge, the Rwandan genocide, and countless other events, it is surely immoral to say that God exists. It shows an astounding lack of respect for the millions of victims, and an astounding lack of respect for mankind's suffering.

In a section of her book *On Revolution*, Arendt asks why the American Revolution succeeded while the French—and every revolution after it—failed. Her answer is that the Americans didn't have to deal with the misery and want of millions of people. (She also notes that the American revolution was merely political, that it didn't usher in the *novus ordo saeculorum*.) The French revolution and others after it couldn't be only political because the masses were starving, they wanted food and a degree of social equality. Robespierre, Saint-Just and others became concerned not with mere liberty, which could exist only for the privileged few, but with *happiness*, the happiness of the many. "After the downfall of the Gironde, it was no longer freedom but happiness that became the 'new idea in Europe'." In other words, *compassion* was *l'ordre du jour*; compassion was held to be the greatest virtue, and if you were suspected of not having it you were *beheaded*—"in the name of the people!" But the Jacobins' social project was unrealizable. It was too ambitious.

In the meantime, though, Robespierre justified his activities through Rousseau's notion of the general will. I'll quote Arendt's discussion because it's enlightening. "Rousseau took his metaphor of a general will seriously and literally enough to conceive of the nation as a body driven by one will, like an individual, which also can change direction at any time without losing its identity... [But what can possibly bind the many into one? To answer that question,] Rousseau took his cue from the common experience that two conflicting interests will bind themselves together when they are confronted by a third that equally

¹ [No, no, no. You know that's wrong, Chris. True only in certain societies for the last several thousand years. See below.]

opposes them both. Politically speaking, he presupposed the existence and relied upon the unifying power of the common national enemy. Only in the presence of the enemy can such a thing as *la nation une et indivisible*, the ideal of French and of all other nationalism, come to pass. Hence, national unity can assert itself only in foreign affairs, under circumstances of, at least, potential hostility. This conclusion has been the seldom admitted stock-in-trade of national politics in the nineteenth and twentieth centuries [yes! yes! Bush and Al Qaeda, Truman and the USSR, Kennedy and Cuba, etc.]; it is so obviously a consequence of the general-will theory that Saint-Just was already quite familiar with it... Rousseau himself, however, went one step further. He wished to discover a unifying principle within the nation itself that would be valid for domestic politics as well. Thus, his problem was where to detect a common enemy outside the range of foreign affairs, and his solution was that such an enemy existed within the breast of each citizen, namely, in his particular will and interest; the point of the matter was that this hidden, particular enemy could rise to the rank of a common enemy—unifying the nation from within—if one only added up all particular wills and interests. The common enemy is the sum total of the particular interests of all citizens. “The agreement of two particular interests,” says Rousseau [quoting some guy], “is formed by opposition to a third.” [This guy] might have added that the *agreement of all interests is formed by opposition to that of each...* Rousseau equates will and interest, you see. “If only each particular man rises against himself in his particularity, he will be able to arouse in himself his own antagonist, the general will, and thus he will become a true citizen of the national body politic. Every person must remain in constant rebellion against himself.” This idea would be important for the revolutionary tradition. “The theory of terror from Robespierre to Lenin and Stalin presupposes that the interest of the whole must automatically, and indeed permanently, be hostile to the particular interest of the citizen.” The theory of the general will (which is incoherent to begin with) thus ends up justifying Stalinism.

Anyway, for Robespierre it was obvious that the only force that could unite the different classes was the compassion of the privileged for those who were suffering. That was the general will, so to speak. “The goodness of man in a state of nature had become axiomatic for Rousseau because he found compassion to be the most natural human reaction to the suffering of others, and therefore the very foundation of all authentic ‘natural’ human interaction.” Rousseau and Robespierre knew from inner experience that there’s a conflict between reason and the passions, and also that there’s an “inner dialogue of thought in which man converses with himself. And since they identified thought with reason, they concluded that reason interfered with passion and compassion alike, that it ‘turns man’s mind back upon itself, and divides him from everything that could disturb or afflict him.’ Reason makes man selfish; it prevents nature ‘from identifying itself with the unfortunate sufferer.’ The reason Rousseau captured the minds of the revolutionists was that he emphasized suffering and compassion in a society teeming with sufferers and barren of compassion. What counted during the Revolution was “selflessness, the capacity to lose oneself in the sufferings of others, and what appeared most odious and even most dangerous was selfishness rather than wickedness... Where passion, the capacity for suffering, and compassion, the capacity for suffering with others, ended, vice began. Selfishness was a kind of ‘natural’ depravity.”

In her analysis of Dostoyevsky’s *Grand Inquisitor*, she remarks insightfully that “The sin of the Grand Inquisitor was that he, like Robespierre, was ‘attracted toward *les hommes faibles*,’ not only because such attraction was indistinguishable from lust for power, but also because he had depersonalized the sufferers, lumped them together into an aggregate—the people *toujours malheureux*, the suffering masses, etc. To Dostoyevsky, the sign of Jesus’s divinity was his ability to have compassion with all men in their singularity, that is, without lumping them together into some such entity as one suffering mankind.” Yes, reification, depersonalization, is really the origin of “evil,” and to the extent that even “good” people reify others they’re not far removed from “bad” people. So, in a way, the hero of Camus’s *The Fall* was right: in modern society everyone is guilty, because everyone necessarily reifies “man.” Goodness is compassion, and compassion is concrete, not abstract. Pity, says Arendt, is abstract.

Montesquieu: Even virtue must have its limits. Saint-Just: Nothing resembles virtue so much as a great crime.

I’m reading *Max Weber and the Sociology of Culture*, by Ralph Schroeder. “Weber defines culture as follows: ‘Culture is the endowment of a finite segment of the meaningless infinity of events in the world

with meaning and significance from the standpoint of human beings." He conceptualizes the pattern whereby culture shapes social life as follows: "Not ideas, but material and ideal interests directly govern men's conduct. Yet very frequently the 'world-images' that have been created by 'ideas' have, like switchmen, determined the tracks along which action has been pushed by the dynamic of interest." Yeaahhhh... Whatever. Anyway, Weber's ontology of the social world is that beliefs and values are just as "real" as material forces. They're somehow independent (though not entirely) of the rest of the social world. "Somehow the non-ideational world can become transformed by the ideational one and vice versa. Weber is, in short, a 'social-ontological dualist'." This view, according to Schroeder, is incompatible with positivism, "which stipulates that there is only one—so to speak continuous—social reality." And of course it's opposed, at least in spirit, to the positions of Marx and Durkheim.

How are worldviews, or culture, and social life interrelated? There are three ways: the dynamic of charisma and routinization, the differentiation between the spheres of life, and the inner logic of world-views. These are arguably the essential constituents of Weber's account of cultural change. "The concept of charisma is used mainly to explain the origin of new systems of ideas." Then there is a systematization of the new belief-system so that it constitutes a coherent whole, and subsequently an accommodation of the system to the interests and predispositions of various strata of believers. The opposition between charisma and routinization is so important for Weber that one interpreter considers it to be the essential origin of all social change. Another says that "the concept of charisma is the core of Weber's world-view and appraisal of the historical process." Holy crap. As for "spheres of life," there are several: political, economic, religious, and intellectual. The religious and intellectual are the main sites of cultural change. "These spheres can either overlap, in which case beliefs in one sphere tend to reinforce those in another, or they may become differentiated and come into conflict with each other. Wherever the spheres of life become more differentiated, there is a greater potential for the impact of ideas. Conversely, an overlap between them typically means that ideas remain enmeshed within the social fabric. The differentiation between the spheres of life is thus an important indication of how much scope there is for cultural change." Those hypotheses are actually quite suggestive.

"The inner logic in the development of world-views is the result of a tension between world-views—which typically postulate that there is an overall meaning of the world—and the way in which reality encroaches upon this meaning." In other words, it results from the conflict between these views and...reality. Hehe. Weber distinguishes between three world-historical stages: magic, religion, and science. (They overlap a little.) "What sets magic apart from religion is that in magic, extraordinary powers are believed to reside within tangible embodiments... Also, magical powers are not unified within a single, all-embracing realm of the divine... The impact of magical forces on social life is one of promoting stability, or of reinforcing existing social relations by endowing them with sacred authority." "The world-religions, by contrast, reorient the believer's inner life in accordance with other-worldly or transcendent goals." They have the power to reshape social relations because this inner reorientation can change the person's outward behavior. Regarding the stage of science, Weber thought, of course, that it is characterized by a collective loss of meaning, a threatening of the norms that were internalized during the stage of religion, etc. His ethical ideal in this context is "the individual as an autonomous chooser of values" that he (the individual) uses to orient himself and maintain self-consistency amidst the various demands of a routinized, rationalized world.

"How does cultural change take place? The pattern that recurs throughout history is the struggle between charisma and routinization. The paradigm for this struggle can be found in Weber's *Ancient Judaism*, where the revolutionizing fervor of the prophets is eventually transformed into rabbinical legalism." I have to admit that a lot of Weber's ideas are extremely powerful. A peculiar one, though, is that "the predispositions of similarly located strata are, contrary to Marx, thought to be the same in all places and at all times. [Marx, of course, thought that the interests, or the "predispositions" in Weberian terminology, are dependent upon the mode of production.]" For example, peasants almost always adopt a magical world-view, the main effect of which is traditionalism.

An example of conflict between different "spheres of life" is the one that develops between the brotherly ethic of Christianity and the unbrotherliness of capitalism. "The religious demand to share

material goods with fellow-believers can no longer be accommodated in the economic sphere of modern capitalism with its characteristic impersonality, its 'culture' of a 'vocational workaday life' and orientation towards profit-seeking." This conflict supposedly promotes social change. But if you want to explain why the Christian ethic inevitably tends to lose the battle, you have to turn to Marx. Weber can't account for it, unless he accepts central Marxian premises. Similarly, I'm doubtful that Weber can fully explain—without invoking Marxian patterns of explanation—why, at the stage of magic, "there is little differentiation between the spheres, so that for the most part, political, economic, and religious factors are closely linked," or why it was only with Protestantism that the religious sphere finally became completely divorced from the political and economic spheres.

"What accounts for the cultural distinctiveness of modern life?" That's Weber's big question. To answer it we have to see what he says about pre-modern and non-Western societies. First, magic. One of his ideas is like one of mine (from a long time ago): "magic and science share a purposive, practical orientation which sets them apart from the other-worldly aims of religion." That seems partly true. Religion is largely a response to alienation, to the need to give the world meaning etc., while magic/animism and science exist more for the purpose of gaining control over the external environment, obtaining worldly goods and security. "Magic has a rational aim which is pursued by irrational means, whereas religion is characterized by an increasingly irrational aim and increasingly rational means to salvation." The goals of magic (viz., external advantages like securing protection from evil) are rational in the instrumental, means-end sense. "Magical behavior or thinking must not be set apart from the range of everyday purposive conduct, particularly since even the ends of religious or magical actions are predominantly economic." World-religions, by contrast, become increasingly oriented toward the otherworldly, un-"practical" or "instrumentally rational" end of salvation. The *means* used by magic, on the other hand, are irrational from the standpoint of modern views of nature because of their mistaken attributions of causality. Religious means to salvation are rational insofar as they consist of small everyday efforts that are not supra-human or extra-ordinary. The original source of charisma, by the way, is the belief that "magical power is embodied in a person who can bring about supernatural events by virtue of an innate capacity." Charisma is originally magical. It's like animism, "the belief that spirits, souls or demons inhere within certain tangible objects and thereby give them their efficacy." Suggestive observations. Polytheism seems to be an extension, a systematization, of magic. Why does magic have a stabilizing effect on social life? For many reasons. One is its predominantly instrumental nature, which causes it to "produce an increasingly extensive web of irrational powers and obligations which lend stability to social life." Anyway, I should read *Economy and Society*. Incidentally, it's significant that magic has been by far the most widespread belief-system throughout history.

With world-religions, however, the world must have a meaning outside of what is empirically given. There must be *transcendence* of some sort. This means that religion, unlike magic, has the possibility of tension or conflict (between two realms of reality) built into it, and so it can be a revolutionary force. Confucianism doesn't really qualify as a religion according to this criterion, and others; it has a strong affinity to magic, which causes it to impede social change. Moreover, "the differentiation between spheres of life [which promotes social change, as with the beginnings of Protestantism] is limited because no doctrine of salvation—and hence no purely religious aim—emerged in Confucianism. What did take place was a 'rational systematization' of magic." Politics and the religious sphere were united. Anyway, I won't summarize the whole analysis of China's religions; I'll have to read Weber's original texts. I'll just say that he places a lot of emphasis on the individual's "inner orientation," "inward convictions," in explaining social change. Weber was definitely an idealist. ("The Protestant ethic produces 'inward compulsion'; the Confucian makes external formal demands" which manifest themselves in rituals, formalism, routinization.)

Ancient Judaism "was free of magic and all forms of irrational quest for salvation." It was the starting-point for the process of 'disenchantment' (the literal translation of the German term *Entzauberung* is 'de-magicification'), which distinguishes Occidental civilization from all others... Several elements of Judaism are antithetical to magic: the first is universalism. Yahweh was not a local or a functional god. Although he was originally seen as being at the helm of a political confederation, his powers were subsequently conceived of as reigning over all spheres of life and the promise of otherworldly salvation

was open to all... Most important, however, was the fact that he controlled the whole course of history [unlike magical spirits]...[and, of course, he was *transcendent*, unlike such spirits]." Jews, unlike Hindus or Buddhists or Taoists, sought to understand God's mysterious yet intelligible purpose in letting history develop as it did. That is, there was an opposition between an omnipotent God and an imperfect world, unlike in Eastern religions where the world fit into a harmonious and eternal cosmic order and there was no single omnipotent God with whom a people had established a *covenant* that required them to act in certain ways in order to retain his favor. The covenant was a binding contract between Yahweh and his people; if they failed to be loyal to him, there would be consequences. So the possibility of *tension* was built into the religion. As the Jews' fortunes changed, the prophets could hold up ethical ideals which had to be fulfilled in order for Yahweh to look favorably again on his people. In this dualistic system, "in which the deity determined the course of world-history and was at the same time completely set apart from an imperfect creaturely world, there could be no [stabilizing] magical compulsion. The world was conceived as neither eternal nor unchangeable, but rather as having been created. Its present structures were a product of man's activities and of God's reactions to them."

This notion of the covenant, of using a covenant as the basis for legal and moral relations between the divine sphere and the human (and within the human), was apparently unique to Judaism. It originated in an environment characterized by competition between magicians, oracle priests and prophets of war, as well as by the unity of religion and politics. "In this configuration, a novel and independent conception of religious meaning could evolve not only because of Israel's isolation from the other great cultural centers, but also in response to the constant political threat to which the political confederation was exposed." Moreover, in this primitive time—even later, during the time of troubles—the magical mentality still existed to an extent, and the 'contract,' the 'promise,' between God and his people must have been thought of as almost magically powerful. (To the primitive mind, words have awesome magical power.) If the people violated it...woe betide them! See *The Genealogy of Morals*.

Weber believed that "'charisma is the specifically creative revolutionary force of history.' Charisma and routinization/rationalization are world-historical forces which, being in permanent conflict, are the essential origins of all social change as such." This conception is illustrated in Weber's analysis of ancient Judaism. The evolution from divinely inspired prophets to legalistic priests. As the prophets made Judaism an ethical religion oriented towards salvation, and the collective fate of Jews was made dependent on their loyalty to Yahweh, and a meaning was given to the course of history (viz., collective salvation!), the possibility of something akin to the Protestant ethic of worldly asceticism arose, "with all the possibilities for cultural change that this implied for Weber." The reason this development didn't take place was, evidently, that charisma lost out to a baneful kind of routinization. The prophets, like the early Protestants, demanded an inward transformation, while the priests (whose rivals they were) emphasized ritual and ceremony. During the peaceful times under Persian rule, the severity of the prophets became less popular and external rituals, priestly legalism, held sway, which precluded the necessary inward transformation and "reorientation of conduct." "The means to salvation increasingly became narrowed to the formal observance of law and ritual." Yahweh changed from a wrathful god into a beneficent redeemer of the individual. And, while politics and religion had become separate during the heyday of the prophets, religion fused again with social life, thus reducing the likelihood of cultural tension and creative development.

Weber located the roots of Western rationalism not in the Reformation but in ancient Judaism. One commentator says, "If the nation or an individual suffered and God failed to help, that was a sign that some commandment had been violated. Which one? Irrational means of divination could not answer that question, only a knowledge of the laws and a soul-searching scrutiny of one's conduct. The idea of the covenant had thus led to a comparatively rational mode of raising and answering such questions." To locate the origin of modern "rationalism" in that fact, though, strikes me as far-fetched. Weber writes, "In all times there has been but one means of breaking down the power of magic and establishing a rational mode of life; this means is great rational prophecy... Prophecies have released the world from magic [*Entzauberung*] and in doing so have created the basis for our modern science and technology, and for capitalism." Wow. That's just...crazy.

Translating *Entzauberung* as “disenchantment” seems pretty damn stupid. The latter term contains a value-judgment, like “alienation,” while the former doesn’t (as far as I know). It’s downright misleading.

Weber thought that early and medieval Christianity were a regression in the evolution from Judaism to Protestantism. “The most important feature of the Judaic and Protestant world-views was the unbridgeable gap between an all-powerful and inscrutable divine ruler and an imperfect and sinful humanity. Early Christianity, by contrast, bridged this gap through its doctrine that an ‘unlimited’ or ‘unconditional trust’ in an incarnate savior could produce salvation. The conduct that resulted from this view of salvation was indifference to the world on the basis of reliance on god’s will. Christianity demanded only an inward devotion to the savior, rather than a radical reorientation of conduct.” Its prescribed path to salvation was through faith, magic and ritual, which are not rational. “Whereas Judaism and Protestantism could influence everyday life precisely because of the uncertainty about whether god’s commands were being fulfilled or one’s election was assured, Latin Christianity did not produce this kind of psychological pressure. Not anxiety, but unconditional trust in the savior’s magical powers was the testing ground for salvation... The ethic that resulted was not an ethic of rigorous and methodical conduct, but of brotherly love and charity.” Equanimity, indifference to politics and economics, peaceful faith and love. This religion was in fact similar to Buddhism. But it came to rely increasingly on external, “irrational,” magical rituals; salvation depended less and less on the certainty of divine grace and more on institutions and external rituals like baptism and communion. Institutionalization and routinization made the demands of Catholicism contrast even more strongly with the inward ethic of Judaism and Protestantism.

Catholicism, in short, tried to bridge the gap between the divine and the human in various ways, for instance through institutions and rituals. And it’s because the divine and the human were not fully separated—religion interpenetrating the political and economic spheres—that religious life promoted social stability, as it did in the primitive stage of magic (when there was no transcendent authority at all). With Protestantism, by contrast, the believer was forced to reorient his conduct dramatically so that it met the demands of a wholly *transcendent* authority. Transcendence, as you can see, is an absolutely essential prerequisite for, or component in, the full emergence of a dynamic rationalism. The alternative, after all, is magic, which, for various reasons, promotes social stability and irrationalism.

This Weberian “dialectic” between transcendence and magic is very thought-provoking. Secularism and rationalization do logically seem to succeed a transcendent religious worldview: the more you separate God from the world, the closer you get to jettisoning the whole idea of God. Initially the divine (or “spiritual”) and the earthly were united; as history progressed and people became increasingly alienated from society, the two realms slowly separated, so that “meaning” and “truth” and “harmony” became located in a transcendent world and *our* world was devalued. (Cf. Platonism also.) Finally with modern civilization a complete divorce was achieved, soon after which the transcendent realm simply became unnecessary and was forgotten because it was so different from, and irrelevant to, the concrete world. Yet people didn’t thereby lose their innate need for “meaning” and existential harmony. (Originally—for most of history—they weren’t fully aware of this need because it was wholly satisfied in their social structures and through their magical ideologies. Their later transcendent ideologies were supposed to satisfy it too, but the more transcendence was involved the less successful they were, because of the contradiction between people’s social being and their ideological consciousness (which is greater to the extent that transcendence is emphasized). The existential, ideological need becomes more acute as social being grows more alienated—suffering from an insufficiency of ‘immediate,’ unconscious, concrete recognition—and this basic alienation remains¹ no matter how much love and recognition is projected by society into a transcendent realm. Generally speaking, comforting ideologies simply cannot compensate for a comfortless social life.) They need it now more than ever, precisely because “meaning” has become so transcendent it has effectively ceased to exist. So, yes, with complete, with *absolute* transcendence the world has become extremely rational, as it were, but it has also become extremely meaningless.² Where can it go from here?

¹ On a *societal* level.

² By the way, the degree of cultural emphasis on (the) “transcendence” (of *meaning*) can be taken as a measure of the degree to which reification has proceeded. For reification is an essential part of alienation.

Society has reached the extremity of transcendence, which means the extremity of what has been the historical trajectory of ideology for thousands of years. Evidently the only possibility is to go back in the opposite direction again, in the direction of magic—but in the opposite way: meaning has to be invested in the world again, but on a *rational* level somehow. We can't simply return to an earlier stage of history; that's impossible. Therefore, barring some global catastrophe, in the next few centuries we're going to see mankind retreating from transcendence, from alienation, by reforming its social structures in collectivistic ways.

I want to be alive two hundred years from now!

Weber is right that magic and science have similar instrumental ends. Magic, however, also has another end, or at least it fulfills another function: it makes sense of the world on a 'spiritual' level; it gives man the sense that he *belongs* in this world, that the world has meaning for him. Science fulfills no such function. Quite the contrary, indeed (at least in the last three hundred years).

Initially the central "postulate" of Protestantism was a completely otherworldly orientation, a radical devaluation of the world, which contrasted with Catholicism. The Catholic god had representatives on earth, institutions and rituals, saints, cathedrals with diaphanous interiors reaching toward the heavens, etc.; the world, therefore, was not completely devalued, nor was there a consistently otherworldly orientation. But in Puritanism, for instance, the external, sensuous world had to be mastered and overcome by a methodical lifestyle; the emotions and appetites had to be subjugated to impersonal and constant motives. Only thereby would salvation be gained. (Weber acknowledges the irony in the fact that such a world-denying attitude could evolve into an entirely this-worldly, capitalist orientation. "Such are the unintended consequences of ideas." Ideas? Sure, whatever.)

"With Luther originates the idea that salvation was foreordained by the unknowable will of god and that there was a 'calling' to realize his will. Weber stresses not only that the idea of the calling was radically new, but also that it is only through this idea that later forms of Protestantism can be understood. Luther's conception had not, however, been driven to its consistent conclusion, since his doctrine still allowed for a union with the divine. Despite god's transcendence, the Lutheran attitude was one of 'inward emotional piety' combined with a quietist indifference to the traditional social order. The world was not devalued because the believer was a 'vessel' of god, despite his absolute transcendence.

"Only with Calvin were these Lutheran ideas carried to their ultimate conclusion... His intensification of Protestant doctrine stemmed from his more radical separation of god from the world and from his notion that the creaturely world exists only for the sake of god... Whereas Luther still attached religious significance to subjective piety, the Protestant believer after Calvin could strive to achieve salvation only through mastery over the self and the world." It is at this point that "the great historic process of *Entzauberung*, which had begun with the old Hebrew prophets and, in conjunction with Hellenistic scientific thought, had repudiated all magical means to salvation as superstition and sin, came to its logical conclusion."

The common ethic underlying all forms of Protestantism was "an ascetic conduct which meant a rational planning of one's whole life in accordance with God's will." This ethic arose from permanent uncertainty about God's will and constant watchfulness over oneself. It proscribed, for example, ostentatious wealth and luxurious living, a proscription that encouraged the accumulation of capital.

Why did Protestantism become secularized so easily? Precisely because it demanded a change of conduct in the believer. "While concentrating on the means for achieving salvation, which were of a purely worldly nature, the believer could lose sight of the transcendent religious premise of his orientation. The capitalist entrepreneur might initially have been motivated by the quest for salvation, but with the loosening of all external religious ties, success in a 'calling' could eventually be adopted as a purely secular goal." That idea is a little silly.

"In the end, Weber thinks Protestantism merely provided the entrepreneur with a good conscience regarding restless economic activity." Also, of course, Protestantism fostered individualism. And its elimination of religious elements from social life left a vacuum that could be filled by secular forces, such as the impersonality of the market and the bureaucratic state. That is, in fostering differentiation between

spheres of life—in effectively reducing the social, institutional dominance of religion—it made room for dynamic rationalism.

Comfort = *com-fort* = *strong-with*. Significant.

Con-fuse. “This is con-fusing.”

August 28

The opposition between charisma and routinization is essential to Weber’s political writings too, not only his religious ones. The typical Weberian idealism/superstructuralism is evident in this passage: “Bureaucratic rationalization revolutionizes with *technical means*...as does every economic reorganization, ‘from without.’ It *first* changes the material and social orders, and *through* them the people, by changing the conditions of adaptation... By contrast, the power of charisma rests upon the belief in revelation and heroes... Charismatic belief revolutionizes men ‘from within’ and shapes material and social conditions according to its revolutionary will.” There is *some* truth to that, but the formulations are misleading.

The modern world has become almost entirely rationalized and “dis-encharmed” (which Weber doesn’t think is necessarily good). The economic sphere, for example, has become rationalized by the “extension of the productivity of labor through the subordination of the process of production to scientific points of view.” Weber deplored the diminishing role of charisma in modern life; the aim of his political sociology was to promote charismatic leadership within a “plebiscitary leader-democracy.” He wanted strong leadership, and he thought democracy was best because, “under the social and political conditions of a modern bureaucratic society, it offered a maximum of dynamic leadership.” “Democracy and demagogy,” he wrote, “go hand in hand” in the modern mass state. A strong parliament, therefore, is necessary in order to demagogy from going too far.

Weber’s political ideas are informed by this central question: “How can one possibly save *any remnants* of ‘individualist’ freedom in any sense” in a world dominated by the “irresistible advance of bureaucratization?” He was pessimistic, but he placed most of his faith in charisma. Probably a mistake, given Hitler and others.

Incidentally, an idea, a worldview, can have “charisma” too.

“The advancement of scientific knowledge,” writes Schroeder, “bears the greatest responsibility for the onward march of rationalism and disenchantment.” Weber emphasizes that science cannot give the world meaning. Science is indeed a worldview, but its content is purely impersonal. It demands objectivity, and this undermines ideologies that try to give the world meaning. (Again: idealism. Social relations, not science, are the main villain. I have to admit, though, that science does tend to erase the individual and subjectivity from the picture, quantum mechanics notwithstanding.)

Judging by Elizabeth Lloyd Mayer’s book, there may be hope that, even according to “objective truth,” the individual actually does matter in some way, that there is some underlying undifferentiated realm connecting subjectivities to one another and to the essence of the cosmos. Maybe there is even something like reincarnation.

“Precisely the ultimate and most sublime values have retreated from public life either into the transcendental realm of mystic life or into the brotherliness of direct and personal human relations.” This echoes Hannah Arendt’s belief that there is no longer a “public space,” a genuinely political arena, in which people can meet and interact. (“Politics” comes from “*polis*,” after all. And the modern world is nothing if not anti-“*polit*-ical” in this sense. The public, “*polis*-ical” space is the realm of “*action*,” where people exercise their powers of agency.)

Weber is right that science is and has to be “value-free” in his sense. Reason cannot adjudicate between values, except on the basis of other values. (If you value *x* and *y*, then you are reason-bound to value *z* if it follows from *x* and *y*.)

The *inner logic* of worldviews. The inner logic of Judaism led to Calvinism, which led to secularization: “By contrast with the worldviews of the non-Western civilizations, which produced neither a systematic unification of the divine nor a radical tension between the divine and the world [though Islam

may be an exception, he notes], the ancient Judaic prophets created a worldview in which the divine was endowed with all-encompassing powers and at the same time radically divorced from the world. This worldview was systematically unified in the sense that all worldly events could be interpreted as subject to the control of God. The stage was thereby set for the complete separation of the religious from the other spheres of life.” The inner logic of that worldview, then, “culminated in the Calvinist doctrine of predestination, where the divine and the worldly became separated to the greatest possible extent. This complete separation was also a spur to the process of secularization since it meant that religion was no longer entrenched in the other spheres of life. Secularization, in turn, created a vacuum in the religious sphere of life...” So the inner logic of monotheism led to its (self-)destruction. Overtones of Hegel. But I’m skeptical of developmental hypotheses relying on the “inner logic” of a belief-system. They smack of idealism, as though belief-systems evolve of their own accord based on their internal logic. I’d rather say that there’s an inner logic to the development of social relations, a logic that is reflected in the ideologies fostered by those social relations.

Of course, strictly speaking there is no such “inner logic.” But there are *tendencies, evolutionary pressures, influences* in certain directions.

The Jews and Christians represented the future because they were downtrodden, oppressed, more “alienated” than other peoples, and the future, over the long term, lay in alienation—because, with the development of technology and so on, social structures had to become more complex, more layered and coercive and impersonal, which inevitably estranged social groups and individuals from their world. It was virtually inevitable that monotheism would triumph, although it could have taken slightly different forms than Judaism and Christianity. Also, given social-evolutionary pressures, it was highly likely that monotheism would someday transcend itself, that it would fall away, so to speak, like dead skin off society’s back. God *fell away* as the world matured underneath him.

Schroeder: “The impact of ideas on social life can be measured by the degree to which a worldview either revolutionizes or reinforces the (given) predispositions of believers.” Their predispositions are based on their material and ideal interests.

I get the impression that Weber approaches the historical data with a preconceived end in mind, with hypotheses he’s determined to prove, resulting in the corroboration of his hypotheses. He arranges the evidence so that it supports his ideas. This is inevitable, to an extent, in all scientific endeavors, especially social scientific ones, but Weber seems less unbiased and open-minded than he should be.

I need a precise definition of “alienation.” It’s a useful concept insofar as it denotes a condition that arises from a lack of “transparency” in social relations, or a lack of freedom, and especially the presence of reification. But all these concepts are pretty vague. By the way, alienation (in my sense, whatever that is) is by no means an unequivocally bad thing. Anyone who has read Hegel should know that. Without alienation—i.e., ‘being a foreigner,’ ‘being an alien’ (in some way) in one’s environment—humankind would still be at the most primitive level, virtually undifferentiated.

August 29

Reading Alan Turley’s article “Max Weber and the Sociology of Music” (2001). “Bureaucratization in the Catholic Church had a rationalizing/bureaucratizing effect on its music, and was eventually responsible for the music ‘conventions’ associated with European classical music. Examples of this would be notational systems, structured harmony, organized choirs, ensembles, orchestras, and the standardized construction of instruments.”

“Rationalization is the universal historical process that is central to Weber’s work.” Yup, that’s for sure.

“The move from ancient to modern music gradually eliminated the mystical and ‘irrational’ qualities of art and replaced them with rational qualities... The simple principle of distance between tones in the music that a musician might make or a singer might sing was replaced by the organized, standardized, ‘rational’ principle of chordal harmony.” “Written notation and standardization of instruments [which were

essential to the process Weber is describing] are rational outcomes in an organized society.” Etc. Weber stressed the importance of commercialism and so on in calling forth a rationalized music.

Interestingly, and apparently in contradiction to Weber’s theories, “music has become less bureaucratized from Weber’s time to the present. Only classical music and opera possess the highly formalized, standardized, and bureaucratized structures Weber’s theory describes and predicts.” How should this fact be interpreted? Maybe it simply points to the inadequacy of a methodological approach that emphasizes rationalization above all else, as though it is the only important feature of modernity. Modernity isn’t *only* about bureaucracy and rationalization; many phenomena are utterly opposed to such trends.

Nevertheless, “conductor-led orchestra *is* the most bureaucratized form of musical performance; each instrument is hierarchized from first chair to last, and all instruments are organized into sections or musical arrangements.” Turley points out, though, that India, Egypt, China and Japan had bureaucratized music also, music that was highly formalized and “standardized.”

Therborn defines ideology, according to Callinicos, as “the primarily discursive practices through which human beings live their relation to reality.” Althusser: “Ideology is indeed a system of representations, but in the majority of cases these have nothing to do with ‘consciousness’; they are usually images and occasionally concepts, but it is above all as *structures* that they impose on the vast majority of men.” Callinicos elaborates: “More precisely, ideologies are practices which function symbolically, usually through the generation of utterances, subject to definite norms and constraints. Very often these norms and constraints derive from the prevailing structure of class power.”

“Isn’t the notion of reification idealistic?” you ask. No, because reification operates on an unconscious or half-conscious level, and it characterizes behavior as much as consciousness. People *act* in a “reified” way.

Marco Orru’s article “Weber on Anomie” (1989). I’ll have to quote a lot of it; otherwise I’ll forget everything.

“To understand Weber’s treatment of anomie it is necessary to frame it within his general discussion of the great world religions and their respective roles in China, India, and the West. For this purpose, Weber’s identification of two ideal-typical religious reactions to the ‘irrationality’ of the world serves as a starting point. One reaction, asceticism, consists in the active control and mastery of the world in the interest of a religious idea; the other reaction, mysticism, consists in the contemplative flight from the world, which leads to the total devaluation and rejection of the world. The first attitude (asceticism) requires active ethical behavior, while the second (mysticism) is characterized by the extrusion of all everyday mundane interests.

“Weber conceptualized asceticism and mysticism as polar concepts that are differentiated into inner-worldly and other-worldly variants according to whether the mastery of the world (asceticism) or the rejection of the world (mysticism) is external (addressed to the outside world) or internal (addressed to the inner self). This differentiation generates four ideal types of religious rejections of the world, which can be demonstrated by the use of historical instances. The Protestant sects exemplify inner-worldly asceticism; the medieval monastic orders represent other-worldly asceticism; the Confucian Literati typify inner-worldly mysticism; and the Buddhist monks illustrate other-worldly mysticism.”

In the context of anomie (which literally means lawlessness, the absence of ultimate guiding values), two of these types are significant: inner-worldly asceticism, “wherever it is capable of opposing an absolute and divine ‘natural law’ to the creaturely, wicked, and empirical orders of the world,” and other-worldly mysticism, which springs from classical Hinduism. In this case, the tension between the world and its religious rejection disappears, since the mystic is not a tool for God in the world but a *vessel* for him. The mystic is beyond good and evil; his preaching has no bearing on the world. He is sinless; ethical, legal and rational considerations are meaningless to him, which means that he is in a state of “anomie” (lawlessness). Inner-worldly asceticism isn’t as radical as such mysticism: it rejects the world and its laws, like the mystic, but in favor of a *divine law* which is supposed to guide conduct. The Judeo-Christian tradition, then, is not as anomic as the Hindu tradition. But there are exceptions, for instance Manichaeism

and antinomianism, which are influenced by Zoroastrianism. (The fight between good and evil, the challenge toward the categories of good and evil.) More recently, existentialism was a version of radical anomism.

This Weberian treatment of anomie is different from others, for instance the Durkheimian, which emphasize “the deregulation of ultimate values or the breakdown of institutional norms.” It is also virtually irrelevant to Western society. That is, the total absence of ultimate values has not been a major problem for the West, which has tended to reject radical anomism. The Durkheimian analysis is more relevant, since it describes a society in which desirable goals and institutional norms are not fully internalized. “In *Suicide*, Durkheim viewed anomie as a condition that occurs when economic materialism becomes ‘an end transcending itself...the supreme end of individuals and societies alike.’ Durkheim declared, ‘It is not true, then, that human activity can be released from all restraint. Nothing in the world can enjoy such privilege.’

“Merton’s conceptualization of anomie described instead the consequences of an instrumental imbalance between cultural values and social norms and the ensuing condition where norms lose their regulatory power for the individual. Merton clarified that, ‘In no group is there an absence of regulatory codes governing conduct, yet groups do vary in the degree to which these folkways, mores, and institutional controls are effectively integrated.’”

“Max Weber as a Critic of Marxism” (1977), by Wolfgang Mommsen. “The separation of the workers from the means of production was to Weber not a specific feature of capitalism. He rather considered it an essential precondition of highly developed modern societies of whatever type...[i.e.,] a feature of all modern bureaucratic societies.” There may be some truth in that. In the USSR, workers were separate from the means of production. The problem with modernity isn’t private ownership of the means of production but “the omnipotent structures of bureaucratic rule.”

Weber distinguished between formal and substantive rationality. Capitalism was formally rational (e.g., the workers are formally free, prices are calculated rationally according to market conditions, etc.) but displayed much substantive irrationality, as Marcuse would argue later. Weber: “Substantive and formal rationality (in the sense of exact calculation) inevitably do not go with one another; this fundamental and in the last resort inescapable irrationality of the economic order is one of the sources from which all ‘social’ problems originate, in particular, however, all varieties of socialism.” The best way to organize society, he says, would be to make constant compromises between formal rationality and “substantive value attitudes.”

I read Machiavelli’s *The Prince*. Refreshing realism. (But) I can well understand why it was Hitler’s bedside reading. Lenin and Stalin used it too. And Mussolini wrote his dissertation on it.

“I certainly think it is better to be impetuous than cautious, for fortune is a woman, and it is necessary to conquer her by force.”

I was wrong to say that reification cannot become much more extreme than it has in the contemporary world. It *definitely* can! It can go on indefinitely, getting worse and worse!

August 30

Intimations of Hegel and Marx from Dante: “In every action what is primarily intended by the doer is the disclosure of his own image. Hence it comes about that every doer, in so far as he does, takes delight in doing; since everything that is desires its own being, and since in action the being of the doer is somehow intensified, delight necessarily follows... Thus nothing acts unless by acting it makes patent its latent self.” Willhelm von Humboldt too. Dante was a monument to the mind.

Reading a chapter from Arendt’s *On Revolution* called “The Revolutionary Tradition and Its Lost Treasure.”

“Jefferson knew...that the [American] Revolution, while it had given freedom to the people, had failed to provide a space where this freedom could be exercised.” The new democracy wasn’t *rich* and *deep* enough; there weren’t enough opportunities for the people to engage in political activity. This is why he

avored rebellions every few decades, why he thought the Constitution should not be a sacrosanct document (“too sacred to be touched”), why he thought, in fact, that each generation should have the right to send deputies to a national political convention which would amend the Constitution! He wanted democracy to extend down to the very bottom of the body politic, down to the townships. Otherwise, he thought, the republic was doomed: it would become an oligarchy. And he was right. (It’s doubtful, though, that anything the founders could have done would have prevented the oligarchy from appearing in the long run, since it emerged organically out of industrial capitalism. Economic structures would have corrupted and eroded genuine township-democracy.)

“His greatest fear was lest ‘the abstract, political system of democracy lacked concrete organs.’” His proposed solution was to subdivide all counties into wards (“little republics”). The idea of the ward anticipated later revolutionary organs like the *soviets*, the *Räte*, the councils, and the communes in France. Jefferson wanted as close an approximation to direct democracy as was possible in a modern state. “What he perceived to be the mortal danger to the republic was that the Constitution had given all power to the citizens, without giving them the opportunity of *being* republicans and *acting* as citizens. In other words, the danger was that all power had been given to the people in their private capacity and that there was no space established for them in their capacity of being citizens.” He knew that the most likely source of “corruption and perversion” in the government would be the intrusion of private interests into the public domain. His “little republics” would guard against this. “The elementary republics of the wards, the country republics, the State republics, and the republic of the Union would form a gradation of authorities...”

“The basic assumption of the ward system, whether Jefferson knew it or not, was that no one could be called happy without his share in public happiness, that no one could be called free without his experience in public freedom, and that no one could be called either happy or free without participating, and having a share, in public power.” Wise words.

Arendt’s discussion of the councils, communes, etc. is very interesting. These were bodies that spontaneously arose among the masses during times of rebellion, democratic political organs with no precedent—and yet the revolutionaries were ambivalent towards them! Marx and Lenin were quite taken with them for a time, but in the end Marx decided they were merely temporary, initial stages of the revolution, while Lenin crushed the soviets during the Kronstadt rebellion (in which they had revolted against the party dictatorship). It is these political bodies that are the “lost treasure” of the revolutionary tradition.

“The one-party dictatorship, that is, the model of the professional revolutionary, eventually prevailed [after a revolution], but it prevailed only after a violent struggle with the organs and institutions of the revolution itself. The councils, moreover, were always organs of order as much as organs of action, and it was indeed their aspiration to lay down the new order that brought them into conflict with the groups of professional revolutionaries, who wished to degrade them to mere executive organs of revolutionary activity.” Reading accounts of such extraordinary events and movements, you can’t deny that “the people” are, after all, capable of governing themselves, that decentralized government can work in certain conditions, and that if the people are irresponsible and selfish and petty-minded it’s because of their social environment and not any supposed innate stupidity.

You should read Reed’s history of the Russian Revolution. Read his descriptions of the soviets. They’re remarkable. As Arendt says, “Nothing contradicts more sharply the old adage of the anarchistic and lawless ‘natural’ inclinations of a people left without the constraint of its government than the emergence of the councils that, wherever they appeared, and most pronouncedly during the Hungarian Revolution, were concerned with the reorganization of the political and economic life of the country and the establishment of a new order.” And think of the little communities, the “councils,” that spontaneously emerged in New Orleans right after Katrina (judging by what those eyewitnesses wrote)—and remember how they were intentionally fragmented and destroyed by the power-structures, the police and the army! It’s a poignant metaphor of how power always treats those beneath it.

Arendt: the party system vs. the council system. The problem with councils, she says, is that they are incapable of fulfilling administrative duties. “Workers’ councils have again and again tried to take over

management of the factories, and all these attempts have ended in dismal failure.” Councils are appropriate for politics, not administration. The opposite is true for party apparatuses, which have oligarchic, bureaucratic structures. “Our whole tradition of political thought has concluded that the essence of politics is rulership and that the dominant political passion is the passion to rule or to govern. This, I propose, is profoundly untrue. . . . It is in parliament and in congress, where he moves among his peers, that the political life of a member of representative government is actualized, no matter how much of his time may be spent in campaigning, in trying to get the vote and in listening to the voter.” Arendt thinks of politics in the old Athenian way, before Plato and Aristotle had introduced the ‘ruler/ruled’ dichotomy into the Western tradition. Modern politics isn’t politics in its truest sense.

I should read the whole book. And so should you.

August 31

Why is ethnic cleansing the dark side of democracy, as Michael Mann claims? Because the latter “is premised on the creation of an ethnic community that ‘trumps’ or ‘displaces’ class divisions.” “Ethnic cleansing,” for Mann, is simply the attempt to create mono-ethnic populations for a given political unit; “it isn’t necessarily murderous, and may more often involve assimilation, whether coercive or not. . . . Ethnic cleansing and democracy have an elective affinity to one another in two respects: first, most democracies develop on the basis of relatively mono-ethnic populations, and second, democracy carries the possibility that the majority might tyrannize minorities.” Ethnic cleansing is generally perpetrated by democratic, or democratizing, regimes—where “democracy” is understood not as a concrete set of political institutions but as an ideology of equality. “This egalitarian concept threatens to undermine those forms of social stratification that restrain ethnic cleansing.” (Think of the Native Americans, the Aborigines, Armenia, Hitler’s Final Solution, Rwanda, Yugoslavia.)

“Ethnic conflict becomes murderous when key social forces, in multi-ethnic and geopolitically unstable environments, conceive of democracy as the rule of an ‘indivisible, united, integral’ people. In contrast, where the people is conceived of as ‘diverse and stratified,’ and class differences are politically institutionalized, the potential for mass ethnic killings is blocked by countervailing, non-democratic features of these societies. It is for this reason that neither pre-capitalist agrarian societies nor established liberal democracies tend to engage in ethnic cleansing. . . .” There has to be cross-class solidarity for ethnic cleansing to occur. That is, ethnicity has to (tend to) trump class as the main form of social stratification. “The theoretical crux of Mann’s argument thus seems to be that class conflict, especially when institutionalized, tends to undermine ethnic conflict.” Riley argues against that thesis.

“Mann repeatedly emphasizes that modern democracies have grown out of processes of ethnic homogenization.”

What is “organic democracy” as opposed to liberal democracy? And “organic nationalism”?

Murderous ethnic cleansing occurs in the context of war. So how does Mann explain ethnic warfare? “It breaks out either when dominant ethnicities believe they can successfully eliminate minorities, or subordinate ethnicities believe they can successfully establish their own state.” But, more fundamentally, why do ethnic groups fight? “Mann’s explanations tend to slide into group psychology. [He invokes] the psychological concepts of ‘threat’ and ‘perceived threat’.” Riley favors a sociological explanation over Mann’s social psychological one.

Being a “nice guy” to a woman means being asexual. Politeness doesn’t touch the reptilian, sex. If a woman shuns a nice guy it’s because an asexual man does not affirm her self-conception, which is as a sexually desirable and desirous female.

Humans are reptiles first, mammals second, humans third.

The hours when I’m alone are the hours when I’m most (not-)myself.

It used to be that there was only one thing you wanted recognition from: your immediate community. Now there are two things you want recognition from: your ‘immediate’ community, and *everything else* (mediated).

Again, recognition doesn’t manifest itself only psychologically, but also behaviorally.

The notion of a “social structure” is elusive, illusive and allusive. What exactly does it mean? A family, a town, a country and a society all have social structures. The term refers to the set of relationships between (groups of) people, or the roles they have to play. These roles are defined in relation to each other, which means the social structure is an “organic whole” and should be analyzed holistically. The causes (diachronic and synchronic) and nature of one set of roles can’t be understood without understanding the causes and nature of all sets of roles. Their roles determine, or at least *strongly influence*, how people act; therefore, you can’t *fully* understand how and why one person acts in a certain way without understanding how and why everyone acts as he does. A person can be said to internalize his role(s) to a greater or lesser extent. Sometimes the roles conflict with each other—that is, the duties etc. associated with one role cannot be followed without violating the duties etc. associated with another—and when this happens the individual may experience a psychological crisis of some sort, or, if it happens on a large scale, a societal change or crisis may occur. If, for example, male workers can’t fulfill both their family and their employment obligations (roles), a social rebellion may ensue. This might eventually cause their roles—i.e., their relations(hips) to others—i.e., (from a ‘total’ perspective) the social structure—to change. A new set of roles, or norms, or societal duties, emerges.

The social structure is incredibly important in determining people’s behavior, since people have an amazing capacity to define themselves according to their roles (i.e., to ‘do what they’re supposed to do,’ to act as their roles require). Usually they aren’t consciously aware of the myriad rules and norms that govern social interaction, but somehow they internalize them to an extraordinary degree, so that every little gesture, every utterance, every body-movement can be instantaneously filtered through the thick web of internalizations in their mind. An “intelligent” person, among other things, is someone who has internalized norms (e.g., “social cues,” interpersonal expectations in given situations, etc.) exceptionally well and has an unusual capacity to act on that basis—i.e., to adopt the viewpoint of the other, which is a necessary viewpoint in the context of norms/roles,¹ and to be *creative* from that viewpoint—but can also shed these norms when he wants to, or ‘see through’ them and ‘ignore’ them, precisely on the basis of adopting the other’s viewpoint. For sometimes roles are insensitive to the other. Bureaucratic roles are especially so.

“Role-model.” A pithy term.

How do people internalize norms and roles? By ‘retaining’ people’s reactions to their behavior; by ‘taking over’ these reactions inside themselves, as Mead described, and acting in accordance with them, that is, as dictated by their desire for recognition (or approval) in conjunction with the other’s reactions which they have ‘taken over’ inside themselves by taking the perspective of the other. They want approval, so they will act in ways that get them this approval.

Went to dinner with April Lau, from high school. Good time.

“Schumpeter disagreed with Marx: ‘Society is bound to grow beyond capitalism, but this will be because the achievements of capitalism are likely to make it superfluous, not because its internal contradictions are likely to make its continuance impossible.’” A position I hadn’t considered. I suspect Schumpeter was wrong—or rather, he was right, but so was Marx. Marx would have agreed that capitalism

¹ That’s why most animal societies don’t have elaborate systems of roles and norms: these animals mostly lack the capacity to view, and to act in, the world from the other’s perspective—which is to say that the other is not *in* their consciousness, which is to say that they are not self-conscious. For self-consciousness is (made possible by) the other in consciousness. I should reread my notes on Mead. Incidentally, these reflections are helping me understand better why intelligent people are typically more “self-conscious” than unintelligent people, and what the psychological implications of that fact are.

would become superfluous, but then he would have said, “More importantly, it’ll become *impossible* once the forces of production have been ‘socialized’—through the evolution of capitalism—to an extreme, proto-socialist degree.” And he would have been right.

September 1

Capitalism atomizes society, so how do the forces of production become increasingly ‘socialized’ and ‘cooperative,’ or the relations of production less and less class-stratified (in narrowly capitalist ways)? That’s a paradox.

Capitalism is still thriving, which is to say that property-relations still divide society into classes that are, at least ‘objectively,’ mutually antagonistic. (The notion of “objective class interests” isn’t as problematic as everyone thinks. Game theory is one way of cashing it out. See *Classes*.) People in positions of economic power understand this antagonism, as shown by the constant class war they engage in. (Class war is manifested not only in aggressive political lobbying, predatory lending, the hundreds of thousands of lay-offs that have been occurring recently, and so forth, but even in the ordinary practices of marketing and advertising, as Chomsky has pointed out. The goal of advertising, which is the goal of capital in general, is for money to be funneled from the pockets of the masses into the coffers of the elite. The goal, in other words, is profit, and profits are acquired through implicit class warfare, whatever outwardly benevolent forms it may take.¹ Capitalism, like most modes of production, is nothing but institutionalized class war.) However, [...]

(Boccherini’s Symphony No. 4. Borodin’s Petite Suite. “Soave sia il vento” from *Così fan tutte*. Bach’s Italian Concerto.)

Reading Amaury de Riencourt’s *The Soul of China: An Interpretation of Chinese History* (1965). It’s a flawed book in many ways [for instance in its Orientalism], but it’s stimulating.

He attributes immense social and psychological importance to the Chinese language, which has essentially “no grammar [?], no alphabet, no spelling, no inflections, no declensions, no conjugations nor tenses, [and in which] every word might be a noun, a verb or an adjective... The Chinese remained staunch rationalists but lacked the feeling for logical sequence in any line of reasoning which is so familiar to Western thinking.” The language’s ideographic structure has stayed the same for thousands of years, “and its immensely conservative influence can never be overestimated. Languages and dialects could change, social conditions could undergo revolutions—but as long as the ideograms remained intact, the Chinese mind revolved within the confines of a rigid mold.”

Chronological conception of time, deep feeling for historical sequence, burying the dead rather than burning them as in India—*duration*, not *obliteration*—ancestor worship as a way to remember the past and be remembered oneself, human-centered outlook rather than nature-centered as with Indians (who disregarded history, were interested in metaphysical questions)—Confucius was like Socrates, rejecting metaphysical speculations and focusing on virtue, society, etc.—but originally, as with the Greeks and all cultures, metaphysical questions were paramount (see the *I-Ching*): Yang vs. Yin throughout the universe, Heaven Yang and Earth Yin, everything founded on this dualism or on a unity of the dualism. Historiography became a substitute for true religion: mythical past figures were models for living an ethical life. “The true goal of the higher type of Chinese man was not self-realization through mystical introspection, as in India, but the securing of an honored place in the harmonious procession of historical personages. Spiritual realization came from ‘duration,’ triumphing over the corrupting process of *time* rather than escaping into *eternity*.” Clearly China had more dynamic social relations than India, frozen in

¹ For instance, it’s true that, other things being equal, the interest of both the workers and the owners is that the firm does well, makes a lot of profits. In this sense their interests are the same. Nevertheless, it’s always the case that the more resources go to one class, the fewer [at least relatively] go to the other. This basic antagonism can be glossed over and softened in various ways, but it can’t be eradicated. And successful capitalists understand that fact, as shown by their business practices and political maneuvers.

the caste system and thus sublimating its spiritual yearnings into timeless states like nirvana. But in China, *philosophy of history* more than *religion*. Time is masculine (creative, active, spiritual), space feminine (receptive, passive, earthy).

Heaven and Earth are complementary halves, duplicates mirrored in each other. “Man is surrounded by incorporeal spirits and forces, and a complicated system of regulations is necessary to obtain satisfactory relations with these mysterious forces: rituals have to be performed...” Consistent with this interaction of Heaven and Earth is the fact that “The Book of Changes claimed that every occurrence in the tangible and visible world was only a symbol, an *image* of an abstract *idea* located in the invisible world. Every event that took place on Earth was a symbolic duplication of a thought originating in the spiritual world beyond man’s sense perception, in Heaven...” Plato. Medieval Christianity, with its attempt to symbolize heaven in the structure of cathedrals and so on, to make social institutions a symbol of the divine order. The difference (or one of them) is that Christians strongly devalued the worldly, unlike the Chinese, who thought earth complemented heaven. In all these cases, though, an intuition of transcendence. An escape from the world into something beyond. But not yet *complete* transcendence, *complete* devaluation of the earthly. (That’s what Weber would say, anyway. He’d be right insofar as earthly life was still interpreted as having meaning in some way or other. –What is “meaning”? Being part of something greater than yourself. Making an impact on something greater than yourself. Being recognized and valued by something that transcends you.)

This semi-Platonic metaphysics, upheld by Confucius, “implied also a rejection of *causality* in the Western sense of the word. Instead of cause and effect, the Chinese chose to study the coincidental relations between phenomena. Instead of the logical chain of mechanical *causation*, we have *association* between the apparently most incongruous elements; this association is based on their synchronization. In this type of ‘associative thinking,’ concepts are not logically deduced from one another but are placed side by side in a *pattern* and are *organically* related to one another. Already strongly pragmatic, the Chinese assumed that synchronism, implying parallelism rather than causal succession, must be meaningful: the *objective* phenomenon is somehow related to the *subjective* state of the observer at the time, and the whole of it is a symbolic reflection of an idea produced in Heaven... This peculiarly Chinese world-picture is essentially based on *magic* (which constrains the higher powers) rather than *religion* (which conciliates). Chinese rituals are based on...*sympathetic magic*, the fundamental *mimetic* principle that ‘like attracts like.’ ...The universe is an aggregate of organic entities precisely fitted into one another, a spontaneous and harmonious super-organism in which laws, causes and supreme deities are unnecessary...[but] a refined form of magic is imperative because man has to be in control of his earthly habitat.” Therefore: direct yourself to the rhythm of nature, the *Tao*; anything done outside this rhythm is *Li*, “tension or reason.” “The greatest psychological characteristic of the Chinese is their close relationship with the earth and the molding of their energy on the normal pattern of nature.” “History is an eternal recurrence, not a continuous development of life toward higher forms of life and expression. It has no depth but is projected on a flat, two-dimensional screen, as is [the Chinese] perspective-less painting.”

The scholars. Successors to the priests, after religion was changed into ancestor worship long before Confucius. Their task was to memorize the ideograms etc. and preserve the traditional culture and moral code.

Confucianism: Heaven and Earth must submit to the Tao, which is the source of morality and the right way of government. The emperor, the Son of Heaven, has only to set a good example and the social order will fall into place. (A kind of mimetic magic.) “The family is the indestructible cell of society, to the interests of which the individual must sacrifice himself in all circumstances.” The state is a political extension of the family. Just as the son can disobey a bad order from his father, the subject can disobey his emperor if the latter transgresses the moral law. Confucius taught that music is “the most powerful agent working for social and political harmony... ‘When one has mastered music completely and regulated his heart and mind accordingly, the natural, correct, gentle and sincere heart is easily developed and joy attends its development.’” And “‘The best way to improve manners and customs is to pay attention to the composition of the music played in the country.’” In other words, music has a utilitarian function. “The essence of Chinese music, like all Asiatic music, is the absence of harmony and the complete predominance

of melody... It is essentially Tao-like, well-balanced, joyful and contented, neither longing for spiritual understanding as with Hindu music nor yearning for the three-dimensional infinite as with Western man."

"Under Confucianist influence, artistic creation became bound to social ethics." It became utilitarian, and might have become quite mediocre were it not for the influences of Taoism and Buddhism.

China produced hundreds of historians. India produced none until Islamic times.

Confucianism was born in the north, where barbarians threatened the social order and scholars were concerned with maintaining social stability. Taoism was born farther south amidst the beauties of nature, away from a threatened social order. Lao Tzu was a Chinese Rousseau, revolted at the artificiality of civilization, in love with nature, emotion, intuition, the individual, solitude, "non-assertion," "non-activity." He rejected history, like the Indians. The Tao, for him, has nothing to do with "morality," which is only a man-made set of rules; it is immanent in all things and can be approached only through mystical introspection. Taoism is pure individualism. (Ironically it gave rise to the Legalists, who were ruthless and fanatical and "left the individual alone and helpless, the perfect tool in the hands of the dictatorship called forth by the Legalists." The author compares this Taoist legacy to the relationship between Rousseau and Robespierre.) Confucius and Lao Tzu represent opposing sides of the Chinese character.

Taoism had vast influence on art and poetry. It called forth the mystical, timeless side of the Chinese. The painter losing himself in an aesthetic continuum without beginning or end, submerging his ego in the timeless essence of the universe, painting nature "from the inside," unlike the Western artist. A substitute for religion. The Chinese artist is a pantheist, or rather an *immanentist*, not a *transcendentalist* like Western man. (The Chinese artist's love of the *line* comes from calligraphy.) Poetry and painting were impressionistic.

Cultural insights can be gleaned from the traditional Chinese inability [or choice not] to paint human figures realistically. Good at nature, 'bad' at humans: less individualistic than the West, less scientific, less fascinated with psychology, less human-glorifying than the post-Renaissance West.

Chinese architecture inspired by calligraphy. Curved lines. *Rhythmic* architecture, not *dynamic* and full of tension like in the West. No will to dominate nature or aspire to heaven (as in Gothic architecture); contentment with the earth, serenity.

The art of gardening. Harmony between the spirit of the soil and the spirit of the human. French gardening, on the other hand, is resolutely geometrical, anti-natural, dominating, three-dimensional. The gardens at Versailles.

After Confucius and Lao Tzu, during the age of the "Hundred Schools" of philosophy (the Hellenistic age or thereabouts), there was great cultural ferment on the basis of economic and social changes. Mo Ti was a philosopher along the lines of Bentham: a crude utilitarianism was his creed. Everything was evaluated in terms of its economic usefulness. Music and art he regarded as wasteful, economically unproductive; material prosperity was what mattered.

"Mencius extracted from Confucius the useful and the practical." For instance, the people should select the ruler, and they could remove him if he was unsatisfactory. They had a "sacred right of rebellion." The good ruler would give up warfare and concentrate on abolishing poverty, regulating economic processes, instituting compulsory education. Other philosophers argued, against Mencius, that man was fundamentally bad. And so on and so forth.

An era somewhat comparable to early modern Europe. "Nation-states"—not really, though—emerging on the ruins of feudalism, a proliferation of wars, the rise of urban middle classes, "democratization" of social and political structures, social rebellions in some states. Hsü Hsing, a "barbarian" of the south, "advocated a thorough social revolution and the dictatorship of the working man." Legalism arose, advocating a strong centralized state under a dictator in which capital would be nationalized and trade monopolized by the state, and concentration of wealth would be forbidden. "Family solidarity, ancestor worship and every form of social tradition dear to Confucius had to be smashed [according to Han Fei-tzu, the main theoretician] to leave the individual 'common man' face to face with a mammoth state, alone and powerless." The rulers are wicked, he said, morality is nonsense, the people are not intrinsically good; effective laws are necessary, laws that recognize no social distinctions: "whoever violates the interdicts of the state...should be guilty of death and should not be pardoned." Social equality in a

“democratic” age was to be purchased with the loss of freedom. Ch’in, the strongest state in ‘China’ (China), adopted this idea of an all-embracing legal system and eventually imposed it on all the states when it absorbed them in 221 B.C.

The age of the Warring States. Two hundred years long. Hellenistic era. It’s all strikingly modern, the improved technology, the massive brutality, the conscription, the total war. Ch’in won, uniting all of China (in 221) for the first time under a single ruler. That legacy would last until 1911. Legalism died out after the death of the first emperor, and the Han dynasty was established within a few years. Confucianism was revived soon after, becoming, eventually, virtually the state religion.

Great contempt for economic pursuits all through Chinese history (except during the Warring States era). The merchant was the lowest of the low. True in Japan too. The profit motive was considered despicable.

The conservatism of traditional China resulted partly from the examination system that all scholars had to go through after the land was united under the Han. Many years spent mastering classical texts, memorizing poetry, steeping themselves in Confucianist orthodoxy and classical culture until it was reflexive for them, the very core of their being. And these scholars (*mandarins*) were, of course, the elite, more respected than anyone in the land. Everyone wanted to be them. Unfortunately, whatever creativity and originality they had was destroyed after all their years of study. Every generation studied the same texts, was subject to the same despotic brainwashing. This helped make the social order as unchangeable as it was. (There is truth in that much-maligned term “Oriental despotism,” and Hegel’s description of China wasn’t wholly incorrect. Nor was Marx’s, or Wittfogel’s.)

The cultural ideal, to repeat, was the man who fit into the norm of the Tao, who was cultured but not exceptionally endowed, who epitomized the “golden mean,” so to speak. The mandarin system could perhaps be called, in Weberian terms, the routinization of the original creative, charismatic ideas from Confucius and earlier figures. It was one of the most successful (that is, stultifying) routinizations in history.

Something that recurs throughout history, according to the author: “the inherent, fundamental socialism of the Chinese.” Lack of true individualism, predominance of family and clannish collectivism, and the latter’s transfer to the state once “Caesarism” came about. Compromise between family and state collectivism. Several great socialistic experiments, for example when one Han emperor established state ownership of all natural resources in order, apparently, to protect the lower classes against the greed of the wealthy. Prices were controlled, transportation projects were directed by the state, etc. A hundred years later, land reform: huge private estates were turned over to the state and given away to landless peasants. “State-owned communal farms were created; this in fact reduced the farmer to the status of a state slave and pleased no one.” Banks were nationalized, wine, salt, copper and so on became state monopolies, etc. But, as always, it ended badly, in corruption and inefficiency, even rebellions. Once again a thousand years later (a very ambitious attempt that time). Then under the Ming. And finally under Mao—which, not surprisingly, failed as miserably as all the others had. “Of all civilizations, only the Peruvian Incas displayed greater instincts for socialism and schematic uniformity.”

September 2

Chinese distaste for abstraction(s), for logic and reason, arising largely from their language. Intuition. Philosophies not theoretical postulates but ways of transforming the inner self for social and moral harmony. Essential Chinese pragmatism. “Recipes for action,” concrete; distrustful of scientific, abstract theorizing. Synthesis, not analysis.

Man and nature form one single society, not two separate worlds.

Yin and Yang not opposed but complementary. Cooperative. No real *dualisms* in Chinese culture. No opposition between matter and spirit, since everything is interrelated. Matter is a symbolic reflection of spirit.

Another feature of traditional Chinese culture: “the complete indifference to the idea of *quantity* and the disregard for quantitative measurement.” Numbers are *emblems*, used to classify and qualify times

and spaces according to hierarchies. Labels for the ordering of things. A *cyclical*, not a *linear*, view of numbers. 1 is not the beginning of a series but the center of the mathematical world, the most highly rated number. A higher number like 300 is essentially peripheral, subordinate to the simple numerical emblems. Similarly there is never a *succession* of phenomena in nature but a mere *alteration* of complementary aspects. Not succession, not cause and effect, but interdependence. No *direction* in time or space. Cycles, not linear development. Natural phenomena are not determined events but *symbols*, signals from heaven pointing out related phenomena, portents of things to come.

In observations of concrete things an extremely analytical mentality and a great empiricism, which made possible their discovery of gunpowder, printing, etc.

“A fantastic web of rites and obligations imprisoning the individual from cradle to grave and fettering his mind.” The twin arts of rites and music symbolizing the interplay of, respectively, dissociation and union, two fundamental principles. Rites emphasize distinctions between people, music emphasizes their harmonic association. “Music expresses the harmony of heaven and earth, ritual the hierarchic order in heaven and earth.” “The Chinese etiquette was, in a sense, a definite religion in which God, Satan, the human soul, sin, hell and paradise were purely and simply ignored, a creed based on a complex set of *magical* relationships.” All these “disciplines and obediences,” all this self-control, this ability to integrate every aspect of human life, resulted in “a lack of individual personality and originality, a devotion to the concrete and singular welded to a repulsion for the abstract and general, a utilitarianism and thirst for sheer efficiency... The greatest weakness was the lack of religious feeling for the *transcendental*.” He thinks this was one of the reasons that Western science never developed in China.

Their conception of law was different from the West’s (except with Legalism). Not something to be enforced rigidly and mechanically, not concerned with abstract justice. Tradition and custom more than *law*.

Mahayana Buddhism came after the collapse of the Han dynasty (220 A.D.), when barbarians were invading. Societal upheavals, confusion, temporary eclipse of Confucianism, etc. Mahayana Buddhism was optimistic, a religion of salvation, “espousing the fundamental optimism and earthiness of the Chinese but adding an indispensable strain of mysticism and religiosity to soothe them in their great times of trouble.” It completed Taoism, so to speak, by adding a profound metaphysical doctrine. Art and literature fell under its spell, as did millions of impoverished farmers ruined by wars, and especially women. Consoling message of reincarnation and karma which promised rewards and punishments after death. “Oppressors and exploiters would pay for their sins under the iron rule of karma, and the lower classes saw a ray of hope” in this religion that had shed the exhausted, pessimistic, agnostic character of original Buddhism. “Gautama’s doctrine was the Indian counterpart of classical Stoicism, centered around man’s suffering, aiming at putting an end to that suffering through voluntary annihilation in a voidlike Nirvana: he taught that there was no Brahman, no Atman, no Godhead, and made no room in his doctrine for love, pity or mercy. [That’s debatable. It sounds more like Hinayanism than Gautama’s original teachings.] The transformation of his philosophy into the Mahayana’s Greater Vehicle was so complete that it amounted to the creation of a new religion, emotional and positive, endowed with a deep metaphysical doctrine...” The human desire for transcendence in times of suffering. Christianity, Mahayanism. But the otherworldly aspects of Buddhism ultimately didn’t take root in China. Sages came to seek “the positive of Tao of nature rather than the annihilation of an Indian Nirvana. The fat, hilarious Buddhas of China had little in common with their ascetic counterparts in India. And in the moving poetry of Li Po and Tu Fu we find more cosmic wonder in the Taoistic strain than Buddhist melancholy at the impermanent illusion of this earth which the Chinese could never bring themselves to share.”

Neo-Confucianist revival under the T’ang, the dynasty that “guided China through the most brilliant and refined age any civilization had ever known.” Massive cultural flowering, economic prosperity and the use of printing. But from now on there was no more real *originality* in culture. Only appropriations of the past, syntheses. There would be more barbarian invasions (Mongols and so on), but China always eventually returned to the old order, absorbing the invaders into their traditional culture—unlike Rome, for instance. “The Chinese owe this amazing vitality and power of absorption to the family system... The extreme stability of the family, its complete, unquestioned devotion and obedience to the chief of clan, its

yearning to procreate in abundance because of the increased power and prosperity reflecting on the family, the immortality conferred on departed parents and ancestors because of the pious homage still paid to their memory—all this seduced the barbarians...” And don’t forget the sheer numbers of the Chinese, numbers overwhelming those of the invaders. “And so, Chinese history proceeded in a rhythmic, cyclic fashion, with the seemingly unending recurrence of barbarian invasions, their absorption by the Chinese and the consequent injection of new cultural energy, then a few hundred years of prosperity until the gradual weakening and decay of the whole upper stratum of society called forth a new wave of northern barbarians...”

The perennial overpopulation intensified another Chinese trait: an exquisite, refined politeness that wasn’t just a matter of form but was actually part of the essence of their being. Consideration for other people. Without this, living in such overcrowded conditions would have been unbearable.

The parallels between early Chinese Communism and the Legalism of the Ch’in are astounding. “History has come full circle.” The ideologies themselves are different in many ways, but the historical processes that led to the institutionalization of these ideologies have a *lot* in common. The *goals* of the Ch’in and Maoist governments, too—the collectivistic, bureaucratic, (quasi-)totalitarian goals, the desired refashioning of human nature—these goals are like shadows of one another. So are the political policies. Think of the great burning of traditional books that the Ch’in emperor organized, the attempt to wipe out the past, as compared with the Communist burning of millions of unacceptable books and its own attempt to rewrite history. That’s one example out of a hundred.

It’s striking that only the modern West, out of all the cultures in history, developed three-dimensional painting and ‘three-dimensional’ music. “Rationalized” art. All previous music was, in a way, “flat and depthless”; the West injected a unique dynamism and individuality into its art. (Foreshadowings in antiquity, in the Hellenistic era. Some of the sculptures and, perhaps, architecture?) *Perspective*. The only art with *perspective!* In what way does a culture that knows nothing of perspectival painting *see* the world? Your internalized web of norms influences not only your behavior but how you absorb and interpret experience, how you *see* and *hear* things. (“The creation of the senses is a historical process.” The young Marx.) A culture’s art is a projection of how it assimilates the world. A projection of its *norms of perception*, its historically molded *senses*. Try to place yourself intuitively in the position of someone who views traditional Chinese painting as normal—the position, that is, of a person from that culture. Someone who feels *at home* when looking at such two-dimensional art with such oddly unrealistic human figures, art that is, for him, a fully comprehensible expression of his own (culture’s) spirit. Or imagine what it must be like to delight in those flat, gold, almost monochromatic medieval European paintings of Jesus. How does, or did, such a person experience the world? How did his normatively structured modes of perception, and thus of thinking and acting, differ from yours?

I discovered why the Boston Public Library never seems to have any of the books I want to check out: there’s a whole other section of the library, a research section, to which the public doesn’t have access. If you want a book from it, you have to write out the call number and the title and give it to a librarian who will go into the stacks and fetch the book for you—after which you’re not allowed to leave the library with it! It’s only for “in-library” use, because they’re worried about theft. What’s the fucking point of having a library if you can’t check out the books you want?

Max Weber’s essay “The Protestant Sects and the Spirit of Capitalism.”

The editor points out that Weber had changed the tone of his theory by the time he wrote this essay (after the famous book): “Weber emphasizes that social organization and life conduct are the key, rather than religious doctrine. The sects downplayed the importance of doctrine... ‘It is not the ethical *doctrine* of a religion, but that form of ethical conduct upon which *premiums* are placed that matters. (It has been the fundamental mistake of my critics not to have taken notice of this fact.)’ The ‘Protestant Ethic’ is a way of behaving, more than a way of believing; and it is rooted in the distinctive organization of the group.”

Connection between reification and rationalization. Two sides of the same coin.

The Protestant Ethic and the Spirit of Capitalism. Around 1900 (when the book was written), business leaders, owners of capital, skilled laborers, etc. were overwhelmingly Protestant. In Europe, not only America. Why? Partly because when capitalism was expanding much earlier, the economically advanced districts of Europe went over to Protestantism, and so their descendants are Protestant. But why did these districts become Protestant? After all, the change from Catholicism to Protestantism didn't mean a secularization of social life, as people sometimes think, but the opposite, a renewal and intensification of religion. No doubt a release from economic traditionalism would encourage a rejection of traditional authorities. But why did this early bourgeoisie, these "burghers," choose then to become Calvinist, which meant an almost tyrannical form of ecclesiastical authority? Shouldn't they have preferred secularization, freedom from all religious authorities? No. I suspect this issue is related to the human desire to be bound by norms, by rules, be they earthly or transcendental; the unconscious terror, that is, of anomie, lawlessness. This in turn derives from the need for *meaning* in life. Norms provide such meaning, in that they bind the individual to something larger and greater than himself, an authority that transcends himself (as the generalized other transcends himself), submitting to whose rules implicitly means recognition from this abstract entity. In other words: 'generalized other' leads to 'desire for recognition,' which leads to (or, ultimately, *is*) 'desire for existential meaning,' which leads to 'desire to submit to a set of imposed rules,' which leads to 'conversion to Calvinism,' particularly in the context (in early modern Europe) of a deterioration in traditional norms/values brought about by the rise of capitalism and urban living.

Fanatical, Puritan Protestantism eventually evolved into its opposite, secular Protestantism. Why? Because capitalism undermined both the credibility of transcendent (religious) authority and, in fact, the "human" need to submit to authority of some sort. This isn't a transhistorical, *human* need, but it's an extremely common manifestation—a very powerful, very 'tempting' manifestation—of the human desire for recognition. In societies characterized by some social fragmentation, including medieval Europe and Rome during its decline, the latter desire is sublimated into the voluntary submission to an authority, for instance the Church. But capitalism has undermined not only religious authority but *all* authority. That means it has undermined the force of social norms, and that has led to widespread anomie, which is to say a lack of virtually the only kind of 'societal' recognition that has been possible for the masses¹ living in (semi-)fragmented communities.

The reason I'm not affected by anomie, unlike so many of my spiritually minded peers, is that I have made *posterity* into my authority. I don't care what present society thinks of me; I care only that I become an idol for posterity—that *I* become an authority, in fact, in the eyes of my own 'authority' (viz., posterity). Ha! The intricate dialectic of the human spirit.

Think of the word 'normal.' Norm-al. Following norms. "He isn't norm-al."

Asceticism, including Puritan asceticism. Giving yourself laws. "Will to power"? Sure, but what does that mean? Why power? Because it confirms your value, your sense of self-worth. But why is that? Why doesn't being *powerless*, or having *no* control over yourself (or the world), confirm your value? Because power, or control, means being able to actualize your sense of self in the world. Necessarily, that's what you want: you want to act as you want to act, you want to be what it is that you want to be, you want the relationship between you and the world to be the way that you want it to be. And so to have control means to make yourself and the world what you want them to be, which can only be done by acting on/in the world in accordance with your (desired) sense of yourself (which includes your sense of how the world should be), that is, by actual-izing, or real-izing, or object-ifying, or externalizing, yourself. When you recognize yourself in the world you thereby recognize your (externalized inner sense of your) value, because

¹ I say 'the masses' rather than 'people' because well-endowed individuals have always been able to sublimate their desire for recognition into, say, the desire to be a political authority or an intellectual authority or whatever. The masses, on the other hand, have had almost the sole recourse of being good followers of rules imposed from above. That statement over-simplifies, of course, but I'm in a hurry because I have to go shopping now.

‘being valuable’ means ‘being (and acting) as one wants to be (and act).’ Achieving your desired self means—achieving your desired self! I.e., your valued self! But, furthermore, to recognize yourself (your desired (sense of) self, your self-ideal, so to speak) is also to know that the other is recognizing your valued self, i.e., is valuing your self,¹ since the other is in you, which means that what *you* think, so does the other (at least, as far as you’re concerned). You have to externalize yourself because that’s the only way to show yourself to the other, which means it’s the only way to be recognized by him, and being recognized by him is the only way to be recognized by yourself (because the other is (also) in you, you are your own other; in wanting to recognize yourself in the world—i.e., to prove your value—you’re wanting the other to recognize you). To show yourself to yourself—that is, to test yourself, to prove yourself, to confirm that you are what you want to be—you have to show yourself to the other. The other is in the world and in you; by modifying the world according to your (self-)desires, you’re revealing yourself to the other in the world and the other in you, and thus to you yourself. These two others are really one, a single ‘other’ considered from two sides.

I am you and you are me, insofar as both you and I are my other. If I know that you disapprove of me, I, in some implicit way, necessarily disapprove of myself. If you insult me, I insult myself; and if I insult you, I insult myself. People are sensitive to insults to the extent that they internalize them, i.e. to the extent that they unconsciously see them as initiating from themselves.

I got off track. I was talking about asceticism. Why do people give themselves strict laws, laws that outlaw pleasure itself? First of all, you have to realize that it isn’t merely *they* who give themselves these laws. The laws are sanctioned by some higher (imaginary) authority; this authority watches the ascetic over his shoulder, as it were. The authority is actually the one who demands the laws. It’s significant that asceticism arises mainly when there is no credible external authority. Nietzsche thought that asceticism is cruelty turned inwards, and he was right insofar as the ascetic is masochistic. Maybe he was right even in other, less extreme cases. In a sense, of course, he’s right ‘by definition,’ or rather if you see ascetic self-denial as cruel: if you think, in other words, that it’s ‘cruel’ to deny yourself sensuous pleasure, well then, yes, asceticism is cruelty directed at yourself. Q.e.d. But Nietzsche’s theory is more substantive than that. He means that the ascetic has aggressiveness in himself that he has to let out somehow, either on others or on himself. If I can trust a paper I wrote as a freshman, “Nietzsche argues that it was because of the Christians’ *ressentiment*, their inability to vent externally their hatred of their masters, that they embraced the ascetic ideal by imposing severe strictures on their own sensual pleasure—i.e., by being cruel to *themselves* rather than their *enemies*.” This theory isn’t groundless.² But the way it’s formulated is too Nietzschean, too ‘slaves vs. masters’-esque, too psychologistic and idealistic, abstracted from social structures. Simplistic. What I would say is that “ascetics” of various sorts suffer from a kind of insecurity, which is, like all insecurity (in the last analysis), “ontological” insecurity. A deficiency in one’s sense of being. The self’s lack of fullness, its insufficiency of recognition. This is less a *feeling* than a *condition*, a way of *acting*: how one acts and how one ‘feels’ are inseparable, but the term ‘feeling’ misleads you into thinking that it’s a pure state of consciousness divorced from your externalization of yourself. Maybe for most of history (prehistory) this insufficiency didn’t effectively exist for humans, but in the last several thousand years it has emerged and gotten worse as social structures have become fragmented and coercified, reified. The other in you that transcends you and, for you, doesn’t exist in you but in other people, in the world, has become associated increasingly with oppressive social relations, with the oppressive nature of

¹ Kojève wasn’t quite right to say that you desire the other’s desire (i.e., that you want to represent his own self-ideal, that you want him to value you more than he does himself). Rather, you desire the other’s positive valuation. Kojève’s formulation implies that a fundamental conflict, an epic battle, is implicit in all human relationships, but I doubt that. Nature wouldn’t have designed things that way, wouldn’t have placed an essential *negativity* into all human interactions. Desiring the other’s desire is, instead, symptomatic of some sort of sickness, an excess or a deficiency of some kind; it’s an overcompensation for a lack of peaceful self-esteem. It’s especially common in the modern age. (Like Sartre, Kojève confused a modern condition with the human condition.)

² [I wrote the rest of this paragraph on September 7th; it anticipates themes and concepts I addressed in the following entries. You should read those first.]

social relations, with their dehumanization, their independence from and insensitivity toward the individual. Just as he internalizes these relations, so he internalizes their semi-hostile attitude toward him, which is to say that, since the other in him is somewhat hostile (refusing him recognition), he's half-hostile toward himself (since he is his own other). This colors his interactions with people—he treats them unconsciously as if they might be mildly hostile toward him¹—and, as Nietzsche said, he comes to resent those in positions of power, since he associates them with the social order that is denying him recognition and reifying him.² More pertinently to the issue at hand, though, some people sublimate their lack of recognition, their ontological insecurity—i.e., the half-conscious or 'behavioral' consciousness that they don't fully exist, that they don't belong, that they don't have control in their life, that they're somehow contemptible—in an ascetic way. They want their implicit, their "desired," their implicitly self-valuing sense of self to be validated; to achieve this, they accept that in some way they are contemptible but they split off this contemptible part of themselves from what they see as their essence, their higher self, which isn't contemptible. Given that humans seem to have an innate consciousness that their "private parts" are somehow different from the *self*, somehow dirty and shameful, it's natural that the person who becomes an ascetic will, like so many philosophers and religious people have done, categorize this gross material part of himself as the contemptible part, the part that isn't really *him*—thus saving himself from the pain of true self-contempt, which might otherwise have been imposed on him by the nature of social relations. He internalizes society's lack of respect/esteem for him, but to save his (sense of) self he splits it into two, the *lower, inessential* part of which is indeed contemptible. After all, he can't simply choose to *reject* society's 'attitude,' its dehumanized treatment of him; society is *in him*, in the other. So he has to sublimate it. So he devotes his life to battling the lower part of himself, to overcoming it, so that the higher part can finally achieve the recognition it has been denied on account of its 'fusion' with the lower part. This fusion is what has to be overcome.

It's a very poignant state of affairs. "Ah, Bartleby! Ah, humanity!"

(Needless to say, those ideas are quite one-sided, and Protestant asceticism even in its extreme manifestations had other meanings too, more positive meanings and also more mundane 'material interest-bound' meanings.)

To recognize your self in the world isn't something that has only to do with *you*. Your "desired self" isn't the way *you alone* want to be, something that has nothing to do with the rest of the world; it incorporates a *relationship* between you and the world. To realize yourself (in the way you want to be realized) entails a change, a drastic change, in the 'external' world. For the world, after all, is a part of you, is the other in your consciousness. All things in the world,³ but particularly the social world and the people in it, are (for you) instantiations of the other in you. Therefore, to recognize yourself entails that everyone and every institution recognize you as you want to be recognized, in other words that the world remodel itself according to your (half- or un-conscious) conception of how it should be, i.e. your conception of what its relation to you should be, which is also what your relation to yourself should be. And if you could, you would remodel the world yourself, as Napoleon and Hitler and others tried to do. In order for you to "become who you are," the world has to "become what it is" (for you). It's too bad that's impossible.

(Obviously it's practically impossible, but it's impossible in principle too. For your self-consciousness—that is, the other in your consciousness—"transcends" any concrete instantiations of it; it can't exhaust itself in any object or any number of objects. Even if you were emperor of the world, if everyone recognized your value and you had power over everything, there would still be a 'remainder' of the other in your consciousness, which is just to say you would still have a self. As long as you are your own other, you will never *completely* recognize yourself, because, in the end, to recognize yourself means to become one with yourself, which is impossible as long as you're self-conscious. Only in nirvana or

¹ Vicious circle there, by the way.

² That is, turning him into a *thing*.

³ Well, maybe not plants or inert objects.

something like that would you “recognize” yourself, or be at one with yourself.¹ Humans, as they exist now, are condemned to self-division, condemned never to coincide with themselves absolutely.)

Being one with yourself means that the world is one with itself, and vice versa. For the world is in you, and you are in the world. (That sounds like a paradox, but that’s only because you’re “listening to my *words* and not the *Logos*.”)

What does it mean to “overcompensate”? Narcissism, sadism, masochism, egomania...

In all honesty, I’m not particularly committed to the search for knowledge. It’s just that I have nothing better to do. (So much free time! I’m a totally superfluous person.)

When a man talks in a woman’s high-pitched voice (just for fun), he feels intrinsically frivolous and childish.

The spirit of capitalism, says Weber, is that the accumulation of capital is an end in itself. Whatever furthers this end is good; whatever hinders it is bad. It’s a veritable *ethic*, an ethic of avarice. One’s *duty* is to accumulate money. Everything is judged by whether it conduces to the accumulation of money. See Ben Franklin’s *Necessary Hints to Those That Would Be Rich*.² From this perspective, I was wrong in my entry of April 16th: the reason for the irrationality of an obsessed businessman isn’t that his behavior has no end, no goal, but that it is *its own* goal, namely to accumulate money—and (here’s the crucial point) this goal does nothing to increase the man’s happiness. The reverse may well be the case. But if it’s true that everyone desires his own happiness, it’s irrational to spend all of your time freely doing something that, far from making you happy, can well make you miserable. You’re contradicting yourself; your values contradict one another. (At least, so it appears. But the appearance is superficial.)

Early capitalism needed an ideology that justified the endless accumulation of money. An ascetic ideology fit the bill. “Make money for the glory of God!” What’ll they think of next?

September 4

Even in the 1300s and 1400s, commercial activity was still seen as ethically wrong or, at best, barely neutral. The capitalistic circles themselves thought of it this way. From the point of view of their eternal salvation, it was a definite risk. That’s why they donated so much money to the Church at the end of their lives. Sort of an insurance. “Just in case, you know.” Better safe than sorry. “Now, how could activity,” Weber asks, “which was at best ethically tolerated, turn into a calling in the sense of Benjamin Franklin? The fact to be explained historically is that in the most highly capitalistic center of that time, in Florence of the fourteenth and fifteenth centuries, the money and capital market of all the great political powers, this attitude was considered ethically unjustifiable, or at best to be tolerated. But in the backwoods small bourgeois circumstances of Pennsylvania in the eighteenth century, where business threatened for simple lack of money to fall back into barter, where there was hardly a sign of large enterprise, where only the earliest beginnings of banking were to be found, the same thing was considered the essence of moral conduct, even commanded in the name of duty. To speak here of a reflection of material conditions in the ideal superstructure would be patent nonsense. What was the background of ideas which could account for the sort of activity apparently directed toward profit alone as a calling toward which the individual feels himself to have an ethical obligation? For it was this idea which gave the way of life of the new entrepreneur its ethical foundation and justification.” Fair enough. It must be said, though, that the colonists who came

¹ Above I said that nirvana signifies only an absence of pain, not a state of perfect recognition, but when I wrote that I had doubts about it, and it turns out those doubts were well-founded. The Buddhist nirvana and the Christian heaven are two interpretations of essentially the same state.

² To quote Weber: “The ethical quality of Franklin’s sermon to young businessmen is impossible to mistake, and that is the characteristic thing. A lack of care in the handling of money means to him that one so to speak murders capital embryos, and hence it is an ethical defect.” Great analogy! If you read the passages quoted by Weber, you’ll see it isn’t an exaggeration.

to New England around the middle or the end of the seventeenth century had come from a fairly bourgeois background in England, where capitalist activity had by then a definite foothold. The Pilgrims were immensely influenced by the economic conditions in England, and they carried the developing bourgeois Zeitgeist over to the New World. There's never a simple "*reflection*" of material conditions in thought; what there is is a mediation, a mediated transformation of material conditions into ideologies. And the actual thoughts and feelings that go through people's heads have their (ultimate) starting-point in (the physical processes and conditions that mediate) people's interactions with each other and nature, interactions that are basically *behavioral* instead of '*reflective consciousness*'-generated. Behavior, mediated by physical and economic conditions, comes first; then reflective consciousness and philosophies and ideologies.

There are several ways to establish historical materialism. You could, for instance, also appeal to ontogenesis.

How silly it is that Marxism still has to be argued for!

On the other hand, it isn't the sole explanation of everything. A *souçon* of Weber has to be added to the *entrée* of Marxism. Idealism *and* materialism.

Have I ever mentioned that the Wittgenstein of *Philosophical Investigations* fits peculiarly well with Marxism (if you discard all the useless scraps in that book)?

Luther's notion of the *calling*. Called by God. With the Reformation, "one thing was unquestionably new: the valuation of the fulfillment of duty in worldly affairs as the highest form which the moral activity of the individual could assume. This it was which inevitably gave everyday worldly activity a religious significance, and which first created the conception of a calling in this sense. The conception of the calling thus brings out the central dogma of all Protestant denominations which the Catholic division of ethical precepts into *praecepta* and *consilia* discards. The only way of living acceptably to God was not to surpass worldly morality in monastic asceticism, but solely through the fulfillment of the obligations imposed upon the individual by his position in the world. That was his calling." A fruitful passage.

You might ask if it was simply an astonishing coincidence that Protestantism fit the demands of emerging capitalism so well. The answer is, obviously, no. The ideology was functionally selected as appropriate to the 'self-justifying' needs of masses of people; it spread like wildfire. It may, perhaps, be a "coincidence"—though almost certainly it isn't—that this crazy man Luther (and, even more so, Calvin) devised an ideology compatible with a bourgeois order,¹ but it isn't a coincidence that his ideology spread so successfully. As Engels once said, what's important (from the perspective of historical materialism) isn't how one unusual individual came up with his ideas; what matters and has to be explained is why those ideas spread or didn't spread amongst millions of people. Gerrard Winstanley² was ahead of his time, so his utopian communist ideas fell dead-born from the press; Luther and Calvin were right in sync with their time. Whether ideas end up influencing society depends, in large part, on the relation between the ideas and "material" conditions, economic tendencies, etc.

Functional selection through causal mechanisms.

Losing yourself in love, love of God or of a person, fully believing in your worthlessness compared to this being, this being which has given you *grace* through no merit of your own—submerging your individuality, your sense of self, in this being, being filled with love and gratitude, exalting the other at your own expense, breaking down the distinction between self and other in a self-humbling way. This is basically what mysticism is, a state of mystical rapture; ordinary passionate love is related to mystical rapture. Despite appearances, this self-debasing person is glorifying himself, partaking in the glory of the radiant other who has deigned to recognize him. By exalting the other he is exalting himself—he is merging himself with the

¹ Instead, there were probably complicated unconscious mechanisms in Luther's mind through which (his experiences of) society's bourgeois practices passed and were psychologically filtered into this peculiar sublimation called Protestantism.

² [See September 7th.]

other—for, in being loved by an exalted other, one is exalted oneself (however much one “doesn’t deserve it”). The way to recognition here is, paradoxically, through self-effacement; it is through self-degradation, for the less *you* are, the less self *you* have, the more the *other* is, this other who loves you and in whom you are merged. (And therefore the more *validating* is the other’s love.) Moreover, the less self you have, the more you can *lose yourself* in the other, thus attaining fullness of self. Women are adepts in this underhanded self-glorification. So are Christians.

Calvinism is indeed a severe doctrine, which must have created “unprecedented inner loneliness for the single individual” in the time of the Reformation. Your eternal fate is predestined before your birth, because when God created the world he determined the course of everything in it. Nothing you do can affect your predetermined fate; you are a sinner, a contemptible creature who certainly cannot “change God’s mind” regarding your fate by doing good things or participating in any rituals or sacraments or religious ceremonies (even at funerals!), which are all vestiges of magic and superstition. God is wholly transcendent; he cannot be influenced by anything that happens on earth. An elect few have been chosen for heaven (before they were born); the masses have been condemned irrevocably to hell. Calvinism decisively eradicated magic by establishing absolute transcendence, an absolute dichotomy between the sinful world and a God that humans cannot even understand, much less influence. And so no one can help you in your hope for salvation—no priests, no friends, no Church, even no God, since Christ died only for the elect and you don’t know if you’re one of the elect. You’re all alone. Your purpose on earth is solely to work for the glory of God, work selflessly for his glory without caring a whit for your own because you’re nothing and you can’t change your fate anyway. The purpose of life, the purpose of everything you do, is to glorify God.

Calvinism was, therefore, individualistic, rationalistic, and anti-authoritarian (since it “undermined every responsibility for ethical conduct or spiritual salvation on the part of Church or State as useless”). Emotions were dangerous in that they could distract from service to God; excessive love of fellow men was dangerous. However, since God evidently designed the world so as to be useful to the human race—given the world’s wonderfully purposeful, rational organization—one should serve in the interest of “impersonal social usefulness,” since this is clearly in accordance with God’s plan and so glorifies him. “Follow your calling! Labor in the interest of the community, i.e. of its rational organization!”

(You should love your neighbor only because it increases God’s glory. –Mediation: God mediates between you and your neighbor. Transcendence, unspontaneity. Bad. Origin of wickedness.)

Ordinary believers couldn’t follow Calvin in every respect: they needed reassurance that they were of the elect. So, naturally, they behaved as God-fearingly as they could, figuring that if they carried out all the duties of their calling they belonged to the elect. Good works, then, were a sign of election. They were the means not of attaining salvation but of getting rid of the fear of damnation. *Constant* good works. No release, no relief (in the manner of Catholics). Monitor yourself at all times, for the more care you take, the more certain you are of salvation. You’re proving to yourself your election. “Fatalism is, of course, the only logical consequence of predestination. But on account of the idea of proof the psychological result [among Calvinists] was precisely the opposite.”

In short: systematic conduct, methodical rationalization of life. Success in a calling was proof of God’s blessing. Pietism adopted this asceticism too (on the whole—but with a greater emphasis on emotional states), as did other sects. Lutheranism, by contrast, was a more emotional, less ascetic belief-system, partly because it didn’t emphasize predestination and so didn’t foster the desire for “proof.” It also was more well-disposed towards religious pageantry and institutions like the confessional. By the way, one of the reasons why so many sects formed around this time is that groups of people wanted to exclude the un-elected from their church. So they started new churches which catered only to the elect.

A result of Calvinism was that self-confidence became a religious virtue, being an indication that one belonged to the elect. Pietism, like Lutheranism, encouraged an attitude of humility, a desire to feel reconciliation and community with God in the present rather than a future life, as with Calvinism. The Calvinist oriented his efforts toward the beyond, the Pietist less so.

Methodism: Method-ism. Methodical, systematic nature of conduct. But major emphasis on feeling. Emotional act of conversion. Religious ecstasy. Sanctification in this life, possible freedom from sin. Un-Calvinist, less transcendental.

Weber's brilliant discussion.

Baptists and Quakers "repudiated all idolatry of the flesh as a detraction from the reverence due to God alone." With Quakers, refusal to bow, to kneel, to remove the hat, to use formal address. Only God deserves respect. "The basic idea is to a certain extent characteristic of all asceticism. Hence the fact that true asceticism is always hostile to authority. In Calvinism it appeared in the principle that only Christ should rule in the Church..." Origins of the nature of democracy in cultures influenced by Puritanism. Historical background for the American lack of respect for authority. —Plausible Weberian hypothesis.

Baptist sects rejected predestination. "The peculiarly rational character of Baptist morality rested psychologically above all on the idea of expectant waiting for the Spirit to descend... The purpose of this silent waiting is to overcome everything impulsive and irrational, the passions and subjective interests of the natural man. He must be stilled in order to create that deep repose of the soul in which alone the word of God can be heard." Obvious parallels with Hindu asceticism, *all* asceticism. "God speaks only when the flesh is silent... The radical elimination of magic from the world allowed no other psychological course than the practice of worldly asceticism."

"Ascetic conduct meant a rational planning of the whole of one's life in accordance with God's will. And this asceticism was no longer an *opus supererogationis* [as during the Middle Ages, with monasticism], but something which could be required of everyone who would be certain of salvation."

"Decided propensity of Protestant asceticism for empiricism, rationalized on a mathematical basis." Windelband: modern science cannot be understood as the product of material and technical interests. "Just as the Christian," argued the Protestant, "is known by the fruit of his beliefs, the knowledge of God and His designs can only be attained through a knowledge of His works. The favorite science of all Puritan, Baptist, or Pietist Christianity was thus physics..." From empirical knowledge of the laws of nature, ascend to an understanding of the essence of the world. Metaphysical speculation was inadequate for that.

Taking three classes. The English Revolution (or Civil War), a historiography class; American Society and Political Culture, 1600–1865; and Contemporary Europe. Also TAing a Classics class. Lots of reading. I'll mention only the better and more substantial texts here, in case I ever want to return to them.

Tanner's *English Constitutional Conflicts of the Seventeenth Century: 1603–1689*.

September 5

Seeking self-glorification through being "insignificant, despised and abased," as in many Christian sects. Splitting yourself into two parts, the lower and the higher. The lower you repudiate, the higher, the "spiritual," you embrace and hope for redemption. The higher is the essential part of your self, the lower virtually irrelevant to it. You want approval for repudiating it; that's why you repudiate it in the first place. Evidently this splitting can result in pathological states and conditions. Mystical ecstasies, hysterical disorders and such.

The circumstance to which the psyche is ever tending can be expressed in one word: immediacy. Un-mediation. The self seeks at the same time fullness of self and negation of self, for the two mean the same thing, namely immediacy. Union of the world with the self, of the self with the self, of the world with the world. It's probably a futile goal, but it can be approximated. —The "life" instinct *is* the "death" instinct. Eros is Thanatos.

Non-mediation. No language, no self–other, no time, no divisions. Something like music.

Bach was a good Protestant—a Pietist, if I'm not mistaken—in his overflowing productiveness, his methodical work-ethic, his composition after composition every week every day, every one of which for the glory of God. Weber was right and Bach was beautiful.

Not totally sober at the moment, so I'll take advantage of the opportunity and be honest. Saw a party going on next door—I'm in a new apartment, by the way, near Central Square, in a great neighborhood

with a delightful little park with a fountain where young mothers take their young children to frolic and squeal under the cold water spraying in high arcs above them with mist—"I see a rainbow, Mommy!"—and my quality of life has definitely improved, partly because my housemates aren't freaks—and so, since it's late at night, I heard and saw a party happening in the yard of the apartment next door. Waited and debated, then chugged vodka and grabbed a beer and went outside to join them. I'm fucking lonely and it seemed a sign from God to meet people. For the glory of God, therefore, I went outside to get drunk. MIT students, I was told; a department get-together. Wandered around a bit but felt like a stranger in a strange land (Lewis or Clark stumbling into brown-skinned natives war-painted playing beer pong) so I left. Still lonely, though, as lonely as last week and last month and three-and-a-half months ago and last year and ten years ago, so I called April just to say hi but I didn't have much to say after that (she was with a friend)—I'll see her again next Thursday at UMass, like I saw her two days ago there because she studies there—and then I called Nadine, my German ex-student (hot) with whom I've been hanging out lately but she didn't answer. Then: home.

Should I read the last chapter of Weber's book now? (Talking to myself, writing to myself.) A bit head-muddled but—all the better. (Posterity glorifies people who write to themselves in small candlelit rooms not knowing if their papers will eventually be lost and history will know nothing or if they'll be immortalized, it's a sham.) Alternatively, I could sit here and keep listening to Bach's cello suites. Or I could do both. Or—

whatever.

...I don't understand how, if you're as beautiful as so many women, it's possible not to spend three hours every day in front of the mirror loving yourself.

People are too eager to judge you. For some reason, Western capitalism puts this trait in people. The people I like most are the ones who haven't succumbed to it, the easygoing ones. Getting rarer every year. (And the so-called intellectuals are the worst. They label you after you've said two sentences.) A kind of unintelligence. Insensitivity.

Young pretty [American] women seem peculiarly susceptible to this weakness, this type of snobbishness and impatience.

For some important English Puritans in the mid-1600s, "Waste of time is the first and in principle the deadliest of sins. The span of human life is short and precious to make sure of one's own election. Loss of time through sociability, idle talk, luxury...is worthy of absolute moral condemnation. [The Puritan] does not yet hold, with Franklin, that time is money, but the proposition is true in a spiritual sense. It is infinitely valuable because every hour lost is lost to labor for the glory of God. Thus inactive contemplation is also valueless...for it is less pleasing to God than the active performance of His will in a calling." "It is action that God is most served and honored by... The public welfare or the good of the many is to be valued above our own.' Here is the connecting-point for the transition from the will of God to the purely utilitarian viewpoint of the later liberal theory."

Contemporaries thought that Puritans were melancholy and morose. That came from their strictures on spontaneity.

Labor is a good ascetic technique. That's another reason for the Protestant's love of it. —With Protestantism you can see the beginning of the change from "Contemplation is higher than labor!" to the reverse. "Labor came to be considered in itself the end of life, ordained as such by God... 'One does not only work in order to live, but one lives for the sake of one's work, and if there is no more work to do one suffers or goes to sleep.' [—Zinzendorf.]" Not *labor* but *rational* labor in a *calling*.

A lot of these Puritan doctrines are simply 'rationalizations' of capitalist practice. (Interest, profit, wealth are rationalized in obvious ways.) But rationalizations are necessary, and, if powerful, they can greatly influence practice.

Everyone wanted to be wealthy, so, naturally, a justification was found for wealth. Poverty became the sinful thing, wealth the virtuous thing. Begging was socially despised, so, naturally, Protestants found reasons why it was sinful. The specialized division of labor had become necessary, so, naturally, a "fixed calling" was interpreted as ascetically valuable, spiritually redeeming, a glorification of God.

Much of the last chapter reads like a defense of historical materialism.

Everything, everything, *everything* for the glory of God. Nothing for the sake of enjoyment. Acquisitiveness, not enjoyment! Save, don't spend! Middle-class capitalism, not extravagant feudalism! Weber's brilliant discussion.

"The intensity of the search for the Kingdom of God commenced gradually to pass over into sober economic virtue; the religious roots died out slowly, giving way to utilitarian worldliness."

Puritanism and Kant. Deontology. Everything is done for the glory of God—or, in Kant, for the glory of reason. Not for love, only for abstract duty. —Reification. Legalism (not in the Chinese sense). Commodity-fetishism. Capital-fetishism. (God evolved into Capital, a transcendent entity which is the meaning of life (for a certain class of people). The parallel isn't exact, though: Capital, or Profit, isn't an *other*, it can't recognize you as God can. But by directing your efforts toward its accumulation you're trying to achieve recognition from an abstract other, a contentless remnant of God;¹ this other, which is closely associated with Capital itself, is the successor to God—in this context.) And rationalization. Successors to magic and authority-fetishism.

September 6

If you fail to get recognition from some person or group of people, you respond by denying that person recognition. You get yourself to have contempt for him, or you ignore him or whatever. What exactly is going on here? It's a defense-mechanism, but what does that mean? Well, it's pretty simple: you want to deny that the offending person is important to you, because the more important he is—i.e., the more valuable he is, or the more recognition you give him—the more painful is his lack of respect for you. You want to push him out of your consciousness, out of the *other*-part of you, the part you want recognition from because you recognize its value, its *absolute* value, its transcendence relative to you. When you recognize or value someone you are, to that degree, treating him as an instantiation of the (transcendent) other in you; therefore you want recognition from him in turn (to that degree), since you always want recognition from the other. If he doesn't give it to you then you withdraw your recognition from him as a way of preventing a lack of recognition towards you from the other, which is (experienced as) a terrible thing.

There's always a danger in these investigations that the language I use can be misleading, arising from the fact that the other is both transcendent and immanent in you. Obviously you don't want recognition from *your own consciousness*, insofar as your own consciousness is you. What you want recognition from is the *transcendent* part of your consciousness, or your consciousness insofar as it transcends you. The other in you is projected out of you, into concrete individuals, abstract ideas, etc. You identify it with these people (and, half-consciously, these ideas); that is, you identify this aspect of your consciousness with them, you invest it in them. You interiorize them by exteriorizing (into them) your self-consciousness, the other in you.

Nor is any of this idealism in the pejorative sense. All these processes go on unconsciously, half-consciously, 'behaviorally,' and without them, human behavior wouldn't make sense. We'd be robots. The choice is either behaviorism or this phenomenological psychology.² Either a denial of subjectivity, or

¹ It's hard to describe, since it's merely formal. It's *in* your self and *beyond* your self; in your consciousness and beyond it. In the world and outside it. In everyone and beyond him. Ultimately it's just the generalized other, the other in you (which, while merely "formal," can be associated with different ideas (not to mention, of course, concrete people), like God, mankind, posterity, capital-accumulation—and in this sense can take different "forms").

² Incidentally, there are other ways of expressing it—other 'vocabularies'—for instance in Freudian terms, involving cathexes and whatnot. But Freudian language is more mechanistic, less 'subjectivistic,' and thus, for humans, less interesting, less compelling, less 'in-our-own-terms,' less of an *explanation*. An explanation of the self and its behavior should be in terms explicable to the self, intuitively graspable, using concepts that can be intuitively related to experience. It shouldn't use mechanistic concepts.

subjectivity. There's no in-between. Unless you want to be a behaviorist, which is stupid, you have to take seriously these sorts of phenomenological investigations. (Behavior can also be explained biologically, of course, but that's on a different level.)

Met Nadine, showed her my new apartment, went outside to show her the little park on this half-misty, half-rainy night, saw the grass made golden by the street-lights, glistening, we kissed, then walked to the subway and kissed again—and she tucked her hair behind her ears in that beautiful feminine way. Nadine. Chopin-loving Nadine.

You can either spend most of your life ignoring mankind's suffering, or you can—never laugh again.

September 7

It's the little things that people do that are most revealing, the unnoticed things that reveal humanity. Like in the park today when the woman talking to her friend sitting on the picnic blanket burst out laughing very hard, tipped backwards and raised her legs in the air and kicked them gleefully in a vertical sawing motion for a few seconds. I saw that and said to myself, "That's a very natural, fun thing to do when you're sitting on the grass and laughing. Kick your legs up in the air! It doubles the pleasure of laughing. But why? Why exactly did she lean backwards and kick her legs in the air? It wasn't a considered, intended act; it was a spontaneous expression of glee. But why does glee express itself in that way? Waving your limbs about, running around, jumping up and down, just moving your body senselessly in any way can be a *joy*. Why? Because that's the way humans were meant to be: to be animals that take joy in their living, in their physical activity, in their *throwing* themselves into the world,¹ acting on it wildly like the wild frolicking animals they are." A whole world, a whole worldview can be contained in the simplest act of a woman on a picnic blanket in the park.

Dropping the English Revolution class because three classes is too many and anyway I can't abide the thought of immersing myself in historical minutiae that make contemporary philosophy seem riveting by comparison. But I'm reading Christopher Hill's radical history of the period entitled *The World Turned Upside Down* because it reminds me of E. P. Thompson's *Making of the English Working Class*.

"There were, we may oversimplify, two revolutions in mid-seventeenth-century England. The one which succeeded established the sacred rights of property (abolition of feudal tenures, no arbitrary taxation), gave political power to the propertied (sovereignty of Parliament and common law, abolition of prerogative courts), and removed all impediments to the triumph of the ideology of the men of property—the protestant ethic. There was, however, another revolution which never happened, though from time to time it threatened. This might have established communal property, a far wider democracy in political and legal institutions, might have disestablished the state church and rejected the protestant ethic."

English Revolution = (sort of) earlier version of French Revolution.

"Spontaneously generated" embryos of democracy in Cromwell's army—similar to the Workers' and Soldiers' Councils in Russia in 1917. "The rank and file organized themselves from below, led by the yeoman cavalry regiments. Petitions were drafted, some of them dealing with political as well as military matters..." Hannah Arendt. Lost treasures of the revolutionary tradition, first appearing in mid-seventeenth-century England.

Levellers, Diggers, Ranters, Seekers, Anabaptists, Familists, Quakers. Gerrard Winstanley, remarkable man. Visionary genius. Communal cultivation of the commons as the basis for social equality. No private property. Property is anti-Christian. God is Reason, the law of the universe. Pantheism. Etc. Anticipates Spinoza, the Enlightenment, utopian socialism, even Marx in many ways, including, to an

¹ Take that, Heidegger, you pessimist!

extent, the class struggle. Gerrard Winstanley. Detailed, practical proposals for communism in England, pamphlets probably meant for Oliver Cromwell to read. Unparalleled visionary, magnificent, right on nearly every point. Read his pamphlets, reader.

Protestant ethic. *Choose* to labor, be a *fanatic* about labor, because then you'll be able to tolerate the enforced labor of the emerging capitalist order. Something initially unpleasant can become almost a joy if you merely change your attitude. Cf. my story about weightlifting. Puritans literally making a virtue of necessity. But the lower classes tended to reject this ethic. Finally they had to be coerced into it through the Industrial Revolution.

You still see conservative ideologists preaching the same old Protestant ethic—work, work, provide for your family, do your duty and everything will turn out fine for you. The elect are those who work; if you're poor you probably deserve it because you're lazy. Pull yourself up by your bootstraps. It's a powerful ideology, unfortunately.

September 8, 9, 10

Reading an excellent textbook on Ancient Greece for the class I'm TAing. In the past I may have overemphasized the differences between our prehistoric ancestors and us. The differences in consciousness and behavior.

Watched *Moulin Rouge* again. Near the end, when Nicole Kidman belts out "*Forgive everything!*" to Ewan MacGregor as he's walking away from her, I *bawled*. Like a God-filled mystic. So beautiful that moment. I want to watch the movie with Nadine.

Ah, sweet catharsis.

Nadine. Seeing her tomorrow at the Boston Music Festival, bands playing downtown, I'll find out then whether our kissing was a fluke or if it was meaningful—you'd think meaningful since we were both sober, and she waited for me to kiss her before we parted which must mean *something*, don't you think? But you never know with women. A mixture of doubt and delight in my mind. Want to write about it because I'm alone listening to Mozart's 24th concerto and Nadine isn't here to talk to—although, honestly, she isn't the greatest conversationalist; talks too much—but I'm in a happy mood and don't want to read about contemporary Europe but I suppose I will. Beautiful girl named Holly in that class, looks like my future wife (*sweet-looking*); I have her email address, hopefully we'll hang out sometime.

La vie, c'est souvent belle. J'aime la vie, oui, je l'aime. Even after 40,000 years, I still love life! This love, this love is nature's love for itself, and mankind's love for itself, in spite of everything, in spite of history! After all that has happened, the Spirit can still affirm living!—the World-Spirit embodied in me, it can survey its past and stubbornly refuse to be a pessimist! For Spirit is more than its tragic past objectifications. There is *hope*.

By the way, there are orders of magnitude more neural connections in the brain than there are stars in our galaxy. If that doesn't make you a humanist, then nothing will.

What's the relation between the other in the sense I've been implying and the other in the sense of a different group of people, as in East vs. West or European vs. Aborigine or Aryan vs. Jew or even, in a different way, man vs. woman? These two meanings of 'other' have some relation to each other, but I don't know what it is.

In a book called *Facing East from Indian Country*, the author remarks that "[With respect to Native American religious practice,] basic moral principles remained constant, but the beings with whom one dealt, and the ways in which one dealt with them, changed with time and situation in much the same way that human ties evolved over a life course. So Native religions were inclusivist, ready to incorporate new ideas and ceremonies, and generally tolerant of differences of opinion, as long as those differences did not result

in perceived harm to other people. All of this was profoundly alien to the worldview of the European Christians. Whether Catholic or Protestant, all Christians were exclusivist..." The opposing religious systems had utterly different premises, as Weber saw. Animistic, magical traditions were meant to influence the course of nature—to make crops grow or convince animals to give themselves up to hunters—by influencing spirit beings. The word *manitou*, for instance, referred to an "impersonal force that permeated the world, observable in anything marvelous, beautiful, or dangerous." Deceased ancestors, animals, trees, winds, waters—all were other-than-human persons with whom it was important to maintain mutually beneficial relationships because they possessed or controlled this power." Indians would freely adopt elements of Christianity if they thought that might have beneficial practical results. Christianity, on the other hand, was supposed to give life *meaning*, to provide comfort to the meek, the alienated, to make life bearable in a world of "sin." It gave people *hope*. Primitive magic had no such purpose, since societies that practiced it were in greater harmony with nature and themselves than Christians were, and so didn't need "hope." Indeed, if you look at it objectively, "primitive magic" was far more rational, more *this-worldly*, than Christianity, Judaism and Islam are.

(The arrival of Christians in America ended up creating a desire on the part of many Indians for Christianity, due to the social turmoil that accompanied the encounters between Europeans and Indians. Many of the latter turned to a religion that offered salvation from the suffering caused ultimately by its very emissaries! It could almost have been an immense, magnificent Christian conspiracy: 'If we cause war and turmoil in Indian societies, Indians will increasingly seek refuge in an ideology that exists precisely to comfort people experiencing war and turmoil! Their acceptance of our ideology will give us power over them.' It's brilliant!)

Iroquoian grammar is revealing. Transcendent, abstract ideas cannot be expressed in it; its whole structure, its orientation, is concrete, specific, designed to express concrete relationships. (In its concreteness it's like Chinese. And the Chinese people, like the Indians, didn't have a transcendent monotheistic religion or purely abstract philosophies. They were wholly *grounded, this-worldly, rooted in the earth.*) For example, you can't say "The Father, the Son, and the Holy spirit"; you have to say "*Our* Father, *his* Son, and *their* Holy Spirit." There's no place for transcendence or abstractness in the Iroquoian language. Nor in the society.

Nadine doesn't want a relationship now despite her sexiness because she's worried she'll be hurt when she leaves America in December. Hmph. I haven't given up yet. She almost cried while we were talking about our situation, said she's very sensitive etc. and doesn't want to get hurt. ...Well, fair enough. I'll respect her wishes.

September 13

April spent the night here and most of today. No hanky-panky, only good old-fashioned talking. She's the exceptionally rare kind of person who is totally easygoing and intelligent and shares my dry, understated sense of humor.

K. Peter Etzkorn's "Georg Simmel and the Sociology of Music" (1964). "Simmel views music as an acoustic medium of communication which conveys feelings of the performer. 'Just as language is related to concrete thought, so is music related to feelings which are somewhat less precise. The first creates the second, since the second created the first.'" "Instrumental music represents to Simmel a more elaborated mode of expressing human emotions than can be gained through vocal music alone... It is much less direct [than vocal music] in expressing emotions..." "Sound patterns *per se* are devoid of meaning unless they are perceived as conveying learned emotive content." Societies become conditioned to associate particular instrumental sounds and techniques with particular emotions and kinds of behavior. "Apparently [the style of] music is characteristic for the character of a people.' Variations in the appreciation of different musical styles might therefore be associated with social group differences. More specifically, Simmel stipulates that in order to become great art, music must embody national or social group characteristics. Only thereby will

it have meaning for the members of the nation.” These highly sensible remarks suggest that what was wrong with much twentieth-century classical music was its separation from—i.e., its lack of an expressive relation to—the emotions and dynamic, ‘emotional’ ways of acting. It might not be going too far to say that such music tended to vitiate the nature of music itself—and that in this sense, at least, contemporary popular music (even hip-hop, heavy metal, punk) is more truly “musical” than a lot of high-brow avant-grade stuff is and was. On the other hand, Eduard Hanslick’s essay *The Beautiful in Music*. Music isn’t *only*, or perhaps even *primarily*, an “*expression*” of “*emotions*,” but it surely has some essential connection to feelings, to affective states of mind and behavior.

Mark Leonard’s *Why Europe Will Run the Twenty-First Century*. Makes a fairly convincing case that the decentralized nature of the EU represents the future of politics and the global economy.

Thought-spawning: “At the heart of Europe’s strategy is a revolutionary theory of international relations. Many foreign policy experts argue that foreign and domestic policy are fundamentally different. Domestic policy, they say, is hierarchical. They argue that in domestic politics a centralized state makes the law and enforces it when it is broken. The classical definition of a state is a body with a monopoly on legitimate force. Foreign policy, by contrast, is anarchic: there are many competing states with no overarching government or global policeman to keep the peace.

“But Foucault shows us that this image of domestic politics is wrong. [No, it’s right. As a description of how nation-states currently operate, it’s right, at least as far as it goes.] The real reason that societies do not collapse into chaos is that their citizens do not want them to. [Um, what?] Order is not produced through hierarchy [huh?],¹ but because a majority of people have a stake in preserving order. [Those are not mutually exclusive.] That is why people internalize the rules and police themselves. [That is “*why*” they internalize rules? No. Logical fallacy.] The key to order, therefore, is co-opting people—or countries, for that matter—to uphold the rules themselves, rather than coercing them into submission. The same is true of the global system...” Behind the sloppy thinking and careless wording is the insight that there are other ways of guaranteeing social order than through centralized bureaucracies and hierarchies of coercion.² The most reliable means to “order” is *socialization*, or *internalization of norms*. In every ordered society there exists such socialization, which in itself relies only incidentally or not at all on the threat of force. Far more effective than force in securing consent and compliance are non-coercive mechanisms, such as (on the positive side) *ontogenetic learning* and (on the negative side) the possibility of *social rejection*. The more important the threat of force is, the more pathological and unnatural the society is. Totalitarianism is the extreme, in which the threat of the concentration camp is, as Arendt argues, the linchpin of social order. Undoubtedly Mark Leonard underestimates the importance of force in the liberal-democratic nation-state; he is right, though, that there is no *a priori* reason why the centralization and hierarchization of force should be a prerequisite for order in *any* technologically advanced, mass-populated society.

[...]

After all, it was easy to be a great humanist in the 16th, 17th, 18th and 19th centuries, even during much of the 20th, because in the former case(s) you were not really at odds with the major trends of culture and in the latter you had the immediate, glorious past of four centuries to support you in your opposition to bureaucracy and commodification. Erasmus, Da Vinci, Alberti, Michelangelo, Milton, Schiller, Goethe, Kant, Beethoven, Shelley were fundamentally in tune with their times (despite appearances), while Ortega, Adorno, Eliot, Sartre, Camus, Beauvoir and the rest were in tune with a huge, disillusioned portion of modern society. Only in the last few decades have the old ideals become totally unfashionable. Susan Sontag recognized this fact in the passage I quoted months ago.

¹ He should have said: not *necessarily* produced through hierarchy.

² By “coercion” I mean the threatened withdrawal of conditions for the individual’s or the group’s (1) self-preservation or (2) non-enslavement or -imprisonment. Coercive methods rest, in the end, on brute physical force; non-coercive methods operate through the human desire for recognition/validation.

“With Daniel Boone and his successors, a ‘new man’ appeared, created by the meeting of whites and Indians, a product of the violent absorption of the Indians by the whites.” That’s true: Daniel Boone did represent a new ideal, a new man, just as the Protestant ethic represented a new ideal, and the Protestant a new man. Two new ideals that came together in America and fused, representing a new American ideal, the “American man.” Boone was the adventurer, the wilderness-conqueror, the rugged, heroic individualist, an ideal that later metamorphosed into the adventuresome entrepreneur along the lines of Carnegie, Morgan, Ford, Rockefeller, and ultimately Bill Gates, etc. The good Protestant, on the other hand, was the hard worker, the man who pursued his calling with religious fervor—an ideal that later shed its religious overtones and became that of the hardworking, thrifty bourgeois who lifted himself up from poverty by his bootstraps. Two modern ideals, two (closely related) versions of individualism. They were mutually reinforcing; together they came to define “the American dream.” This history is one of the reasons why the Protestant ethic has (had) an influence in America that it didn’t (and doesn’t) have in Europe, despite its having been founded in Europe. Another reason, of course, is that early American colonies were almost exclusively Puritan, with the result that there was far more social-structural and ideological homogeneity in America than in Europe. Und so weiter.

David Foster Wallace hanged himself. Forty-six years old. Yesterday as I was reading Mark Leonard’s book, Wallace was preparing for his own death, perhaps placing his head through the noose and jumping down from a chair, then choking and twitching and suddenly seeing bulge-eyedly in the last flicker of consciousness the horror of what he was doing. As I was joking with April, his wife was finding his body.

September 14

Am I sad that Wallace is dead? No, I don’t care much. To be sad means to feel something or at least to have one’s behavior changed temporarily, and I neither feel anything nor am acting differently in any way whatever as a result of hearing the news. And yet it would be perfectly natural for me to say to someone, “I’m saddened by his suicide,” and the person would surely believe me. But it wouldn’t really be true. Yet in the moment of saying it, I would mean it. But essentially all I’d mean is “It’s too bad he killed himself.” It’s a shame, it’s a pity, etc. Trite things we say because we know others expect us to say them and we expect ourselves to say them and we’re only following norms. I’m sad, I’m happy, I’m angry, I’m excited, I can’t wait, I love you, I don’t like her... Words, words, words. Words bind us to the (norm-governed) social order; uttering all the predictable responses, any predictable utterance in a given situation, reinforces our place in the social universe, keeps us securely and reassuringly in the fold of norms. Order, we need order, we want order, order, everything for the sake of order. Without order we have nothing, no self.

The tragedy of Wallace is that he wasn’t able to rise above his anomic society. Neither in his writing nor in his life. He was fragmented. I know that’s a cliché and impersonal, but like most clichés it has truth.

Bent Flyvbjerg’s “Habermas and Foucault: Thinkers for Civil Society?” (1998). Not a very good paper that got published because it adheres to scholarly protocol. I appreciate Habermas’s Kantian ambitiousness, his aversion to relativism, and he’s far more stimulating than Foucault, but essentially it’s all castles in the air. But why do people think Foucault is important? Everything substantive he says is either confused or obvious.

On the basis of McLellan’s review, I won’t be reading Charles Taylor’s book *A Secular Age* anytime soon. Unoriginal, safe, idealistic—conventional wisdom dressed in the robes of neo-philosophy. But those robes are so threadbare that, to all intents and purposes, the emperor has no clothes. ‘Secularism is an impoverished creed, humans “ache” for transcendence and “fullness,” religion can never die out, belief and unbelief are simply alternative ways of living, etc. etc. etc.’ Go tell it on the mountain, ass.

Who knows, there may be a “transcendent” layer of reality. There surely is, in fact. (What that means is another question entirely.) But if you’re going to write a book you should say something worth saying. Don’t just rehash all the same old shit in post-philosophical, post-critical, post-eloquent language.

V. Y. Mudimbe’s “Reading and Teaching Pierre Bourdieu” (1993). “The habitus is an accretion of internalized lessons that the agent has learned over the course of his socialization... It is ‘a durably installed generative principle of regulated improvisations; it produces practices which tend to reproduce the regularities immanent in the objective conditions of the production of their generative principle.’” That sort of makes sense if you think about it. “Each agent,” writes Bourdieu, “wittingly or unwittingly, willy nilly, is a producer and reproducer of objective meaning. Because his actions and works are the product of a *modus operandi* of which he is not the producer and has no conscious mastery, they contain an ‘objective intention,’ as the Scholastics put it, which always outruns his conscious intentions.” Another suggestive idea is that *culture is a game*. There are rules, strategies, the forbidden possibility of breaking the rules, ‘competitors,’ and so forth. “In the game you cannot do just anything and get away with it. And the feel for the game, which contributes to this necessity and this logic, is a way of knowing this necessity and this logic.’ In any case, the orthodoxy and regularity of modes of practice in the game express the habitus, a disposition referring back to the language of rules inculcated in the agent.” *Play...game...culture*. In children, play and games are ways of accommodating the child to the slow inculcation of cultural norms. Ways of ‘easing the transition’ from an earlier lawless state to the rule-boundedness of the social order. Ways of internalizing, or facilitating the internalization of, societal norms. *Culture is a game*. Not literally, but it’s a good metaphor.

The fall of man, the rise of religion, the upsetting of an eons-long equilibrium—this coincided with the slowly progressing depersonalization of nature, i.e. the slow decline of belief in the ‘intentionality’ of natural phenomena, the ability to influence them as one influences humans, to interact with the natural world as with the social world. No longer was nature an other, or infused with others, somewhat comparable to the human other. This natural, *immanent* other was instead projected into the beyond, with the result that one oriented one’s life toward the beyond.

Incidentally, from what I’ve read of Weber, he wasn’t quite right about magic. It satisfied *both* the practical and the ‘religious’ desires in people, the desire to bring about one’s ends and the desire for ‘existential meaning.’ In satisfying the first, it satisfied the second, for the second is essentially the desire to belong in the universe, to be a respected, integral part of it like all other parts. This desire didn’t even become an object of awareness until the world was separated into “nature” and “society,” which coincided with the division of the cosmos into *this* realm of reality and the *other* realm. These divisions existed to an extent even in China and India, although it wasn’t until the rise of the West that they became really extreme. The Hellenistic era had a relatively advanced conception of them.

It would seem as though science is, after all, part of the problem, since science teaches us that the universe is mechanistic, that the chasm of *free will and consciousness* separates humans from the rest of nature, thus alienating us from it. But this is a capitalist science; it isn’t necessarily the *correct* science. It *can’t* be, at least not until it can account for paranormal phenomena of the sort that Mayer describes. Those suggest that consciousness is most definitely a part of the deepest layer of reality immanent—*immanent*, not “transcendent”—in the world.

Instead of saying “consciousness transcends itself,” which sounds idealistic, it might be better to say “I transcend myself. A human being transcends himself, in his thoughts and his behavior.”

The word “significance.” Sign-ificance. “Life has no sign-ificance.” Same with “meaning.” “Life has no mean-ing.” It’s extremely revealing that these two words both involve the concept of “sign.” To say that life isn’t significant literally means that it isn’t a sign of something else, of another layer of reality. Events in our world don’t *mean* something else, don’t *refer* to something, don’t *sign-ify* something. You can see in the very structure of these words that the concept of existential meaning or significance arose under the influence of a transcendental religion like Christianity, which interpreted, especially in the Middle Ages, worldly events as signs of heaven or God’s will. Everything was a mere sign (or *symbol*); everything referred to heaven and derived its sign-ificance from that. The physical structure of cathedrals, the

hierarchical structure of the Church, etc. If Riencourt can be trusted, the Chinese traditionally had a similar understanding of worldly events as being signs of “heavenly” events, or rather the “flip-side” of such events. But they didn’t emphasize the transcendental aspect as much as Christians did, and I bet that in the Chinese language the modern characters for “existential meaning,” if they exist at all, have no relation to the character(s) for “sign.”

Thomas Luckmann’s “Shrinking Transcendence, Expanding Religion?” (1990). Good article. Usefully distinguishes between kinds of transcendence.

The Protestant ethic has partly withered away, and is still withering, to be replaced by the ideology of personal fulfillment. That’s a positive development, an important advance in the dialectic. “There seems to be a powerful ‘elective affinity’ between the structural privatization of individual life [in modern society] and the ‘sacralization’ of subjectivity that is celebrated in much of modern consciousness.” Good point. What exactly are the reasons for the mass-acceptance of this ideology? My speculations on March 24th left a lot to be desired. I didn’t even understand its importance, as shown by the last sentence of the relevant paragraph: “An attenuated ideology of Romanticism clings desperately to life despite its obvious inadequacy to contemporary conditions.” No, Chris, you’ve got it all wrong! It isn’t clinging desperately to life; it’s ascendant! Its greatest triumphs are ahead. Hence it can’t be only a despairing reaction to dehumanization or whatnot. It has also to do with the individual’s great freedom, his unprecedented leisure-time, as well as the forces of commercialism, which trumpet the gospel of “self-fulfillment” because it’s incredibly profitable.

Luckmann notes that the New Age movement represents a somewhat “magical” worldview. Think of astrological advice columns too. Remnants of magic have by no means entirely left the modern consciousness. Nor is magic entirely “untranscendental,” as Weber implies.

September 15, 16

Hans Mol’s “Time and Transcendence in a Dialectical Sociology of Religion” (1981). Dialectic between integration and differentiation... Present throughout nature and society. Everywhere. One’s methodology should be premised on this fact.

Don’t forget the purely cognitive benefits of religion, the ‘ordering’ functions it performs. But those aren’t purely cognitive. Providing a means of orientation, like all ideologies do. The need to order your world and act on that basis, for without some kind of order, action is difficult or impossible. You act in light of ends, you pursue ends on the basis of your knowledge of means. The more systematic your ‘knowledge’ is, the better you can orient yourself and the more intelligently and effectively (*ceteris paribus*) you can act. Archimedes’ points, transcendental ideas like God or democracy or private enterprise or the nation.

“For the Australian Aborigine, time was not a horizontal line extending back horizontally through a series of pasts but rather a vertical line in which the past underlies and is within the present... Time as an abstract concept does not exist in Aboriginal language... The Aboriginal religion did not look back to a golden age or forward to an afterlife.”

Ramakant Sinari’s “The Phenomenological Attitude in the Samkara Vedanta” (1972). John Searle’s “How to Study Consciousness Scientifically” (1998). He writes, “Consciousness and indeed all mental phenomena are *caused by lower level neurobiological processes in the brain*; and...consciousness and other mental phenomena are *higher level features of the brain*.” Both those statements are ambiguous, but on one reading they’re right. In the rest of his paper he addresses common philosophical objections to the possibility of understanding consciousness, one of which is this: “There is no way that we could ever give an intelligible causal account of how anything subjective and qualitative could be caused by anything objective and quantitative, such as neurobiological phenomena. There is no way to make an intelligible connection between objective third-person phenomena, such as neuron firings, and qualitative, subjective states of sentience and awareness.” This objection, I’ve said many times, is insurmountable. For no matter how sophisticated is our knowledge of biochemistry, no matter how great our understanding of the physical processes that go on in the cell and between cells, it will always be an intuitive mystery how something

private and seemingly non-physical can arise from something public and physical. This is the mystery of a specific kind of *emergence*. Human beings lack the necessary cognitive apparatus to understand it, just as we apparently lack the cognitive apparatus to understand—or rather to do away with—the dichotomy between causal necessity in the brain and freedom in consciousness and behavior.

Stated in Nagel's terms, "the problem is that we have no idea how objective phenomena, such as neuron firings, could necessitate, could make it unavoidable, that there be subjective states of awareness. Our standard scientific explanations have a kind of necessity, and this seems to be absent from any imaginable account of subjectivity in terms of neuron firings. What fact about neuron firings in the thalamus could make it necessary that anybody who has those firings must feel a pain, for example?" The answer is that, to our limited human understanding, *no* fact can make it necessary. Whatever complex of biochemical processes we ultimately decide produces consciousness, the emergence of consciousness from it will inevitably seem arbitrary and mysterious to us, because of the leap between public and private.

Searle disagrees:

I accept the unstated assumption behind the objection: given our present scientific paradigms it is not clear how consciousness could be caused by brain processes. But I see this as analogous to the following: within the explanatory apparatus of Newtonian mechanics, it was not clear how there could exist a phenomenon such as electromagnetism; within the explanatory apparatus of 19th century chemistry, it was not clear how there could be a non-vitalistic, chemical explanation of life. That is, I see the problem as analogous to earlier apparently unsolvable problems in the history of science. The challenge is to forget about how we think the world ought to work, and instead figure out how it works in fact.

My own guess—and at this stage in the history of knowledge it is only a speculation—is that when we have a general theory of how brain processes cause consciousness, our sense that it is somehow arbitrary or mysterious will disappear. In the case of the heart, for example, it is clear how the heart pumps the blood. Our understanding of the heart is such that we see the necessity. Given the contractions, it causes blood to flow through the arteries. What we so far lack for the brain is an analogous account of how the brain causes consciousness. But if we had such an account—a general causal account—then it seems to me that our sense of mystery and arbitrariness would disappear.

It is worth pointing out that our sense of mystery has already changed since the 17th century. To Descartes and the Cartesians, it seemed mysterious that a physical impact on our bodies should cause a sensation in our souls. But we have no trouble in sensing the necessity of pain given certain sorts of impacts on our bodies. We do not think it at all mysterious that the man whose foot is caught in the punch press is suffering terrible pain. We have moved the sense of mystery inside. It now seems mysterious to us that neuron firings in the thalamus should cause sensations of pain. And I am suggesting that a thorough neurobiological account of exactly how and why it happens would remove this sense of mystery.

Needless to say, Searle doesn't know what he's talking about. The problem isn't analogous to earlier questions about Newtonian mechanics. Nor is it analogous to the question about how the heart pumps blood. Nor has our sense of mystery really changed since Descartes; the only difference is that we formulate the Cartesian question in sophisticated scientific language. The question remains, how can something physical and public give rise to something strangely (or 'partly') non-physical and private?

It's astounding that no one before me kept a lifelong daily record of his solutions to theoretical problems—a document in which he proceeded from problem to problem, trying to solve them. Hammering out his worldview. Billions of people, and, as far as we know, not *one*, at least not in anything like the thoroughness, or even the *form*, of my journal. Nietzsche came the closest.

Erik Olin Wright's "The Shadow of Exploitation in Weber's Class Analysis" (2002). Interesting: "The analysis in Weber's 1896 study of the causes of decline of ancient civilizations has a particularly

Marxian flavor to it. His central argument is that the contradictions of slavery as a way of organizing production were the fundamental cause of the ultimate collapse of the Roman Empire.”

Class, status, party: (1) economic, (2) communal, (3) political: (1) no necessary subjective identity or collective action; (2) some subjective identity, “positive or negative social estimation of *honor*,” consciousness of belonging to a group; (3) collective action. “In these terms, members of a class become a status group when they become conscious of sharing a common identity, and they become a party when they organize on the basis of that identity.” Definition of class in terms of the economic opportunities people face in the market (their “life-chances”), and also in terms of *rationalized* economic interactions. “For Marx, expropriation of the workers from the means of production is crucial because it enables capitalists to exploit workers; for Weber this expropriation is crucial because it allows for the full realization of economic rationality within production.”

Relationship between rationalization and alienation...

Weber agrees with Marx that class is the primary axis of stratification in capitalism. Furthermore, both of their class concepts are relational rather than gradational (“lower, middle, upper”); both see property-ownership as the fundamental source of class division, and Weber recognizes that propertylessness is a coercive, unfree condition; and “for both Weber and Marx, the material interests structured by class locations have a strong tendency to shape the actual behavior of people within those locations.” Duh.

(I should keep in mind that “fragmentation” or “atomization” in itself is not a sufficiently specific diagnosis of capitalist social life, for there was a kind of fragmentation amongst peasant communities in pre-capitalist societies—which is precisely why peasant class-consciousness rarely developed.)

Weber: “We may speak of a ‘class’ when (1) a number of people have in common a specific causal component of their life-chances, insofar as (2) this component is represented exclusively by economic interests in the possession of goods and opportunities for income, and (3) is represented under the conditions of the commodity or labor markets. This is ‘class situation.’ ...The kind of chance in the *market* is the decisive moment which presents a common condition for the individual's fate. Class situation is, in this sense, ultimately market situation.” Marx’s view is more complicated:

In Marx’s class analysis, the effect of exchange on life chances is only half the story. Of equal significance is how property relations shape the process of exploitation. Both “exploitation” and “life chances” identify inequalities in material well-being that are generated by inequalities in access to resources of various sorts. Thus, both of these concepts point to conflicts of interest over the distribution of the assets. What exploitation adds to this is a claim that conflicts of interest between classes are generated not simply by conflicts over the distribution and value of resources people bring to exchanges in the market, but also by the nature of the interactions and interdependencies generated by the use of those resources in productive activity.

Exploitation, for Marx, identified the process by which labor effort performed by one group of economic actors is extracted and appropriated by another group. That appropriated labor is referred to as “surplus labor,” meaning laboring activity above and beyond what is required to reproduce the laborers themselves. In capitalism, for Marx, this appropriation occurs because employers are able to force workers to work longer hours and perform more labor than is embodied in the products that they consume with their wages. Expressed in the classical language of the labor theory of value, the labor value of what they produce is greater than the labor value of what they consume. The difference—surplus value—is appropriated by the capitalist. This appropriation is exploitation.

The concept of exploitation, defined in this way, is used by Marx in two general explanatory contexts. First, Marx sees exploitation as the source of profits in capitalism: Capitalists appropriate surplus value from workers that, when capitalists sell the commodities embodying that surplus value, is turned into money profits. Profits, in turn, are essential for investment and capital accumulation. In this way, exploitation figures centrally in Marx’s account of the dynamics of capitalism. Second, Marx sees exploitation

as central to explaining the particular character of conflict between workers and capitalists. Exploitation constitutes a social relation that simultaneously pits the interests of one class against another, binds the two classes together in ongoing interactions, and confers upon the disadvantaged group a real form of power with which to challenge the interests of exploiters...

The labor theory of value operates on an extraordinarily high plane of abstraction. That explains the difficulty in understanding it.

For Weber, classes are premised on the existence of a market, which means that slaves and serfs don't belong to a class. They're a status group.

At the end of his paper, Wright lays out the ramifications of the two different approaches to class analysis.

How funny is it that some woman named Sarah Palin, who thinks dinosaurs existed six thousand years ago, could with a little luck become president! All that's necessary is that McCain get elected and then die. If it weren't so funny it would be terrifying. But...no, it's just freaking hilarious. The political system doesn't anger me anymore—to be “angry” at it is like saying, “Auschwitz was a bad thing”: it's not even in the ballpark of doing justice to the fact—and so I have to sit back and laugh heartily, and then shoot myself in the head.

I can't watch Sarah Palin talk: she's a cartoon. She makes Bush look like a personification of integrity and intelligence.

September 17

Years ago I mentioned an episode of a sitcom in which a fat man chose to gluttonize himself precisely because women were rejecting him. I asked the question, what does it mean when someone chooses to be a buffoon, in the manner of Marmeladov in *Crime and Punishment*? What exactly is going on? If people want to be validated, why would someone choose to debase himself so that he is explicitly contemptible to others? You have to realize, first of all, that no one does this unless he thinks that people *already* consider him a buffoon. On the basis of that impression he chooses to make himself an even greater buffoon, thus confirming and accepting his other-determined identity (his identity in the eyes of the other). It's easier for him to do this than to try to rise above and prove wrong the other's opinion of him. But why is it easier? Because to make himself *respected* by the other, which is naturally what he desires in spite of himself, would entail directly confronting the pain of having his sense of self not be validated—the pain of knowing he's an object of contempt. On some level, of course, he's already aware of this, but he doesn't have to confront it head-on if he adjusts his behavior and his sense of self so as to incorporate the other's impression of him. By accepting that impression and choosing to see himself in the same way, he makes it possible for his sense of self—which is now his *new* sense of self, his self-contemptuous sense of self—to be validated. That's what we want: to be seen as what we see ourselves to be. Normally we try to bring the other's perception of us in line with our self-perception, but in those cases when the other's perception is too set in its contemptuous ways and refuses to be changed, we may settle for bringing our self-perception in line with the other's perception, thus restoring some degree of harmony between how we see ourselves and how we're seen. *Recognition of ourselves as who we want to be*: that's what we desire. By *choosing* to be a buffoon, Marmeladov makes it possible for himself to be recognized (by others) as who he wants to be, namely a buffoon—for he knows that's how he is already seen by others.

There are risks, though, in the Marmeladovian strategy. One risks splitting oneself into two pieces, a lower and a higher, an inferior and a superior. The superior is essentially the “internalized” other looking at and judging you; the inferior is the concrete you, the you of your behavior and your “contemptible” personality. You may come to see yourself as loathsome, despicable, and thus succumb to various neuroses or psychoses premised on your harmful self-division. I should reread Laing's book.

Now that I have access to a real library—at UMass—I intend to get back on track with my reading. For light reading I'm perusing an anthology called *Feminism In Our Time: The Essential Writings, World War II to the Present* (1994). A decent article by Naomi Weisstein called "Kinder, Küche, Kirche as Scientific Law." She laments that "it has been a central assumption for most psychologists of human personality that human behavior rests primarily on an individual and inner dynamic, perhaps fixed in infancy, perhaps fixed by genitalia, perhaps simply arranged in a rather immovable cognitive framework." She argues, by contrast, that "what a person does and who he believes himself to be, is in general a function of what people around him expect him to be, and what the overall situation in which he is acting implies that he is. Compared to the influence of the social context within which a person lives, his or her history and 'traits,' as well as biological makeup, may simply be random variations, 'noise' superimposed on the true signal which can predict behavior." I think she goes too far there. Biological makeup and "traits" are enormously important in conditioning a person's actions and reactions in a given situation. Still, she's right to condemn personality theory for looking "for inner traits when it should have been looking [*also*] at social context."

"An ingenious experiment...showed that subjects injected with adrenaline, which produces a state of physiological arousal in all but minor respects identical to that which occurs when subjects are extremely afraid, became euphoric when they were in a room with a stooge who was acting euphoric, and became extremely angry when they were placed in a room with a stooge who was acting extremely angry." Social context, not biology or inner traits.

Similarly, a relatively high level of testosterone in a man does not necessarily mean that he will be aggressive, dominating, competitive. These modes of behavior are, in large part, socially determined: they depend on the social context in which the man finds himself, as well as on his past experiences, etc. On the other hand, it's a little silly to extend this argument to the hypothesis that biological differences are minimally relevant to the fact that men have almost always been the hunters and women the gatherers and/or agriculturalists. It's also silly to say that hormones and so on are not an important cause of men's generally greater aggressiveness and dominance than women. Social conditions do determine how psychophysiological 'energy' will manifest itself behaviorally—as in the adrenaline experiment—but the fact remains that a person's behavior will be *somehow* affected by the presence or absence of certain hormones and endorphins and protein-levels and whatnot. Person X will tend to be more physically active than person Y, who will tend to be more nurturing and emotional than person Z. Not *solely* because of biology, but *partly*.

Feminists often construct strawman arguments that they have no difficulty tearing down.

"How are women characterized in our culture, and in psychology? They are inconsistent, emotionally unstable, lacking a strong conscience or superego, weaker, 'nurturant' rather than productive, 'intuitive' rather than intelligent, and, if they are at all 'normal,' suited to the home and the family." Yes, they are still characterized that way, though not *explicitly* so because people are forced to be hypocrites in these politically correct times. In any case, there's no denying that, on average, and in comparison with men, that characterization is pretty accurate (though a caricature). Modern women *are* all those things. And women *have been* all those things, more or less, since...I don't know...let's say the Early Bronze Age at least. You can draw whatever conclusions you want from that fact.

On the level of caricatures, however, men don't fare much better.

Women and men will always define themselves in relation to each other, behave in complementary ways. That doesn't mean, though, that the oppression or devaluation of women is unavoidable. But what about *mild* "devaluation" relative to men?—the vague impression of relative passiveness and weakness that has obtained not only in the most "civilized" cultures throughout history (from China and India to the Incas and Aztecs) but also in Native American society, early Germanic society, New Guinean tribes, the entirety of Polynesia, etc. etc.? Is *that* unavoidable? Yes.

Incidentally, what I wrote above about Marmeladov can, if revised, be applied to the case of millions upon millions of women. Women find that society expects them to act in less-than-fully-dignified ways, so they act in such ways for the sake of the other's approval (or recognition, validation).

September 18

It doesn't look like those hospital bills are going away. So I need more money. So I'm teaching English again, part-time, starting next week. I could use more human contact anyway: don't have much of a social life at the moment.

Laurel Ulrich's book *A Midwife's Tale: The Life of Martha Ballard, Based on Her Diary, 1785–1812*. Schnabel and Rocca's *The Next Superpower?: The Rise of Europe and Its Challenge to the United States*.

Sent Chomsky a query about his opinions on the mind-body problem and the free will issue. "...Similarly," I continued, "the free will vs. determinism debate is unresolvable due to the cognitive limits of the mind. Our conscious perception of freedom is as necessary and inevitable as is the scientific framework of physical causation in the brain.¹ The two ways of looking at the same phenomenon (namely consciousness) cannot be reconciled. Would you agree, or am I off my rocker?"

He agreed, though not with my opinions on the mind-body issue. "My feeling is somewhat different," he wrote. "I've been arguing for many years that the mind-body problem disappeared after Newton's discoveries were absorbed. I'll attach a recent paper about it.

"I suspect you're right about the free will problem. I've also suggested for many years that it may be beyond our cognitive limits. Which wouldn't be too surprising, since so are many other phenomena of nature, so it appears. Again, discussed a bit in the same paper." It's an excellent, borderline brilliant, paper he wrote some months ago. Very long, very erudite, and very historically grounded.

By the way, unlike most people, who, moreover, don't receive hundreds of emails a day, Chomsky replied within twenty-four hours, as he always does. You see, he has common courtesy, which is anything but "common" anymore. (Maybe it never was, except among the minority of humanly decent people in every age.)

His paper has made it clear to me that I've been using the word 'mechanistic' improperly, as when I say that the modern scientific worldview is mechanistic whereas Hegel's was teleological. Strictly speaking, 'mechanistic' (mechanism, mechanical, machine) has to do with matter colliding against matter—pieces of matter coming into contact with each other. Newton's notion of "action at a distance" is not mechanistic, which is why he wasn't satisfied with it. Action at a distance is inexplicable, mystical, occult, absurd, unscientific. He and his contemporaries thought that to understand something means to understand the *mechanism* through which it operates, which necessarily involves direct physical contact. And maybe they were right: due to the nature of our innate cognitive equipment—see Piaget—we intuitively understand the physical causation, the physical motion of the everyday world; we understand objects to be *substances* of some sort, *solids*, mutually separated *atoms* that come into contact with each other, and to us this is the only way motion can originate. Except—what about *willed* actions! When I move my limbs, the movement is somehow physically undetermined! My "will" determines it. But what does that mean and how is that possible? Well, that's just the mystery of will, of "free will." In any case, I've been using the word 'mechanistic' as though its opposite is some version of the concept 'willed,' which isn't the right usage. For neither quantum mechanics nor general relativity nor "field theory" (electromagnetism, etc.) is properly mechanistic. Not even Newtonian physics is mechanistic.

Chomsky is right that ever since Newton, the concept of matter has been essentially incoherent, ill-defined. My knowledge of this fact was precisely why in my paper on emergentism I shied away from formulating the issue in terms of "mind vs. matter," choosing instead "private vs. public." In the light of modern physics—even in the light of Newton, with his "action at a distance"—our intuitive understanding of matter is not valid, and no such criteria as extension or mass or divisibility or any other traditional ideas can be used to delineate what is material from what is not material. *Except*, perhaps, to say that matter is not private or first-personal. Maybe this criterion is inadequate too, but it's useful for expressing our

¹ Neither of which 'frameworks,' by the way, we understand even on their own terms.

intuition of the mind-body problem. The sensation I have when pinching my skin is a very different kind of thing from the skin itself. It's private and—yes, as Descartes said, it isn't divisible or extended in the way that skin is! I have to admit, though, that when I think hard about this problem I get the feeling that there may be something specious about it. It seems less substantive and less easily graspable than the problem of free will. Anyway, there's no good reason to believe that matter can't think or feel. I am *conscious matter*, whatever "matter" is. That's obvious.

"...Joseph Priestley made it clear that his conclusions about thinking matter followed directly from the collapse of any serious notion of *body*, or *matter*, or *physical*. He wrote that 'The principles of the Newtonian philosophy were no sooner known than it was seen how few in comparison of the phenomena of Nature were owing to solid matter, and how much to powers which were only supposed to accompany and surround the solid parts of matter... Now when solidity had apparently so very little to do in the system, it is really a wonder that it did not occur to philosophers sooner...that there might be no such thing in Nature.'

"There is, then, no longer any reason to suppose that 'the principle of thought or sensation [is] incompatible with matter,' Priestley concluded. Accordingly, 'the whole argument for an immaterial thinking principle in man, on this supposition, falls to the ground; matter, destitute of what has hitherto been called solidity, being no more incompatible with sensation and thought than that substance which without knowing anything farther about it, we have been used to call immaterial.' The powers of sensation, perception and thought reside in 'a certain organized system of matter, [and] necessarily exist in, and depend upon, such a system.' It is true that 'we have a very imperfect idea of what the power of perception is,' and that we may never attain a 'clear idea,' but 'this very ignorance ought to make us cautious in asserting with what other properties it may, or may not, exist.' Only a 'precise and definite knowledge of the nature of perception and thought can authorize any person to affirm whether they may not belong to an extended substance which also has the properties of attraction and repulsion.' Our ignorance provides no warrant for supposing that sensation and thought are incompatible with post-Newtonian matter..."

However true this all is, the intuitive difficulties remain. Maybe the *conceptual* difficulties don't...but yes, they do, given the difficulties involved in the idea of "radical emergence."

September 19

My greatest worry in life is that my journal will never be published. The world values values like mine less and less. I keep telling myself that eventually, maybe after a hundred or two hundred years, things will get back to normal, nihilism will have run its course and the ideal of "greatness" will make a comeback, but it's possible that the human species has entered its terminal phase. Besides, don't advanced technology and science by their nature rule out authentic humanism and cultural idealism? We need myths, we *need* them. At least for us higher men, life is unbearable unless there are myths to chase. But how can there be myths in a world of economic abundance?

[...]

Just as the S&L crisis of the 1980s was a fitting commentary on Reagan's economic leadership (or lack of it), so the current financial crisis, which could potentially cause the downfall of financial institutions across the world, is the perfect end to the Bush years. Deregulation, lack of government oversight—something economists have been warning against for decades—is causing an economic cataclysm. And then there's *environmental* deregulation, lack of government oversight, and the predictable result is global chaos decades from now.

Don't forget Enron and such debacles earlier in the decade. Republicans should be lined up against a wall and shot, having ruined millions of lives. Don't forget Iraq and Afghanistan.

And McCain was a zealot in defense of deregulation, and now he's saying that the crisis was caused by too much deregulation! If that man and his half-wit sidekick are elected, I'm fucking emigrating. How fucking stupid do people have to be to support him? What the fuck is wrong with this country?

Christ, when I watch that man talk I can see right to the back of his nasty little hypocrisy-soaked brain. He is despicable, repugnant. Everything he stands for, his pseudo-patriotism, his unprincipled politics, everything he is is *nasty*. I saw him yelling at a woman for five minutes until she cried, a woman who was speaking before a committee on behalf of American families who had been hurt by Vietnam, and he ranted about his patriotism and how he wouldn't let anyone "like *you!*" criticize him and his fellow senators. He was offended, his temper flared up, he yelled at this woman fighting for families until she cried. I was so disgusted I almost threw up. This blot, this stain, this *thing* can't be elected, that's impossible.

Without hyperbole, it truly is *beyond belief* that so many Americans are still undecided. "I'm not sure, I'm just not sure! Isn't Obama a Muslim? I don't know enough about him. I was told he's a Muslim! I don't like McCain's ideas, but at least I know him." This is the *stupidest* country in the world. Commercialism, pop culture has made people *stupid*. Eight years of Bush and they're still undecided?! What fucking planet are you people from?! The economy is going to hell and you're still undecided?! *Fucking morons*. You want health care but you're thinking of voting for McCain. You want us out of Iraq but you're thinking of voting for McCain. You want economic reform but you might vote for McCain. You want a better education system, you want more rights for women, but—McCain. You're worried about the environment, but "at least I *know* McCain!" You're worried about national security so you want to vote for the warmonger. Fucking brilliant.

September 20

People in olden times had wonderful euphemisms for sex. You can see them in the Bible. Another one is in the book I'm reading: a young woman accusing a man of rape said that "he ask'd me to lay down," and when she refused "pushed me down...& tried to be concerned with me." What a beautiful way of putting it!

In *Self and Others*, Laing quotes Buber: "In human society, at all its levels, persons confirm one another in a practical way, to some extent or other, in their personal qualities and capacities, and a society may be termed human in the measure to which its members confirm one another.

"The basis of man's life with man is twofold, and it is one—the wish of every man to be confirmed as what he is, even as what he can become, by men; and the innate capacity in man to confirm his fellow-men in this way. That this capacity lies so immeasurably fallow constitutes the real weakness and questionableness of the human race: actual humanity exists only where this capacity unfolds. On the other hand, of course, an empty claim for confirmation, without devotion for being and becoming, again and again mars the truth of the life between man and man.

"Men need, and it is granted to them, to confirm one another in their individual being by means of genuine meetings: but beyond this they need, and it is granted to them, to see the truth, which the soul gains by its struggle, light up to the others, the brothers, in a different way, and even so be confirmed."

Laing elaborates:

Total confirmation of one man by another is an ideal possibility seldom realized. For practical purposes, as Buber states, confirmation is always "to some extent or other." Any human interaction implies some measure of confirmation, at any rate of the physical bodies of the participants, even when one person is shooting another. The slightest sign of recognition from another at least confirms one's presence in *his* world. "No more fiendish punishment could be devised," William James once wrote, "even were such a thing physically possible, than that one should be turned loose in society and remain absolutely unnoticed by all the members thereof."

Thus, we can think of confirmation as partial and varying in manner, as well as global and absolute. One can think of actions and interaction sequences as more or less, and in different ways, *confirmatory* or *disconfirmatory*. Confirmation can vary in intensity

and extensity, quality and quantity. By reacting “lukewarmly,” imperviously, tangentially, and so on, one fails to endorse some aspects of the other, while endorsing other aspects.

Modes of confirmation or disconfirmation vary. Confirmation could be through a responsive smile (visual), a handshake (tactile), an expression of sympathy (auditory). A confirmatory response is *relevant* to the evocative action, it accords recognition to the evocatory act, and accepts its significance for the evoker, if not for the respondent. A confirmatory reaction is a direct response, it is “to the point,” or “on the same wavelength” as the initiatory or evocatory action. A partially confirmatory response need not be in agreement, or gratifying, or satisfying. Rejection can be confirmatory if it is direct, not tangential, and recognizes the evoking action and grants it significance and validity.

Chapter 9 is good. A couple of insights: “The intensification of the being of the agent through self-disclosure, through making patent the latent self, is the meaning of Nietzsche’s ‘will to power.’ It is the ‘weak’ man who, in lieu of potentiating himself genuinely, counterfeits his impotence by dominating and controlling others, by idealizing physical strength or sexual potency, in the restricted sense of the capacity to have erections and to ejaculate.”

“Every human being, whether child or adult, seems to require *significance*, that is, *place in another person’s world*. Adults and children seek ‘position’ in the eyes of others, a position that offers them room to move... Perhaps the greatest solace in religion is the sense that one lives in the Presence of an Other.”

September 21

The Nietzschean, Heideggerian worry that everything will become unbearably light in the modern or postmodern world is only partly right. I used to agree with it, but I see now that was one-sided. In a sense, yes, things are “lighter” now than they were four hundred years ago, which is to say that nihilism has crept up on us behind our backs. Moreover, this is an essential component in the unhappiness of the modern man. But this sort of thing doesn’t last; mankind rebounds, it always has. In the long run, people find a new project to throw themselves into.

Besides, “great men,” the people Nietzsche was concerned with, have always sensed the shadow of nihilism looming over them; they’ve spent their lives trying to escape it. In that respect nothing has changed.

Actually, there is a way to ward off the shadow: simply devote oneself to the betterment of the species. Ultimately what makes people act and feel as if life has no meaning is atomization, or certain kinds of atomization. In an atomized world, then, working against atomization can give you the self-satisfaction you crave. Nihilism is a problem only for people who dwell on it. Just stop thinking about life’s meaninglessness and *do* something! Then it won’t be meaningless anymore. (Well, that’s not strictly true. If you live in a nihilistic society, it’s hard to overcome nihilism in your own life. On one level it’s impossible. On another level, though, it isn’t.)

The world’s “objective truth,” from one perspective, may be meaninglessness, but humans weren’t destined for obsessive intellectualizing. We were destined, we were designed, to *act*—not to worry about individual greatness, i.e. immortality.

I’m tempted to think that there is no “choice,” after all, between socialism and barbarism; rather, there is a single inevitable path, towards socialism. Consider the two options: either global disaster occurs, or it doesn’t. If it doesn’t—if, that is, a nuclear war doesn’t happen and global warming isn’t as catastrophic as everyone fears—then economic and political evolution will lead to relative decentralization combined with international governance. If disaster does occur, the species will undoubtedly survive, along with some forms of advanced technology and scientific knowledge. (Global memory can’t be *wiped out*, after all; much of it will survive.) But capitalist social relations will be in tatters. On their ashes will rise up little socialistic communities because nothing else will be possible: cooperative social structures will be the

foundation of communal subsistence, of efficient allocation of resources—far more efficient than under capitalism. These communities will grow and spread, to what end no one will know. That’s my prediction.

Was supposed to meet Wannu tonight but her friend died. Had a heart attack at the gym. She called me in tears, could barely talk through her tears. Is meeting his parents tonight. So now here I am in front of my computer listening to “Graceland,” thinking about the vicissitudes of fate.

Just as I judge, broadly speaking, the degree of worthlessness of a pop song by the degree to which I can hear “Money!” whispering or screaming through the music, so I consider the spiritual worth of a piece of classical music to be inversely proportional to the music’s expression of boredom and aimlessness. There is no boredom in Beethoven; impressionism, by contrast, is saturated with it. The whole-tone scale is musical boredom, the lack of a *goal* toward which one strives. Anomie, ennui, a musical yawn. Satie’s “Gymnopédie No. 1” is the listlessness of a Sunday afternoon in the middle of summer. In most Debussy you can hear the lassitude of *fin-de-siècle* France. Same with a lot of polytonality, and, in different ways, serialism, neoclassicism, indeterminism *definitely*, and some Mahler and Strauss, and Wagner and even some Brahms and Liszt. The spirit of a society is expressed in its music.

Leslie Paul Thiele’s “Postmodernity and the Routinization of Novelty: Heidegger on Boredom and Technology” (1997). Quite good. Achieves the impossible: makes Heidegger interesting.

Postmodernism is modernism stripped of teleology. It is chiefly characterized by the routinization of novelty...

Deep boredom is not the inevitable by-product of leisure. Hunter-gatherer societies, such as the !Kung San of the Kalahari, devote only a fraction of their time to work, usually less than twenty hours a week. In comparison to agricultural and industrial societies, these hunter-gatherers enjoy all but a few hours each day untouched by the hard labor of making ends meet. Yet boredom among such peoples is seldom demonstrated. Their free time is filled with storytelling and ritual. Deep boredom, it appears, is not the product of idleness per se but of a certain form of idleness. Deep boredom is the product of idleness that has lost its meaning, or rather idleness that has lost its capacity to generate meaning.

...Hamlet is bored, we are led to believe, because he dreads the meaning of a dead father and villainy too close to home. Unable to confront his fears—and the anxieties they harbor—the young Prince becomes psychically and physically immobilized. This is indeed the etiology of deep boredom. It is an emotional and spiritual paralysis that arises from the repression of anxiety or fear. Such boredom remains unalleviated by opportunities for the activity or companionship which may remedy more superficial forms of boredom. The desolation of deep boredom is characterized not simply by unfulfilled desire, but by the unfulfilled desire for desire. Boredom might be described as “psychic anorexia.” Spiritual or emotional nourishment is needed, but the victims of boredom cannot bring themselves to the table. All appetite for life is lost.

Psychic bulimia might be a more apt description of the problem; the bored typically oscillate between psychic torpor and psychic bingeing. Despite its paralyzing power, boredom does not always produce enervated resignation and passivity. As often as not, it produces a fast-paced, systematic exercise of power. Reinhard Kuhn observes that “violent and indiscriminate action is as natural a consequence of ennui as is total inaction.” The profoundly bored often marshal a vast array of forces into service in revenge of their condition. They may craft devious designs to make another pay dearly for their own existential plight. Out of boredom, Fyodor Dostoevsky remarks in his *Notes from Underground*, people are brought to take delight in sticking pins in other people simply to observe the reaction. “Boredom,” he wryly observes, “leads to every possible kind of

ingenuity.” As Baudelaire suggests, boredom may turn the earth into a shambles and swallow the world with a yawn.

Soren Kierkegaard insisted that “Boredom is the root of all evil.”

The problem is not simply that modern peoples are, owing to increased leisure, highly susceptible to bouts of boredom. The problem is that the resources of ages past that were traditionally employed to combat boredom are no longer readily available. Nietzsche wrote that for the “majority of mortals” ascetic practices and ideals have been the “chief weapon” in the struggle against boredom. Indeed, the suppression of boredom was one of the primary reasons for the development of morality and religion. Today, these means of suppression have been drained of much of their power.

Anxiety is the disposition in which thrownness is made self-conscious and experienced most profoundly. Anxiety disallows our everyday turning away from thrownness, maintaining the relation of Being-in as problematic. ...a dread of confronting one’s finitude, one’s ungroundedness... The worldly stage is nervously sensed as not of one’s making or choosing. One finds oneself cast in a role beyond one’s power fully to direct or control. Anxiety is perhaps best described as the state of unease in which one’s “there” is revealed to be not fully one’s own. One feels displaced. The world is disclosed as foreign. Anxiety is the foreboding of homelessness.

...Boredom is, in itself, an anesthetizing mood. It inhibits thought and reduces feeling to torpor. To psychologize its genesis, one might say that the fear of facing one’s ontological condition, the fear of anxiety itself, lures one into the insensibility of boredom. Heidegger describes this repression as a form of cowardice. He writes that “An experience of Being as something ‘other’ than everything that ‘is’ comes to us in anxiety [*Angst*], provided that we do not, from anxiety of anxiety, i.e. in sheer timidity, shut our ears to the soundless voice which attunes us to the horrors of the abyss.” Anxiety and boredom both confront us with the abyss of Being as nothingness. Both anxiety and boredom bring us face to face with the threatening insignificance of the finite self. In anxiety, however, one experiences a profound concern for this terrifying mystery, a concern that may transform itself into wonder if courageously digested. In boredom, the mystery is avoided by a listless or frenzied turning away.

...Rather than confronting and overcoming deep boredom, we choose to ignore, resent, or suppress it. This marks the true victory of nihilism. ...Busy-ness is the chief means by which everyday life evades ontological questioning. The everyday achieves its escape from anxious thought in heightened worldly activity. The “tranquillity” of inauthentic Being “drives one into uninhibited ‘hustle.’” Boredom does not preclude such activity. Indeed, a continuous flurry of activity often becomes boredom’s chief defense against thoughtful anxiety. The engines of convention and coping that propel our everyday busy-ness find a particularly powerful fuel in modern technology. Technology, for Heidegger, does not refer to the development of machines, tools, or skills but to the “enframing” (*Gestell*) of the world under the imperial mandate of efficient exploitation. Deep boredom evidences itself today not so much in Hamlet-like brooding as in this fast-paced enframing of the world.

Thus, the bustle of modern life is mainly an attempted escape from anxiety and boredom. That’s a typically idealist thought, not true but perceptive anyway. The extension of boredom from denoting a feeling to characterizing a way of life, an entire society, is probably valid. Every society does have a *Zeitgeist*, an “objective spirit” evidenced in its social relations, its institutions, the activity of its citizens.

I *feel* bored only sometimes. But my whole life itself is infused with boredom—because I long for transcendence, perfection, but am trapped in a world of which I am the center yet *in* which I am insignificant. That’s the dissonance: I’m the center of *my* world but I mean nothing to *the* world. The knowledge of this is what I’m escaping when I watch TV or go to bars. In the past, by contrast, people were both the center of their world and central to the world. (The sun revolves around the earth, etc.)

We shouldn’t try to *master* boredom, though (says Heidegger); moods cannot be willed away. They exist on a different level than will and intellect:

The attempt to master any mood, in the sense of conquering it, is largely destructive. Moods are not mastered by will and suppression. Instead of suppressing boredom and other moods, Heidegger stipulates, we need to “awaken” to them. We must learn to acknowledge and “wait” through boredom. Boredom is truly overcome only when it is courageously and patiently explored and endured.

Heidegger meets Buddhism. Insight meditation.

The benefit of boredom is the opportunity it allows us to awaken to its nature and understand its threat. What Heidegger said of technology, employing Hölderlin’s words, might well be said of boredom: “Where danger is, grows the saving power also.” If we awaken to the mood of boredom, if we learn how to wait through it, we may rediscover and reaffirm a philosophic path. [“The philosophic mood is a *waitful* disposition.”] Waiting is not a passive state of being. It is an active endeavor, a questioning of our being in time. Waiting is grounded in an opening to this mystery. By waiting through boredom, we rediscover the nature of our temporal worldliness.

The philosopher’s typical overestimation of philosophy. Of all famous philosophers, only Marx avoided that danger. *No one else* did.

“The former Age of Anxiety has given way to the Age of Boredom... Even the death of God has become all too familiar. It can no longer move us.”

Another way of expressing the dissonance that disturbs me is to note the discrepancy between grandeur and smallness. Hegel, Nietzsche, Heidegger thought in grand terms, as did Plato, Spinoza, Kant, and dozens of others. Some of them were more deluded than others (read: Heidegger), but they all strove for epic heroism. “God is dead!”—“I have destroyed metaphysics!”—“I am Spirit’s knowledge of itself!”—“I will be the Philosopher-King, the Divine!”—“Two things fill me with awe: the stars above and the moral law within!” And people have idolized these men. But on the other side...humans are ants. Minuscule, microscopic insects proclaiming their immensity, their immortality. It’s a damned laughable farce. “Few people have dared to climb the mountain of Nietzsche’s thought!” Give me a break. Nietzsche was a man. These people leap unthinkingly into the delusion of transcendence, they live in transcendent denial of the mundane world, Nietzsche most of all. It’s comical.

I guess I’ve harped on this theme before, haven’t I?

Death. Dreadful, horrifying death. “Everything I do, I do it for you.” Death. The ultimate imbalance between man and his world. The reason death is so disturbing is that it signifies a great and necessary lack of confirmation of the self, a lack of recognition of the self’s desires and self-image. Death is the ultimate insult, the ultimate disconfirmation of one’s being. It is the original cause and symptom of man’s not-being-at-home in the world, man’s alienation. Are chimpanzees obscurely aware of death? Then they too are to that extent alienated from their world. There’s no way around it: even the most primitive religions are symptoms of alienation, in large part direct or indirect reactions to the knowledge of death. Think of the Iroquois’s animism, forests in the night being the home of dead spirits that hunt prey and disappear in the day. No society has ever considered death to be wholly unproblematic, perfectly acceptable. It is so disconfirmatory that comfort has always been sought and will always be sought. The unbelievable

conclusion is that nature has implanted in humans *unavoidable alienation*. It can be assuaged through religion, but it exists underneath the lies and gives rise to them.

Death symbolizes the foreignness of the world—the world that created man, this world is nonetheless *foreign* to him! How is that possible?! He is *part of* nature, yet he is not at home in it!

On the other hand, I may be making a big deal out of nothing. People rarely think about death, after all. The pleasure, the immediacy, of being alive shuts out thoughts of death. As I wrote a long time ago, the problem isn't death itself; the problem is *dwelling on* death, a morbid preoccupation that exists only in certain societies. —Yes, that's the answer. Marxism once again.

September 22

If I truly wanted to be happy in every moment of my life, I'd never stop drinking. I'm never happier than when I've been drinking my beloved vodka.

I've been reading about DFW. It's strange to me, but not really, that a genius like him could be stuck permanently in a state of regressive or "recursive" fixation on the objective-spirit-of-the-age's self-conscious self-consciousness, like, I don't know, a dog running frantic self-circles to catch its tail round and round and round a blank space, while an ordinary person like me could have no trouble getting past all that to fix his spirit on what matters in life and history—could, that is, be a serious person and a serious thinker, far more serious than the self-revolving genius stuck in the mud of the culture's narcissism so that he is so muddily self-conscious of his self-conscious self-consciousness that in the end he lets out a cry and places his head in a noose. Wallace's outlook, despite its freewheeling expressions, was parochial, narrow, smothered under the slag-heap of postmodern literature and literary theory, a ton of dross that would crush even the most robust idealist. If Lord Byron suffered, as his wife said, from a classical education, Wallace suffered from a postmodern education, and finally it claimed him. We didn't suffer a great loss with his death.

Self-consciousness:

...Please believe me. The whole reason I'm having us talk about my record and what I get afraid might happen is that I don't *want* it to happen, see? that I don't want suddenly to reverse thrust and begin trying to extricate myself after you've given up so much and moved out here and now I've—now that we're so involved. I'm praying you'll be able to see that my telling you what always happens is a kind of proof that with you I don't *want* it to happen. That I don't *want* to get all testy or hypercritical or pull away and not be around for days at a time or be blatantly unfaithful in a way you're guaranteed to find out about or any of the shitty cowardly ways I've used before to get out of something I'd just spent months of intensive pursuit and effort trying to get the other person to plunge into with me. Does this make any sense? Can you believe that I'm honestly trying to *respect* you by warning you about me, in a way? That I'm trying to be honest instead of dishonest? That I've decided the best way to head off this pattern where you get hurt and feel abandoned and I feel like shit is to try to be honest for once? Even if I should have done it sooner? Even when I admit it's maybe possible that you might even interpret what I'm saying *now* as dishonest, as trying somehow to maybe freak you out enough so that you'll move back out and I can get out of this? Which I don't *think* is what I'm doing, but to be totally honest I can't be a hundred percent sure?...

Or, self-consciousness:

...As mentioned before—and if this were a piece of metafiction, which it's NOT, the exact number of typeset lines between this reference and the prenominate referent would very probably be mentioned, which would be a princely pain in the ass, not to mention cocky,

since it would assume that a straightforward and anti-embellished account of a slow and hot and sleep-deprived and basically clotted and frustrating day in the lives of three kids, none of whom are all that sympathetic, could actually get published, which these days good luck, but in metafiction it would, nay *needs* be mentioned, a required postmodern convention aimed at drawing the poor old reader's emotional attention to the fact that the narrative bought and paid for and now under time-consuming scrutiny is *not* in fact a barely-there window onto a different and truly diverting world, but rather in fact an "artifact," an object, a plain old this-worldly thing, composed of emulsified wood pulp and horizontal chorus-lines of dye, and *conventions*, and is thus in a "deep" sense just an opaque forgery of a transfiguring window, not a real window, a gag, and thus in a deep (but *intentional*, now) sense artificial, which is to say fabricated, false, a fiction, a pretender-to-status, a straw-haired King of Spain—this self-conscious explicitness and deconstructed disclosure supposedly making said metafiction "realer" than a piece of pre-postmodern "Realism" that depends on certain antiquated techniques to create an "illusion" of a windowed access to a "reality" isomorphic with ours but possessed of and yielding up higher truths to which all authentically human persons stand in the relation of applicant—all of which the Resurrection of Realism, the pained product of inglorious minimalist labor in countless obscure graduate writing workshops across the U.S. of A., and called by Field Marshal Lish (who ought to know) the *New Realism*, promises to show to be utter baloney, this metafictional shit...

A colorful regurgitation of the same old postmodernist tripe through the "barely-there window" of a sort of scorn that manages to legitimize the very thing it is scorning by adopting the language and analytical framework of the very thing it is scorning, making the attempt to transcend this hated metafictional shit a failure.

September 23

A note to feminist crazies like Adrienne Rich: having him put himself inside you means that you, so to speak, are *being done to*, that he is *doing to you*. That's it. That's the archetype of the male-female (sexual) relationship. In itself it has nothing to do with oppression and does not legitimize oppression or economic inequality or anything like that. But one of the reasons why male homosexuality strikes people as strange is that the idea of a man *being done to* seems peculiar, unnatural. [...]

Anyway, I've said my piece.

[...]

The desire and expectation of *being done to* is, in indefinitely many forms and 'intensities' throughout history and across societies, common to most women, at least on some deep unconscious level. And yet, being humans, they also want to *do*. They want to be active, not just (relatively) passive. But in the psyche there is no sharp division between active and passive, and neither category ever applies in any sort of purity. Passive and active go together, they're fused in every act and feeling in both men and women, if only because the dialectical influence of the Other entails the interpenetration of passive and active. It's preposterous to say that one sex is active and the other passive, for everything in consciousness and behavior is relative. Nothing is pure or absolute or unmediated. In fact it's extremely difficult to say exactly what 'passive' and 'active' *mean*, although intuitively the matter is somewhat clearer. But "being done to" vs. "doing" is mostly a sexual distinction, and in the larger arena of life both sexes are almost (*almost*) equally active and passive—or so nature intended. I.e., so they *could* be, and so they *should* be, *have* to be, in order for people of both sexes to be happy. But to the extent that sexuality permeates the psyche and animates activities, there is inequality (this low-level "phenomenological" inequality, revealed in behavior) between men and women. Only in so-called civilized societies does such inequality become pathologically extreme and extend to 'other' spheres of life too, so that women may end up being little more than slaves.

The ‘domain’ of sexuality varies among societies. In some, it’s emphasized less than in others (and thus the former usually treat their women more respectfully than the latter). Its importance in the society is reflected in the degree of its conscious psychological importance to the individual. Since in America it dominates culture—due to the possibility of exploiting it for the sake of economic gain—women are seen by their culture as mere sex-objects, i.e. as passive beings. The nature of the capitalist economy is primarily responsible for the way women are treated now.

September 24

Reading a good book called *Twentieth-Century French Philosophy* (1996), written by Eric Matthews. Places it all in perspective, in the broader perspective of the Cartesian tradition. Bergson to the French feminists, e.g. Irigaray and Kristeva. I’ve only just begun the book, but even the Introduction has deepened my understanding of philosophical history.

My distinction between private and public is basically synonymous with Bergson’s distinction between inside and outside, or intuitive and analytical/conceptual. Like Schopenhauer, Bergson views intuition as providing epistemologically privileged access to the interior of things (in particular the self). This division between the self’s “interior” and its “exterior,” however mistakenly Bergson interprets it and whatever false conclusions he deduces from it, is a necessary condition of our existence and cannot be analyzed away, as functionalists and behaviorists believe. The untranscendable division between the mental and the material can be reduced to it.

Marx and Nietzsche contra Cartesianism and Kantianism, the latter’s emphasis on reason’s autonomy from society and psychology, a doctrine that is also implicit in the Cartesian divorce between mind and body. “Transcendental subjectivity,” thus freedom from mechanical determinism in the world. Descartes: Galilean advocate of modern physical science and Augustinian philosopher of subjectivity (cf. Augustine’s remark, “Return to yourself; truth resides in the inner man”). Hence dualism between (the physical) world and self, mechanistic science and freedom. One trend leads to positivism, Comte, Mill, eventually logical empiricism; the other trend leads to Bergson and thence Sartre, Merleau-Ponty, *et al.*—who considered themselves *anti*-Cartesian mainly because, under the influence of Bergson and Heidegger, they rejected the strict dualism between consciousness and body/world. (Also because, unlike Descartes, they weren’t interested in physical science and didn’t have a mechanistic view of the world.) The self is embodied, they insisted. “Being-in-the-world!” Some French thinkers also rejected the Cartesian doctrine of consciousness’s *transparency*, again influenced by Marx, Nietzsche, Freud, structuralism, anthropology. Reason and consciousness are relative to society and culture. Post-structuralism, a thoroughgoing relativism, emerged at the end of this reaction against Cartesian rationalism. –I, like Chomsky, consider facets of this rationalism to be sound, in particular the belief in universal, *a priori* capacities and rules of cognition, rules innate in human biology. Also, universal and partly unconscious *desires*.

Bergson and Schopenhauer: “Intuition is supposed to be the basis of metaphysics because it grasps things from the inside, and therefore *absolutely* (in some sense), rather than from some merely relative point of view.” A view derivable from Cartesianism. Writes Bergson: “Intuition is the kind of *intellectual sympathy* by which one places oneself within an object in order to coincide with what is unique in it and consequently inexpressible.” A silly but influential position. Analytical knowledge consists in classification, in relating objects to other objects, categorizing them, treating them as instances of general kinds. We can have both intuitive and analytical knowledge of the self, but only the latter is expressible in words.

Abstract, “spatialized” time, measurable (like space)—in minutes, seconds, etc.—is different from inner, experienced time, or *durée*. In general, Bergson’s views on time remind me of my own ideas from seven years ago. He even agrees with my former self that the self (consciousness) essentially *is durée* (duration). “Bergson makes no distinction between our inner experience and the duration ‘in’ which that experience occurs: our self *is* duration.” I called duration “the moment,” the immediate moment in which past, present and future blend together.

(For most people, everything they do and think is basically derivative, even if they happen to alight on a thought that no one has had before. The situation is reversed with me: everything I do and think is basically original, even those of my thoughts that happen to have been thought before.)

Multiple layers of personality, of the self, from the most superficial, least personal, purely practical and social, where our thoughts etc. are “closest to being merely general and so communicable to others,” to the deepest (unconscious?), where “thoughts, feelings, perceptions, desires and so on flow into each other in such a way that it is impossible to separate ‘cause’ from ‘effect’ in the way that scientific precision requires.” In fact, within consciousness there is, strictly speaking, no causal determination at all, because, as Hume taught, cause and effect must be distinct existences, and there is no such distinctness or mutual isolation in consciousness. Only matter, it seems, or public events, can be separated in the necessary way, and even matter (post-Newton) is apparently not discrete or particulate in the way that common sense assumes. Public events aren’t either, for that matter, at least not until they’re arbitrarily divided up by thought. There seems to be no strict *causation* in the social world or the individual psyche, nor even on the deepest level of the physical world! Maybe (the framework of) causation is, after all, some sort of mind-produced illusion that doesn’t apply to things in themselves. (Kant didn’t use the word ‘illusion,’ but you know what I mean.)

My actions are not “*caused*” by my thoughts or feelings or character-traits; rather, they “*belong with them* in the total flow of my life-history.” The concept of cause is impersonal, subjectivity-denying.

Interaction between mind and body. Physical perception is at the same time mental interpretation, “impregnated with memory-images.” My perception of a rose is different from your perception of it, even though in some “superficial” sense it’s also the same.

One of the divergences between Schopenhauer and Bergson: the former’s metaphysics conceives reality as Being, in Parmenidean-Platonic-Western fashion; the latter conceives it as Becoming, as Change. Biological evolution analogous to the creative evolution of the individual, with his continuous change, a continuity secured by “memory,” or “the preservation of the past in us.” (Not necessarily conscious recollection.) “The whole universe, to the extent that it is living anyway, can be seen as having ‘duration,’ in Bergson’s sense, rather than existing in objective, reversible, physical time. What it is now incorporates what it has been, but goes beyond it: just as an individual human personality at any stage in its life incorporates but transcends the past... Biological evolution... can be seen as genuinely creative of novelty, new forms which go beyond what has existed in the past and are not simply determined by that past: nature itself is not mechanistically determined but is *free* in much the same sense that humans beings are.” Vitalistic metaphysics: reality is alive, life is inherently purposive, a striving towards some yet-to-be-defined goal. The *élan vital*, the driving force of all living activity. That’s an exciting but unscientifically speculative metaphysics.

Zeno’s paradox of motion!!

Sent Chomsky a follow-up email in which I also asked about his opinions on structuralism. He wrote back:

The distinction you make [between one’s skin and the sensation of pinching one’s skin] is real, but it is not clear why it has anything to do with anything like a “mind-body” problem, since exactly the same problem holds for your skin and any concept we have of body, matter, etc.¹ That’s the impact of Newton’s discoveries. The public-private distinction can

¹ That doesn’t seem right. What if we define matter as “that which has mass and takes up space”? Then skin is matter. Or what if matter is simply “the substance of which physical objects are composed”? Then skin is matter. Or what if matter is “anything that is composed of elementary fermions”? Then skin is matter. Unlike sensations. Besides, Chomsky argues that we *don’t have* a coherent concept of matter, and I agreed with him while saying that the *intuitive* problem remains. Maybe Chomsky would say that Newtonian matter can “act at a distance,” which is contrary to our understanding of the nature of skin. But it’s also contrary to our commonsense understanding of the nature of *matter*.

also be made, but it seems to have no relation to the mind-body problem in any of its formulations. Merely to take an extreme case, the late John Wheeler, one of the great 20th century physicists, argued in a book published by the American Physical Society that the world consists of bits of information, answers to questions we pose. If so, is the world public or private? [Public, obviously. What's your point? Wheeler's theory is bizarre anyway. "Bits of information" are abstract, timeless and spaceless, qualities that appear to have little in common with the world.] The discussion in the paper of Russell bears directly on this.

I wrote about Saussure and structuralism in my monograph *Current Issues in Linguistic Theory*, in 1964 (actually came out in several versions, but these discussions are the same). The signifier-signified distinction is Saussure's version of the standard theory of reference. The problem is the obscurity of the notion "signified"—also discussed a bit in the paper I sent you, and more extensively elsewhere. His (standard) assumption is that there is a word-thing relation, where things are mind-independent entities. That seems false.

The langue-parole distinction is also extremely obscure, and whatever it is supposed to mean, it can hardly be appropriate for the study of language. For example, as he points out, it has no place for the concept "sentence," surely a key notion of the study of language.

Met a 31-year-old Indian, post-doc student doing cancer research, for the second time. She likes me and I like her—as a friend. There's no chemistry. I'm not very attracted to her, that is. Don't know why. She ain't bad-looking—not *great*-looking, but okay. But if she were prettier I would definitely have made a move by now. Am I devaluing her, then? Maybe as a woman, as a sexual being. But not as a person, at least I don't think so. Well, in a way, yes I am, because I don't really desire her desire (i.e., that she desire me). But in a way I'm not, because I like being with her and consider her more intelligent than most people.

I suspect it's better to say that the public-private distinction doesn't refer to two different kinds of things, but to two ways of experiencing the same thing, namely one's body. Whether any of the classic formulations of the mind-body problem invoked 'my' distinction is beside the point; I'm saying that the Cartesian intuition just *is* the intuition of public vs. private. That's damned plausible, considering how Descartes described the bodily and the mental.

Emmanuel Mounier: "The person could be defined as a movement towards a transpersonal condition which reveals itself in the experience of community and of the attainment of values at the same time."

September 25

Despite what John Searle thinks, it's indisputable that consciousness will never be fully understood. We're too *close* to it, as I've always insisted. A clear, distanced perspective is impossible. Is consciousness a "nothingness," as Sartre argued? In a way, yes; in a way, no. Is it free? In a way, yes: every conscious state has the phenomenology of being chosen, i.e. of being *me*, an expression and manifestation of me. But in a way, no: I don't literally choose my conscious states or my feelings; even my actions are not chosen in a vacuum of freedom, for I'm somehow not really capable of acting in certain ways, while other ways are easy and natural for me. The very idea of freedom, of the "will," is incoherent, and certainly impossible to understand. Is the world inside consciousness or outside it? Both. How is consciousness produced by neural

But if skin is matter, then action at a distance applies to it like all other matter. So what's the big deal? (I won't raise the objections in another email because I can tell that Chomsky is one of those guys who will never admit he's wrong, and who probably gets irritated if you keep raising objections.)

processes? Emergence, whatever that means. Am I “responsible” for myself, e.g. for forgetting to do something I was supposed to do? Yes and no. See? We’ll never understand this stuff.

“Value in its original upsurge is not *posited* by the for-itself; it is consubstantial with it—to such a degree that there is no consciousness which is not haunted by *its* value and that human reality in the broad sense includes both the for-itself and value.’ ... Conscious human beings exist in the world as a ‘lack,’ as a negation [or, better: a transcendence] of the situation in which they find themselves. The lack consists in an ‘internal relation’ between the negation and what it negates: that is, a relation which constitutes both the related terms in their being. Thus consciousness is constituted in its being by what it is not.

“What we lack, and so what we are, is precisely *value*: ‘Value is the self insofar as the self haunts the heart of the for-itself as that for which the for-itself *is*.’ We might translate this by saying that, for conscious human beings, what we are is defined not by our factual state but what we ‘are-to-be,’ that is, by what values our lives are directed towards. But these values, Sartre appears to be saying here, are inseparable from what our factual situation happens to be, since they express our negation or transcendence of that particular factual situation. The self which we ‘have to be’ is defined by what is lacking in what we factually are, and vice versa.” This ties into what I’ve been saying in recent entries about one’s “desired self,” which I also touched on in the last chapter (“On life”) of the so-called book I wrote. Your desired self, which includes (your relationship to) the *world* as you desire it, is not completely separate from your self (and the world) as it is. It affects everything you do, the way you act-in-the-world, the way you react to people. You aren’t fully aware of it, but you’re constantly accommodating yourself to the world as it is (with its social norms and so on) in light of the way you unconsciously/half-consciously want it to be.

What do I think of Sartre’s “bad faith”? I have yet to settle accounts with the idea. I sympathize with Sartre’s intuition, but I dislike the moralism from which it is inseparable. To refresh your memory: bad faith consists in a “refusal to come to terms with the ambiguity of the human situation,” or “an illusion by which we seek to conceal from ourselves the uncomfortable ambiguity of our position.” For instance, a woman knows that the man she’s on a date with wants to seduce her, but she wants neither to be regarded as a mere sex-object nor to be respected in a purely, asexually “respectful” way. She deceives herself, therefore, by refusing to acknowledge the sexual character of the man’s behavior and by distinguishing herself from her body: “her hand rests inert between the warm hands of her companion—neither consenting nor resisting—a thing.” She is in bad faith because she’s refusing to make a decision that she can’t avoid making. She must either accept the man’s advances or reject them. Another example: Roquentin’s keeping a diary, by which he “seeks to impose a narrative structure on the random sequence of real events,” is an instance of bad faith, of self-delusion.

But then clearly bad faith is inseparable from the human condition, and in a sense everyone is always guilty of it. For everyone structures his life, narrates it to himself, considers it to have meaning. But how futile and empty is the idea of “good faith” if everyone is always, necessarily, to some degree guilty of bad faith! Besides, we don’t have total control over ourselves, over our consciousness—we don’t have total freedom—because such a notion is meaningless. And we shouldn’t be condemned for something we don’t have control over. On the other hand, we do have *some* control, *some* freedom. There’s the rub: *how much* freedom? How is it possible to have only *some* free will? In certain situations one can rightly be criticized for deluding oneself; in others, one can’t. Where’s the dividing-line? Should the woman be criticized? From one perspective, yes: she’s “leading the man on,” she’s being a little cowardly, weak-willed, vain. (Likes the attention.) From another perspective, no: what’s so bad about postponing her decision? Why is it wrong for her to enjoy the moment? The concept of bad faith is oversimplifying and not very useful.

Existence is far more “ambiguous” than Sartre thought: value-judgments are not so easily justifiable.

“Is it possible to show that values are in some sense subjective without drawing the conclusion that they are therefore entirely arbitrary?” Matthews thinks not, at least not in the framework of *Being and Nothingness*. I showed in my morality paper that the answer is yes. I showed that there is a third way between objectivity and arbitrariness, that it’s possible to *rationaly argue* with someone about values even though there is no objective truth vis-à-vis values. Where Sartre failed, I succeeded.

All things considered, the philosophy of *Being and Nothingness* is confused. It's a strange combination of behaviorism and introspective phenomenology. And there's a host of other problems with it. Like, self-consciousness is supposedly the self, and yet Sartre also argues, contradictorily, that the self is an object (for consciousness) in the world like other objects. (Silly doctrine!)¹ Moreover, if that latter claim is true, consciousness is impersonal—there is no self *in* consciousness—which means that all these analyses of consciousness are analyses not of the self but of a selfless consciousness, so why should we care about them? It isn't *I* who am free; it's *consciousness*.² Another problem: how is it possible to glean a whole existential system from a *nothingness*? Another problem: if the self is nothing(ness), then I am nothing(ness), which means I don't exist. Etc.

Merleau-Ponty. The body-subject. “Body on the subject-side of experience rather than the object-side.” Rejects the Cartesian-Sartrean dualism between consciousness (“nothingness”) and body. Bodies can have a purposive relationship to objects without the self's explicit consciousness of it. (E.g., reflexive actions.) Freudian repression is not the problem it was for Sartre, since M-P doesn't equate subjectivity with consciousness. “Repression is for him a kind of imprisonment in our own past thoughts and desires, made possible by the fact that we are embodied beings, so that those past thoughts and desires can continue to exist in the purposive behavior in which our bodies engage without the participation of our conscious minds.” I like that way of conceptualizing it.

M-P: “Man taken as a concrete being is not a psyche joined to an organism, but the movement to and fro of an existence which at one time allows itself to take corporeal form and at others moves towards personal acts.” Excellent formulation. Non-dualism.

September 26

Structuralism, Saussurean linguistics—language a system of differences that determines and structures our world for us rather than being a transparent reflection of reality (duh), which implies that societies with different languages might then have different realities, so to speak—and already here you can see latent postmodernism. Conscious thought intelligible only against the background of structures of which we are not conscious. “The subject is not something given and transparent [*pace* Descartes] but something constructed in language.” Unconscious linguistic, anthropological, societal structures. Neo-Kantianism in some respects. Matthews considers structuralism a philosophic revolution, but obviously he's wrong: it's only a mildly original continuation and alteration of Kantian rationalism, historical materialism, Nietzsche (the self is not a metaphysical absolute but a construction of language), Heidegger, Merleau-Ponty (“being-in-the-world,” embodied and partially unconscious subjectivity), even Freud (unconscious structures, empirical instead of *a priori* analysis of the self and reason). Merely another step in the “decentering” of the subject from its central position in Descartes. Kant was already decentering it, at least the *empirical* self (as opposed to the transcendental).

One of the reasons I can't help having contempt for relativists like Foucault and Rorty, who in this respect seem no more intelligent than the average politically correct American, is that anti-relativist objections to their theories are brain-numbingly obvious. So either these thinkers are, like the average American adult, stupider than an intelligent eight-year-old, or they have some sort of weird hidden agenda.

If Foucault is giving a generalized critique of general theories [i.e., of theories that purport to be “objectively true,” or true even outside the discursive practices in which they're embedded], then he may be open to a familiar objection to all such attempts, namely, that they are self-defeating. If all attributions of truth and falsity are relative to discursive

¹ Sartre is failing to distinguish between my *idea* of myself and my *active* self, the *acting* I of self-consciousness in every instant. The former is indeed an object in the world...*somewhat* like other objects.

² I seem to recall I made this criticism during my Madison summer.

practices [and so are not valid outside a particular discursive practice], the objection would go, then the truth-claims of Foucault's own thesis will be equally relative to a particular discursive practice. That is, he will not be able to claim that his own thesis is objectively true, or such that it ought to be accepted by any rational being. Foucault could, however, defend himself against such objections by, for example, presenting his enterprise as not so much a general theoretical critique of theories as a piecemeal liberation of his readers from the harmful influence of the belief in the need for general theories to be accepted by any rational being.

But what is meant by "general theory" here? *Every* hypothesis is general, inasmuch as it is put forward as being *true*—not true "relative" to anything, but simply true. Therefore, by writing his painstakingly dense books, Foucault is trying to free his readers from the temptation to take seriously theories such as his. It puts a new twist on Nietzsche's maxim that the best disciple is he who rebels against his master.

Certainly broad, unscientific worldviews like "Enlightenment-humanism" or "Marxism-Leninism" deserve to be dismantled or at least dissected and aren't "objectively true" (partly because they incorporate a system of values). But either the Foucauldian position is obvious in this way or it's unrigorous and ultimately self-refuting.

Freud's famous saying: "Where id (it) was, there Ego (I) shall be." Lacan translates it: "*Here, in the field of dream, you are at home.*" That's actually a thought-stimulating translation. Since reading (most of) *The Interpretation of Dreams* I've had sympathy with the hypothesis that dreams are disguised wish-fulfillments—despite my inability to *believe* that theory—because there is something inexplicably comfortable, home-like, about dreaming, even when dreaming nightmares. As I fall asleep every night I reflect with delight that I'll soon be dreaming. That state of free imaginings is restful, peaceful, an ideal home for the self because it's so unreal. But how is that fact to be understood? It's extremely significant.

Emmanuel Lévinas: "Metaphysics is enacted where the social relation is enacted—in our relations with men. There can be no 'knowledge' of God separated from the relationship with men. The Other is the very locus of metaphysical truth, and is indispensable for my relation with God."

First debate tonight. Obama was brilliant. McCain was awkward and amusing in that uniquely despicable way of his, but he didn't do as badly as I was hoping. By any reasonable standards, Obama "won"—but politics isn't reasonable, and politically it will probably be considered a draw. Even though Obama was far more presidential, sure of himself, knowledgeable, articulate, honest, and came across as a more decent, honorable and open-minded person than that sack of shit McCain, who acted at times like he was still on the campaign trail. Made a hilariously awkward joke at the beginning about his age because that's what he's been monkey-trained to do—and an instant later he remembered where he was (the absence of sycophantic laughter flustered him), coughed and frowned and got serious again.

My main criticism of Obama is that he wasn't aggressive enough. Didn't attack McCain enough. Why didn't he draw attention to McCain's inconsistencies?!

September 27

Alison Assiter's "Althusser and Structuralism" (1984). The whole dominates its elements: the latter are interconnected in the system; their position is determined by the system. Structuralism opposed to atomism. Every system has a structure which is hidden behind phenomena; the latter are merely outward expressions of the former. The task of science is to uncover the hidden structures. This is all very Marxist, of course. Holistic. Structuralism diverges from Marxism in its tendency to have a static approach to facts: synchronic, not diachronic, analysis. But it considers the two approaches to be complementary. Saussure: meaning emerges from the differences between all the words in a language. Holistic theory of meaning. The system predominant over its elements. Levi-Strauss: ceremonies, rites, methods of cooking not discrete entities; get their meaning from the contrastive relations they bear towards each other. "Like phonemes,

kinship terms are elements of meaning; like phonemes, they acquire meaning only if they are integrated into systems.” They are “*of the same type* as linguistic phenomena.” Barthes: food is not just food but also a system of signs which signify. Norms governing cuisine reveal culture. Same with traffic light systems, furniture systems, etc. They all have meaning and structure in a way similar to language. (Semiology: extending the idea of a sign system outside the realm of language. Problematic. Indeed, obviously false in some ways. *Structures* comparable to linguistic structures?!)

Althusser: Spinoza was the first thinker to pose the question of how the elements of a whole can be determined by the structure of the whole. The “whole” he equated with God or nature. It is a substance, which he defines as “that which is in itself and is conceived through itself: in other words, that the conception of which does not need the conception of another thing from which it must be formed.” The paradox, which is unavoidable, of a self-determining, a self-caused, thing. Althusser: “the structure is immanent in its effects, a cause immanent in its effects in the Spinozist sense of the term; *the whole existence of the structure consists in its effects.*” Cf. my paper on the emergence of consciousness, where I discussed all this with more rigor than Althusser did. (Not *enough* rigor, but *more.*)

Structural causation in society—what I’ve insisted on since my paper on methodological individualism—according to which a given society causes itself, so to speak, i.e. determines the nature of particular social relations. (The whole determines the parts, though in an “efficient causation” sense any given part, for instance a political event or the nature of power-relations in a particular firm, comes into existence as a result of a variety of temporally prior events, etc.) This holistic causation isn’t incompatible with Althusser’s “economic determination ‘in the last instance,’” though many commentators have thought it is. The problem, which is insuperable, is in clarifying the interrelations of (1) types of causation and (2) “tokens” of causation, or concrete instances.

The phenomenon of structural causation, or downward causation, whether in the biological cell or in society, tests the limits of human cognition. No wonder atomists accuse holists of “mysticism”!

I asked above about the relations between the various concepts of “the other.” The two most fundamental are self vs. not-self (primary) and male vs. female (secondary). European vs. Asian, or white vs. black, or Christian vs. Muslim, etc., are not nearly as basic to the psyche. They exist only in relatively advanced societies, where different ideologies and cultures meet. Every manifestation of “the other,” though, serves the function of allowing or facilitating some degree of self-definition, self-identity, potentially even self-confirmation (which is at the same time confirmation by the other), which is what the self desires.¹ Self-confirmation requires neither that one *invent* an other, such as Asian or black or Muslim,² nor, if an other has been invented, that one *denigrate* the other. The mere presence of this (“tertiary”) other, once it has been invented, facilitates the task of self-definition in an ambiguous world and thus a kind of self-contentment—although undoubtedly the *denigration* of the other provides *greater* self-esteem, in that it confirms the (relative) worth of the self. In an archaic and simple society, to invent and denigrate an other may be superfluous because the social conflicts don’t exist that give rise to the self’s desire to be *better* than other selves, i.e. to confirm its value not through *community* and *solidarity* but through *competition*, through proving itself better than the other (be it primary (everyone), secondary (e.g. women), or tertiary (e.g. blacks)). But in a complex and divisive society, inventing and denigrating a tertiary other may be of great psychological value for the individual, not to mention its benefit for the *society* (especially the *elite*) by helping to unite its citizens against a perceived enemy for whom they have contempt or hatred.

The invention of a tertiary other satisfies the self in other ways too. In particular, the very ‘coming-together’ of members of the same society that it may lead to signifies a palpable confirmation of the self’s value by the primary other (viz., in effect, all the men and women who are ‘like’ it).

¹ Laing’s word ‘confirmation’ may be better than Hegel’s ‘recognition,’ in that it has a clearer meaning. It clearly implies activity in the world and the participation of the other in the self.

² Cro-Magnon man recognized himself, his world, probably more fully than we do ourselves, even though presumably the only others for his consciousness were self vs. not-self and male vs. female. There was no ‘tertiary’ other, as it were, no ‘cultural’ other. Presumably.

What could be more boring than reading my own writings? I revisit entries or papers only if compelled to for some reason. Why do I find it boring? It's hard to say for sure. I'd rather be reading things by someone else. It's more intellectually interesting because it introduces me to new ideas. And it allows me to indulge in my anal love of accumulating ideas, hoarding them in my journal. I have this perverted obsession with reading and writing, writing about my reading, writing down the titles of most of the books I read, like if I don't write them down it won't count and I won't have accomplished anything, won't have hoarded experiences by crystallizing them in words. Rereading myself doesn't give me an excuse to note that I've read something new, nor an opportunity to hoard my impressions of new ideas. Another strange thing: when I read a paper or a book I want to read the *whole thing*, a desire that can be hard to overcome (though I often do succeed in overcoming it). It isn't rational, it's stronger than that. Sometimes, if it's a bad book, I'll skim through a lot of pages just so I can say (to myself) that I read it from first page to last. And then I write down the title in my journal and proceed to the next book. Sometimes I'll even feel uncomfortable reading something unless I first write it down.

The connection between money and feces. "Filthy rich; stinking rich; filthy lucre; rolling in it; he has money up the ass; a shitpot full of money; looking for a 'pot' of gold; putting money in the pot (in poker); shooting craps; the investor was cleaned out..." Association between feces and the devil. Sulphurous smell, etc. I should reread *Life Against Death*. Feces is precious for the small child, a treasure because it's mysteriously made by his own bodily functions and defecation is pleasurable. Sometimes the child thinks he or she is giving birth, like his mother. During toilet-training, his parents' contradictory attitude toward his feces—praising him ecstatically when he defecates into his little pot but insisting that poop is bad, foul-smelling, dirty—can confuse him. He may want to hoard it, hide it from his parents so they can't take it away because it's *his*. Depending on his experiences during this phase of life he may retain his acquisitive attitude but transfer it to money. The leap isn't great, after all: the child can see that money is precious to people, that they treasure it and store it away like feces. So he may end up becoming a miser, and in general having a miserly attitude with respect to many things in his life (for example, his possessions, his lovers—maybe he'll be jealous, he'll treat them like *acquisitions* that are *his alone*—his friends, even his feelings).

September 28

In a little over one month, Sarah Palin is going to do a greater service for this country than John McCain ever has: she's going to get Obama elected. I love you, Sarah!

Eugene Victor Wolfenstein's "Mr. Moneybags Meets the Rat Man: Marx and Freud on the Meaning of Money" (1993). Here's the tension: "I am a discrete, self-contained individual, who finds in any other individual a limitation upon and negation of selfhood and freedom; [but] I am a self in the same sense and only insofar as the Other is also a self, only insofar as we partake and recognize ourselves as partaking of the 'universal essence common to all men.'" That sentence sums it up.

Clark Butler's "Hegel and Freud: A Comparison" (1976). Fascinating paper. What I (think I) am for you, I am for myself. Because you are in me, you are part of me. You instantiate the ("generalized") other in me, to a greater or a lesser degree. To say it differently: "As G. H. Mead has insisted, one necessarily identifies with whomever one communicates [with], and in so identifying one reverts to identification with oneself because the other with whom one identifies is conscious of oneself."

Dreaming is reverting to the prenatal state. Sort of. No subject-object, no true self-consciousness. That explains its pleasure, the pleasure of sleep and dreaming.

I've never been happier, my friend. I feel like I'm at the peak of my intellectual and interpersonal powers! No self-mutilating desire to write poetry, barely any desire to write fiction! And I'm so *free*!

The "self-confident" person is he who doesn't automatically identify with whomever he happens to be talking to. He is more independent than that. In the past, no doubt, he has been prone to identifying

with others, since during childhood and adolescence everyone is relatively “sensitive” or “insecure” in this way, relatively prone to identifying with people. At that stage of life one’s sense of self is still undeveloped, still in need of confirmation. But the self-confident adult has, in the past, been fortunate enough to live in the company of people who value him, who confirm his value, such that he has internalized the other’s confirmation of him and no longer has such a need to be concretely “confirmed” or recognized.

This universal need to be valued—I still don’t have a clear understanding of its unconscious origins. Its essential relation to self-consciousness. The latter and the former must not be two separate principles, they must be internally related, in fact merely analytically distinguishable expressions of the same desire or tendency. Hegel and his commentators interpret self-consciousness as precisely the desire for desire, the desire to be valued, but that doesn’t seem right. Surely a being is conceivable that is aware of itself but has no (“insecure”) desire for approval from the other. On the other hand, I can’t escape the feeling that in having these doubts I’m overlooking something obvious.

Example of the many, *many* parallels between Freud and Hegel: “They both hold that the crucial drama of human history is one of unsuccessful rebellion against social authority, followed by confessions of guilt and freely consented introjection of the once rejected authority. They both take the ‘dialectic of revolution and restoration’ to be the essential key to an understanding of history and the human society.”

Useful:

One thing which the dialectical method never sufficiently explains is why a dialectic gets started in the first place... Why is there a dialectic at all? *A dialectic begins*, we know, *with acts of abstraction and reification*. [My italics.] But why does an individual abstract, and why does he abstract one aspect of reality rather than another? As to the first question, Hegel can only reply that man is essentially a thinker, and that thinking essentially entails abstraction. And as for the second question, Hegel indicates that the initial aspect which is abstracted at the dialectic’s onset is chosen because of its simple, unmediated character. But although this answer may explain why a particular abstractive act is dialectically first, it does not always answer the question as to why such an act is temporally or empirically first. We know that the temporal, empirical order does not always follow the dialectical logical order. For example, nature religion, the worship of natural things and forces, seems to precede in time the religion of indeterminate Parmenidean being (e.g., Brahmanism, Sankara), although the category of being dialectically precedes that of the thing of perception... [What follows is a discussion of Freud’s potential for illuminating Hegel’s dialectic.]

I would say that on the level of ideology and consciousness, dialectical development is a response to—and on the level of being or behavior, it *is*—the conflict-ridden, “dialectical” development of productive forces and relations of production, which antagonistically fragments and progressively reifies communities. It has this effect because (1) individuals are committed to their material interests—they do what they have to do to survive and prosper—and (2) as technologies and economic techniques evolve, an economic surplus and a division of labor develop, which (3) gives rise to a divergence in material interests between people and therefore, in light of (1), causes conflict between people. The further the economy develops, the more economic and social antagonisms arise. But I don’t know how to explain the dialectical form of the development (*viz.*, affirmation, negation, negation of the negation). It’s worth noting that, in its strict triadic structure, the dialectic is a simplification and is by no means always present.

September 29

Suspense, suspense with this election. I’m *suspended*. America is *suspended* with this election and this financial crisis going on. It’s a movie, a simple-minded Hollywood drama of good against evil, against cartoonishly evil villains. It’s gotten to the point that the main reason I am *passionate* for the Democrats is

not my compassion for mankind but my *hate* for Republican operatives. It's a corrosive hate; I turn away from the news even as I scour the internet for it because if McCain is elected with his sidekick Palin my brain will rust from the corrosive hate. George Bush is at least only a moron, a self-parody who means well; McCain is... deranged. He's a black hole of soullessness. I'm reading about John Brown—David Reynolds' *John Brown, Abolitionist: The Man Who Killed Slavery, Sparked the Civil War, and Seeded Civil Rights*—an excellent, massive book that rehabilitates Brown from the propaganda that he was insane, a fanatic—and there's no question in my mind that violence can be justified, nor that McCain must be killed if the race becomes close.¹ [Hm, I'm not so sure about that... I guess I was in a certain mood when I wrote this.] To raise moral quibbles about something like that is so preposterous as to be virtually a "category mistake." It doesn't even make sense! In this case, the logical positivists are right that moral judgments are senseless: there is only the human imperative to do what must be done. No more arguments, no more debates, no more back-and-forth accusations of blame, finger-pointing, finessing the masses, cock-teasing democracy; direct action is what's called for. Brownian motion is called for in times like this.

Oh the hypocrisy of condemning people like John Brown and accepting "righteous wars" or praising them! The nonsense morality! Disinterestedness, inaction, is infinitely more morally repugnant in extreme cases than violence is. The disinterested reasoning and distant action of a McNamara or a George Bush or every State in history offends the moral sense infinitely more than immediate and violent insurrection against oppression does. The latter is *human*, the former is not. (Bureaucratized violence—impersonal violence—totalitarianism, superfluity of the individual.) The Terror of the French Revolution? What about the thousand-fold terror of the *ancien régime*, the million-fold terror of the American government? But no, *John Brown* was a *fanatic* and a *terrorist*!

The \$700 billion bailout didn't pass the House. Bummer.

Nothing could fill me with more glee than the existential crises of Wall Street tycoons. For decades deregulation has been ruining the common man; now that it's boomeranged on the elite, everyone suddenly cares. You know that famous image of jolly old Saint Nick "Ho-ho-ho!"-ing with his jolly fat hands on his big belly shaking with glee? That's me.

John Brown, hero. R. W. Emerson: "John Brown will make the gallows as glorious as the cross." Did you know he had wild support amongst Northern intellectuals and Northern soldiers during the war? Alfred Kazin said the war wouldn't have happened without him. (Probably false. But he definitely hastened the war.) Brown knew that only violence could end slavery.

In asking myself how it's possible that so many people used to support slavery even on *moral* grounds, as having a "civilizing" influence on blacks, I'm led to the conclusion that nothing is easier for humans than to invent and believe in ideologies which justify activities that bring material benefit and social recognition to the people who believe in these ideologies. Arguments can always be thought of for both sides of an issue, even moral arguments. Most of the time you're going to subscribe to philosophies and values that permit you to confirm yourself in the way you're accustomed to, because your most *fundamental* values are material comfort and social recognition. Whatever values are consistent with these deepest values are probably the ones you'll subscribe to. It's not just intellectual laziness, either. It's also the fact that the way you live structures your perception of the world, even determines the *data* that enter your consciousness. Living amidst a certain class of people in certain physical and economic conditions, not being exposed to other conditions, will naturally lead to your adoption of the views of this social group. You'll see certain things happening and not other things; you'll encounter certain types of behavior and not others, which may well cause you to make unsound generalizations about human behavior or the behavior of particular ethnicities. Your "social being" may end up distorting or suppressing your *innate human* commitment to kindness, fairness, compassion, solidarity. Other people, due largely to their different social conditions, may more nearly approach a realization of these human values than you; they may have a clearer

¹ At this point, a McCain election seems almost impossible. But it's dangerous to underestimate the stupidity of Americans. They change their minds every week, depending on the images in the media.

understanding of the nature of society's present configuration and of its (in)compatibility with human values. Some types of social being are relatively conducive to prejudice; other types are relatively conducive to rationality (practical and theoretical).

(Founding morality on rationality, the ancient philosophical project. It can be done. I have done it. Moral rationalism need not entail moral realism. *Consistency*, consistency with fundamental values. Consistency itself is more consistent than inconsistency is with the universal desire for truth and understanding; that's why it, or rationality, is valuable, "*rationally*" valuable.¹ Other values, such as not enslaving black people, can be rationally, i.e. non-arbitrarily, argued for by deducing them from values to which one's 'opponent' is, perhaps unconsciously, committed. On some level, as I said, everyone unconsciously values compassion, love, brotherhood, recognition—because such things are what make humans most happy—and so to the extent that one's behavior conflicts with these values, one is being inconsistent or irrational, and is blocking one's own happiness.

(There's often an element of ambiguity, though, and no one even approaches complete rationality, whatever that would look like.)

Primary, secondary, tertiary other not clearly separated in the psyche. Mere analytical distinctions. Each is involved in the others.

Parents in America not a true other. Being with them not so fun because no need to impress them. Their opinion doesn't matter much; they're part of you—no real *otherness* in your relationship with them—so the possibility of their 'devaluing' or 'disconfirming' you is almost as unlikely and unreal as the possibility of your devaluing yourself. In order to confirm your self you don't try to impress only yourself and no one else; you orient your efforts toward the other. You're witty and confident for the benefit of the other; you *perform* for the benefit of the other. Not for yourself, and not for your parents. –To be sure, there's *some* otherness in your relationship with them. Only not very much. Especially if they support you and esteem you as you esteem yourself—and especially if they respect you more than you respect them, or if they're not intellectually stimulating or very impressive, etc. The more impressive you consider them, the more you'll seek their approval. So the pleasure you get from their company depends on more than one factor, not surprisingly. And yet the factors are connected. The "level" or "degree" of a person's otherness depends in large part on the extent to which he instantiates certain values you've internalized, in particular self-confidence, intellectual ability, "charisma," perhaps physical beauty. It depends, that is, on how "impressive" he is. But, *ceteris paribus*, if your parents are as impressive, or have as compelling a presence, as a friend of yours does, you'll prefer spending time with your friend to spending it with your parents, because, as I said, in a way they're not as "phenomenologically" separated from you as your friend is.

Incidentally, animals act on the foundation of otherness too. They are in some obscure, unconscious way aware of it. Even cats, dogs, even reptiles—but in that case it's entirely physiological. Reptiles have only the most rudimentary, *physiological* kind of consciousness, which is just to say that they have essentially *no* awareness of an other.

September 30

In my thoughts yesterday on morality I forgot to mention *intelligence*. Intelligence—interpersonal and logical—cooperates with rationality to provide a so-called objective foundation for particular values and particular courses of action in given situations. *Open-mindedness* is virtually synonymous with intelligence. "A closed-minded but intelligent person" is practically, though not *quite*, an oxymoron.

¹ Yes: though it sounds odd, it's rational to value rationality, because you *necessarily* value it even if you think you don't. In other words, by *explicitly* valuing it and adhering to it, you're being consistent with yourself, i.e. (practically) rational. I've said before that rational norms are the only self-justifying norms; I should note that rationality is the only self-justifying *value*, too. The only non-arbitrary way to justify other values is to show that they are deducible from values to which you are particularly committed—that is, to justify them through *reason, logic*.

(Antonin Scalia is as closed-minded as they come but he's certainly intelligent in some ways. I'd say he's theoretically irrational—draws fallacious conclusions—and “abstractly-empathically” unintelligent. If you want, you can call the former a kind of unintelligence too.)

I have to make a presentation on John Brown, so I'll take notes on the book here.

Reynolds' book is “cultural history.” The cultural biographer asks three questions: how does his subject reflect his era, how does he transcend it, and how did he impact it. Brown was not insane; he was an amalgam of social currents. Sheds light on the legacy of Puritanism, the social impact of Transcendentalism, the significance of slave revolts, the popular culture of the time (its reactions to him), the causes of the Civil War. Reynolds wants to show *how* and *why* Brown was unique among Abolitionists in his espousal of violence—how, that is, he “transcended” his time. Regarding his *impact*: first of all, Brown didn't *end* slavery but he *killed* it. After Harpers Ferry (in 1859) it was doomed. Likewise, didn't cause the Civil War but sparked it. Contributed to Lincoln's election because after Harpers Ferry the Republicans had to choose a moderate candidate over controversial ones. Had a *cultural* impact, though, mainly because the Transcendentalists Emerson and Thoreau took up his cause. Union soldiers sang a song called “John Brown's Body,” to the tune of which Julia Ward Howe wrote “The Battle Hymn of the Republic”—a song that aptly fuses the two themes that sum up Brown, namely antislavery and religious devotion. Was a Calvinist, a fervid Puritan in the old Cromwellian way. “The last Puritan.” But fused his Puritanism with democratic egalitarianism, a concern for social rights. Anticipated civil rights goals of the mid-20th century.

(Illuminating political cartoon on p. 15.)

In the South, “New England Puritanism” was considered a major cause of the war because it was linked with reform. Why? Because of its heritage of antinomianism—the breaking of human law in the name of God. Militant Abolitionism, Transcendentalist self-reliance (cf. Thoreau's civil disobedience), the “individual sovereignty” of anarchists and free-love activists. “Northern Calvinistic *insubordinatism* vs. Southern Episcopal *subordinatism*.” Brown was descended from Puritans and his father was an Abolitionist. “I believe in the Golden Rule,” he said, “and the Declaration of Independence. I think that both mean the same thing.” Uniquely combined Calvinism and a republican belief in human rights. Believed in predestination, of course: thought he was predestined from all eternity to free the slaves.

William Lloyd Garrison (pacifist) vs. John Brown. Slave revolts horrified the former, inspired the latter. Five or six major slave revolts before Harpers Ferry. Brown admired Nat Turner and Cinque above all. (*Amistad*, 1837.) Why did he accept insurrectionary violence when other whites didn't? Because he was thoroughly open to the black experience. Least racist white American. Lived with blacks in rough conditions on the frontier, played with them as a child, tried to educate them, fought with them against whites, studied the history of guerilla uprisings, hid fugitive slaves. Once went into a church and was stunned to see black people sitting at the back, out of sight of the minister and choir. Furious, he escorted them to his own preferred pew—while reminding the congregation that God “was no respecter of persons”—and then he and his family sat in the seats vacated by the blacks. In the mid-1830s, proslavery forces turned violent; this brought out the militancy in Brown. Particularly when Elijah Lovejoy, an antislavery editor, was killed in 1837. This event pushed other Abolitionists away from violence; it pushed Brown towards it. He asked his sons to make common cause with him against slavery.

In the '50s there were other violent white Abolitionists sympathetic to violence, for instance the anarchist Lysander Spooner, but Brown was the most determined and ambitious. Discussed his plans with Frederick Douglass to invade the South with 25 men, free slaves and establish a colony in the Appalachian mountains which would be their home-base for successive mini-invasions, each one freeing more slaves. The South would be terrorized as during slave revolts in the past; the whites' control over blacks would become insecure. “Twenty men in the Alleghenies could break slavery to pieces in two years.” His plan wasn't as unrealistic as you might think: it had many precedents in the New World. (Toussaint L'Ouverture, the Second Seminole War of the late '30s, etc.) He set his sights on Harpers Ferry in the early '50s because it was a symbol of government and had an arsenal that produced most of the weapons of the armed services.

John Brown, beloved by Malcolm X, was an exemplary man. Supported feminism (suffrage), even split the household duties between males and females; was tolerant, respectful, friendly towards people of

all religions (or no religion), classes and races; gave to the poor even when he was in dire financial straits (i.e., most of his life); and he started a little community in North Elba, New York where blacks and whites lived and worked together on equal terms. It was also a stop on the Underground Railroad. But in the mid-1850s he went to Kansas with his sons because proslavery forces were gathering there and he worried that it would become a slave state, which might have a domino effect on Nebraska and other territories. It was in Kansas that Pottawatomie happened.

There was a lot of proslavery violence in Kansas, “border ruffians” stuffing ballot boxes with proslavery votes and assaulting Free State men (who were not Abolitionists but wanted Kansas to be free of slaves, indeed all blacks). Anarchy. In 1855, 1200 proslavery men gathered to attack Lawrence, a Free State town, thus starting the “Wakarusa War.” John Brown and his sons arrived to defend the town, but the tension was defused at the last instant and the battle was called off. But the next year they did attack Lawrence, burned it, destroyed it. Brown decided it was time to retaliate, especially since Senator Charles Sumner had just been brutally beaten in the halls of Congress by a Southerner, and President Franklin Pierce had a proslavery attitude, and Kansas was steeped in proslavery terror, etc. etc. So Brown gathered some men and went to Pottawatomie in the middle of the night. Their weapons were swords rather than guns because Brown wanted to kill in the way that Indians or blacks would have. Wanted the attack to be symbolic of race. The men went to houses of known proslavery men, knocked on the door, then escorted the man or men who answered to the forest, where they were killed. There were five victims that night. The murders had a minimal impact on the political situation in Kansas, but around the nation their impact was huge. They initiated the Southerners’ misreading of the North as aggressively Abolitionist, thus aggravating tensions between the North and the South and, in the long run, pushing the nation towards civil war. Whereas slavery’s defenders had previously considered Abolitionists to be laughable cowards, now they were *afraid* of these “ferocious criminals.” Many Northerners came to see Brown as a hero, a legend, especially since he resisted capture in the months after Pottawatomie. It was in those months, too, that he won the battle of Black Jack and fought the battle of Osawatimie, where he was heavily outnumbered but inflicted heavy losses.

“Take more care to end life well than to live long.” Brown’s characteristic pithiness.

Went east to raise funds and buy weapons—met major intellectuals, antislavery businessmen—then went back west to plan the attack on Harpers Ferry and recruit men. Stayed at F. Douglass’s house for three weeks and wrote a Provisional Constitution for post-slavery America, in which there would be complete social equality for all races and sexes. Then he went to Canada and organized a convention attended by thirty-four blacks and twelve whites; he told them his plans and tried to recruit men, and they discussed and voted on his constitution.

In the following months, more action and heroism. Freed eleven slaves and took them 1000 miles to Canada, won small battles, eluded capture, raised funds for Harpers Ferry.

October 1, 3

Women are like a magic lamp in which a genie sleeps: you rub them and all of a sudden the spirit of their sexuality awakens to grant your every wish.

Reading an 18th-century American novel called *The Coquette*, by Hannah Foster. Epistolary novel like so many of the time; it’s a true story about a woman who was seduced by “a libertine of vicious character,” a “rake,” like so many women of the time, only *this* one died giving birth to his still-born, illegitimate child.

The problem with modern society is that it gives women every opportunity to indulge their romantic whims. That’s unhealthy for everyone. Alexander Pope was not off the mark when he opined, “Every woman is, at heart, a rake,” a thought that has been modernized in the song “Girls Just Want to Have Fun.” Giving women free rein to pursue their crushes, their lusts, their momentary desires, their fetish of the wealthy or the charming libertine, has led to the ruin of millions of them. Freedom is a dangerous thing;

some people apparently can't handle it. A culture of arranged marriage (at least if the two future spouses have *some* say in the matter) is in some ways preferable to a culture of love. Love is moody, after all; feelings are fleeting, and they lead many women astray. *Respect* is a surer foundation for marriage than love. Unfortunately, among all the suitors of a pretty woman, it is often the least respectable with whom she falls in love.

Transcendentalism was essentially a manly, a virile form of Romanticism. It infused Romanticism with the air of autumn in Concord, when every breath you take of the brisk air is a draft of strong color from the leaves. Romanticism was the decadence of the Old World, the stupor of the senses and feeling; Transcendentalism was the self-confidence of a New World flexing its mind.

October 6, 7

Reading papers on John Brown and the pre-Civil War era in preparation for an essay I have to write.

Transcendentalism and Puritanism. Connection? Transcendence. Thoreau: Brown was “a Transcendentalist above all—a man of ideas and principles.” Puritanism. Secular Puritanism. Puritanism and Hannah Arendt’s “revolutionary tradition,” with its “lost treasure” of spontaneous, grassroots democratic upsurges. Connection? Maybe not direct. Two manifestations of modern individualism; not-incompatible reactions to the emerging capitalist order. In fact, mutually reinforcing: anti-authoritarian. Freedom—though Calvinism may be a more individualistic kind of freedom than radical democracy is.

Paper topic: locate Brown in the tradition of revolution, from the English Civil War to the 20th-century Hungarian Revolution. (Hannah Arendt. Chatham etc. = grassroots democracy.) Not a fringe figure, not a freak; his Provisional Constitution, antislavery convention, interracial community of North Elba, League of Gileadites and so on were central expressions of the revolutionary spirit that hung over three centuries and more (ending in 1968). Came close to espousing communist ideals. Tie him, with his *thoroughgoing Puritanism*, to the Levellers... “The last Puritan.”

Popularity of “John Brown’s Body” among soldiers. “The song was largely a framework for improvisation of lyrics by soldiers on long marches. These ‘verbal riffs,’ [Reynolds] suggests, appropriately paralleled the centrality of improvisation in such African-American music forms as slave spirituals, blues, and jazz (p. 468). The song thus unites Reynolds’s dual focus on Brown as an embodiment of Transcendentalism and a representative of white receptiveness to black culture. The shared value of improvisation, moreover, is particularly significant in the typical performance context of the song, the Union army arrayed in rank and file... The troops did not show quite the same affection for ‘The Battle Hymn of the Republic,’ a far more conventionally Christian anthem that, as Franny Nudelman has recently noted, turned away from the immortal individualism that John Brown symbolized. Like the supporters of slavery, Union ideology found it impossible to keep Brown’s name and fame out of the war.” Individualism and, perhaps, proto-democracy in the military, sort of like in Cromwell’s military of the 1640s. Sort of. White receptiveness to black culture: revolutionary. Yet another expression of the revolutionary spirit. Popular culture of the time, some of it black-inspired, radically democratic. Walt Whitman. John Brown a product of this, not a fanatic or a freak. In some ways the epitome of his age, in some ways a remarkable throwback—because *a man*, endowed with courageous convictions and the courage of those convictions.

Intelligent confident Lucy in my History class, kissable, debatable, spendmylifewithable. I could love her and respect her more than myself. But she has a boyfriend. Curses, she makes my heart ache which is why I have to write about her, I have to talk to someone—you—about her.

October 9, 10

Even movies that are supposed to be “real,” “cool,” “realistic,” like *High Fidelity*, have little in common with reality. It’s something about the nature of movies, even unglamorous ones: they glamorize life. They make it seem better and more exciting than it is, even if they explicitly set out to show its gloomy, grimy side. They make you think you’re missing out on life. After watching *High Fidelity* right now I feel depleted and estranged from everything, because life just isn’t that *special*. That glossy film with the cinematic sheen on it that Hollywood uses, that special kind of film or those special kinds of cameras that make everything look so much more glamorous than homemade videos—it estranges the viewer from his own decidedly unglamorous life. And women and men...women and men aren’t the way they are in movies, nor is sex movie-sex (even if the moves are the same). And seeing how irrational real life is makes you hate it; the idiocy and randomness of who gets whom or who’s attracted to whom, based as it is on moods, circumstances, lighting, clothing, timing, drinking... And especially not having anything in common with people, not liking their kinds of music or fashion or TV shows or sports or dancing. Being full of love but empty of affection—yes—it’s hard to bear.

All in all, the worst people in the world are in show business and politics. And business, of course. The three areas that are central to the modern world are magnets for the worst people, who have metallic, magnet-pulled souls. Souls of *nickel*, but with no resistance to corrosion.¹

Two kinds of happiness: abstract and concrete. Intellectual, mediated, vs. ‘immediately’ interpersonal. The latter more powerful because more immediate. The latter also more of a force for good, more compassion-based, love-based. Concretely I’m made happy by being with happy people or by helping people; I never get pleasure from the suffering of a person who is directly present. But the suffering of a person who is *not* directly present—or, rather, my *knowledge* of such suffering—can give me pleasure, *abstract* pleasure. I get less pleasure from the *knowledge* that others are happy than from the knowledge that they’re in pain (of some sort—not physical). Thus, my abstract, intellectual side is more cruel than my concrete, ‘emotional’ or ‘directly interpersonal’ side. (Cf. Montaigne’s observation that his reason is more depraved than his instincts. Profoundly true, a *human* truth.) The knowledge, for example, that Edmund Ruffin, the rabid proslavery fire-eater who fanned the flames of Southern secession, killed himself right after Lee surrendered at Appomatox delights me. The thought of that nasty old man living to see all his dreams of a slave-holding nation shattered warms my intellectual heart. But to think of the happiness and success of certain Wesleyan alumnae has quite the opposite effect on me; and even the knowledge of my friends’ happiness, or even of happiness that *I have caused*, pleases me but little. The “pleasure” it gives me, in fact, is so thin that to call it “pleasure” is well-nigh misleading. This explains how it’s possible that even the greatest benefactors of the human race have often been miserably unhappy, despite their knowledge of having benefited millions of people. Such people are commonly fueled more by their desire to *overcome the (hostile) other* than to *help the (“meek”) other*—because their fuel is, in large part, necessarily *intellectual* or *abstract*, and intellectual pleasure is more often malicious than sympathetic. [That’s very debatable.] It comes from the assertion of oneself over the oppositional other in one’s mind, the internalized enemy which, because it has been internalized, engenders a conflict in the self, a kind of intellectual displeasure. When you vanquish this enemy you restore a degree of self-unity, of self-confirmation, of self-recognition (which entails recognition in the world, i.e. the vanquishing of your enemy in the world. Your enemy in the world is the meaning of the internalized enemy in your mind which is causing your unrest; it *is* the enemy in your mind, at least as far as *you’re* concerned). The enemy, the “hostile other,” in question can be something like fundamentalist Christians, proslavery Southerners, a particular person, Wall Street, etc. The Other can take indefinitely many forms, some hostile (i.e., set in opposition to your sense of self), some friendly, some neutral.

When I read that Obama is surging ahead in the polls, what explains my happiness at the news? Does it arise from pure “sympathy” with him and his supporters, or from the impression that my ideals and

¹ [I remember that when I wrote that sentence I was pleased with the play on the word ‘nickel,’ which is both an anti-corrosive metal and an almost-worthless unit of money.]

desires (for the world and for myself) are being realized at the expense of those belonging to the hostile other (the Republicans, etc.)? Obviously the second. My happiness at his success is inseparable from my happiness at the downfall of my “enemy” (or enemies). It is at the same time sympathetic and malicious; but without the maliciousness, the sympathetic wouldn’t exist. This is true of intellectual, abstract pleasure in general: it is highly mediated, highly ambiguous and ambivalent. Directly, concretely interpersonal pleasure is less mediated, less ambiguous, more “pure” and “good” and “compassionate” or “sympathetic.” (Sadists and such, to the degree that they’re sadistic, are exceptions, which is to say that they’re unnatural. They can be common only in unnatural societies.)

This is all tied in with reification, in obvious ways. Indeed, in its abstract or intellectual forms, the Other itself is a reification and is made possible by a correspondingly reified social structure.

I just heard that a legislative panel found that Palin had abused her authority in firing a state official. More fantastic news. The pleasure it gave me was identical to my pleasure at having read recently that Obama is 11 points ahead in the polls, and that Connecticut’s Supreme Court overturned a ban on same-sex marriage.

H. D. Thoreau, who idolized John Brown, said that people who regarded Brown as a criminal or who didn’t recognize his wisdom and nobleness “either have much flesh, or much office, or much coarseness of some kind. They are not ethereal natures in any sense. The dark qualities predominate in them.” Metaphorical language but insightful. He’s right. On such matters one can’t help speaking metaphorically because literal concepts like ‘reasonable’ or ‘moral’ or ‘intelligent’ are not full-blooded enough. They’re thin, un-descriptive. Such people, anti-Brownians, are, on the whole, indeed coarse and unethereal, unspiritual, un-lucid, with dark flesh-imprisoned minds fixated (be)nightedly on themselves, closed to new impressions of whatever sort, locked in the past. Thoreau even called these people “decidedly pachydermatous.” After Brown’s hanging, Thoreau wrote that “he has not laid aside the sword of the spirit, for he is pure spirit himself, and his sword is pure spirit also.” Those aren’t empty phrases; Hegel would have agreed with them while interpreting them in an emphatically un-Thoreauvian way. John Brown was mainly spirit, Spirit, a step forward in world history. He may have been “wrong” in his methods—though I don’t really think so—but Hegel would have said that accusation is irrelevant, as irrelevant as it was in the case of Napoleon. (Napoleon, of course, was despicable; there’s no gainsaying that.) Spirit, History, was working through John Brown, who knew that slavery would not be abolished except through violence.

You have to read this book. It’ll change your views on the slavery era. “No one in American history—not even Washington or Lincoln—was recognized as much in drama, verse, and song as was Brown. Most of this expression was eulogistic.” John Brown *truly was* one of the most important people of the 19th century. [Um, that seems wrong.]

October 11, 12

Again, I have to remind myself not to oversimplify when phenomenologizing. There is no clear dichotomy between “abstract” and “concrete”: each is involved in the other. Nevertheless, what I wrote yesterday has some value.

Poor inner-city neighborhoods are like the state of nature. It’s Hegel’s dialectic of recognition: by fighting to the death you get recognition. If you shrink from a fight you become a slave—no respect, you’re the neighborhood’s bitch. If you kill someone you’re a Master, or something like it. It’s the same in prisons: if you don’t defend yourself violently, you’re the cell-block’s bitch. “Respect, man, it’s all about respect. You ain’t got respect you ain’t got nothin’.” Being ass-fucked is the ultimate denial of your masculinity: as these people see it, you become a *woman*, supposedly the worst fate that could befall you. From this perspective, for a man there is effectively no difference between becoming a slave and becoming a woman: in both cases there is no respect (because no *activeness*, no self-assertiveness: your will is not your own, you exist to do the other’s bidding). What is masculinity, after all? *Existing for yourself*, recognizing no will superior to your own. Being your own boss, legislating for yourself, doing what you want without

caring what others think. Such a man is seen as truly a man, a man in the way that John Brown was or that Kant's philosophy demands. Femininity, on the other hand, is seen as the opposite: existing for the other, doing what the other desires, substituting his will for yours. It's both very (sexually) attractive and, in a way, very contemptible. (No woman is wholly feminine, and she usually becomes less so as she gets older. In any case, all this is just drawing out the ridiculous implications of human behavior.)

Most men, by the way, are only superficially men (from this perspective), for the will they follow is not theirs but the mob's. Groupthink is supremely unmasculine, even though the vast majority of men are groupthinkers. That is to say, they're contemptible, according to the standards they themselves subscribe to (or say they subscribe to).

$10 + 8 = 18$. $8 + 10 = 18$. Two different ways of mentally constructing the same object. Two different syntheses.

Reading parts of *The Cambridge Companion to Vygotsky*. Mediation, explicit and implicit. Thought and word: "thought is an inchoate, fused, unpartitioned, nonsequential whole that comes into contact with words, which involve generalization and discrete, sequential representation." Suggestive way of formulating the opposition. Tension. Thought and speech interpenetrate and transform one another; they are not independent and isolated elements. "The relationship of thought to word is not a thing but a process, a movement from thought to word and from word to thought." Dialectic.

"Explicit mediation involves the intentional introduction of signs into an ongoing flow of activity. In this case, the signs tend to be designed and introduced by an external agent, such as a tutor, who can help reorganize an activity in some way. In contrast, implicit mediation typically involves signs in the form of natural language that have evolved in the service of communication and are then harnessed in other forms of activity. Because the integration of signs into thinking, remembering, and other forms of mental functioning occurs as part of the naturally occurring dialectic outlined by Shpet and Vygotsky, they do not readily become the object of consciousness or reflection."

Vygotsky's developmental method.

Vygotsky and Mead, similar concerns. But the former has a more "cognitive" approach than the latter.

From a Wikipedia article:

Through play the child develops abstract meaning separate from the objects in the world, which is a critical feature in the development of higher mental functions.

The famous example Vygotsky gives is of a child who wants to ride a horse but cannot. As a child under three, he would perhaps cry and be angry, but around the age of three the child's relationship with the world changes. "Henceforth play is such that the explanation for it must always be that it is the imaginary, illusory realization of unrealizable desires. Imagination is a new formation that is not present in the consciousness of the very raw young child, is totally absent in animals, and represents a specifically human form of conscious activity. Like all functions of consciousness, it originally arises from action."

He wishes to ride a horse but cannot, so he picks up a stick and stands astride it, thus pretending he is riding a horse. The stick is a *pivot*. "Action according to rules begins to be determined by ideas, not by objects... It is terribly difficult for a child to sever thought (the meaning of a word) from object. Play is a transitional stage in this direction. At that critical moment when a stick – i.e., an object – becomes a pivot for severing the meaning of horse from a real horse, one of the basic psychological structures determining the child's relationship to reality is radically altered."

As children get older, their reliance on pivots such as sticks, dolls and other toys diminishes. They have *internalized* these pivots as imagination and abstract concepts through which they can understand the world. "The old adage that children's play is imagination in action can be reversed: we can say that imagination in adolescents and schoolchildren is play without action."

Another aspect of play that Vygotsky referred to was the development of social rules that develop, for example, when children play house and adopt the roles of different family members. Vygotsky cites an example of two sisters playing at being sisters. The rules of behavior between them that go unnoticed in daily life are consciously acquired through play. As well as social rules, the child acquires what we now refer to as self-regulation. For example, as a child stands at the starting line of a running race, she may well desire to run immediately so as to reach the finish line first, but her knowledge of the social rules surrounding the game and her desire to enjoy the game enable her to regulate her initial impulse and wait for the start signal.

Can be supplemented with Mead.

“The major theme of Vygotsky’s theoretical framework is that social interaction plays a fundamental role in the development of cognition. Vygotsky (1978) states: ‘Every function in the child’s cultural development appears twice: first, on the social level, and later, on the individual level; first, between people (interpsychological), and then inside the child (intrapsychological). This applies equally to voluntary attention, to logical memory, and to the formation of concepts. All the higher functions originate as actual relationships between individuals. [No, that statement is much too empiricist.]’” Compare Vygotsky with Piaget. The former places more emphasis on culture, social factors, and language.

Identity-construction. Moderate Republican, radical environmentalist, stylish dresser, etc. Indefinitely many possible identities in the social, behavioral, mental space of the Other in which you exist, i.e. of Society as a reification or abstraction; you pick out certain identities, valorize them by choosing them for yourself. The person with a robust, spontaneous, dynamic sense of self, a strong sense of his active “I” as opposed to his passive “me” (in Mead’s terminology), doesn’t have a great need to label himself in these static ways; only someone with a weak or tenuous sense of his active self, his I, relies on labels (or discrete identities) to sustain his self-esteem and self-stability, i.e. to make possible the continuous confirmation of his self in the world. One person confirms himself relatively directly in his activities, without the *overt* mediation of discrete, static identities; his *acting* gives him the sense of being alive, of having a self (a self that is stable and confirmed), and this allows him to be flexible in his beliefs, his ideologies, even his modes of acting. He doesn’t identify himself by a particular *type* of acting or believing which forecloses other possibilities, but rather by throwing himself entirely into his actions (whatever they be at that moment). The other person doesn’t have such a vivid sense of being alive, of being immediately and actively alive, but must invoke his (memory of his) past reactions to the other and the other’s past reactions to him—i.e., those things from which the “me” is constructed—in order to have a secure and recognizable sense of himself. This may lead to ideological inflexibility, close-mindedness, an unwillingness to think through new situations or philosophies, and inhumane bureaucratic behavior.

I’m more attached to my identity as a Marxist than as a writer, but I’m not so attached to it that I can’t consider anti-Marxian arguments. Actually I’m not very attached to either label, but if someone attacks Marxism I’ll vehemently defend it because on a less superficial level than “labels” it’s an important part of myself, and since I want my self to be confirmed, I’ll argue that Marxism is valuable. Still, I have a strong enough sense of myself (my I) to be able and willing to consider changing my mind on any given issue addressed by Marxism. Unlike many people, I won’t suffer a debilitating loss of self-confidence if I’m confronted with proof of my error.

[Those two paragraphs show confusion about the I and the me.]

Eriksonian identities vs. Meadian identities. Two definitions of “identity”: (1) “...a sense, felt by individuals within themselves, and as an experience of continuity, oriented toward a self-chosen and positively anticipated future...”; (2) “a self-understanding to which one is emotionally attached and that informs one’s behavior and interpretations.” The task of an Eriksonian individual is to construct an integrated, enduring, consistent identity; a Meadian individual has many identities, which are in relation to roles and cultural personae.

“Vygotsky’s key to human existence was the capacity to escape enslavement to whatever stimuli humans happened to encounter, whether from within or without. The way that they accomplished this was

(broadly) linguistic, that is, through the active construction and use of symbols. Just as humans can modify the environment physically—thanks to their production of, and facility with, tools and symbols—humans can also modify the environment’s stimulus value for their own mental states.” Transcendence belongs to the human condition. It is through mediation, or transcendence of the immediate, that man modifies himself. Hegel.

“I am a social relation of me to myself,” says Vygotsky, echoing Mead. Kierkegaard would have added, “...and a social relating of me to myself.” Most of this is not original with Vygotsky or Mead or even Kierkegaard or Marx; it started with German idealism. And before that it had been intuitively grasped hundreds of times by thinkers in a dozen cultures.

“...definite link between play worlds and institutional life. Fantasy and games serve as precursors to participation in institutional life, where individuals are treated as ‘scholars,’ ‘bosses,’ or ‘at-risk’ children—whatever the institutional role—and events such as the granting of tenure, a corporate raid, or the ‘self esteem’ of at-risk children are taken in all seriousness.” All this, be it juvenile play or games or institutionalized culture, takes place through symbolic mediation. New meanings are assigned to ordinary objects; people locate themselves in a nexus of “imaginary” relations and alter their behavior accordingly.

Identities, symbolically mediated, allow us to sort through and structure environmental stimuli, to determine which are worth reacting to in what ways and so on. “An identity is a key means of escape from the tyranny of environmental stimuli.” Each of us has an assortment of identities that he may not be discursively aware of. These identities are necessary, and your actions are always mediated through them. The me is, it seems, present in the I, and the I animates the me. Still, I’d emphasize that certain people’s identities are more static and closed, lifeless and rigid, more ‘important’ to them (rigidly dominant in them), than other people’s are. In being more creative, the latter people show that social roles matter comparatively little to them. Their me is less determining, their I more so, than in others, which is to say that they have a more expansive and strong sense of their active, acting self. (Unlike the other people, they may be hard-pressed to say who they are, to pin themselves down as, e.g., a Republican, a banker, an extrovert, a Roman Catholic. But the presence of such discursive, passive senses of self is not the foundation of psychic health, and may indeed signify a weak sense of one’s active, this-moment, real self, as I suggested above.¹) It’s also likely that these “expansive” people are relatively intelligent.

Practical mediation vs. symbolic mediation.

October 14

The *Cambridge Companion to Critical Theory*. The whole Cambridge collection is online. I’m in heaven.

Shaved off my mustache. I look better this way. And mustaches aren’t popular these days: people think they look creepy, like a pedophile. Don’t ask me why. On a *Seinfeld* episode George grew a mustache—I forget why—then complained about it, saying “I feel like an out-of-work porn star.”

Dialectic of Enlightenment. Alienation versus the *hic et nunc*, the here and now. It is this from which we are estranged. “It is the inability to see or feel what is here, now, in front of us that characterizes our inability to come to terms with our existence.” Projecting ourselves into the future, we prevent ourselves from enjoying the moment. (Buddhism. The evils of the self’s continuous self-transcendence.) “The character of this genuine reality, in the view of Horkheimer and Adorno, is intensely somatic. We ‘are’ most adequately in the unmediated richness of sense.” Unoriginal but largely true. We are not only

¹ What does it mean to have a weak sense of your “active” or “spontaneous” self? Simply that you don’t (*relatively*) un-mediate yourself, your self. Your immediate self-esteem is low, so you valorize particular *roles* or *ideologies* and place yourself in them as a way of indirectly valorizing and validating yourself. So when people criticize a role or ideology you identify with, such as social conservatism or white supremacy, you may lash out with extraordinary violence, since as far as you’re concerned these people are attacking your value as a self. Another person wouldn’t react violently because he values his “spontaneous self” sufficiently not to take the attacks personally.

intellects, but if we define ourselves as such, perpetually *striving, scheming*, we'll be condemned to unhappiness and the risk of self-destruction. Duh. But they've forgotten Marx.

A. and H. argue that "genuine morality is ultimately primitive and individual, not schematic." In a sense, they're right.

Two kinds of knowledge: mimesis (good) and "enlightenment" (bad).

Mimesis is the assimilation of consciousness to reality, [the merging of self with object]. It does not involve reproduction or apprehension; it is, rather, a matter of unmediated organic intuition. Mimesis is "physical imitation of external nature." As such, it is not an intellectual process. Indeed, it is not even restricted to human beings. Mimesis is the expressive response of created things to their environment, and it acquires its origins with the capacity to *suffer*, which is something proper to all living beings... [Art is a *human* expression of mimesis.] "Enlightenment" knowledge is characterized by its attempt to thrust all known and knowable objects into the corset of systematic "science." It thus renders itself unable to accommodate the *hic et nunc*. [Kierkegaard.] But as the authors argue, the world, and everything in it, is essentially unique. No one thing is the same as another. Individuals truly are individuals, and not exemplars of a species. Classification is no more than a *preparation* for knowledge, never its fulfillment.

The source of this compulsion to "know everything in advance" is, according to the authors, partly psychopathic and partly the result of fear. The fear is the primitive fear of nature, the hostile other which brings death... [With enlightenment,] the substantive intuitions of true knowledge are replaced by the ghostly compulsions of deduction and all the "logical" hierarchies of systematic knowledge.

Anti-intellectualism. In the bad sense. And straw-man opponents.

Interesting observation: "Sacrificial practices [in archaic cultures] derive from a central principal of mythical thinking, namely, the law of equivalence, which for Horkheimer and Adorno represents the magical origin of rational exchange. Every piece of good fortune, every advance, which the gods bestow on human beings, must be paid for with something of comparable value. Following this principle, early humankind attempted to influence the course of human and natural events by offering sacrifices to the gods in the hope that the deities would intervene on their behalf." What does the so-called law of equivalence say about the human mind? It's a primitive, relatively spontaneous expression of the unintellectual self. If you receive something, you must give something; if you give something, you must receive something. Anthropologists have observed this law in hundreds of societies, and it is surely evidenced in young children too. What explains it??

Winnicott: "It is creative apperception more than anything that makes the individual feel that life is worth living." One of those simple truths that is worth remembering.

A. and H.'s central assumption: the ego as such is autocratic. The integration, the formation, of the self is inherently violent and repressive. (Cf. Freud.) The ego's phylogenetic and ontogenetic emergence—which they equate with the emergence of "Enlightenment"—brought (brings) benefits, but it cannot emancipate humankind from fear and immaturity. Man's fulfillment does not take place through the development of reason and the mastery of nature. Fascism proves that. The only hope for humankind is a utopian rupture of some sort, a break from the dialectic of Enlightenment.

To repeat: the ego's emergence was paid for with the sacrifice of inner nature (i.e., of unconscious-instinctual life) and the loss of a mimetic, 'sympathetic' relation to nature. The ego *excludes, represses*. This is a Freudian vision, but, contrary to Adorno, Freud also suggests that the healthy ego is *inclusive* as well, in that it channels and organizes energy from the id. Enlightenment, therefore, need not be wholly repressive and violent; it can be inclusionary, perhaps even mimetic. But Adorno rejects this possibility.

Relationship between the id (the non-ego within the body/psyche) and the other... Self-consciousness a hindrance to unfettered self-expression and self-confirmation. Acute self-consciousness = excessive ego, weak but strongly defensive ego that erects walls against both the other's critical look and

the id's instinctual libidinal energies. (This explains why, for instance, shy and insecure people sometimes have bursts of energy, especially in solitude: because, namely, their self-consciousness entails a suppression of psychic energy, which finally has to be released—usually in solitude, when there is little or no pathological self-consciousness. Reification of the self and the other—internalization of an “abstract other” which tends to have a negative attitude toward the self—such as occurs in shy or schizoid people blocks the self's access to reserves of psychic energy, places obstructions in the path of self-objectification and -confirmation,¹ and amounts to a self-fulfilling prophecy, a vicious circle of unrecognition. It's no accident that our society, the most reified in history, is also the most plagued by alcoholism, by weekly orgies of drunkenness, of “letting loose” in nightclubs, etc.—opportunities for purging the body/psyche of energy that has been suppressed during the weekdays of self-consciousness and atomization.) The greater the focus on the other, the greater the focus on the self, and the greater the suppression of unconscious libidinal energy. The healthy self *acts, opens* itself to its (*socialized*)² instincts; it doesn't maintain rigid boundaries between itself, the other, and its intuitive, spontaneous, instinctual impulses.

Useful concept from Marcuse: the “repressive desublimation” of sexuality carried out by the advertising industry.

Suppression vs. repression (censorship...). The latter more historically specific, specific to certain societies. Maybe didn't exist in archaic ones. A degree of *suppression* is necessary in every society, but suppression needn't mean unhappiness or a lack of self-integration.

October 16, 18

‘Nothing matters. There is too much of everything for anything to matter.’ As matters stand, that's true.

Reading Howard Gardner's *The Quest for Mind*, an exposition of the structuralism of Levi-Strauss, Piaget and other thinkers. In the beginning of the book he notes that Levi-Strauss asks the following question: Why are pet birds given human names (Pierre, Donald, Jacqueline) and dogs given un-human names (Fido, Spot, Pluto)? He doesn't say what Levi-Strauss's answer is; presumably the reader will learn later on in the book. Anyway, I want to offer my own answer and see (later) how it measures up to L-S's. I'd suggest that dogs are too ‘close’ to people for us to give them human names. We walk them, pet them, play with them, clean up their shit: their “world is too much with us.” To call such an animal *John* or *Peter* or *Joseph* would sound odd, to say the least: dogs are too different from us to have human names. They don't have our *dignity*, so to speak; the name ‘John’ is far too dignified, too human, to be given to an animal that rolls around in the mud and smells bad and acts slavishly. Birds, on the other hand, are relatively diffident, distant from our everyday life. They live in their cages, hop and fly from branch to branch, and generally mind their own business as we mind ours. Their life is fairly separate from ours, unlike a dog's life. They don't act slavishly with people; they have dignity and diffidence, even more than cats do. — That's my answer. I'll tell you what L-S's is when I get to that part of the book.

Piaget argues that “all mental states involve a form of implicit activity on the world.” Profoundly true. [Um, no.] “All thinking involves, for Piaget, a series of mental operations, and these operations are simply internalized actions and sequences of actions. [Nope, not true at all. Way too reminiscent of empiricism.] The child who appreciates that one ball has the same amount of clay as another that has been altered in shape is demonstrating the capacity to perform an operation of reversibility.”

¹ Consider the many times I've observed that in particular moments I become unusually witty and energetic, for no apparent reason—moments that coincide with a lack of self-consciousness, a strange feeling of ‘freedom,’ ‘looseness,’ ‘spontaneity.’ The jokes well up out of nowhere, unpredictably. Cf. Freud's thoughts on the close relation between jokes and the unconscious: the former, I'd suggest, are an expression of the latter('s ‘energy’) and come straight out of it.

² Contra Freud.

Met Nadine & Company last night. She gave me the greatest compliment I've ever received by saying, half-jokingly, that I'm a womanizer. I *wish* I were. But when I drink I'm capable of approaching that ideal—heck, sometimes even when I'm sober—and I'm fun to be with. I always kiss her at the end of the night and she doesn't object, but we're just friends.

Piaget. (1) Young child is incapable of thinking about himself. Doesn't differentiate between himself and the rest of the world. (Primitive man.) (2) Children initially think they think with the mouth. Can't think with the mouth shut. Also opine that the mind is *air*, "because you can't touch it." (Anaximenes.) (3) "For the youngest child, the dream is an image or voice coming from outside and manifesting itself in front of your eyes." Sometimes sent by birds, pigeons, or the air. Gradually children understand that the dream is internally caused. (4) In general, the child's ideas about thoughts, words and dreams are characterized by "realism, the attribution of an independent, quasi-physical reality to mental states and constructs." A name, for instance, is confused with the object itself: "to touch the name of the sun would be to touch the sun itself, to curse the sun is to threaten its existence. This realism gives rise to feelings of 'participation' in which the name passes to and fro between the object (the sun) and ourselves." (Primitive man. Magical power of naming.) Also confusion between internal and external, and between thought and matter. (Thought is a whisper or a voice or smoke, etc.) (5) All objects are perceived as being made for a given purpose. No such thing as chance or mechanical necessity; everything in nature is purposeful. No distinction between physical and moral causes. (The sun exists because it has to keep us warm.) Hegel was right that the early history of man repeats itself in the first few years of a child's life. Why? Because, as Piaget argues, the child comes to learn about itself and the world through *action*, through acting on its environment. The modern child grows up in a technological world, where man is separated from nature and from his fellow men. Early humans, on the other hand, grew up in a natural world. The separation between nature and man, between man and man, between internal and external, between name and object, between thought and matter, didn't exist yet because technology was primitive, the productive forces were primitive, and so were, necessarily, production relations. So in acting on the world, primitive man was acting on a rather undifferentiated world. His actions did not spur him to make distinctions between facets of reality that today we distinguish.

His cognitive and emotional capacities probably didn't mature at the same rate at which a modern child's mature, and his self-understanding (which includes his understanding of the world) *definitely* didn't, because it's explicitly mediated by material conditions—and if material conditions don't necessitate that the actor distinguish between things then he won't distinguish between them. Thought is an internalization of action. "Mental operations are simply internalized actions." [Again, no! Some are, but some aren't.] Social being—*active* being—first, consciousness second. Piaget supports Marxism.

Levi-Strauss. Cultural phenomena should be considered in terms of signs. These phenomena can, for analytic purposes, be treated as arbitrary, like linguistic signs; the point is that their interrelations tell us something about the structure of the human mind. The content of myths may vary between cultures, but the structure does not.

Taboo on incest: a rule found in all societies, therefore *the* rule of Society. How to explain this rule? I've always wondered that. The horror with which I look upon the idea of having sex with my mom is not rational; its very strength proves that. How was this horror inculcated in me? Is it somehow instinctual? At what age did I find the idea of incest unthinkable? Probably as soon as I reached a vague understanding of sex. What age was that? Five or six at the latest, probably earlier. Surely the incest taboo has to do with the nature of the inherently "idealizing" relationship between child and parents, which I've mentioned before. But what about brother and sister?

L-S argues that that phenomenon can be explained only by considering the nature and function of kinship systems. "The fatal flaw of incest is that it prevents the formation of larger units: if one marries one's sister, the possibility of exchanging women and so of establishing alliances is precluded. Inasmuch as society and survival are thought to depend upon the building up of such alliances, incest cannot be tolerated, and strong sanctions are devised against it.

"The prohibition is seen as a manifestation of giving or self-sacrifice, as the group's way of saying that, in sexual matters, a person cannot do as he pleases. Among primitive peoples, incest is regarded as

socially absurd rather than as morally repugnant, reflecting a sort of Cartesian principle that one cannot marry oneself, or a part of oneself.” L-S tells of a primitive man who rejects incest because it prevents one from having a brother-in-law. “With whom will you hunt?” he says. “With whom will you garden? Whom will you go to visit?” It’s not *wrong*, it’s just absurd.

Obligation of reciprocity. Exchanging women—gift-giving. Women are “objects” even in [some] primitive societies.

Basic mental structures (says L-S): the universality of rules, the principle of reciprocity, the socially solidifying nature of the gift, the tendency to think in oppositions. (Why oppositions? Because *omnis determinatio est negatio*. Concepts are meaningful only in opposition to other concepts. Saussure et al.)

L-S’s answer to the question about pet names is a little different from mine, and probably more satisfying. But I think they’re complementary. Quite similar, in fact. He argues that, while both birds and dogs are part of human society in that we keep them around the house, birds are thought to have among themselves their own society with its own relationships. “We can afford to give them human names because they have a parallel existence and will not be confused with our society. Domesticated dogs, however, are a part of the family and do not have their own society. Thus...[we give them] names which are parallel to the kinds of names humans have, but do not come from the same set.” Yes. But there’s no need for this explanation to be framed in terms of structuralism. I think that questions about “methodology,” in fact, are not as important as scholars think. I don’t worry about methodology; I just give whatever explanation seems best. There’s no reason to limit yourself *a priori* to a specific “method.”

October 20

Article in *Rolling Stone* about Wallace. I see that his whole life was essentially my life between 18 and 25. In other words, it sucked. Right up to his death he had the same insecurities, the same thoughts, I had. Consider what he wrote in a letter: “I go through a loop in which I notice all the ways I am self-centered and careerist and not true to standards and values that transcend my own petty interests, and feel like I’m not one of the good ones. But then I countenance the fact that at least here I am worrying about it, noticing all the ways I fall short of integrity, and I imagine that maybe people without any integrity at all don’t notice or worry about it; so then I feel better about myself. It’s all very confusing. I think I’m very honest and candid, but I’m also proud of how honest and candid I am—so where does that put me?” These sorts of paradoxes, the paradoxes of self-consciousness, I was writing about eight years ago and finally stopped caring about one or two years ago. Being self-conscious on a second level, then being conscious of *that* level, then being conscious of this *fourth* level, until you lose all sense of yourself and conclude that self-determinations determine a vacuum and hence are vacuous. But then what? Then you stop thinking and go outside and play and know who you are again, unconsciously. Wallace’s curse was that he couldn’t stop thinking.

Just think: he craved the label ‘genius’ but couldn’t accept it when it was conferred on him. He knew it didn’t mean anything. His friend Mark Costello called him once: “He was talking,” says Costello, “about how hard the writing was. And I said, lightheartedly, ‘Dave, you’re a genius.’ Meaning, people aren’t going to forget about you. You’re not going to wind up in a Wendy’s. He said, ‘All that makes me think is that I’ve fooled you, too.’” An honest person in this age can’t accept that he’s a genius and then go on with his life in the certainty that he’s a genius, comforted eternally by that thought. He knows it’s false, even if it’s true: he’s not an object, not a *brilliant rock* or something like that; he’s a person who changes from moment to moment, of whom it’s meaningless to predicate the stable, static, *lustrous* quality *genius*. Wallace couldn’t believe he instantiated a concept, since his mind had motion (self-consciousness)—and he knew, anyway, that if he *did*, the concept was basically meaningless. He craved self-confirmation but couldn’t achieve it because the greater one’s self-consciousness, the more quickly and completely one transcends one’s objectifications. In the end, therefore, once he stopped taking his medication he couldn’t bear the unfulfillment of his desire to be *thickly valued*, to be *value itself*, and he killed himself.

The reason *I'm* able to tolerate my lack of recognition—to say it yet again—(or, to speak more accurately, the *story I tell myself*¹ (in order, namely, to salve the wound, and stanch the bleeding, of insulted self-love))—is that I know being published wouldn't satisfy me because nothing matters, published authors are no better off than I am because fame means nothing and proves nothing, and besides, writers are irrelevant now even to *culture* because culture is dead and everything is irrelevant. For myself I'm an unusually valuable person and for now that's enough, it's enough if *I* know my value. No one has a better chance than I of living posthumously. (And yes, I know that's a pointless desire, like the desire for recognition itself, but you can't reason these desires out of existence. They're there, driving you, driving even your act of communicating that these desires are pointless.)

Wallace's self-absorption ultimately made his writing less interesting than it could have been.

Good joke from him, funny because it's true: "What does a writer say after sex? '*Was it as good for me as it was for you?*'" (The not-knowing-yourself. The knowing-the-other-better-than-yourself.)

"For Levi-Strauss, the major facet of cognition is the perception of opposites or contrasts in the world."

Piaget's constructivist view of knowledge—according to which the child slowly constructs, through action, his spatial, linguistic, mathematical, logical knowledge—doesn't necessarily contradict the theory that these kinds of knowledge are, in a way, innate, nor that they are justified *a priori*. He thinks it does, but he's wrong. Through interaction with his environment the child educates himself into a form or 'structure' of knowledge that is genetically predetermined, in much the same way that his future pubertal growth-in-knowledge (sexual, emotional, intellectual) is genetically predetermined but also influenced by his interactions with the environment. Both growth-spurts in knowledge are simultaneously innate and constructed. [*No, they're triggered by environmental factors but not constructed by them. Piaget was right that his constructivism was incompatible with innatism, and he was wrong about his constructivism.*] [...]

Likewise, L-S's emphasis on perception and Piaget's emphasis on action are complementary, not contradictory.

October 23

Alan Greenspan: "I'm sorry, I was wrong after all." (Not in so many words.) Failure of an economist, failure of a thinker, failure of a man. With a face that says "Why, in God's name, am I still alive?" The so-called free market doesn't work after all. Big surprise, that.

Critical Theory. "Actualization of reason," the ideal bequeathed from Hegel. "The Hegelian idea of a rational universal." The *deficient rationality* of contemporary capitalism. Marx: the rationality immanent in the forces of production is prevented actualization by relations of production and ideological distortion. (Also from Marx: *structures* will evolve of themselves, *individuals* can do little but accept the necessity of this evolution and perhaps contribute to it in a small way. Marxian structuralism. True. Leninist voluntarism false. History of USSR, China, Cuba, Vietnam corroborates Marx's structuralism. On the other hand, Lenin and Sartre weren't *entirely* wrong, nor was Levi-Strauss entirely right (in his methods and assumptions²). The history of the USSR etc. corroborates this point too, since individuals did, after all, have a huge impact in the short term.)

Honneth:

In contrast to the approaches that have achieved dominance today, Critical Theory must couple the critique of social injustice with an explanation of the processes that obscure that injustice, for only when one can convince the addressees by means of such an

¹ The *real* reasons, of course, are deeper than the following rational justifications. They have to do with neurochemicals and hormones.

² His specific positions, of course, were sometimes wrong, but that's not what I'm talking about here.

task of keeping inner and outer reality separate yet interrelated.” “The substance of *illusion*, that which is allowed to the infant, and which in adult life is inherent in art and religion, and yet becomes the hallmark of madness when an adult...forces others to acknowledge a sharing of illusion that is not their own [i.e., to accept “the objectivity of his subjective phenomena”].” Natural root of grouping among humans: coming together on the basis of the similarity of our illusory experiences, which are “the intermediate area between the subjective and that which is objectively perceived.” This intermediate area is originally manifested as “an intermediate state between a baby’s inability and his growing ability to recognize and accept reality.” A *transitional* state, characterized by, e.g., thumb-sucking, cloth-sucking (the corner of a blanket), babbling. *Transitional phenomena*. Sometimes the infant needs a particular object, like the corner of a particular blanket or a word or a tune, when going to sleep, as a defense against anxiety. *Transitional object*. Gradually, as the baby gets older, teddies and dolls and hard toys become the transitional object(s). Finally, after years, the object ceases to have meaning, “and this is because the transitional phenomena have become diffused, have become spread out over the whole intermediate territory between ‘inner psychic reality’ and ‘the external world as perceived by two persons in common,’ that is to say, over the whole cultural field. At this point my subject widens out into that of play, and of artistic creativity and appreciation, and of religious feeling, and of dreaming, and also of fetishism, lying and stealing, the origin and loss of affectionate feeling, drug addiction, the talisman of obsessional rituals, etc.” Fascinating, thought-provoking.

Transitional object symbolic of some part-object, such as the breast. But its *not being* the breast is as important as its symbolic value because it shows that the baby “is already distinguishing between fantasy and fact, between inner objects and external objects, between primary creativity and perception.”

More accurately, the transitional object stands for an external object (like the breast) *by standing for an internal object* (see Klein), which is a mental concept or representation of the external object.

In the beginning the infant has the illusion that his mother’s breast is part of him: when he’s hungry the breast appears, as if created by him at just the right moment (i.e., when he desires it). The mother eventually has to dis-illusion her baby, and then wean him. “The transitional phenomena represent the early stages of the use of illusion, *without which there is no meaning for the human being in the idea of a relationship with an object that is perceived by others as external to that being.*” (My italics.) This ties into what I’ve said about other people being instantiations of the other in oneself. There’s an element of illusion here.

“The task of reality-acceptance is never completed, no human being is free from the strain of relating inner and outer reality, and relief from this strain is provided by an intermediate area of experience. This intermediate area is in direct continuity with the play area of the small child who is ‘lost’ in play.”

Winnicott says parenthetically that, in an adult, the pathological “true- and false-self organization” (see Laing) signifies an inability to accept the “paradox” of illusion, of mediating between inner and outer. Acute observation. Illusion, part inner and part outer, is healthy, indeed necessary.

When I’m reading a good book I experience periodic surges of intense excitement, maybe ten seconds long, in which I half-intentionally clench my fists, my jaw, my throat, squinch up my face and possibly make a high-pitched squealing noise. Quite pleasurable. A feeling of extreme freedom, satisfaction with the world, love of myself. Can be caused by other things too, for instance by looking forward to an evening with female friends or by reflecting that I have liquor in my freezer that I can drink whenever I want (I never drink it alone, by the way). The consciousness of being free, of being able to do what I want. Making the world *mine*. In other words: close connection to “illusion”—“*experiencing*,” living in a space between the inner and the outer worlds. That’s the task of the human being, to create this half-imaginary world for himself.

Said more succinctly: becoming aware of my *playing* fills me with joy. When I’m playing is when I’m most happy, and when the world is most mine.

For Winnicott, psychotherapy = playing, the overlapping of two areas of playing (patient and therapist). If playing isn’t possible, the therapist’s job is to bring the patient into a state of being able to play.

“Play is exciting...[because of] the precariousness of the interplay of personal psychic reality and the experience of control of actual objects. This is the precariousness of magic itself, magic that arises in intimacy, in a relationship that is being found [by the baby] to be reliable [viz., the relationship between baby and mother].” In other words, “the precariousness of play belongs to the fact that it is always on the theoretical line between the subjective and that which is objectively perceived.”

The near-withdrawal state of children at play (being “lost in play”) is akin to the *concentration* of older children or adults.

Development from transitional phenomena to playing, from playing to shared playing, from shared playing to cultural experiences.

October 25

(I think I’ve mentioned this before.) It’s revealing that it makes little sense to speak of a “genius” in the realm of popular music. Not even Bob Dylan or Freddie Mercury can be called a genius in the fullest sense. The type of music is too mediocre, even if certain songs are very good. With classical music, on the other hand, there are most definitely geniuses. This is because the music is, ironically, more individualized than pop. It *expresses the individual* more. It’s more ‘interior,’ more soulful, more creative.

Had an Ethiopian dinner with a student of mine, Polish, 35-year-old divorcée, then took her to my apartment, listened to Schubert and Chopin (she plays the piano), kissed and cuddled. Aniela. DJ on the radio and station manager. I didn’t want sex, I’m a woman and prefer cuddling. She didn’t seem to want sex either.

Said I’m unlike anyone she’s ever met. I laughed it off, but it pleased me.

A little something I wrote for class, probably not at all what the prof wanted:

The Phenomenology of Thoreau’s Spirit

One of the tasks of a historian is to reconstruct what it was like to live in a given society. Social and cultural history, in particular, consist in this attempt to represent a society’s “spirit,” its “objective spirit,” as manifested in the daily routines of an ordinary worker, in the social movements that dominated the age, in popular music and literature, in the political practices of the elite, and so on. Everything that happens in a society, everything that is true of it, is an expression of that society, or rather of its “being,” its “spirit,” of *what it is like to live* in it. It is all an indissoluble unity, an expression of the whole—from the quotidian acts of the midwife to the exalted statesmanship of the king or Parliament or the President—although for the purposes of analysis this societal unity has to be broken up, abstracted from, in order to be synthesized again, painstakingly, in thought. This re-presentation of reality in words is necessarily incomplete, inadequate, because being cannot be reproduced in thought except in a wildly distorted form. (As experienced by people, being is immediate and concrete; as described in words, it is mediate and abstract.) Nevertheless, such an attempt to reproduce the being of an earlier society can shed light on the human condition, for example by showing which aspects of human behavior are variable and which are constant across cultures.

In this paper I would like to undertake such a “phenomenology of spirit,” an imaginative reconstruction of an earlier time. Specifically, I want to use Henry David Thoreau’s “Plea for Captain John Brown” as a window into American culture on the eve of the Civil War.

“A Plea for Captain John Brown” is a speech that Thoreau gave in Concord on October 30, 1859, weeks before John Brown was hanged for his raid on Harpers Ferry. It is a stirring document, full of righteous fury and eloquence. Brown’s trial was still going on; the country was reeling from the implications of his October 16th raid. The national consensus was that Brown was a fanatic, a criminal, a madman, a murderer; the South, however, differed from the North in seeing him as representative of the Republican

party, of abolitionists all across the North. Perhaps (thought the South) he was more courageous than they, but he was symbolic of the North's dangerous individualism, its Puritanism, its evil abolitionism, its determination to attack the South and suppress slavery once and for all. Most Northerners, on the other hand, disowned Brown, viewing him as a freak, an anomaly; and the Republican party certainly had no connection to the Harpers Ferry raid. Even Abolitionists were reluctant to praise him—or at least they tempered their praise with criticism of his methods—for the majority of them were pacifists. William Lloyd Garrison, a founder of Abolitionism, declared the raid to be “a misguided, wild, and apparently insane, though disinterested and well-intended effort”; Horace Greeley called it a “deplorable affair...the work of a madman.”¹

Meanwhile, however, Brown was giving interviews and writing letters in which he appeared decidedly clear-headed, in fact honorable, principled, full of integrity and intelligence. As his words were published in newspapers everywhere, the nation came to see him, paradoxically, as both an admirable man and a murderer, both humane and treasonous. Governor Wise of Virginia, who talked to Brown in the hours after the raid, said he was “firm, truthful, and intelligent...cool, collected, and indomitable...a man of fortitude and simple ingenuousness”²—yet at the same time he called him a criminal and a traitor. The nation was torn between these positive and negative interpretations of the man, with the negative, however, predominating everywhere.

The 1850s were a culturally frenzied time. In his book *Beneath the American Renaissance*, David Reynolds emphasizes the ferment and confusion of antebellum America—the cultural experimentation, the impulse for reform of every variety, the coexistence of every conceivable cultural extreme. It was the age, after all, of Transcendentalism and evangelical reform, of sensationalist literature and Poe's irrationalist fiction, of *Moby Dick* and *Leaves of Grass*, of resurgent Puritanism and atheism and free-love movements, of Emily Dickinson and Nathaniel Hawthorne, and, in general, of battles between conservative ideologies and an emerging radical democracy in both culture and politics. Slavery was arguably the dominant issue, though, especially after the passage in 1850 of the Fugitive Slave Act and in 1854 of the Kansas-Nebraska Act, which led to widespread proslavery and antislavery violence in Kansas. (The name “Bleeding Kansas” designated this time.) By the end of the 1850s, Emerson was writing that the country had to be purged through war.

It was in this environment that Thoreau wrote “A Plea for Captain John Brown.” Like many other writings that have been admired through the ages, this document provokes a paradoxical reaction in the reader: he enjoys its style, its imagery, its vigor, but only because he knows that it was written a long time ago. Something written in the same style *now* would be ridiculed as over-ornate, over-eloquent, absurdly grandiose and magniloquent, stylistically naïve, hopelessly out of touch with the zeitgeist. It would be considered *badly* written. But because it is not a product of our time, we are able to look upon it with unadulterated admiration, even to lament that such writing has gone out of style.

I will quote a few sentences to give the reader a sense of what I mean. Referring to Brown's interviews with proslavery men, Thoreau says, “Read his admirable answers to Mason and others. How they are dwarfed and defeated by the contrast! On the one side, half-brutish, half-timid questioning; on the other, truth, clear as lightning, crashing into their obscene temples. They are made to stand with Pilate, and Gessler, and the Inquisition. How ineffectual their speech and action! and what a void their silence!” “[John Brown] was not our representative in any sense. He was too fair a specimen of a man to represent the like of us. Who, then, were his constituents? If you read his words understandingly you will find out. In his case there is no idle eloquence, no made, nor maiden speech, no compliments to the oppressor. Truth is his inspirer, and earnestness the polisher of his sentences...” “Treason! Where does such treason take its rise? I cannot help thinking of you as you deserve, ye governments. Can you dry up the fountains of thought? High treason, when it is resistance to tyranny here below, has its origin in, and is first committed by, the power that makes and forever recreates man. When you have caught and hung all these human rebels, you have accomplished nothing but your own guilt, for you have not struck at the fountain-head...”

¹ David Reynolds, *John Brown, Abolitionist* (New York: Vintage Books, 2005), p. 340.

² *Ibid.*, p. 332.

The question is, what would it be like to take such writing seriously if it belonged to the present rather than the past? Thoreau's speech electrified its listeners, it spread far and wide, helped inspire Emerson to take up Brown's cause, and in the end it went far towards rehabilitating Brown's reputation.¹ *One speech* had such influence. *What would it be like* to live in a society where the opinions of a solitary writer-philosopher in Massachusetts mattered?

Ultimately what we find foreign in Thoreau's speech is not merely its archaic and romantic language; it is its *authenticity*. It contains almost no hint of a divided consciousness such as characterizes postmodernity; it is pervaded by a spirit of certainty and righteousness, an almost religious devotion to *principles*. The pithy, forceful language expresses a *certainty of self*, a naïve authenticity that is alien to our own collective consciousness. Thoreau's culture, while riven by internecine conflicts and full of collective doubt, was yet more authentic, less self-conscious, than ours, a fact that made possible the appreciative reception of Thoreau's speech.

Emerson and Thoreau, two of the most famous writers of the time, preached self-reliance, individualism, devotion to principles, integrity, moral reform, civil disobedience. This is indeed why they defended John Brown, going so far as to compare him with Christ. For Brown was far more authentic, self-certain, than even the Transcendentalists, who, on the whole, merely *wrote* about self-reliance and dedication to principles. But these Transcendentalist ideas, which were so celebrated a hundred and fifty years ago, now seem a little hollow, backward, insufficiently nuanced to be truly compelling any longer. We have become too *cynical* for them to grip our minds. Our society is too fragmented, too fast-paced, too solipsistic and technology-obsessed, for Thoreauvian idealism to inspire millions.

The same spirit that animates Thoreau's speech is evident in the popular Civil War song "John Brown's Body," and also in the song inspired by the latter, "Battle Hymn of the Republic."² The univocal, fervidly self-righteous consciousness that speaks through these cultural artifacts doesn't strike us as primitive only because in our encounters with them (the artifacts) we automatically adjust our impressions to take account of the fact that they were produced long ago, in a more heroic and idealistic time. It's impossible to imagine contemporary soldiers singing something like the Battle Hymn of the Republic while waging war. That's the stuff of comedy, of parody. This fact alone shows how distant our world is from John Brown's.

On the other hand, if you place "A Plea for Captain John Brown" beside, for example, the Book of Job or the *Odyssey*, you can see that the latter texts are, in a sense, much more "authentic" or "naïve" than the former, in that they evince less self-reflection, less self-consciousness. That is, they contain no hint of a *pose*, such as appears even in Thoreau's speech—with its calculated eloquence and intentionally lofty imagery—and appears far more so in our own postmodern literature. Thus, there are many possible degrees of cultural self-consciousness, any one of which can apply to a particular society.

This brief paper has raised certain questions and left certain conceptual problems unaddressed; in a longer essay one would have to look more closely at the meanings of "authenticity," "self-consciousness," and "objective spirit," concepts that are invaluable to any cultural analysis that aims to be at all penetrating. For the present, though, we'll have to be content with the tentative suggestions that have been put forward here.

*

Discarded thoughts, which I'll expand on in the longer paper I have to write for that class:

"It must be kept in mind, though, when doing this sort of phenomenological investigation that the 'self-consciousness' in question is not really a tangible *state of mind*, a real conscious state in the mind of every person in a given culture; it is manifest rather in people's behavior, in the functioning of institutions, and can be 'read into' cultural artifacts like music, literature, painting, political documents. This is why

¹ See chapter 14 of *ibid.*

² *Ibid.*, pp. 469, 470.

Hegel called the phenomenon *objective*, not *subjective*, spirit. It is an objective fact about the society, not a state of mind in people's heads..."

"Dostoyevsky's *Notes from the Underground* is more self-conscious, which is to say (implicitly) self-questioning, than *Walden*; and, insofar as the two works were popular in their respective societies, the latter differed in the same way as the works themselves..."

October 28

"In playing, and perhaps only in playing, is the child or adult free to be creative. This consideration arises in my mind as a development of the concept of transitional phenomena and it takes into account the difficult part of the theory of the transitional object, which is that a paradox is involved which needs to be accepted, tolerated, and not resolved." "It is only in being creative that the individual discovers the self [and uses the whole personality]. (Bound up with this is the fact that only in playing is communication possible; except direct communication, which belongs to psychopathology or to an extreme of immaturity.)" Wonderfully suggestive.

Music: for me, soothing. Consoling. Reduction in anxiety. Interpersonal, yes. (Thank you Sacks and Chris of April 14th! You've helped me understand music!) My perpetual desire: overcome anxiety. Not conscious, mostly unconscious. Anxiety, tension. The defining characteristic of modernity. *Flowing* the ideal. *Flowing*. No defenses, no obstructions, no self-consciousness. Musical flowing, self-flowing, self-flourishing. Playing, playing-in-onself, playing *between* oneself and the other. (Winnicott: neither external nor internal; in-between.) *Some* tension is good, necessary for playing—a different kind of tension, different kind of anxiety—tonality exploits that good tension, tonality is *playing*, atonality isn't. Atonality is like *science, math, a task*, a logical puzzle.¹ And logic is not playful. Real music is playful, tense not only on an intellectual but on an affective level. Play: affective. Cognitive too, but not *only* cognitive. The impression of *flowingness* essential—a quality perceivable not through cognition but through affective intuition. No flowingness in atonality. What is flowingness? Going somewhere with relative ease [i.e., spontaneity], coming from somewhere, a *direction* necessary, therefore an element of tension, but essentially not mere *cognitive* tension. (Different kinds of tension or anxiety. How to differentiate them? Some good, some bad. Some, indeed, necessary to biological and psychological functioning, others necessary to play.)

My old question of why self-confidence or charisma is attractive to everyone. What *is* it, in fact? What *is* this quality? If I can answer that then the question of why it's attractive will answer itself. I suspect the answer is: "flowingness." No obstructions, no obstructive self-consciousness. No anxious division between self and other. Play. Charisma is playful. Free. Attractive because playing is the human ideal, it is happiness. Creating. (Self-confirming.) Charisma is creative, self-expressing, self-certain, playful, artistic. Winnicott: connection between transitional phenomena and playing. So, connection between transitional phenomena and charisma or (creative) self-confidence. Creating a middle space between self and other, as with transitional objects. Of the same type as sharing interests—a middle space, exciting, something to *connect* over, to "come together over"—charisma produces the impression of having something in common, or rather has an interpersonal effect *qualitatively similar* to the exciting, 'playful,' 'self/other-division'-dissolving impression of having something in common. This is the source of its power.

I've noted before that being "recognized" by a charismatic person is very self-confirmatory. But this is true also of playing intently, or of conversing about shared interests, or of creating an artwork you're proud of. These phenomena are all similar. If the interpersonal effect of a charismatic person is *uniquely* powerful, it's because such a person is, after all, an other, a concrete other, whose recognition therefore *directly* confirms you—while in the case of the artwork you're merely being *implicitly* recognized, i.e. the other recognizing you is abstract, not concrete. It therefore may, possibly, be less (directly) satisfying than

¹ [That's stupid. Doing math can be playful; it is for mathematicians. But atonality perhaps doesn't *communicate* "play" in the way that tonality does. On the other hand, I'm sure this is all crap.]

having a conversation with someone like Bill Clinton in which (conversation) he laughs with you, likes you, shakes your hand, etc.

Wow, I may have just put to rest the basic lostness I had been experiencing for years with respect to questions about charisma and so on.

Real self-confirmation has nothing to do with correspondence (between, e.g., self and its objectification); it is simply *overflowing*. It is an existential condition, not an ‘epistemological’ condition. Overflowing into the world, submerging the other in your self and your self in the other, so that the concept of “objectification” does not apply. Cf. the paradox of the transitional object. Neither outside nor inside the self. No inner–outer or self–other dualism. That’s self-confirmation, that’s happiness, that’s what we desire and strive for in (virtually?) everything we do.

In cerebral art there is no overflowing. There is careful measurement, analytical separation, a poverty of *creativity* in the true sense, the sense of “spontaneity.” Evidently the capacity to intuit “overflowingness” is within everyone, an unconscious capacity, judging by the universality of people’s reactions to particular artworks, particular charismatic (“demonic”) people, particular activities. An elemental capacity of enormous human importance—as important as the capacity actually to overflow, in play and so on. Closely related to spontaneity.

Destructive kinds of tension versus productive kinds of tension. Blocking versus stimulating.

“...*the resting-state out of which a creative reaching-out can take place*. Free association [in psychotherapy] that reveals a coherent theme is already affected by anxiety, and the cohesion of ideas is a defense organization.” Brilliant, far-reaching observation. The cohesion of ideas is a defense organization.

Trust. The necessity of trust. There’s a lack of trust in modern society, hence anxiety—a play-vitiating anxiety. [...]

Hmm... It occurs to me that playing does entail a self–other division. This is what makes possible its tension. In its strictest sense, then, playing is not simply continuous with “overflowing” or spontaneity, which don’t imply a self–other division. And this is why true play is not compatible with a state of intoxication. But is it possible, after all, to define play with any exactness? I should look at Huizinga again. Play is compatible with quite-high anxiety. But this anxiety is not the destructive kind, the “insecure” kind related to shyness.

Solitary playing vs. shared playing (the *game*). They seem quite different. The painter vs. the two people flirting. The solitary child with his doll vs. the group of children playing cops and robbers. Surely the second kind adds a whole new element of tension, of interpersonal tension and pleasing anxiety. Can one really be considered an extension of the other? Games have *rules*—but, in a way, all play does, doesn’t it? Art has rules. But games have rules in a different sense than art does or dollhouse-playing does.

Joking is playful. Wit is playful. And it evinces a kind of “flowing” (from the unconscious). The tension that characterizes it is not inhibiting; it permits flowingness. All play does. It has spontaneity, comes from the unconscious. I should drop the term “*overflowing*”; it’s misleading, it connotes a threatening of the play-element (*viz.*, a kind of tension).

But is there any so-called tension in transitional phenomena? If not, how can the latter be continuous with playing, as W. argues? Transitional objects are purely comforting, right? But playing, as W. admits, is “inherently exciting and precarious.” Or maybe there’s an element of this with transitional phenomena too. I suspect that’s true, judging by what I’ve read.

“Creative impulses are the stuff of playing. And on the basis of playing is built the whole of man’s experiential existence. No longer are we either introvert or extrovert. We experience life in the area of transitional phenomena, in the exciting interweave of subjectivity and objective observation, and in an area that is intermediate between the inner reality of the individual and the shared reality of the world that is external to individuals.” My journal, my transitional object. My “blankey.”

Playing is not synonymous with “doing anything that’s enjoyable,” though it’s tempting to think it is. But how much do these questions of definition even matter? More than you’d think. We’re trying to get clear on psychological capacities, on the differences between types of activity, on the origin and meaning of certain activities. It isn’t a mere matter of *stipulating* the definition of “play.”

No, I was wrong about having gotten past my “basic lostness.”

October 29

The Republican party is literally trying to disenfranchise new voters in Ohio. (It hasn't been successful yet.) The McCain campaign has said, in an optimistic tone, that many newly registered voters typically don't vote on election day. (Most of such voters favor Obama; hence the optimism.)¹ McCain himself has called Rashid Khalidi, the director of Middle East Studies at Columbia University, a neo-Nazi, and has accused Obama of being friends with him. –This is the slime I try to ignore in my reading and writing. McSlime.

There is no *playing* in what Noam Chomsky does, namely list the ways in which the U.S. government is terrible. There is no real *creativity* in it. [Um, not really true.] In that respect he isn't truly fulfilling his humanity (which consists in playing, creating). *Morally* he is, though, since, arguably, he has a moral obligation to do what he does or something like it.

Winnicott.— Male and female elements in all men and women. Can be dissociated (pathological). Male: instinct, drive, impulse, object-relating that presupposes separateness. Id satisfactions in the baby “that include anger relative to frustration. Drive satisfaction enhances the separation of the object from the baby, and leads to objectification of the object... Object-relating backed by instinct drive belongs to the male element in the personality uncontaminated by the female element.” Oral erotism, oral sadism, anal stages, etc., arise out of the male element. The *female* is simply *being*. Insofar as the infant *is* the breast, *identifies* with it, the female element is at work. “The male element *does* while the female element (in males and females) *is*.” *The pure female aspect has nothing to do with drive or instinct*. It is the basis, though, for self-discovery, a sense of existing. (It seems like it has to do with *receptivity*, while the male has to do with *assertiveness*. But in a particular man, the female element may predominate, while the male element may predominate in a particular woman.)

W. distinguishes between *frustration*, which belongs to satisfaction-seeking, and *maiming*, which belongs to the experience of being. The notion of “maiming” takes into account the frequent viciousness of women's lashing-out. Their violent attacks don't come from *frustration*, from the frustration of not having certain urges satisfied, but from a deficiency in their sense of being. (To say it again: particular women, for example nymphomaniacs, may crave the satisfaction of impulses, but this craving originates in the uncommon strength of their *male* element.) None of this is falsifiable, but it has some plausibility.

The reason, then, why “creative” people are said to be both female and male is that they have both a heightened capacity for receptivity and the ability/desire to *assert*. Both are necessary for, e.g., artistic creation.

Kohut's Tragic Man vs. Guilty Man. The latter in the terrain of instinct or drive, the former in the terrain of...being? Former “feminine,” latter “masculine”?

Internet-date with beautiful Indian from Canada who's getting a Ph.D. in Management. Why is it always the beautiful ones who are boring? It's like clockwork. I broached every subject from business, traveling, politics, Boston, Halloween, speed-dating, music, her family, to philosophy, literature, history, Korea, India... Nothing stuck. She's one of those pathetic snobbish girls who only dates narcissists. The West corrupted her. If she had grown up in India, she'd probably be easygoing and pleasant.

You have no idea how tired I am of females. It may be Tragic Man, but it's Pitiful Woman.

(Like God-knows-how-many artists, philosophers and scientists in history: 28 years old and still no deeply satisfying relationship with a woman. It must be the female element in our personalities that they dislike.)

¹ In other words, the best hope for Republicans lies in a failure of democracy, and they explicitly acknowledge this by *hoping* many people won't vote.

October 30, 31

Sexual foreplay is aptly named. It constitutes play, surely. But intercourse, often, is not play. It's very serious, albeit enjoyable. And yet it seems natural to call oral sex a kind of play. Teasing, titillating, tongue-flicking and licking—that's playful. I'd even say that intercourse *can* be playful, depending on how it's done. The spirit of play can be absent or present. It can be absent in one moment and present the next. In and out of play. We live our lives in and out of play from moment to moment. Is it only "family resemblances," then, given the immense variety of activities that constitute play? How does one define *playing*? The spirit of play is not the spirit of seriousness, but play can be serious and serious activities can be playful. I don't have access to *Homo Ludens*, but luckily the internet exists. "Huizinga's book describes play as a free and meaningful activity, carried out for its own sake, spatially and temporally segregated from the requirements of practical life, and bound by a self-contained system of rules that holds absolutely." That's a plausible-enough definition. Appropriately vague.

Saw Aniela again last night, the Polish woman. Dinner, then spent the night at her place. It's too bad she's leaving next week; we like each other. Her attitude towards me is so rational it's stunning: she likes being with me, thinks I'm "the ideal man," so she... *likes* me. Finds it beyond belief that I don't have a girlfriend. Indeed it is surreal, and always has been.

It isn't an exaggeration to say that "civilization" breeds irrationality. For it makes people (and their world) more complicated than they are in natural conditions, which means that they sometimes act against their interests. It's always a good idea to ask yourself, "What would a Sapa villager be inclined to do in this situation?" The villager has fewer prejudices than the modern person, so his instincts are more sound.

Taking a break from extracurricular reading because I have to write two long papers and do a lot of grading for the Classics class. In one of the papers I want to look at the immigrant situation in Europe to see if there is even a shred of support for the prediction of a "clash of civilizations" made by many Westerners—like Bruce Bawer, in his asinine book *While Europe Slept: How Radical Islam is Destroying the West from Within*—which necessitates a lot of reading. E.g., Samuel Huntington's original article, his book, commentaries, detailed empirical analyses of contemporary Europe and Turkey, etc. Huntington's article is not impressive. Shallow and idealistic.

[...] J. S. Mill: representative democracy is not possible in multiethnic societies. Not always true (Bulgaria, Romania, Slovakia). But look at Yugoslavia, Czechoslovakia, the USSR, Macedonia, Iraq, even India! (India may be in-between.) Obviously Mill's formula oversimplifies.

November 3

"On This Day I Complete My Twenty-Eighth Year." Getting older doesn't bother me as much as it did when I was younger. Life isn't life and death isn't death: truly, the twain do meet.

[...]

Spent last night with Aniela. Concert then her room—cuddling, caressing, feelings of love, sleeping entwined in arms and legs. She gave me two good novels for my birthday. In the morning said she'd had the best dream of her life and couldn't wait for me to wake up so she could tell me. A long time ago—(this part isn't the dream)—she swore to herself she would never fly in a hot-air balloon until she'd found someone who loved her. Well, last night she dreamt for the first time that she was flying in a hot-air balloon, with some guy whose face she couldn't see. Presumably it was me, because, you see, I "love" her. Or, at least, that's what her subconscious thinks. And, who knows, maybe I *could* love her. Anyway I'm very glad I met her.

November 5, 8

Happiness. Obama probably wouldn't have won if the economy had been better, but what matters is that he won. His campaign strategy of taking the high road was not helping him until the Wall Street crash happened; McCain's scurrility paid high dividends (for McCain), even until the end. After all, the popular vote was 52 to 46 in a year when you'd think a Democratic victory would be *totally inevitable* if most Americans were sane.

Thank God! Reagan's atrocious legacy may finally be ending! [Wow. Naïve much?] It's a strange feeling to be able to *hope* again. Obama can't change the world, but let's enjoy the honeymoon while it lasts.

Watched the results last night with Aniela. Then nakedness and sex and happy sleep.

Putin's Russia: Life in a Failing Democracy. Anna Politkovskaya, a courageous investigative journalist who was later murdered for being courageous. Putin's Russia ain't a nice place, judging by this book. "I looked into his eyes," McCain said, "and saw three letters: K...G...B." For once John was right. This book makes me appreciate my country.

President Barack Obama. President Barack Obama. I like saying that. Makes me feel like this country really is mine, or can become so.

Four years ago Obama was an Illinois State Senator. Now he's president of the United States. His race, ironically, was of huge importance in this meteoric rise. (If he weren't black, he wouldn't be president! Now *that's* progress!)

Aristophanes's *Lysistrata*. Old Comedy, "Dionysian" and fairly unself-conscious, overtly sexual, more sexual than New Comedy and modern comedy. Think of children's humor. "The childhood of mankind." And yet it's also mixed with sophisticated satire and some irony. (Compare Old Comedy and Aeschylean tragedy, and New Comedy and Euripidean tragedy.)

Piano concert at Longy last night—Schumann, Schubert (Moments Musicaux), Brahms, Chopin 3rd sonata—Aniela and I together sitting hand in hand her head on my shoulder. Then Bacchic debauchery at a party with ESL students. Back to Aniela's apartment, where, for some reason, I cried in her arms drunkenly, and she actually said while looking into my eyes, "I love you." In the morning our usual cuddling and quiet talking, then a delightful bout of lovemaking—taking her from behind, "glorying in the very stink and sweat that rose from her arse," her belly flat on the bed and legs stretched out together straight behind as I dug my fingers and prick into the fleshy pink cleft that clenched around me like my teeth biting her buttock and my hand grabbing her tit, then raising her to be a dog and pummeling away at her inflamed moaning flesh. A fine body she has, very fine. (Fine face too, somewhere between Franka Potente and Sting. Short hair dyed dark-purple, boyish and cute.) Went to the airport this evening, said our goodbyes; she plans to return to the States in the spring.

[...]

Regrets

I feel as though I gave too little
and kept too much;
and so too much was lost
and little will last.

November 10

Predictions: Obama will be a centrist, not a "transformational figure." Bush and Cheney will not be prosecuted for their crimes. Osama bin Laden will not be caught, but terrorism will slowly start to

decline. American education will not significantly improve. Obama will not address global warming aggressively enough, nor will he establish universal health insurance, but his efforts with respect to the latter issue will be more satisfactory than with respect to the former. He will fail almost entirely at cleaning up the corrupt lobbying culture.

It's too bad Howard Dean never became president; he's more progressive than Obama. I hope he joins Obama's Cabinet. Remember in 2004 when everyone thought it was a dreadful mistake to choose Dean as DNC Chairman? I never understood the reasoning behind all the pessimism; personally, I was optimistic. I thought he'd be excellent at his job. And I was right. Look at where the Dems are now.

Obama, please don't be another Clinton! Don't choose Larry Summers as Treasury Secretary. Summers, Rubin and Greenspan are mainly responsible for our economic problems; it makes no sense to appoint Summers to a Cabinet post. He's a neoliberal ideologue, not as bad as Greenspan or Henry Paulson but not much better. Transformational change will not happen with Summers at the helm. Besides, the guy is a total asshole. He's a terrible person, not because of his "political incorrectness" but because of his personality and his opinions on economic and social priorities.

What's going to happen to the Republicans? Four years after Karl Rove and his ilk were talking about a permanent Republican majority, the party is in tatters. It's no longer possible to be an intelligent, open-minded, un-bigoted person and believe in the Republican ideology of social and economic conservatism. [...]

November 14, 15

Why are modern women obsessed with shoes? They often buy dozens of pairs, and they carefully take note of the shoes that a man is wearing at a bar or on a date. If they aren't impressed with your shoes, you may have already lost your chance. Maybe a partial answer is that shoes are an eloquent and powerful expression of masculinity and femininity. Masculine shoes exude simple self-confidence: they're one color, a dark color, they're comfortable, ideally they're polished and have an attractive, confident shine. Feminine shoes, on the other hand, definitely don't exude self-confidence: often they're garish (they're supposed to be), they have heels—high heels to give the illusion of height—they wobble perilously every time she takes a step, they're petite, they're uncomfortable. So the woman wants to be sure she looks feminine, and she wants her man to look masculine.

There are other explanations, but I'm bored.

Culturally, what has America contributed to the world? Quite a lot. A number of artistic and intellectual movements have originated in America. But let's look at music. What do we have? Ragtime, blues, jazz, rock, rap, and their offshoots. Do you notice a common thread? It's stunning: all these movements grew out of the African-American experience. It was blacks, not whites, who gave us this music. And all of it has an essential *freedom*, an improvisatory element. Originally it didn't even have to be written down.¹ How much less "American" would America be without (the descendants of) its black forced-immigrants!

November 22 to December 10

Saw Chomsky give a talk at a church downtown. His creaking, cracking, croaking voice. Brief and not satisfying but insightful as ever.

Lonely hours.— "Preserve your memories," says Paul Simon; "they're all that's left you." Well, what if you don't have any memories? Then you have nothing.

¹ On the other hand, classical music too, in its origins, was quite improvisatory.

Being a station-manager, Aniela sometimes has to go to high-class parties with Polish celebrities and businessmen and the like. Went to one tonight; came back and wrote me this email about how much men suck:

It was very short party for me! I'm very angry! Why men look at me like a sexual object? Why men see in my eyes only their penises and what if I need something different? What about my personality? Why I often meet a lot of idiots, imbeciles, cretins? I'm sick of stupid people! My party was disgusted! Too many idiots! I want to tell you something. Could you imagine it? It's a typical situation, when you are at the party. One of men was starting to talk with me "Hi honey! (?) I'm Peter! You look fantastic and very sexy! You know, I'm a business partner for your company, very rich person and my comfortable car is on the street now near the restaurant. Do you want to go with me to the hotel? Do you want to fuck with me?" Wow! Such a interesting conversation! I told him "Sorry, I don't interested in you. Please, go away and leave me alone! I don't care about that!". When he was walking away he called me BITCH! Wow! That's going too far! It was my fantastic "glamour" party. So, I always have this same problem! Often animals are more intelligent than people! I need somebody who can use brain, not only penis!!! It isn't high standard, I think. My life style is different! Sometimes I don't understand men! You're a man! Could you explain me why men are often so stupid? Is it normal? What about my feeling? I'm sorry Chris, I don't disturb you. I know you are very busy now, but I'm only in a bad mood. I know tomorrow is new day, new chance to be happy...

Could you hug me when you will go to sleep?

Miss you.

Speaking of men being animals, the first day I saw Aniela I was carried away by the sexiness of her tight jeans hugging her buttocks.

Paper below that I wrote for a class, though that was only the pretext. It's more than twice as long as the prof wanted it so I'll have to cut it down, but my purpose was to write something publishable. The prof is a dipshit—one of the worst classes I've ever taken.

Three weeks ago I knew next to nothing about the Islamic world; but *now*...I still know next to nothing. But at least I disguised that well. I'm not satisfied with the paper, though: it wasn't ambitious or theoretical enough. [And it's badly written.]

“Eastern Muslims” and “Western Liberals”: Ne'er the Twain Shall Meet?

Among the many competing visions of Europe's future, two in particular have a strong hold on the academic and the “policy-analytical”¹ mind. The reason for the appeal of these two visions, both of which I shall describe momentarily, is that they have the characteristics of overarching narratives, indeed of “metanarratives,” to quote Jean-François Lyotard.² John Stephens defines a metanarrative as “a global or totalizing cultural narrative schema which orders and explains knowledge and experience.”³ The great

¹ By that term I'm referring to the so-called policy analysts who so eagerly and prolifically offer their interpretations of politics to the educated public.

² See Lyotard, *The Postmodern Condition: A Report on Knowledge* (Minneapolis: University of Minnesota Press, 1979).

³ Stephens, *Retelling Stories, Framing Culture: Traditional Story and Metanarratives in Children's Literature* (New York: Garland Publishing Inc., 1998), 6.

monotheistic religions are metanarratives; Marxism-Leninism is a metanarrative; Francis Fukuyama's famous thesis about the end of history is a metanarrative. Postmodernists like Lyotard argue that metanarratives as such are unsound, oversimplifying, intellectually dishonest. It seems more circumspect, however, to say that, while one should always be suspicious of a belief-system that claims to be the definitive interpretation of a diverse set of social phenomena, such theories should not be forbidden *a priori*. They should simply be evaluated on their merits, tested in the crucible of empirical reality; they should be treated like any other hypothesis. It may, after all, be the case that there *are* broad historical tendencies and trends, and accordingly that a so-called metanarrative (which picks out these tendencies) may be true, i.e. may be a satisfactory scientific interpretation of the world.

Let us, therefore, consider the two abovementioned theories and not scorn them because of their ambitiousness. The first is defended in Mark Leonard's (unacademic) book *Why Europe Will Run the Twenty-First Century*.¹ Leonard's vision of the future—which in some respects is a version of revisionist Marxism²—is actually three (related) visions. First of all, he argues, the EU-model of governance and regional economic integration represents the future: more and more areas of the world will find it necessary to do as Europe has done and “form a common market with coordinated macroeconomic policies in different sectors, [for example] foreign trade, agricultural, industrial, and fiscal.”³ Europe has paved the way: the successes of the EU have inspired such institutions as NAFTA in North America, MERCOSUR in South America, ASEAN in Southeast Asia, SAARC in South Asia, APEC in the Pacific region, and so on. Globalization has proceeded to such a point, in fact, that regional organizations like the EU have, arguably, become *structurally* necessary for global stability, so much so that they may gradually eclipse the nation-state in importance. This narrative of the decline of the nation-state and the rise of regional and interregional organizations is sometimes conflated with the second “vision” I just mentioned, namely that Europe, being the most successful of these regional units, will succeed the United States as the world's superpower, or at least will have no trouble holding its own against China and America in the twenty-first century. And the new age of Europe will approximate Kant's ideal of “perpetual peace,” precisely because of the nation-state's decline and regionalism's rise.

The third aspect of this first narrative is the spread of liberal democracy and social equality around the world. Global integration in capitalist conditions arguably requires moves toward political liberalism insofar as it necessitates the rule of law, social and political stability—since entrepreneurs are averse to investing in unstable regions—significant freedom in the market, and, partly as an outgrowth of these factors, measures to ensure some individual liberty. Arbitrary, repressive governance hinders capitalist development; therefore, arbitrary and repressive governments tend to be undermined as capitalist development intensifies. Democracy, on the other hand, is promoted, partly because social and political stability are difficult to achieve if the majority of the population is denied a political voice. Later in the paper I'll speculate further on why capitalism—in the long run—seems to give birth to democracy—to *liberal* democracy, given the “liberal” requirements I mentioned a moment ago.

The foregoing, then, constitutes one popular narrative. Its predictions of the future are optimistic.

Contrasted with these encouraging prophecies are the apocalyptic ones that take their cue from Samuel Huntington's “clash of civilizations” thesis, which is the framework for the second theory I want to examine. In the age of Al Qaeda and Bush's “war on terrorism,” the most popular narrative in the Huntingtonian vein is the one that emphasizes the clash between Islam and the West. Bruce Bawer's hyperbolic book *While Europe Slept: How Radical Islam Is Destroying the West from Within*⁴ is symptomatic of this thinking, which sees Europe's problems with Muslim immigrants as, first, a sign of the threat that radical Islam poses to liberal democracy and Western civilization, and, more specifically, a threat to the very existence of Europe as we know it. That the West will prevail in this epic struggle is, according

¹ (New York: PublicAffairs, 2005)

² I'll elaborate on that claim below.

³ *Ibid.*, 136.

⁴ (New York: Doubleday, 2006) See also Robert Spencer's *Onward Muslim Soldiers: How Jihad Still Threatens America and the West* (Washington, D.C.: Regnery Publishing, Inc., 2003), a book as laughable as Bawer's.

to these observers, by no means a foregone conclusion. Liberal democracy and global integration are perceived as “delicate flowers,” the flowers of the West, which must be protected at all costs from the gathering tempest of Islamism.

As I have summarized these two grand narratives, they might not strike one as very scientific or plausible. Nor might it appear that they are necessarily opposed to each other, given that, by and large, they apply to two different realms of social reality: the first presumes to locate inherent tendencies in the global economy and politics toward regionalism, toward international, cooperative management of economic and political affairs, toward liberal democracy, toward a reduction in the sort of conflicts (territorial, economic, armed) that have historically been engendered by the nation-state system; the second largely ignores the economic tendencies of global capitalism and focuses on the conflicts between cultures that result from globalization. If formulated in a certain “scientific” way, I believe these two positions *can* be compatible with each other—can, indeed, reinforce each other. Nevertheless, they come into conflict if the encounter between the “West” and “Islam” is exaggerated, as it often is, to the point of being called *the* fundamental issue of our time, *the* major consequence of globalization, *the* tendency that overrides all others.

I’ll argue in this paper that the so-called threat posed by Islam (to Europe and to Western society as a whole) is not as dire as Huntington and others suggest. Indeed, there is virtually no “threat” at all. The first narrative I described above is far more cogent and explanatorily powerful than the second. I will establish this claim initially on the basis of a few theoretical considerations but in particular by looking at recent developments in the Islamic world that are more consistent with our “optimistic” than our “pessimistic” narrative. In the paper’s second section I’ll explain why I believe that Europe, which is often portrayed as a cauldron of cultural conflict, is not particularly endangered by its Muslim population. This fact will, again, militate against any Huntingtonian theory.

The major lacuna in this paper will be the lack of attention devoted to the decline of the nation-state. I hope, however, that my analysis will at least “obliquely” support the hypothesis of the nation-state’s relative decline.

The Islamic World

Samuel Huntington’s book *The Clash of Civilizations and the Remaking of World Order* has been devastatingly criticized since its publication in 1996, and I won’t rehash all its faults here. The only reason I mention it is that it is the classic statement of a mode of thinking that has become wildly popular in the years since September 11, 2001, to the extent that the book’s thesis is now a part of the collective consciousness of the West, indeed of much of the world. (I’m not saying that everyone agrees with it.) Huntington expressed it in his original *Foreign Affairs* article in 1993 as follows:

It is my hypothesis that the fundamental source of conflict in this new world will not be primarily ideological or primarily economic. The great divisions among humankind and the dominating source of conflict will be cultural. Nation states will remain the most powerful actors in world affairs, but the principal conflicts of global politics will occur between nations and groups of different civilizations. The clash of civilizations will dominate global politics. The fault lines between civilizations will be the battle lines of the future.¹

The main “clash” that people pay attention to now is between the Muslim and the Western “civilizations,” but Huntington also distinguishes between the Confucian, the Hindu, the Latin American, the Japanese, the Buddhist, the Slavic-Orthodox, and the African civilizations.

Huntington’s analysis is enormously oversimplified and crude; he basically ignores the messy concreteness of socioeconomic reality in favor of making sweeping generalizations about religions, cultures

¹ Huntington, “The Clash of Civilizations?” *Foreign Affairs* (Summer 1993).

and “civilizations”—concepts so abstract as to be nearly empty.¹ And yet the framework he defended has millions of adherents in, especially, Europe, America, and certain Muslim countries. The question “Why?” is not hard to answer: oversimplified metanarratives are attractive in that they reinforce the believer’s self-identity and allow him to classify and thus “understand” a huge variety of phenomena.² They simplify the world. This in itself is not a vice; every theory is something of a simplification, and humans could not function without simplifying their world to make it intellectually manageable. The very act of conceptualizing involves an element of “simplifying.” But there are good simplifications and there are bad simplifications, “true” simplifications and “false” ones.

The minuscule kernel of truth in Huntington’s theory is that people from different societies can potentially, under certain conditions, develop hatred for each other, for the “Other,” and become violent in their hatred. This is what has happened in the case of some radical Muslims in the Middle East, Europe, and several other regions; it is also what happened to many Americans after September 11th, when the country rose up in fury against the Other and advocated annihilation of the Middle Eastern “enemy.” This fact of *potential* hostility towards people not from one’s own society or “civilization”³ has been true throughout history; it is not new to the post-Cold War world. But such hostility is by no means always a reality: usually, in fact, it is not. Most Americans are not *hostile* but rather *indifferent* towards Latin American society (or “civilization,” in Huntington’s terminology); they are not hostile towards traditional Hindu, Buddhist, Confucian, Japanese culture. But they *are* towards Muslim society, or at least certain aspects of it; and some Muslims are hostile towards the so-called West. The interesting question, then, is, “*Under what conditions* does a ‘clash’ break out between people of different backgrounds, ideologies, or cultures?” Huntington and his followers essentially ignore this question.

It is useful to recall here the wisdom of Marxism as filtered through Barrington Moore, the famous sociologist. In his classic *The Social Origins of Dictatorship and Democracy*, he chastises sociologists and historians who use “cultural,” as opposed to socioeconomic, explanations—people like Huntington and everyone else who blames Muslim “culture” for the problems of terrorism, immigrant-assimilation (or lack of it) in Europe, etc. The problem with cultural explanations, argues Moore, is that they imply a conception of “social inertia” which is unsound:

There is a widespread assumption in modern social science that social continuity requires no explanation. Supposedly it is not problematical. Change is what requires explanation. This assumption blinds the investigator to certain crucial aspects of social reality. Culture, or tradition...is not something that exists outside of or independently of individual human beings living together in society. Cultural values do not descend from heaven to influence the course of history. They are abstractions by an observer, based on the observation of certain similarities in the way groups of people behave, either in different situations or over time, or both... To explain in terms of cultural values is to engage in circular reasoning. If we notice that a landed aristocracy resists commercial enterprise, we do not *explain* this fact by stating that the aristocracy has done so in the past or even that it is the carrier of certain traditions that make it hostile to such activities: the problem is to determine out of what past and present experiences such an outlook arises and maintains itself...

¹ For succinct criticisms of Huntington, see the following: Edward Said, “The Clash of Ignorance,” *The Nation* (Oct. 4, 2001); Sandra Buckley, “Remaking the World Order: Reflections on Huntington’s *Clash of Civilizations*,” *Theory & Event* 2, No. 4 (1998); Carl Gershman, “The Clash within Civilizations,” *Journal of Democracy* 8, No. 4 (October 1997).

² [This explanation, of course, is inadequate, in that it says nothing about the utility of Huntingtonian propaganda to political and economic power-structures in Europe and the United States.]

³ It’s worth noting that this fact is totally vacuous, because hostility is “potential” everywhere, not only between cultures. Indeed, it is *actual* everywhere: intraculturally, interpersonally, intrapersonally, etc.

The assumption of inertia, that cultural and social continuity do not require explanation, obliterates the fact that both have to be re-created anew in each generation, often with great pain and suffering. To maintain and transmit a value system, human beings are punched, bullied, sent to jail, thrown into concentration camps, cajoled, bribed, made into heroes, encouraged to read newspapers, stood up against a wall and shot, sometimes even taught sociology. To speak of cultural inertia is to overlook the concrete interests and privileges that are served by indoctrination, education, and the entire complicated process of transmitting culture from one generation to the next...¹

Just as “cultural values” are transmitted from generation to generation only if very specific socioeconomic and political conditions obtain—and hence it is these *material conditions* that do much of the explanatory work vis-à-vis any given social phenomenon—so masses of people see it as a “cultural value” to destroy the “Other” largely because the concrete, material conditions in which they live have somehow encouraged them to desire the Other’s destruction—or, rather, have encouraged them to *invent* an Other that has to be destroyed.

Therefore, let’s set aside the hypothesis of a clash of cultures: it has no explanatory value, it is question-begging. It isn’t even really a true hypothesis: it simply states the problem that has to be explained, namely why it is that so many Muslims have become hostile to the West, and how this conflict is likely to unfold.

But what narrative can take its place? We all crave a narrative (in every facet of our life), but we also want it to be *true*, i.e. an explanation of the world. Can we replace Huntington’s sterile question-statement with something like a true narrative of the modern world?

One venerable narrative, dating from 1848, suits our purposes. The world has in recent years sloughed it off and let it mold by the wayside, but too many of its prophecies have been vindicated for persistence in this neglect to be reasonable. I am referring, of course, to Marxism—or, to speak more prudently, a revised and updated version of Marxism. To mount a defense of this system would require a long book; here I will present only a skeletal sketch of one aspect of its account of capitalist development, an account that supports the ideas I attributed to Mark Leonard above.² This sketch, supplemented with a little history, should enable us to put in perspective the challenge posed by radical Muslims to Western society.

Karl Marx was the first to predict what everyone by now recognizes as a truism: capitalism will eventually spread across the entire world, for it is inherently expansionist.³ What the economic reasons are for its tendency toward explosive growth need not concern us. What matters is that, from its humble beginnings in feudal England and the Netherlands, the capitalist mode of production established itself first in Western Europe, then in North America, and then slowly, brutally, in Russia, Japan, Latin America, Africa, India, and so on, and it is still expanding (or consolidating its prior advances) to this day—into China and South Asia, the Middle East, Eastern Europe, remoter parts of Africa and South America, and it has a long way to go in Russia and India. What is important for us to notice is that its evolution has not been peaceful: at every step of the way it has faced violent resistance, and it has used violence itself without compunction.

¹ *The Social Origins of Dictatorship and Democracy* (Boston: Beacon Press, 1967), 485, 486.

² In fact, on one construal, the ideas *constitute* an aspect of (“revisionist”) Marxism.

³ See the *Communist Manifesto*: “The need of a constantly expanding market for its products chases the bourgeoisie over the entire surface of the globe. It must nestle everywhere, settle everywhere, establish connections everywhere... The bourgeoisie, by the rapid improvement of all instruments of production, by the immensely facilitated means of communication, draws all, even the most barbarian, nations into civilization... It compels all nations, on pain of extinction, to adopt the bourgeois mode of production; it compels them to introduce what it calls civilization into their midst, i.e., to become bourgeois themselves. In one word, it creates a world after its own image.” Marx’s main mistake was that he got the timeline wrong.

Consider Russia during the last decades of the Tsarist regime. Industrial capitalism was just beginning to force itself on a society that was still semi-feudal, in which the immense majority of the population consisted of peasants who had recently been freed from serfdom. (Serfdom was abolished in 1861.) One has but to read Maxim Gorky's autobiography to get a sense of how miserable life was then for the destitute masses. In 1917, the sufferings of the peasants, the factory workers and the soldiers were at a peak and the country was descending into chaos. The Tsar abdicated, a Provisional Government was formed, and the party that ended up gaining power was the one supported by many of the peasants, the soldiers and the workers, namely the Bolsheviks. The masses hated what they had seen of capitalism, so, naturally, they supported a party that promised to rid the country of capitalism.

Every region of the world has had to come to terms, in its own way, with capitalist encroachment and the inevitable undermining of traditional social structures it entails. The "clash of civilizations," in this sense, has been going on at least since the 1300s, when nascent capitalism started emerging in the interstices of feudal society. Centuries later it came into contact with other areas of the world, such as China and India, initiating an era of world-convulsions. China in particular has had a turbulent history for the last century and a half. For instance, in reaction to the empire's economic problems, social unrest and political humiliation at the hands of the Western powers, the Taiping Rebellion broke out in the 1850s. Its inspiration and unifying ideology was not Confucian or Buddhist; it was Christian. The rebellion failed, so the imperial regime staggered on until 1911, when a revolution toppled it and Sun Yat-Sen declared China a republic. But the country remained unstable; the majority of the population continued to live in poverty and misery, and after decades of ideological and military conflicts the Communists came to power. Mao Tse-Tung went a long way toward erasing China's traditional social structure with his Great Leap Forward and Cultural Revolution, but by the late 1970s China's leaders understood that they had to adopt capitalist reforms if their country was to survive. So now, like Russia and India, the nation is finally integrating itself into the capitalist world order.

In whatever area of the world you investigate, you find that people cope with social change by using the tools they have at hand. Ideologically, for example, people adhere to whatever belief-system provides the narrative they find most persuasive and most comforting in light of their social conditions. A peasant in Latin America might cope with poverty by appealing to Christianity; an intellectual in the same society might subscribe to Marxism because it provides a counter-narrative to the hegemonic "neoliberalism" and because of its fruitfulness for activism. Millions of Russians after the Revolution repudiated their former Christianity in favor of Marxism because the Bolsheviks were doing the most to remedy Russia's ills and restore national pride. In the Middle East, on the other hand, Marxism didn't have much success partly because there already existed a powerful ideological consolation and a counter-narrative to the West's, namely Islam. And the reason there has been both widespread opposition to the West and a revival of religion is not that there is any supposed necessity of inter-"civilizational" conflict or the presence of a Middle Eastern cultural "essence" or of massive cultural inertia or "the weight of tradition," but simply that—as with Russia, China, India, and other countries—specific socioeconomic and political events and conditions have fostered discontent.

Before looking at these conditions, it may be helpful to state once more the argument of this paper. In brief: the resurgence of Islam in the past decades is due ultimately to societal upheavals inevitable during the extended transition from feudalism and tribalism to capitalism. *[No! That's ridiculously oversimplified! Idiot!]* This broad claim should be uncontroversial. Since the 1400s, every society progressing towards mature capitalism has experienced ideological and political revolutions/reactions. [...] And the Islamic world has had its flirtations with Arab nationalism, with socialism, with constitutional monarchies, and, perhaps more lastingly, with Islamism. Upon surveying all the wreckage, one sees that most societies that have achieved relative stability and a genuinely "mature" capitalism, such as the United States, Western Europe, Japan, South Korea, and Taiwan, are liberal democracies. Perhaps one could find counter-examples, but the evidence is compelling: liberal democracy seems to be uniquely suited to mature, stable capitalism. I'll speculate later on the reasons for this, but, in any case, the fact supports the hypothesis that inherent in capitalism is a long-term "tendency" toward liberal democracy. What I will argue, therefore, is that as capitalism continues its penetration of the Islamic world we will see moves toward democracy and

liberalism and away from theocracy and, eventually, Islamism. In the end, the entire world is marching (very slowly!) toward, on the one hand, liberal democracy and social equality for all groups of people, and on the other hand, a partial decline of the nation-state and the rise of regionalism and globalism. My discussion of Europe in the second section will bear out this thesis by showing that Muslims are not the danger there that they are sometimes thought to be.

[Stupid amateurish idiot.]

To resume the thread: what have been the specific causes of the worldwide strengthening of Islam? (Identifying the causes will allow us to make a prognosis.) First we have to distinguish between four aspects of the phenomenon: (1) political regimes that, to varying degrees, are associated with Islam, for instance Iran, Saudi Arabia and Pakistan; (2) mainstream Islamists, such as the Muslim Brotherhood, who are more extreme than the majority of believers but less extreme than the bin Ladens and al-Zawahiris; (3) the fringe fanatics in every Muslim society, the jihadists; (4) the masses of ordinary believers, comparable in most respects to ordinary Christians in the United States. To some extent these effects do not all have the same causes, and their fates correspondingly will diverge.

Many works have been published explaining the nature and causes of each of these four phenomena;¹ here I will only touch upon the circumstances associated with the latter two. In his excellent book *The Far Enemy: Why Jihad Went Global*, Fawaz A. Gerges gives a detailed history of the rise of recent anti-American jihad, as distinguished from jihad against local Muslim rulers (in Egypt, Saudi Arabia, Algeria, etc.) who are viewed as corrupt and beholden to the West. What is important for our purposes is, first, that no form of jihad has been “structurally inevitable” in the way that, e.g., the expansion of capitalism and the consequent spread of liberal-democratic ideologies are. On the most basic level, Islamic extremism has been a reaction to “the failure of secular governments to promote good governance and economic advancement in most Muslim countries.”² More specifically, the jihadist movement is

nourished on a diet of political persecution and suffering... The bloody history of official torture and persecution perpetuates a culture of victimhood and a desire for revenge and enables the movement to mobilize young recruits and constantly renew itself. Arab/Muslim prisons, particularly their torture chambers, have served as incubators for generations of jihadis... As long as Muslim governments violate the human rights of their citizens and sanction abuse, they will continue to breed radicalism and militancy.³

In large part, therefore, it is governments’ *policies*—including the United States’, which supports many autocratic regimes⁴—that are responsible for jihad. If different policies are followed, it is likely that the support for jihad among young Muslims will diminish.

Secondly, the common perception that Islamic extremism is a well-organized, semi-monolithic movement is completely false. Even such groups as Al Qaeda (during its heyday before the Iraq war) are poorly organized, “amateurish” in fact.⁵ “Personalities in jihadist circles are more important than organization...”⁶ For instance, the picture that emerges from the 9/11 Commission Report is that before

¹ See, for example, Reinhard Schulze, *A Modern History of the Islamic World* (New York: I. B. Tauris & Co. Ltd., 2000); Henry Munson, *Islam and Revolution in the Middle East* (Binghamton, New York: Vail-Ballou Press, 1988); Michael Oren, *Six Days of War: June 1967 and the Making of the Modern Middle East* (New York: Oxford University Press, 2002); Fawaz A. Gerges, *The Far Enemy: Why Jihad Went Global* (New York: Cambridge University Press, 2005). The origins of the contemporary Islamic revival can be traced to the late 1960s, with the humiliating Arab defeat in the Six Day War and the popular hatred of inept, brutal U.S.-backed dictators like the Shah of Iran.

² 2002 report on the “Causes of Islamic Extremism” from the U.S. Institute of Peace, at <http://www.usip.org/peacewatch/2002/6/extremism.html>.

³ Gerges, *op. cit.*, 9.

⁴ For elaboration of that claim, see Robert Dreyfuss’s *Devil’s Game: How the United States Helped Unleash Fundamentalist Islam* (New York: Macmillan, 2006).

⁵ Gerges, *op. cit.*, 41.

⁶ *Ibid.*, 37.

2001, Al Qaeda was practically synonymous with Osama bin Laden.¹ Gerges agrees: “Al Qaeda was—and still to a lesser extent is—synonymous with bin Laden and his close confidants, with no independent institutional anchor... It is unlikely to survive [bin Laden’s] demise...”² The salient feature of the global jihadist movement is its reliance on *personalities*, on charismatic individuals like bin Laden and al-Zawahiri. This fact has obvious implications with respect to the long-term institutional durability of jihadist groups.

The fragmented and amateurish nature of jihadist networks unfortunately does not prevent them from occasionally inflicting high casualties in their attacks. The world was reminded of this by the Mumbai tragedy of November 2008, in which over 170 people were killed. It appears to have been an unusually well-coordinated series of attacks. “An attack of this nature,” writes Bill Roggio, a military blogger, “cannot be thrown together overnight. It requires planning, scouting, financing, training, and a support network to aid the fighters.”³ Speculations abound that the Pakistani government or Pakistani militant groups were involved.⁴ As of this writing, the truth has not been uncovered.

Days after the Mumbai attacks, a report was released by the Congressional Commission on the Prevention of WMD-Proliferation and Terrorism that gave a dire prediction: “Without greater urgency and decisive action by the world community, it is more likely than not that a weapon of mass destruction will be used in a terrorist attack somewhere in the world by the end of 2013.”⁵ “Nuclear terrorism is still a preventable catastrophe,” but to prevent it would require a dramatic toughening of the Nuclear Non-Proliferation Treaty, among other provisions.⁶

In short, despite their usual incompetence, terrorist groups remain capable of wreaking destruction and undermining social progress. However, there is nothing *inevitable* about Islamic terrorism. It is loathed, not supported, by the immense majority of Muslims (see below). Despite decades of violence it has failed to obtain access to weapons of mass destruction, and it may be forever stymied in that objective if governments can coordinate effective policies. Moreover, recruits for terrorism will be ever harder to find if the counterproductive policies of past and current governments are remedied. “The volume of Saudi volunteers for *jihad* in such places as Iraq, Afghanistan and Lebanon appears to have markedly shrunk...[primarily because] the fading of Iraq as a terrorist paradise and the increasing effectiveness of policing elsewhere have produced a more hostile global environment for jihadist radicals.”⁷

Now, given the social conditions in many Muslim countries, it would be understandable if a high proportion of Muslims were attracted to fundamentalism, indeed to violent extremism. Consider these conditions:

For more than five decades, the peoples of the Middle East and the Islamic worlds have lived in a vortex of social change. Once rural if not tribal, they now seek a better life in megalopolises so polluted that the very act of breathing is dangerous to their health. Except for the wealthy minority, there is little but squalor. The extended families, that massive network...that once provided the foundation of Middle Eastern society, are beginning to crumble... Social despair is paralleled by economic despair. Middle Eastern universities are bursting at the seams, but there are few jobs for graduates... A narrow class of merchants, speculators, and industrialists has become inordinately wealthy under the new economic order, but the masses have not. Things have become worse, not better...⁸

⁸ Monte Palmer and Princess Palmer, *Islamic Extremism: Causes, Diversity, and Challenges* (New York: Rowman and Littlefield, 2008), 18, 19.

“With governments as oppressive and ineffective as they are corrupt, it is only natural that many Muslims have sought salvation in their religion.”

And yet, as has been documented repeatedly, the vast majority of Muslims in the Middle East are not Islamists and certainly not jihadists. Monte Palmer and Princess Palmer estimate, based on surveys, that 75% of Muslims are quite moderate, 20% (in Egypt and Lebanon, at least) would feel comfortable living in an Islamic theocracy, and the remaining 5% is split between non-believers and “fanatics.”¹ The Pew Research Center reported in 2005 (at the nadir of the war in Iraq, when anti-Americanism was at its peak) that Muslim attitudes toward terrorism and jihad had become increasingly *negative*: “in Turkey, Morocco and Indonesia, 15% or fewer now say [suicide attacks] are justifiable; in Pakistan, only one-in-four now take that view (25%), a sharp drop from 41% in March 2004; in Lebanon, 39% now regard acts of terrorism as often or sometimes justified, again a sharp drop from the 73% who shared that view in 2002.”² Gerjes concludes that “bin Laden and his transnationalist cohorts have lost the war of ideas—the struggle for Muslim minds.”³ Again, this is particularly significant in light of the public relations disaster that was the Iraq war.

It appears likely, moreover, that with the election of Barack Hussein Obama, anti-Americanism will decrease throughout the Islamic world, even fewer recruits will be available for jihad, and American foreign policy will be less counterproductive than it was under George W. Bush. For example, Obama has vowed to end the Iraq war, a promise that Muslims overwhelmingly support and a policy that could end up indirectly defusing sectarian tensions in Iraq. Similarly, a more conciliatory stance than Bush’s toward Iran might strengthen moderates and reformists in that country.⁴

Indeed, frustration with Islamic regimes is palpable. According to recent polls in Iran, 84% of university students are dissatisfied with the clerical state and only 6% of students watch or read religious materials.⁵ One analyst argues that Islamism has already failed in Iran.⁶ The younger generations—i.e., people under the age of 30, who constitute over 60% of Iran’s population⁷—have been utterly disillusioned by the reactionary government. “Power has corrupted religious institutions and discredited the idea of Islamic values in government.”⁸ Economic problems have contributed to the frustration: most urban men and women have at least a high school education, but “data from 2005 show that while 90% of men have left school by age 23, it is not until age 29 that a corresponding percentage of men have found employment. The situation for young women appears bleaker: while their levels of educational attainment do not differ greatly from those of their male counterparts, the same data set shows that even by their late 20s, only 20% of them are employed.”⁹ The popularity of Western culture—be it fashion, music, movies, even ideologies—stokes the ferment for change.

The Saudi Arabian government, too, is facing popular pressure. As in Iran, there are demographic problems: population growth averages about 3.5% annually, which means that the country must create between 260,000 and 500,000 new jobs every year, which is not happening.¹⁰ Since the number of foreign workers continues to rise, the number of unemployed among locals does as well. Widespread political corruption is another source of discontent among the populace.¹¹ Many women, too—who cannot vote or drive cars—are demanding change: while they constitute more than half of all university graduates, they

¹¹ Ibid.

represent about 5% of the kingdom's workforce.¹ Progress is being made, though: King Abdullah, who is supportive of reform, proclaimed in 2008 that he would issue a royal decree giving women the right to drive.² And in 2005 Saudi Arabia had its first-ever municipal elections across the kingdom. Officials say that in the 2009 elections, women will be allowed to vote.³

Like Saudi Arabia and Iran, Pakistan has a population whose majority does not support its government's traditional friendly relations with Islamists.⁴ Historically, despite the state's manipulations on behalf of Islamic parties, they have usually captured less than 8% of the vote in elections,⁵ a trend that continued in the elections of February 2008.⁶ Ideology seems less important to most Pakistanis than quality of life. And the latter is poor: one-third of the population lives in poverty; only 35% is literate; health care and other social services are in decline while the annual population growth rate is 2.7%.⁷ The majority will support whichever political party can improve their social and economic position. And politicians recognize this, which is why they are increasingly pragmatic rather than ideological. Vali Nasr compares political trends in Pakistan, Bangladesh, Indonesia, Malaysia, Turkey and other countries to European Christian Democracy in the twentieth century: "Muslim Democracy" takes whatever it can use from Islam and from liberal and secular ideologies, whatever it needs in order to gain power and get things done.⁸ The tremendous success of anti-Taliban, anti-Islamist parties in Pakistan's recent elections shows that the populace supports this strategy.

One could list for pages and pages, hundreds of pages, such reasons as the foregoing to think that liberalization and democratization represent the future of the Islamic world. One could also, of course, list recent events that might suggest the opposite. But this exercise would have little value. Social development is a complex process, full of setbacks and incremental advances. What I am concerned with is the long-term direction of historical evolution, not the daily record of protest movements and political reactions.

The issue of gender equality, for example, can be analyzed from a variety of perspectives, some of them more relevant to this paper than others. What is relevant, first of all, is that Islam itself, as laid out in the Koran, does not require political, economic or social subordination of women. Indeed, when it was founded in the 600s, Islam had a very progressive influence on gender roles. In pre-Islamic Arabia women were treated as little more than chattel, or inheritable property,⁹ the Prophet tried to establish greater equality for them in his writings and in reality. Thus, feminists have pointed out that, while the Koran does distinguish between men and women, it does not argue that men are more *valuable* than women.¹⁰ Nor does it "strictly delineate the roles of woman and the roles of man to such an extent as to propose only a single possibility for each gender."¹¹ The Koran is not a rigid, dogmatic, legalistic document; it is rich, full of poetic ambiguity and inconsistency. Yet it is infused throughout with a spirit of openmindedness and generosity.

More important, though, is the fact that any ideology can and will be reinterpreted continually in the light of social conditions. A group of people that is committed to a particular ideology or religion but finds some of its provisions unpalatable given material circumstances will either ignore those provisions or explain them away. Young Catholics in Europe and Latin America ignore the Church's dictates on birth

control and abortion but consider themselves good Catholics anyway. Why do they ignore the Church in these matters? Because they want the freedom that others have, they want to be in control of their own lives, they want opportunities and independence—just like Muslims growing up in modernizing, globalizing, democratizing societies. The mere popularity or “resurgence” of Islam in itself says almost nothing about the concrete directions of social evolution, because Islam is a living creed, as mutable as Christianity, a creed that reacts and changes in response to such developments as high unemployment, political oppression, the spread of information technology, the decline or the rise in private investment. Even if there were some sort of “objective” incompatibility between Islam and gender equality, that fact would foreclose neither the equalizing of gender relations in Muslim countries nor the possibility of millions of Muslims’ favoring women’s empowerment.

Thirdly, we can look at the empirical data. With respect to gender relations, what is happening in places like Egypt, Morocco, Iran, Saudi Arabia, Algeria?¹ Again, the differences between nations are vast; generalizations are risky. For instance, women’s participation in the labor-force is high in predominantly Muslim Southeast Asian countries like Indonesia and Malaysia, while it is low in the Middle East.² However, we can at least outline trajectories of change.

Consider, first of all, a phenomenon that has upset many secularists: women’s return to veiling in certain Muslim countries over recent decades. It is argued that veiling symbolizes the control of men over women’s sexuality—since its purpose, ostensibly, is to safeguard women’s “honor”—that it is incompatible with women’s rights, and therefore that its continued popularity in some areas of North Africa and the Middle East (as well as in Europe and North America) bodes ill for the prospects of social equality in those regions. This stereotypical Western perspective, however, overlooks the phenomenon’s complexity.

In some areas, it is of course common that girls and women are forced by their male family members to wear the veil. Iran and Saudi Arabia require that women veil themselves. These facts are regressive, and they hark to the forms of oppression that have plagued women for thousands of years in the Arab world. However, the veil itself—which, by the way, is not an Islamic tradition inasmuch as it (1) pre-dates that religion and (2) is not explicitly prescribed in the Koran³—is not regressive, because it has different meanings depending on the socioeconomic and cultural context. It may symbolize oppression in Western eyes, but many women who wear it do so precisely because they find it liberating. It frees them, for example, from male stares, from the objectifying gaze of males in the street. “Being totally covered,” says one Egyptian woman, “[lets me] feel more free, purer, and more respectable.”⁴ “It is a personal statement: My dress tells you that I am a Muslim and that I expect to be treated respectfully, much as a Wall Street banker would say that a business suit defines him as an executive to be taken seriously.”⁵ From one perspective, in fact, the veil is a tool of radical feminism. “Some young Muslim feminists consider the hijab and the nikab [two forms of the veil] political symbols, too, a way of rejecting Western excesses such as binge drinking, casual sex and drug use. What is more liberating: being judged on the length of your skirt and the size of your surgically enhanced breasts, or being judged on your character and intelligence?”⁶

¹ Throughout this paper I am disregarding Iraq and Afghanistan, simply because the social and political situations there are volatile and new developments may emerge in response to the new regimes. I am also not considering the Central Asian countries, partly because to do so would unduly lengthen the paper and also because the legacy of the Soviet Union complicates matters.

⁴ Quoted in Ask and Tjomsland, *op. cit.*, 63.

⁵ Yvonne Ridley, “How I Came to Love the Veil,” *Washington Post*, October 22, 2006.

⁶ *Ibid.*

The veil is not a purely religious symbol. It also has significance for class relations, in that it “allies modest middle-class women” and differentiates them from the lower class.¹ In some countries, such as Egypt, it serves to voice protest against an unpopular “secular” government.

Moreover, many women wear the veil partly because it helps legitimize their presence outside the home, their presence in universities and professional occupations. It makes it harder for them to be condemned by a still-conservative society for doing things that are not conservative. By adopting Islamic dress, that is, women “are carving out legitimate public space for themselves.”² They are embracing their autonomy, not negating it. This ‘religiously expressed’ trend towards female empowerment is evident also in the fact that Islamist women are now invading the mosques, previously a male sphere: they defiantly enter the main part of the mosque, the men’s part, and the men are “defenseless [because] the process is taking place within the legitimate dominant culture.”³

Women are fighting for their rights all across the Islamic world. It should neither surprise us nor disconcert us that they sometimes do so through religious channels, for instance by becoming aggressive Islamists or by choosing to wear the veil even when their governments and their husbands disapprove of it. We may not like it that through the veil they often express their opposition to “Western culture”—but let’s not forget that hundreds of millions of bona fide “Westerners” dislike the very things disliked by millions of Muslims, namely the objectification of women, sexual liberalization, a popular culture that promotes violence, a perceived vacuum in spiritual life, and such “unethical” practices as homosexuality and abortion. People in the Islamic world can articulate their opposition in their dress, unlike Westerners, and this practice can make them seem alien to us, as if they are the Other, the Enemy; but many, perhaps most, Americans and Europeans have the same qualms about modern society as most Muslims do.

Consider the issues of homosexuality and abortion. Political propagandists like to point out that large majorities of Muslims in nearly all countries think that both practices are immoral, an observation that is supposed to demonstrate the undemocratic, regressive nature of Islam. They fail to point out that most Christians agree with Muslims on these points.⁴

As for gender equality, studies have actually shown that highly religious Muslims in Southeast Asia are *more* likely to support equality than less religious Muslims.⁵ The opposite is true in France and Spain (as well as, but less so, in several other Catholic countries): the more Christian one is, the more likely one is to oppose gender equality. Education, though, is a significant variable in both Islamic and Christian countries, insofar as it encourages egalitarian attitudes.⁶

Sexual freedom is another issue that supposedly separates the “Islamic” from the “Western” world. The reality, however, is far different from what American newspapers would lead you to think. Aside from the fact that one cannot generalize over countries as different as Morocco and Malaysia, Algeria and Syria, it is worth noting that even Iran is undergoing a “sexual revolution.”⁷ Premarital sex, sexual experimentation, promiscuity, adultery are rampant in cities like Tehran. The Iranian-American anthropologist Pardis Mahdavi has collected some telling data (as described in *The Nation*):

Adultery, for women, is punishable by stoning in Iran, but fully half of Mahdavi’s married, female research subjects are unfaithful to their husbands; for many of them, picking up lovers is a regular form of recreation. And despite the legal requirement that women in Iran cover their hair and hide the curves of their bodies, fashion obsesses the women in Mahdavi’s study. They apply layer after layer of makeup, and they find ways to make the

hijab as sexy as the skimpy summer attire of Western women... Iranian doctors, parents, educators and even institutions are bending to the forces of change...¹

Mahdavi's study, published as *Passionate Uprisings: Iran's Sexual Revolution*, concentrates on upper-middle-class Tehrani youth, but that makes its findings no less significant. The punishments for partying, dating, having premarital sex and adopting Western fashion are usually not very severe, ranging from one or two nights in jail to a whipping. More encouragingly, the government now requires young couples to attend classes on family planning, where they are supposed to learn about disease transmission, contraception, mental health, even female sexual pleasure.²

In Saudi Arabia, the capital city of Sangeethadh has become a mecca for homosexuals. It is a "gay heaven," according to one man who has lived there since 2000.³ Sodomy is officially punishable by death, but "the kingdom leaves considerable space for homosexual behavior" as long as it isn't shamelessly public. The same is true of lesbianism: "there's an overwhelming number of people who turn to lesbianism," says one Saudi woman.⁴ The reason is that sex-segregation makes heterosexual dating difficult. Frustrated men and women turn to their own sex for satisfaction. This leads to some confusion about their religious identity, but not as much as one would think, for the Koran is surprisingly reticent on the subject of homosexuality. It considers sodomy a sin but neither devotes much space to the subject nor prescribes punishments. Gay Muslims often rationalize their behavior by telling themselves that God is merciful. Presumably, then, God would also forgive other transgressions:

Private misbehavior is fine, as long as public decorum is observed. Cinemas are forbidden, but people watch pirated DVDs. Drinking is illegal, but alcohol flows at parties. Women wrap their bodies and faces in layers of black, but pornography flourishes.⁵

Last, what do Muslims think about democracy and human rights? The answer should be evident from the foregoing, but it is instructive anyway to look at polls. A Gallup poll published in 2008 that surveyed over 50,000 Muslims in 35 nations and claimed to represent the views of 90% of the world's 1.3 billion Muslims indicated that what Muslims (including many radicals) most admire about the West is its democracy and its technology. The majority want guarantees of freedom of speech, and they don't want religious leaders to have a role in drafting constitutions. John Esposito, one of the authors of the book in which the poll was published, has said, "Muslims want self-determination, but not an American-imposed and -defined democracy. They don't want secularism or theocracy." (Again, many Christians share this hostility toward secularism.) Ninety-three percent of those polled, incidentally, called themselves "moderate" Muslims.⁶

In December of 2008, WorldPublicOpinion.org published the results of a survey it had conducted in seven Muslim nations, viz. Egypt, Turkey, Jordan, Iran, Indonesia, the Palestinian Territories, and Azerbaijan. The topic was the role of the United Nations. On average, 63% of respondents thought that the UN should have the authority to enter countries to investigate human rights violations; 76% thought the UN should have the right to authorize military force to stop a country from supporting terrorist groups; 70% of Iranians (and smaller majorities in Indonesia, Azerbaijan and Turkey) thought the UN should be "significantly more powerful" than it is.⁷

⁶ The information in this paragraph comes from the BBC article "Most Muslims 'desire democracy'" (February 27, 2008), available at <http://news.bbc.co.uk/2/hi/americas/7267100.stm>.

⁷ The report can be found at <http://www.worldpublicopinion.org/pipa/articles/bmiddleeastnafrica/index.php?nid=&id=&lb=brme>.

In another survey, a majority of Middle Eastern Muslims (64% on average) thought that globalization and international trade are good for themselves and their countries, although they were concerned about the effects of trade on the environment and job security.¹

Such statistics indicate that the social values of people in the Middle East do not differ widely from those of Westerners. It is worth remembering, too, that the “Islamic” world is as diverse as the “Western” world. Some people reject liberal values; many embrace them wholeheartedly. Many women wear the veil; many dress like ordinary American girls, in shorts or tight jeans. If you walk down a street in Damascus or some other Syrian city, you’ll see women dressed completely in black as well as women who have donned “the latest fashions freshly arrived from French and Italian boutiques.”²

Trends toward female empowerment are observable not only in the ‘cultural’ sphere of public opinion and fashion but in the economic sphere as well. Let us note, first of all, that a generation ago the average woman in the Middle East and North Africa (MENA) raised more than six children, while today she can expect to raise half as many. (The number is even smaller for women in their early twenties.)³ Partly as a result of this, women’s participation in the labor force in MENA has grown by 50% since 1960. The growth rate was a high 5.3% during the 1990s.⁴ In Saudi Arabia, one of the more conservative countries, women’s labor-force participation went from 16.5% in 1990 to 24% in 2000; in Iran it went from 22% to 30% during the same years.⁵

With active encouragement from their governments, women have been spending more years in school (which has helped to lower fertility-rates and increase work-force participation).

Among the total population in MENA over the age of 15, the average years of schooling rose from less than a year in 1960 to 5.3 years in 1999—the largest gain of any region in the world. For women, the increase was more dramatic: from 0.5 to 4.5 years... In 1970, women made up only 16.4 percent of literate adults. By the year 2000, they accounted for more than 50 percent... [University] enrollment rates rose from around 9 percent in 1990 to almost 14 percent in 1997... And by 2000, women outnumbered men entering local colleges and universities in many MENA countries, including Lebanon, Oman, and Qatar.⁶

Without going into details, the trends are clear.

As a middle class is born and pressures toward political reform mount, a nascent civil society is developing in the Middle East. In countries like Syria and Iran it might not be much to speak of, but dissident groups, both liberal and conservative, are gaining support everywhere. Women are agitating for rights, students are rejecting the ways of their parents—a generation-gap is noticeable all over the region.⁷ Indeed, it’s noticeable from Morocco to the United Arab Emirates, and beyond to Iran and Pakistan. Change is accelerating.

What are we to conclude from this brief discussion? It looks as if the Islamic world’s experience parallels Russia’s, China’s, India’s, sub-Saharan Africa’s and Latin America’s. All these regions have been “colonized” by capitalism and are continuing to be colonized by it, albeit no longer explicitly under the mantle of Western colonialism. And they have all reacted to it in their unique but broadly similar ways,

corresponding to their unique social conditions and the specific forms that their colonization has taken. Each region has had to respond somehow to the massive destruction of traditional social relations, be they tribal, feudal, familial, and so on, as well as the poverty, famine, class inequality and ethnic tensions that have directly or indirectly followed the supplanting of pre-modern social relations by capitalist exploitative ones. In retrospect, this process of reaction and adjustment was bound to be agonizing and agonizingly protracted. One hundred and fifty years after the abolition of serfdom, Russia is still struggling to develop a coherent and stable institutional framework for capitalism; 150 years after the Taiping Rebellion, China is finally starting to achieve the same goal; African and Latin American nations have had their own horrific legacy of colonization to overcome, and in the absence of a unifying, ancient, plausibly anti-Western ideology like Islam they have floundered from democracy to proto-fascism to proto-Communism to military dictatorship to democracy. Regarding the Middle East, the presence of Israel has exacerbated enormously the already formidable problems of modernization and democratization, contributing to the region's authoritarianism as well as its anti-Americanism and the Islamic revival after the Six Day War in 1967.¹ Like nearly all other parts of the world, therefore, the Middle East (and the Islamic world in general) has passed through a phase of rejection of the West, rejection of its ideologies and social arrangements—a rejection actively encouraged by many Islamic governments, for political purposes. But, again like most parts of the world, Arab and Muslim countries are now being swept up ineluctably by the forces of liberalization and democratization, and of course globalization. In the coming years we will surely continue to see radical or moderate Islamists maintain power and win elections in Egypt, Saudi Arabia, Pakistan, Afghanistan and other countries, but, as has happened with Iran's clerical state and Saudi Arabia's monarchy, the Islamists will lose the support of the population in the face of economic stagnation, political oppression, enforced gender inequality, and rampant corruption. Democratization—*liberal* democratization—will gradually, if painfully, spread.

One wonders why liberal democracy follows capitalism in this way. In the short term, of course, it does not: centuries of struggle were necessary for stable democracy to be established in the West, and in the meantime we had fascism, Nazism, and other unsavory forms of government. “Illiberal,” “totalitarian” democracy has existed too,² for instance in Iran after the Islamic Revolution of 1979. But this sort of “democracy” is unstable, insofar as it tends to become authoritarian very quickly and eventually ‘manufactures discontent,’ which finally results in societal upheavals. Be that as it may, it is obvious that capitalism, especially in its early stages, need not correlate with democracy.

In the long run, however, there is indeed a correlation, an ‘emerging’ of liberal democracy out of capitalism. Is this connection merely a historical accident, or does democracy somehow grow out of the intrinsic tendencies of capitalism? I cannot consider this question in detail here, but I would suggest, with Göran Therborn, that democracy emerges not directly from capitalism's tendencies but from its *contradictions* (in Marxian terminology). This was true, at least, with respect to the original struggles for democracy in the West. In brief, the most important factor was probably the creation of a working class that had a vested interest in extending the franchise to all people, in achieving social equality as far as it was able:

Legal emancipation of labour and the creation of a free labour market, industrialization, concentration of capital are all intrinsic tendencies [of capitalism] which simultaneously lay the basis for a working-class movement of a strength and stability inachievable by the exploited classes of pre-capitalist modes of production. In accordance with Marx's analysis of the growing contradictions of capitalism, the working class is, *ceteris paribus*, strengthened by the advance and development of capitalism...³

¹ See Palmer and Palmer, loc. cit.

² See Hunter and Malik, op. cit., 90.

³ Göran Therborn, “The Rule of Capital and the Rise of Democracy,” *New Left Review* I, No. 103 (1977).

The scholarly literature testifies to the role of the working class and its labor movement in, for example, extending the franchise to women, and generally in bringing about democratic change in nineteenth- and early-twentieth-century Europe and America.¹ And to a great extent this is still true, for example in Latin America. Evo Morales was elected president of Bolivia in 2005 after popular protests and movements against the neoliberal regime. He was himself once a poor farmer; the poor farmers brought him to power; after elected, he led an effort to revise the Bolivian constitution so that it would be friendly to the indigenous poor. Venezuela too has made notable moves toward democracy in recent years, again on the basis of mass demonstrations and exceptional activism by the indigenous poor in support of Hugo Chavez. Such examples of the continued importance of working-class activism to democratization could be multiplied.

New elements, however, have been added in this age of globalization. New pressures toward democracy and liberalism. They are almost too obvious to point out: (1) the masses' easy access to information about comparatively prosperous and "free" societies such as the U.S. Television, the internet, radio, movies, and popular culture in general broadcast seductive images of a vibrant society—and raise political issues of equality and liberty—to people all over the world, who become progressively discontented and finally demand egalitarian reforms. Their governments can resist for a while, but not forever. (2) The intensifying of private and public investment in the economy, which leads to a higher demand for skilled and unskilled workers, which leads to a higher supply of them, which is made possible and is followed by an increase in education—and all this empowers the populace vis-à-vis its repressive government. (3) International political pressure on authoritarian regimes to reform themselves, to end their violations of human rights. (4) The rising need to coordinate economic and financial regulations, enter trade agreements, etc., with liberal democracies like the U.S. and European countries—and, in general, to integrate the national economy with the economies of "free-market democracies."

Summing up, one could say that, while the recent revival of Islam is not going to die out any time soon, the influence of religious fundamentalism is waning relative to the dynamic of capitalist integration and democratization. The former is reactionary and without hope; the latter is the future, as it has been for centuries.²

Europe and Muslims

The purpose of this paper is to deflate Western paranoia about the Islamic world. To that end, I have argued against the idea of a clash of civilizations, except insofar as the spread of capitalism has indeed been undermining pre-modern social structures (in the West, too) ever since its inception. I have argued that the Islamic world is not some sort of monolithic threat to modernity, that Islam is not "essentially" reactionary or repressive merely because it has been used to legitimize such regimes. Virtually any ideology can be manipulated in this way, for example Christianity. No ideology is ever the primary "cause" of a social structure; Islam, therefore, should not be blamed for the social and economic conditions that obtain in the Middle East. In fact, the blame lies far more with the imperialist policies of the United States during the Cold War, when authoritarian governments (in Saudi Arabia, Iran prior to 1979, Iraq during the 1980s, etc.) were propped up as bulwarks against Communism and other American "enemies." Underdevelopment, political oppression, poverty, widespread anti-Americanism and the rise of Islamic fundamentalism and jihad were the results. I have also argued that Muslim terrorism, which (according to polls) is as hated in Muslim societies as in the West, is not the apocalyptic threat it is sometimes thought to be. Unless governments fail to take it seriously and let it flourish—which is unlikely—it will probably not destabilize the world much more than it already has by instigating Bush's misadventure in Iraq. It is disorganized,

¹ See, for example, *ibid.* Cf. also Therborn, "The Travail of Latin American Democracy," *New Left Review* I, No. 113–114 (1979); Mary Nolan, *Social Democracy and Society: Working Class Radicalism in Düsseldorf, 1890–1920* (Cambridge: Cambridge University Press, 1981); and Ruth Berins Collier, *Paths Toward Democracy: The Working Class and Elites in Western Europe and South America* (Cambridge: Cambridge University Press, 1999).

² Incidentally, this applies to Christian fundamentalism too. Like the Islamic variant, it is basically a doomed attempt to dam the flood of global integration and stop the erosion of traditional social structures.

amateurish, fragmented, reliant on a few charismatic personalities because it lacks a coherent set of institutions. Its history is a record of blunders, accidents, miscalculations, and the occasional fortuitous success.

Furthermore, I have argued that, under the pressure of globalization, the Islamic world is starting to experience a wave of democratization and liberalization. [...]

In short, the long-term future looks fairly bright. To corroborate this vision I will consider the situation of Muslim immigrants in Europe, which is often cited as proof that the West is “under attack” by a dangerous, reactionary thing called “Islam.” Less hyperbolically, it is thought that the Muslim presence “could be a huge long-term threat to Europe,”¹ i.e. to Europe’s social unity, and could thus lead indirectly to a decline of Europe on the international stage, which in turn could endanger a liberal-democratic world order. As we will see, these predictions are overstated.

First of all, what exactly is the problem under consideration? It has been stated a thousand times in the mainstream media and the scholarly literature: Muslim communities in Europe are not integrating themselves into the dominant secular, liberal-democratic order, a fact that is both cause and effect of social tensions. That is, Muslims increasingly identify not with Europe or their country of residence but with Islam—a phenomenon that is especially pronounced in the younger generation.² “Many Muslim communities are turning inward and rejecting European institutions and traditions.”³ Large proportions of non-Muslim Europeans, for their part, are hostile towards Muslims. The Pew Research Center reported in September of 2008 that, among the respondents to its polls (1000 people in each country), 52% in Spain, 50% in Germany, 46% in Poland, 38% in France, and 23% in Great Britain had negative views of Muslims.⁴ More concretely, a 2003 Ipsos poll in France indicated that 25% of French Muslims—but 75% of those under the age of 25—thought the values of Islam were incompatible with those of France, while 62% of the general French population shared that view.⁵ The European values in question seem to be those of “gender equality; sexual liberalization; and the principles of compromise, egalitarianism, and identification with the state.”⁶

The usefulness of polls, however, is limited, partly because the public’s views are subject to change from year to year. (For example, the Pew Research Center’s findings in 2006 were more encouraging than those in 2008. Among Muslims, in fact, the findings were striking: in France, Germany, Spain and Great Britain, Muslims were more positive than the general public about the way things were going in their countries. Also, in general they were far more concerned about unemployment than about cultural or religious issues such as women’s roles and the decline of religion.⁷) Demographic data are more reliable. According to the U.S. Department of State’s *Annual Report on International Religious Freedom 2003*, there are more than 23 million Muslims in Europe, almost 5% of Europe’s population. Timothy Savage summarizes other statistics:

The Muslim birth rate in Europe is currently more than three times that of non-Muslims... By 2015, Europe’s Muslim population is expected to double,⁸ whereas Europe’s non-Muslim population is projected to fall by at least 3.5 percent. Looking further ahead, conservative projections estimate that, compared to today’s 5 percent, Muslims will comprise at least 20 percent of Europe’s population by 2050. Some even predict that one-fourth of France’s population could be Muslim by 2025 and that, if trends continue,

⁵ Timothy Savage, op. cit.

⁶ Ibid.

⁷ <http://pewglobal.org/reports/display.php?ReportID=254>.

⁸ The U.S. National Intelligence Council, however, projects that it will double by 2025. The report can be viewed at http://www.dni.gov/nic/PDF_2025/2025_Global_Trends_Final_Report.pdf.

Muslims could outnumber non-Muslims in France and perhaps in all of western Europe by mid-century... [A]s important as the dramatic increase in the Muslim population is the dramatic decline of the general European population, which, according to UN projections, will drop by more than 100 million from 728 million in 2000 to approximately 600 million, and possibly as low as 565 million, by 2050.¹

It must be kept in mind that these numbers, which might seem frightening to some people, will probably have little effect on European stability unless there are coordinated social movements among millions of Muslims to fight liberal democracy, gender equality, egalitarianism, European integration. Or, alternatively, there could be, for instance, increasingly widespread and destructive riots in response to discrimination, which could conceivably lead to the election of far-right governments that would only exacerbate the problem.

Probably the most immediate cause of concern for Europeans is the perceived spread of radical Islam among young Muslims, which has resulted in such violent episodes as the terrorist attacks in London on July 7, 2005, the murder of Theo van Gogh in 2004, the rage ignited by Danish cartoons of Mohammed in 2006, and the terrorist plot of 2006 involving planes leaving London's Heathrow airport. Counterterrorism officials estimate that 1 to 2 percent of European Muslims are involved in some type of extremist activity (which isn't necessarily violent).² Given the public's fear of terrorism and suspicion of Muslims, it is not surprising that headscarves, which have become increasingly popular among young Muslim women, have provoked controversy in France and Germany, nor that many people support greater restrictions on immigration.

But let's look more closely at what is happening. Why do many Muslim communities segregate themselves from the larger population to an even greater extent than other immigrant communities do? Why do they cling to traditional Islamic values? Why has terrorism increased? Barbara Franz gives a succinct, and I think correct, answer: "Europe's current Islamic alienation... is more about Marx than Mohammad or bin Laden."³ It is more about political and socioeconomic alienation than religion per se.

Indeed, the "Marxist," "materialistic" approach is merely common sense. The facts speak for themselves: in Britain, for instance, Muslim communities are concentrated in the most deprived urban areas.⁴ The current unemployment rate for Muslim men is nearing 40 percent, with economic inactivity at 50 percent. One-third of British Muslim children live in households where none of the adults is employed, households where depressive attitudes prevail, where the social circles are narrow and conservative. In France, Muslim enclaves have a 30% unemployment rate amongst 21- to 29-year-olds; incomes are 75% below the average. The Turkish community in Germany has an unemployment rate of 24%, while 50% in urban centers live in "financially precarious circumstances." All these Muslim communities derive originally from guest-worker programs established after World War II, when Europe needed foreign labor to fill factory jobs. Like Mexican communities in the United States, they began in poverty and have not yet, after two or three generations, transcended their poverty.⁵ In conditions of overcrowded housing, poor health and low educational qualifications, despondency and identity crises are common.

The problem of poverty is reinforced by the problem of discrimination. The riots in France of October, 2005 had nothing to do with Islam, as shown by the inability of Muslim organizations to stop the violence and by the fact that churches and synagogues were not intended targets. They took place in

⁴ Most of the information in this paragraph and the next is taken from Javaid Rehman, "Islam, 'War on Terror' and the Future of Muslim Minorities in the United Kingdom: Dilemmas of Multiculturalism in the Aftermath of the London Bombings," *Human Rights Quarterly* 29, No. 4 (2007), and from Barbara Franz, op. cit.

⁵ Robert Leiken, "Europe's Immigration Problem, and Ours," *Mediterranean Quarterly* 15, No. 4 (2004). For a good overview of the history of Muslims in Europe, see Jørgen S. Nielsen's *Muslims in Western Europe* (Edinburgh: Edinburgh University Press, 2004).

working-class suburbs populated by North Africans; they were triggered by the deaths of two boys being chased by the police; and they were a response to racism. Discrimination against Arabs and Muslims in the employment, housing and education sectors is extremely common throughout Western Europe.¹ The youths who perpetrated the riots in France were frustrated not with a secular society but with socioeconomic structures.

The immigrant children should go to school in the *banlieues* and should think about their future. Many do just that. Only, this does them no good. Whether they drop out of school at 15 or graduate high school with honors—they will remain jobless either way. And if one nevertheless makes a career, say as a graphic designer or revenue officer, he will still remain a second-class French citizen. The bouncer will not let him into the disco in Saint Germain on Friday nights.²

For people who do not daily encounter hostile looks and discriminatory practices, who are not forced to be apologetic simply because they choose to wear clothing that is deemed un-Western, and who are not bombarded by propaganda constantly reminding them that they are the Other—the potentially dangerous Other—it is difficult to imagine what such a life must be like. Especially if such discrimination coexists with poverty, with a lack of opportunities, with no prospect for social advancement.

Add to all this the disastrous foreign policy of the United States and Britain, which has infuriated Muslims across the world. There is no question that the Iraq war has been a recruiting tool for terrorists in Europe, nor that it has inflamed the resentment of many European Muslims toward the West.

It is a social-psychological fact that when one is rejected by a community for some reason, e.g. because one is perceived as belonging to a different religion or ethnicity than the community, one may well react to this rejection by choosing to identify more strongly than before with the religion or ethnicity in question. It is a defense mechanism, a way of maintaining self-esteem in the face of rejection. To protect your sense of self, you spit contempt right back at the people who have contempt for you. If there is another despised community into whose fold you can retreat for comfort, you are all the more likely to use the defense in question, i.e. to consciously *choose* the identity that the Other has thrust upon you without your consent. And anyway, there is little else left for you: your identity has been decided in your enforced ostracism. This is partly what has happened with Arabs and Muslims in Europe. For decades they have been trampled under, discriminated against, even as they tried to minimize their otherness by adopting the ways of their host countries. But now, in this age of information technology, of globalization, of constant media-generated reminders of the chasm between the prosperity of the few and the indigence of the many—the chasm between the *promise* and the *reality*—and an age when anomie afflicts nearly everyone, the prosperous no less than the persecuted, and *cosmic lostness* seems stitched into the very fabric of society, some members of the younger generation of European Muslims have decided to accept the roles that Europe's social structure has pigeon-holed them into. They have decided to wear the headscarf, to sneer at the decadence and inhumanity of Western culture. Some of them have, indeed, gone too far in their rejection of those who have rejected them, becoming terrorists, extremists, bigots, homophobes, haters of equality. But noxious attitudes like these have grown out of specific socioeconomic conditions, conditions resulting partly from specific political policies. What is needed is not a renewal of intolerance toward immigrants, a “cracking down” on immigration, a “zero-tolerance” policy toward “urban violence,” but a concerted and coordinated effort across Europe to fight discrimination, to renovate desolate housing projects, to revitalize urban economies, to create new jobs through public works programs, to integrate Muslims into politics.

That is the only possible solution: integration. *Assimilation*, or a mass repudiation of Islamic identity, is surely not necessary, but integration is. The alternative is continued segregation, and segregation

¹ See the 2006 report on ‘general’ racism published by the European Monitoring Centre for Racism and Xenophobia, at <http://fra.europa.eu/fra/material/pub/ar06/AR06-P2-EN.pdf>. There is also a report on Muslims alone, at http://eumc.europa.eu/eumc/material/pub/muslim/Manifestations_EN.pdf.

² Alex Capus, quoted in Franz, op. cit.

has never fostered social stability. On the contrary, we have seen that various forms of segregation are the main cause of the problem—or, rather, are the problem itself.

Perhaps the reader will object that the prospects for a decline in discrimination against Muslims are not good, given that Muslims have suffered from discrimination ever since their arrival in Europe decades ago. (Actually, centuries ago.) How could discrimination ever end? Well, this question was asked by Malcolm X in the 1960s with respect to relations between blacks and whites in the United States—and now the U.S. has a black president. How did the miracle come to pass? How has discrimination against blacks been so undermined that Barack Obama can be president? Again, Marx is of use. Racism is not a spontaneous, natural reaction to the encounter between one race and another; it typically grows out of a particular socioeconomic condition, namely the correlation between class-stratification and race. Simple inductive reasoning corroborates that claim. For example, in the United States today there is a great deal of racism towards Mexicans, most of whom are in “lower” classes; there is less racism towards people from India, who tend to have a more visible presence in the middle class than Mexicans. Likewise, when the French began to colonize North America in the 1600s, they displayed little or no racism per se towards Indians but were in fact relatively diplomatic and respectful in their relations with them.¹ By the 1800s, however, when Indians had been decimated by war and disease and were subordinate economically, politically and militarily, racism among Americans was rampant. It was rampant regarding blacks too as long as they were economically and politically subordinate to whites (and as long as this subordination was enforced); as their class position has risen following the Civil Rights era, mainstream racism has diminished.

The evidence leads one to believe that some discrimination against Arabs and Muslims will persist in Europe until the majority of Muslims have become part of the middle class. However, since discrimination is a major reason why Muslims have trouble improving their economic circumstances, it appears that we face a “catch-22.” The best way out of the problem is the path followed by the United States from the 1960s to the present day: a civil rights movement and a forceful intrusion by European governments into civil society on behalf of the underprivileged. “Affirmative action” programs are necessary.² European leaders would be well-advised to examine in detail the measures enacted by the U.S. government to overcome racism—as well as the successes and failures of these measures. The current situation in Europe, though, is not strictly parallel to the past situation in America, partly because the segregated groups supposedly disagree about *values*.

But is this problem so intractable after all? I mentioned above that the socially conservative views of many Muslims around the world do not differ much from the views of conservative Christians. It is true that European Muslims are more conservative than the general public. A Gallup poll in 2007 found that Muslims in London, Paris and Berlin are conservative on the issues of homosexuality and abortion:

At least two-thirds of the general public in France (81%), Germany (68%), and the United Kingdom (66%) say homosexual acts are morally acceptable; among Muslims in the countries’ capitals, the corresponding figures are just 18%, 26%, and 4%, respectively... Among the general public in each country, majorities say abortion is morally acceptable (though just barely in Germany). Muslims in London are least likely to agree at just 10%...³

¹ See Richard White, *The Middle Ground: Indians, Empires, and Republics in the Great Lakes Region, 1650–1815* (New York: Cambridge University Press, 1991).

² According to the Congressional Research Service’s report on “Muslims in Europe: Integration Policies in Selected Countries” (2005), affirmative action programs have not been instituted but are starting to be considered. The European Commission recognizes the need for aggressive policies to integrate Muslims into society and is finally making a concerted effort to coordinate such policies across Europe. The report is available at <http://www.fas.org/sgp/crs/row/RL33166.pdf>.

³ <http://www.gallup.com/poll/27397/Values-Questions-Set-European-Muslims-Apart.aspx>.

Upon seeing these data, however, one's inclination is to say, "So what?" Comparable divisions exist in America between "secularists" and "Christians," but the disagreements have yet to tear the country apart. In fact, diversity of opinion, and the freedom to express it, is the very essence of a healthy civil society. To call it a "culture war," as it has been called in America, is sheer hyperbole.

In general, the difference in values between European Muslims and the greater public has been exaggerated. [...]

In fact, Europe quite obviously needs its immigrants in order to survive. And it needs *more* immigrants. Its population is declining, as we saw above, and a decline in population does not bode well for economic vitality. If the EU continues to take seriously the imperative to integrate immigrants into society, *increased* migration could well be called for. This bears on the question of Turkey's membership in the EU. Turkey currently has a population of about seventy million; its population is expected to stabilize in 2030 at eighty-five million.¹ With negative demographic trends across Europe, the induction of Turkey into the EU would probably result in an enlarged supply of labor, which could be of great benefit to the economy. Burak Akçapar in fact argues that if Turkey becomes a member, "the problem for the EU could be not that there would be too many but too few Turks to migrate to the EU markets, where youthful and skilled Turkish labor will be increasingly needed..."² As for the so-called Muslim threat, Turkey is one of the most secular, modernized states in the Islamic world.

However, I won't delve into the thicket of arguments for and against Turkey's EU membership. My point is only that the decline of Europe's non-Muslim population need not entail a decline of Europe itself. Far from being the agent of Europe's demise, immigration could be its savior.

Islam and the West are not enemies. They are not even entities: they are abstractions with virtually no explanatory value. "Islam" has far more in common with "Christianity" than "Christianity" has with the "West." Analysts should talk less about "values" and "cultures," or "cultural values," and more about the real conditions on the ground that drive people to behave as they do. Huntingtonian thinking is jihadist thinking, it is "us" versus "them" thinking, "right" versus "wrong," and it obscures all the real issues. Barrington Moore said it best: to rely primarily on cultural themes in one's explanations—as Osama bin Laden does, as George W. Bush does, as Samuel Huntington does—is to create "a strong conservative bias under the color of scientific neutrality and objectivity"³ (if, that is, it's done in a relatively sophisticated way). On the other hand, both truth and compassion are to be found in the Marxian narrative.

December 11, 12

Watched a video of Valentina Igoshina (beautiful 30-year-old Russian pianist) playing a Chopin Prelude and sent her this email: "I just heard your version of Chopin's famous A major Prelude. What a lovely, unusual interpretation! But it shouldn't be unusual, because it's lovely. ☺ Full of languor, a sort of soulful repining... I can imagine Chopin playing it that way as he sits alone in George Sand's estate at Nohant... It's a summer afternoon, he's looking out through the window at the heavy air and thinking of the coming dusk—the dusk of his life (even though he's in his thirties)—Sand and her children have gone out for a walk, Chopin is in an autumnal mood.

"The piece as you play it is like the coda to a human life. A person is born, lives tumultuously, subsides into old age, dies peacefully...and this Prelude is time's final caress of its child. [...]"

She made my day. Enriched my life.

December 13

A silly little paper for my other class:

On the Meaning of John Brown

Defenders and detractors of John Brown may disagree about many things, but few will deny that he was, at the very least, a fascinating character. In his lifetime he was even more famous—more loved and more loathed—than he is now. From the Transcendentalists to the governor who hanged him, from the Union soldiers to Ku Klux Klan members, people have been fascinated by him. Why is this? It isn't only because of his daring raid on Harpers Ferry, for other men have done daring things without becoming objects of fascination. Rather, the cult of John Brown seems to derive from his singlemindedness, his unshakeable conviction of righteousness, his willingness to commit violence in pursuit of a noble end (a *holy* end, for him), combined with his intelligence, his eloquence, his courage. In short, what intrigues people, at least implicitly, is the contrast between him and his age. *He* had integrity, he was an old Puritan, an anachronistic Puritan from the days of Oliver Cromwell, he was “*authentic*”; his age was hypocritical, confused, self-estranged (as evidenced by its Civil War). This is the impression one gets from the outraged literature of the time,¹ and from the testaments of Brown's character given by Thoreau, Emerson, Thomas Wentworth Higginson, Henry A. Wise (governor of Virginia), and others.² In this paper I will investigate such claims. That is, I will explore the relation between Brown and his age, between Brown and the Transcendentalists in particular, in the hope that doing so will yield insights not only into the phenomena I'm 'directly' discussing (namely the Transcendentalists, Brown, and their society) but also into the meaning and nature of “*authenticity*” itself, this concept which is central to Brown's mystique.

First I will examine pieces of Thoreau's writing and compare them to Brown's, in order to shed light on the former's relative “*inauthenticity*.” Then I'll clarify what I mean by “*authenticity*,” drawing on Hegel and Dostoyevsky. Lastly, I'll speculate on the causes of the character-differences between Brown, on the one hand, and Emerson and Thoreau on the other.

A reasonable place to start is Thoreau's speech “A Plea for Captain John Brown,” delivered first in Concord on October 30, 1859 and then in other New England towns in the weeks before Brown's execution. The speech was also published in newspapers. It is a stirring document, full of righteous fury, and it roused Emerson to join the ranks of Brown's defenders. Brown's trial was still going on; the country was reeling from the implications of his October 16th raid. The national consensus was that Brown was a fanatic, a criminal, a madman, a murderer; the South, however, differed from the North in seeing him as representative of the Republican party, of abolitionists all across the North. Perhaps, thought the South, he was uniquely courageous, but he was symbolic of the North's dangerous individualism, its Puritanism, its evil abolitionism, its determination to attack the South and suppress slavery once and for all. Most Northerners, on the other hand, disowned Brown, viewing him as a freak, an anomaly; and the Republican party certainly had no connection to the Harpers Ferry raid. Even Abolitionists were reluctant to praise him—or at least they tempered their praise with criticism of his methods—for the majority of them were pacifists. William Lloyd Garrison, a founder of Abolitionism, declared the raid to be “a misguided, wild, and apparently insane, though disinterested and well-intended effort”; Horace Greeley called it a “deplorable affair...the work of a madman.”³

¹ See, e.g., Emerson's essays and Thoreau's “A Plea for Captain John Brown.”

² See David Reynolds, *John Brown, Abolitionist: The Man Who Killed Slavery, Sparked the Civil War, and Seeded Civil Rights* (New York: Vintage Books, 2005), chapters 2, 13, 14, etc.

³ *Ibid.*, 340.

Meanwhile, however, Brown was giving interviews and writing letters in which he appeared decidedly clear-headed, in fact honorable, principled, full of integrity and intelligence. As his words were published in newspapers everywhere, the nation came to see him, paradoxically, as both an admirable man and a murderer, both humane and treasonous. Governor Wise of Virginia, who talked to Brown in the hours after the raid, said he was “firm, truthful, and intelligent...cool, collected, and indomitable...a man of fortitude and simple ingenuousness”¹—yet at the same time he called him a criminal and a traitor. The nation was torn between these positive and negative interpretations of the man, with the negative, however, predominating everywhere.

The 1850s were a culturally frenzied time. In his book *Beneath the American Renaissance*, David Reynolds emphasizes the ferment and confusion of antebellum America—the cultural experimentation, the impulse for reform of every variety, the coexistence of every conceivable cultural extreme. It was the age, after all, of Transcendentalism and evangelical reform, of sensationalist literature and Poe’s irrationalist fiction, of *Moby Dick* and *Leaves of Grass*, of resurgent Puritanism and atheism and free-love movements, of Emily Dickinson and Nathaniel Hawthorne, and, in general, of battles between conservative ideologies and an emerging radical democracy in both culture and politics. Slavery, though, was arguably the dominant issue, especially after the passage in 1850 of the Fugitive Slave Act and in 1854 of the Kansas-Nebraska Act, which led to widespread proslavery and antislavery violence in Kansas. (The name “Bleeding Kansas” designated this time.) By the end of the 1850s, Emerson was writing that the country had to be purged through war.

It was in this environment that Thoreau wrote “A Plea for Captain John Brown,” hoping it would help raise Brown’s name from infamy. I will quote a few passages to give the reader a sense of its style (which will be important to my argument). Referring to Brown’s interviews with proslavery men after Harpers Ferry, Thoreau says,

Read his admirable answers to Mason and others. How they are dwarfed and defeated by the contrast! On the one side, half-brutish, half-timid questioning; on the other, truth, clear as lightning, crashing into their obscene temples. They are made to stand with Pilate, and Gessler, and the Inquisition. How ineffectual their speech and action! and what a void their silence!

...[John Brown] was not our representative in any sense. He was too fair a specimen of a man to represent the like of us. Who, then, were his constituents? If you read his words understandingly you will find out. In his case there is no idle eloquence, no made, nor maiden speech, no compliments to the oppressor. Truth is his inspirer, and earnestness the polisher of his sentences. He could afford to lose his Sharpe’s rifles, while he retained his faculty of speech,—a Sharpe’s rifle of infinitely surer and longer range...

...Treason! Where does such treason take its rise? I cannot help thinking of you as you deserve, ye governments. Can you dry up the fountains of thought? High treason, when it is resistance to tyranny here below, has its origin in, and is first committed by, the power that makes and forever recreates man. When you have caught and hung all these human rebels, you have accomplished nothing but your own guilt, for you have not struck at the fountain-head...

The contemporary reader tends to enjoy this Thoreauvian heroic style. One enjoys the imagery, the vigor, the pithiness—but only because one knows that it was written a long time ago. A speech written in the same style *now* would be ridiculed as over-ornate, over-eloquent, absurdly grandiose and magniloquent, stylistically naïve, hopelessly out of touch with the zeitgeist. It would be considered *badly* written. But because it is not a product of our time, we are able to look upon it with unadulterated admiration, even to lament that such writing has gone out of fashion.

¹ Ibid., 332.

In other words, our reaction is inseparable from *nostalgia*. But what is nostalgia? It is a longing for, or fondness of, an idealized past. Usually the idealization involves the perception that the past was simple, certain, “whole,” full of an authenticity that has been lost. The appeal of Thoreau’s writing for us is not purely literary, since it contains literary flaws (such as exaggeration and romantic metaphors). The appeal consists also in its perceived *authenticity*,¹ its being an upsurge from a more authentic, naïve time than our self-conscious present. It contains almost no hint of a divided consciousness such as characterizes postmodernity; it is pervaded by a spirit of relative certainty, an almost religious devotion to *principles*. The pithy, forceful language expresses a sort of *certainty of self*. Thus, Thoreau’s culture, while riven by internecine conflicts and full of collective doubt, was yet more authentic, less “self-conscious,” than ours, a fact which made possible the appreciative reception of Thoreau’s speech.

Emerson’s language is equally revelatory: he refers to Brown as “that new saint, than whom none purer or more brave was ever led by love of men into conflict and death,—the new saint awaiting his martyrdom, and who, if he shall suffer, will make the gallows glorious like the cross.”²

The Transcendentalists’ enthusiasm for John Brown parallels our appreciation of the Transcendentalists’ writings and our nostalgia for a culture that could produce such writing. The Northern intellectuals who supported Brown, such as Thomas Higginson, Wendell Phillips, Frank Sanborn, Emerson, Thoreau, and others, seem to have viewed him as an evolutionary throwback, a reincarnation of Oliver Cromwell. The degree of his religiousness is well-known: like every good Puritan from the 1600s, he “possessed a most unusual memory of [the Bible’s] entire contents” and considered himself an instrument of God.³ He was certain that slavery was “the mother of all abominations”;⁴ he therefore devoted his life (especially his last ten years) to its abolition. So little does he appear to have doubted himself or his cause that he never even *considered* compromise with “evil”; compromise would have been a betrayal of God and of Brown’s mission on Earth. This complete integrity and self-certainty is evident in the final speech he gave to the court that sentenced him to death:

... This court acknowledges, as I suppose, the validity of the law of God. I see a book kissed, which I suppose to be the Bible, or at least the New Testament, which teaches me that all things whatsoever I would that men should do to me, I should do even so to them. It teaches me, further, to remember them that are in bonds as bound with them. I endeavored to act up to that instruction. I say I am yet too young to understand that God is any respecter of persons. I believe that to have interfered as I have done, as I have always freely admitted I have done, in behalf of His despised poor, I did no wrong, but right. Now, if it is deemed necessary that I should forfeit my life for the furtherance of the ends of justice, and mingle my blood further with the blood of my children and with the blood of millions in this slave country whose rights are disregarded by wicked, cruel, and unjust enactments, I say, let it be done.⁵

Upon comparing this speech with Thoreau’s, one begins to see what it is that the Transcendentalists found so magnetic about Brown. Thoreau speaks, writes and thinks in literary terms, which is to say in terms of the effect he wants to have on his audience. He is a self-conscious intellectual, a man perfectly familiar with self-doubt and the feeling of inadequacy, who is “aware of himself as an object of someone else’s observation”⁶ and is thus *critically* aware of himself, a fact that comes across in his carefully constructed,

¹ Throughout this paper I am using the word “authenticity” in a non-moral sense. I don’t mean to imply that “inauthentic” people or cultures are thereby inferior or somehow immoral; the term is purely descriptive, not evaluative.

² From Emerson’s lecture “Courage,” delivered on November 8, 1859.

³ Benjamin Quarles, *Allies for Freedom* (New York: Da Capo Press, 2001), 12. Quotation from Brown, *ibid.*

⁴ *Ibid.*

inflated sentences. Brown, on the other hand, simply states his convictions clearly and without ulterior motive. Without literary embellishments. He is too self-certain for inessential embellishments, for artificial devices that come from the writer's desire for applause. As Thoreau says, "Truth is [Brown's] inspirer, and earnestness the polisher of his sentences." Moreover, this observation is expressly intended to contrast with Thoreau himself, for in the prior sentence he has stated with a hint of self-disapproval, "In [Brown's] case there is no idle eloquence, no made, nor maiden speech"—which is precisely what Thoreau is giving, namely a "made speech" characterized by "idle eloquence."

Thoreau has already made the point explicitly when he says, "[Brown] was too fair a specimen of a man to represent the like of us." And earlier in the speech he has gone so far as to say, "No man in America has ever stood up so persistently and effectively for the dignity of human nature, knowing himself for a man, and the equal of any and all governments. In that sense he was the most American of us all."

For Thoreau and Emerson, therefore, as for most of the Transcendentalists, Brown is the ideal man not only because he guides his actions by his conscience and devotes himself to fighting for a higher principle (which, in his case, is the eradication of slavery), but also because he does so in the most "manly" of ways, viz. by *knowing himself for a man*. In the eyes of his admirers he suffers from no "divided consciousness," and in this sense differs both from New England intellectuals and from American culture as a whole in the 1850s. He symbolizes the ideal of authenticity. He is Emerson's "hero," the man whose essence is "self-trust," who "speaks the truth and is just, generous, hospitable, temperate, scornful of petty calculations and scornful of being scorned."¹

In short, Brown "knew himself for a man" more fully than Thoreau and Emerson knew themselves as such: they were well aware that, while Brown *acted*, they merely *wrote*. However, what does the word "authentic" really mean? And what causes a person or a culture to be inauthentic? In thus contrasting the Transcendentalists with Brown, what exactly are we doing?

In a sense, the first question is not hard to answer. Inauthenticity can mean various things: self-delusion; "playing a role" or "wearing a mask"; being compulsively self-conscious to the extent that you don't have a clear sense of who you are; failing, for whatever reason, to "realize" (or *real-ize*) yourself (i.e., your potential), for example by watching TV all day every day; immersing yourself in superficial, commonplace pastimes that don't touch your "inner self," for instance by living like a New Yorker who rushes from place to place day after day, shopping, eating, drinking, watching movies, meeting friends, without ever pausing and self-reflecting for the sake of "staying in touch with" himself. What these modes of inauthenticity have in common is that they are ways of *not being oneself*. They imply a dichotomy between the "real self" and the "false self," between reality and appearance. The truly authentic person lives in a "fullness of being"; he suffers from no self-suppression or self-stuntedness or insecurity.

There are other ways to express the meaning of inauthenticity. For instance, one could use Hegelian language and say that inauthenticity at its most extreme is characterized by a "disintegrated consciousness." The example that Hegel chooses to illustrate what he means by this term is the Nephew in Diderot's dialogue *Rameau's Nephew*, the character who is so confused about his identity that he can be anyone and everyone, he can adopt whatever mask it pleases him to adopt in a given moment.² This character effectively has no self: his "self" is merely a series of masks floating in air, masks on top of masks all the way down to the "core"—but there is no core. There is only an infinite floating in a vacuum-of-identity. Dostoyevsky provides an even more extreme example of the disintegrated consciousness in *Notes from the Underground*, which comprises a series of self-reflections by the "Underground Man." The Underground Man's paradox is that he knows nothing about himself precisely because he knows everything. He is compulsively self-conscious, which means he never stops questioning himself, never stops wondering who he "truly" is, to the point that he considers himself to lack an identity:

¹ From Emerson's essay "Heroism."

² See Hegel's *Phenomenology of Spirit*, the chapter entitled "Self-alienated Spirit." See also Lionel Trilling's *Sincerity and Authenticity*, which is an illuminating discussion of all these themes.

...I did not know how to become anything; neither spiteful nor kind, neither a rascal nor an honest man, neither a hero nor an insect... [A] man in the nineteenth century must and morally ought to be pre-eminently a characterless creature; a man of character, an active man is pre-eminently a limited creature...¹

In other words, the disintegrated consciousness, which is the most alienated, least “authentic,” of all consciousnesses, is obsessed, tortured, by its consciousness of freedom in relation to itself. According to R. D. Laing, the famous psychoanalyst, schizophrenia is the (patho)logical conclusion of this disintegration of consciousness.

What does all this have to do with John Brown and the Transcendentalists? First of all, it clarifies what we mean by saying that Brown is comparatively “authentic”: we mean that his consciousness and behavior are farther away from the extreme of “dis-integration” than Emerson’s and Thoreau’s are. In other words, his actions are simple extensions of his sense of self to a relatively high degree. Emerson and Thoreau (I’ll call them “ET” for short, and treat them as instantiations of a single mode of consciousness) are characterized by a greater division between their “inner,” “true,” “ideal” self and the self they present to the world, the self that determines much of their behavior. The division is reflected also in their writing, for as they write they are continuously, of necessity, making compromises between what they believe and would like to say and what they think will be acceptable and most effective in light of their audience.² That is, they are adjusting their behavior in light of social norms and people’s expectations, which presupposes and reinforces a separation in their consciousness between what is “false” (in their behavior and writing) and what is “true.” Their sense of self, therefore, suffers from a partial lack of integration with itself, a lack of un-mediated “wholeness” and self-certainty, corresponding to the split between their inner self/behavior and the self/behavior they present to others.

Freud believed that the pathological is a clue to the “ordinary,” the “healthy.” They exist on a continuum; there is no radical separation between mental health and mental ill-health. This Freudian belief supports my claim that John Brown and ET represent different places in a continuum from complete authenticity or self-certainty—as manifested, for instance, in an infant’s consciousness, in which there is no self-awareness, no self–other division—to, perhaps, schizophrenia, if R. D. Laing’s interpretation of schizophrenia is right. One could also say that ET is more authentic, less mediated by critical self-consciousness, less intensely “aware of [itself] as an object of someone else’s observation,” than many postmodern intellectuals, whose writings are saturated with compulsive self-consciousness. The writer David Foster Wallace is a good example of such an intellectual; so is Samuel Beckett, even Sylvia Plath—writers whose works testify to the cultural and personal insecurity that exists in this age.

The question arises, then, as to the *causes* of these various degrees of self-insecurity and inauthenticity. What factors caused Brown to be more self-certain than the Transcendentalists, and why were they more self-certain than many contemporary intellectuals are? To answer this question we have to look at the social environments in which these people grew up, the environments that formed them.

John Brown matured in the wilderness, on the frontier. Much of his youth was spent in Ohio, working at his father’s tannery, living in the log cabin his father had built. These were rough conditions; his family never—throughout his life, in fact—transcended its poverty. Moreover, Brown’s parents were severe with him, readily punishing and whipping him for his wild behavior.³ He did not feel unloved, though. Quite the contrary. His mother died when he was eight, but he cherished her memory. His parents were also extremely devout Calvinists, a characteristic that they would pass on to their son. He grew up to

¹ *Notes from the Underground*, chapter 1.

² Comparisons between Thoreau’s journal and his “Plea for Captain John Brown” support that point. In the journal his wording was often stronger than in his speech, evidently because he thought his audience wouldn’t appreciate his more strongly worded sentiments. The apposite portion of the journal is available at http://www.library.ucsb.edu/thoreau/writings_journals_pdfs/J15f4-f6.pdf.

³ Reynolds, op. cit., 32.

be a stern, self-confident, commanding figure who disliked “‘vain and frivolous’ conversation and people.”¹ Almost the entirety of his life would be lived in outposts in the wilderness, be they in Kansas, Ohio, or upstate New York.

Emerson and Thoreau, by contrast, spent most of their lives in or around Boston, Massachusetts. They both studied at Harvard and taught school briefly afterwards. Their continuous contact with civilization is reflected in their writings, which preach a return to nature, a rejection of laws and institutions that conflict with one’s conscience, a reliance on *intuition* rather than established religion or anything predominantly social in character. The individual should, in a sense, have priority over society. In short, they were firmly convinced that society was corrupting, that it was false, sometimes evil, and that if the individual was not careful, *its* falsity could become *his* falsity.

The main reasons they had such an adverse reaction to “society” are also the main causes of their inauthenticity relative to Brown. Quite simply, modern society structurally imposes *roles* on people, modes of behavior they have to adopt if they are to survive the hustle and bustle and not become social outcasts. Social structures constrain one’s freedom. Moreover, they fragment the populace, atomize people, make them strangers to one another, which ultimately makes them mutually suspicious.² The end-result is mass insecurity and self-consciousness. The necessity to spend most of one’s time playing various roles, worrying about people’s reactions to one’s behavior, worrying if one is fulfilling the designated roles properly, and so on, can have destructive implications with respect to one’s sense of self. An individual may even *lose* his sense of himself, which is to say he no longer knows who he is. Emerson and Thoreau probably did not suffer from this pathology, but their emphasis on the individual’s need to “trust himself” shows at least that they were not strangers to the modern problem of a loss of identity.

Brown, however, *was* a stranger to this problem because he was not formed by the social structures of American city-life. His identity was forged on the frontier, where it was unnecessary to adopt a plethora of identity-confusing “roles.” He was raised by strict Calvinists and he became a single-minded Calvinist. His world was not ambiguous.

To be sure, his innate psychological endowment obviously had a lot to do with his character. But so did his background. It is not unreasonable to suppose that the differences between his background and Emerson’s (and Thoreau’s) partly determined the differences between their characters.

The foregoing reflections have a number of implications that might stimulate further thought. For instance, it would seem that societies, at least as “ideal-types,” necessarily evolve in the direction of encouraging greater and greater inauthenticity amongst their denizens, inasmuch as they tend to proceed from a relatively primitive, “natural” state of little social differentiation or “role-playing” to an increasingly “civilized” state of economic and social coercion in the form of interwoven norms and roles—roles that emerge from the evolving state of technology, of the division of labor, of urban centers, of social structures. It would make sense, then, to call a society “self-conscious” or “inauthentic” to the degree that its institutions and social relations were such as to promote these traits in its inhabitants, i.e. to encourage the latter to adjust their behavior in light of how they see themselves and think they are seen by others (which is just to put on an *act*³).

Alternatively, one might approach the Transcendentalists’ writings in terms of what they reveal about, e.g., the self-consciousness of certain sectors of American culture at certain times, and how that self-consciousness evolved towards greater self-doubt and despair—as well as the social causes that might have led to such an evolution in the 1840s, ’50s, and ’60s. Similarly, one might examine John Brown’s writings as clues to how a relatively “authentic” person thinks and acts in given social conditions. They are clues to the mental structure of a certain kind of person.

¹ *Ibid.*, 36.

² See Christopher Lasch’s *The Culture of Narcissism* (New York: W. W. Norton & Company, 1979) for an insightful discussion of all these themes.

³ The act may deceive the actor himself, but it nevertheless retains some of its ‘act-ive’ character as long as the actor adjusts his behavior—perhaps involuntarily—in response to a discrepancy between how he perceives himself and how he wants to be perceived (by himself and others).

Such investigations, however, lie beyond the purview of this paper. My purpose has been only to sketch a few telling differences between the characters of John Brown and his Transcendentalist admirers, and to speculate on why they so admired him. It appears, in the end, that their admiration was evoked by one thing above all: their sense that he was a more “genuine man” than they. —The cult of masculinity and the cult of authenticity overlap.

*

Here are victims of redaction, redacted because I would’ve spent tens of pages precisifying them:

I will argue that societies, at least as “ideal-types,” progress from a primitive sort of authenticity to greater and greater degrees of inauthenticity, or alienation and anxious self-consciousness, and then transcend these conflicts to reach a higher level of “authenticity,” which again succumbs to enervating self-consciousness and disintegration, and so on. Yet this conflict-ridden evolution is a story of continuous progress, of *development*; there is never a simple return to an earlier stage. Individuals—at least, those individuals who are intelligent and sensitive enough to have the capacity for continuous development—experience a similar evolution throughout their lives, evolving from a state of wholeness to partial disintegration to a higher-level (i.e., more self-conscious and multifaceted) wholeness to a higher-level disintegration, etc. Later on I’ll discuss Brown and his nineteenth-century admirers from the perspective of this Hegelian theory I’ve laid out.

If the theory, incidentally, seems confused or meaningless, it might seem less so if one considers the history of American culture. In the 1820s and ’30s, for example, popular literature included James Fenimore Cooper’s tales of the frontier, Washington Irving’s short stories, Edgar Allan Poe’s stories, and some of Emerson’s essays; in the 1850s there were such works as *The Scarlet Letter*, *Uncle Tom’s Cabin*, *Leaves of Grass*, *Walden*, and Melville’s “Bartleby, the Scrivener.” In three or four decades, then, we can see that the society had become more self-conscious and self-critical, as reflected in its literature. With Cooper it was lost in romantic adventures involving Indians on the frontier; with *Walden* it was critiquing itself, turning away from itself in weariness, and with *Uncle Tom’s Cabin* it was condemning its own institution of slavery. *Leaves of Grass*, too, represented a growing national self-consciousness, which however had not yet reached a mature “anxiety.” In “Song of Myself,” for example, Whitman experimented with different voices, different identities—“I am large, I contain multitudes”—thereby celebrating both America’s diversity and its self-conscious unity. This cultural self-consciousness was still, on the whole, strong and healthy, like Whitman’s poetry—susceptible, indeed, to self-doubt and self-weariness, but not nearly as much as it would be a century later. After the Civil War and Reconstruction there was a rich, vibrant period of literary realism, naturalism and satire: this was the age of Mark Twain, William Dean Howells, and then Henry James, Stephen Crane, Kate Chopin, etc. The country was increasingly self-conscious and self-critical but still basically integrated with itself in all its multifaceted permutations, not yet “disintegrated.”

But if we jump ahead half-a-century and more—broadening our scope to Western culture as a whole—we find, e.g., Jean-Paul Sartre, Bertolt Brecht, Albert Camus, Samuel Beckett, Arthur Miller, Allen Ginsberg, Sylvia Plath, and so on. Avant-garde everywhere. By now, the culture (especially the “avant-garde” of culture) was plagued by anxiety, debilitating self-consciousness and self-doubt, fragmentedness, disintegration, alienation. To quote Susan Sontag, it “had entered, really entered, the age of nihilism.”¹

Strictly speaking, of course, it is not legitimate to ascribe properties like “self-conscious,” “anxious” and so forth to an entire *society* or *culture*; by definition, only an individual can have such properties. Nevertheless, in a metaphorical sense it is not absurd to say that a society is full of anxiety and inauthenticity. What one is saying is that the majority of the population has these traits—or perhaps a better translation would be that the institutions and social relations of the society encourage these traits in

¹ Susan Sontag, *Against Interpretation and Other Essays* (New York: Farrar, Strauss and Giroux, 1966), 311.

individuals. The *roles* that are structurally imposed on people impel them into pathologies of behavior and consciousness, pathologies manifested in “culture.”

December 14, 15

Reading Max Scheler’s *Ressentiment*, his commentary on Nietzsche’s theory. The editor paraphrases Scheler’s definition:

Ressentiment denotes an attitude which arises from a cumulative repression of feelings of hatred, revenge, envy and the like. When such feelings can be acted out, no *ressentiment* results. But when a person is unable to release these feelings against the persons or groups evoking them, thus developing a sense of impotence, and when these feelings are continuously re-experienced over time, then *ressentiment* arises. *Ressentiment* leads to a tendency to degrade, to “reduce” genuine values as well as their bearers. As distinct from rebellion, *ressentiment* does not lead to an affirmation of counter-values since *ressentiment*-imbued persons secretly crave the values they publicly denounce.

Scheler also argues that “particular places in the social structure are peculiarly apt to produce *ressentiment*. *Ressentiment* emerges not from native impulses but from specific positions in the social structure in which men are variously placed.” The feminine role, for instance, insofar as it is supposed to be passive and accepting, has a greater affinity for *ressentiment* than the masculine role. “When women reject certain masculine values which they secretly crave they may be said to be engaging in *ressentiment* behavior.”

It seems like we’re talking merely about *bitterness*, *rancor*, or a long-term version of these feelings. But even if that’s true, Nietzsche’s analysis counts as an important discovery.

Bernard Madoff: Wall Street dude arrested yesterday who swindled people out of \$50 billion. It doesn’t please me that a lot of ordinary middle-class people were victims, but it *does* please me that a bunch of wealthy New York socialites are in the doghouse now. Is that because of *ressentiment*? In a much-diluted way, perhaps yes. A slight underlying bitterness, dissatisfaction, rancor directed against Life or Society or People. Remember, though, that the label “*ressentiment*” isn’t the point; the point is to understand the psychological dynamics suggested by the label.

Schadenfreude isn’t always a product of *ressentiment*. (Am I understanding the term right?)

“Relative deprivation” (a sociological term): “privation is felt to be painful only in reference to others who are seen as possessing the prized values.” (Desire is mediated by consciousness of the other.) When you’re unhappy you want others to be unhappy. If equality of unhappiness is established, you’re not so unhappy anymore. And you have little or no *ressentiment* anymore. You want to be equal to or better than others because self-esteem is mediated by consciousness of the other’s attitude (implicit or explicit) towards you. If the other doesn’t respect you, you can’t respect yourself—because you are the other (or the other is *part of you*¹).

The word in French: “First of all, *ressentiment* is the repeated experiencing and reliving of a particular emotional response reaction against someone else. The continual reliving of the emotion sinks it more deeply into the center of the personality, but concomitantly removes it from the person’s zone of action and expression. It is not a mere intellectual recollection of the emotion and of the events to which it ‘responded’—it is a re-experiencing of the emotion itself, a renewal of the original feeling. Secondly, the word implies that the quality of this emotion is negative. ...suppressed wrath, independent of the ego’s activity, which moves obscurely through the mind. It finally takes shape through the repeated reliving of intentionalities of hatred or other hostile emotions...”

¹ I don’t mean that *others*, that *other people*, are part of you. I mean the “Other” is. Other people are instantiations of the “Other” in you. But the Other is also outside you, realized in (or as) these people.

“...Thirst for revenge is the most important source of *ressentiment*. As we have seen, the very term ‘*ressentiment*’ indicates that we have to do with reactions which presuppose the previous apprehension of another person’s state of mind. The desire for revenge—in contrast with all active and aggressive impulses, be they friendly or hostile—is also such a reactive impulse.” Cf. what I wrote above.

The thirst for revenge, envy, the impulse to detract, spite, *schadenfreude*, malice, and finally *ressentiment* are all unnatural impulses/feelings. Impulses that are not spontaneous—that instead *poison*, that *rankle*—are unnatural, in that they arise from excessive, or “civilized,” self-consciousness and individuation. They’re perversions of natural feelings/impulses. Anger and violent rage are natural, being-annoyed is natural; prolonged hatred isn’t. (What *is* hatred? Just an amalgam of such feelings as envy and the desire for revenge? Sometimes “repulsion”? What is repulsion specifically?) There are two main kinds of violence in nature: the violence of securing food, and the violence of spontaneous, ‘immediate’ impulses of ill-will. Civilization (in the loosest sense) has given us the violence of revenge, etc. Bottled up, simmering, rankling, then a violent act to release it. Same with malice.

Ressentiment: essentially *diffuse*? Partly or wholly unconscious.

I can’t think of anyone I hate. I would surely hate a lot of Washington politicians if I knew them. Repulsion. Disgust at their arrogance and hypocrisy. But what is disgust? There would also be a desire for revenge, or a sort of bitterness or *ressentiment*, at being ignored by strong personalities. This would in fact be the main reason for my hate, since hate is necessarily directed at someone you think (unconsciously, if need be) has done you wrong.

Important insight: With revenge and *ressentiment*, “the injured person always places himself on the same level as his injurer. A slave who has a slavish nature and accepts his status does not desire revenge when he is injured by his master...” There isn’t much *ressentiment* in a society with sharply divided classes, like old India, because there is no equating of oneself with people in a higher class (or caste). But in modern society there is, because, according to Scheler, equality is a universally acknowledged right and yet inequality abounds.

The French Revolution and *ressentiment*. Killing off the nobility. Revenge. Insofar as social movements are propelled by these motives, they’re propelled simply by the desire for recognition. And then “*ressentiment*” intersects with Axel Honneth’s book.

December 16

My investment in vegetables is already paying off: I’m happier and more energetic. More “noble,” as in “free of bitterness.” Aside from eating oranges and bananas during the day, each night I cook myself a burger topped with cabbage, onions, carrots, tomato-slices and cheese—can barely get my mouth around it—and I eat celery with peanut butter. PB&J sandwiches every night too, as always. Soon I’ll be adding more vegetables.

The elderly: *ressentiment* against youth. Tertullian: the sight of Roman governors burning in hell is one of the chief sources of heavenly beatitude. Christian *ressentiment*. (Scheler disagrees with Nietzsche’s verdict on Christianity, but he agrees about Tertullian.) The romantic type of mind, romantic nostalgia for a past age: *ressentiment*, at least when the nostalgia is based on a wish to escape from the present rather than on a direct love of the values of the earlier period.

“The formal structure of *ressentiment* expression is always the same: A is affirmed, valued, and praised not for its own intrinsic quality, but with the un verbalized intention of denying, devaluating, and denigrating B.” But then there’s an element of *ressentiment* in everyone. For instance, I said above that when one is satisfied by a Democratic victory, a reason for the satisfaction is the Republican loss. *Schadenfreude*.

“To its very core, the mind of *ressentiment* man is filled with envy, the impulse to detract, malice, and secret vindictiveness. These affects have become fixed attitudes, detached from all determinate objects. Independently of his will, this man’s attention will be instinctively drawn by all events which can set these affects in motion... Therefore such phenomena as joy, splendor, power, happiness, fortune, and strength

magically attract the man of *ressentiment*. He can't pass by, he has to look at them, whether he 'wants' to or not. But at the same time he wants to avert his eyes, for he is tormented by the craving to possess them and knows that his desire is vain." Scheler says that this man devalues, denigrates what he really desires as a way to reduce the "tension between desire and impotence." "We have a tendency to overcome any strong tension between desire and impotence by depreciating or denying the positive value of the desired object. At times, indeed, we go so far as to extol another object which is somehow opposed to the first." The book is full of such acute observations.

It's "tension," yes. But another way to say it is in terms of recognition (self-confirmation). A "tense" state of mind is in a state of insufficient self-confirmation. To remedy that, you [i.e., as a man of *ressentiment*] make yourself value something different, something that you already have or that is easier to acquire or is opposed to whatever it is that's responsible for your lack of self-confirmation.

Anyway, the story continues. The man of *ressentiment* comes to hate the very essence, the existence, of the strong, happy, rich, beautiful person. The latter's existence is a reproach to this man. The last stage of *ressentiment*, the stage after this consuming hatred, is when the man turns values themselves upside-down because he can't justify or even understand his own life in terms of such values as health and freedom. (E. A. Poe comes to mind.) So he comes to feel that "all this is vain anyway" and that salvation lies in poverty, suffering, illness and death. If this stage goes on long enough—in particular, if it spreads through a society—there is no longer a need for revenge against the strong, handsome, rich man because he is in fact pitiable, beset with "evils." "His sight now awakens feelings of gentleness, pity, and commiseration." And as the generations are taught this new morality, the strong people, the "masters," become infected, plagued with a "bad conscience" because they aren't, um, weak enough.

December 17

In Scheler, resentment and *ressentiment* bleed into one another. The former is properly more specific, the latter more general, and Scheler recognizes this; but some of his examples of *ressentiment* are merely examples of resentment. This is understandable, though: even in their strictest senses, the two concepts cannot be absolutely distinguished from one another.

Scheler's comparison of the ancient and the Christian conceptions of love is illuminating. I'll quote at length.

[With the Greek and Roman philosophers and poets,] logical form, law, justice—in short, the element of measure and equality in the distribution of goods and evils—are superior to love. Even though Plato, in the *Symposium* for example, establishes great differences in value between the various kinds of love, in Greek eyes the whole phenomenon of "love" belongs to the domain of the senses. It is a form of "desire," of "need," etc., which is foreign to the most perfect kind of being. This view is the natural corollary of the extremely questionable ancient division of human nature into "reason" and "sensuality," into a part that is formative and one that is formed. In the sphere of Christian morality, on the other hand, love is explicitly placed above the rational domain—love "that makes more blessed than reason" (Augustine). This comes out quite clearly in the parable of the prodigal son. "Agape" and "caritas" are sharply and dualistically separated from "eros" and "amor," whereas the Greeks and Romans...rather see a continuity between these types of love... The most important difference between the ancient and Christian views of love lies in the *direction of its movement*. All ancient philosophers, poets, and moralists agree that love is a striving, an aspiration of the "lower" toward the "higher," the "unformed" toward the "formed," "appearance" towards "essence,"...a "mean between fullness and privation," as Plato says in the *Symposium*... [Expressions in metaphysics:] Already Plato says: "We would not love if we were Gods." For the most perfect form of being cannot know "aspiration" or "need." Here love is only a road to something else, a

“*methodos*.” And according to Aristotle, in all things there is rooted an upward urge towards the deity, the *Nous*, the self-sufficient thinker who “moves” the world as “prime mover.”... The universe is a great chain of dynamic spiritual entities, of forms of being ranging from the “*prima materia*” up to man—a chain in which the lower strives for and is attracted by the higher, which never turns back but aspires upward in its turn. This process continues up to the deity, which itself does not love, but represents the eternally unmoving and unifying *goal* of all these aspirations of love. Too little attention has been given to the peculiar relation between this idea of love and the principle of the “agon,” the ambitious contest for the goal, which dominated Greek life in all its aspects—from the Gymnasium and the games to dialectics and the political life of the Greek city-states. Even the objects try to surpass each other in a race for victory, in a cosmic “agon” for the deity. Here the prize that will crown the victor is extreme: it is a participation in the essence, knowledge, and abundance of “being.” Love is only the dynamic principle, immanent in the universe, which sets in motion this great “agon” of all things for the deity.

[In the Christian conception of love] there takes place what might be called a *reversal in the movement of love*. The Christian view boldly denies the Greek axiom that love is an aspiration of the lower towards the higher. On the contrary, now the criterion of love is that the nobler stoops to the vulgar, the healthy to the sick...the good and saintly to the bad and common, the Messiah to the sinners and publicans. The Christian is not afraid, like the ancient, that he might lose something by doing so, that he might impair his own nobility. He acts in the peculiarly pious conviction that through this “condescension,” through this self-abasement and “self-renunciation,” he gains the highest good and becomes equal to God... God is no longer the eternal unmoving goal for the love of all things... Now the very *essence* of God is to love and serve. [Scheler says that “the later theological thesis according to which God has created the world ‘for his glorification’ is foreign to the spirit of the Gospel. It is an element of ancient philosophy which has entered Christian theology.”] An event that is monstrous for the man of antiquity, that is absolutely paradoxical according to his axioms, is supposed to have taken place in Galilee: God spontaneously “descended” to man, became a servant, and died the bad servant’s death on the cross! Now the precept of loving good and hating evil, loving one’s friend and hating one’s enemy, becomes meaningless. There is no longer any “highest good” independent of and beyond the *act* and movement of love! Love itself is the highest of all goods!... Indeed, the achievements of love are only symbols and proofs of its *presence in the person*... But there is another great innovation: in the Christian view, love is a non-sensuous act of the *spirit* (not a mere state of feeling, as for the moderns), but it is nevertheless not a striving and desiring, and even less a need. These acts consume themselves in the realization of the desired goal. Love, however, *grows* in its action... Whenever I see badness in another, I must feel partly guilty, for I must say to myself: “Would that man be bad if you had loved him enough?” In the Christian view, *sensuous* sympathy—together with its root in our most powerful impulse—is not the source, but the partial *blockage* of love. Therefore not only positive wrongdoing, but even the failure to love is “guilt.” Indeed, it is *the* guilt at the bottom of all guiltiness.

Thus the picture has shifted immensely. There is no longer a band of men and things that surpass each other in striving up to the deity. It is a band in which every member looks back toward those who are further removed from God and comes to resemble the deity by helping and serving them.

According to Scheler, *ressentiment* can indeed result in a Christian-like celebration of the weak. But true Christian love is “motivated by a feeling of security, strength, and inner salvation, of the invincible fullness of one’s own life.” One is *rich* enough to share one’s being. A good example of this personality-type would be the Dalai Lama. Such a man “does not love sickness and poverty but what is *behind* them [i.e., the

positive phenomena that are still there], and his help is directed *against* these evils.” St. Francis kisses festering wounds and refuses to kill bugs that bite him not because he’s perverted but because he has overcome his nausea through a feeling of life and vigor. The opposite of this attitude is that of “recent modern realism in art and literature,” in which social misery is described, wallowed in—“a typical *ressentiment* phenomenon.” Something bug-like is seen in everything that lives, whereas St. Francis sees something holy even in the bug.

All these ideas are valuable. You shouldn’t be put off by the undercurrent of contempt that mars Scheler’s discussion of *ressentiment*: the analysis needn’t imply value-judgments. “Great” people can be partially motivated by a diffuse rancor and resentment. *Ressentiment* isn’t *bad*, it’s just something that exists—in almost everyone, to varying degrees.

I could go on quoting forever. With ancient love, says Scheler, there is a little anxiety, since the noble fears the descent to the less noble. The true Christian, though, is too certain of himself to have this fear.

Another thing: Christian love doesn’t consist in the desire to help or even in “benevolence.” Rather, it’s “immersed in positive value,” and helping is only a consequence of it. Altruism, socialism and such are very different from Christian love: they are means to an end, whereas in Christianity, love is the end. —It goes without saying that “true Christianity” is not the Christianity of the masses. It also goes without saying that Scheler’s discussion isn’t very *realistic*. All the falsely clear-cut distinctions he makes between personality-types, and the account of “spiritual love,” and his psychologism.

A general question: what’s the relation between love and desire? This is surprisingly difficult to answer. Does love merely *entail* desire, or *is it* a kind of desire? What does it say about these concepts and experiences that such a basic question is well-nigh unanswerable?

I had to revise my long paper, cut out the non-Europe parts. After writing the following I mostly cut-and-pasted the rest:

Evaluating the Muslim “Threat” in Europe

The problems of Muslim integration in Europe are often treated as proof of Samuel Huntington’s thesis of a “clash of civilizations” between Islam and the West. Writers more sophisticated than Huntington¹ might not explicitly draw the Huntingtonian conclusion, but it hovers around the margins of their work all the same.² Western popular culture, on the other hand, is saturated with it, i.e. with the demonization of Muslims in Europe and around the world.³ This is not surprising in the age of a “war on terror.” It is, however, unfortunate, because the difficulties of Muslim integration into the “liberal world order” are less usefully thought of as exemplifying a clash of civilizations than as arising out of particular socioeconomic conditions faced by many Muslims. The focus of this paper will be on such conditions in Europe. Specifically, I will argue that Muslim immigrants are probably not the “huge long-term threat to Europe”⁴ that they might appear to be.

That they *appear* to be so is true. European suspicion towards Muslims is understandable. First of all, Islamist terrorism has increased since 9/11. Terrorist attacks occurred in London on July 7, 2005; Theo van Gogh was murdered by a Muslim man in 2004; Danish cartoons of Mohammed ignited rage in 2006, though no terrorist attacks resulted; and in 2006 an ambitious terrorist plot was uncovered involving planes

¹ For succinct criticisms of Huntington, see the following: Edward Said, “The Clash of Ignorance,” *The Nation* (Oct. 4, 2001); Sandra Buckley, “Remaking the World Order: Reflections on Huntington’s *Clash of Civilizations*,” *Theory & Event* 2, No. 4 (1998); Carl Gershman, “The Clash within Civilizations,” *Journal of Democracy* 8, No. 4 (October 1997).

² See, for example, Robert Leiken, “Europe’s Angry Muslims,” *Foreign Affairs* (July/August 2005). More egregious is Bernard Lewis, “Islam and Europe” (Washington, D.C.: The AEI Press, 2007).

³ See, e.g., Robert Spencer, *Onward Muslim Soldiers: How Jihad Still Threatens America and the West* (Washington, D.C.: Regnery Publishing, Inc., 2003); and Bruce Bawer, *While Europe Slept: How Radical Islam Is Destroying the West from Within* (New York: Doubleday, 2006).

⁴ “Forget Asylum-Seekers: It’s the People Inside Who Count,” *Economist*, May 8, 2003.

leaving London's Heathrow airport. The proportion of European Muslims involved in such activity is, of course, extremely low: counterterrorism officials estimate that 1 to 2 percent of European Muslims are involved in some type of extremist activity (which isn't necessarily violent).¹ This fact, however, is not necessarily comforting, since even a few dozen terrorists can inflict great damage.

Moreover, the above-mentioned incidents do not convey the full extent of terrorist activity in Europe. In 2008 alone, authorities broke up a terrorist cell in Barcelona, arresting ten men who were plotting an attack on Barcelona's subway; Spanish police arrested eight Algerian men who were members of "Al Qaeda in the Maghreb," a group that had recently claimed responsibility for bombings in Algeria; ten suspected terrorists were arrested in France, the Netherlands and Germany; German police foiled an attempt by two men to bomb a plane;² and 14 people with ties to Al Qaeda were arrested in Belgium.³ In 2007, "Europe saw four failed and attempted Islamist terrorist attacks. The UK experienced two failed attacks, while Denmark and Germany both reported one attempted attack each."⁴ The EU member states reported that 201 terrorist suspects had been arrested in 2007; in 2006, the number was 257. Many more individuals, though, are under investigation: in 2007, for example, the United Kingdom reported that at least 2000 people posed a direct threat to its national security.⁵

Terrorism is not the only cause for concern. The European public has also been appalled by reports of women's ill-treatment in a minority of Muslim communities. Such practices as forced marriages, arranged marriages, "honor killings" (in which a woman is killed, usually by her family members, for having somehow sacrificed her "honor"), and genital mutilation have stolen newspaper headlines and given fuel to right-wing politicians who decry immigration. Reliable statistics on these phenomena are not available, but in Germany there were at least 47 honor killings of women from 2000 to 2006, while in the United Kingdom, 18 out of 22 domestic homicides in 2005 were classified as "murder in the name of so-called 'honor.'"⁶ Tens of thousands of European-born Muslim women are annually forced into marriages in their family's home countries,⁷ and approximately 500,000 girls and women in Europe are said to be at risk of genital mutilation.⁸ These practices were not so common twenty years ago; they have resulted largely from the recent embrace of radical Islam by Muslim men, the causes of which we shall investigate shortly. But they have led people like Seyran Ates, a Turkish-German women's rights activist, to conclude that "two societies with two different value systems live side by side, but separate from one another."⁹

The human rights violations carried out in Islam's name have given many Europeans a negative view of Islam and its believers. The Pew Research Center reported in September of 2008 that, among the respondents to its polls (1000 people in each country), 52% in Spain, 50% in Germany, 46% in Poland, 38% in France, and 23% in Great Britain had negative views of Muslims.¹⁰ More concretely, a 2003 Ipsos poll in France indicated that 62% of the French population thought the values of Islam were incompatible with those of France, while 25% of French Muslims—and 75% of those under the age of 25—shared that

view.¹ (The European values in question seem to be those of “gender equality; sexual liberalization; and the principles of compromise, egalitarianism, and identification with the state.”²)

Demographic data are even more striking than polling data. According to the U.S. Department of State’s *Annual Report on International Religious Freedom 2003*, there are more than 23 million Muslims in Europe, almost 5% of Europe’s population. Timothy Savage summarizes other statistics: [...]

One would be forgiven for concluding on the basis of such data that Europe is indeed facing a “huge long-term threat.”

In addition to the terrorism, the radicalization of disenchanted Muslim youth, the violations of women’s rights, and the exponential rise of Europe’s Muslim population, many non-Muslim Europeans are disturbed by the simple physical transformation brought about by Arabs and Muslims living in cities and suburban neighborhoods. As the Pew Forum states,

it is not uncommon to see women wearing headscarves and men with skull caps and beards. On many European streets, shops now sport signs in Arabic and other Near Eastern languages and sell an array of exotic-looking products from the Middle East and other parts of the Islamic world. Indeed, in the space of a few decades, whole neighborhoods in cities like Birmingham, Rotterdam and Paris have been transformed.³

In such circumstances, a rise in xenophobia is virtually inevitable. And in response to xenophobia and discrimination, increased radicalization and self-segregation of Muslim populations occurs—which leads to more xenophobia. The situation is certainly not innocuous.

Let’s look more closely, though, at what is happening in Europe. Why do many Muslim communities segregate themselves from the larger population to an even greater extent than other immigrant communities do? Why do they cling to traditional Islamic values? Why has terrorism increased? Barbara Franz gives a succinct, and I think correct, answer: “Europe’s current Islamic alienation...is more about Marx than Mohammad or bin Laden.”⁴ It is more about political and socioeconomic alienation than religion per se.

In fact, if one attributes immigrants’ lack of societal integration mainly to their *religion*, or to their “*culture*,” as conservative commentators like Huntington do, then pessimism is a natural attitude. For “*culture*” is conceptualized as “*tradition*,” “*the weight of tradition*,” the traditions that have descended through century after century down to the present day, by which time they are so hoary as to be virtually embedded (supposedly) in the people, indeed in the “*race*.” Culturalism is not far from racialism, which is not far from racism. As the story goes, people in a particular region of the world—in this case, North Africa and the Middle East—acquired a long time ago, in some primeval past, something called “*a culture*,” which has stayed with them nearly unchanged for centuries and millennia just because cultures are the sorts of things that are very hard to change. The longer they exist, the harder it is to change them. By virtue of mere “*cultural inertia*,”⁵ traditions pass from generation to generation passively, like the ebb and flow of time itself. There is little room for human agency in this history: one grows up in a cultural atmosphere, soaks it up like a sponge, and passes it on to one’s descendants. So now, in the twenty-first century, an Arab or Middle Easterner necessarily has this tremendous cultural burden simply because he comes from North Africa or the Middle East. He cannot be other than he is; it is virtually in his blood. Therefore, if he

emigrates to Europe or some Western region he will necessarily come into conflict with it: a “clash of cultures,” a “clash of civilizations,” will result, and Armageddon will come to pass.

The reality, of course, is not so simple. A “culture,” insofar as it makes sense to speak of such a thing, is not some sort of *fog* that hangs over a piece of land or a group of people, something that one *breathes in*, so to speak, “automatically.” Nor is it a *monolithic thing*. “Cultural values” are not unchanging Platonic Forms (*pace* Huntington and Bernard Lewis); they are essentially mere extrapolations from how a given group of people behave in specific material conditions. There is no such thing as “cultural inertia” in the strict sense; and the passing of a way of life from one generation to the next is not so unproblematic or automatic as one might think. To maintain “cultural traditions”—i.e., particular ways of living—amongst a populace even for a few years requires active indoctrination, violent suppression of dissent, the promulgation of laws and their enforcement, manipulation of information reaching the masses, censorship, constant repetition of particular images and sound-bites, the establishment and maintenance of a specific curriculum in schools, the self-monitoring of the individual, and so on. It is by no means an inevitable or passive process. It is especially not inevitable if people have emigrated from the society whose social structures helped sustain the “cultural values” in question and now live in a completely different society, where there is enormous pressure to adopt new social roles, new value-systems, new ways of interacting with others. If, nevertheless, after two or three generations of living in the new society, many people aggressively hold on to the traditions of their old culture, one cannot simply say, “Oh, it’s just because they’re Muslims, it’s part of their *culture* to have honor killings, to wear the veil, to embrace jihad, to suppress women’s rights.” This is not an explanation. There are *specific reasons* why many Muslims in Europe—but only a minority—have decided to make a supreme effort to maintain their old ways of life and fight Western practices.

To understand these reasons it is necessary, first of all, to understand the social conditions of certain Muslim communities in Europe. Consider the United Kingdom. It has about 1.6 million Muslims (out of a population of nearly 60 million),¹ most of whom live in segregated communities in deprived urban areas. Nearly half live in and around London. On the whole, these communities are plagued by poverty, overcrowded housing, poor health, low educational qualifications, and high unemployment. The current unemployment rate for Muslim men is nearing 40 percent, with economic inactivity at 50 percent. One-third of British Muslim children live in households where none of the adults is employed, households where depressive attitudes prevail, where the social circles are narrow and conservative.

France has about 6 million Muslims, who constitute 10% of its population.² Muslim enclaves in the country have a 30% unemployment rate amongst 21- to 29-year-olds, while incomes are 75% below the average. French prisons hold nine times more young men with North African fathers than ones with French fathers. Germany has almost 3.5 million Muslims, most of whom are Turkish. The Turkish community has an unemployment rate of 24%—almost two and a half times the national average—while 50% in urban centers live in “financially precarious circumstances.” Immigrants’ educational qualifications also tend to be substantially lower than those of the general population.³

In short, Muslim immigrant communities are usually poorer and less educated than the rest of the population. This isn’t surprising. Most of the communities derive originally from guest-worker programs established after World War II, when Europe needed foreign labor to help rebuild the continent. Like Mexican enclaves in the United States, they began in poverty and have not yet, after two or three generations, transcended their poverty.⁴ This is not due to laziness. To a large extent, it results from discrimination. A 2005 study in Belgium that monitored job-seekers of foreign origin for three months

¹ The information in this paragraph comes from Javid Rehman, “Islam, ‘War on Terror’ and the Future of Muslim Minorities in the United Kingdom: Dilemmas of Multiculturalism in the Aftermath of the London Bombings,” *Human Rights Quarterly* 29, No. 4 (2007).

² I’ve taken the following information from Barbara Franz, *op. cit.*

⁴ Robert Leiken, “Europe’s Immigration Problem, and Ours,” *Mediterranean Quarterly* 15, No. 4 (2004).

found that 50% of them experienced discrimination during their applications.¹ In the United Kingdom, several studies have found that “the presence of educational qualifications for Pakistanis and Bangladeshis does not reduce the probability of unemployment to as great an extent as it does for other groups.”²

December 18

Scheler distinguishes between Christian love and modern “humanitarianism” or “love of mankind.” He agrees with Nietzsche that these modern phenomena arise out of *ressentiment*. The Christian “love of one’s neighbor” is not love of mankind; it is directed not at the sum total of humans but at *individuals*, the “‘nearest’ visible beings who are alone capable of that deeper penetration into the layer of spiritual personality which is the highest form of love.”

Christianity is on a different level, so to speak, than democracy or egalitarianism. It doesn’t advocate a social revolution: give to Caesar what is Caesar’s, etc. Scheler thinks that modern political and social ideologies have almost nothing in common with Christianity, though superficially they seem similar. He has a point. But he takes it too far.

Though I disagree with Nietzsche about a lot, I sympathize with his suspicion toward belief-systems that emphasize transcendence, that deprecate this world in favor of a higher one. That attitude evinces a self-consciousness about man’s place in the universe; it demonstrates an awareness of *divisions*, such as between man and nature, man and society, man and himself, low and high. It isn’t *naïve*. It’s “inauthentic.” Nietzsche wanted authenticity and naïveté.

Incidentally, to the extent that it makes sense to talk about “declining life,” “decadence” and so forth, a good criterion for applying those concepts is the relative presence or absence of inauthenticity, self-consciousness, anxiety, disintegration, etc. But what the analyst really needs is intuitive powers.

Glenn Gould was probably right that Bachian polyphony and contrapuntalism is on a higher spiritual (and intellectual) plane than later homophony, be it in Mozart, Beethoven, or whomever. It’s more pure, less emotional—less tainted by association with the earthly. Interweaving of melodic lines enjoyed for its own sake. “God’s thinking before he created the world.” (Goethe) Ethereal, *transparent* in some indefinable way, *diaphanous*, it exercises your intellect and raises you above yourself. Beethoven is comparatively human. With his music you’re more uplifted, but you’re less *lifted up*.

Here’s an email I sent Dad’s friend Rich Pollak.

I certainly share your enthusiasm for Perahia’s Goldberg Variations. It’s remarkable. I love his frequent Baroque ornamentations; they add buoyancy and an improvisatory quality. And authenticity. Most of the time I like his tempo, not too slow and not too fast. So, no, you’re not “wrong.” :)

On the other hand, there’s still a “special place in my heart” for Gould’s version. Maybe just because I’ve listened to it dozens of times. But Gould has a unique forcefulness and vigor, arguably even more vigor than Perahia. It’s true he lacks Perahia’s spontaneity and sparkle. But his recording has an unmatched clarity and brightness. Also, I like his approach of emphasizing the piece’s wholeness rather than the discontinuities between each of the variations: in an interview on the CD he says that he carefully maintained a basic “rhythmic pulse” throughout the piece in order to emphasize the harmonic unity that all the variations share. As for “authenticity,” he adds his own sort of Baroque ornamentations—trills and *appoggiatura* that aren’t as “light” or “sparkly” as Perahia’s but

¹ See the 2006 report published by the European Monitoring Centre for Racism and Xenophobia, at <http://fra.europa.eu/fra/material/pub/ar06/AR06-P2-EN.pdf>.

² From The Open Society Institute’s 2007 report on the United Kingdom: http://www.eumap.org/topics/minority/reports/eumuslims/background_reports/download/uk/uk.pdf.

have a more solid, weighty character—and, in addition, he doesn't use the pedal as much as Perahia. This contributes to the recording's clarity. I also love his interpretation of the aria. It's amazingly slow, but that sets it apart nicely from the saturnalia that follows. And then when you hear it again at the end, after the melee that has preceded it, at that slow pace and so quiet, so *diaphanous*, tears come to your eyes. It's a spiritual experience. It's like ecstasy.

The Fritz Reiner CD case doesn't have a CD in it.

Anyway, thanks for the CD. I love Perahia no matter what kind of music he plays. His Schubert, Mendelssohn and Chopin are great too. [...]

“Little children and slavish natures have the habit of excusing their acts by asking, ‘Have the others not done what I did?’ According to *genuine* morality, companionship in badness makes it *worse*, for the badness of imitation and slavishness is added to the badness of the desired *content*.” An obvious but little-recognized truth.

Scheler's psychologism goes so far as to blame the emergence of capitalism on *ressentiment*! Still, every chapter in the book contains thought-inspiring passages. And at least they all have the merit of *esprit*, of being philosophically adventuresome. In the last chapter he digresses into vitalism, biology, competing theories of evolution, value theory, metaphysics, a critique of industrialism and consumerism, and more. It's all very confused and slapdash, but, unlike modern professorial micro-scholarship, it has the merit of being “vital.”

Trying to tease apart the causal factors in the rise of any ideology is hopeless. Every ideology spreads due to social structures, environmental factors, and a whole array of psychological influences—negative ones like “*ressentiment*” and positive ones like benevolence and the magnetism of charisma.

Paul Tillich: “The tension between liberalism and democracy explains many traits of American democratic conformism.” Suggestive. If you're wondering what this tension is, Tillich states it tersely: “Liberalism and democracy could clash in two ways: liberalism could undermine the democratic control of society or democracy could become tyrannical and a transition to totalitarian collectivism.” (From *The Courage To Be*.)

In medieval times: realism vs. nominalism. Universal prior to the individual, or individual prior to the universal? Philosophical reflection of social change: the individual gradually becoming not just an instance of the “universal” but someone in his own right, a thing more real than the universal. Nominalism won.

Winnicott: transitional objects, play, art, culture, the creative life of people, is located in the “potential space” between self and other, or self and reality. My journal is my potential space. The space of my potential. My potential recreation of *space* (the universe). My potential spaceyness. The spatialization of potentiality. The potency of——well, forget it.

A Tillichian observation: In Plato, the soul's spirited element could potentially bridge the cleavage between reason and desire. (Platonically, what's the relation between the *sensual* and the *sensuous*?) But actually Platonism tends to be dualistic.

Two meanings of courage (says Tillich): ethical and ontological. A matter of valuation vs. the universal and essential self-affirmation of one's being. “The courage to be is the ethical act in which man affirms his own being in spite of those elements of his existence which conflict with his essential self-affirmation.” Two conceptions of courage: heroic-aristocratic and rational-democratic.

The aristocratic element in the doctrine of courage was preserved as well as restricted by Aristotle. The motive for withstanding pain and death courageously is, according to him, that it is noble to do so and base not to do so. The courageous man acts “for the sake of what is noble, for that is the aim of virtue.” “Noble”...is the translation of *kalós* and “base” is the translation of *aischró*, words which usually are rendered by “beautiful” and “ugly.” A beautiful or noble deed is a deed to be praised. Courage does

what is to be praised and rejects what is to be despised. One praises that in which a being fulfills its potentialities or actualizes its perfections. Courage is the affirmation of one's essential nature, one's inner aim or *entelechy*, but it is an affirmation which has in itself the character of "in spite of." It includes the possible and, in some cases, the unavoidable sacrifice of elements which also belong to one's being but which, if not sacrificed, would prevent us from reaching our actual fulfillment. This sacrifice may include pleasure, happiness, even one's own existence. In any case it is praiseworthy, because in the act of courage the most essential part of our being prevails against the less essential. [Yes: the desire for recognition prevails against the animal desire for comfort.]... Since the greatest test of courage is the readiness to sacrifice one's life, the soldier's courage was the outstanding example... As long as the aristocracy was the group which carried arms, the aristocratic and the military connotations of courage merged. When the aristocratic tradition disintegrated and courage could be defined as the universal knowledge of what is good and evil, wisdom and courage converged and true courage became distinguished from the soldier's courage. The courage of the dying Socrates was rational-democratic, not heroic-aristocratic. ...But the aristocratic line was revived in the early Middle Ages. Courage became again characteristic of nobility... [Cf. Nietzsche's love of the barbarian spirit.]

Is it true that "rational-democratic ethics are a heritage of the Christian-humanistic tradition"? Is it even wholly justified to associate Christianity with humanism? Is it at all meaningful to say that humanism grew out of Christianity? In an obvious sense it is: humanism was reborn in a Christian society. But was that *despite* Christian traditions or (partly) *because* of them? Both, of course. And what's the relation between late-medieval humanism and modern democratic ideologies?

"The spiritual substance of Renaissance humanism was Christian as the spiritual substance of ancient humanism was pagan, in spite of the criticism of the pagan religions by Greek humanism and of Christianity by modern humanism." Good way of expressing it.

December 19

"These are the times that try men's souls." More literally true now than when Thomas Paine said it. Fortunately the human spirit can never die. And so neither can this journal. –Increasingly, its entries are inspired by my pedagogical impulse. I want to spark thought in the minds of future generations (since current generations are beyond redemption).

Stoicism and neo-Stoicism are not just philosophical schools; they are ways that people have "answered the problem of existence and conquered the anxieties of fate and death. Stoicism in this sense is a basic religious attitude, whether it appears in theistic, atheistic, or trans-theistic forms. Therefore it is the only real alternative to Christianity in the Western world." It's true that the Stoic doctrines of the Logos and the natural moral law influenced Christian dogmatics and ethics. "But this large reception of Stoic ideas could not bridge the gap between the acceptance of cosmic resignation in Stoicism and the faith in cosmic salvation in Christianity." I'm a Stoic by temperament but have the Christian's yearning for salvation.

Stoic courage is not an invention of the Stoic philosophers. They gave it classical expression in rational terms; but its roots go back to mythological stories, legends of heroic deeds, words of early wisdom, poetry and tragedy, and to centuries of philosophy preceding the rise of Stoicism. One event especially gave the Stoics' courage lasting power—the death of Socrates. That became for the whole ancient world both a fact and a symbol. It showed the human situation in the face of fate and death. It showed a courage which could affirm life because it could affirm death. And it brought a profound change in the traditional meaning of courage. In Socrates the heroic courage of the past was made rational and

universal. A democratic idea of courage was created as against the aristocratic idea of it. Soldierly fortitude was transcended by the courage of wisdom. In this form it gave “philosophical consolation” [see Boethius] to many people in all sections of the ancient world throughout a period of catastrophes and transformations.

The description of Stoic courage by a man like Seneca shows the interdependence of the fear of death and the fear of life, as well as the interdependence of the courage to die and the courage to live. He points to those who “do not want to live and do not know how to die.” He speaks of a *libido moriendi*, the exact Latin term for Freud’s “death instinct.” He tells of people who feel life as meaningless and superfluous and who, as in the book of Ecclesiastes, say: I cannot do anything new, I cannot see anything new! This, according to Seneca, is a consequence of the acceptance of the pleasure principle or, as he calls it, anticipating a recent American phrase, the “good-time” attitude, which he finds especially in the younger generation. As, in Freud, the death instinct is the negative side of the ever-unsatisfied drives of the libido, so, according to Seneca, the acceptance of the pleasure principle necessarily leads to disgust and despair about life. [Tillich may be misunderstanding Freud.] But Seneca knew (as Freud did) that the inability to affirm life does not imply the ability to affirm death. The anxiety of fate and death controls the lives even of those who have lost the will to live. This shows that the Stoic recommendation of suicide is not directed to those who are conquered by life but to those who have conquered life, are able both to live and to die, and can choose freely between them. Suicide as an escape, dictated by fear, contradicts the Stoic courage to be.

Stoic courage is based on the control of reason, i.e. the internalization of the Logos. In their effort to conquer desires and fears, “the Stoics developed a profound doctrine of anxiety which also reminds us of recent analysis. They discovered that the object of fear is fear itself. ‘Nothing,’ says Seneca, ‘is terrible in things except fear itself.’ And Epictetus says, ‘For it is not death or hardship that is a fearful thing, but the fear of death and hardship.’ Our anxiety puts frightening masks over all men and things. If we strip them of these masks their own countenance appears and the fear they produce disappears...” I’m not convinced.

Ancient humanism: Stoicism, renunciation, tragedy of existence, the ambiguity of being (creative *form*, inhibiting *matter*), circular repetition of history (a doctrine resulting from societal stagnation), asceticism, the individual valuable not in himself but as a representative of something universal, e.g. a virtue. Modern humanism (Renaissance, Erasmus, Spinoza, etc.): “being as being is good,” not asceticism but active shaping of the material world, belief in progress and creativity, hope, the individual valuable as a unique expression of the universe and irreplaceable. Rejects both Stoic renunciation and Christian salvation. Replaces renunciation by “a kind of self-affirmation which transcends that of the Stoics because it includes the material, historical, and individual existence.” Nevertheless, it can be called neo-Stoicism. Spinoza is its representative. For him, everything shares the “courage to be,” which is to say that it essentially endeavors to affirm or preserve itself. This is its essence and its particular virtue. That is, “virtue is the power of acting exclusively according to one’s true nature. And the degree of virtue is the degree to which somebody is striving for and able to affirm his own being... Self-affirmation is, so to speak, virtue altogether. But self-affirmation is affirmation of one’s essential being, and the knowledge of one’s essential being is mediated through reason, the power of the soul to have adequate ideas. Therefore to act unconditionally out of virtue is the same as to act under the guidance of reason.” Tillich and Spinoza are right that an ideal-typical person, whose mind hasn’t been damaged by civilization, will, in acting to confirm his being (which action is the essence of the self), act virtuously and lovingly with others.

“The Self has itself, but at the same time it tries to reach itself.” It wants to coincide with itself.

“Insofar as courage is the affirmation of one’s self it is virtue altogether.”

Anxiety: the state in which a being is aware of its possible non-being. The awareness that non-being is a part of one’s own being. The awareness of one’s finitude as finitude. Hmm... I guess that’s acceptable, though a little simplifying. Cf. what I wrote about “tension” on the 16th.

...Fear, as opposed to anxiety, has a definite object which can be faced, analysed, attacked, endured. One can act upon it and in acting upon it participate in it—even if in the form of struggle. In this way one can take it into one’s self-affirmation [or -confirmation]... But this is not so with anxiety, because anxiety has no object, or rather, in a paradoxical phrase, its object is the negation of every object. Therefore participation, struggle and love with respect to it are impossible... [The *helplessness* of anxiety] expresses itself in loss of direction, inadequate reactions, lack of “intentionality.” The reason for this sometimes striking behavior is the lack of an object on which the subject can concentrate... Fear and anxiety are distinguished but not separated. They are immanent within each other: The sting of fear is anxiety, and anxiety strives toward fear...

The fear of death determines the element of anxiety in every fear. Anxiety, if not modified by the fear of an object, anxiety in its nakedness, is always the anxiety of ultimate non-being. Immediately seen, anxiety is the painful feeling of not being able to deal with the threat of a special situation. But a more exact analysis shows that in the anxiety about any special situation, anxiety about the human situation as such is implied. It is the anxiety of not being able to preserve one’s own being which underlies every fear and is the frightening element in it. In the moment, therefore, in which “naked anxiety” lays hold of the mind, the previous objects of fear cease to be definite objects. They appear as what they always were in part, symptoms of man’s basic anxiety... This situation drives the anxious subject to establish objects of fear. Anxiety strives to become fear, because fear can be met by courage. It is impossible for a finite being to stand naked anxiety for more than a flash of time... But ultimately the attempts to transform anxiety into fear are vain. The basic anxiety, the anxiety of a finite being about the threat of non-being, cannot be eliminated. It belongs to existence itself.

This sort of Existentialist thinking is so foreign to the spirit of Marxism that I never know what to make of it. Is it postulating as an absolute truth something that is characteristic only of certain societies, or is there indeed a trans-historical validity to all this? Did Cro-Magnon man experience “anxiety”? In forty thousand years, will existential anxiety still be around? It does seem ineluctable, this anxiety. How could it ever be overcome? Surely it’s inherent in the human condition.

The source of my infinite wonder has always been: *why is there something rather than nothing?* And how can there be something without its having some kind of transcendent meaning?

Three types of anxiety according to the three ways in which non-being threatens being: the anxiety of fate/death, of emptiness/meaninglessness, and of guilt/condemnation. They correspond, respectively, to ontic self-affirmation, spiritual self-affirmation, and moral self-affirmation. —I don’t object to most of Tillich’s ideas, but I object to his framing human life in terms of ontology, of “being.” It’s unnecessarily metaphysical and theological.

1. Anxiety over death is the most universal. Inescapable. Can be mitigated depending on the form of society, but even in collectivist and primitive societies people are afraid of death. As regards “fate,” Tillich has in mind, ironically, the contingency of life. Its irrationality, its lack of necessity. Fate and death are associated because life’s contingency and unpredictability wouldn’t produce anxiety unless death waited quietly in the background. “And death stands behind fate and its contingencies not only in the last moment when one is thrown out of existence but in every moment within existence. Non-being...stands behind the experience that we are driven from the past toward the future without a moment of time which does not vanish immediately. It stands behind the insecurity and homelessness of our social and individual existence. It stands behind the attacks on our power of being in body and soul by weakness, disease and accidents... We try to transform the anxiety into fear and to meet courageously the objects in which the threat is embodied. We succeed partly, but somehow we are aware of the fact that it is not these objects with which we struggle that produce the anxiety but the human situation as such.”

2. Man’s spiritual self-affirmation is his living creatively, his taking “culture” seriously, as a matter of ultimate concern for him. Emptiness and, more despairingly, meaninglessness manifest themselves when

a person loses his concern for creative living. Their threat is *implied* in man's finitude but *actualized* by man's estrangement. Tillich notes that ontic and spiritual anxiety can't really be separated, since the onset of one tends to provoke the onset of the other.

3. Man is responsible for making something of himself, for doing something good with his life. He sits in judgment on himself, a situation that can produce the anxiety of guilt, or even the anxiety of self-rejection or condemnation. "Even in what he considers his best deed, non-being is present and prevents it from being perfect. A profound ambiguity between good and evil permeates everything he does, because it permeates his personal being as such... The awareness of this ambiguity is the feeling of guilt. The judge who is oneself and who stands against oneself, he who 'knows with' (conscience) everything we do and are, gives a negative judgment, experienced by us as guilt. ... This anxiety can drive us to the feeling of being condemned—not to an external punishment but to the despair of having lost our destiny." Again, this moral anxiety can't be entirely separated from the other anxieties.

These anxieties are existential in that they're implied in the existence of man as man, his finitude, and his estrangement. They're fulfilled in the situation of despair.

To support his distinctions, Tillich suggests that at the end of ancient civilization ontic anxiety predominated; at the end of the Middle Ages moral anxiety was widespread; and at the end of the modern period spiritual anxiety is common. But in each period, needless to say, the other anxieties have been present, have been "embraced" by the predominating form of anxiety. Incidentally, "if one period deserves the name of the 'age of anxiety' it is the pre-Reformation and Reformation." Tillich repeatedly makes statements that seem dubious but prove to be well-founded in his arguments.

"It is significant that the three main periods of anxiety each appear at the end of an era. The anxiety which, in its different forms, is potentially present in every individual becomes general if the accustomed structures of meaning, power, belief and order disintegrate..." On the other hand, you could say that the individual experiences anxiety *only if* accustomed structures of meaning etc. disintegrate. The presence of structures of meaning is, in a way, more "natural" than anxiety.

Watched a show about Truman Capote. Makes me wonder how people were able to take him seriously. He was an overgrown baby, as Sylvia Plath wrote in her journal.

December 20

What's the relation between existential anxiety and pathological anxiety, as in neurosis and psychosis?

There is one common denominator in all the theories of neurotic anxiety: anxiety is the awareness of unsolved conflicts between structural elements of the personality, as for instance conflicts between unconscious drives and repressive norms, between different drives trying to dominate the center of the personality, between imaginary worlds and the experience of the real world, between trends toward greatness and perfection and the experience of one's smallness and imperfection, between the desire to be accepted by other people or society or the universe and the experience of being rejected, between the will to be and the seemingly intolerable burden of being which evokes the open or hidden desire not to be...

...[In all these theories] there is the lack of a clear distinction between existential and pathological anxiety, and between the main forms of existential anxiety. This cannot be made by depth-psychological analysis alone; it is a matter of ontology...

Pathological anxiety is a state of existential anxiety under special conditions. The general character of these conditions depends on the relation of anxiety to self-affirmation and courage... He who acts courageously takes, in his self-affirmation, the anxiety of non-being [or, rather, of the world's not being the self] upon himself. The preposition "upon"

is metaphorical and points to anxiety as an element within the total structure of self-affirmation, the element which gives self-affirmation the quality of “in spite of” and transforms it into courage. Anxiety turns us toward courage, because the other alternative is despair. Courage resists despair by taking anxiety into itself.

This analysis gives us the key to understanding pathological anxiety. He who does not succeed in taking his anxiety courageously upon himself can succeed in avoiding the extreme situation of despair by escaping into neurosis. He still affirms himself but on a limited scale. *Neurosis is the way of avoiding non-being by avoiding being.* In the neurotic state self-affirmation is not lacking; it can indeed be very strong and emphasized. But the self which is affirmed is a reduced one. Some or many of its potentialities are not admitted to actualization, because actualization of being implies the acceptance of non-being and its anxiety. He who is not capable of a powerful self-affirmation in spite of the anxiety of non-being is forced into a weak, reduced self-affirmation... He surrenders a part of his potentialities in order to save what is left. This structure explains the ambiguities of the neurotic character. The neurotic is more sensitive than the average man to the threat of non-being. And since non-being opens up the mystery of being, he can be more creative than the average. This limited extensiveness of self-affirmation can be balanced by greater intensity, but by an intensity which is narrowed to a special point accompanied by a distorted relation to reality as a whole...

Tillich proceeds to discuss in more depth the difference between the neurotic and the healthy personality. The former is more intense but limited, the latter more extensive but “lacking in the intensity which can make the neurotic creative. His anxiety does not drive him to the construction of imaginary worlds.” The neurotic settles down to a fixed self-affirmation which involves his retiring to a “castle which he defends with all means of psychological resistance,” because if he didn’t defend it he’d succumb to despair. However,

There is a moment in which the self-affirmation of the average man becomes neurotic: when changes of the reality to which he is adjusted threaten the fragmentary courage with which he has mastered the accustomed objects of fear. If this happens—and it often happens in critical periods of history—the self-affirmation becomes pathological. The dangers connected with the change, the unknown character of the things to come, the darkness of the future, make the average man a fanatical defender of the established order. He defends it as compulsively as the neurotic defends the castle of his imaginary world. He loses his comparative openness to reality, he experiences an unknown depth of anxiety... This is the explanation of the mass neuroses which usually appear at the end of an era. In such periods existential anxiety is mixed with neurotic anxiety to such a degree that historians and analysts are unable to draw the boundary lines sharply. When, for example, does the anxiety of condemnation which underlies asceticism become pathological?... To what degree are present-day Existentialist descriptions of man’s predicament caused by neurotic anxiety?

Again: “neurotic anxiety is the inability to take one’s existential anxiety upon oneself.” Good formulation. But I’m still suspicious about his whole approach. On the other hand, it’s hard to deny, for example, that “Large sections of man’s civilization serve the purpose of giving him safety against the attacks of fate and death. He realizes that no absolute and final security is possible; he also realizes that life demands again and again the courage to surrender some or even all security for the sake of full self-affirmation.”

Just a reminder for you philosophy students: Plato “teaches the separation of the human soul from its ‘home’ in the realm of pure essences. Man is estranged from what he essentially is. His existence in a transitory world contradicts his essential participation in the eternal world of ideas... Wherever Plato uses a myth he describes the transition from one’s essential being to one’s existential estrangement, and the return from the latter to the former. The Platonic distinction between the essential and the existential realms is fundamental for all later developments. It lies in the background even of present-day Existentialism.” Platonism, alienation, disenchantment.

...“Courage is the self-affirmation of being in spite of the fact of non-being. It is the act of the individual self in taking the anxiety of non-being upon itself by affirming itself either as part of an embracing whole or in its individual selfhood.” That’s one of Tillich’s main ideas: the dichotomy between participation and individualization. Two ways of affirming the self. Mysticism, collectivism, semi-collectivism, conformism, as against individualism and “Existentialism” in their manifold manifestations. He has a point. But I’ve discussed this alleged dichotomy before.

“The courage to die is the test of the courage to be.” Why? Because being includes non-being: death is a part of life. An inability to accept death is an inability to accept life. The essential component of true self-affirmation is unqualified acceptance of the relation between oneself and the world, a relation that includes one’s final negation by the world (which is also one’s re-absorption into the cosmos).

A show called “Extreme Makeover: Home Edition.” A crew of designers redesign the house of an underprivileged family. The old house is demolished and hundreds of volunteers build the new one in a week as the deprived family is sent on their way to a week-long vacation somewhere; they come back to a new home and a better life. Watched this show tonight with my roommate’s two granddaughters who are here for Christmas, 13-year-olds one of whom I’d adopt if she didn’t already have a family because of her intelligence and cuteness (goes without saying) and last night the three of us confabbed in my room and watched Youtube videos; Rachel, the cuter one, got upset whenever I left the room momentarily—“Don’t go, Chris! Here, sit next to me, there’s room on this chair.” On the show it was a family of five, a son with an intestinal disorder and two daughters, 4 and 8, who have Spinal Muscular Atrophy which means they’re wheelchair-bound and have to be carried up and down steps and around tight corners etc. by their poor mother who has a bad back (the father is at work most of the day). The daughters might die young and there’s no cure. But they have a bright spirit that puts to shame, I don’t know, the sunlight irradiating Vermeer’s “Girl With a Pearl Earring.” Especially Brooke, the 8-year-old. What an angel on Earth. Worries about her mother’s back, her sister’s frustration, her brother’s stomach cramps, but gives nary a thought to her own semi-immobility. Wanted a new stairless house just so her mother wouldn’t have to carry her. I watched her talking to the interviewer and loved that bright face. Left the room, hid myself in the bathroom and, surprisingly, cried. Love of that girl worrying about her mother, pain for the mother learning one day that her daughter had SMA, wonder at the fact of people’s helping each other when nature turns inhuman. Little miracles.

December 28

I read Kobo Abe’s *The Woman in the Dunes*, one of the books Aniela gave me. Then email:

[...]

Pretty Aniela, I finished Abe's book. Yowzers, it's a weird one. Reminded me of Japanese horror films, how bizarre, Kafkaesque they are. Nightmarish images, disjointed plots, discordant reflections on (and *of*) the human situation. (I like that word 'discordant.')

Japanese society is, um, very confused about itself, and has been so ever since modernization came to it with the Meiji restoration in the 1860s. It has the highest suicide-

rate in the world. I liked the book, but I didn't *love* it. It made me feel like an insect. So I guess it was an artistic success. A man trapped in a sand-hole, forced to shovel out every night the mounds of sand closing in on him, the ceaselessly moving sand that will inevitably smother life, the million grains of sand clinging to his skin constantly no matter how he tries to clean himself -- in his hair, in his mouth, his ears, his eyes -- and the dunes up above with ten billion grains of sand that *never stop moving*, like water, blown in wavelets ceaselessly undulating to no end or purpose.....the villagers imprisoning this man and his woman in their hole just so they can shovel out sand every night and sleep during the day, the man trying to escape but failing always.....it's an inspired premise for a novel. Very moving. *Horribly* moving. Can you imagine such a fate as that man's?? And the symbolism, the allegorical significance is terrifying. On the plus side, reading the book made me appreciate not living in a sand-hole. Seriously! Such a thing is possible, after all, but here we are living comfortably, taking showers every day, eating great food (especially because I'm home with my parents), living in freedom, enjoying life more or less. How lucky we are! All in all, the book is a peculiar mixture of life-negation and life-affirmation, negation and affirmation of the human spirit. You have good taste, pretty Aniela.

Tell your family I said "Happy New Year!" I miss you my dear lovely Abe-loving Aniela! I miss you and I kiss you ceaselessly, eternally like the sand rippling over dunes or the stars flickering behind the moon! I hope 2009 will be the happiest year of your life! If you stop smoking maybe it will be! Hugs, kisses, nakedness, passionate leg-entwined embraces -- breast-kissing, nipple-licking closeness!

Love,
Chris

January 1, 2009

Reading Lionel Trilling's *The Liberal Imagination*. Also James Fenton's *An Introduction to English Poetry*.

Music and poetry used to be expressions of essentially the same mental faculty, the same Dionysian tendency. Rhythm, meter, harmony, dance, performance, tragedy...magical invocations, participation in being, tribal participation, contests of artistic expression, drumming and dancing, self-abandon. Then writing happened, and they slowly started to go their separate ways. And now they're divorced, at least among self-respecting intellectual poets. Most poetry is now anything but musical. No meter, no true rhythm, no rhyme, no performance, mostly just looking at a page and reading words in your head. Poets write for the page, that's all. In popular culture things haven't come to such a pass. (Look at rap, etc.) They never will, fortunately.

Serious *music*, too, "intellectual" music, is no longer very musical. It's animated—or inanimated—by the academic spirit, the spirit of Apollo; Dionysus exists only in pop culture. But it isn't Dionysus in his original pure and life-affirming sense; it's a "repressively desublimated" Dionysus, a puerilized Dionysus, commercialized and reified, *lucrified*, atomized, *defanged* so to speak. Nor is Apollo what he once was.

I read André Gide's *The Immoralist*. Written in 1902. Byronism, Romanticism, anomie, aimlessness, *rot*—the rot of the French aristocracy—decadence. Not very satisfying literature.

No denying it: the modern desire to succeed is inseparable from malice. Inseparable from wanting to get the last laugh, to prove everyone wrong. The most successful are often the most malicious, the most insecure and narcissistic. Norman Mailer comes to mind. (Most of his writing I can't read: "The ego is too

much with us.” Repellent.) Maybe a writer, like an actor, shouldn’t thrust himself into the spotlight, since his public persona then obtrudes into his works.

January 14, 23, 27

Back in Boston.

The joy of listening to Murray Perahia play Mendelssohn’s *Songs Without Words*.

I had the flu, lay in bed for a day retching wretchedly. And I read a lot of my journal, reread my life. The two experiences have made me feel like separate from my self of last semester. And not being with my peers for weeks. Peaceful, calm, unreal. Separate from the rat race. Sitting here in my room submitting writings to academic and literary journals online, my Boston acquaintances not showing much desire to see me but I not caring. And anyway I have Aniela and Sofia and Emily and Precious Angel (her real name), a girl I met at the writers conference who emailed me. People I’ve made a connection with. Don’t need much in life, only a few connections to help me weather the Silliness.

Aniela is apparently a superlative pianist, once wanted to pursue it as a career. Has played many of Chopin’s etudes; sent me the sheet music as a Christmas present.

The nightmare is over. The Moron and the Devil are gone. America is entering the 21st century.

I might as well give up whatever ambitions I’ve had to write fiction, maybe even a screenplay. From now on, focus on politics and other areas of nonfiction. Periodically return to creative writing if the spirit moves me, but the spirit rarely moves me. What’s the point of agonizing over fiction-writing if I can’t contribute something momentous? I love neither reading nor writing fiction; only nonfiction grips me. You can’t “learn” much from fiction anyway.

Schade that my imagination is limited. But nobody can do everything. I have to accept my limitations and embrace what I’m good at. The only good “fictional” thing I’ve ever written is the Book of Joe, and even that leaves a lot to be desired.

Watching Chomsky—inspired to learn about Israel-Palestine once and for all. This time I’m going all the way. Understand the whole history so I can write about the present situation and maybe get something published. Still waiting to hear from journals about my Muslim essay and my John Brown paper. (I shaved many pages off the bloated Muslim essay.)

Gideon Biger, “The Boundaries of Israel” (2008). Osamah Khalil, “Pax Americana: The United States, the Palestinians, and the Peace Process, 1948–2008.” Wikipedia and other websites. Jasmin Habib, “Both Sides Now: Reflections on the Israel/Palestine Conflict” (2007). Most of Charles Smith, *Palestine and the Arab-Israeli Conflict: A History with Documents* (2004). Etc.

The Israeli state is reminiscent in many ways of the Nazi state. The emphasis on racial purity, on the need to cleanse the country of “foreigners,” on racial entitlement to the land; the treatment of people from a different race as second-class citizens, the outrageous violations of their rights; the militarism, expansionism, rejection of peace treaties, willingness to sacrifice civilians. Israel’s history is horrifying. “Irony is the iron law of history.”

(Another obvious parallel is the American persecution of Indians. Coming to a land and pushing aside the natives to make room for new settlements. Stealing their land, killing them, intentionally making life miserable so that they’ll leave.)

February

Putting together another book, which I’m going to self-publish. The *Times* had an article about it: apparently self-publishing is popular and cheap, a way to get exposure, etc. The only problem for me is that I can’t put substantive analyses in this book because people wouldn’t understand them. Also, my journal is

so *rich* that it's hard to choose what to include in the book. And arranging all the selections in a proper order, that's a real challenge.

Taking three courses: a history of American social movements since the late 19th century, a course on fascism, and a history of American politics since World War II. A lot of reading. Good book on fascism: Daniel Guerin's *Fascism and Big Business* (1934). Marxist analysis.

This damned economic crisis is interfering with my plans. Nobody wants to read a book on humanism, culture, Christianity, etc. when the news is flooded with reports of—600,000 jobs lost in January! 500,000 in December! It's getting worse and worse! Anyway, I've almost finished putting the book together.

Alger Hiss's Looking-Glass Wars (G. Edward White). *The Story of American Freedom* (Eric Foner). *Woman Suffrage and Women's Rights* (Ellen Carol Dubois). *Death in the Haymarket: A Story of Chicago, the First Labor Movement and the Bombing that Divided Gilded Age America* (James Green). *A History of Fascism, 1914–1945* (Stanley Payne). *"One Hell of a Gamble": Khrushchev, Castro, and Kennedy, 1958–1964* (Fursenko and Naftali). *The Populist Moment: A Short History of the Agrarian Revolt in America* (Lawrence Goodwyn). *The Fascist Revolution: Toward a General Theory of Fascism* (George Mosse). *A Fierce Discontent: The Rise and Fall of the Progressive Movement in America, 1870–1920* (Michael McGerr).

March

Very great excitement about Obama's budget proposal. If Newt Gingrich is terrified of it, you know it's an enormous step in the right direction. The stimulus bill was a disappointment—too many useless compromises that took the teeth out of it!—but it looks like the budget will pass in its essentials, at least it can if the Dems in Congress grow testicles and reject compromise with Limbaughian evil.

Conflict between my libertarian-utopian ideals and my quasi-Nietzschean aesthetic of struggle, the strong personality, and triumph. Each conception is attractive and yet infantile in its own way.

Published my book, *Notes of an Underground Humanist*. (Title from Dad.) Now marketing. I wish I'd put more in the book—more thoughts on Christianity, for example. (Pointing out that it has far more in common with socialism than capitalism or liberalism.) I've become averse to writing in my journal—no longer want to write short reflections à la Nietzsche that I can put later in a second book, because I'm past that stage of life. Everything is *obvious* to me, all my thoughts, any thoughts I can come up with. I've seen it all, been through it all; being "original" or "controversial" (as in my journal) seems boring now. But I should keep writing in my spare time so I can put out another book in a year or two.

Also publishing poems in *The Chaffey Review*. Still waiting to hear from academic journals about my essay.

Dereliction of Duty (H. R. McMaster). *The Birth of Fascist Ideology* (Zeev Sternhell). *American Babylon: Race and the Struggle for Postwar Oakland* (Robert Self). *Sacco and Vanzetti: The Anarchist Background* (Paul Avrich). *Stonewall: The Riots that Sparked the Gay Revolution* (David Carter). *The Doctrine of Fascism* (Mussolini).

I'm going to a \$200 Grub Street conference in April to connect with authors, agents and publishers. I'm determined to be a success, if only to stick it to the assholes I've known.

Again I've lost direction. Have to write all the time but don't know what to write. Strangely intense this moment, not so much the same automatic behaving that is most of my behavior and writing, alone and melancholy after finishing the Sacco and Vanzetti book. Just returned from being with my family—parents liked my book but mother was conventionally critical of sections on women. Aniela coming in a few days, staying hopefully for a few weeks in my room, I miss her and she's coming just in time.

The best way to conceptualize the failure of Marx's main predictions is to say that capitalist society contains a variety of *tendencies*, many of which are in direct opposition to each other. Marx picked out certain tendencies, such as that towards the increasing antagonism of classes and immiserization of the workers, while underestimating the significance of others, such as the incorporation of the non-capitalist classes into the democratic process and thus the advance of reformism, welfarism, etc. The tendencies that Marx picked out were the closest to being exclusively economic—history shows that class polarization is an essential economic tendency of capitalism, which is however mitigated by extra-economic, political forces. His error was in thinking that purely economic trends were all-important. If they were, then a revolution might have happened. —Of course, even certain *economic* tendencies oppose certain others, and so even in the economic sphere a revolution was not necessarily the logical outcome. Perhaps the slow 'incorporation' of workers into the capitalist economy was also an economic tendency and not only a political or social one. Nevertheless, class polarization has been a uniquely powerful and recurring economic trend.

April

The Cultural Front: The Laboring of American Culture in the Twentieth Century (Michael Denning). *America in the Seventies* (edited by Beth Bailey and David Farber). *Phyllis Schlafly and Grassroots Conservatism: A Woman's Crusade* (Donald Critchlow). *Ronald Reagan and His Quest to Abolish Nuclear Weapons* (Paul Lettow). *I've Got the Light of Freedom: The Organizing Tradition and the Mississippi Freedom Movement* (Charles Payne).

If Marx was a "breakdown theorist," he may have been right. Capitalism broke down almost completely during the Great Depression. [Not really true.] If the government hadn't intervened, it couldn't have survived. Strictly speaking, "laissez-faire capitalism" isn't possible for long, even in 19th-century capitalism: business crises will eventually run the system into the ground, or workers will rise up and destroy it. But *why* does capitalism break down (or have a tendency to do so)? Why exactly? Is it because of the reasons Marx gave?

Marx's notion of capitalism was excessively "pure," excessively "liberal" or "Manchesterian." He refused to accept that government could become an economically integral aspect of the system, that it could be a major economic force in its own right. This fact is why capitalism was not utterly destroyed in the 1930s or before.

Short paper for one of my classes:

Conceptualizing the Rise and Fall of Social Movements

The task of conceptualizing the inner dynamics of mass movements is not an exact science: pinpointing the properties that cause some movements to succeed and others to fail is a subtle art at best. The attempt itself to find commonalities between movements that take place in different settings and different contexts—at different times, in different places, amongst different classes of people—is fraught with philosophical peril. To what extent can one legitimately extrapolate transhistorical tendencies or features from concrete, specific events that will never occur again in their specificity? What methodological rules should one follow in undertaking such a project? How does one determine the project's success? —Philosophical questions like these should always be kept in the back of one's mind, but they should not interfere with the task of finding real answers to real historical questions, which is the purpose of this paper. Specifically, I will compare and contrast social movements that occurred in America between the 1870s and the 1920s in order to shed light on the qualities that made some movements more successful than others. In this endeavor I'll draw upon the interpretations of movement-formation and -consolidation presented in Lawrence Goodwyn's *The Populist Moment* and Hugh Davis Graham's article "The Role of Ideas in the African-American Civil Rights Movement." I will also examine several historians' accounts of the rise and fall of particular movements.

The movements I will consider are the radical workers' movement in Chicago from the late 1860s to 1886, the Populist movement in the South and West in the late 1880s and 1890s, and Progressivism. Among these, the first ended in catastrophic failure; the second was very successful for a while but petered out before achieving any of its major goals; and the third was quite successful, though it met its demise during the Great War. The question, then, is what factors explain these successes and failures.

Before analyzing the movements in depth, it would be wise to set out a framework for understanding and interpreting them. As mentioned above, the first framework I'll use is Goodwyn's.¹ It comprises a fairly intuitive and obvious set of parameters, but that is exactly why it's useful. Goodwyn's claim is that any process of democratic movement-building involves four stages, which can be stated briefly as (1) movement-forming, (2) movement-recruiting, (3) movement-educating, and (4) the movement's politicization. Stage (1) involves "the creation of an autonomous institution" that allows for new interpretations which challenge those of the established authority; (2) involves tactics, i.e. ways to attract the masses; (3) involves the effective education of people who have been recruited; and (4) requires the creation of a political institution that can effectively harness the ideas and energies of the mass movement. A given social movement can fail at any of these stages. (Goodwyn suggests that these stages are *sequential*, so that one literally follows the other, but we'll see that he's wrong about this. A movement can fail or succeed at all of these "stages" more or less simultaneously.)

The second framework we'll use to illuminate the social movements under consideration is set out in Hugh Davis Graham's aforementioned essay.² Graham's account is perhaps even more useful than Goodwyn's, at least for the purposes of this paper, since it is more specific. Graham identifies five attributes of successful mass movements: (1) group consciousness (group resentment); (2) a spontaneous insurgency; (3) charismatic leadership; (4) a structure or organization that gives the movement "institutional continuity"; and (5) an ideology that offers group members "a vision of a just future."

In the light of these two interpretations let's consider, first, the Populist movement at the end of the nineteenth century. According to Goodwyn, the first stirrings of the Populist movement occurred on the frontier of the South, in reaction to the brutal and degrading crop lien system that structured the lives of millions of farmers. The "movement-forming" stage, which lasted several years, presupposed and began with the resentment of thousands of poor farmers towards the merchants and capitalists who supplied them with credit and materials. This group consciousness was a sort of incipient class-consciousness amongst farmers. It led to what Graham would call a spontaneous insurgency: in the late 1870s and early 1880s, farmers came together to establish cooperatives that would function as "rural organizations of self-help,"³ through which they could buy and sell to one another while bypassing the hated merchants. These early cooperatives were already Goodwyn's "autonomous institutions" in which a new ideology or ideologies could arise and flourish. The ideology in question was that of *cooperation*, as opposed to the dominant ideology of competition. Of course, in the beginning the new ideology was only implicit; it had not yet been fully articulated. But with the arrival of "charismatic leadership," its articulation began in earnest. In the mid-1880s, leaders such as S. O. Daws and William Lamb molded the many cooperatives into a more coherent and effective organization (called the Farmers Alliance) and traveled around Texas as "lecturers" who would spread the new ideology and help organize new cooperatives and suballiances. This process constituted "movement-recruiting" and "movement-educating," stages that operated simultaneously.

By 1886, in fact, the soon-to-be "Populist" movement had, according to Graham's schema, become a fully successful and mature mass movement. It had effective leadership, institutional continuity, and a compelling ideology of cooperation. It was allying itself with the Knights of Labor; its leaders were calling for boycotts and sympathetic strikes with railroad workers. The main thing it still lacked was a political outlet. (This final step of "politicization" is disregarded by Graham in his general interpretation of social

¹ He discusses it in *The Populist Moment* (New York: Oxford University Press, 1978), xvii – xix.

² See Peter A. Coclanis, ed., *Ideas, Ideologies, and Social Movements: the United States' Experience Since 1800* (University of South Carolina Press, 1999).

³ Goodwyn, op. cit., 26.

movements.) But the politicization of farmers was increasing rapidly, to the point that major political demands were being voiced by the organization as a whole.

There is no need to rehash the entire history of Populism. Suffice it to say that the movement developed astonishing sophistication: recruiting spread to Kansas, Nebraska, the Dakotas and various Southern states; the ideology became more coherent and focused, being centered on Charles Macune's notion of the sub-treasury system; tactics of educating the masses—and keeping them actively in the fold of the movement's democratic culture—became more effective (so that, for example, sophisticated use was made of the press, and traveling lecturers grew skillful at explaining the Alliance's economic theories); its leadership was bold, visionary and had clear goals in mind; and finally—a result of the foregoing—the decision was made to start a third political party, to break off from the Democratic Party (which didn't support the sub-treasury system) and found the People's Party. Ultimately Goodwyn is right that all these successes were due to the simple fact that the Alliance instilled in its members profound *self-respect*, *energy*, a spirit of hope and optimism, and that it thoroughly integrated them in a dynamic community oriented toward definite ends.

Unfortunately the People's Party did not last long once it was created, largely because it “sold out” to the political establishment by fusing with the Democratic party. (Also, it didn't have sufficient electoral support on the national scale.) Nevertheless, Populism was a remarkably successful movement, especially considering that its goals were revolutionary and its ideology completely opposed to that of American industrial capitalism.

The radical workers' movement in Chicago after the Civil War achieved successes as well. It was part of the broader labor movement that swept the nation through the 1870s and 1880s (and afterwards); this vast labor movement was far too multifaceted, though, for us to analyze here, so we'll focus only on Chicago.

Like agrarian populism in the South, this workers' movement began with spontaneous insurgency. For example, in 1873, during a depression, workers organized mass meetings and protests in which they demanded “bread or work.”¹ One can quibble about whether such events can be called truly “spontaneous”—for, after all, they required *some* organization, *some* planning—but the point is that there was not yet an overarching movement with institutional continuity, long-term strategies, means of education and recruitment, and so on. Instead, there were isolated moments of protest and an emerging class consciousness.

Actually, by 1873 the movement was already growing in sophistication. In early 1874 socialist leaders founded the Workingmen's Party of Illinois and started a German weekly newspaper; socialist candidates challenged Republicans during the spring election.² The city was full of socialist and anarchist agitators and would remain so for many years—and soon outstanding leaders would appear, among them Albert Parsons and August Spies, who would attempt to channel working-class anger into constructive political goals through speeches and the publication of radical newspapers. This period of Chicago's history was so full of popular ferment that Goodwyn's and Graham's frameworks start to break down: all the “stages” of movement-formation occurred together in a whirlwind of social agitation. Movement-educating, movement-recruiting and movement-politicization took place simultaneously (in the late '70s and '80s) as German immigrants gave well-attended speeches on Marxism and anarchism, newspapers agitated for the eight-hour-day, political parties were formed, and strikes were coordinated across the city. Competing radical ideologies flourished, such that there was not much coherence to the goings-on. Indeed, to call this ferment a “movement” may be inappropriate: it was rather seething discontent expressing itself in myriad ways than a single, coordinated, coherently strategized movement. Its goals varied: many workers wanted only the eight-hour-day, others wanted a revolution—but what sort of revolution? Anarchist, socialist, or communist? All of these.

The conditions that fostered all this activity were similar to those responsible for the Farmers Alliance: abject poverty, class resentment, a lack of respect from capitalists. It is in such conditions that

¹ James Green, *Death in the Haymarket* (New York: Pantheon Books, 2006), 48.

² *Ibid.*, 49.

revolutionary movements are always born. Likewise, on a general level the tactics used by revolutionary movements to recruit and educate followers are almost always the same: speeches and newspapers primarily. In order to achieve their ends, though, the Chicago workers made far greater use of strikes than Southern farmers did—for obvious reasons. These strikes had mixed results, sometimes leading to the brutal suppression of the workers and sometimes resulting in employers' accession to workers' demands. (For instance, in the summer of 1877 thousands of workers went on strike to protest layoffs and wage-cuts; their uprising was suppressed by the police at the cost of many deaths.¹ On the other hand, the strike in response to Cyrus McCormick's wage-cut in 1885 ultimately led to a pay-raise for the strikers.²) On the whole, strikers in Chicago during the '70s and '80s were not notably successful in achieving their demands, but strikes were immensely useful for the "movement" insofar as they generated enthusiasm, hope, collective self-respect amongst the laborers, and proved to the latter that they were not, after all, as powerless as they sometimes felt.

On the other hand, the relative militancy of Chicago workers as compared with Texan farmers was arguably counterproductive in both the short-run and the long-run. For strikers provoked violence from the police and repression from city authorities. Similarly, Spies's militant language in his newspapers may in the end have done more harm than good, since it gave ammunition to pro-business leaders like Joseph Medill (the editor of the *Chicago Tribune*) and also may have encouraged the anonymous bomb-thrower to hurl his stick of dynamite into a pack of policemen in the Haymarket in May of 1886—an act that indirectly led to the bloody suppression of the entire workers' movement in Chicago. Before this catastrophe, the decades-long agitation had finally developed into a genuine *movement* worthy of the name, with its acknowledged goal being the eight-hour-day and massive strikes being its tactic of choice.³ And these strikes might finally have achieved major gains in May 1886 were it not that violence once again ruined everything: a group of strikers attacked strikebreakers, thus provoking policemen to fire on the attackers, which led indirectly to the Haymarket's bomb-throwing incident and the subsequent destruction of the movement.⁴

We see, therefore, that tactics of violence and incendiary language tend to be counterproductive (if, that is, the economic and political elite is fairly entrenched), even if they do generate enthusiasm among insurgents. They give the authorities an excuse to engage in brutal repression. The Populist movement tended to avoid these tactics, choosing such "legitimate" avenues as politics and economic alliances; as a result, it was able to spread all through the South and West. Chicago's labor movement, on the other hand, was unduly provocative at times, attacking strikebreakers and policemen and encouraging violence in its newspapers; this led to its downfall. —We must admit, though, that it's far easier to avoid violent confrontations in the Texan countryside than in Chicago's inner city. Different tactics, too, are appropriate to different conditions. City workers are forced to take a more aggressive stance than poor farmers, since the latter are thinly dispersed through the countryside. Had labor leaders in Chicago not been as militant as they were, the masses might not have followed them—or different leaders, more aggressive ones, might have taken their place, simply because the masses were angry and demanded action.

Another way of comparing the Populist and the Chicago workers' movements is to say that the former failed at the "top," so to speak—at the level of its political leadership, which lacked skill at navigating politics—whereas the latter failed at the "bottom," on the ground, in violent confrontations between workers and police. But this is a function of the differing natures of the movements: the workers' main weapon was necessarily direct action and strikes, while the farmers' main tactic had to be the establishment of cooperatives (because this was how they asserted their independence vis-à-vis capitalists), which ultimately required coordination not only on the state level but on an inter-state level. And this required skilled political maneuvering.

¹ *Ibid.*, 76 – 80.

² *Ibid.*, 114 – 117.

³ See *ibid.*, chapters 8 – 10.

⁴ See *ibid.*, chapters 11 and 12.

Populism and the labor movement, however, were both very different from Progressivism. They were revolutionary—they questioned the structures of American society; Progressivism was merely reformist. It was *fashionable*, so to speak, *respectable*: it was popular among the middle classes, among politicians (such as Theodore Roosevelt and Woodrow Wilson), occasionally even among the upper classes. This “respectability” is partly what allowed it to have more successes than the other two movements we’ve looked at. In fact, Progressivism was a single “movement” only in a tenuous sense: different groups had different goals, sometimes contradictory ones; different impulses inspired its participants, from conservative religious moralism to the desire for social justice to the business manager’s need for a more smoothly functioning corporation or factory. What these impulses had in common was that they were oriented towards “progress,” towards a more harmonious and well-functioning society, the mitigation of social conflict and social ills.

Partly because of its nebulousness, Progressivism had a broader following than Populism and the labor movement. Any activist around the turn of the century who favored social reform but not economic revolution was part of the movement. Populism appealed specifically to poor farmers, the labor movement to workers; Progressivism appealed to anyone who disliked upper-class individualism or class conflict or alcohol or divorce or the disenfranchisement of women or racial conflict or inefficiency in factories, etc. Moreover, it was *safe* to be a progressive: since one was not challenging the structure of society, society did not set itself in absolute opposition to one. This is indeed an important, though obvious, lesson of Progressivism’s success as against the failure of the earlier labor and Populist movements: generally speaking, a movement that doesn’t challenge the foundations of society (and more specifically the foundations of the economy) will have far more success than a movement that does, simply because in the latter case, economic and political authorities will do their best to stomp it out. What is necessary is to secure the cooperation, or at least the benign neglect, of the authorities—and progressives were able to do so, to the point of capturing the American presidency.

One should not think that progressives’ *tactics* were more effective than those of socialists or Populists; in fact, the temporary popularity of the latter movements in a fundamentally hostile society proves that their tactics were remarkably effective. Instead, progressive *goals* were (comparatively) *acceptable to the authorities*. The latter had no reason to suppress a movement which, far from challenging economic and political power-structures, actually wanted to *strengthen* them (for the sake of forcing reforms on society). Progressive tactics, after all, were not much different from those of Populism: publishing newspapers, giving speeches around the country, trying to influence businessmen and politicians, protesting in the streets, establishing organizations to coordinate activism, sponsoring their own politicians, and so on. What differed were the goals, and the sorts of people who were attracted to them.

Still, questions remain: why did Progressivism emerge at the time it did (at the end of the nineteenth century) and not before, and why did it collapse after World War I? What were the “fundamental” reasons? Could it have been saved? Michael McGerr’s *A Fierce Discontent* is informative and well-written, but it does not give satisfactory answers to these questions. Its purpose is arguably more descriptive than explanatory: McGerr aims to tell a story (about “parents and their children,” about “private, intimate life” as well as public life¹), not to give underlying, “structural” explanations. In the penultimate chapter of his book he essentially states that after the war, Americans were sick of Progressivism: Wilson’s administration had become autocratic, it had taken Progressivism to its logical autocratic conclusion and thereby antagonized everyone, from workers to businessmen to consumers. People wanted a return to *laissez-faire* individualism; they wanted the government out of their lives. –This explanation may be true as far as it goes, but it isn’t very profound.

Goodwyn’s explanations of Populism are more adequate: they place the emphasis where it belongs, on economic factors, on the daily lives of the farmers and laborers who constituted the movement. The context and significance of Populism are described convincingly—especially in the final chapter (“The Irony of Populism”), which places the movement in a broad historical perspective. Goodwyn’s study is, quite simply, more ambitious than McGerr’s, more all-encompassing—and more ambitious than Green’s

¹ Michael McGerr, *A Fierce Discontent* (New York: Oxford University Press, 2003), xv.

as well. Green's purpose, like McGerr's, is to tell an engaging story, to appeal to a popular audience, and so his book focuses on characters, scenes, plot, *drama* rather than the broad structural and political tendencies that shaped the class conflicts of the day. It does, indeed, explain the short-term failures and successes of the Chicago workers' movement, as well as placing the movement in a historical and regional perspective: for instance, the book discusses the long-term ramifications of the Haymarket affair, going so far as to describe how, and to what extent, the tragedy still lives on in the public's memory. The book also gives an account of labor struggles taking place around the nation in the 1870s and '80s, thus placing the Chicago workers' movement in a national context. Nevertheless, Green's story lacks the breadth, the historical inclusiveness, and the explanatory power of Goodwyn's book (mainly because Green's subject-matter is more limited than Goodwyn's).

These criticisms notwithstanding, the three books mentioned in this paper—Goodwyn's, McGerr's, and Green's—are extremely useful for the light they shed on the successes and pitfalls of particular social movements. It is even possible to glean practical lessons from them, as we have done here—lessons that activists can use in their struggles against the status quo. It appears that the three most important lessons are as follows: (1) do not intentionally engage in violence if the power-structures one opposes are entrenched and have overwhelming force on their side; (2) if the movement succeeds in becoming politicized, be wary of compromises with, and within, the political system—for this is arguably what led to the downfall of Populism (namely when the Populists merged with the Democrats and accepted William Jennings Bryan as their candidate for president); (3) on the other hand, it is unwise to agitate for revolutionary economic change in a society of entrenched power-structures, since the latter can easily suppress such agitation. More realistic is piecemeal social reform, such as many progressives advocated. (For example, the enfranchisement of women, the outlawing of alcohol, the reform of managerial practices, the mitigation of poverty.) History is littered with the corpses of revolutionary social movements.

Here's a shorter, less interesting paper for another class:

The Political Ramifications of the Cuban Missile Crisis

In their article "October Missiles and November Elections: The Cuban Missile Crisis and American Politics, 1962,"¹ Thomas Paterson and William Brophy ask, first, whether the Kennedy administration's actions during the crisis were influenced by domestic political considerations—given that a congressional election was about to be held—and, second, whether the results of the election on November 6 were significantly influenced by Kennedy's handling of the crisis. Did its successful outcome provide much benefit to the Democrats, who ended up doing unusually well on election day? The authors answer in the negative: the crisis's ramifications for politics were "indiscriminate." It helped some Democrats and hurt others; it helped some Republicans and hurt others. Similarly, Kennedy's actions between October 16 and October 28 were, on the whole, not politically opportunistic: they were sincere attempts to defuse the crisis by whatever means necessary. Domestic political thinking had little to do with the decision-making process.

These conclusions might seem obvious, but the background provided by Paterson and Brophy makes them seem less so. First of all, the Kennedy administration was determined to get more Democrats into Congress in the November elections so that its legislative program could succeed. For months, Republicans had been criticizing the administration for tolerating a Soviet military buildup in Cuba, for not doing enough to punish Castro, even for abandoning the Monroe Doctrine (by allowing a Soviet presence in Latin America). After the Bay of Pigs fiasco, the administration was particularly vulnerable to these sorts of criticisms. While the Democrats were still in a strong position in October, it would be reasonable to suppose that the Kennedy administration might have manipulated the Cuban missile crisis so as not to appear soft on Communism or Castro, and thereby to prove wrong Republicans' criticisms and succeed in the elections. Indeed, some people accused the administration of somehow *orchestrating* the crisis for these ends.

¹ This article was published in 1986 in *The Journal of American History*.

Because, moreover, the Democrats did well in the elections—losing very few seats in the House and gaining some in the Senate, which was extremely unusual for midterm elections¹—it is reasonable to think that the national security crisis had benefited them. After all, it is well-known that the electorate prefers to keep incumbents in power during a security crisis—especially when the incumbents are doing a good job of resolving the problem.

Paterson and Brophy, however, argue fairly convincingly that such hypotheses are mistaken. They demonstrate, for instance, that even before October the Democrats were doing well in the polls, that support for Republicans was not increasing despite their constant attacks on the administration for its handling of Cuba. Most of the public seems to have cared more about domestic issues than Cuba, and it supported Kennedy's domestic initiatives (such as Medicare, civil rights legislation, and aid to the unemployed and college students). Even more tellingly, Gallup polls indicated that most people did not change their views about Democrats or the Kennedy administration between early October and October 30, suggesting that the missile crisis did not greatly help Democrats on election day. The party was already ahead of Republicans before the crisis, and it remained ahead of them.

Paterson and Brophy also argue that Kennedy's choice of a blockade to deal with the Cuban situation was not motivated by domestic political concerns. For, if such concerns had been in his mind, arguably he would have preferred a military strike over a possibly protracted blockade in order to silence the Republicans who had accused him so often of being indecisive. But the records of ExCom's meetings show remarkably few references to domestic politics: the decision-making, by and large, took into account only what was in the best interests of the country and the world, and not what was in the best interests of the Democratic party. Indeed, the authors point out that it would be very odd for a man in Kennedy's position to spend much time thinking about the political fortunes of his party—not when the fate of the world rested on his shoulders! Politically speaking, he limited himself to forging a bipartisan consensus for his plan to blockade Cuba.

Certainly there was political pressure on Kennedy to act decisively against the Soviets. But the authors argue that this public pressure demanded only that Kennedy do *something*; it did not prescribe a specific course of action. However, it's possible they're mistaken about this. In his article "The Cuban Missile Crisis and Politics as Usual,"² Timothy McKeown argues that the choice of a blockade was attractive largely because of domestic politics. Certain Republicans would have preferred a more forceful course of action, but it was apparent from polls taken even before the crisis that the general public overwhelmingly favored a blockade over armed intervention in Cuba. And, since Kennedy's popularity in the autumn of 1962 was lower than it had ever been, he had good reason to heed the public's wishes in this matter. A blockade was neither too aggressive nor too "weak"; politically speaking, it was "just right."

If one retorted, again, that the records of ExCom's meetings show few references to political concerns, McKeown would answer that this is irrelevant. Recent scholarship has shown that ExCom was "probably not intended to play a primary role in the assessment of the domestic political consequences of decision-making" during the crisis; it was outside ExCom's meetings that domestic politics was considered in depth, especially in meetings between Bobby Kennedy and his brother. Written records were not kept of all these meetings. In any case, common sense should tell us that public opinion, interest group pressure, congressional politics and so on played an important role in Kennedy's decision-making: after all, the latter didn't exist in a vacuum. McKeown demonstrates this effectively.

However, even McKeown agrees with Paterson and Brophy that *partisan* political concerns probably played a relatively small role in Kennedy's mind during the missile crisis. There wasn't much *opportunism* involved; there was only a lot of responding-to-pressure—and, of course, attempts to shape public opinion (through television addresses and so on). While Paterson and Brophy probably underestimate the role of domestic politics, what they are really concerned with is the relationship between the missile crisis and the November elections—and so the fact that "domestic politics" *per se* played a very important role does not necessarily pertain to their thesis. They do a very good job of making the

¹ In other words, the party of the president typically lost many seats in the midterm elections.

² *The Journal of Politics*, Vol. 62, No. 1 (Feb., 2000).

counterintuitive argument that the elections had relatively little bearing on Kennedy's decision-making, and that his decision-making did not have a huge effect on the outcome of the elections.

A particularly powerful argumentative tool of theirs is to examine the outcomes of individual races. Admittedly, after the resolution of the crisis partisan politics began again, with the Republicans arguing that Kennedy's policy had failed inasmuch as Cuba remained a Soviet military ally and Kennedy had been forced to promise that he would never again invade the island—while the Democrats argued that everything had been resolved satisfactorily. But detailed examinations of the races show that neither Republicans nor Democrats benefited overwhelmingly from the missile crisis. First of all, “the elections barely changed party alignment in the House.” More tellingly, Paterson and Brophy show that such things as gerrymandering, domestic policy issues, and the Democratic party's strength in voter registration best explain the Republicans' failure to make major gains in the House and Senate. In several races, the missile crisis actually helped Republicans who had taken a strong stand against Cuba.

Paterson and Brophy admit that the crisis may have helped incumbents in general, be they Republican or Democrat, simply because, as stated above, the electorate tends to favor incumbents during national security crises. And 1962 was a good year for incumbents. Still, one should not overemphasize the importance of this fact, since a number of Washington veterans did lose to newcomers—usually not for reasons connected to the missile crisis.

Ultimately, despite the impressive array of data and the subtle arguments given in the article, the reader is not *wholeheartedly* convinced of Paterson and Brophy's thesis, simply because the Cuban missile crisis was such an important issue at the time that its lack of importance to the elections is surprising, almost unbelievable. On the other hand, politics is a messy business: for one issue to trump all others would be unusual, to say the least. And the mere fact that the Democrats were in power during the crisis should not be expected to count overwhelmingly in their favor, since there was a bipartisan consensus behind Kennedy's plans and, after all, Republicans had been insisting for a long time that something had to be done about Cuba. In a way, the events of October proved them right. —In short, both parties were helped and hurt by the missile crisis, which means that its effects on politics were, in the end, “indiscriminate.”

*

Why didn't America become fascist in the 1930s? When almost all Europe was heading towards fascism—Germany, Italy, France (sort of), Spain, Portugal, Eastern Europe—America had a decidedly leftist orientation. Why? For many reasons. An important one is that fascism is an extreme form of nationalism, and nationalism is usually strengthened by invoking an ethnicity it can be based on, a “pure” ethnicity, and America was not a nation of a single, pure ethnicity. It was literally a nation of recent immigrants, of every ethnicity in the world. Germany, of course, was not, nor was Italy, France, Spain or the others. They were comparatively “pure”—and insofar as aliens lived amongst them, ethnic minorities like Jews, the aliens could be attacked by the ethnic majority. Such minorities, therefore, *bolstered* fascism rather than undermining it, as in America. In America, what united millions of workers and agricultural laborers was a working-class lifestyle, poverty, oppression, hatred of the upper class. *Not* ethnicity, as in fascist countries. Proto-fascists like Father Coughlin, the 1930s version of Rush Limbaugh, failed to capture the hearts of most immigrants and workers. It was far easier for a left culture to emerge, a Popular Front, than a right one. —Also because Europe was going fascist and it's always tempting for Americans to define themselves in opposition to Europe and/or the rest of the world—even, or *especially*, if these Americans are first- or second-generation immigrants—and since ugly prejudices were surfacing in Germany and so on, it was exceptionally easy for leaders to organize opposition to European fascism and its prejudices.

On the other hand, a main reason why fascism instead of leftism happened in Europe is that business supported fascism as a bulwark against reform. The Marxist interpretation is basically right. It might be too simplistic to say that fascism was an “*agent*” of capitalism, as Marxists used to argue, since it had some anti-capitalist, and especially anti-bourgeois, elements. Fascists wanted a cultural revolution, and they hated “parasitic” finance capitalists. Fascists themselves, then, certainly weren't mere agents of the capitalist classes, mere fighters on behalf of the privileged. Nevertheless, as a social force fascism indisputably served

the interests of the capitalist order by suppressing worker revolts, and this is why it was allowed to go as far as it did despite its unsavory, un-bourgeois elements.

The Bonapartist interpretation, inspired by Marx's analysis of Louis Napoleon, is also insightful.

Summary of Denning's argument I have to write for class.— Overarching argument: Corresponding to the Popular Front of the 1930s was a "cultural front," a broad alliance of radical artists and intellectuals that permeated the cultural industries and apparatuses. This front reshaped American culture. (He refers to a second American Renaissance, the first being in the 1840s and '50s.) "Just as the radical movements of abolition, utopian socialism, and women's rights sparked the antebellum American Renaissance, so the communisms of the depression triggered a deep and lasting transformation of American modernism and mass culture, what I will call the *laboring* of American culture." (Why "laboring"? (1) Pervasive use of the term "labor" and its synonyms; (2) proletarianization of culture, integration of the working class into culture and the arts, resulting from the huge expansion of secondary and higher education and also the industries of entertainment; (3) unionization of the new masses of cultural laborers, including screenwriters, actors, journalists, teachers, and so on; (4) the Popular Front was not simply New Deal liberalism and populism but a social democratic culture, "industrial democracy" and "industrial unionism.")

Why did the left have an unprecedented impact on culture in the 1930s? Most historians invoke the image of the "fellow traveler," the individual intellectual attracted to the Communist Party, but this is misleading and inadequate. It's a manifestation of the typical individualistic thinking of the bourgeois social scientist, the methodological individualism. The historian's focus in this case shouldn't be on the momentary political commitments of individual writers and artists, or on the hackneyed narrative of their "seduction and betrayal" by the Communist Party. Rather, the cultural front resulted from social-structural forces, viz. "the encounter between a powerful democratic social movement—the Popular Front—and the modern cultural apparatuses of entertainment and education." The Popular Front wasn't just the Communist Party with its periphery of "fellow travelers"; it was a vast social-democratic movement "forged around anti-fascism, anti-lynching, and the industrial unionism of the CIO." It was a historical bloc, based in the CIO's industrial unions. And it wasn't merely a brief historical episode, an accidental detour which led nowhere, as historians have argued ever since the 1950s. Summing up its significance, Denning says that this unique constellation of social forces in the '30s informed the life-work of two generations of artists and intellectuals. "For the first time in the history of the United States, a working-class culture had made a significant imprint on the dominant cultural institutions. Both high culture and mass culture took on a distinctly plebeian accent. Black and ethnic writers, descendants of the proletarian avant-garde, dominated twentieth-century American literature. Vernacular musics like jazz, blues, and country resonated around the world. Gangster movies and *films noir* had founded the 'American' look in film. The cultural front had been a laboring of American culture."

Thus, Popular Front = *social movement*, not mere political alliance or "sentimental façade." It can also be seen as a "structure of feeling," in Raymond Williams's phrase, a concept that denotes "forms of practice and social and mental habits." (Each generation can be said to have its own structure of feeling.) In a way, then, the Popular Front was "a political and cultural charter for a generation"; and it didn't end with the Nazi-Soviet Pact of 1939, as historians tend to think. It really lasted until after the war—even, in a vague way, until the early 1960s, when a new structure of feeling took over. It was coextensive with "the age of the CIO," which lasted from the '30s to the '50s.

"The cultural front is the terrain where the Popular Front social movement met the cultural apparatus [i.e., the whole apparatus of culture, from education to the media] during the age of the CIO. From that conflict and conjuncture came the Popular Front 'flavor' of American mass culture."

Denning admits, though, that in the end the laboring of American culture was a failure, "pummeled by the new postmodern forms of commodity fetishism." But, as Fredric Jameson has said, history progresses by failure rather than success. And it's better to think of a given historical figure as more of a failure than a success, "an actor or agent constrained by his own ideological limits and those of his moment in history." (Peter the Great, Napoleon, Marx, Lenin, John L. Lewis, etc.)

“The Literary Class War”: Rethinking Proletarian Literature (Chapter 5)

Review of Denning’s goal: to establish through a number of examples that conventional interpretations of the Popular Front (which started in 1935) are wrong. The Front’s culture was neither a passing fad without long-term significance nor a selling-out of the more radical cultural and social movements between 1930 and 1934. Instead, proletarian literature left a “profound and lasting mark” on American literature/culture (making it more working-class) and, secondly, the Popular Front’s literature was actually a continuation of the radical avant-garde of the early depression rather than a repudiation of it. It was, to a large extent, the avant-garde’s institutionalization.

Denning starts by criticizing the common attempt to define “proletarian” literature. The problem with this attempt is that genres are not abstract and ahistorical ideal-types. They have “grown out of particular social formations and must be understood not as a class of objects but as the products of those formations.” (His criticism of this ahistorical literary thinking therefore ties into his implicit criticism of methodological individualism.) A better question to ask is “What was the proletarian literary formation?” What kinds of writers and writing did it produce?

Definition of a “cultural formation”: the combination of a cultural politics and an aesthetic ideology. (Useful distinction.) The former denotes cultural infrastructure (publishers, galleries, patrons, reviewers); the latter is the “conscious and unconscious ways of valuing that a cultural formation develops and inculcates, its ‘aesthetic,’ its sense of what is good, true, and beautiful.” Denning proceeds to examine these two things in the context of proletarian literature, looking first at the variety of little magazines and literary circles it produced.

Hundreds of short-lived leftist literary magazines popped up around the country in the early 30s. Many clubs too, especially the John Reed clubs (for artists and intellectuals but also ordinary working-men). Important bohemian subculture. Engaged in cultural events and supported labor struggles. Denning describes in detail the lives of these clubs and of the intellectuals who took part in them, like Richard Wright, Michael Gold, Ralph Ellison, Malcolm Cowley, Jack Conroy, and Kenneth Burke, showing how their early experiences informed their later careers. He eschews abstract analysis of radical literature; concentrates on the concrete, especially “cultural politics” but also aesthetic ideologies, showing how they spread and colonized the broader culture. Examples of these ideologies or styles: the blues vernacular and racial romances of Langston Hughes; gangster melodrama; worker narratives and industrial lore; the surgical experimentalism of William Carlos Williams; lyric feminist regionalism; the migrant narrative; and the “ghetto or tenement pastoral,” a new and lasting genre, like the migrant narrative. (“By the time of Coppola’s *Godfather* trilogy, the story of the ghetto had become quintessentially American.”) A common thread through all this is an emphasis on social and economic exploitation.

All in all, Denning’s argument is fairly persuasive. A working-class perspective in much literature and culture persisted through the ’40s and afterwards. His methodology is also sensible—focusing on social formations and ways of life rather than abstract analysis of texts. He does the latter, though, (sort of) in other chapters, and the two approaches are complementary. This is actually a criticism I have of his rejection of methodological individualism: holism and individualism are complementary, or *should* be. He prefers to think in terms of social forces, but the flip-side of these forces is their manipulation of the individual, in other words of his “political commitments.” Thousands or millions of intellectuals were indeed attracted to working-class ideologies for a few years, and many of them subsequently moved to the right. The language of “seduction and betrayal” is tendentious, but the broader narrative it’s used to describe obviously has some truth to it. Denning’s main point is still sound, though: even if most individuals ended up repudiating the radical sins of their youth, it’s undeniable that the social/cultural formations of the ’30s and early ’40s influenced culture into the ’50s and ’60s, and beyond. It’s hard to “prove” that statement, but on some level it’s surely a truism. (Is Denning’s argument ultimately truistic? No, but it probably isn’t as revolutionary as he thinks.)

The system of dating history by decades impedes understanding. Horribly. 1930s, 1940s, 1950s, 1960s, 1970s... Each decade is supposed to have its own “character.” But history doesn’t work like this; social movements etc. don’t begin at the beginning of a decade and end at the end. The “60s” really lasted

until the early 70s; the 50s started around 1948; the 80s lasted, in some ways, up through W.'s presidency and are only now finally ending. (The conservative, even the neoliberal, hegemony is ending. [Ha! Wow were you wrong.]) Moreover, the dates themselves artificially break up history, disrupt its continuity. Thinking-in-decades sinks deep into the mind until it's virtually a structure of experience, a structure of knowledge. It *gets in the way*.

Noam Chomsky said in an interview once that "Conservatism has an honorable tradition, but this [viz., the radical nationalism of Cheney and friends] isn't it." He's right: conservatism does have an honorable intellectual tradition. But Phyllis Schlafly's confused amalgam of Christian fanaticism and bastardized classical liberalism isn't part of it. (Classical liberalism = Locke, Montesquieu, Voltaire, Adam Smith, Humboldt, Hume.) –The history of liberal and conservative ideologies is fascinating, as you can see from Wikipedia. "[A]t the heart of classical liberalism," wrote Nancy L. Rosenblum and Robert C. Post, 'is a prescription: "Nurture voluntary associations. Limit the size, and more importantly, the scope of government. So long as the state provides a basic rule of law that steers people away from destructive or parasitic ways of life and in the direction of productive ways of life, society runs itself. If you want people to flourish, let them run their own lives."'" That's classical liberalism: individual freedom, free markets, limited government. It emphasizes human rationality, individual property rights, natural rights, the protection of civil liberties. It's a combination of political liberalism (the rule of law, restrictions against the arbitrary use of power, consent of the governed, legal toleration of a plurality of religions and moral codes) and economic liberalism (private property, limited state interference in the economy). As you can see, it's all united by a belief in individual freedom and the sovereignty of the individual.¹

But in a modern society where corporations accrue immense power and are legally treated as persons, people who use the same language as the classical liberals are far from thinking the same thoughts as they. They're really apologists for capitalism and social inequality. Classical liberals wanted individual freedom above all; but in modern capitalism, real freedom is impossible for millions of people who are economically oppressed by the power of corporations and the ruthlessness of the market. People used to need protection from the absolutist state (hence classical liberalism); now they need protection from corporations and the market—hence *social* liberalism, the liberalism of social democracy and the New Deal.² This is the true successor to classical liberalism, in that it more nearly fulfills the intentions of the original liberals than does the ideology of such "liberals" as von Hayek, von Mises and Friedman. Government now has to interfere in society and the economy because, in a liberal-democratic regime, the greatest danger to freedom is not from government but from oligopolies and an unregulated market.

Properly speaking, of course, anarchism or communism is the real successor to classical liberalism, since it's the logical conclusion of the philosophy of individual freedom and rights.

What is called conservatism nowadays is really liberalism in the old sense of a minimal state and an unregulated market. Actually, conservatism just means a preference for tradition, and so 100 years ago a conservative might have been someone who advocated a return to the *ancien régime*. But now that free-market liberalism and the language of "individual rights" have become the tradition, a conservative is a liberal in that sense. And yet not entirely: the mass of American conservatives combine anti-government liberalism with a rejection of "cultural liberalism," or the belief that individuals have the right to choose their own lifestyle and beliefs. (As you can see, this is simply a component of political liberalism.) The combination of cultural conservatism (or "social conservatism") with anti-government liberalism in the ideology of American conservatism is no doubt a bit strange and potentially unstable—and, in fact, since this unholy alliance was born in post-World War II America, the two factions of conservatism have threatened to come apart repeatedly. (They're possibly coming apart again now, with the tension between the business wing and the religious wing of the Republican party.) Still, the alliance does make some sense

¹ That's one of several links to the idea of democracy, with its doctrine of popular sovereignty. Another (related) link is liberalism's emphasis on the consent of the governed.

² This is the kind of liberalism that American politicians have in mind when they say that an opponent is a "liberal," "a tax-and-spend liberal."

insofar as both wings represent tradition. [*No: insofar as they represent a defense of hierarchy and power. That's really what "conservatism" has always been about.*]

And then you have “neoliberalism” and “neoconservatism.” The former, at least in theory and rhetoric, exalts the principle of free markets and free trade. The contemporary world-system is largely neoliberal. Neoconservatism, on the other hand, “supports using U.S. power, including military force, to bring democracy and human rights to other countries, seeing this as virtuous or even morally obligatory. In addition, unlike traditional conservatives, neoconservatives are comfortable with a minimally bureaucratic welfare state; and, while generally supportive of free markets, they are willing to interfere for overriding social purposes.” The rhetoric of neoconservatism can sound noble and inspiring, but from Reagan’s terrorist wars and Cheney’s misadventures you can see that the rhetoric masks less noble aims. Neoconservatives may pretend to be idealists—and some of them are ex-Marxists—but beneath the mask they’re unscrupulous agents of business, imperialism, state power, and reactionary nationalism. They have little in common with true “conservatives” (in the Hayekian sense), except for their support of business. Reagan, by the way, was more of a neocon than a conservative, although his rhetoric celebrated the limited state and the unregulated economy. The rhetoric was a ruse. (Admittedly, Reagan did deregulate parts of the economy, with disastrous results.)

Actually, it’s possible [but unlikely!] that what Chomsky was referring to when he said that conservatism has an honorable tradition is the conservatism of Edmund Burke and such thinkers. This is very different from American conservatism even in its half-honorable Hayekian form—although it has some similarity to certain sentiments in Popper’s *The Open Society and Its Enemies* (such as its preference for piece-meal reform over revolutionary change).

Most American conservatives and neocons take from classical liberalism whatever can be used to justify their support of big business and ignore the rest.

Phyllis Schlafly’s conservatism, which is that of Sarah Palin, would seem to have some things in common with John Brown’s belief-system. Like Brown, Schlafly thinks that the Declaration of Independence is perfectly compatible with Christianity and that America is a nation favored by God. Our God-given rights are best protected by a liberal regime, by the reduction of government to a minimal size (because power corrupts, and because government interferes with “individual rights” and the sanctity of family and tradition). Brown hated government too. However, beneath these surface-similarities are huge contrasts. First of all, the most obvious: Brown took seriously the Declaration of Independence’s guarantee of rights, so seriously that he condemned the Constitution for being tainted with slavery and devoted his life to freeing slaves. In other words, he took Christianity seriously. He hated government because it didn’t protect the rights of black people—and his advocacy of a limited government was natural and sensible because government at that time was small to begin with. In Schlafly’s day the government was immense, and necessarily so; and any idiot could see that it had to be immense in order to protect people’s rights. Advocating a limited government in this day and age is beyond preposterous. Brown lived on the frontier where government was virtually nonexistent. And what little he saw of government convinced him it was an instrument of evil—as, more or less, it was, back then. (The blacks, the Indians, the workers.)

Fascism as arising from the mass desire for social order and harmony, an exhaustion with the turmoil of early capitalism and industrialization, an exhaustion with partisan bickering and the petty materialistic troubles of daily life, the rat race, the daily soul-numbing struggle, a longing for *escape*, a vestigial longing for a utopia or something higher than this life, a religious faith like Communism, the desire for *meaning* in life. To immerse oneself in a collective project!—and at the same time, of course, to be freed from the miseries of industrial poverty. Fascist idealism, the radical phase of the French Revolution, Communism, Islamism, wars of national independence and their aftermath—they have (at least superficially) some things in common.

I can’t help thinking that “the socialization of the means of production” can come about in two ways: either capitalism is overthrown in an early stage of development and government takes control of

industry, or capitalism is allowed to mature to a ripe old age, during which process socialization will come about organically and inevitably. Marx may have confused these two possibilities, or conflated them. He thought that the “old age” of capitalism would coincide with a proletarian revolution, but he was wrong. Such a revolution, as in Russia [sort of], can happen only before capitalism has become entrenched (by means of liberal democracy, bourgeois hegemony, etc.)—and if it does it will inevitably fail in the long run because a state-socialist country can neither survive in a capitalist world nor be truly *socialist* to begin with. The natural way for socialization to occur is to let capitalism evolve in its own way, for during this evolution government will become more and more involved in the economy—at the same time that the global economy becomes more and more integrated—until finally the world wakes up one day and finds that it has public control over its economic activities.

In other words, class polarization is, in the end, unrelated to the likelihood of socialization in the near future (except immature socialization, as with the Russian Revolution). Marx thought otherwise: he thought that the more polarization, the closer society was to the achievement of socialization. Perhaps this doctrine has a grain of truth with respect to the immature kind of socialization—though even then we’re only talking about probabilities (that revolution will happen)—but it doesn’t with respect to the *natural* kind, the kind that organically grows out of economic evolution.

Similarly, while there is an economic tendency towards class polarization and relative immiseration of the masses, there is a powerful tendency *against* such polarization (in the long run). These two tendencies, of course, have very different economic (and social) causes. I don’t know exactly what they are, but they exist.

Ed Hunt, dude in my History program, Chomsky-loving intellectual with a good sense of humor and a totally laid-back attitude, we get along famously. He’s like a little Chomsky with his soft-spokenness and his command of data and fixation on the U.S. government. One of the very few guys I’ve ever truly liked talking to—about history, philosophy, politics, lotsa stuff. Good friend. At least I think he will be, when we have time to hang out together.

Watching Jacob Bronowski’s series *The Ascent of Man* on YouTube. Magnificence.

If American conservatism is a bit paradoxical, though, so is American liberalism. Conservatism fuses old-style liberalism with religious conservatism—which negates aspects of old liberalism—while modern American liberalism fuses the desire for a strong social democratic government that can protect the underprivileged with an old-liberal (or “libertarian”) desire that government not regulate social life, that it allow prostitution, gay marriage, “alternative lifestyles” of whatever kind. On the face of it, this fusion is as paradoxical as the conservative one. But it really isn’t. As Eric Foner writes in *The Story of American Freedom*, modern liberalism is based on an extension of the idea of freedom that took place during the New Deal. Whereas before, freedom just meant liberty of contract, during the 1930s it came to mean civil liberties and economic freedom, or the abolition of economic and social insecurity. (Actually, these newer freedoms hailed from the Progressive era, but they were buried under the conservatism of the ’20s. Rediscovered and fleshed out during the ’30s.) So two notions of freedom competed: “freedom for private enterprise” vs. a “socialized liberty” based on an “equitably shared abundance.” Thus, as I wrote above, modern liberalism, or (according to Wikipedia) “social liberalism”—whose opposite, confusingly, is *not* mere “social conservatism” but the *whole* conservative ideology¹—is in fact a fully consistent extension of the original intentions of the classical liberals, i.e. an extension of freedom. It is freedom in every realm. *Positive* liberty as opposed to *negative* liberty. I.e., it’s the “freedom” to have the power and resources to fulfill your potential as you see fit, which was the value that the classical liberals had in mind when they formulated the doctrine of negative liberty (freedom from restraint). They thought that negative liberty as translated into small government would be enough to secure that end, but, in this age, they’re wrong.

¹ Social conservatism = cultural and religious conservatism; social liberalism = cultural liberalism and “redistributive” liberalism, viz. giving more wealth and power to workers and the poor. These two liberalisms follow from the idea of positive liberty.

Another way of saying it is that modern liberals want, above all, to protect the rights of all oppressed people, be they gays, women, blacks, workers, immigrants, radicals. [No, this is truer of *leftists* than liberals. But leftists are really just those who take classical liberal ideals of freedom and equality more seriously than anyone else.] They want to protect the freedom of everyone to the extent that his freedom doesn't impinge on anyone else's (in the second sense of 'freedom,' the New Deal sense, the "positive liberty" sense).

Modern American conservatism is not so consistent. It wants negative liberty, freedom from restraint, which means limited government—except that it wants to deny this freedom to gays, atheists, women who want abortions, and so on. In *this* sense it wants an active government.

Modern history proceeds, with temporary regressions, in the direction of social liberalism.

Actually, the thinking of conservatives like Schlafly does have a fundamental consistency. While they may invoke the language of limited-government liberalism and rail against interference in the economy, their real values are the socially conservative ones. They don't really care about limited government in the way that, say, Robert Nozick did; they want it to be limited only because they think it tends to undermine socially conservative values, like paternalism and the sacredness of the family. But they want it big to the extent that it can enforce their values. As for its interference in the economy...most of them don't care much, despite what they say. Or, at most, they fear that such interference will lead to interference with the family and religious values.

The 1930s obviously had a gargantuan influence on subsequent history. They were, in a sense, the origin of the "liberal consensus" that lasted into the 1970s. Before the Depression there was a conservative consensus; from the mid-'70s a conservative consensus began to emerge again; and with our current global recession, we're starting to return to a liberal politics. Whenever a major economic recession hits, the liberals come in and fix it. And it's always conservatism that has caused it. (Well, conservatism doesn't cause *every* recession.)

Mark Twain: "Whenever you find yourself on the side of the majority, it is time to pause and reflect."

May

The Looming Tower: Al-Qaeda and the Road to 9/11 (Lawrence Wright). *The Maya of Morganton: Work and Community in the Nuevo New South* (Leon Fink).

I'm watching the world become more and more impersonal. Marx was wrong that capitalism is the only source of the problem: technology itself is partly to blame. At a certain point, the use of advanced technology necessarily alienates people from themselves, lessens their ability to recognize themselves in their acts and works. Reading books on the internet is less "human," more "alienating," than reading them in the old-fashioned way, with a book in your hand whose pages you turn. Humans desire *action*, *touch*, tactile sensations, the fashioning of tools and the interaction between *hands* and *world*. A huge portion of the brain is devoted to coordinating hand-motions, and it is through using one's hands that one feels most at home in the world. But a lot of technology eliminates the need for action and reduces the importance of hands. One starts to feel like a passive observer.

On the other hand, it's arguable that in a more advanced society people would be less chained to technology than they are now. They would choose to forego the temptations of the television, thus reducing atomization. Perhaps a more advanced society would use sophisticated technology in some areas, such as energy-production, but in daily life would indulge in the delights of a relatively primitive lifestyle. Some people might choose to hand-wash their clothes because that can be fun; many artists might retreat from computer-design to old-fashioned painting and drawing.

In his essay “The Role of the Individual in History,” Plekhanov argues (among other things) that quietism is not a logical product of the consciousness that a given event is inevitable. The common criticism is that, if socialism is *inevitable*, what’s the point of fighting for it? Plekhanov thinks this criticism is misguided. But he’s wrong. He makes the Hegelian mistake of defining freedom as the consciousness of necessity, a definition that makes little sense. Maybe “freedom” is increased through *reason*, through understanding general tendencies (half-necessary) and social forces and thus being able to influence them (or society on the basis of one’s understanding), but genuine *necessity*, over which one has no control whatsoever, is always opposed to freedom.

“Being conscious of the absolute inevitability of a given phenomenon can only increase the energy of a man who sympathises with it and who regards himself as one of the forces which will call it into being.” Two criticisms. (1) The logical result of a consciousness-of-inevitability is passivity, because through acting a person aims to *change* something. Only if a man thinks that a given phenomenon is probable but not inevitable—or only possible, or nearly achieved already, or whatever—is he logically justified in doing everything he can to bring it about. (2) If the individual himself is one of the forces that will call it into being then the phenomenon can’t be inevitable. Or at least it can’t be seen as inevitable by the man, because his consciousness is necessarily of freedom. He can always act in more than one way; he can make a choice. If something depends on his actions it isn’t inevitable, because his actions are free.

Luckily this is all academic, since, in fact, nothing in history is inevitable. At most, it is highly probable.

Here’s a stupid pointless paper I had to write about a book:

Questions Raised by 9/11, and Their Answers

Lawrence Wright’s book *The Looming Tower: Al-Qaeda and the Road to 9/11* is an illuminating account of Muslim terrorism prior to the attack on the Twin Towers. It describes the origins of such terrorism and specifically the rise of Osama bin Laden and al-Qaeda. At the same time, it traces in great detail the history of the U.S. government’s attempt to destroy terrorism, showing that it was partly because of bureaucratic incompetence and obstructionism in the FBI and CIA that 9/11 happened. The picture that emerges from the book is that bin Laden and his deputy al-Zawahiri have been the driving forces behind Muslim terrorism since the 1990s—that they have coordinated and financed, and/or inspired through their public announcements, a majority of the most destructive terrorist acts. Were it not for these two men, especially bin Laden, 9/11 would not have happened. Through its illustration of this fact, the book raises a philosophical question: exactly what impact can the individual have on history? For instance, if one or two strong people in the FBI or CIA, people like John O’Neill (an FBI specialist on terrorism), had succeeded in rising above the bureaucratic mess and discovered the 9/11 plot—which the book shows was by no means an impossibility—perhaps the Towers would not have been destroyed, which means that neither Afghanistan nor Iraq would have been attacked and the war on terror would not have been declared (at least not when it was)—and the ramifications of the war on terror have been immense and wide-ranging. In this paper I shall discuss the question raised by the book, this very interesting question about the individual’s relation to history. What is more important: “great men” or social structures and impersonal dynamics? We’ll see that structural forces are overwhelmingly more important.

The history of postwar America is replete with examples of individuals seeming to have an inordinate impact on historical evolution. The Cuban Missile Crisis is one such example. The book *One Hell of a Gamble* demonstrates that Khrushchev and Kennedy essentially held the fate of the world in their hands during the relevant two weeks, and that at certain moments the world came remarkably close to nuclear war. In fact, any of the nuclear submarine commanders facing off in the waters around Cuba could have inadvertently set off a nuclear war had he let his nerves get the best of him. One particularly harrowing event is described in the National Security Archives:

...Vadim Orlov recounted the tense and stressful situation on 27 October when U.S. destroyers lobbed PDCs [practice depth charges] at [submarine] B-59. According to Orlov,

a “totally exhausted” Captain Valentin Savitsky, unable to establish communications with Moscow, “became furious” and ordered the nuclear torpedo to be assembled for battle readiness. Savitsky roared “We’re going to blast them now! We will die, but we will sink them all.” Deputy brigade commander Second Captain Vasili Archipov calmed Savitsky down and they made the decision to surface the submarine...¹

Archipov may have saved civilization.

What these examples prove, however, is only the obvious point that in the nuclear age society can be virtually destroyed with the push of a button. A single individual cannot thereby *guide* historical evolution; he cannot have a major *creative* impact, only a destructive one. Moreover, the reason for this insane state of affairs, and the meaning of it, is that social relations within and between countries are structured in a certain way, a certain hostile, bureaucratic, capitalistic, nationalistic way, such that there is the potential for war. No single individual can be responsible for structuring society in this way; he can but actualize (through the bureaucracy) the destructive potential inherent in current social structures and dynamics.

Consider a different example. Lyndon Johnson is said to have had a huge influence on society in two ways: first, through his Great Society and civil rights programs, and second, through his escalation of the war in Vietnam. The latter in particular had far-reaching consequences. For instance, it led indirectly to Johnson’s withdrawal from the election of 1968 and thus set up the Democratic loss to Richard Nixon, whose presidency eventually led to Watergate, which is thought to have transformed the political landscape and the public’s attitude toward politics. More broadly, Vietnam may have hastened or caused the split between students, or liberals in general, and the white working class, which did much of the fighting in Vietnam and was repelled by the liberals’ hostility to the war and to Vietnam veterans. Combined with LBJ’s civil rights programs on behalf of blacks (as well as the “godlessness” of cultural liberals), Vietnam thus pushed the white lower-classes into the arms of the Republican party, which made possible Reagan’s election and hence the three-decades-long conservative hegemony—which itself arguably led to the current global recession (since conservatives advocated financial deregulation). In this picture, LBJ is a gigantically influential person, and it does begin to look as if the “great man theory of history” has some truth.

Appearances are deceiving, though. First of all, Johnson’s liberal initiatives did not spring solely from his own personality, sheltered in some sort of social vacuum. They were the product of years—decades—of civil rights agitation, grassroots mobilization around the country, the tireless work of hundreds of thousands of people. It started in the 1930s, with the epic struggles of the Southern Tenant Farmers Union on behalf of sharecroppers, as well as the anti-lynching movement across the South. (Congress almost passed legislation in the late ’30s making lynching a federal crime.) Black resistance to oppression continued after World War II, when veterans returning to the South insisted on their right to vote. At the same time, technological and economic changes (radio, television, the decline of the cotton economy, etc.) were ending the brutal isolation of segregated communities where blacks were terrorized, involving them in the social currents of the world and showing blacks that a different life was possible.² Change accelerated in the late ’50s and early ’60s, as civil rights workers traveled to the South to challenge Jim Crow. The national media became interested in racial injustice. Demonstrations were organized around the country. By 1964 millions of people were clamoring for change, and Congress finally responded with its Civil Rights Act and other bills. Lyndon Johnson was but a pawn in the hands of progress.

Nor was he alone responsible for Vietnam. H. R. McMaster’s book *Dereliction of Duty* shows that Johnson felt trapped in Vietnam, pressured by Congress and the public neither to withdraw from the country nor to escalate the conflict too quickly, with the result that he built up troops very slowly and finally found himself bogged down in a quagmire. It was the political situation, the Cold War, that generated the pressure to do something about Vietnam; Johnson simply tried to respond to political pressure as best he could. He

¹ <http://www.gwu.edu/~nsarchiv/NSAEBB/NSAEBB75/>.

² See Charles M. Payne, *I’ve Got the Light of Freedom* (Los Angeles: University of California Press, 1995), chapter 1.

was the person *most* responsible for the war, but it was the social dynamics and resultant political considerations that led him to make the decisions he did.

We could discuss a whole range of examples, from Hitler to bin Laden, systematically showing that the importance of individuals has been overstated or at least stated simplistically, but that seems unnecessary. Logic is just as compelling in this case as empirical evidence. And logic agrees with the Russian Marxist Plekhanov when he states (in “The Role of the Individual in History”) that “individuals often exercise considerable influence upon the fate of society, but this influence is determined by the internal structure of that society and by its relation to other societies.” Or, expressed differently, “influential individuals can change the *individual features of events and some of their particular consequences*, but they cannot change their general *trend*, which is determined by other forces.” The trends of society are in a certain direction; a person emerges who embodies or seizes upon these trends, pushing them along, and he becomes influential. But he has been *created* by these trends, these forces. He can merely serve them and guide them in relatively minor ways; he remains their slave. Compared to the structural forces of history, he is as a sailor navigating his skiff in the wind.

In short, while bin Laden may have provided the spark that set off the war on terror, it is because society was a tinderbox waiting for that spark that bin Laden has been influential. He did not “change history”; no one ever *changes* history, he merely plays into its hands.

Here’s a relatively interesting (but still inadequate) paper:

Reflections on Fascism: A Critique of Zeev Sternhell

Questions about the “meaning” or the “nature” or the “significance” of fascism have been debated since the early 1920s. Is it a revolutionary or a counterrevolutionary movement? Is it an agent of modernization or an opponent of it? Is it more socialist than capitalist or vice versa? What is the “meaning” of its celebration of cultural revolution? What is the relation between its ideology and its practice, or between fascism as a social movement and fascism as a regime? Some of these questions are easier to answer than others: for example, fascists opposed “modernization” if that term means liberalism, democracy, Marxism, individualism, and feminism, while they favored it if the term means technological and economic advancement, military superiority, efficiency, and the glorification of speed and machines. (It is well-known that one of fascism’s ideological sources was Futurism, which shared all these traits.) The traditional Marxist interpretation of fascism has been that, despite its revolutionary rhetoric, in practice it was essentially conservative: it maintained the existing class structure and favored big business while brutally suppressing trade unions and workers’ rights. It decisively foreclosed the possibility of revolutionary socialism, thus serving the interests of capitalism. Another interpretation, exemplified by Zeev Sternhell, maintains that fascism was more left than right, more revolutionary than counterrevolutionary: it was basically a revision of Marxism, violently opposed to capitalist society. Far from being a bulwark of the bourgeoisie, it loathed bourgeois decadence and advocated a form of socialism, “national socialism.” These are arguably the two most widespread views, or at least the polar opposites around which debate orients itself. In this paper we shall weigh the respective merits of each and decide in favor of the Marxist one, with some qualifications.

In his books *The Birth of Fascist Ideology* and *Neither Right nor Left: Fascist Ideology in France*, Sternhell traces in great detail the origins of fascist ideology from before 1900 to the 1930s.¹ By following the careers of such intellectuals as Georges Sorel, Maurice Barrès, Georges Valois, Hubert Lagardelle, Arturo Labriola, Sergio Panunzio, Edouard Berth, Pierre Drieu La Rochelle, and many others, Sternhell

¹ In this paper I’ll be concerned only with classical fascism. It seems to me that fascism can take many forms, more or less extreme, depending on the time and place. Classical fascism—particularly Nazism—was merely, in all likelihood, the most extreme, the most nationalistic form possible, because it grew out of a “perfect storm” of epochal social changes.

shows that fascist ideology originated—in its most sophisticated forms—among ex-Marxists and socialists. It arguably existed even before World War I, formulated by revolutionary syndicalists who had lost faith in the capacity of the proletariat to inaugurate a revolution on its own. These thinkers were disgusted with what they saw as the decadence, the selfishness, the pettiness, the materialism and immorality of bourgeois society; they despised democracy, liberalism, individualism, feminism, pacifism, all “un-heroic” ideologies. Like Marinetti and his Futurists, they longed for a revolution to make civilization *heroic* again. They longed for the triumph of ancient martial virtues over bourgeois egoism and cowardice, moral corruption. Many of them initially seized on Marxism as the means to achieve this aesthetic, moral revolution: they embraced the concept of a heroic struggle on the part of the working class to overthrow the bourgeoisie and therewith (as they saw it) the reign of moral relativism, with everything it entailed. When it became evident, however, that the proletariat was not up to the task, having been duped by its political leaders into settling for piecemeal social reform rather than revolution, intellectuals like Sorel decided that the revolution would have to be *national* rather than “social.” It would have to be undertaken by the people as a whole, not just the working class. Sorel and his followers, therefore, turned to nationalism, the glorious idea of the “nation,” as the myth that would inspire popular revolutions in France, Italy, Germany, and so on. Out of the ashes of the old corrupt regime would be born a nation of “corporations,” a harmonious, hierarchical social order that would not pit worker against capitalist but would merge all interests in the unity of the state. The nation, as embodied in the State, would constitute a sublime collective affirmation of the will to power, a spiritualized entity in a continuous state of martial tension and valor, a semi-realization of Hegel’s idealistic philosophy.

In *The Fascist Revolution*, George Mosse gives an analysis that supports Sternhell’s. True fascist movements set out to create a new man, a new nation, devoted to principles of beauty, war, hierarchy, self-sacrifice, youth, masculinity, virility, creativity, national unity and mobilization against outsiders or such “parasites” as Jews and financiers. The central principle in all this was nationalism, which often took the form of an obsession with racial purity. What was desired, in short, was a cultural revolution—but not a “social revolution,” if that term denotes the overthrow of capitalism. Most fascists were not against capitalism *per se*; in fact, Sternhell shows that many supported it, or rather they supported “a capitalism of producers, hostile to the plutocracy and high finance, the stock exchange, the middlemen, and the money grubbers. [They were] strongly attached to the market economy, to competition, and to the nonintervention of the state in economic activity.”¹ No doubt fascists hated materialism, money, speculation, and bourgeois values;² but they accepted the necessity of some form of a capitalist economy, be it “planned” or not.³ Consistent with their qualified acceptance of capitalism was their ideological replacement of the Marxist opposition between workers and capitalists with the opposition between “producers” and “profiteers” or “financiers,” i.e. parasites. Fascists wanted to do away with the parasites and keep the producers, a class that included both workers and “productive” capitalists, such as industrialists.

Already we begin to see that Sternhell is largely right about fascist ideology: it is neither conventionally right nor left. Actually, despite the title of his book cited above, he thinks it is more left than right. And this view, too, is not quite as absurd as it would have seemed to a free-thinking German in the 1930s. Consider Stanley Payne’s excellent definition of fascism: it is “a form of revolutionary ultra-nationalism for national rebirth that is based on a primarily vitalist philosophy, is structured on extreme elitism, mass mobilization, and the *Führerprinzip*, positively values violence as end as well as means and tends to normalize war and/or the military virtues.”⁴ This definition has almost nothing in common with Marxism, but it certainly denotes a (quasi-)revolutionary ideology, an ideology directed at the destruction of the cultural and political status quo.

¹ Sternhell, *The Birth of Fascist Ideology* (Princeton, New Jersey: Princeton University Press, 1994), 91.

² See, e.g., chapter 7 of Sternhell’s *Neither Right nor Left* (Los Angeles: University of California Press, 1986).

³ Some fascists favored a kind of laissez-faire capitalism; others wanted something along the lines of state capitalism. See *ibid.*, chapter 6.

⁴ Stanley Payne, *A History of Fascism, 1914–1945* (Madison, Wisconsin: The University of Wisconsin Press, 1995), 14.

Sternhell is fairly convincing, therefore, with respect to the “abstract” ideology that fascists believed in. However, that the movement as a whole was truly “leftist” is far less clear.

Before continuing, we must point out a confusion that can mar historical analyses: the term “fascism” does not denote a movement that was homogeneous across Europe. Fascist ideology is not like Communist or Socialist ideologies in their simple and specific social content, their easily definable program(s) for a revolution and a utopia. Rather, it is more like a “form” that can be filled in with virtually any social content. Communism preaches the overthrow of the capitalist class by the workers, their subsequent dictatorship, the socialization of the means of production for the purpose of expanding and rationally allocating output, and ultimately a society in which everyone works according to his abilities and is compensated according to his needs. This doctrine is extremely specific. Fascism, by contrast, preaches national revolution, the exaltation and rebirth of the *Volk* through a war against foreigners and liberals, militarism, an authoritarian state, a rejection of modern ideologies, and so forth. But *these* goals can be manifested in any number of ways. One fascist might desire the destruction of capitalism in favor of something like socialism, while another might hate socialists and desire that the business class remain in power. One fascist might want to protect certain minorities while another is perfectly happy to send them to concentration camps. One fascist might want to redistribute land to the peasants, while another wants to consolidate the power of landowners and keep peasants in virtual serfdom. The possibilities are endless. This is, indeed, the great strength of fascism: its flexibility, its mutability, depending on which social group or which region is being appealed to. What stays constant is only the *form*, so to speak, the form of mass mobilization and national rebirth, into which one puts whatever content one wants. To be sure, the idea of national rebirth is naturally compatible with ideas of beauty, youth, violence, self-sacrifice, hierarchy—and egalitarianism too!—elitism, a sort of radical democracy, mass spiritual identification with the *Führer* or the *Duce*—a whole array of dazzling and apparently contradictory ideas that are little more than means of fleshing out the abstract *form* of national mobilization for rebirth. What the social content of the regime will be is difficult to tell in advance.

Sternhell insists, against conventional wisdom, that fascist ideology is just as coherent and specific as Communist ideology, and in a sense he is right. Payne’s definition quoted above is coherent and specific. But the conventional wisdom is right too: within the framework of this specific definition can be anything from laissez-faire capitalism to state capitalism, from rabid anti-Semitism to rabid anti-anti-Semitism. *This* is the solution to all the debates about the “coherence” of fascist ideology, this distinction between the “form” of “palingenetic ultra-nationalism”¹ and the “social content” that can be almost whatever one wants it to be. This is also how it is possible that some fascist parties were so pro-worker they almost qualified as Communist while others showed no consideration whatsoever for workers.

We can see now that Sternhell’s claim that fascism is more left than right is misleading. In a sense it is true, for fascism aims at a national revolution; but in a sense it is false, for this national revolution can theoretically veer toward the left or toward the right.

Another argument Sternhell adduces in favor of the leftist nature of fascism is that many of the founders of its ideology were once self-styled Marxists or revolutionary syndicalists. Supposedly, then, fascism is a “revision” of Marxism. But this too is wrong or misleading, for these intellectuals who despised bourgeois decadence and would go on to be fascists were much closer in intellectual orientation to Nietzsche than to Marx. It was Nietzsche who raged against “decadence,” not Marx. Sternhell himself admits that Sorel, a progenitor of fascists, even in his Marxist days had incomparably more affinity to Nietzsche than to Marx. “Anti-rationalism and pessimism, the cult of heroic ages and values, and a horror of the Enlightenment were basic to [Sorel’s] thinking”²—and totally opposed to Marx’s. Anti-materialism, anti-determinism, intuitionism, idealism, moralism, the celebration of will and heroic myths, the glorification of violence for its own sake, the emphasis on psychology over economics—all this is (semi-)Nietzschean, not Marxist. The main reason that future fascists at one time called themselves Marxists is that they believed they “had found in Marxism the most extraordinary weapon of war against bourgeois society ever

¹ That’s Roger Griffin’s definition of fascism. See *ibid.*, 5.

² *The Birth of Fascist Ideology*, 69.

invented.”¹ Marxism for them was a means to an end, not an “objectively true” system (or method), as Lenin, Trotsky, Luxemburg and others thought it was. Proto-fascist intellectuals wanted to use its notion of class struggle to overthrow bourgeois culture and politics—but when they finally understood the proletariat’s weakness they rejected the class struggle, embracing instead the myth of the nation and thereby showing themselves not to have been committed to a social or economic revolution but merely to a cultural and political one. Their hatred of bourgeois society was *aesthetic* in inspiration, not properly “social” or “economic” or even “moral” (for they rarely condemned its *injustice*, unlike Marxists).² To call them revisionist Marxists is therefore a half-truth at best. And to call fascism itself a revision of Marxism is downright false; it is rather a rejection of nearly everything that Marxism stands for.

Sternhell makes a more important mistake, though, in the very method he uses for analyzing fascism. He looks exclusively at the history of ideas, whereas he ought to have combined this approach with social history. It is indeed illuminating to examine the writings and rhetoric of fascist leaders—but only insofar as these factors influence the masses, for it is *movements* we are concerned with, not ideas for their own sake. Sternhell may be right that the “pure” idea of fascism, as expressed in the definitions above, is more compatible with a highly regimented state-socialist economy than with the chaotic, self-interested, materialistic world of “money-grubbing” capitalism. (In fact, he is probably wrong. See below.) But if we want to understand the dynamics of social movements, the real forces that swayed populations and nations during the 1920s and ’30s, we have to look at the ways in which ordinary people interpreted fascist ideology.

The first point to make is one that has already been made: most fascist leaders and intellectuals themselves accepted capitalism, in some form (usually corporatist). They liked the Social Darwinism of the market, its dynamism, its productivity and efficiency, its competitive nature—all qualities that harmonized well with the fascist struggle of nation against nation, race against race, the will to power. They merely wanted to do away with the parasites, the financiers. But this loathing itself fit neatly into the fascist program, for it exemplified and justified the war against outsiders, against Jews or people who were not of the *Volk*.

Similarly, the fascists’ struggle against Communism naturally inclined them to support capitalism. But why did they oppose Communism in the first place? Because they thought it would undermine the nation. First of all, it was internationalist in orientation—indeed, it was associated with Russia—and secondly, it fomented class conflict, which destroyed national unity. Most fascists (especially the more successful ones) preached a kind of class collaboration or corporatism, which effectively meant the continuation of capitalism.

In their actions, too, fascists proved themselves defenders of capitalism from the red menace. In the years after World War I, Mussolini’s *squadrists* frequently attacked and killed socialists and workers on strike. Veterans hated socialists for their internationalism and for having opposed the war, so they joined the movement en masse and terrorized workers all over the country. The same anti-socialist attitudes and actions permeated fascism in Germany, in France, in England, even in Spain, where it was unusually sympathetic to workers.³ It is not surprising, therefore, that the middle classes in many countries, who feared a socialist revolution in the wake of World War I or during the Great Depression, were attracted to fascism. Robert Paxton goes so far as to say that “Above all, it was by offering an effective remedy against socialist revolution that fascism turned out in practice to find a [political] space.”⁴ This quality of being a bulwark against Communism was fascism’s main attraction to the middle and upper classes.

In much of their rhetoric, of course, fascists were vehemently anti-capitalist. This enabled them to attract millions of workers and peasants, for they promised to end their exploitation by big capitalists and even redistribute land from large landowners to the small peasants. (Needless to say, these promises were

¹ *Ibid.*, 70.

² It can be argued, of course, that Marxists too had a deep loathing of bourgeois cultural decadence. What matters is that they combined this loathing with commitment to a thoroughgoing social revolution—i.e., to a revolution with a *social content* as opposed to a mere nationalistic “form.”

³ See Payne, *op. cit.*, chapter 8.

⁴ Robert O. Paxton, *The Anatomy of Fascism* (New York: Alfred A. Knopf, 2004), 56.

not kept when fascists attained power.)¹ Sternhell takes this rhetoric at face-value, or at least he thinks it represents the “true” fascism. We have already argued that “true” fascism is, by and large, not *inherently* committed either way—neither to the left nor to the right—on issues of social importance, such as the relative positions of the classes, the form of the economy, or gender-roles.² Its definition makes no reference to these issues. But insofar as fascism does lean toward one side or the other, it surely leans to the right—the *extreme* right—for a couple of reasons. First—with respect to the economy—the idea of a “national socialism,” a fascist socialism, is nearly self-defeating. For fascists opposed the class struggle by definition: they thought, rightly, that a struggle of worker against capitalist would destroy the unity of the nation and thus defeat the very purpose of fascism. It would tear the nation apart. This implies, moreover, that it would necessarily not be motivated by nationalism but by a Marxist desire for social justice. In the 1920s and ’30s, however, the only way that socialism or some sort of collectivism could be achieved was through the class struggle, or through a peasant- and worker-supported rebellion against capitalist interests.³ Hence, a fascist socialism would not have been fascist; it would have been Marxist. The very term “fascist socialism” is almost an oxymoron. (“Fascist state capitalism” makes more sense.) This, incidentally, is why it was wrong for some of their supporters to accuse Hitler and Mussolini of “selling out” when they crushed trade unions and labor rights after achieving power: they understood that to encourage or even allow such class conflict would violate fascist principles, in particular the principle of *nation above class (and everything else)*. They were being perfectly consistent.

The previous point generalizes to all social issues: people who believe in the nation above all cannot believe in social justice or freedom above all. Or, at best, they identify the cause of the nation with the cause of social justice—but this is merely a disingenuous rationalization for their emotional identification with the nation. Through this emotional identification, this profound desire for national unity and glory, they are implicitly devaluing the particularistic struggles of oppressed groups within the nation. They are effectively denying the legitimacy of claims for social equality on the part of, e.g., women, workers, homosexuals, and immigrants. After all, such groups within the nation that fight for social rights are said to be thereby undermining the nation itself, weakening it, fostering unnecessary conflict, and are thought to hate it, to be subversives. Insofar, therefore, as socialism and leftist ideologies in general are defined by their concern for social justice, equality and freedom, they are in principle opposed to fascism and nationalism.⁴ In practice people might be confused about this fact, as evidenced by the millions of workers and peasants who claimed allegiance to fascism only to be crushed by the regime, but in principle there is no point of contact between the radical left and the radical right (of which fascism is one variety). In brief, ‘left vs. right’ generally means ‘a concern for social and economic freedom vs. suppression of dissent and of (most people’s) freedom (be it social, political or economic).’

Stated more simply, nationalists *qua* nationalists can brook no diversity; they are authoritarian. The nation must be a single homogeneous entity. If oppressed groups agitate for rights, they must be crushed. This belief-system is the very opposite of socialism and its fellow radical ideologies.

We are beginning to see that fascism is not what Sternhell seems to think it is: it is not leftist, not social-revolutionary, but largely reactionary, for which reason it can be potentially useful to the ruling class (but only during acute social crises, since the powerful are suspicious of its disruptive potential). This is consistent with the Marxian analysis. Actually, the traditional Marxian position is that fascism is merely an “agent” or a “tool” of capitalism, a means of propping up a decaying capitalist economy, but this view has

¹ *Ibid.*, chapter 5.

² Fascists tended to be very traditional with respect to gender-roles, but this was not theoretically necessary. It was not out of the question for fascist movements to have been progressive in this area—although it was unlikely, for reasons I’ll discuss in a moment.

³ Some fascist intellectuals seem not to have fully understood this fact. They advocated national collectivism without understanding its fundamentally Communist nature. See Eugen Weber, *Varieties of Fascism* (Princeton: D. Van Nostrand Company, Inc., 1964), chapter 4.

⁴ It makes sense, then, that fascists would be socially conservative (on gender-roles, for instance, or homosexuality), as in most cases they were.

been somewhat discredited. For it ignores “fascism’s autonomous roots and authentic popular appeal.”¹ Thus, Daniel Guerin is wrong that fascism “aims to restore endangered capitalist profits.”² It cannot be so crudely reduced to the economic level. In fact, the very language that Guerin (as a Marxist) tends to use is questionable: what does it mean to say that a movement like fascism “aims” or “aspires” to do something, such as restore profits or protect big business? Social movements are not the sort of things that display intentionality; only people do. We ought to be more careful in how we formulate hypotheses.

Nevertheless, the Marxian approach has value: it provides us with the tools to understand how fascists came to power in two countries, and why it was fascists rather than Communists who did so. Quite simply, the answer comes down to financial and political support, which means support from those in power. We have seen that capitalists and conservatives had reason to appreciate fascism both on the level of its ideology—which replaced the class struggle with the struggle of the nation against outsiders—and on the level of its actions, which were anti-Communist. In the context of an economic and political crisis, during which both Italy and Germany showed “problems of economic dislocation..., a deadlock of constitutional government..., a militant Left growing rapidly and threatening to be the chief beneficiary of the crisis, and conservative leaders who refuse[d] to work with even the reformist elements of the left,”³ fascists could be quite useful to conservatives. Only two parties were substantially increasing their votes and membership during the respective crises of Italy (after World War I) and Germany (during the Great Depression): the Socialists/Communists, and the Fascists/Nazis. The liberal and conservative parties had lost support and become feckless. Naturally, then, the conservatives who ran the government appealed to the fascists to help get society under control and prevent a revolution.

What does this prove? It does not prove that fascism is an “agent of *capitalists*,” as some Marxists have maintained, for big businessmen neither created the movement nor trusted it. It does show, though, that to call fascism—as a regime—an “agent of *capitalism*” is not off the mark. Moreover, not only were fascists granted their power by conservatives; once they had come to power, they stabilized capitalism by suppressing trade unions, workers’ rights, and all oppositional movements.⁴ Sternhell might argue that this was mere political expediency, but we have already seen that it follows directly from fascist ideology, from its nationalism, its authoritarianism and its class-collaborationism (all of which features fit well together, as we saw above).

One way that this analysis has been formulated by Marxists is by using the language of “Bonapartism.” This term derives from Marx’s analysis (in *The Eighteenth Brumaire of Louis Napoleon*) of Louis Napoleon’s government in France during the 1850s. Stanley Payne summarizes the theory as follows:

[It explains] how in a situation of sociopolitical fragmentation (“equilibrium of social forces”) a new force might create independent state power that did not rest solely on the interests of one social class, even though in the economic realm it might guarantee the “class interests of the bourgeoisie.” ...Fascism [can be seen] as the product of a political and social crisis in which traditional forms of class domination were no longer effective and in which competing forces canceled each other out, allowing a new form of dictatorship to free itself of class domination.⁵

This is a fairly accurate summary of what happened in Italy and Germany during the years of fascism’s rise to power. Liberal government, to repeat, had become ineffective, essentially deadlocked between the right and the left and various smaller parties. The bourgeoisie had become incapable of running the country.

¹ Paxton, *op. cit.*, 207.

² Daniel Guerin, *Fascism and Big Business* (New York: Pathfinder, 1973), 8.

³ Paxton, *op. cit.*, 105.

⁴ *Ibid.*, 10.

⁵ Payne, *op. cit.*, 446. Needless to say, however accurate the “Bonapartist” label may be, fascism also has many features not shared by mere Bonapartism, for example its advocacy of cultural revolution.

Fortunately for the ruling class, a wildly popular ultra-nationalist party emerged that promised to restore order. Somewhat reluctantly it was given the reins of power, and it proceeded to rule independently of both labor and business, though with a very pro-business agenda.¹ (And, of course, it was much less independent of business than of labor.)—This account is simplified, but it is roughly accurate.

In short, fascism's great success in Germany and Italy is due ultimately to its dual character of being populist-nationalist and being a useful tool for the capitalist class during conditions of social crisis and political deadlock. Its lack of a specific social program tying it to a single class or group—i.e., its character as an “anti-ideological ideology,” an ideology that aims merely for national mobilization and unity-against-outsiders as an end in itself—allows people to see in it whatever they want, be they peasants, urban workers, the middle classes or big businessmen.² This gives it a broader social base than Communism, which appeals specifically to workers. Conversely, the authoritarianism inherent in any kind of ultra-nationalism, especially fascism, makes it a possible ally of conservatives and big capitalists, whose rule over society always has an authoritarian element, an element of force. The two qualities, therefore, are symbiotic: without the first (viz., amorphous populism), the ruling class would have had no reason to co-opt fascism, since the latter would not have had its widespread support among the populace; but without the second (viz., reactionary authoritarianism), fascism would not have been a potential ally of conservatives in the ruling class, which means they would not have offered it political power. Admittedly, the German conservatives, among them Franz von Papen and President Hindenburg, may have made a mistake in empowering Hitler, for he soon brushed them aside and consolidated power in his own hands. But the point is that fascism's dual nature—its populism and its usefulness to the authorities—explains its success, and that when fascism came to fruition it did indeed benefit the capitalist class and the forces of social reaction as a whole.

Perhaps it seems that this analysis contradicts George Mosse's widely accepted thesis that fascism aims for a cultural revolution. The impression is mistaken, though. Mosse is right. What must be emphasized, however, is that the revolution sought by fascists is basically in the service of counterrevolution. Fascists oppose all the progressive, *authentically* “revolutionary” tendencies of modernity, such as social equality, tolerance, inclusive democracy and international integration. In the sphere of culture and politics, these are the quintessentially progressive—revolutionary—trends of the modern world, the properties that distinguish it from the *ancien régime*. In seeking to replace these properties with hierarchy, authoritarianism, a closed national community, racial purity, militarism, in short *hatred of the impure Other*, fascists want to roll back history and recreate culture in the image of a mythical past. The myth of the *past*, of a primordial state of purity that has been lost, is implicit in all variations on the fascist theme, from Hitler's to Phyllis Schlafly's to the radical Muslim's. Indeed, the myth of the nation (or the race, or the religious community) itself is essentially regressive: the nation was born in the mists of early history, and those mists are more or less what the fascist wants to return to. Sorel invoked the heroic age of Greece; Mussolini invoked ancient Rome; all nationalists invoke an age prior to modern “corruption.” Even if individual fascists did not always see themselves as inspired by reaction or the myth of the past, this is the logic of their movement. They oppose the direction in which they perceive that society is evolving (toward “decadence,” etc.); progressives/revolutionaries, by contrast, want to *hasten* social evolution. The logic of their movement hates not only the past but even the myth of the past, preferring the myth of an open-ended, utopian future of universal freedom.—In short, while the fascist utopia can perhaps be called “revolutionary” inasmuch as it is very different from anything that has ever existed, its animating impulse is a counterrevolutionary hatred of the egalitarian and libertarian trends unleashed by the French Revolution.

¹ Cf. Paxton, op. cit., chapter 5.

² It's worth noting that every type of nationalism as such is basically “anti-ideological,” i.e. lacks a “social” content (beyond the proscriptions against immigrants, subversives, racial inferiors, etc.). Fascism is not alone in this respect. What makes it unique is its magnificent use of mass media, its modern propaganda-techniques, its uncompromising and radical nature, and the conditions of its emergence (in advanced European countries).

Nor is this true only of classical fascism. Because it was, so to speak, an anti-ideology, an ideology (and a movement) devoted to national purity rather than any specific social-revolutionary content,¹ it has similarities with a variety of (conservative) movements. Movements or regimes that in many ways differ from classical fascism can be labeled proto-fascist insofar as they are exclusionary, devoted to such concepts as “purity,” national or racial unity and supremacy, xenophobia, and an imposed uniformity on the population. Osama bin Laden’s Islamism is an ideology of “Islamofascism,” a kind of quasi-fascism with an Islamic content; the Ku Klux Klan has a fascist ideology, as does, to a lesser degree, Jerry Fallwell’s Christian movement (Fallwell at least has *some* respect for democracy and the rule of law); even American Progressivism, from the 1890s to 1920 or thereabouts, had latently fascist elements, namely those that emphasized national purity and uniformity. (Some examples are its anti-divorce, anti-alcohol, anti-prostitution, pro-segregation, and Christian fundamentalist provisions—all provisions that emphasized “purity” or “morality.”) Fascists and proto-fascists² are international-democratization’s discontents: they dislike diversity and freedom/equality; many of them dread the erosion of their old ways of life. They want to recreate culture in a particular authoritarian and exclusionary image, to stem the tide of liberalization. The most fanatical among them, for example the Nazis and Mussolini’s Fascists, want to create a “new man,” a pure man, who is not so much a new man as an old one, an old un-liberalized one,³ a man who will accept a social hierarchy in which fascists themselves are at the top. These discontents exist even during normal times, but it is only during social crises and times of political deadlock that they can start mass movements and potentially seize power (or be granted it by sympathetic elites).

We have criticized much of Sternhell’s analysis, but before concluding this paper it is worth noting that, from a different perspective, fascism *can* have similarities to authentically revolutionary movements, movements for freedom and equality. The similarities are superficial, though. For instance, revolutionary movements can have semi-fascist means of organizing, can share the fascist emphasis on hierarchy, militarism, unity, virility, youth, violence, even race. An example is the Black Power movement in America during the 1960s. The Black Panthers were bona fide revolutionaries fighting for freedom and equality, but they exhibited many of the semi-fascist traits just mentioned. For instance, they all wore the same uniforms and thought of themselves as an egalitarian elite while obeying the cult of Huey Newton (the Leader). They staged mass meetings, roused their audiences into a black-nationalist frenzy through belligerent oratory pitting the white man against the black. And yet, despite these seemingly fascist tricks, the Black Panthers were ideologically at the opposite end of the spectrum from classical fascists, nor did they have the same cross-class appeal or even the same racial prejudices. They were not opposed to internationalism, either: in fact, their Maoism proclaimed the unity of oppressed peoples all over the world.

What are we to make of such phenomena, phenomena that seem to blur the lines between progressive-revolutionary movements and fascism? What do they tell us about our subject? In brief, they merely serve as warnings for us to be careful in how we classify and analyze social phenomena, since movements can have surface-similarities while being essentially different. It is absurd to say that Black Power, for example, has anything more than the most superficial resemblances to Fascism: it is the product of totally different social dynamics, different structural forces, different motivations and desires, different

¹ To repeat: millions of people who called themselves fascists, for instance peasants and workers, did hope for a social revolution, which means that *their* “ideology” had a “social content.” But to the extent that it did, it was not purely fascist. The logic of fascism is hostile to social revolution; it aims only for a “national” revolution. Peasants and workers were deceived: they did not fully understand the movement to which they belonged, as was shown by what happened to them when Hitler and Mussolini came to power.

² That is, those who believe in the ideology of fascism, not those who misunderstand the movement and are swept up in it (such as urban workers who think fascism will improve their economic conditions). Nor am I referring here to those people, like hapless petty-bourgeois, who are drawn to fascism simply because it will protect their property from socialist expropriation. I’m talking about the true believers.

³ More precisely, he is a new man inasmuch as he is a technologically savvy, militarily disciplined and selflessly devoted modern mass man; but he is an “old” man inasmuch as he has not been corrupted by modern culture. Culturally he is primitive, heroic, ancient, chivalrous, “moral,” “pure,” a “barbarian” (as Hitler was fond of saying); organizationally, so to speak, he is modern and efficient.

sorts of injustice and economic grievances. However, because it is an oppositional subculture trying to survive within a hostile dominant culture it can, and does, adopt some of the same techniques and rhetorical strategies as fascism did. It could have adopted more, too. It could have gone so far as to model itself, to an extent, on Mussolini's Fascist party—and yet even then it would have remained essentially different from the earlier movement. Its difference is manifested in the fact that its ideology is committed to specific *social* goals, in particular to economic and political equality for black people, while Mussolini's ideology is committed only to the *form* of national unity, hierarchy, militarization.

Given the fascist emphasis on national unity and an authoritarian state—an emphasis that leads, in practice, to a conservative regime, despite fascism's superficially revolutionary nature—it is not ridiculous to say that a number of ostensibly liberal-democratic regimes have fascist characteristics. It is not a mere misuse of language to say that the United States government under George W. Bush had vaguely fascist qualities. One has only to think of Guantanamo, the Patriot Act, the constant fear-mongering, the widespread surveillance, the common accusation of treason against political opponents, the circumventing of due process and constitutional rights, the propagating of enormous, appealing lies or “myths” (like the great fascist myths) to the point at which an entire alternate reality was constructed for the sake of securing the population's submission, and the intense efforts to program the populace to think in terms of good and evil, of purity and impurity, of nation vs. outsiders. This is all semi-fascist. The analogy should not be carried too far, however, since Bush's administration had no Bonapartist quality—it was explicitly in the service of business, so that it was not “free of class domination”—and it did not grow out of any kind of semi-revolutionary mass movement or a crisis of liberal democracy or social chaos.

Nevertheless, the intuitive reasonableness of comparing Bush's presidency to a semi-fascist regime shows just how mistaken Sternhell is in equating fascism to the revolutionary left. The Marxist analysis—qualified and modified as it has been in this paper—is far more defensible, which is probably why it remains the conventional wisdom even after eighty years of revisionism.

*

(There are a few easily fixable inconsistencies. I could have gone into more depth, used more examples, but there was a page limit on the assignment.)

It's insane how independent I am. Humans weren't meant to be this independent. But self-sufficiency has its rewards.

I like the word “rhythm.” It's the most profound word in the English language. It explains everything, applies to everything. Every society has its own *rhythm*; a person's state of mind is determined by the *rhythm* of his life. Certain rhythms resonate with the biological basis of the psyche, others do not. A Mayan refugee said that “there's a different *rhythm* to life in the United States.” The cosmos has its own rhythm, and it is not capitalism's. It's closer to the Mayan's. And music has a rhythm, and the infant lives life according to a rhythm—rhythmical processes—with no self-consciousness, and that's the happiest time of life.

Rhythm is like *Logos*. Pithy. If you look at the word long enough it starts to be something foreign, like Old English, like an upsurge from antiquity and nature itself. Mysterious, ineffable, like the innermost secret of the world, the word a work of philosophy in itself.

English is the only language in the world that writes “I” with a capital letter.

The idea of historical “progress” is indeed a myth. Progress toward equality, toward justice, is certainly not inevitable and, even on the level of millennia (i.e., the glacially slow level), in fact does not exist. There are, however, always certain pressures towards equality and freedom, and in the modern age these pressures are more powerful than ever before. (That isn't saying much.) There are also pressures

against freedom and equality; these are the short-term, *explicitly* powerful pressures. They're the top-down pressures; progressive tendencies are always bottom-up.

Here's another paper. The prof just wanted us to compare a few social movements, but I wanted to do more than that. That's why parts of the paper are not strictly relevant to the paper's stated purpose (which wasn't relevant to the assignment).

The Conditions for Success of Social Movements

It is well-known among historians that hard times do not in themselves create social movements. Modern history is replete with instances of collective hardship that have not generated movements for social change. Often such hardship has the opposite effect: it weakens and demoralizes people, directing their energies into the struggle for survival rather than political reform. However, in exceptional circumstances oppression may indeed spark genuine and sustained movements for change. The question of what these circumstances are is the main subject of this paper. Specifically, I will look at, first, the civil rights movement in Mississippi during the early 1960s, and second, the labor struggles of the Mayans in Morganton, North Carolina in the 1990s. I will compare these two progressive efforts and relate them to the Italian anarchist movement in the Northeast during the early 1900s. The result of this analysis will be a partial understanding of the conditions under which radical social movements form and thrive.

African-Americans in Mississippi had always lived in poverty and fear, from Reconstruction (and before) to the 1950s. They were overwhelmingly agricultural laborers, tenant farmers, and domestics,¹ and the threat of lynchings was always at best hidden, at worst explicit and omnipresent. Any black man who stepped out of line could quite possibly be lynched. Under such brutal repression and in such a backward and isolated region, it was essentially impossible for a civil rights movement to get underway. This circumstance already suggests two major factors that militate against grassroots mobilization for social change: first, violent and unrelenting suppression of freedom and instilling of fear, and second, isolation (usually imposed by geography and/or economic primitiveness) from broader social currents. Where these two factors are present, or even one of them, economic hardship and social injustice will probably not lead to a movement for change, simply because people lack economic, political and psychological resources and indeed tend to have difficulty even imagining a different social order. This is why the peasantry in most societies is naturally inclined towards conservatism and political passivity: it is, in most cases, brutally oppressed, atomized, and isolated from the rest of the world.²

Only when certain "liberating" economic and political developments occurred did the black struggle for civil rights begin. What these changes were need not overly concern us; suffice it to say that the decline of the cotton economy between the 1920s and the 1960s "led to less need to control blacks, either through the near-peonage of sharecropping or through violence."³ Also, (1) the rise of radio and television, (2) industry's increasing investment in the South, and (3) the recruitment of blacks as soldiers in World War II lessened the South's isolation from the rest of the country. Lynchings became less frequent; the region started to open up. Activists in the 1950s established networks all across Mississippi, but it wasn't until the last few years of the decade and the early years of the '60s that the civil rights movement really began in earnest.

One of the most effective organizations in this struggle was the Student Nonviolent Coordinating Committee, or SNCC, which functioned in Mississippi and other Southern states. SNCC, which consisted

¹ Charles M. Payne, *I've Got the Light of Freedom* (Los Angeles: University of California Press, 2007), 16.

² Needless to say, under certain conditions—including a partial, often capitalism-imposed overcoming of its atomization and societal isolation—the peasantry does have revolutionary potential. See Harry E. Vanden, "Marxism and the Peasantry in Latin America: Marginalization or Mobilization?", *Latin American Perspectives*, 9.4 (1982): 74–98.

³ Payne, 19.

mostly of young blacks from within and outside the state, eschewed Martin Luther King's media- and publicity-oriented tactics as well as the reliance on centralized, charismatic leadership that his organization (the Southern Christian Leadership Conference) exhibited. Instead, SNCC heeded Ella Baker's advice to engage with *individuals*, with individuals of all colors and classes. Its focus was on long-term organization, not temporary mobilization for huge marches and protest rallies.¹ Thus, its members would enter a town, establish connections with any older activists (from the 1940s or '50s) who lived there, and proceed, month by month, to talk to as many African-Americans as they could find, be they sharecroppers or farmers or teachers or ministers. They would treat these people not as movement-fodder but as human beings worthy of respect, developing friendships with them, listening to them, slowly earning their trust. The official goal was usually to convince them to register to vote—which involved, for instance, educating them so that they could pass the registration test required by law, as well as simply building up their confidence to face the prejudice and hostility of the town's white registrar (and of the white population as a whole, which of course was none too kind toward blacks who wanted to vote). Unofficially, though, the most important goal was to help the local blacks realize that they themselves could change their lot in life, that they had the potential within themselves to organize their community and fight back against oppression. SNCC basically aspired to be the midwife of an emerging participatory democracy; its members sought to instill a sense of "individual efficacy" in the locals because, as Ella Baker (SNCC's mentor) said, "strong people don't need strong leaders."²

My basic sense of it [said Baker] has always been to get people to understand that in the long run they themselves are the only protection they have against violence or injustice... People have to be made to understand that they cannot look for salvation anywhere but to themselves.³

SNCC, in short, was the very opposite of a top-down organization, the opposite of an NAACP or an SCLC. It relied on the initiative of a few hundred young activists, but equally it relied on the willingness and ability of local people, having been exposed to SNCC's philosophy, to take advantage of their communal networks and organize resistance to racism. Voter registration schools were set up; boycotts were planned; mass meetings were organized. Gradually the old fear and passivity subsided, to be replaced by self-respect and determination.⁴

SNCC's drive to organize the South was highly successful. Indirectly it helped bring about political and legislative change, such as the 1964 Civil Rights Act, partly because the national media was sympathetic to the fight against racism and assisted the movement by documenting white brutality in Mississippi. Directly, though, it empowered people, gave them a new sense of themselves. Some discovered that they were natural leaders and effective public speakers; many discovered inner resources they hadn't known they possessed, reserves of physical courage and psychological endurance. The reason SNCC was successful is that it treated the process of individual growth among poor blacks as having an importance equal to short-term tactical goals⁵—and this, in fact, is precisely what allowed it to achieve these short-term tactical goals, for more and more people got involved as they saw their communities being infused with a new sense of purpose and a participatory democratic spirit.

The movement among Mayan laborers in Morganton, North Carolina had a similar, though less pronounced, effect on its participants. It was of a completely different scale and purpose than SNCC's organizing drive: it consisted of a few hundred Mayans and Mexicans rebelling against inhumane conditions in the Case Farms poultry plant where they worked. In 1995, after years of resentment and two

⁵ Payne, 331.

mini-strikes (in 1991 and 1993), some of the Guatemalan (Mayan) workers abruptly stopped working when a request for a bathroom break was denied by a supervisor.¹ The personnel manager refused to discuss their grievances and even had three workers arrested; a few days later, as a gesture of solidarity with the workers in jail, hundreds of their compatriots went on strike (for four days). Union officials who had heard about the strike came to Morganton to unionize the workers, and within two months the workforce did indeed decide to unionize. For the next six years they would wage an ultimately unsuccessful campaign against Case Farms to win a contract, striking periodically, fighting protracted legal battles, and struggling mightily to retain broad worker support for the union.

Though the workers failed in their long-term objectives, the mere fact that the movement lasted as long as it did calls for an explanation. After all, these were immigrant workers many of whom did not speak English or even Spanish; they were living in a region and working for a company notoriously hostile to unions; and tensions not only between Mexicans and Mayans but even between the various groups of Mayans themselves (some more pro-union than others) surfaced continually. The North American workers at the plant, both black and white, were generally uninvolved in the strikes and did not show much support for union activity. So why and how did these Mayan (and Mexican) workers achieve what they did?

The answer lies in the similarities of their culture to that of SNCC and blacks in Mississippi during the 1960s. Both communities were partly separate from the mainstream American culture, possessing their own group-oriented, democratic traditions. Neither had absorbed the atomized, individualistic ethos of urban America; a philosophy of “mutualism,” of “sticking together,” reigned. Of course, saying so is only to hint at the answer we’re seeking; what matter are the specific social forms and causes of this communal spirit. Even here, the two movements had some things in common: first of all, the dominant culture’s hostility to them on account of their skin-color. In the case of the Mayans the hostility was merely implicit (most of the time), but it nonetheless forced them to “stick together” more than they might have otherwise, thus fostering the social and psychological conditions necessary to sustain a workers’ movement.

A second similarity was the importance of the church to both movements. Religion itself served as a powerful bond between the people, but the local church too could be useful in several ways: first, as providing an integrated community through which propaganda could be disseminated and events could be planned; second, as providing a venue for mass meetings; and third, as providing authority-figures who actively helped the movement. (This was not always the case in Mississippi.) The Mayans were lucky enough to have Father Kenneth Whittington open his church to them and devote its resources to their movement.

Unique to the Mayans was their having emigrated from Guatemala, a country with a troubled history that had taught them “community surviving skills.”² Years of civil war (in the 1980s) had taught them to defend themselves and their rights, and as guerillas or government soldiers they had learned how to organize themselves. The “regional tradition of cooperatives and other forms of community self-help”³ also ensured that the idea of a union was not new to them, was indeed perfectly natural. Communal organizations had already sprung up in Morganton, including an all-Hispanic soccer league and two Hispanic evangelical churches (in addition to Whittington’s St. Charles Catholic Church, which ministered to both whites and Mayans). Leon Fink also notes that “a sophisticated sign of communal organization emerged only weeks before the strike of 1995 with the formation of an Aguacatán burial society.”⁴ Many of the workers still had family in Guatemala to whom they sent money; when one of the Mayans in Morganton died, the burial society would send his body home to be buried. They would also raise money from Mayan communities all over the United States to send to his family for the purposes of burial and other expenses. –All these organizations, all these traditions, all this community self-help and

⁴ *Ibid.*, 73. Aguacatán is a Maya-populated area of Guatemala.

togetherness—notwithstanding linguistic and ethnic divisions—militated in favor of mobilization on behalf of labor rights.

An additional reason why the Morganton labor movement lasted as long as it did is that, like the civil rights struggle in Mississippi, it had a decisive impact on people's sense of self-worth. All successful movements have this effect, and it is partly this that explains their success. Leaders emerged from the ranks of the workers; people invested themselves in a collective project and so expanded their sense of self. "The possibility of change—of tangible improvement and empowerment—in a central aspect of daily life...stirred a host of people to assert themselves in ways they had not done before. For the moment, at least, they [became] leaders."¹ It is true that, as they waited for a contract, year after year, they grew disillusioned with the union and with themselves. Case Farms simply refused to come to an agreement. However, that the movement lasted until 2002, even if in a divided and increasingly despondent state, testifies to the power of the promise of change in the context of a tightly knit and frustrated immigrant community.

The Italian working-class immigrants in the Northeast at the turn of the century were such a community—or rather, they constituted many such communities scattered around cities like New York, Boston, and Philadelphia, and all these communities had ties to each other. These Italians, too, often did not speak English and were discriminated against by the people of their host country. They relied on necessity on each other, and they kept their own neighborhood-wide cultures somewhat separate from the mainstream American culture. Like the Mayans, many of them had emigrated from rural areas. —All these features help explain the similarities that Italian anarchism exhibited to the other two movements we have looked at. There were differences too, but first we'll examine the similarities.

For one thing, anarchism was not a "top-down" movement; it existed wholly on the grassroots level, and it was vibrantly democratic. It amounted, in fact, to an entire culture in itself, a way of life—more so even than the civil rights movement in Mississippi. Italian anarchists had theater groups that performed radical plays and raised money for causes; they attended lectures in rented halls and clubhouses; they "churned out journals and leaflets on makeshift presses";² they had concerts, picnics, dances, and recitals, "imparting a new revolutionary content to [such] customary social activities";³ they established anarchist schools "in which the children, educated in an atmosphere of freedom and spontaneity, would learn about working-class movements and revolutions, as well as how to think and live according to their lights and in harmony with their neighbors"⁴—schools that sound remarkably similar to SNCC's Freedom Schools for black children and teenagers;⁵ anarchists even substituted their own holidays in place of religious and national ones, holidays commemorating such things as the 1886 Haymarket executions and the Paris Commune. So, while the Mayans of necessity had their own alternative culture in Morganton, a culture out of which grew their labor movement, and African-Americans had their own religious and communal traditions in Mississippi out of which grew their civil rights movement (once activists had taken the initial steps), anarchism *was* Italians' alternative culture. It was the guiding light of their cultural activities, the common thread through them, and it had been so since the 1890s.⁶

An even clearer parallel between anarchism and the other two movements is the transformative effect it had on people's self-esteem. An Italian laborer working twelve hours a day in a factory, being mocked and discriminated against by white Americans, living in poverty, might easily find himself succumbing to despair and self-contempt. His participation in anarchist culture, however, with its diverse opportunities for interaction with his compatriots, was an effective antidote to despair and alienation. It was

² Paul Avrich, *Sacco and Vanzetti: The Anarchist Background* (Princeton, New Jersey: Princeton University Press, 1991), 54.

³ Ibid.

⁴ Ibid., 56.

⁵ Payne, *op. cit.*, 302 – 306.

⁶ For descriptions of the anarchist life, see the interviews of Italian anarchists in Paul Avrich, *Anarchist Voices: An Oral History of Anarchism in America* (Princeton: Princeton University Press, 1995), 92–188.

an outlet for *active engagement* in something larger than himself, in a community driven by a purpose. In this respect anarchism may even have been more successful than the civil rights movement, since it was all-encompassing, totally absorbing the community's cultural energies. And it was undoubtedly more "successful" than the Mayans' labor movement, since this existed only among a tiny minority in a small town and never became the basis of their culture.

On the other hand, in many ways anarchism was decidedly less successful than the culture of SNCC, even than the Mayans' labor struggles. First of all, anarchists tended to be extremely doctrinaire, prone to narrow and petty ideological disputes. Followers of one sect were often condemned by another sect as traitors to the anarchist cause, perhaps even agents of the government or of capitalists. As Paul Avrich notes, such sectarianism is "the bane of every ultra-radical movement."¹ It hampers effective coordination of radical activities.

One result of the Italian anarchists' doctrinaire way of thinking was their refusal to engage in any sort of labor organizing or unionizing. They rejected the American labor movement, "disdain[ing] [its] conciliatory measures and [advocacy of] piecemeal economic and social change. Achieving limited improvements, they argued, would only blunt the revolutionary ardor of the workers...and delay the final overthrow of capitalism."² The Italians did not *organize*; they preferred to participate in strikes and demonstrations, since these showed the fundamental incompatibility between capital and labor. This philosophy is precisely the opposite of Ella Baker's: she disliked demonstrations because they did not produce long-term gains.³ And the fate of anarchism shows that her attitude was not without justification: anarchism achieved essentially no long-term gains for the working class; only the labor movement, the tradition of the AFL and the CIO, did that. Even the Mayans of Morganton extracted concessions from Case Farms, such as small pay-raises, due to their willingness to organize and unionize. Anarchists merely got themselves persecuted by the government, deported, and killed.

The anarchist embrace of violence constitutes another difference from SNCC's philosophy. SNCC, like SCLC, was firmly committed to nonviolence, so much so that its members usually refused to fight back when attacked by whites. This certainly helped them sell their cause to the mainstream culture, for Americans saw on their televisions police brutality towards unarmed, peaceful demonstrators. It also harmonized well with the Christian backgrounds of SNCC's activists, and it gave them the motivating consciousness of being noble, Christ-like fighters on behalf of truth and justice. Anarchists, by contrast, skulked around in the shadows building bombs and mailing them to authority-figures or planning assassinations that resulted only in brutal government crackdowns on their activities.

To an extent, the differences between Italian anarchism and the Mississippi civil rights movement can be explained by the differing social environments, namely an urban versus a semi-rural one. The violent, militant, anti-"organized" nature of anarchism, and its aggressive atheism, grew partly out of the fast-paced, atomized, technologically sophisticated nature of urban life, the deadening, machine-like repetition of the working day in factories and the whole industrial environment, the violently *mechanizing* character of dehumanization in a vicious urban context. Also, it seems that most Italian immigrants simply lacked the religiosity of Mississippi blacks (and the Mayans)—or they had it beaten out of them in mines and factories—and this lack made room for their violent radical ideology. More generally, the problems that immigrants faced were different from those of blacks half a century later: it was not discrimination based on the color of their skin that was at issue; it was capitalist dehumanization, a dehumanization more extreme than that of the Mayan poultry-workers. The anarchists were social revolutionaries who sought the violent overthrow of the dominant class; SNCC merely wanted an improvement in race relations, a raising of the status of blacks. The difference in goals, therefore, partly determined the difference in methods.

On a broader scale, though, a telling similarity exists between all three movements we have looked at: none of the people who rebelled had been subject to prolonged indoctrination and atomization by the dominant power-structures. The Italians and Mayans were recent immigrants from rural countries; the

¹ Avrich, *Sacco and Vanzetti*, 52.

² *Ibid.*, 53.

³ Payne, *op. cit.*, 306.

African-Americans lived in a relatively isolated and rural region. Each group still had democratic and communal traditions; none had yet succumbed to resignation or apathy or a materialistic self-centeredness. This was not true of the North American blacks and whites who worked at the Morganton poultry plant: they had grown up in North Carolina and so had been successfully atomized and indoctrinated with anti-union thinking, with the result that the vast majority of them took no part in union activities. Similarly, around the turn of the 20th century it was usually immigrants who became anarchists and revolutionaries—Italians, Russians, Germans, and others. This is because, again, they had not yet been assimilated into the dominant society, had not been subjected from childhood to pervasive American indoctrination but instead retained their own languages, some of their own traditions, and “stuck together” in their immigrant communities separate from mainstream society.

The situation is different now. Corporate power has privatized much of civil society, banished broad swaths of participatory democracy (e.g., labor unions, to which about seven percent of the private-sector workforce now belongs,¹ from a high of 35% in 1953²), and established society-wide structures and individual behavior-patterns of atomized capitalism, thus forcing individuals to rely on their own resources and effectively precluding coordinated mass-movements for foundational social change.³ Civil society itself has been under attack for decades, since a privatized civil society is a contradiction in terms.

It seems from our analysis, then, that radical social movements tend to form and thrive where (1) there is some degree of intolerable oppression but not so much that any manifestation of resistance will meet with instant and savage reprisal; (2) there is some contact with social currents from progressive parts of the world (if, that is, the oppressed people in question live in a backward and isolated region like Mississippi in the 1950s); (3) people are not so atomized—i.e., capitalist power-structures are not so entrenched—that a truly democratic grassroots subculture cannot exist; (4) the oppressed population is either still in a semi-traditional (“communal”) state of mind and behavior⁴ or it comprises urban workers in societies undergoing the initial viciously exploitative stages of industrialization (such as the Italian anarchists and the German workers in Chicago during the 1880s); (5) ideally, (i) sectarianism does not splinter the movement—a phenomenon that occurs most often among social revolutionaries and results from an excessive emphasis on ideology—(ii) secretive, conspiratorial tactics do not become the norm (because such tactics are not effective, can be counterproductive, and foster a spirit of mutual suspicion and sectarianism), and (iii) long-term organizing is not shunned in favor of mass spectacles like demonstrations and speeches, which are arguably not as effective as organizing; and (6) the movement has a transformative effect on individuals’ sense of self, empowering them through their identification with a community mobilized toward the goal of social justice. If it does not have this effect, it will not get very far.

³ Mike Davis, *ibid.*, provides a good history of the corporate offensive up to the 1980s. See Christopher Lasch, *The Culture of Narcissism* (New York: W. W. Norton & Company, 1979) for a thought-provoking analysis of the atomized, “narcissistic” personality that is the product of this entrenchment of corporate interests.

⁴ This is Craig Calhoun’s “radicalism of tradition” thesis (set forth in “The Radicalism of Tradition,” *American Journal of Sociology*, 88.5 (1983)). Examples of it are the Morganton Mayas, the Mississippi blacks, the Farmers Alliance of the late 19th century, the Southern Tenant Farmers Union during the 1930s, the millions of peasant revolutionaries in the Russian and Chinese Revolutions, and most recently the peasant-propelled democratic movements in Latin America that have brought leaders like Evo Morales to power.

genius was inexhaustible. His melodic and semi-tonal genius will never be equaled, it boggles the mind of God.¹ And his spiritual profundity is almost the equal of Bach and Beethoven.

From an article called “Was Schopenhauer an Idealist?”: “...two of the most cherished beliefs of the Enlightenment: faith and reason are or ultimately can be brought into harmony, and reason can justify all the essential truths of morality and religion.” Both beliefs are false (except maybe, in part, the one involving morality). Faith is by definition opposed to reason.² If reason can justify religious beliefs, then they cease to be religious. They become scientific or philosophical. Insofar as they are religious, they are not scientific or “rational.” Morality is not derived from reason either, at least not in the way we want it to be. In itself it isn’t “unreasonable” to want to kill someone or even to do so; killing someone is unreasonable only in the context of other, conflicting values held by the killer.

Lessons from the Civil Rights Movement

The 1960s saw the rise of a number of organizations devoted to black liberation. Some of the most famous include Martin Luther King’s Southern Christian Leadership Conference (SCLC), the Student Nonviolent Coordinating Committee (SNCC), the Congress of Racial Equality (CORE), and the Black Panther Party. The former three were born in the late 1950s or early ’60s, and they operated in the largely rural South; the Black Panther Party was born in the late ’60s, a product of the Black Power movement, and it originated in Oakland, California. Its social and cultural environment, therefore, was quite different from that of SCLC, SNCC and CORE, resulting in such differences as the Panthers’ greater radicalism and espousal of violence (limited violence, only in self-defense). This paper will compare the Panthers to SNCC in the areas of ideology, tactics, structure, and general efficacy. Lastly, the respective causes of the demise of SNCC and the Black Panthers will be examined. The result of this analysis will be a series of lessons for activists.

To get a sense of the Black Panthers’ radicalism, one might look at their Party Platform of 1966. Among the ten points listed are the following: “We want full employment for our people”; “We want an end to the robbery by the white man of our Black community”; “We want decent housing, fit for shelter of human beings”; “We want all black men to be exempt from military service”; “We want freedom for all black men held in federal, state, county and city prisons and jails” (because “they have not received a fair and impartial trial”); “As our major political objective, [we want] a United Nations-supervised plebiscite to be held throughout the black colony in which only black colonial subjects will be allowed to participate, for the purpose of determining the will of black people as to their national destiny.”³ These six provisions already show the fusion of Marxism-Leninism, Maoism and black nationalism that characterized the Panthers’ ideology.

Here is a typical statement from the party, a statement that could have been made by any Bolshevik or Marxist:

As we live in a capitalist environment, the masses of the public are exploited at the hands of a few individuals that control and hold all of this nation’s wealth. More people are waking up to the facts of capitalism’s true nature, and as these people do so, they see that capitalism is the oppressor. Once this is realized these aware segments of our communities then move to further the destruction of this capitalist state. That puts them in opposition to

¹ Take, say, the middle section of the A minor sonata’s third movement. It’s beyond divine. You always think it’s impossible for Schubert to come up with yet *another* astonishing melody, but his mind was a gold-mine.

² The *act* of reasoning involves an act of faith at every step, i.e. an act of freedom, since *every* act has an element of freedom/faith/will. (A *leap* of freedom, a *leap* of faith, a *leap* of will. Using the word ‘leap’ brings out the essential sameness in all three ideas.) But the idea of reason is opposed to the idea of faith/freedom/will.

³ *The Black Panthers Speak*, ed. Philip Foner (New York: Da Capo Press, 1995), 2, 3.

the government, which perpetrates and tries to spread capitalism and imperialism throughout the world.¹

The Panthers had a fairly sophisticated ideology according to which they were a vanguard party that would start the revolution to free African-Americans from oppression under the capitalist system. They were far beyond Malcolm X's crude early position that white people were the devil; the Panthers were willing to cooperate with radical whites, with anyone who would help them stand up for their constitutionally guaranteed rights. At the same time, they celebrated the black cultural heritage, preaching black pride—one means toward which, they thought (following Frantz Fanon), was revolutionary violence. "By fighting back, the black man would assert his dignity as a man," would achieve the rebirth of his personality.² This ideology amounted to an all-encompassing and internally consistent worldview.

SNCC, at least in its early years, was far less ideologically driven—or rather, its ideology was much more "pragmatic" than dogmatic. The organization was formed in 1960 during the student sit-in movement, as a way to harness the energies and coordinate the efforts of the young activists. It was initially funded by SCLC and guided by Ella Baker, an experienced civil-rights activist (who had also been instrumental in founding SCLC). Partly because of Baker's influence and partly because it operated in the rural, Christian South—and most of its members were from the South—SNCC's approach to activism was both nonviolent and deeply *personal, flexible*, based on a willingness to engage sympathetically with every black and white person whom its members encountered. This is evident from its statement of purpose:

We affirm the philosophical or religious ideal of nonviolence as the foundation of our purpose, the presupposition of our faith, and the manner of our action. Nonviolence as it grows from the Judeo-Christian tradition seeks a social order of justice permeated by love... Love is the central motif of nonviolence. Love is the force by which God binds man to himself and man to man. Such love goes to the extreme; it remains loving and forgiving even in the midst of hostility. It matches the capacity of evil to inflict suffering with an even more enduring capacity to absorb evil, all the while persisting in love.³

In its early years, SNCC's members saw nonviolence not just as a tactic but as a way of life, something that should permeate one's entire being. They approached their activism in the spirit of this nonviolence, being open to talk to even the most racist white man and try to convince him of the error of his ways. Medgar Evers, who worked for the NAACP in Mississippi (where SNCC operated) and was something of a hero to activists there, often received hate calls from whites who would curse at him and threaten his life. His wife remembers one call made by a drunken woman "full of talk about niggers and their low morals"; rather than hang up the phone, Evers began a long conversation with the woman and her husband about their racial attitudes, by the end of which "they were almost cordial."⁴ This is a good illustration of SNCC's philosophy: "what underlies the nonviolent attitude is a confidence that your ugliest enemy can change."⁵

SNCC and the Panthers, therefore, had very different ideologies. The former's was Christian, the latter's Marxist. In fact, the differences between the groups are such as to make the task of comparing them seem almost futile. Nevertheless, it is enlightening, as we'll see. Corresponding to their different ideologies were different goals. The Panthers' revolutionary goals are stated above; SNCC initially had less explicitly ambitious aims, less "political" ones. It merely set out to organize people, to coordinate resistance against Mississippi's white power-structure. For the first half of the 1960s its main project was registering black people to vote, which required educating them so that they could pass the registration test required by law,

as well as simply building up their confidence to face the prejudice and hostility of the town's white registrar (and of the white population as a whole, which, of course, was none too kind toward blacks who wanted to vote). Citizenship Schools were organized across the state, schools in which teachers from the same community as their students taught lessons "concentrating on literacy, the state constitution, and local and state government, [as well as] Negro history and community problem-solving, by which they meant boycotts, demonstrations, and the like."¹ One of the purposes of these schools was to train leaders, to discover and foster leadership capacities in ordinary agricultural laborers and domestic servants.

Organizers from SNCC would enter a new town and seek out informal leaders, such as an elderly woman who was well-respected. They would make connections with any older activists from the 1940s or '50s who had established networks of personal contacts across the town or region. They would canvass from door to door to encourage people to take the voting registration test—and also just to develop friendships, to listen and talk to people, to slowly earn their trust. "Canvassers were instructed not to worry about numbers; the idea was to reach individuals, and you did that by returning over and over to the same people."² Organizers also tried to gain the cooperation of local preachers, teachers, grocers and so on. They planned regular mass meetings at churches where local leaders would give speeches motivating the congregation and would lead everyone in song. Music and religion, in fact, were immensely important to the Southern movement. Mass singing worked against the fear that affected everyone, and it encouraged emotional investment in the movement. It also strengthened communal bonds and helped people "develop a sense of involvement and solidarity."³ Religion did the same: it gave believers collective strength and a sense of ultimate vindication in the face of evil. Its influence was incalculable.

Originally SNCC was literally just a coordinating committee, "a group of leaders from decentralized movements," too amorphous even to be called an "organization" per se. In 1961, though, the committee named a permanent staff and developed a more strategic approach to its activities. An executive committee and an advisory board were established; a person was placed in charge of fundraising, another was in charge of voter registration activities, and a third was assigned to direct action.⁴ Some of the new developments made SNCC a (*slightly*) less "democratic" organization than it had been; however, on the ground, so to speak, its original mission continued to inspire all its activities. The mission to which SNCC remained committed was not merely that of registering voters or promoting desegregation in schools and public facilities. On a more fundamental level, the goal was to promote radical democracy, to instill a sense of "individual efficacy"—by means of community-involvement—in poor, oppressed African-Americans. As Ella Baker said, "strong people don't need strong leaders."⁵ Baker distrusted the tradition of mobilizing people for a demonstration, a march or a speech, and then letting them return to their daily lives. Such actions might garner media coverage, but they rarely led to long-term, lasting changes. More productive, she thought, was the tradition of slowly, patiently organizing towns and regions, gradually empowering individuals to make changes themselves rather than wait for leaders to do so for them. Her philosophy paid off: more and more people got involved with the movement as they saw their communities being infused with a new sense of purpose and a participatory democratic spirit. In place of the old fear and resignation was a new, slowly developing self-respect and determination.

The Black Panther Party had nominally similar aims to SNCC's—namely, black self-determination and empowerment, federal and state recognition of blacks' rights—but the substance of these aims was different. The Panthers arose "as a response to police brutality, the failures of Great Society liberalism, and the uneven economic development of the American metropolis."⁶ They originated in Oakland's ghettos, where police brutality and poverty were not offset by such consoling forces as religious traditionalism, a

strong communal support-system, an integration of music into daily life, or the many subtle comforts of slow-paced rural living in the South. Some of SNCC's tactics and goals (specifically the goals of desegregation and voting registration) were not sufficient in the context of Oakland's inner city, where discrimination and endemic black poverty were the real problems. The Panthers had to adopt a more militant stance.

For example, one of the party's early tactics was to "patrol the pigs," to follow police cars through the slums of Oakland and, with the help of guns and a lawbook, defend the rights of anyone who was stopped by the police. The police department was outraged, but soon the brutality and harassment declined, which duly impressed the local community.¹ The Panthers also held rallies, for instance after the killing of a black youth named Denzil Dowell by the police. Hundreds of people showed up for this rally, at which Huey Newton gave such an effective speech that many of the spectators signed up to work for the party that day.² Soon after, the party began printing its own newspaper, *The Black Panther*, thousands of copies of which were distributed to the community.

Huey Newton also knew how to exploit the media. In 1967 the California state legislature debated a gun-control bill that targeted the Panthers; Newton sent thirty members of the party (out of seventy-five or so) to protest the bill in front of the legislature as it was being debated. The press arrived to document these armed black men standing outside the building reading a statement, and the incident was broadcast all over the country. This national recognition eventually led to the establishment of party branches in New York, Detroit, Los Angeles, and other cities.³

Even as they continued defending themselves and their community against police harassment, which increased as the party became more well-known, the Panthers undertook such constructive projects as delivering social services to the poor and teaching classes in black history. 1968 saw the creation of a "free breakfast for schoolchildren program"; in 1969 the Intercommunal Youth Institute and the People's Free Medical Research Health Institute were founded, followed by a free clothing program and, in 1972, a free food program.⁴ They also protested rent evictions, demanded school traffic lights (and won them), and informed welfare recipients of their rights. All these activities not only provided material benefits to the community but also brought about "spiritual and ideological transformations" among their participants and beneficiaries. Like SNCC, the Panthers adhered to an ideology of community self-help and education, although in this case the ultimate goals were the explicitly revolutionary ones that (1) the ghetto free itself from oppression by the white power-structure and achieve democratic, socialistic self-control, and that (2) this little revolution spread to all cities across the nation and finally across the world. Held to these standards, of course, the Panthers were bound to fail.

Nevertheless, in many ways they were remarkably successful. First of all, their longevity itself was a striking achievement, given the FBI's and the Oakland police department's determination to destroy them. Under the aegis of COINTELPRO, the FBI engaged in outright warfare against the party, using such tactics as surveillance, eavesdropping, infiltration, false testimony, and political assassination. The Oakland (and Chicago) police, for their part, "responded to the Panthers with nothing short of guerilla warfare."⁵ The campaign decimated the party's leadership, with Bobby Hutton, Fred Hampton and others being killed, Huey Newton and others being sent to prison, and Eldridge Cleaver being forced into exile. Despite all this, the Panthers lasted in some form until the late 1970s—arguably because they changed their strategy and rhetoric from its earlier militant radicalism to a slightly more moderate, politically acceptable stance. After Newton's release from prison in 1970 they shifted from advocating an immediate national or international revolution to focusing solely on Oakland, bringing about socialistic reform that would make the city a model for others in the country. To do so, the party would not only have to cooperate with the city's liberal white power-structures but would have to come to power itself, which meant that it—or its candidates for

¹ Foner, op. cit., xxviii.

² Ibid.

³ Ibid., xxxi.

⁴ Self, op. cit., 229–231.

⁵ Ibid., 229.

public office—would have to become “respectable.” Bobby Seale and Elaine Brown ran for office in 1973 on a pledge to reform the way the city did business and on the basis of a “massive voter registration and grassroots organizing drive.”¹ Both were “startlingly” successful in their respective races, receiving endorsements from the liberal community and a hefty proportion of the total votes cast, but neither won. Brown ran again in 1975, and in 1977 a respected African-American liberal named Lionel Wilson ran for mayor with the energetic backing of the Panthers and won.

In short, the respective successes of SNCC and the Panthers were prodigious. They can be analyzed on two levels: the level of community-organizing and -uplifting, and the level of political change achieved through their efforts. Between 1960 and 1964, SNCC embodied what Charles Payne calls the “community-organizing” (or bottom-up) tradition, as opposed to the “community-mobilizing” (or top-down) one that the Black Panthers epitomized. Payne summarizes the characteristics of SNCC’s tradition:

[a] developmental perspective, an emphasis on building relationships, respect for collective leadership, for bottom-up change, an expansive sense of how democracy ought to operate in everyday life, an emphasis on building for the long haul, an anti-bureaucratic ethos, a preference for addressing local issues...²

The advantage of this model is that it gives locals maximum input in decisions and actions that will affect them, thus directly empowering them and fulfilling the promise of a participatory democracy. The disadvantage is that the process of change is excruciatingly slow. *Individuals* are transformed, small local communities attain a measure of self-control, but statewide change takes years and years, and nationwide change is probably impossible. For the latter to occur, a significant element of top-down, undemocratic leadership is necessary.

In its early years, as we have seen, SNCC was extremely successful on the level of bottom-up community-organizing, but not until the federal government enacted and enforced its civil rights acts in 1964 and 1965 did the white power-structure and repression in the South really begin to erode on a massive scale. SNCC was indeed instrumental in getting the federal government involved, but that’s largely because, from the sit-ins and Freedom Rides to Freedom Summer in 1964, the national media was there to document what was going on—and even then it was mainly because *whites* were being brutalized and killed that a nationwide culture of change came into being. In other words, local agitation in itself was not sufficient; the top-down, undemocratic, corporate media was an indispensable (albeit perhaps unwitting) “ally” of SNCC. It is always necessary to “get the word out”; and SNCC’s organizing tradition in itself can probably not accomplish that effectively, if only because a sustained and well-coordinated large-scale effort requires a certain amount of centralized, bureaucratic leadership. The people doing the fieldwork in disparate regions of the country have to be directed and coordinated, and the directors have to fundraise and cooperate in manifold ways with the corporate media and the government, which inevitably involves making Faustian bargains—which alienates people in the movement—and so what ends up happening is that the intimate, trusting, cooperative, *local* style of SNCC’s early years gets lost.

By the time the Black Panthers were founded, the freedom movement’s early democratic and local forms had long since given way to a *mobilizing* tradition, a fact that partly explains the Panthers’ adoption of a top-down model of leadership. Also, this model was appropriate to a chaotic, mass-populated urban environment where a movement needs to be disciplined if it is to survive. And so it achieved one of its functions: it revitalized Oakland’s black community, gave it hope, gave it a mission. The Panthers were tremendously exciting and motivating to radicals all over the country, precisely because Newton, Seale and Cleaver were *not* “democratic” but semi-authoritarian, good at making speeches and organizing mass spectacles and laying down the law in the party newspaper. Nor was their only success a boost in morale; they also organized services for the poor, as was mentioned above. They spawned like-minded groups across the country; they had enough of an impact for J. Edgar Hoover to declare them the number one threat

¹ *Ibid.*, 305.

² Payne, *op. cit.*, 364.

to the nation's internal security. Later on, the party played a big role in getting Lionel Wilson elected mayor of Oakland by registering thousands of voters and bussing them to the polls on election day.¹

On the other hand, the party's masculine authoritarianism alienated many of the women involved, from Elaine Brown to low-level functionaries who were not respected by their sexist male superiors.² In fact, this is another way of contrasting the two models of leadership: the bottom-up one is more "feminine," given its emphasis on cooperation, trust, emotional nurturance, friendship, communal participation, *personality*—and all this was true of SNCC's movement, in which women played an unusually active role.³ The top-down model can be called more masculine because of its impersonality, its authoritarianism, its bureaucratism, its atomistic structure. Each model has its place. The former is more individually and communally empowering, more emotionally rewarding, while the latter is perhaps more efficient and "results-oriented," certainly more sustainable in an advanced capitalist society. This is probably one reason why the Panthers lasted in a relatively potent form for at least a decade, whereas SNCC petered out five years or so after its inception, once its democratic, bottom-up structure had begun bursting at the seams.

Consistent with SNCC's personalized structure was its ideology of empathic nonviolence. Both of these features were suited to the semi-rural, Christian social structures in which the organization worked, and both were essential to the movement's success. We have already discussed the empowering nature and trusting atmosphere of SNCC's democratic structure, but equally important was its nonviolence, both because of its effect on the inner life of the activist and because of its positive reflection on the movement in the eyes of the wider world. Media images of civil disobedience being met with violent reprisal were compelling, and they helped push American culture in the direction of liberalism.

The Panthers' advocacy of violence, on the other hand, was somewhat counterproductive in that it delegitimized their struggle in the eyes of mainstream America—although in the ghetto it had the effect of recruiting blacks to the cause (because they were impressed by the Panthers' willingness to stand up for themselves). What this contrast amounts to is that the party's violence had a largely positive effect on morale and recruitment in the ghetto—thereby enabling the party to survive and grow—but a largely negative effect on the effort to bring about substantive political reform, thereby vitiating the party's long-term goals. This is something of a catch-22, but the paradox necessarily grew out of the conflict between the Panthers' urban environment and its need to appeal to broad swaths of the nation's population in order to achieve meaningful change. —The conflict is revealed, for example, in the contrast between Bobby Seale's early radicalism and the later "respectable" political positions he took while running for mayor.

So, a crucial lesson for activists is that in a liberal-democratic society of entrenched capitalism, partaking in violence can only hurt one's cause in the long run. It turns society against the radical cause, and it also gives authorities an excuse to engage in violent repression. Because of the Panthers' espousal of violence, the FBI could claim that it was morally defensible, even necessary, to attack them. If the power-structure is weak or unstable enough that a violent rebellion might be able to overthrow it, then perhaps it is advisable to engage in such violence (as Lenin, Mao and Castro did). In the United States, however, it is not.

More generally, in a late-capitalist liberal democracy any group that advocates social revolution or radical change in socioeconomic structures is doomed to fail or to be brutally repressed, unless the society is experiencing an upheaval comparable in severity to, say, the Great Depression. Otherwise the authorities are simply too powerful, capitalist ideology is too hegemonic, the middle classes are too secure, the masses are too atomized. The early civil rights movement was able (and allowed) to gain the momentum it did because it did not challenge capitalism or liberal ideologies; its aim was merely the extension of liberal rights to a minority that had been denied them. There was nothing in the logic of broader economic and financial movements to oppose such an extension of liberalism: if anything, industry and finance heartily desired it, since in the long run it would lead to greater social stability and more opportunities for

³ Payne, *op. cit.*, 266–276.

investment. Jim Crow had become economically obsolete with the demise of the cotton economy;¹ it was a hindrance now, and moreover tarnished the U.S.'s international image. The national media, therefore, cheered SNCC and SCLC from the sidelines, and Kennedy and Johnson offered at first passive and then active support. Only when Martin Luther King turned his attention to the Vietnam War and the plight of the poor working class did the media turn against him. For *these* were the truly revolutionary issues.

The Black Panthers, then, were too radical. Ultimately this is what doomed them. This is what caused the FBI virtually to destroy them. Activists should learn from their example that reformism is the only option in America today and has been so for a number of decades. Only through slow reform can a new society be born now.

It is strange, therefore, that the Panthers lasted in some form—admittedly a less radical form—until the late '70s, whereas SNCC was falling apart by 1965 or '66. What explains this? Arguably, the explanation is that from the beginning the Panthers had an organizational structure and a “style” (including media savvy) more suited to a modern society than SNCC's was. Once SNCC stood at the head of something like a mass movement—by the end of 1964—its decentralized structure broke down and became fragmented. As SNCC's membership rolls rapidly increased around the time of the Democratic National Convention and afterwards—becoming at the same time more white and middle-class, i.e. more diverse, more reflective of a mass movement—internal tensions started preventing constructive work from being done. Interracial tensions flared up because blacks thought that the new educated white staffers looked down on them or brought unconscious racial prejudices to the organization; an atmosphere of mistrust and envy was propagated as newcomers were given positions of authority and, in any case, the old intimacy was lost; certain movement veterans, like Stokely Carmichael, became celebrities as they traveled around the country giving speeches about black power, which further bruised the egos of their unrecognized coworkers; disappointments at the 1964 DNC in Atlantic City demoralized people, and politics continued thereafter to disillusion some, radicalize others, and generally wreck the *trust* that had once held the group together; debates about the future direction and organization of SNCC became more and more intense after 1964.² James Forman, SNCC's executive director, suggested that “the only way [SNCC] could maintain internal cohesion and unity was to establish a strong centralized executive structure,” but his proposal was rejected.³ Meanwhile the expanding organization became more fragmented, more individualistic, and after 1966 it “simply faded away.” Its members moved on to other projects, such as feminism, Black Power, the anti-war movement, and the fight against poverty.

In retrospect it is clear that when a decentralized, locally semi-autonomous social movement or organization meets mass society, as SNCC did in 1964, the energies unleashed cannot be contained by the movement/organization, which therefore breaks apart. The result can be a fruitful cross-fertilization of movements, but the point is that the decentralized, democratic structure is not durable and does not seem to be the best way of accomplishing large-scale changes. If SNCC was indeed able to do so it was with the help of SCLC, CORE, the NAACP, the media, and the federal government, all of which organizations were relatively undemocratic. The Panthers, in contrast to SNCC, were able to mobilize people and organize social programs for more than ten years, and they maintained a relatively high level of discipline all this time because of their centralized leadership. Unfortunately their radicalism alienated them from the middle classes and provoked repression from the FBI, which reduced the impact they might have had. And as the '70s made way for the conservatism of the '80s and the Tax Revolt which adversely affected inner cities around the country,⁴ the Panthers lost whatever influence they had still had in 1977.

It is also worth noting in this connection that the tradition of mobilizing thousands of people for marches, demonstrations and speeches is perhaps not as unproductive as Ella Baker thought. Especially in a society where *image* is incredibly important, where the media has tremendous influence through its propagation of images and sound-bites, mass spectacles can be powerful means of encouraging change and

¹ See *ibid.*, chapter 1.

² Cf. *ibid.*, chapter 13 and Hogan, *op. cit.*, chapters 10–12.

³ Hogan, *op. cit.*, 200.

⁴ Self, *op. cit.*, 316–327.

sending messages both to communities and to politicians. Barack Obama's successful campaign for the presidency testified to the power of image and spectacle, as well as the efficiency of top-down leadership. His campaign mobilized millions of supporters—they were called his “army” of supporters (and armies, of course, are not democratic)—giving them orders through email and text-messages, and thus won the election. It was the cult of personality, and it worked.

In the end, however, for large-scale change the ideal structure is the one that combines top-down with bottom-up leadership. First of all, this is the most *effective* model: it combines efficiency with semi-democratic and personal participation, which latter quality is necessary in order for movement-workers to feel as if they are valued members of a team and thus have a high morale. They have to feel like their participation matters, like they are not mere bureaucratic cogs. Secondly, this model retains some of the moral appeal of the bottom-up tradition. Fieldworkers should be able, through some mechanism or other, to voice concerns and suggest ideas to the top leadership, because ultimately what is happening “on the ground” is what matters most. If leaders lose touch with the grassroots they not only risk irrelevance; their organization also loses touch with democracy, which is precisely one of the values that progressive organizations are supposed to be committed to.

Luckily, it seems as though many political groups have learned these lessons. For instance, the Public Interest Research Groups, or PIRGs, which exist in many states and advocate for liberal causes, combine a somewhat bottom-up “feel” (for the grassroots workers) with a top-down structure. Doubtless no major organizations are democratic *enough*; all have become far more centralized than decentralized. But, again, for large-scale movements this structure seems inevitable in atomized, “privatized” late capitalist societies.

The tradition of decentralized, local initiative worked well for SNCC as long as the movement was largely isolated from mainstream society, politics and the media. Black communities were able to rely on their own traditional, religious, communal ethos to undertake social change together. In the isolated rural backwaters of modern America their communities were sufficiently small and homogeneous for the essential element of *trust* to hold activists together. But as soon as it became necessary to confront America's great heterogeneous civilization, the local tradition of activism came under attack and finally collapsed. Local activism still exists, however, all across America; “small-scale” activists would do well to study SNCC's achievements for the lessons they yield. For instance, Ella Baker's and Bob Moses's style of leadership will always be on some level the ideal one, namely the undogmatic, flexible, personal, dialogical, “Socratic,” community-empowering (as opposed to community-dominating) style. This is the democratic style. Making personal connections is more important than maintaining ideological purity—that's another lesson from SNCC. Dogmatism only leads to sectarianism and infighting; the important thing is to maintain an expansive democracy. Even national organizations should do so to the extent that they're able. Similarly, extreme radicalism is not advisable since it antagonizes people: the fate of the Black Panthers teaches us that. Hence, violence should not be intentionally used except perhaps in conditions of exceptional social crisis, i.e. when the society is literally falling apart. Things should be open and aboveground, so to speak, not secretive and conspiratorial. (The Panthers understood that: they contrasted their own tactics with those of the Weather Underground.) In general, the attitude that should be fostered is openness and acceptance. But mass, “undemocratic” mobilization can potentially be useful too, if it is not the only or the main tactic.

However, the main lesson that SNCC's legacy—as well as, indirectly, the Panthers'—teaches us is that “democratic patience” is the greatest virtue. The loss of it caused SNCC's downfall, just as its presence made possible the early victories. “It was necessary for people to be persistent and patient with one another. Apparently, this was the single most important lesson that SNCC could not find a way to sustain.”¹ Perhaps future activists will have more success.

*

¹ Hogan, op. cit., 254.

“Ernst Troeltsch’s History of the Philosophy of History,” by Robert Rubanowice.

I love love love reading intellectual histories, so now that summer is here I’m going to read some. First, *Modern Philosophy: Descartes to Kant*, by Etienne Gilson and Thomas Langan (1968). A 500-page tome. I still don’t have the mastery of that era that I’d like.

The human mind, constantly classifying and ordering and associating things to one another. Ceaselessly, unconsciously and consciously, in the very structures of its physical perception as well as in the ways it interprets that perception, the stories it tells itself constantly, explicitly in philosophy and science and implicitly in common sense and ordinary language—just a never-ending *ordering, classifying, naming, a boxing-in* of all the data that come to it into thousands, millions of boxes, some large and some small, and then shunting some aside perhaps for later use while keeping others nearer the front of the mind because of their practicality. The compulsion to *associate*: think of Francis Bacon’s tripartite division of the mind into memory, imagination, and reason, corresponding to his tripartite division of the sciences into history (natural and civil), poetry (narrative, representative, or allusive), and philosophy (divine, natural, or human). Memory = history; imagination = poetry; reason = philosophy. The child’s urge to name, to associate, to make connections, to make everything *neat*, so as to gain power [over its experience, etc.]. The child’s mind is the philosopher’s.

Bacon was wrong that induction is the proper method of science—that one simply observes, classifies “without presuppositions,” then extrapolates regularities and laws from these observations, then further reduces these to more general laws, and so on—but his mistake was virtually inevitable in one who was reacting against the scholastic tradition. Scholasticism placed far too much emphasis on sterile rationalism, deduction-spinning, concept-spinning without regard for experience; Bacon proselytized for an empiricist philosophy. It would have been contrary to the dialectical tendencies of historical and mental evolution for Bacon to have put forward a model akin to the modern deductive-nomological one, since this one is not as far removed from scholastic rationalism as his empiricism was. Affirmation, negation, negation of the negation. That’s the natural trajectory of the mind and behavior, whether in an individual’s or in society’s history. Why? Because the mind operates through the positing of contrasts, through differentiation. The ubiquity of “binary oppositions” (e.g., light/dark, good/bad) is essentially related to the dialectic: the *oppositions* manifest the mind’s nature in a static, conceptual, atemporal way, while the *dialectic* manifests the mind’s nature in a dynamic, temporal way. And the reason why the negation of the negation often seems to take the form of a synthesis of the two earlier stages is that the mind remembers or retains them both and hence cannot just return to the initial stage but has to effect a reconciliation. Both stages are false in their own way; but since they are opposites, the only direction to go is toward the middle.

Posted an ad on Craigslist; some nutsos and illiterates replied to it, but then I heard from a 23-year-old female Harvard philosophy grad student who loves classical music, plays the harp and likes doing outdoorsy things (as do I).

If I’d been accepted [to Ph.D. programs in philosophy], I could have been studying philosophy at Harvard when I was 23, like this girl. Could have been taking courses on Continental philosophy, gotten a Masters, maybe a Ph.D., which would have led to who knows what. Korea never would have happened. Life is absurd.

Thomas Hobbes’s crude reduction of life to mechanics, machinery, “the motion of limbs,” has a contemporary parallel in Daniel Dennett’s stupid reduction of the mind to a lot of software programs or whatever.

Descartes wanted “to provide science with a notion of matter in which nothing would resist a purely mechanical explanation. In this sense, the main object of the six *Meditations* is to establish that matter is nothing but geometrical extension, motion itself being a mere mode of extension.” (“In science proper, this resulted in a mechanicism without dynamics.”) Matter = extension. Interesting. As I wrote months ago, Newton rejected that, or anyway he rejected mechanicism and thus, according to Chomsky, made the idea of matter incoherent. (Action at a distance! That damned action-at-a-distance!)

Descartes had left his followers a very grave problem to solve: If mind and body are really distinct, how can they unite to form the substantial unity of man? More generally, if no immaterial elements such as forms are included in the structure of physical beings, how can there be any communication between these two radically separated substances, extension and thought? To these two problems, a third one was soon to be added. According to Descartes, mind and body are really distinct because they can be conceived apart, but if the same principle is applied to any two substances, since they can be conceived apart, it will become difficult to imagine how one of them can communicate with any other one. This difficulty became known as the problem of the “communication of substances.”

And so the adventure began, the centuries-long quest to come to terms with Cartesianism. Some philosophers would call it a misadventure, a sort of philosophical detour. I don’t entirely agree: I think Descartes articulated dualisms that had been obscurely implicit in philosophy for millennia, and eventually we were going to have to settle accounts with these dualisms. Every major culture obscurely recognizes dualisms between mind and body, inner and outer, spirit and matter, subjectivity and objectivity, etc. Descartes simply formulated them with unusual clarity.

He also did a philosophical service by clearing the way for skepticism, for instance through his first rule of method, that “one should accept in judgments nothing more than what is presented to the mind so clearly and distinctly that there is no occasion to doubt it.” An “immediate consequence” of this is that “we must never attribute to any thing what is not clearly and distinctly included in its notion.” It’s easy to see how these rules could lead to Hume’s skepticism.

For Cartesians, clear and distinct ideas are the most simple elements of thought, from which all knowledge can be derived *a priori* by way of deductive rules. One version of rationalism. We’ll see this principle being followed by Spinoza and Leibniz.

“*All we know are our own representations*, and of these, only our ideas can be considered true and objective. Descartes has shown that only our clear and distinct ideas possess internal grounds for being held as representative of something; as for all the other affections in the soul, all the confused representations, be they sensations, dreams, imaginings...they surely exist in the soul, but what possible ground is there for affirming that they reveal something true about things lying outside consciousness?” Cartesian skepticism, ancient skepticism.

Said more concisely, the question—or one of them—is how we can know anything outside ourselves if we immediately know only ourselves. Descartes invokes God’s perfect nature: he wouldn’t *deceive* us, would he?! Malebranche relies on the Bible: it says there that things exist in an extended world, so, well, they must thus exist. The Bible doesn’t lie, after all. In fact, we don’t see bodies in themselves at all; when I see a book I am really just having the “idea” of extension presented to my spirit in a particular and sensory way by means of the “movement” of the impression (or “sentiment”) of color. It is the universal and objective idea of extension which allows me to see something; only by participating in, or (as I would say) instantiating, the “idea”¹ of extension are things perceivable. And this idea, an aspect of universal Reason, has been given to us by God and is a part of him. Thus, the things we see in the world have a dual nature: they are particular (this is the bare sensory impression or “sentiment”) but they also participate in the divine idea, as do we—without which participation they could not have the element of objectivity and universality, of *truth*, that allows other people to see them in the way I do. —All this is rather Kantian. It also paves the way for Spinoza’s pantheism, especially when you add Malebranche’s occasionalism (which is sort of implicit in this analysis; see the next paragraph).

Anyway, it’s clear then that Malebranche’s answer to the question above isn’t as simplistic as Descartes’s. It involves (1) God’s being the cause of the “movements of knowledge and feeling in my soul” (part of which causation is precisely our possession of universal Reason, our participation in the divine idea), (2) the Bible’s revelation that objects actually do exist, and (3) the conclusion that God must be

¹ The term “idea” is unfortunate, since what Malebranche really means is surely something like “structure,” or “perceptual structure” (to psychologize it and put it in modern terminology).

arranging things in these objects in the ways that appear to me (through sensations, etc.), because, after all, he's causing movements in my soul, so it only makes sense that he would cause corresponding movements in the objects. This is the doctrine of occasionalism. One way to express it is: "My body and my spirit are distinct and cannot interact. But God, author of the movements of both, can, as part of the economy of creation, move my body and my spirit simultaneously so that the movements of the one will correspond perfectly with the affections of the other." In fact, substances in nature that seem to interact causally don't really do so: God coordinates them in such a way that the relation of cause and effect *appears* to hold between them.

Whatever. I'll pass over the confusions. From all this it's also easy to see Berkeley's idealism just around the corner. If we have no contact with objects in themselves, we might as well jettison the whole idea of them! We don't need them.

Here's a rather obvious resolution of Zeno's paradox I hadn't considered: "The difficulty 'How can one cross an infinite number of points in a finite time?' results from an illusion. Since both time and space are divisible to infinity, we actually cross an infinite number of parts of space in an infinite number of parts of time, which is not absurd." Actually, this isn't quite the same thing as the paradox of Achilles and the tortoise.

Pascal, forerunner of Kierkegaard and existentialism. He was the first great modern philosopher to really understand Christianity; Kierkegaard was the second.

Spinoza resolves some of the Cartesian problems by declaring that there is only one substance. So there is no problem of communication between mind and matter, because thought and extension are simply two attributes of the same substance. And there is no problem of communication between substances in nature because every thing is a mode of one universal substance. Here's a passage from the internet on Spinoza's notion of substance:

For Spinoza, there is only one substance, the existence of which is demonstrated by a version of the ontological argument, which is thought of as being both God and Nature. It is an unending controversy whether Spinoza was a pantheist, or an atheist who called nature 'God' because it was the one true substance and existed necessarily. Everything else is a mode of this one substance. The view is analogous to a claim that the universe is space-time as a whole, with matter as distortions in it. If this were true, material objects would be modes of space-time. The analogy would be more exact if one also thought of the laws of nature as equivalent to the divine intellect immanent in nature. Spinoza's view [stresses the following two definitions of 'substance': (1) "being ontologically basic—substances are the things from which everything else is made or by which it is metaphysically sustained; (2) being, at least compared to other things, relatively independent and durable, and, perhaps, absolutely so."] Nothing but the universe as a whole meets these criteria fully.

Spinoza has always fascinated me, perhaps, on some level, more than any other thinker (except *possibly* Kant and Hegel). He challenges me: I barely understand him at all. But I always feel as though his philosophy is unfathomably deep, as though Truth is buried in it somewhere. He's like a European Buddha-Philosopher.

On the other hand, I often think he's the victim of conceptual confusions.

"Leibniz shared Descartes's idealist vocation and mathematicist prejudices: he set out in the search of Truth in the fair form of a philosophy that would proceed deductively from clear and distinct principles supposed somehow to enfold in their logical expression the very fountainhead of Being itself. ... Leibniz's philosophy demands that everything be understood in terms of the 'first truths.'" And the most important first truth is the principle of identity, from which he constructs his entire philosophy. *A is A*. "Identity is that exact coincidence of subject with predicate which alone is absolutely necessary. Identity, necessity, the absolute—these are three ways of expressing the same reality; they are the properties of the clear and distinct truth." To know absolutely—"clearly and distinctly"—is to know what *has* to be, and what has to

be is the principle of identity. It has to be because it is its own ground: a judgment of identity needs no more explanation.

“Leibniz made an important addition to Cartesian lore when he decided he had discovered why a truly clear and distinct idea is something divine, an absolute criterion by which the reality and intelligibility of all things are to be measured. This is because a clear and distinct idea has to be a judgment of identity, and a judgment of identity answers perfectly the question of ‘sufficient reason’: it is its own explanation because what it announces is simply one with itself. The judgment of identity manifests the ultimate, the divine reality, because it states with perfect simplicity that the subject is what it is. Ultimately, every true judgment then must be reducible to a judgment of identity, if it is true, if what it states is real, for that is just what it means to be *real, to be one with oneself perfectly*.” Every true judgment has to be reducible to a tautology. The only reason there seem to be contingent truths for us is that we don’t know enough, we aren’t God. But if we were God we would see the *reason* for the connection between, for example, gold and its color yellow, which would make the judgment “gold is yellow” (or some such one) necessary, an expression of gold’s identity with itself. –All this reminds me of Kripke’s *Naming and Necessity*.

“To know something necessarily—i.e., absolutely—is to know its *reason* for existing; to know its reason for existing is to know the thing in its essence, so that the essential connection of all the predicates...is reducible to an essential expression of what the thing itself is.”

From this source [writes Leibniz] springs immediately the received axiom that nothing is without a reason, or that no effect is without a cause. Otherwise there might be a truth which could not be proved *a priori*, or which would not be resolved into identical truths; but that is contrary to the nature of truth, which is always, either expressly or implicitly, identical.

The authors comment: “No more dramatic reduction of the order of being to the order of logic can be imagined. The ‘cause’ of anything is its ‘reason,’ i.e., its essential intelligibility—the fact that its entire destiny can be reduced to a logical whole...” At any rate, if every truth can be proved *a priori*, everything is necessary. This was Spinoza’s conclusion too, but his reasoning was different. Leibniz even agrees with him about the ultimate “sufficient reason” for everything, the reason “why there is something rather than nothing”: it has to be a self-caused substance (otherwise there would be an infinite regress of external causes), a substance which causes itself and everything else. And what is this self-caused substance? Why, God, of course! God encompasses the world, and every thing in process that we see has its place in the unity of the totality, “the necessity and reality of which is evident *to any finite mind that has been led to discover within itself the ultimate sense of its own innate ideas*. We shall see that this is the key to Leibniz’s conception of how we should live our lives.” Let me take a wild guess: it has a lot in common with Spinoza’s conception, i.e. with the conception of every philosopher in history (except Nietzsche and some Christians).

Time and space are not real, he argues. They are relations of “extrinsic denomination,” whatever that means, due only to the limitations of our finite point of view.

As for the problem of the mind/body dualism—which generalizes to that of how *any* two particular substances can interact (which interaction would entail something passing over from one into the other, which is inconceivable because “it would violate the unity and integrity of each and leave them other than they are”)—Leibniz introduces his famous doctrine of pre-established harmony. Strictly speaking, there is no such thing as causation; what appears to be causation is in fact *concomitance*. God has arranged it from the beginning so that everything that happens in the mind corresponds to everything that happens in the body. –Um, I’m sorry dude, but Spinoza wins on this one. First of all, he anticipated my position, my emergentism, and secondly, his notion of a universal substance obviated the need to have recourse to any such absurd idea as occasionalism or pre-established harmony.

So, for Leibniz, every substance is a little world closed in upon itself. For it to open out onto other substances is both unnecessary (because of pre-established harmony) and impossible (because of the self-sufficient nature of substance). This Leibnizian atomism is different from the materialistic atomism of the ancients and others in that it rejects mechanistic efficient causation in favor of pre-established harmony:

each monad reflects all the others in a sort of ‘spiritual’ way. Thus Leibniz also rejects Descartes’s division of the world into the mechanical-material sphere and the spiritual, ‘alive’ sphere. –I’ve never understood the monads. The life of each one—(yes, monads have a “life,” because among the substances they all reflect are macrocosmic living ones like humans and plants)—consists in some degree of *perception* and *appetition*. “The monad as representative of the whole universe is *perceptive*, while the monad considered as an individual realizing itself in a unified way is *appetitive*.” Okay. That makes about as much sense as any of this.¹

Leibniz discovered the unconscious. Yes. He understood that we are not conscious of the majority of representations in our mind. All monads, all substances—simple (atoms) and complex (e.g., plants)—have perceptions, according to Leibniz, but most are dim, unconscious; only a *fraction* of *human* perceptions are truly conscious. Remember Nietzsche’s tribute to Leibniz in *The Gay Science*? “...*Leibniz’s* incomparable insight that has been vindicated not only against Descartes but also against everyone who had philosophized before him—that consciousness is merely an *accidens* of the power of representation and *not* its necessary and essential attribute...”

Interesting observation: “The ‘Copernican revolution’ begins not with Kant, but with Descartes.” In a way, that seems obviously true. Descartes’s emphasis on consciousness, on the subject, on innate ideas, etc. Consciousness was no longer dependent on experience; experience depended on the structure of consciousness. Kant really just brought the “revolution” to its highest point. –But no, Kant’s revolution consisted in “putting man in his place,” by drawing the boundaries of reason. Man can’t have absolute knowledge. This is fundamentally contrary to Descartes. Cartesian rationalism—which, in a way, is also Kant’s—shouldn’t really be called a Copernican revolution; it’s more of a Ptolemaic counterrevolution, since it puts man at the center of the world, or at least of *his* world. Kant accepts this Cartesian innovation while adding his own properly Copernican element, his humbling of man.

Hitherto I hadn’t known much about Christian Wolff besides the fact that Karl Marx had contempt for him, saying that he was basically Germany’s Bentham. And so indeed he was. The same shallow, derivative, prolific tediousness.

The Cambridge Platonists. (Middle of the 1600s.) Anti-Puritans. Love, generosity, faith, humility, hope. The Neo-Platonic spirit (they’d all read Plotinus): “the emphasis on the unity of reality radiating downward from the highest principle; the suggestion that one should turn inward to find the presence in us of that highest principle;² the union of the practical and theoretical lives...” A Platonic opposition to Bacon’s and Hobbes’s materialism. They condemn the attempt to derive the higher from the lower—soul from matter, idea from material sensation, life from mechanism. Impossible! they say. Instead, they turn materialism upside down: there is spirit in everything, a world-soul that directs everything. (Cf. Leibniz’s rejection of Descartes’s mechanistic materialism. Spiritual, living monads.) Needless to say, they didn’t have much influence.

With Locke begins the modern tradition of criticism, or critical epistemology (which eventually morphed into the philosophy of language and, on the continent, phenomenology), the tradition that opposes the construction of great metaphysical edifices towering above reality. Locke, Berkeley, Hume, Kant, Nietzsche, Husserl, the analytic philosophers, and on up to the present day. On the other side are Malebranche, Spinoza, Leibniz, Hegel, Schelling, Schopenhauer. (Descartes sort of straddles both.) But Locke, true to the spirit of jolly old England, rebels against the immense Baroque rationalistic deductions from first principles;³ he wants simply to look at the human understanding clearly and unpretentiously, analyze it to see how it works, where its ideas come from, and what exactly we can know.

First, of course, he rejects the idealists’ clear and distinct innate ideas. His arguments are easily refuted by Leibniz—with respect to the innate part, not the clear and distinct part. Anyway, you already know what empiricism is: the *tabula rasa*, the sensations, the complex ideas built up out of sensations, and

¹ Actually, it does make *some* sense. If you translate these old metaphysical philosophies into modern scientific language, they’re sort of understandable.

² Cf. the Hindu doctrine of Atman and Brahman. Also, of course, Augustine, Malebranche, et al.

³ There’s a notable similarity of spirit in Baroque architecture, painting, music, sculpture, and philosophy.

so on. Locke says that all our ideas come from either sensation or inner reflection. He divides ideas into simple and complex. The simple ones include (1) atomistic sense-data (such as the feel of cold when you touch an ice-cube), (2) atomistic reflections on the mind's own operations, (3) "qualities discovered through the cooperation of several senses, and (4) ideas derived from a cooperation of sense and reflection." Examples of (3) are extension, figure, rest and motion, qualities called "primary." (The Cartesians claimed that these qualities are actually innate ideas in us; that's why they apply to all our experiences of objects.) Category (4) includes existence, unity, power, succession, pleasure and pain. These qualities are "suggested" by everything we perceive within us and outside us.

Then the mind *combines, compares, and separates* the simple ideas to form complex ones, which fall into the three categories of *substances, modes, and relations*. The idea of substance is invented by the imagination to give body to the accustomed "going constantly together" of a number of simple ideas. "Not imagining how these simple ideas can subsist by themselves, we accustom ourselves to suppose some *substratum* wherein they do subsist, and from which they do result, which therefore we call *substance*." Hume essentially borrows his account from Locke.

Locke argues that we cannot know the real essences of things, because no complex idea fabricated out of the atoms of sensation, discrete and external, could ever actually be the thing itself.

As for causation, Locke argues that it is only through the inner experience of causing our own acts that we have a clear grasp of the principle and can apply it to the external world. "The simple ideas we have of bodies, derived from sensation, yield no experience of bodily motion actually beginning." All we can see from sensation is that bodies have the power to receive change, as when a billiard ball strikes another; we never actually see the beginning of a series of changes. Bodies have the passive power of being able to receive change, but do they have an active power? Well, in our inner life we encounter the active power of the will. We then apply the principle to external causation, attributing to bodies a comparable active power. You can see here the direction in which Hume will take this analysis: he'll "jump on the suggestion that cause is traceable to mental conditions and suggest that it is merely the imagination's way of structuring experience." You can also see the potential for a rationalist analysis, according to which the mind furnishes "objectively valid" ideas from which experience is constructed.

Descartes's explanation of personal identity is in terms of the spiritual substance. Locke rejects substance dualism—he even suggests that man *could* be nothing but matter endowed with the power of thinking, although he decides that *probably* thought is immaterial—so he has to come up with a different explanation of personal identity. He finds it in memory: identity extends as far as memory does.

The main purpose of Locke's *magnum opus* is to inquire into the nature of knowledge. It isn't to be found on the level of the ideas taken in isolation, but in the perception of connections between them. He anticipates the transcendental idealists in pointing to the assembling activity of the spirit as that which gives rise to knowledge. This is sort of ironic. "Locke's psychologism is father to the more fundamental transcendentalism of Kant." Locke even admits there is a lot which the human mind is incapable of understanding, for instance matter, motion, and mind itself. This, too, is distinctly un-empiricistic of him.

True knowledge, in the full sense of the word, begins only with the complex ideas, but the simple ideas are valid as far as they go, since they just represent what they represent. They can't be "wrong." Complex ideas Locke divides into mathematical and moral ones, and those relating to natural substances. Ideas in the first category (math/morals)—or, rather, propositions made from these ideas—don't refer to real objects but only to the ideas themselves, or to their mutual compatibility. So, in a way, mathematical and moral truths are true of concrete things too, simply because the latter, in not being denoted by the former, cannot contradict them. "It doesn't matter whether there really is any such thing as an equilateral triangle in the world; the principles concerning equilateral triangles will be true." Again, Locke is close to rationalism. The same applies to moral truths: if it's true in speculation that murder deserves death, then it's true with respect to a concrete act of murder. (Locke doesn't really explain how it's possible that complex ideas do manage to have an applicability to reality.)

Locke didn't like Descartes's deductive physics, preferring a physics of experimentation. "Science shouldn't try to meddle with the archetypes of material substances, [since they] lie without us and cannot be known in themselves." Our only contact with them is through the simple ideas, which may, after all,

differ from them. Therefore, “sciences must of necessity be experimental and stop looking for absolute knowledge.” In this respect, Locke is a skeptic.

Locke’s vision of the science of the future has proved in one essential respect far more exact than the Cartesian prediction: Science is to be a never-ending, by nature never-satisfied quest, its conclusions always tenuous, always subject to revision as experimentation advances and experimental tools improve. Yet science can be said to acquire some truths “once and for all.” Only the realistic position, which admits the possibility of a grasp of certain truth short of a perfect knowledge of being, can explain the actual evolution of a science that is neither deductive nor absolutely uncertain.

Yup.

In some ways Locke is rather Cartesian, for instance in his “anchoring our knowledge of existence in an internal intuition of our own being, completely divorced from any embarrassing questions about the existence and nature of other things.” He also deductively demonstrates that God must exist: something must have created being (which I know exists from my own internal intuition), and this something is God. Lastly, he even argues that sensation does, in the end, give us knowledge adequate to practical pursuits. It isn’t certain enough to found an objectively valid science, but it serves practical purposes well.

As for political philosophy: there is a natural law grounded in the will of God. The best way to approximate this natural law in societies is for government to enforce the preservation of life and property and allow people to pursue happiness. Private property grows out of the natural right of self-determination with regard to life and happiness. “What man fundamentally possesses is his own person and his own labor. In the process of acquiring what he needs, he works on the things of the earth, transforming them, mixing his labor with them, and therefore making them in some way his own.” Hence the right of private property. Locke also invokes the state of nature and the social contract in the predictable ways. The main difference from Hobbes is that the people remain the ultimate possessors of power: if the government abuses its power, going beyond the mere assurance of preservation of property (which is not for its own sake—contrary to modern-day “liberals”—but for the sake of liberty and happiness), its legitimacy is forfeit, power reverts to the people, and revolution becomes just.

Newton was tremendously influential not only in science but in philosophy. In achieving the perfect marriage between the *a priori* and the *a posteriori*, he influenced everyone from the *philosophes* to David Hume to Kant. He proved that the proper scientific method is as follows:

From empirical observation of phenomena one rises by induction to principles expressive of the general nature of the relationships involved. Then, through the medium of a mathematical formulation of these relationships, one deduces the results one should obtain when applying these formulae to the gross phenomena of the planetary system. Whereupon one returns to empirical observation to verify the conclusions, i.e. to see if the planets showed up where they should if everything really works as projected.

“Newton is [also] one of the fathers of the favorite eighteenth-century proof for the existence of a watchmaker to explain the wonderful clockwork of the universe.”

“Out of the collisions of spiritualism and materialism, innatism and empiricism, was generated the need, if solutions to these problems were ever to be found, to plunge deeper into the workings of the human soul. And indeed the eighteenth century is the century of *psychology*.”

Damn it, I really wish my professors had done more to mentor me in philosophy, at least guided me a little. They should have given me reading lists, advised that I read histories of philosophy first and then the classics. None of them put even the slightest thought into guiding me, despite their acknowledgement of my talent. There was at best benign neglect and at worst outright hostility to my pretensions to independent thought.

I could have sought assistance, yes, but I guess I didn't think I needed it. I did periodically ask for suggestions on what to read.

Almost a decade ago I took a few notes on Berkeley and Hume, but I was philosophically naïve (because untutored) back then. I won't spend much time on them now, though; I'm already well-acquainted with them. Berkeley: occasionalism. We mustn't mistake the connections in nature for causes. Ideas (which are the "objects" we perceive) can't be causes; they're inert. Only spirit, mind, has causative power. Berkeley's half-opposition to the atomism of the empiricist tradition was somewhat influential during the Enlightenment. (He stressed that the senses depend on each other, involve each other in their operations.)

Hume brings atomistic empiricism to its logical conclusions. Actually, the rationalists too, except Spinoza, were atomists, but "the inherently disintegrating nature of Hume's theory of sensation was kept in check and amply compensated in the Cartesians by the marvelous unification given the world by an infinite God. Remember how Malebranche's God could coordinate a world the individual pieces of which never could touch one another. Or think of Leibniz's miraculously harmonized clocks, so carefully kept parallel by the divine Clockmaker, who can establish them to run simultaneously without any causal connection between them." It's the old problem of the communication of substances. Given the Cartesian assumptions about matter's being extension and extension's not implying motion but only mobility, etc.—so that things can't actively move each other—if God is taken out of the picture as the source of all motion, Hume's theory of causation, based on *impressions* and the role of the imagination, becomes inevitable. (?) "The whole problem is translated into a quest for principles governing the 'association of ideas.'" Hume identifies three principles: resemblance, contiguity in time and place, and cause and effect.

Hume's discussion of the imagination is rather complicated. I'll just try to summarize what he says about causation. Cause-and-effect is a relation between things that are *contiguous* and that are related *successively*, so that the cause always precedes the effect. Hume argues that if they weren't successive, that "if one cause were co-temporary with its effect, and this effect with *its* effect, and so on, 'tis plain there would be no such thing as succession, and all objects must be co-existent." So it would seem, but I'm not sure. If I push an object, the cause appears to be simultaneous with the effect. But that does seem illogical somehow. On the other hand, if a cause is temporally prior then there must be a temporal gap between it and its effect, which is patently illogical. Or is that statement mere sophistry? Maybe there doesn't have to be a temporal gap. So is the cause "infinitesimally" prior to the effect? That just seems silly. Besides, the cause will still have ceased to act before the effect occurs, which raises the question of why the effect occurred! —Reason is inadequate to analyze causation.

Contiguity, succession, what else? *Necessary connection*.

Two objects may be contiguous and one may precede the other in time without their being considered related to one another as cause and effect. For this relationship to be in force, there must be some connection, considered in some way necessary, between the two impressions. What grounds this supposed necessity? We find a prime example of belief in causal necessity immortalized in the principle, presumed intuitively certain, that whatever begins to exist must have a cause. But is this principle really *necessary*; is it, as claimed, intuitively certain? Actually, the imagination can perfectly well separate the notion "beginning to exist" from the notion "having a cause." "The separation of the idea of a cause from that of a beginning in existence is plainly possible for the imagination; and consequently the actual separation of these objects is so far possible that it implies no contradiction nor absurdity; and is therefore incapable of being refuted by any reasoning from mere ideas; without which 'tis impossible to demonstrate the necessity of a cause."

After disposing of ideal necessary connections, Hume proposes that the basis for belief in causal connections is merely experience. But we can't be justified in drawing conclusions on the basis of past experience; there's no necessary reason to think that a given event will always follow another given event. "Reason can *never* show us the connexion of one object with another, tho' aided by past experience, and

the observation of their constant conjunction in all past instances.” Hence Hume’s skepticism (or one aspect of it). And the problem of induction. “The conjunction of one impression with another...can never justify the least leap beyond experience and beyond time. Science is thus reduced by empiricism, and by all those who substitute a dust of sensory impressions for the living whole of our real experience, to a play of ideas devoid of existential significance the moment it strays beyond the limits of concrete sensible verification.” The author is right to criticize empiricism in this way, but reason itself is a culprit too. Kant’s point was that reason mustn’t overstep its bounds: on the basis of pure *reason*, the necessity and the relation itself of cause and effect are inexplicable. Kant’s solution is that our minds are structured as they are below the level of conceptual reasoning, which gets all muddled and twisted in knots when it questions its foundations (among which is the principle of cause and effect). But he has in common with Hume a skepticism about how things are in themselves.

In general, Hume wants to deflate the pretensions of reason, demolish traditional metaphysics, point to the importance of *habit* in how we think, emphasize the self’s “embodiment,” show that reason is not as strictly objective or absolute as the Cartesians thought. Like his predecessors and Kant, he argues that the *imagination*, which associates ideas and makes connections between them, is essentially what constructs the world for us. (Again, irony. The difference between the old empiricists and rationalists is that the former basically think it all has to do with learning from experience, through habit or whatever, while the latter think it’s innate. But they both accept that the mind plays some role in structuring experience.¹) So, for Hume, it’s the imagination that makes us think objects exist externally to us, and which gives rise to our belief in personal identity or a spiritual substance, and which persuades us of the necessity of causation. His predecessors didn’t emphasize imagination to this extent.

Hume is agnostic with respect to the debate between realism and idealism. Reason cannot adjudicate between them because there are valid arguments for both positions.

His ideas on morality were as perceptive as his ideas on everything else. You know by now that what he thinks about values is similar to what I think. An emphasis on subjectivism, etc. Following in the footsteps of Hutcheson.

Condillac, like Hume, wants to study human knowledge in order to know how it operates and thus avoid error. He argues that good philosophical systems are possible only if they start from observed facts. The bad ones are “abstract” or excessively deductive. He criticizes them on a number of general grounds, but one of his specific dislikes is the belief in innate ideas. Instead, he upholds sensation as the source of our ideas. Essentially his goal is to correct and complete Locke’s philosophy. Locke had accepted that intellect was distinct from sense; it simply got all its material from sensation. But Condillac wants to get rid of intellect as a separate faculty altogether, claiming that it is merely *transformed sensation*. Sensations, he argues against the Cartesians, are in themselves clear and distinct, and they show unproblematically that an external world exists. Unconscious sensations (or perceptions) do not exist; Leibniz’s notion of *petites perceptions* makes no sense, for unperceived perceptions are a contradiction in terms. (Cf. Sartre.) The mind, lacking reason and intellect, is wholly passive. Etc. The *Stanford Encyclopedia* summarizes: “Condillac was the chief exponent of a radically empiricist account of the workings of the mind that has since come to be referred to as ‘sensationism.’ Whereas John Locke’s empiricism followed upon a rejection of innate principles and innate ideas, Condillac went further and rejected innate abilities as well. On his version of empiricism, experience not only provides us with ‘ideas’ or the raw materials for knowledge, it also teaches us how to focus attention, remember, imagine, abstract, judge, and reason. It forms our desires and teaches us what to will.” Etc. Condillac was a precursor of associationism.

“The properly philosophical reaction to the movement represented by Locke, and partially at least caused by him, assumed a twofold form. First, there was what is now called the Scottish School of Common Sense. Its founder was Thomas Reid and he remains its greatest name. The other form of reaction borrowed

¹ Actually, it seems as though empiricists suffer from a tension between believing the mind is passive and believing it’s active. The rationalists accept its element of passiveness, but they can better account for the ways in which even the *empiricists* acknowledge it is active, i.e., they can do so without falling victim to a certain sloppiness of thinking.

its inspiration from the classics of modern Christian philosophy; it was initiated in Savoia by the now unjustly forgotten Cardinal Gerdil.”

Reid was awoken from his dogmatic slumber by reading Hume’s masterpiece: he decided that Hume’s skepticism was the logical conclusion not only of Locke’s philosophy but of Descartes’s doctrine that *the immediate objects of man’s knowledge are his ideas*. If you start from this premise, you’re bound to get Berkeley and Hume, i.e. skepticism. The remedy, then, is to deny the premise. As he bluntly states, “No solid proof has ever been advanced of the existence of ideas.” Wow! Talk about boldness! Actually, by ‘ideas’ he only means them as they are conceived by Cartesians and Lockeans. The authors’ discussion of him isn’t as clear as I’d like, but what is clear is that his doctrine anticipates Kant’s in some respects: for example, he disagrees with the Cartesian and Lockean doctrine that the mind is confronted with simple apprehensions containing no conceptual content which it then compares and connects and makes judgments about. Judgments cannot be separated from our immediate perceptions (or, according to the authors, sensations).¹ Sensations implicitly refer to objects in an external world; it isn’t that we simply make an illegitimate *conclusion* that there are such objects, as Berkeley thinks. We cannot help judging, *in the very act of our perception*, that objects and substances and causes etc. exist. Reid anticipates both G. E. Moore and Wittgenstein, and he’s more profound than the former:

If I say that a sensation exists [as the authors paraphrase him], I understand myself; but if you want me to say that there is an agreement between my idea of any sensation and that of existence, I find myself confused... [Wittgenstein.] “It is no less a part of the human constitution to believe the present existence of our sensations, and to believe the past existence of what we remember, than it is to believe that twice two make four... To reason against any kind of these sorts of evidence is absurd; nay, to reason for them is absurd. [Wittgenstein.] They are first principles; and such fall not within the province of reason but of common sense.”

Such original judgments [argues Reid] are therefore a part of that furniture which nature has given to the human understanding... They are a part of our constitution, and all the discoveries of our reason are founded upon them. They make up what is called *the common sense of mankind*; and what is manifestly contrary to any of those first principles is what we call *absurd*... A remarkable deviation from them arising from a disorder is what we call *lunacy*; as when a man believes that he is made of glass. When a man suffers himself to be reasoned out of the principles of common sense by metaphysical arguments, we may call this *metaphysical lunacy*; which differs from the other species of the distemper in this, that it is not continued, but intermittent; it is apt to seize the patient in solitary and speculative moments; but when he enters into society common sense recovers her authority...

He wants to show the fly the way out of the fly-bottle. He even refers to philosophers as patients! Awesome!

The obvious difference of all this from Kant is that Reid takes sensations at face-value: he accepts that the external world “really is” as it seems, whereas Kant considers this conclusion unwarranted. In fact, Reid would judge that not only Kant but all contemporary scientific realists suffer from “metaphysical lunacy.” And he’d be right, in a sense. But that doesn’t mean *we’re wrong*.

Again, ironically, Reid does have something in common with Descartes: his rationalism.

Diderot: atheist and materialist. A self-organizing world of matter, governed by chance. He started from Condillac, who said that there is no autonomous reason or intellect in the soul, only sensations and

¹ Reid distinguishes “*impression*, a change caused in a *passive* subject by the operation of an external cause; *sensation*, an *act* of the mind that can be distinguished from all others by this, ‘that it has no object distinct from the act itself’; *perception* ‘is most properly applied to the evidence which we have of external objects by our senses.’” I’d have to read his works to get a clear grasp of these distinctions.

their offshoots. But if the soul is essentially sensations and shadows of sensations, then why not get rid of the soul altogether in favor of the body? Sensations are simply modifications in the body. There is no reason or intellect, only bodily sensations which become “ideas” that are then associated in various ways, a process we call reasoning. Diderot’s interlocutor objects that feeling is incompatible with matter, but Diderot rejoins, “How do you know that sensibility is incompatible with matter, since you know neither what matter is nor what sensibility is?” In fact, it may be that every piece of matter in the universe has sensations. (Leibniz.)

D’Holbach:

He reduced all phenomena, physical and moral alike, to matter and motion, motion being held to be an essential property of matter. A strict determinism prevails everywhere. [But that statement is misleading: d’Holbach wasn’t as deterministic as Hobbes, nor as “materialistic.” He thought that humans are matter with certain peculiar properties not shared by most material things.] D’Holbach wrote a number of violently anti-religious works, directed against revealed religions in general but particularly against Christianity and priests. All religions are harmful; priests should everywhere be replaced by physicians. The doctrine aims at founding a new system of ethics which consists in identifying with pleasure the fundamental motive of human actions; societies should be organized in such a way that it be the interest of each and every individual to act for the greater benefit of the social body. [From the *Stanford Encyclopedia*: “Ethics on Holbach’s account amounts to enlightened self-interest, vice to a failure to recognize the means to one’s interest, and moral rules to hypothetical imperatives which dictate the means to happiness or self-preservation.” Ayn Rand.] It is the business of the state to see to it that personal interest and morality coincide. The moral problem must therefore be solved by the political power; a non-religious education should train future citizens to act for the benefit of all... [He has a social contract theory of society, and he agrees with Locke about revolution etc.]

Sheer Bentham. Helvetius:

[Similar to d’Holbach.] What is personal to him is, if not the notion itself, this being common to all the Encyclopedists, at least the all-importance he attaches to the idea of education. All men are made alike by nature, yet they are all different. What causes these differences? Education. On the part of the educated, the basis for education is attention; attention itself depends on interest and on passion, which are always bound with the quest of pleasure and the avoidance of pain. On the strength of these principles, it should be possible for education to mold men after a common pattern, abolishing the individual inequalities and training everyone to delight in actions beneficial to the common good of society. Virtuous actions are such as contribute to the welfare of the country; education will have achieved its end if it places children in surroundings that will determine in them the kind of passions from which virtuous actions inevitably flow... [The main thesis of his speculative philosophy is that] “*physical sensibility* and *memory* are the productive causes of all our *ideas*, and that all our *false judgments* are effects of either our *passions* or of our *ignorance*.” At the psychological level, the doctrine is a rehash of Condillac: “all judgment is but sensation,” “judging is feeling.”

“In the field of philosophy, all the Encyclopedists inclined toward an associationist conception of the human mind, a materialist notion of the human soul, and, with notable hesitations, toward a materialistic interpretation of nature and societies.” But of course most of them were deists, and some were far less hostile toward Christianity than others.

Vico impresses me. The *Stanford Encyclopedia* has a good article on him. He was a deeper thinker than most of the other Enlightenment figures.

Montesquieu. Environmental determinist: different laws are appropriate to different peoples, because they have different climates, different customs, etc. And differences between nations are explained by differences between their environments. Governments are either republican (democratic or aristocratic), monarchical, or despotic. A despotism = no other law but that of the tyrant, while a monarchy = a ruler following fixed and established laws. Montesquieu analyzes each of the governmental forms in great detail. He is “among the greatest philosophers of liberalism”; he’s the one who expounded the doctrine of the separation of executive, legislative and judicial powers. From the *Stanford Encyclopedia*:

Certain arrangements make it easier for the three powers to check one another. Montesquieu argues that the legislative power alone should have the power to tax, since it can then deprive the executive of funding if the latter attempts to impose its will arbitrarily. Likewise, the executive power should have the right to veto acts of the legislature, and the legislature should be composed of two houses, each of which can prevent acts of the other from becoming law. The judiciary should be independent of both the legislature and the executive, and should restrict itself to applying the laws to particular cases in a fixed and consistent manner, so that “the judicial power, so terrible to mankind, ... becomes, as it were, invisible,” and people “fear the office, but not the magistrate.”

James Madison had read his Montesquieu.

Condorcet, the prophet of progress. In this respect, the logical conclusion of one of the trends of the Enlightenment.

Kant: metaphysics tries to go beyond experience—it tries to apply the “categories” beyond experience—which is illegitimate. It results in endless arguments that go nowhere because they can’t be tested. Newtonian physics works: it can be tested. Metaphysics doesn’t. Cf. the position of the logical positivists.

Kant was confronted with this spectacle: on the one hand, Hume utterly undermining the possibility of forming from experience a valid principle of being; and on the other, Leibniz blandly assuring that all judgments can be reduced to a judgment of identity, that there exists a sufficient reason for everything (unknown to us, of course; but how reassuring merely to know that such a reason exists and that everything has to be just as it is, and, *as it is*, is perfectly *rational!*) Hume and Leibniz are violent extremes. Kant will seek to find a way between them.

He overcomes “the embarrassment of empiricism—its lack of a credible theory of abstraction [i.e., of abstracting from sensations essential and accidental forms] and consequently its failure to explain universality and necessity—...and subsumes Hume’s theory of association into a ‘transcendental’ explanation: the strand of necessity is not mere habit but is rooted in the very nature of the sensibility (and the understanding) as such.” Yep. Or, to speak in modern language, it’s rooted in the biological structures of human cognition.

Descartes was wrong to substantialize the *cogito*, for “the notion of substance is not supposed to be itself the subject of an intuition but only to serve as a unifying function.” One doesn’t directly intuit a substance; one merely applies the concept to the sensory data one intuit. On the other hand, it may after all be the case that a soul, a spiritual substance, exists outside the realm of appearances. “Neither the materialist nor the spiritualist philosophies are right in asserting, respectively, that there is no soul or that there is a substantial soul, for neither has a legitimate basis for making such assertions. The soul remains an idea of which it is impossible to know whether it exists or not; in any event, reason is led to it necessarily, and there is nothing that suggests that it is impossible for it to exist.” That’s true—except I don’t see how reason is led to it *necessarily*. Same with the idea of God.

A good summary:

The sixteenth century had witnessed the end of a philosophical age—not just that of scholasticism—rather, it was really the end of the age of Greek philosophy. All the technical material used by the Christian philosophers and theologians, from Augustine to Marsilio Ficino, had been dug out of Plato, Aristotle, and Plotinus. The earlier sixteenth-century philosophers had turned to Epicureanism, to Stoicism, and to Greek skepticism; that is, they were still living on the philosophical heritage bequeathed by antiquity...

The birth of modern science was the decisive factor in the rise of modern philosophy. The scientific sterility of Aristotle's logical method contrasted unfavorably with the extraordinary fecundity of the new methods developed by Copernicus, Galileo, and Kepler. In consequence, philosophy underwent a twofold change. First, it detached itself from theology because, under its scholastic form, it had become entangled with the now-abandoned Aristotelian physics; secondly, it asked from the newly founded or reformed sciences of nature new methods of philosophical investigation similar to their own.

“Owing to John Locke, Baconian empiricism was to become the driving force of the eighteenth century as visibly as the mathematicism of Descartes had been the dominant influence in the philosophy of the seventeenth.”

I'm bored with being bored with being bored.

Reading A. J. Ayer's *Philosophy in the Twentieth Century*. “The stumbling-block for [an empiricist] is the development of the ‘pure’ sciences of logic and mathematics, which seem to possess a security which sensory observation could not bestow on them. One way of dealing with it has been to deny them this security by making the difference between them and the propositions of the natural sciences at most a difference of degree, so that they too are open to revision in the light of further experience.” This is what Quine tried in his famous paper on the “Two Dogmas of Empiricism,” which I argued against in one of my papers. (The analytic/synthetic distinction has some validity. And the distinction between logical or mathematical propositions and synthetic [I think I meant *a posteriori*] ones is totally valid.¹)

The problem of free will amounts to the problem that there are two ways of describing people's actions: that which involves the self, its desires and reasons, and that which treats the person not as a self but as a sort of machine. From the inside, one *chooses* one's acts; the *self's desires* and *reasons* are what explain behavior. From the outside, scientifically as it were, it's theoretically possible to explain behavior without essential reference to the self. Or, if there is such a reference, as in sociology and psychoanalysis, the point is that it treats the self not as autonomous but as formed by hundreds of influences.² And with biology you don't even have to refer to the self at all; you just talk about stimulus and response, chemicals and electrical impulses. So, the problem is really that there are two levels of reality, the first-personal and, in the final analysis, the deterministic. There seems no way to reconcile these two levels: they're absolutely opposed. Each is the negation of the other. And yet each exists! *I am free*, that's indisputable. (I'm freely

¹ Recall that in my paper I distinguished between analytic propositions, which rely on conventions of meaning, and logical or mathematical truths, which have to do with *form*, not conventions of meaning. Previous philosophers, I said, have been confused: many seem to have thought that logical truths themselves should be called analytic, but that's wrong. (Is it?) Actually (I said), it's self-evidently wrong: analytic propositions are *defined* as those that can be reduced to logical truths by virtue of their meanings. But then logical truths themselves are “primitive,” not analytic. ‘A is A’ and ‘2 + 2 = 4’ are neither analytic nor synthetic; they're simply...based on *identity*, not on relations of synonymy and so forth. (Actually, they're not quite the same: the second one includes an element of cognitive synthesis, unlike the first. But both involve the relation of identity and have nothing to do with conventions of meaning.) Synthetic *a priori* propositions, like those of “pure natural science,” are another category.

² Or maybe these disciplines have no relation at all to the problem of free will and determinism. They treat of phenomena that are sort of ‘between’ the two extremes, implying neither freedom nor determinism. –How confusing all this is!

moving my fingers right now.) But *I am determined*, that's nearly indisputable too. (I'm an assemblage of cells interacting in such a way that these fingers are caused to move in the ways they're moving.)

So the free will problem is sort of a restatement of the mind-body problem. Two kinds of reality; the question is how they relate.

I'm autonomous, the master of myself and my acts. But beneath my apparent autonomy is its negation. This is an extreme case of the appearance/reality problem, the problem of how there can be an "essence" we don't have "access" to.

Why do I keep thinking, though, that the question of free will vs. determinism borders on being a pseudo-problem? Because it's hard to formulate clearly? Because it's hard to know what the stakes are? Or have I somehow misunderstood it?

Incompatibilism has to be right on some level: there's an incompatibility between my radically indeterministic consciousness and the deterministic nature of those neural processes on which my consciousness supervenes. The fact that free will doesn't make much conceptual sense has little relevance, since *intuitively* it is self-evident.

Excerpted from an email I sent Aniela tonight:

Hi! I wish you were here, I'm feeling strangely mellow and melancholy tonight. I'd like to hold you and just fall asleep in your arms. Tired... Want to write a poem but I've lost the talent. I'm too old, too dried-up. Listening to Zeppelin's "The Rain Song." Good song.

How did the wedding go? [...] I really have no idea why I feel so sad and alone now, I had a great day. But I'm just very very glad I know you and can think of you, it makes me feel like I finally sort of belong in this world or have a home. I don't think you know how important you are to me! You're definitely one of the best things that's ever happened to me. As Stevie Wonder said in "I Believe," "I'm so glad that I found someone to believe in again..."

And then I cried. A singular event.

The term 'synthetic *a priori*' is ambiguous. In philosophical jargon, 'synthetic' is opposed to 'analytic' and thus denotes propositions that are not true solely by virtue of their meanings but instead have empirical content. 'Every event must have a cause' is synthetic¹—and, Kant would say, *a priori*, since it is justified independently of experience. [I.e., it *has* to be true.] In another sense, though, 'synthetic' can mean simply that which is synthesized by the mind, by our innate cognitive structures. In this sense, '2 + 2 = 4' can be called (misleadingly) synthetic *a priori*, since our assent to it depends on our cognitive faculty of mathematical synthesis. But philosophically speaking, the proposition should perhaps be called analytic in that it's true by virtue of its meaning. [*Not* by virtue of linguistic or social 'conventions,' though, as the definition of 'bachelor' is.]

Anyway, the philosophy conference on the early rationalists and empiricists was—the epitome of nerdiness. What a sheltered world philosophers live in! Any outsider hearing the lectures would have been like "Somebody please waterboard me or give me a gun, please." The rationalist lectures were the worst—

¹ [Well, be careful. I suspect that all this talk about 'analytic vs. synthetic' is confused or imprecise. 'Having been caused' is surely implicitly part of our understanding of 'event,' and thus, perhaps, part of its meaning. (Or maybe that doesn't follow?) If so, the statement above is analytic. But the nature of its analyticity is different from 'A bachelor is an unmarried adult male,' in that it expresses an aspect of our innate cognitive structure, so to speak. Anything that happens -- i.e., an event -- *has to be* caused, we think. Its being caused is 'part of' its happening. Linguistic conventions have nothing to do with our understanding of this, which pertains to the framework of causality that we bring to experience. Anyway, 'Every event must have a cause' points to the substantive empirical fact that anything that happens (in our experience) is caused by something else. That's why I said it's synthetic.]

the trafficking in the abstractest of abstract concepts like, apropos of Spinoza, “What is the nature of ideas of ideas? Are they conscious, does it make sense to attribute consciousness to ideas, or is it rather that *we* are conscious *through* ideas?”—and substance, form, souls as the forms of body, yada yada. Concepts piled on concepts, a shitheap of concepts, no one apparently having a clearer idea than I of their meanings since occasionally a question would be asked that cut through the infinite details and everyone would laugh, like “Yeah, what in God’s name is all this Aristotelian crap about forms, what does he *mean*?!” When it comes to philosophy, you have to draw a line somewhere. It’s fine to think about the idea of form or substance to see if it can be useful, but to discuss and discuss for hours—or years—on the basis of concepts you neither question nor understand because they’re more abstract than even such notions as space and time is perverse. The lecture on British empiricism was a breath of fresh air after Leibniz and Spinoza—though that’s not saying much. And yet the people were quite friendly and, of course, brilliant in their own hard-to-take-seriously ways.

I met Ashley today, another black girl from Craigslist, effervescent. Got along well. Will see her again soon. Several other Craigslist girls I’ll meet this week or next (I sifted through the pile and found the intelligent ones).

No more of Ayer’s book. Reading it isn’t a productive activity. Instead, volume 2 of Scott Soames’s *Philosophical Analysis in the Twentieth Century*, a detailed discussion of analytic philosophy from the late Wittgenstein to Kripke.

June

“One of the themes of the *Investigations* is that terms like ‘think’ and ‘understand,’ which appear to refer to private mental events or processes, should really be understood as standing for complex behavioral and social dispositions, standardly including dispositions to use language.” Stated like that, the thesis is wrong. It’s not *either/or*. As I’ve noted in the past, it’s *both*. And that’s the paradox. Understanding and thinking consist partly in a private mental state and partly in behavior. My understanding of a math problem consists both in my conscious state—the ‘click’ of understanding—and in my successful completion of the problem. (Chomsky might disagree with that—or he’d add, probably rightly, that ultimately understanding in this case has to do with the correct application of unconscious computational rules. But this additional element surely doesn’t apply to *all* cases of understanding.)

The older I get, the less I care about philosophy. And not only philosophy. If I belonged to a community of minds, that might not be true.

I’m worried about my future. Very worried.

Excruciating aimlessness.

Back in St. Louis I criticized some of Wittgenstein’s conclusions—or those of his commentators—with respect to rule-following. I was reminded of what I wrote when reading Soames’s summary a moment ago: “In [sections 82 to 85 of the *Investigations*], Wittgenstein is telling us that our use of words and other symbols is not always guided by rules; sometimes it is simply automatic.” But this automatic quality (I wrote) is precisely how we know we’re following a rule! We may not be able to say what the rule is—it may be something like an unconscious computation or whatever, à la Chomsky—but skepticism about rule-following certainly isn’t justified by our so-called “blindness” when following the rules of language. And Soames is wrong to say that “sometimes” our use of words and symbols is automatic; rather, it is *always*, or at least *almost always*, more or less automatic. And that’s because we’re being guided by our unconscious cognitive structures and internalizations. We have no choice in the matter.¹ Soames continues: “Moreover, even when we do have a rule in mind that we are attempting to follow, the rule itself is something that, in principle, might be subject to different interpretations. As a matter of simple empirical fact, our interpretations are often instinctive and unthinking, in the way that our interpretation of a directional sign

¹ It’s astonishing to me that professional philosophers haven’t understood this fact, or its implications.

with a finger pointing in one direction is. But even if, in some cases, our interpretation of one rule requires another rule to guide us, at some point the appeal to rules to interpret symbols has to give out, and we will find ourselves using words without thinking. These are cases in which we use words without following rules at all.” No! We don’t have to be explicitly conscious of the exact rule in question in order to be following one. In fact, it’s precisely in those moments when we’re *not* conscious of what we’re doing that our rule-following is most perfect and complete. As Nietzsche said, animals operate more perfectly, the less conscious they are.

It’s obvious but it’s often forgotten: when you feel bad about yourself or your situation or your not having accomplished everything you wanted to, remind yourself that it could be a lot worse. That helps. It seizes my mind sometimes that I could already have done much more with my life if my circumstances had been different or if I’d willed myself to, but then I tell myself: I could have done a lot *less* too.

Wittgenstein is arguing that the referentialist theory of meaning is wrong: a word’s meaning cannot simply be some object to which it refers. (But he also opposes Russell’s descriptivism.) The private language argument is a special case of his broader argument: the meaning of an expression cannot consist simply in the (kind of) private sensation it stands for. In order for the word to have meaning, there has to be a public or independent criterion for determining whether it is used correctly. But if its use is entirely private, then whatever *seems* right to the user *is* right, which means that there is no real criterion for its correct use. —But as I said a long time ago, all this was anticipated by Hegel. A language of “sensuous certainty” is not a genuine language, because in order for there to be communication there has to be conceptual mediation. An unmediated language would consist in brute sounds “referring” to the immediately present: even the expressions ‘here,’ ‘now,’ ‘this’ are not “brute” enough. So, strictly speaking, the meaning of any word in a natural language, even a name, cannot be *exhausted* in an object to which it refers, because then it is not implicitly being related to other concepts. Saussure said it too: linguistic meaning consists in *differentiation* between concepts. Such differentiation(s)—i.e., concepts themselves—are precisely the “rules” one is following when using language. Kant said it: a concept is essentially a rule. The rule of its use, and thus the criterion for its correct use, is implicit in the concept itself, which means that any speaker who fully understands the concept understands how to use it. It’s superfluous to seek the criterion for correct use in the linguistic community’s agreement with the speaker’s use (and this is what Wittgenstein does; he insists that others be able to verify that the speaker has used the word correctly), because each language-user is *his own community*. He is his own other; he has internalized other people’s reactions to him, and this is how he is able to use language. G. H. Mead said it. People take the role of the other when they speak, implicitly anticipating the other’s reactions to their words; hence their ability to judge at every single moment whether they are using words correctly. Language presupposes both conceptual and interpersonal mediation (differentiation) in one consciousness.

Speaking loosely, we might say that the meaning of the name ‘Saul Kripke’ is its referent, the man, or that the meaning of ‘pain’ is a private sensation, but, strictly speaking, the intentional act of positing a reference-relation when using the word isn’t that which solely gives it its meaning. It derives its meaningfulness from its place in the conceptual and interpersonal universe that exists in one’s head and in one’s society. (Kripke’s “rigid designator” theory meets Frege’s descriptivist theory, his sense–reference distinction. [?])

So, on one weak interpretation at least, Wittgenstein’s private language argument is right, as are many of his ideas about linguistic meaning. To say that a word’s or a sentence’s meaning is just its reference is misleading if you don’t also say that its *meaningfulness* comes from its relations to other expressions, from rules that govern its use, and so on.

—All this is probably meaningless to you if you haven’t read Soames’s book.

Soames effectively argues against Strawson’s performative theory of truth, according to which “To say that a statement is true is not to describe it, to attribute a property to it, or to make any statement about it; instead it is to perform the speech act of endorsing, conceding, or confirming it.” In his arguments, Soames also effectively “endorses” or “confirms” what I wrote in the long footnote about Austin in my

paper on ontology. By the way, while I hate rereading anything I've written, I have to admit that it's refreshing to peruse my philosophical writings after reading those of an analytic philosopher. What breeziness and confidence there is in my writing! What wit, irreverence, ambitiousness, lack of regard for stale conventions! Some of my old papers are quite funny.

The millennia-long debate about radical skepticism about the external world can never be conclusively settled. There are two ways of thinking about consciousness: either consciousness is in the world, or the world exists only in [or for] consciousness. In the final analysis, there is no way of adjudicating definitively between these positions. Common sense and the 'Other-oriented' nature of experience tell us that consciousness is in the world, that there is an external, mind-independent world (and it's the one we perceive); on the other hand, this external world is represented in [or to] consciousness and that is the only way we know of it. Everything we know is in consciousness. So why postulate an external world? Any number of reasons can be thought of, but ultimately none can do away with the fact that, from one perspective, everything we experience *by definition* exists, for us, only in [or 'as apprehended by'] our consciousness. So you have skepticism (Berkeleyan or a milder form) and you have realism, and you adopt one view or the other on the basis of a "Gestalt-switch." In one moment I'm a skeptic or an idealist; in the next I switch my perspective and I'm a realist. Neither perspective can be definitively established or refuted because consciousness cannot step outside itself to see whether there is in fact an external world (or whether the world-in-itself 'looks' like the world we see). So we're stuck with the Gestalt-switches.

Here's a clearer way of saying it: you can think of the objects in (or of) your perceptions as being either just sensory [or perceptual] appearances with no "depth" or full-fledged, independent objects. Ordinarily we think of them as the latter, but through a Gestalt-switch you can adopt the former perspective. And nothing can prove it wrong. In fact, science basically confirms it. But on the level of common sense, Wittgenstein and Austin are right that it's senseless to question ordinary objects or knowledge or to talk about "evidence" for the existence of objects; only when you step back into the skeptic's Gestalt can you start asking these questions.

Complete, Berkeleyan skepticism [i.e., idealism] is silly—though it can't be *proven* false—but other forms of skepticism are not.

It's remarkable how confused philosophers get when discussing this subject. Consider Moore's famous argument that skepticism can't be true because if it were then I wouldn't have hands—because hands are external objects—but I do have hands, so skepticism must be false. This is the sort of thing you'd expect from some homeless bum on the street. If you told him about skepticism he'd look at you blankly and say, "What do you mean?! I have hands, don't I?! So obviously there are external objects!" The famousness of Moore's argument in itself strips philosophers of whatever dignity they thought they had. The whole point is that hands are *in consciousness* [i.e., apprehended by it]—we're aware of them through consciousness, and so to that extent they're "in" it. They can be thought of as mere perceptual appearances, not independent physical objects. For all we know—however unlikely it is—these appearances might be posited by consciousness in such a way that it tricks itself into thinking they have independent existence. And if in some sense hands do exist even when they're not being perceived, who knows what they 'look like' in themselves! They could be [they are] colorless, they could be mostly empty space within and between atoms, who the hell knows! The nervous system creates its experience with the help of sensory data, and it manipulates the data in so many ways that there's little reason to think the world as we perceive it has much in common with the world in itself.

Nothing is more comical than a philosopher.

Suppose a person both accepted a Malcolm-style linguistic account of *red* [according to which the word *red* has to apply to certain objects in order to be meaningful], and was willing to grant that he knew that his use of the word was meaningful. It is hard to see how such a person could then coherently deny that he knew that at one time his word correctly applied to certain things. Rather, such a person should be willing to say, *Since I know that*

my word 'red' is meaningful, and since I know that this could not be so unless there had been red things to which it correctly applied, I know that there have been red objects.

Um, no one is denying that there are red objects. The skeptic's claim is only that these objects don't (or might not) have independent [mind-external] existence. *Of course* there are red objects, you moron! I can see them right now. But do they exist independently? I don't know. Surely not *as the red objects we perceive*. [The world-in-itself is what physics says it is, not what we perceive.]

...One example of this general sort that was actually discussed during the ordinary language period we are studying involves a skeptical claim arising from the observation that what modern physics tells us about the ordinary objects around us is sometimes at variance with what we previously believed. For example, we have learned that familiar material objects, which appear solid, are made up of many tiny atoms at some distance from one another. This has led some to the modest skeptical conclusion that although we normally think that bricks, concrete blocks, and slabs of steel are solid, in fact they really are not solid, since most of the space they occupy is empty, owing to gaps between the atoms that make them up. The proper Malcolm-style response to such skeptics is that the word *solid* is defined by our intention that it is to apply to just such objects as bricks, steel, etc., and not by any abstract principle about how much empty space might exist at microscopic and submicroscopic levels. The putative linguistic fact here is that it is constitutive of the meaning of the word *solid* that it apply to such objects; it is not constitutive of its meaning that the things to which it applies must satisfy abstract descriptive principles that could be falsified by modern physics. Examples like this make it plausible to suppose that linguistic observations of the sort that Malcolm was trying to articulate may sometimes play a significant role in identifying the errors in certain skeptical views...

Huh? The skeptic's point is that our perception of objects is contradicted by what physics tells us about them. We see objects as clumps of congealed matter that definitely don't have a whole lot of empty space in them (in fact, according to physics, far more empty space than matter). Fuck linguistic analysis. It's irrelevant. The skeptic is right in this case: physics undermines commonsense realism.

I like being proven right:

[From a newspaper article.] As my wife and I sat on the couch one night this past winter, reading and half-watching the inevitable HGTV, I started sweating hard and my face got so fevered and flushed that I felt as if I were peering into an oven.

I turned to Deb and said, "Man, I'm having a wicked hot flash." And she said, "Me, too." Then we laughed. You laugh a lot — unless your hormones are making you cry — when you're having menopause with your wife.

I was in the middle of treatment for an aggressive case of prostate cancer last winter, and it included a six-month course of hormone therapy. My Lupron shots suppressed testosterone, which is the fuel for prostate cancer.

When your testosterone is being throttled, there are bound to be side effects. So, with the help of Lupron, I spent a few months aboard the Good Ship Menopause with all the physical baggage that entails. It's a trip that most men don't expect to take.

The side effect that surprised me most were the hot flashes — not that I got them, I was expecting that, but by how intense they were. They often woke me in the middle of the night and made me sweat so much that I drenched the sheets. In midwinter I'd walk our miniature poodle, Bijou, wearing shorts and a T-shirt. I sometimes felt as if Deb could fry

eggs on my chest. (It's also a bit disconcerting when your hot flashes are fiercer than your wife's.)

When it comes to hot flashes, ladies, I salute you. After my brief dalliance with that hormonal phenomenon, it seems to me it's an under-reported condition. And it's certainly under-represented in the arts. Where are the great hot flash novels or movies? How come there's not a Web site or magazine called "Hot Flash Monthly"?

Hand in hand with the hot flashes came the food cravings. I lusted after Cheetos and Peanut Butter M&M's, maple-walnut milkshakes, and spaghetti and meatballs buried in a blizzard of Parmesan. Isn't it funny how cravings very rarely involve tofu, bean curd or omega-3 oils?

Then there was the weight issue. During the six months I was on Lupron I gained about 25 pounds. That was partly a byproduct of the cravings, but it also stemmed from the hormonal changes triggered in my body.

And I hated it, hated it, hated it. I had never had to worry about my weight, and I began to understand why media aimed at women and girls obsess over weight so much. It was strange and unsettling not to be able to tell my body, "No," when it wanted to wolf down a fistful of Doritos slathered with scallion cream cheese.

When I wasn't devouring a king-size Italian sub or smoldering from a hot flash, it seemed that I was crying. The tears would usually pour down when I got ambushed by some old tune: "Sweet Baby James" and "Fire and Rain" by James Taylor, "That's the Way I've Always Heard It Should Be" by Carly Simon and, yes, "It's My Party" by Lesley Gore. Not only was I temporarily menopausal, but it appeared that I was also turning into a teenage girl from the early 1970s.

There were other side effects, too, like headaches and fatigue. But when I started drinking Diet Coke for the first time in my life, my son Owen couldn't take it anymore. He said, "Dad, are you turning into a chick?"

So, what else did I learn during my six months of hormone therapy?

Even though I only got to spend a brief time on the outer precincts of menopause, it did confirm my lifelong sense that the world of women is hormonal and mysterious, and that we men don't have the semblance of a clue.

And, guys, when your significant female other bursts into tears at the drop of a dinner plate or turns on you like a rabid pit bull — whether she's pregnant, having her period or in the throes of menopause — believe her when she blames it on the hormones.

Biological semi-determinism. Nothing could be more obvious. It isn't easy being the second sex.

I asked Chomsky about skepticism. He wrote back:

"A skeptic could also argue that the person's 'memory' is just his immediate experience, referring to nothing that happened before, so he erroneously believes his word 'red' to be meaningful. That's accepting Malcolm's argument, which there's surely no reason to do, if only because of a variant of Hume's 'missing color' argument. I've never (consciously at least) seen anything that's periwinkle, but was told roughly where it lies in the spectrum, which is enough for it to be meaningful. In fact even if I know nothing beyond that it's a color word, which I can infer from usage, it's meaningful. The blind use color words meaningfully, as Barbara Landau and Lila Gleitman showed.

"I don't think Moore or his followers thought he was refuting the skeptic. Just illustrating why it's pointless to pay attention. Like Samuel Johnson's kicking a rock in response to Berkeley." Fair enough. It is indeed pointless to pay attention, at least to the kind of skepticism Moore was arguing against.

I've always had a positive view of H. P. Grice and the field of linguistics he founded called pragmatics. A systematic, logically rigorous attempt to develop a sophisticated understanding of how we use language. Conventional and conversational implicature: tremendously important notions. (And conversational *implicature* too.) Soames fills out the history a little. (I studied at an analytic department, so history was ignored.)

I must confess to a certain fascination with Quine's meaning-eliminativism etc. and Wittgenstein's thoughts on rule-following etc. I can't help thinking that certain truths have been hit upon. I've discussed Wittgenstein plenty and I think I've articulated in some mildly adequate form the substance behind his thoughts and the inadequacies in his own expressions of them. But I haven't discussed Quine much. Quine is, if anything, more radical than Wittgenstein, since he denies meaning and reference altogether. In fact, "the same considerations that lead to eliminativism about meaning and reference lead to eliminativism about propositional attitudes such as believing that P, asserting that P, and wondering whether P... Just as there is, in reality, no such thing as ordinary meaning and reference, so there is no such thing as ordinary belief and assertion. Hence, there is no place for these notions in a truly objective and scientific description of the world." Whatever Quine's flawed reasons were for adopting these paradoxical positions, I can't help thinking that he was onto something. He merely took it too far. In my paper on him and Kant I tried to sort of articulate what I thought was defensible in his position, but of course more can be said. —By the way, Chomsky would disagree with all this, but I haven't read enough Chomsky to take him into consideration. Right now I'm concerned with the "phenomenological" level, so to speak, the level of consciousness and behavior.— Meaning, reference, and 'facts' about belief, assertion, etc., are not facts in the ordinary commonsense, physical or scientific ways. *Obama went to Egypt yesterday. I believe that Céline doesn't appreciate me.* These facts are of two very different kinds—and not just in the obvious ways. The second one actually isn't even a full-fledged *fact*: do I *truly* believe it? Maybe not. Maybe I just think I do, or maybe I'll change my mind in the next instant. Maybe I don't think I'm so great after all, maybe I'm deluding myself, maybe I have no idea what I believe about Céline's attitude towards me, maybe I have no belief whatsoever about her attitude. It seems to me I do, but maybe consciousness is just playing with itself or I'm just playing with words and on some deeper level there is no "belief" coming into play at all. What *is* belief, anyway? What is intention? What is meaning? A sort of 'directing' of consciousness towards some given thing, perhaps combined with a corresponding type of behavior. An 'investing' of consciousness in something, a momentary commitment to something. But it's all much more elusive and illusive than ordinary *facts* like the moon's revolving around the Earth.

It's because Quine thinks that physical facts are the only genuine facts that he rejects the idea that there is a fact of the matter about meaning, belief and so on in any given case. "Brentano's thesis [he writes] of the irreducibility of intentional idioms [to non-intentional notions] is of a piece with the thesis of indeterminacy of translation [and thus of meaning]." He goes on: "One may accept the Brentano thesis either as showing the indispensability of intentional idioms and the importance of an autonomous science of intention, or as showing the baselessness of intentional idioms and the emptiness of a science of intention. My attitude, unlike Brentano's, is the second." Mine is the first. After all, it's obvious that Quine's argument is self-undermining, since if belief, assertion, translation and ultimately meaning are indeterminate, then Quine's position itself is indeterminate, which means it has no content, which means it is meaningless. If it's right...then it's meaningless.¹ (There's an ironic parallel to Wittgenstein's conclusion in the *Tractatus* about that book's argument. Also, it's similar to what I wrote in the first chapter of my senior thesis, if I remember aright.) We can't do away with meaning and assertion and truth and all that. But we *can* confront their elusive, semi-behavioral character. All this stuff also reminds me of my paper on ontology, in which I argued that words, concepts and propositions are fictions, necessary fictions. My papers on art, knowledge and values fit nicely into this framework too. And my views on the self, definitely. (Fictional, etc.)

Epiphany. Before I leave my twenties I want to do one thing I've never done before: get *really* healthy, *really* in shape, so that I can finally, for once, actually feel *really* good about myself, unequivocally, absolutely *good* about myself. I never have. This summer I'm getting off my ass and being *active*—gonna play sports, work out, jog, meet people. [...] There's something subliminal about being physically active, something that touches not only the dark female psyche but even the natural order itself, so that when you're active good things start happening to you, cosmic luck opens itself to you. I've sometimes wondered if I give off some sort of unconscious negative energy. In many situations that thought is preposterous, since I

¹ Quine adopts a complicated strategy to get out of this paradox, but it isn't convincing.

can be exuberant and funny. And even in my quieter moods people can like me, such as that girl Ashley who appreciated my intelligence and dry humor. (But see, it was sheer luck that I met her. Luck!) In any case, I desperately need a change.

Hallelujah! I'm still young and can look forward to tomorrow! (Barbecue, party outdoors later, and gym!)

It's painful how obvious these truths are. There's a certain intelligence in *instinct*, and an unintelligence in analysis.

Evidently I had a good understanding of Kripke's *Naming and Necessity* when I claimed that it's just a sophisticated defense of common sense. Russell and Quine didn't have common sense, and these are the people Kripke is arguing against. (Descriptivism about names?! A rejection of the intuitive distinction between essential and accidental properties?! Give it up, guys! You lose.) "If someone thinks [writes Kripke] that the notion of a necessary or contingent property... is a philosopher's notion with no intuitive content, he is wrong. Of course, some philosophers think that something's having intuitive content is very inconclusive evidence in favor of it. I think it is very heavy evidence in favor of anything, myself. *I really don't know, in a way, what more conclusive evidence one can have about anything, ultimately speaking...*" The sentence I've italicized effectively vindicates my, and Laurence Bonjour's, claim that *intuition* is the ultimate court of appeal for logical truths, mathematical truths, analytic truths, and so on. 'Non-inferential' intuitions are in fact the final basis of every argument; and every step of every argument relies on the intuition of logical laws. Kripke is a universally acknowledged genius, so it's nice to have him on my side.

Kripke: there are necessary *a posteriori* truths, like 'Hesperus is Phosphorus,' and contingent *a priori* truths. ('Hesperus' was the ancient name for Venus as seen in the morning sky; 'Phosphorus' was the name for Venus as seen in the night. The ancients didn't know it was the same planet.) These are major Kripkean innovations.¹ So is his rejection of the belief that epistemic possibility is coextensive with metaphysical possibility; he argues instead that epistemic possibility is broader. Relative to our former knowledge, it was possible that Hesperus and Phosphorus were two different planets. But it wasn't metaphysically possible, because those two names in reality denote the same celestial body, and obviously it's never possible that a particular thing isn't identical to itself. Self-identity is an "essential," not an "accidental," quality. (Quine and previous analytic philosophers rejected the distinction between essential and accidental qualities, but Kripke reinstated it. An essential property of mine is that I'm a human being, or that my body is made of molecules; an accidental property is that I currently live in Boston.) So, because of the fact of *ignorance*, there are more epistemic possibilities than there are metaphysical possibilities.

But lo, trouble is afoot! There's a paradox to be dealt with! Kripke seems to have pretty well demolished both versions of the description theory of names: the first, that a name (like 'Aristotle') literally *means* a particular description (like 'Plato's greatest student'), and the second, that a name *fixes its referent* (e.g., the man named Aristotle) by means of a description associated with the name. The first (Russell's) version is stupid, the second (Frege's) far less so.² But Kripke has argued against even the second version, saying that a name is fixed to a particular referent not through a description—or, more broadly, a "sense," in Frege's terminology—but simply through an initial "linguistic baptism." The name is introduced by someone, for instance a child's parents, and then other people use the name to refer to its bearer, so that a chain is formed from one user to the next, the name's referent being determined by the historical chain stretching back to the original baptism. So this theory is committed to a certain "externalism" about meaning, in that a name's referent is determined not by anything in the speaker's mind but by something

¹ Recall my point in the ontology paper that, in fact, all necessary truths are reducible to *a priori* truths. It's only through empirical investigation that we learned that Hesperus is Phosphorus, but now that we know this, we can see that what is 'really' being claimed by that statement is that Venus is identical to Venus, which is an *a priori* truth. *That planet* is identical to *that planet*, i.e. to itself.

² By his own admission, the Theory of Descriptions was one of Russell's two most valuable contributions to philosophy. The second was his only-slightly-less-silly-and-ad-hoc Theory of Types.

external to it, viz. a historical chain of uses that the speaker knows nothing about. Actually, this externalist theory of meaning constitutes one of Kripke's rare transgressions against common sense, and I'm skeptical of it. Besides, it almost seems irrelevant: the problem, surely, is to know how *I can know* that I'm referring to the correct individual when I use the name 'Aristotle,' to a specific individual who is referred to by everyone else when they use the name 'Aristotle.' Kripke's externalist theory is like, 'Whether you know it or not, you're referring to so-and-so. You may mistakenly think you're referring to *x*, but actually, in spite of yourself, you're referring to *y*. *Y* is the true referent of the name, not *x*.' Okay... That last claim may be true in some sense, but there's something fishy about all this.

I got off track there. I was going to discuss a paradox described by Scott Soames as arising out of Kripke's refutation of descriptivism, but while writing the paragraph I changed my mind about the effectiveness of Kripke's arguments against Frege. It's misleading, anyway, to call Frege a "*descriptivist*," as everyone does, because his notion of *sense* is more inclusive and subtle than that of *definite description*, à la Russell. The paradox that Soames describes is just a post-Kripkean variation on "Frege's Puzzle," which arose out of J. S. Mill's idea that the "meaning" of a proper name is simply its referent.¹ If Mill is right, then how can one explain the fact that the sentence 'Hesperus is Phosphorus' is informative, while 'Hesperus is Hesperus' is not? For 'Hesperus' and 'Phosphorus' *in reality* refer to the same planet. Clearly the Millian view of proper names is not the whole story. Frege introduced his idea of "sense" to explain the difference between the sentences: the name 'Phosphorus' has a different *mode of presentation and description* associated with it than does 'Hesperus,' a different "cognitive value" so to speak. Etc. Frege's resolution of the puzzle is thoroughly intuitive and is thus, ultimately, correct in some precisified way (or so I think). But Kripke came along and discredited Fregean descriptivism in the eyes of many philosophers, which resulted in the rebirth of the puzzle. For the last few decades, philosophers of language have been trying to find ways around these paradoxical implications of Kripke's semi-return to Millian referentialism. But given my qualms with Kripke's externalism and my sympathy for Frege's sense/reference distinction, I'm fairly certain that Kripke's arguments against Fregean descriptivism are not as decisive as philosophers think. I was about to launch into an in-depth discussion, but it's late and I have to get up early tomorrow. Am working again at ELC, one class a day so far.

I'll say only this: the puzzle shows that the same sentence can express two different propositions, depending on how it's interpreted. There can be either an 'epistemic' proposition or a 'metaphysical' proposition, so to speak. Either a proposition that gets its content from the *sense* or a proposition that gets its content from the *reference*. Metaphysically, or 'referentially,' 'Hesperus is Phosphorus' is a tautologous identity-statement: it says that planet *x* is identical to planet *x*. But this isn't the way the sentence is usually interpreted. The 'natural' interpretation, oriented toward the sentence's *sense*, is something like 'The celestial body we see in a particular spot every morning is identical to the celestial body we see in a particular spot every evening.' Or, more exactly and less misleadingly,² 'The *image* we see in the morning sky is of the same celestial body as the *image* we see in the night sky.' The names don't literally *mean* these descriptions, but their sense includes them. Kripke's modal arguments objecting to this Fregean theory have force, but it's simply impossible for them to be true given the intuitive irresistibility (i.e., obvious truth) of Frege's position. In fact, I don't think his arguments against Frege are nearly as powerful as his arguments against Russell.

Freud and Merleau-Ponty are right: ours is a body-ego. Self-consciousness is the self-consciousness of the body. I am a *socialized body*. That's all. As Chomsky would say, we're organic beings. Pathological

¹ Russell would later agree with Mill vis-à-vis "*logically proper names*," the only two examples of which in English are 'this' and 'that,' as used to refer to one's current sense-data. Ordinary proper names, according to Russell, are actually disguised definite descriptions. Their grammatical form conceals their true logical form. But we've seen that he was wrong about this.

² It's misleading because the sentence 'The celestial body we see in a particular spot every morning is identical to the celestial body we see in a particular spot every evening' can itself be interpreted in the same 'metaphysical' or 'referential' way that we can interpret 'Hesperus is Phosphorus.' On the other hand, 'The *image* we see...' cannot.

self-consciousness is the body's dissociation from itself. Intellectualism is the body's partial dissociation from itself. If you keep in mind our bodily essence, human behavior makes a lot more sense than it does otherwise.

After a certain point, the more comfortable life is, the less enjoyable it is.

What would it be for life to have (a) meaning? What would life look like if it had meaning? It would be *purposive* in character: its cosmic structure, so to speak, would be oriented towards a purpose. There would be a fundamental purpose or design behind everything that happened. At the very least, all the events in an individual's life could be related—*would* be related—to a cosmic teleology. *Chance* would have no dominion. A person would get his just rewards. In short, there would be an intelligible reason for everything, including the existence of mankind and the world itself. Natural selection through random genetic variation would not be the law of evolution; evolution would be teleological, or divinely ordained. The human way of behaving, which is based on *design* and *purpose*, would be the universe's way of behaving. They would go hand in hand.

But this desire for meaning became a felt need only with the Hellenistic age, or a few centuries before it, during the Axial Age. (Every society, though, has its own pace of evolution.) Internationalization, urbanization, the breakdown of rural traditionalism. Hence the proliferation of religions, philosophies, sects. Christianity, in the end, proved particularly adept at addressing the social malaise that expressed itself in spiritual yearnings; therefore it was functionally selected among all the competing belief-systems. Its worldview and its concrete humanitarianism and charity work cooperated to give it a mass following.

What explains the intuition that life in a utopia would be meaningless? The perception that it would have no purpose. Everything would be perfect and pleasant already, so there would be no need for *projects* to improve things or seek greater understanding. We would be animals sated and fat in idleness—and so at the same time there would be no outlet for the desire for recognition. Humans seek recognition through their projects; these two expressions of the human spirit (the desire for recognition and the desire for a purpose, a project, something to work toward) are closely linked. In fulfilling a project, one is implicitly recognizing oneself and can be explicitly recognized by others. That's why Lessing was right that it would be a terrible thing to completely understand the world—because then there'd be nothing left to do. (Ironically, it's also very annoying *not* to understand the world.)

Spontaneous, genetically determined expressions of the human spirit: curiosity, creativity (closely connected to purposiveness), and the drive for recognition (which includes erotic love). Each of these is essentially *affirmative*.

Reading *The Cambridge Companion to Heidegger* online. There are a number of ironic similarities between his thought and Marx's. For instance, the partial rejection of the entire philosophical tradition. The criticism of *theoria*, the "artificial" and derivative theoretical stance, in favor of *praxis*, or being-in-the-world. Man is essentially *involved*; his habits of thought and so on grow out of his situation. The rejection of "metaphysics" (though for different reasons). The emphasis on alienation and inauthenticity, concepts that are related. The holistic approach to their subject-matter. The historicism and quasi-social constructivism. The existentialist view of human nature: man's essence is his existence, he is his acts. The rejection of the language of consciousness in favor of that of "[social] being." The distinction between appearance and that which lies underneath, is "hidden" or "covered up." (Marx called it essence, a word Heidegger rejected.) The use of phenomenological analysis to uncover this hidden truth—a use that is, admittedly, only partial in Marx's case. (*Das Kapital* has more than a few "phenomenological" chapters, but its basic method is that of abstraction from appearance.) The conviction that Descartes was wrong: consciousness is not self-transparent but rather has its meaning and ground hidden from it.¹ But the differences between the two thinkers are just as striking, and are mostly to Marx's credit. Ultimately, Marx

¹ Needless to say, Marx and Heidegger interpreted all these doctrines in very different ways.

not only had a far greater understanding of himself—his project¹—and society, but was more theoretically revolutionary. More innovative certainly, infinitely more lucid in his thought and writing, more insightful, *realistic*, more ambitious and original. (Marx had Hegel and Heidegger had Husserl, but one gets the impression that Marx set out on his own to a greater extent than Heidegger did.²)

The parallels betwixt Descartes and Husserl are astounding. Husserl was a 20th-century Germanic version of Descartes. (20th century: the logical precision, the sophisticated methodology, the pared-down theoretical program. Germanic: the besotted writing-style, the Kantian influence.)

Heidegger's nonrepresentational theory of truth. An assertion *directs* us to a state of affairs in the world. It doesn't "represent" anything; it orients us to the thing itself.

An assertion corresponds simply by directing us to the state of affairs "so as to let it appear in the assertion as it is." And so, it becomes clear that the correspondence relationship is not a relationship in which a representation is appropriately like the thing it represents, but rather a relationship of pointing out or uncovering a fact—a thing in a particular condition. "To say that an assertion '*is true*,'" Heidegger concludes, "signifies that it uncovers what is as it is in itself. It asserts, it points out, it 'lets' what is 'be seen' (*apophansis*) in its uncoveredness. The *Being-true (truth)* of the assertion must be understood as *Being-uncovering*." Thus, on a nonrepresentational account of language, assertion is a way of orienting ourselves in an engagement with the world—an "assertative being toward what is asserted"—and correspondence amounts to uncovering.

But consider the example "The picture on the wall is hanging askew." This statement re-presents the state of affairs, the fact which is already presented in itself through perception. It presents it again, by directing our attention to the original perceptual presentation (if, that is, we're in the presence of the hanging picture). And it accomplishes this re-presentation by representing, or re-presenting, the fact in words, through words. The statement considered in itself is not the thing itself; it is a verbal representation of it. It isn't inaccurate, therefore, to say that the statement "mirrors" the fact. From one perspective, yes, it "uncovers" the fact, by directing one's attention to the state of affairs; from another perspective it "mirrors" the fact. And this conceptual mirroring is precisely how it accomplishes its uncovering, even though phenomenologically—in this example of the hanging picture—the mirroring isn't experienced, isn't an object of one's attention.

You have to admit that language itself agrees with Heidegger's theory. Re-presentation of truth, dis-covering truth. From a practical, everyday perspective, his phenomenological approach is right: there is no "mirroring," the representational theory is extraneous conceptual clutter. But 'logically' the element of mirroring is there, implicit in the relation between our statement and the world. Only at a late stage of history, when thinkers started reflecting on the nature of statements in themselves, could the representational theory acquire currency (and justifiably).

One of the connections between Heidegger and postmodernist relativism is in his second conception of truth—a more basic sort of truth than propositional—as the "unconcealment" or "disclosedness" of beings. Prior to our explicitly predicating properties of them in statements, things 'open themselves to us' in certain ways. We see them in certain ways, ways that, according to Heidegger, differ across cultures. And then we pick out their essential properties on the basis of this pre-linguistic, historically relative seeing.

¹ The very questions that Heidegger spent his life trying unsuccessfully to answer, namely "What is the meaning of being?" and "Why is there something rather than nothing?", etc., are well-nigh meaningless. He was a confused man, in *so many* ways.

² Indeed, Heidegger claimed that *Being and Time* adhered to the "principle of phenomenology"—i.e., Husserl's method—more faithfully than Husserl himself did. And Heidegger's account of time borrows a lot from Husserl's. In any case, Husserl obviously attempted a "phenomenological ontology," a clarification of the being of entities in general, before Heidegger did.

The claim that unconcealment is the essence of truth is the claim that the truth of beliefs and assertions depends on the world opening up for us in a particular way, prior to and independently of predicative language. The unconcealment of beings is the “anticipatory gathering,” which lays out certain properties and relationships as salient. This means that the properties of a thing that we consider to be most important to it—the properties that determine its “essence”—are a function of the historical age. Inhabitants of different historical worlds will consider different features of objects to be essential, because their dispositions for the world are shaped in different ways. As a result, what things are, how they actually show up, differs according to the historical world to which a person belongs.

To an extent this is true. But to a very limited extent. Without doubt there’s a basic human form of cognition (and affection and appetition) common to everyone, a cognition that ensures that the parallels between the experiences of people in different cultures are astronomically more important than the differences. An old Samoan ‘saw’ the world in basically the same way I do; only around the most marginal of margins did his perceptions differ. Gold looked the same to him as it does to me: shiny and yellow. His priorities were basically the same as mine: eat, have shelter, find a woman, etc. The structure of his language was basically the same as mine: subject, verb, object, adjective, and the myriad syntactic rules that underlie sentences in all languages—there’s a universal grammar. And modern science is objectively the best way of understanding the world, since it works the best. Gold’s essence really is that its atomic number is 79 and so on, not that it is the kind of object whose beauty approximates God’s or whatever. For science has taught us that the properties that every society uses to pick out a lump of gold are determined by its molecular structure, and that in fact gold itself *is* this molecular structure.

Anyway, Heidegger’s more general influence on postmodernism is through his conception of hermeneutics. Hans-Georg Gadamer, who “developed Heidegger’s account of interpretation into a general hermeneutics,” defines hermeneutics as addressing the central question “How is understanding possible?” ‘Understanding’ here is *Verstehen*, the sort of intuitive, cultural, interpretive understanding of the humanities as opposed to the ‘objective causal knowledge’ of the natural sciences. From Schleiermacher to Dilthey, *Verstehen*, or understanding, was thought of as a special cognitive operation distinct from scientific explanation, which effectively tended to reduce hermeneutics and the humanities to an inferior status as compared to the sciences. But Heidegger essentially reversed this conception.

A central part of Heidegger’s legacy comes from his strikingly different conception of hermeneutics. Heidegger’s analysis of *Dasein* as being-in-the-world changes our understanding of understanding from a derivative phenomenon to the central feature, the keystone, of human experience. As Gadamer remarks, “Heidegger’s temporal analytics of *Dasein* has, I think, shown convincingly that understanding is not just one of the various possible behaviors of the subject but the mode of being of *Dasein* itself...and hence embraces the whole of its experience of the world.” When understanding becomes the central phenomenon for philosophy, hermeneutics is no longer conceived of as simply one minor branch of philosophy. Instead, philosophy itself becomes hermeneutic. Or at least one can now speak of a distinctively hermeneutic approach to philosophy in contrast to the traditional approach running from Descartes through Kant to Husserl. This traditional approach conceived of the human being as a “subject,” a knower disengaged from the world and from practical activity in the world.

Heidegger’s hermeneutic turn is more radical than earlier philosophy, then, in that it avoids the traditional model of the subject as the knower standing over against what is to be known, the objective world. His hermeneutic turn shows both that the mentalistic vocabulary of the subject-object model is not the only possible starting point for philosophy and that this vocabulary is derivative from the more basic starting point where *Dasein* and world are coterminous in understanding. Heidegger conceives of *Dasein* and world as forming a circle, and he thus extends the traditional hermeneutic circle between a

text and its reading down to the most primordial level of human existence. Traditionally, the paradigm for the hermeneutic circle is the reading of a text, where the parts cannot be interpreted without an understanding of the whole, but the whole cannot be grasped without an understanding of the parts. As I shall explain, in Heidegger's deeper conception of the hermeneutic circle as a feature of human existence in general, the relation of knowledge and understanding is one neither of antagonism nor of indifference, but one in which the legitimate task of achieving knowledge is a subspecies of the more general phenomenon of human understanding.

For Heidegger, there is a "primary understanding" or "interpretation" (with a lower-case 'i') which constantly characterizes our being-in-the-world. We're always interpreting situations and so on. Derivative of this is "Interpretation" (with a capital 'I'), which is reflective and theoretical. Philosophy, philology, etc. It isn't of a different order than primary understanding, though: "it can be 'true to' the phenomenal activity of ordinary world interpretations because it is itself a form of the same phenomenon, although a more articulated or explicit form. So philosophical Interpretation is not simply arbitrary, and not threatened by the problem of relativism, because it is a case of the primary understanding that it is trying to capture." (The problem of relativism had plagued traditional hermeneutics, because the status of interpretations was unclear. What determines that one is better than another?) "Philosophical articulations of primary understanding are binding to the degree that they are adequate to phenomenal manifestations of understanding, which include philosophy itself." Okay... Explanation is simply one of the ratiocinative operations that constitute Interpretation, and it too derives from primary understanding.

Traditional philosophy started from disconnections, e.g. between physical and mental or object and subject, and tried to explain or reinstate connections, an enterprise that, not surprisingly, couldn't overcome skeptical challenges and ultimately ran into unresolvable antinomies. Heidegger, by contrast, starts from the primordial connection of Dasein and the world and then has to explain disconnections, such as the theoretical and practical errors that constantly occur in life.

So what exactly determines whether one Interpretation is better than another? Heidegger answers this question by distinguishing between two kinds of truth, which I discussed briefly above. There's the propositional, which "uncovers" a fact, and the more basic truth of primary understanding, which determines how things immediately disclose themselves to us. Since Dasein is being-in-the-world, understanding or disclosure of the world is simultaneously disclosure of Dasein itself. And the essence of this disclosure is (unreflective, implicit) disclosure of Dasein's possibilities. "Dasein exists as 'definite' or concrete possibilities"—not abstract or logical or explicit ones. Its knowledge of possibilities for itself in a given situation is often more like knowing-how than knowing-that. Usually it isn't spontaneously free choices or deliberate decisions that are involved, but implicit projection of possibilities—and Dasein itself, together with its understanding, is this continuous projection of possibilities in the context of a situation.

Distinction between factuality (nonhuman) and facticity (human).

To get back to the issue of how to determine the worth of an interpretation (and Interpretation): Heidegger thinks it's misguided to ask whether an interpretation is true or false. Better standards are authentic or inauthentic, genuine or not genuine, and transparent or opaque. Heidegger's paradigm cases of interpretation are everyday activities like opening a door and hammering a nail, not reading a text (contrary to contemporary tendencies). "Even Heidegger's philosophical Interpretation is an interpretation not of a text, but of Dasein. But these cases are analogues of texts insofar as Heidegger's point is that even the most obvious ordinary objects taken by themselves do not have their characteristics inscribed in them. Instead, the characteristics of the tools come into being in the concrete interpretation manifested in the activity of using them." He opposes the empiricist epistemology according to which we first "perceive" objects with their particular properties and secondarily use them or apply them.

Seeing is not simply perceiving the properties of external objects with the bodily eyes. Instead of construing seeing as seeing that an object has such and such a property, Heidegger construes seeing as already interpreting something as something (e.g., seeing

something as a hammer, as a door, or as a table). [Reid.] Another example of such “seeing-as” (not Heidegger’s own) is found in the hermeneutic phenomenon of reading. When we read a text, we do not first perceive black marks on a white page and then construe their meaning. Instead, the meaning of the text, and indeed the text itself, comes to be only in the reading. Hence, for later hermeneutic theory the text and the reading form the paradigm case of the hermeneutic circle. While the early Heidegger does not emphasize textuality to the same degree, his account does underwrite the shift of philosophical attention from the epistemological model of perception to the hermeneutic model of reading.

Central to his account is the idea of meaning. He doesn’t think of it as a private, internal mental state, nor as something one imposes on an object, nor as an intermediary between the subject and the object. The object is inseparable from its meaning, which is inseparable from the holistic web of meanings of everything in the world. (Duhem, Quine, Wittgenstein.) Objects don’t have meanings prior to or independent of their uses. Understanding consists in practices.

Hermeneutic circle: you have to already understand something in order to be able to interpret it. So, superficially, it seems like in order to understand it you have to understand it first—understanding presupposes understanding—which is paradoxical. But obviously this argument is sophistical. (Two kinds of understanding involved, a more primitive and a more explicit and articulated.) Still, in a way it’s obviously true that you can never get outside the circle of your prior understandings. But you can criticize and reject some on the basis of other (implicit) understandings and (explicit) interpretations. In any case, Heidegger’s point is that the world itself exists in a hermeneutic circle. There is nothing outside the web of meanings, no absolute reality “in itself.” –The scourge of postmodernism looms.

Gadamer’s hermeneutics attempts to reconstruct the meaning of a text. Deconstruction, by contrast, tries to pick apart this faith in the unity and coherence of the text “by finding in the rhetoric and style of the language of the text moments where the assumption of the unity of meaning fails.” (Obvious objection to deconstruction: in the very act of formulating their position, of constructing arguments and so forth, deconstructionists ignore their own doctrine. For they presuppose a “unity of meaning” in their statements and arguments. And if they don’t—if they try not to mean something at all—then they fail to communicate. One can’t simultaneously intend multiple meanings.) In the end, though, both the positive and negative enterprises have something positive to offer—even if, in the case of deconstruction, it’s merely the reminder to examine tensions and contradictions in a text.

From one perspective, Sartre was quite obviously a regression from Heidegger and Merleau-Ponty, a regression back toward Descartes and Husserl. His emphasis on disconnections, absolute dualities, and of course on the self-transparency of consciousness. (In a way, self-transparency is true, but in a way it’s not.) Sartre was also confused: there’s a tension in his philosophy between a public approach and a private approach to the self.

By the way, Heidegger’s fundamental claim that the meaning of being in general is disclosed by Dasein (human being) is either truistic or meaningless. It’s truistic inasmuch as “the meaning of being”—or the meaning of the world—for humans is obviously disclosed by human consciousness. It’s meaningless inasmuch as it doesn’t make sense.

More suggestive is his idea that the basic state of human consciousness is care (which doesn’t mean love). I care. In everything I do, care is there. And so the statement “I don’t care” implies a sort of negation of humanity. I don’t care; in this moment care is absent from me. Global warming? I don’t care: I am not invested in it, it doesn’t affect me, I am separated from this source of affect-ion, my consciousness doesn’t project itself into it, it is not a project for me, I am a passive observer, global warming is merely an external thing, a lifeless reification for me. I am not fully human, not “originarily” human, to the extent that I don’t care, that I don’t affirm—or negate something specific on the basis of a broad, deep and diffuse affirmative attitude toward life and myself. The child in his purity always cares; the adult in an archaic society always cares; the adult in current society often doesn’t. He is bored, detached, withdrawn from the world into

himself, which tends to make him care less about himself too. To the extent that he becomes a thing, losing vitality, he cares less, and vice versa.

[Noted later.] “Heidegger defines care as ‘ahead-of-itself-Being-already-in-(the world)-as Being-alongside-(entities encountered within the world).’ This is a tripartite definition which says that Dasein has the following structures: (1) ahead of itself (understanding), (2) already in (disposition), and (3) alongside. Heidegger often refers to these three structures as existentiality, facticity, and fallenness... The three aspects of care correspond to the three dimensions of time: the future (ahead of itself), the past (facticity), and the present (fallenness).”

Useful summary:

One common view of the history of twentieth-century Continental philosophy is as follows. At the beginning of the century, Edmund Husserl, disturbed by what he saw as the increasing relativism and historicism of Western culture, introduced the phenomenological method as a way to ensure that philosophy would arrive at final, incontrovertible truths... Because phenomenology “brackets,” or suspends belief in, all metaphysical constructs in order to focus solely on what shows up as it presents itself in our experience, its findings are supposed to be apodictic, beyond all possible doubt.

According to the standard story, the early Heidegger came along and raised questions about the viability of Husserlian phenomenology by taking an “interpretive” turn. What is most important about Heidegger’s hermeneutic ontology, so the story goes, is his recognition of the significance of the finitude, worldliness, and historicity of our human predicament—the recognition that our access to things is always colored and preshaped by the sense of things circulating in our historical culture. The story then concludes with poststructuralists and various postmodern thinkers detecting a nostalgia for metaphysics even in such Heideggerian concepts as worldliness, finitude, and history. Jacques Derrida especially points out that Heidegger still seems to be trapped in essentialism and totalization, twin sins of the very “metaphysics of presence” that his hermeneutic approach was supposed to displace.

It’s worth pointing out that, even according to this half-true story of Heidegger’s originality, he is original only in relation to the narrow philosophical trend epitomized by Husserl. “The significance of the finitude, worldliness, and historicity of our human predicament” had been appreciated by Marx and Nietzsche, not to mention multitudes of anthropologists, sociologists and psychologists.

Interestingly, Husserl thought (and Heidegger too?), unlike Kant, that we can know how things are in themselves. Peculiar opinion, especially in light of his method.

It occurs to me that Heidegger’s notion of inauthenticity is basically defined as a turning away from care. Dasein is essentially care, so by being indifferent or living wholly in the present and ignoring the future or death, one is repressing or suppressing, or not accepting, one’s essence, which is also what common sense means by ‘inauthenticity.’ One is not accepting oneself, which is to deceive oneself, to be dishonest (because one always thinks one is self-accepting and self-honest).

Heidegger vastly overemphasizes the historicity, as opposed to the naturalness, of man. And his positing of a fundamental difference between nature and man has overtones of Sartre and Descartes, which would not please him.

“In our ordinary agency, according to Heidegger’s description, the self is not so much an object as an unfolding event or happening—the ‘movement’ of a life course ‘stretched out between birth and death.’ From this standpoint, it is wrong to think of oneself as a mind or a center of consciousness with its own *Eigenwelt*... Because we are generally outside our ‘selves,’ caught up in equipmental contexts in a shared world, Heidegger can say that being a ‘self’ is “only”...a way of being of this entity.” One-sided. The

perspective of the “self” is implicit in everything I do. I am always at least half-conscious of the personal, private nature of my existence.

The contemporary understanding of the self as a narrative also has its origins, or at least its inspiration, in Heidegger, for obvious reasons.

“Inauthenticity is characterized by ‘falling’ and ‘forgetting.’” Being immersed in the tumult of “average everydayness.” In the hands of the right writer, Heidegger’s philosophy can be quite inspiring:

If we can take a stand on our being-toward-death [which is revealed in the experience of anxiety], our lives will be transformed. Facing death, one is pulled back from the dispersal, distraction, and forgetfulness of everydayness. The result is the ability to live with a clear-sighted grasp of the temporal continuity and future-directedness of one’s own life-happening. This lucidity leads to a way of living we might call “self-focusing.” The authentic Dasein, recognizing that not everything is possible, is “snatched back from the endless multiplicity of possibilities which offer themselves as closest to one” and focuses itself into a range of possibilities “which are determined by the end and so are understood as finite.” Such directedness into a coherent range of possibilities brings about a change in the way we relate to our thrownness and our being as projections toward the future. We take over our situatedness with “resoluteness”—a decisive dedication to what we want to accomplish for our lives. And our stance toward the future is that of “anticipation” or “forward-directedness”: a clear-sighted and unwavering commitment to those overriding aims taken as definitive of one’s existence as a whole.

Authentic self-focusing, understood as a resolute reaching forward into a finite range of possibilities, gives coherence, cohesiveness, and integrity to a life course. Authenticity is characterized by a distinctive temporal structure. Where inauthentic existence is lost in the dispersal of making-present, an authentic life is lived as a unified flow characterized by cumulativeness and direction. It involves taking over the possibilities made accessible by the past and acting in the present in order to accomplish something for the future...

Heidegger’s notion of “authentic temporality” might become clearer if we contrast two different ways of understanding the relation of actions to the whole of life. The first is found in the “instrumentalist” approach to living we saw in discussing Rollo May. This stance treats life as a matter of finding the means to achieving ends, where the ends are usually goods external to the activities themselves—such “positive reinforcements” as what “feels good” or satisfies a need. In this instrumentalist, means-ends living, actions are done in order to get something; for example, I run everyday in order to get healthy, or I help a friend in order to get him in my debt. In contrast to this means-ends approach, the second way of living might be called a “constituent-ends” way of living. Here actions are not just routes to achieving extrinsic ends, but instead are experienced as central to constituting a particular way of life, a way of life that is good because it consists of this and comparable sorts of activities. Action here is undertaken for the sake of being such and such: I run as a part of being a healthy person, or I help someone for the sake of being a good friend.

It should be obvious that although the actions performed are the same in both cases, the quality of life will be quite different. In the means-ends case, life tends to be experienced as an episodic sequence of calculative strategies lacking any cumulative significance or overriding purpose... Where the means-ends attitude trivializes the present by keeping us preoccupied with the carrot at the end of the stick, the constituent-end approach, by making us realize that what we are doing at this moment just is realizing the goals of living, throws us intensely into the present moment as the arena in which our coming-to-fruit is fulfilled. Running and being a friend are not just impositions I could as well do without; they make me the person I am. What is important is building myself as

this kind of person, not scoring points or getting rewards “down the road.” When life is lived as an ongoing process of self-building or self-composing, it has the kind of cumulativeness and continuity that makes up authentic temporality.

Well said.

In their fetish of radical (“terrible”) freedom and the essential meaninglessness of life, the French existentialists strayed very far from Heidegger. It’s practically the opposite of his emphasis on our embeddedness. But that’s the difference between old Germany and France: cultural embeddedness, national and racial pride, fascism, as opposed to atomism and individualism, the revolt against the past.

The essay on Buddhism and Heidegger is excellent. Let’s review:

Drawing on his study of Eckhart and other mystics, as well as on Kant, Heidegger maintained that the human being is not a thing but rather a peculiar kind of nothingness: the temporal linguistic clearing, the opening, the absencing in which things can present themselves and thus “be.” If humans are not things, then we have to define “knowing” in a different way than before. Knowing is not a relation between two things, mind and object. Rather, knowing occurs because the openness constituting human existence is configured in terms of the three temporal dimensions: past, present, future. These dimensions hold open the horizons on which entities may manifest themselves in determinate ways—for example, as instruments, objects, or persons... Human understanding, then, does not take place inside a mind locked in the skull. Instead, understanding occurs because human temporality is receptive to particular ways in which things can present or manifest themselves... For Heidegger, thoughts are not radically other than allegedly external entities, such as trees, cars, and books. Thoughts and cars are both entities manifesting themselves within and thus being understood as entities within the temporal clearing of human existence.

For Heidegger, “to be” means to disclose or present oneself. Dasein, then, is what allows beings to be, since it is what allows them to disclose themselves. It is the place where they disclose themselves, the openness in which their presencing occurs. Time is, in a way, the opposite of being: it is absence, nothingness, while being means presence or disclosure. It is through time, therefore, that beings are. Each term implies the other. Hence the title of Heidegger’s major work. It’s in the mood of anxiety that we truly experience our own nothingness; and anxiety is perhaps the most basic human mood, albeit the rarest. –This all sounds very Sartrean. It’s essentially a restatement of the traditional subject-object or mind-body dualism. Dasein is nothingness, everything else is being. Dualism. But if Dasein is time or nothingness, how can it be “embedded” in the world? How can any properties be predicated of it? And how exactly is it attached to a particular body? How do Dasein and its body communicate? We’re back at the mind-body dualism. I wouldn’t blame these problems only on this particular interpretation of Heidegger; they’re implicit in *Being and Time*, from all I’ve read. Dasein is temporality, nothingness, that which allows beings to disclose themselves; and everything else follows from these premises. At least Sartre followed these thoughts to their logical conclusions, by embracing dualism and postulating the absolute freedom of consciousness (or nothingness). Obviously there are major tensions in Heidegger’s philosophy. But similar tensions plague any reasonable philosophical worldview. Consciousness is a sort of nothingness; it is, in this sense, different from ‘its’ body. And yet, etc.

Like Heideggerian authenticity, Zen enlightenment involves insight into one’s groundlessness and nothingness. One experiences the terrifying truth, and everything seems meaningless. But afterwards, one is able to return to everyday activities—as Heidegger thought—with a deeper understanding, however, of what they (don’t) mean.

Environmentalists have seized on his statement that people are most free when they “let beings be” as they are, let them disclose themselves as what they are. (?)

Marx's superiority over Heidegger is revealed in the fact that the latter couldn't escape the paradigm of idealism. He insisted on man's being-in-the-world, on social practice, on our embeddedness in history and so forth, but he still failed to understand that material, historical conditions determine worldviews and social behavior. He reduced everything to metaphysics and idealism. For example, in his early work he thought that the reason why we moderns are so enamored of technology, science and instrumental reason is that we can't endure the experience of anxiety, of understanding our own nothingness! Sheer psychologism, flagrantly ahistorical. Later he got even worse: he thought that the pathologies of modernity result from the self-concealment of being! Ever since Plato, "being as such had increasingly withdrawn itself from human view." (What does that even mean?) The reason he initially loved the Nazis is that he thought they would bring humanity closer to being and nothingness, to authenticity. (And anxiety? They accomplished *that*, at least.) Unrealistic, ahistorical idiot!

According to Buddhism, Gautama Buddha opposed the traditional doctrine of the Upanishads and Vedas, according to which eternal Atman, the unchanging Divine Self, permeates and sustains things by constituting their ultimate essence, their true "self." For the Vedantic tradition, suffering ends only when one overcomes dualism by ceasing to cling to the illusory ego and identifying instead with the Absolute Self; for Mahayana Buddhism, suffering ends only when one overcomes dualism by ceasing to cling to the illusory ego and recognizing that there is no Absolute Self either. The conception of Buddhism as a life-denying tradition may be attributed to those adherents of Hinayana Buddhism who conceived of nirvana, the cessation of suffering, as being possible only for those few individuals who followed the arduous process of deconstructing the ego, encountering its emptiness, and thereby transcending the illusions of the world of appearance. Mahayana Buddhism affirms the possibility of and the need for saving all beings, since all "beings" are internally related—hence, the increasingly active role played by Mahayana Buddhists in the movement to protect nature from human abuse.

"Surrendering one's constricted ego-identity, and thus moving beyond dualism, enables one to become the compassion (Buddhism) or care (Heidegger) that one always already is. 'Authenticity' (Heidegger) and 'enlightenment' (Buddhism), then, result from the insight into nondualism, the fact that there are 'not two,' neither an ego-mind here nor objects there." For both Heidegger and Mahayana Buddhism, everything is internally related. Oppositions, separations, are illusory. —But surely these ideas have a different meaning for Heidegger than for Buddhists.

In a sense, Heidegger was a phenomenalist. To be means to appear, to be perceived by Dasein. Berkeley formulated the position with a logical rigor foreign to Heidegger. But does Heidegger think that objects have an 'inside' not directly perceivable by us? If so, that contradicts aspects of his philosophy; if not, it contradicts science. But he didn't want to contradict science; he wanted to transcend it.

Mind and matter, he thinks, are only theoretical constructs that play no role in making sense of the everyday world. Conceptions of physical objects and their causal relations "are derivative from and parasitic on the world understood as a context of involvements directed toward accomplishing things." Scientific objects and explanations are not primary; our everyday use of the world is primary, and science is merely a "regional inquiry" not at all privileged as compared to ordinary understanding. —But what does all this mean? It's sheer confusion and emptiness. Obviously our ordinary experience is "primary" or "basic," just in the sense that it is experience. It isn't revolutionary to say that our experience of the world is how the world is experienced. Yes, epistemologically experience comes first: it is through experience that we acquire knowledge and, eventually, scientific knowledge. But anyone who would deny that experience has some kind of epistemological priority belongs in an insane asylum. Science is "derivative" and "parasitic" on experience: no shit, Sherlock. But its "derivativeness" says nothing whatever about its status as potentially giving us insights into the nature of the mind-independent world. Natural science is incomparably more powerful than our intuitive, unarticulated pre-understandings of things we encounter in the world. In other words, science is more powerful than—experience itself. For it explains experience.

Writes Heidegger: “Self and world belong together in the single entity Dasein. Self and world are not two beings, like subject and object;...[instead,] self and world are the basic determination of Dasein in the unity of the structure of being-in-the-world.” Yes, “primordially” (Heidegger’s word) there is no division between subject and object or self and world. That is to say, in immediate experience it doesn’t cross one’s mind that there are such dualisms. So what? That proves nothing. The dualism is implicit in every moment of our experience of the world, as is shown by the fact that in any particular instant it might occur to you (in the same way that your existence might occur to you). Denying the self–world opposition is like denying the self. Or the world. Denying the (intuition of the) mind-body dualism is like denying the body.

A note on deconstruction.— Heidegger can be used against thinkers like Derrida and Foucault insofar as he insists on the need for a background of meaning, a horizon of disclosure, a shared life-world with the “they,” a meaningful canvas of “primary understanding” or “pre-understanding” against which life plays itself out. To deconstruct all regimes of meaning is, first of all, impossible even in principle because such deconstruction presupposes an undeconstructed background of meaning. Thus, deconstruction is partly self-refuting in that it presupposes its negation, an implicit naïve affirmation of coherent meaning in the “background.” (It’s self-refuting in other ways too.) Secondly, radical deconstruction wouldn’t be desirable even if it were possible, because it would mean the death of the self. Actually, this objection is essentially a reformulation of the first one.

“The fourfold,” man’s dwelling (in late Heidegger): earth, sky, gods, mortals. Earth and sky = nature; gods and mortals = culture or history. The idea isn’t as silly or empty as you might think. (Gods = cultural and personal ideals, ideals embodied in past heroes. It’s like one’s heritage. Perhaps similar, in one aspect, to a broad understanding of the “conscience.” Sort of eternal truths of morality or aesthetics that can guide behavior, norms that may conflict with current social mores.) Dwelling, belonging, a unity of the environment and culture, a fourfold unity in which each aspect is reflected in and implies the others, a rootedness in the soil and the ethnicity or nation which organically implies one’s specific heritage. Modern mingling of populations destroys dwelling, belonging, destroys “the shaping boundaries of an ethnic or national world.” Heidegger = nationalist fetish of the soil, the peasant, the race, the community’s unity. Modern art is worthless because it doesn’t arise from dwelling, isn’t inspired by Hölderlin’s observation that “poetically man dwells.”

Translated into a human language, Heidegger’s thoughts about value and nihilism are insightful. He agrees with Kierkegaard and Nietzsche that the modern world is nihilistic, but he disagrees with Nietzsche that the remedy is for the individual to create new values. Authority has deteriorated, the authority of religion and heroes and statesmen and great thinkers and shared commitments in the public world—none of this is authoritative anymore, so the individual is isolated and alienated. Kierkegaard thought that the answer to this nihilism was for the individual to make an absolute, unconditional commitment to something, for example love or God, a commitment that would determine one’s whole sense of reality. For Heidegger, though, it isn’t a failure of the individual that is at issue; it’s a failure of the society. Kierkegaard’s and Nietzsche’s individualistic answers to nihilism are inadequate, because the individual is formed by the shared world. In fact, Nietzsche’s formulation of the problem in terms of a lack of values is precisely the problem. “Heidegger argues that to think of nihilism as a state in which we have forgotten or betrayed our values is part of the problem. Thinking that we once had values but that we do not have values now, and that we should regain our values or choose new ones, is just another symptom of the trouble. Heidegger claims that thinking about our deepest concerns as values is nihilism.”

For Plato, we didn’t choose our values; they shone on us and drew us toward them. The idea of the good drew us toward it. Only with the Enlightenment did values come to be seen as things we could choose to reject or accept, things that weren’t binding on us until we accepted them. This is already the beginning of nihilism. Nietzsche took it further and said that we posit values, we create them. But if that’s true, why should they have authority for us? “So, far from giving meaning to our lives, thinking of what is important to us in terms of values shows us that our lives have no intrinsic meaning. As long as we think in terms of value-positing rather than being gripped by shared concerns, we will not find anything that elicits our

commitment. As Heidegger says, ‘No one dies for mere values.’” The language of “values” is already implicitly relativistic, and thus nihilistic.

One of Heidegger’s central ideas—and Wittgenstein’s—is that it’s impossible (and undesirable) to make explicit our everyday practices, concerns, skills, “values.” As Wittgenstein said, they can only be shown. But they are what give our lives meaning, what allow us to make sense of the world. They constitute “a kind of knowing-how rather than a knowing-that. At the deepest level such knowing is embodied in our social skills rather than in our concepts, beliefs, and values. Heidegger argues that our cultural practices can direct our activities and make our lives meaningful only insofar as they are and stay unarticulated, that is, as long as they stay the soil out of which we live. If there is to be seriousness, it must draw on these unarticulated background practices. ... What is most important and meaningful in our lives is not and should not be accessible to critical reflection.” That’s profound and profoundly true. In Nietzschean language, instinct, or the unconscious, is what guides a healthy life. To articulate is to belittle—and to transcend. In making something explicit, I transcend it. In bringing something to the level of consciousness, I deprive it of its power over me. Wasn’t that the assumption behind Freud’s method? If you bring a repressed fact to the light of day, you deprive it of its power over you. It’s the same with the shared practices that determine what matters for us.

The shared practices into which we are socialized provide a background understanding of what matters and what it makes sense to do, on the basis of which we can direct our actions. This understanding of being creates what Heidegger calls a clearing in which things and people can show up as mattering and meaningful for us. We do not produce the clearing. It produces us as the kind of human beings we are...

Our cultural practices and the understanding of being they embody allow us to direct our activities and make sense of our lives only insofar as they are and stay unarticulated, that is, stay the atmosphere in which we live. These background practices are the concealed and unmastered that Heidegger tells us give seriousness to our decisions. Mattering lies not in what we choose, but in “that on the basis of which” we choose. [My italics.] The more our know-how is formulated and objectified as knowing-that, the more it is called up for critical questioning, the more it loses its grip on us. This is part of what Kierkegaard saw in his attack on modern critical reflection, and Heidegger in his attack on value-thinking.

But this isn’t the whole story. After all, “there must always be a clearing—background practices containing an understanding of being—in order for things and people to be intelligible at all.” Evidently the problem lies with our background practices, which are such that we are forced to choose personal values for ourselves. So the question is, what is it about these practices that makes them nihilistic? In order to answer this question we have to understand how it is that practices create shared meanings in the first place.

Enter: the work of art. In a broad sense. An artwork discloses an entire world, a way of viewing the world. Consider the Greek temple versus the medieval cathedral. The temple fostered a moral space defined in terms of gods, heroes, and slaves; the cathedral facilitated a moral space of sin and redemption, salvation and damnation. Each world was totally different from the other. “Heidegger would say that the understanding of what it is to be changes each time a culture gets a new artwork. Then different sorts of human beings and things show up.” The temple and the cathedral represent different cultural paradigms. “A cultural paradigm collects the scattered practices of a group, unifies them into coherent possibilities for action, and holds them up to the people who can then act and relate to each other in terms of that exemplar. Works of art, when performing this function, are not merely representations or symbols, but actually produce a shared understanding.” They create and maintain a sensibility.

Thomas Kuhn draws on these Heideggerian ideas with his notion of a “paradigm shift.” The paradigm that guides scientists’ practices cannot really be stated as a set of beliefs or values, or rules or criteria. It can only be shown. It can’t be rationalized; it can only be imitated. And this is what explains its

authority. Similarly, the artwork resists rationalization, because it isn't a symbol of a system of beliefs and values. It is rather an exemplar of shared practices.

The similarities between Heidegger and Wittgenstein are amazing. And Marx too, though in a different way. Less phenomenological and much less "cultural." Kierkegaard and Nietzsche, by contrast, are rather individualistic and psychologistic. (Heidegger can also be psychologistic, but in a more 'phenomenological' and 'metaphysical' way.)

Interesting terminological point: "Heidegger calls the way the artwork solicits the culture to make the artwork explicit, coherent, and encompassing the world aspect of the work. He calls the way the artwork and its associated practices resist such totalization the earth." In other words, the artwork has an explicable, articulable aspect, but it also has a mysterious, intuitive, ineffable aspect. This is true of cultural paradigms too. (Cf. what I wrote about the "objective spirit" of an era in the first paragraph of my first little paper on John Brown.) Since no interpretation is ever adequate to a work of art or a paradigm, a struggle between earth and world is set up. "This struggle is a necessary aspect of the way meaning inheres in human practices. It is a fruitful struggle in that the conflict of interpretations it sets up generates a culture's history." Hm. That's a rather simplistic, and "idealistic," way of putting it.

The problem with our modern technological paradigm is that it rejects earth in favor of world. It's on the basis of earth that our actions can matter to us, but modern culture celebrates clarity and control. It denies the mystery of being, thereby denying Heideggerian seriousness and authenticity, and meaning. In trying to raise everything to consciousness it belittles being and makes it threadbare. Even the earthy margins of culture are under attack, such as friendship and "the mystical merging of the erotic," which has been turned into private sexual "experience." (The fetish of superficial, private "experiences," having as many experiences as you can because there is no publicly shared meaning in your life to fill up your existence. The meaning of your life becomes the accumulation of experiences, something quantifiable. An escape from meaninglessness, a distraction.) A technological, 'comfortable' utopia would be the worst possible thing for humans. The problem isn't technology itself but the technological understanding of being. Fortunately, according to Heidegger, it can be overcome. He thinks it should be possible for us to use technology without thinking of being in terms of values and calculation and means-end reasoning. We simply have to accomplish a gestalt switch, in which "the clearing belonging to the essence of being suddenly clears itself and lights up." As Dreyfus says,

Once one recognizes the technological understanding of being for what it is—a historical understanding—one gains a free relation to it. We neither push forward technological efficiency as our sole goal nor always resist it. If we are free of the technological imperative we can, in each case, discuss the pros and cons. As Heidegger puts it: "We let technical devices enter our daily life, and at the same time leave them outside...as things which are nothing absolute but remain dependent upon something higher. I would call this comportment toward technology which expresses 'yes' and at the same time 'no,' by an old word, *releasement towards things*."

Such releasement would eventually make possible a renewed understanding of our embeddedness in nature, our localness, and it would give rise to shared meaningful differences between us. We have to learn how to receive (being) again rather than control (it). In this new clearing, a more meaningful society could arise. "The issue," Heidegger writes, "is the saving of man's essential nature. Therefore, the issue is keeping meditative thinking alive." –Ha! There, he said it. Man's essence is meditative thinking. How surprising that a philosopher considers philosophy to be man's essence. Marx had advanced beyond this position.

It's significant that when a stand-up comic gets no laughs he says later, "I died. It was like *death* out there," while when the audience loves him he says, "I *killed!*" A semi-Hegelian struggle for recognition. (Absence of recognition = death of the self. Either the comic or the audience wins the struggle.)

What does it mean to *blame* [I meant *condemn* or *judge*] someone? Does that act make sense? What are its presuppositions? It presupposes that the person in question had control over his act, that he did it intentionally. So it couldn't have been an accident. Or maybe that's not right. Suppose someone accidentally crashes his car into mine; I'll "blame" [or condemn or *judge*] him. I'll get angry at him, which means I'll believe he did something *wrong*. What, though? That he behaved *negligently*. He should have been more careful; he was showing disregard for my welfare and that of my possessions. So, in a sense, it was intentional after all: while he didn't intend the crash, he was implicitly "intending" disrespect for me. But that isn't necessarily true, of course. Surely he wasn't thinking about me or my possessions at all. Maybe he got distracted and lost focus for an instant, with the result that he crashed into me. Is it rational to blame him for getting distracted? No, because by definition he doesn't have control over that. In order for him to have done something wrong, his free will has to have come into play. But here there is no question of free will: there is only an unintentional momentary lapse. But what if his behavior was *explicitly* negligent? What if he ran a red light? Then clearly he did do something wrong, something dangerous. But actually, strictly speaking, my anger at him isn't primarily on account of his ignoring a red light, as is shown by the fact that if he hadn't crashed into me I probably wouldn't have gotten angry. First and foremost, I'm angry that he crashed into me—and *this* anger, in itself, isn't rational, as we saw a moment ago. (Causing a car-accident is not in itself wrong (morally), since it can be accidental. Everything depends on the context.) In this example, whatever rational justification my anger has comes from his having ignored a red light and thus put me in danger. He acted stupidly and morally recklessly. Right? But what if he didn't see my car coming from the other direction, he was terribly late for an appointment—or, to use an 'unselfish' example, he was rushing his pregnant wife to the hospital, or he had gotten a call from his daughter that an intruder was in the house, or some such thing. In 'emergency' cases like this, surely our intuition is that his behavior wasn't truly wrong. Maybe it was still somewhat reckless, but one can hardly blame him for that. So, morally speaking, it seems he's off the hook. In order for me not to "blame" him, then, he has to have had a good, unselfish reason for his behavior, a reason that trumps the claims of ordinary traffic-etiquette. Nevertheless, it isn't morally justifiable for him to put other lives in danger. It may be *understandable*, though. If it's understandable, is blaming him still reasonable? No, according to the common expression "I don't blame him. I would have done the same thing myself." That is, I might still have been morally culpable in doing the same thing myself, but I would have done it anyway, and so I can't "blame" him. "It was wrong, but I would have done it too." So I don't have the right to be angry at him. This is interesting: common sense distinguishes between giving someone the right to be angry, i.e. the right to *judge* the doer from a morally superior standpoint, and acting immorally. One can act immorally without thereby being "blameworthy" from someone else's perspective, because one's act might be *understandable*, i.e. could be done by any reasonable person. So there are two standards and two kinds of blame involved: an objective morality of some sort and the corresponding "objective" notion of blame (or condemnation), versus the *human* standard, so to speak, which is less stringent than the moral one in that any reasonable person would be capable of committing the "objectively" immoral act in question. And common sense is wise here, since it is not rationally justifiable to judge someone to be morally inferior (to oneself)—i.e., to *blame* him, to *shame* him, to get angry at him—on the basis of an act that one would commit oneself given similar circumstances. So let's bracket the question of "objective" morality. The main point I want to make is that in the majority of cases in which we get angry at someone, i.e. blame him, we are "capable" of acting the same way ourselves, which means our anger is unjustified (since the angry state of mind posits a moral *inequality* between oneself and the offender).

And yes, I think that the "moral" perspective is always implicit in such attitudes as anger, disgust, hatred and resentment (though not necessarily contempt). It may be a loose and imprecise understanding of morality, but insofar as the attitude incorporates the judgment that the offender has violated the "proper" way to act toward others (or toward animals, or toward the environment, or vis-à-vis the claims of integrity, as the case may be), it invokes morality.¹

¹ For instance, my resentment of Eric Schliesser for his comments on my senior thesis necessarily incorporates the judgment that he is a "bad" person (to the extent that I resent him), that he has acted badly toward me and vis-à-vis

I sort of inadvertently answered my original question in the course of writing that long paragraph. The act of blaming someone does have a kernel of rational content...I think. It's the judgment that he hasn't acted the way a reasonable and/or high-minded person would act, i.e. the way the *judger* would act (or so the judger thinks). Whenever I'm angry etc. at someone, I "blame" or "condemn" him implicitly. —But, more often than not, the postulated inequality between him and me is an illusion in my mind. It may be true that he acted unreasonably or immorally in some way, but in looking down on him for it I'm probably being inconsistent because I *could* have done the same thing myself. (On the other hand, I didn't, and so at least in *that* moment there *is* a sort of inequality between us, I being the moral and he being the immoral one. And perhaps, after all, there *is* a real difference between the two of us, a "moral" difference in our characters.) —Obviously all this ignores the half-meaninglessness of the concept "moral," which meaninglessness further undermines the rational basis of my implicit self-righteousness in judging the other.

Needless to say, there are other senses of 'blame' too. For example, "I blame him for the break-up of my marriage" simply means "I think he's the one who caused it."

Reading an anthology called *Philosophy in the Twentieth Century*, edited by William Barrett and Henry Aiken. Volume 4, the one I'm reading first, is on Marxism and the philosophy of history. It has a useful introduction. Review of facts I already knew:

Not until the French Revolution did mankind begin to have a full appreciation of *historical development*. With the Greeks, the Chinese and the Indians, history was cyclical. For the Greeks, "the eternal cycle of the heavens was imitated by the cycles of the seasons, and these in turn by the cycles of human history: the rise and fall of empires and men. Plato speaks of the cosmic Great Year (some 36,000 ordinary solar years) at the end of which all human things have decayed and go again through their old patterns. Aristotle remarks that the arts and the sciences have been discovered and have perished numberless times in the past." Christianity brought a new consciousness of history—time had a beginning and an end—but, nevertheless, "as far as the actual social life of man was concerned, the future was thought of as repeating the past, even though the future carried with it the possibility of the religious apocalypse. All of human history was spread out as a simultaneous whole before the gaze of an eternal, and therefore non-historical, eye." Then the Renaissance: a more secular consciousness began, but even in the 18th century "historians still performed their job essentially as moralists and humanists in the style of the great classical historians. Thus Gibbon takes Tacitus as his model." Even Vico, Herder and Condillac didn't undertake a "philosophical analysis of what historical phenomena and historical knowledge essentially are"; they simply described what the course of history had been.

"The French Revolution was the first event in human history that revealed that a revolution did not mean merely the exchange of rulers...but that the whole fabric of human life could be completely transformed from top to bottom. The future thus took on a new dimension of contingency: it could mean that the life of man in that future might be radically different from what it had been in the past... Kant described the Revolution as the most significant event in history up to that point, since it revealed for the first time that the conditions of human life could become totally different from what they were. However, none of this penetrated into Kant's philosophy proper: with him the forms and categories of the mind are necessary and *a priori*, fixed and eternal, not the creatures of historical evolution and change. It was Hegel who was to make the imaginative leap...to the new truth that all forms of the human spirit—including 'reason'—are the product of historical development." For Hegel, even logic is interpreted in quasi-historical terms!

"Yet...in the end Hegel remains faithful to the classical tradition in philosophy that goes back to Plato in its insistence that the philosopher must try to see all things in the universe with unhistorical eyes

intellectual honesty, that he is arrogant and so on. I may also have contempt for him, which might mean only that I don't respect his intelligence—and *this* attitude does *not* seem to incorporate anything like a moral judgment or "blame" or "condemnation" in the full sense, because he doesn't have control over his lack of intelligence (whereas he does—this is the presumption, at least—over his arrogance, his lack of intellectual integrity, and so on, which is what allows these to count as (im)moral qualities).

in the aspect of eternity. For the Absolute is beyond time, change, and history, which belong only to appearance. Thus Hegel's labor to expound the historical point of view in all fields is curiously at odds with itself because history itself has already been completed in the fullness of the Absolute... Real contingency disappears from history, for the end is already given." Marx banishes the Absolute, thus getting down to history itself, but he still adheres to the myth of inevitable progress (according to the editor). This editor's criticisms of past views of history are similar to Ernst Troeltsch's.

Lenin's *Materialism and Empirio-Criticism*, from the selections I've read so far, is sensible. (That isn't the academic consensus, but what do you expect from academic philosophers? He's a Commie, after all.) Here's one of his briefer summaries of Berkeley's thought: "Let us regard the external world, nature, as a 'combination of sensations' evoked in our mind by a deity. Acknowledge this and give up searching for the 'ground' of these sensations outside the mind, outside men, and I will acknowledge within the framework of my idealist theory of knowledge *all* natural science and all the importance and authenticity of its deduction..." This view is essentially that of the logical positivists, of Carnap and Ayer and the rest. They were basically idealists, albeit of a special kind. Like them, Berkeley considered realism and materialism to be little more than nonsense—although the positivists' reasons for saying so were different, namely that metaphysical statements cannot be empirically verified. So they also considered Berkeleyan idealism, which makes metaphysical claims, nonsensical, while nonetheless implicitly adhering to it far more closely than to realism. For they rejected all talk of mind-independent matter. Within a certain linguistic framework, argued Carnap, it makes sense to talk about independently existing objects, e.g. the frameworks of natural science and common sense; but it's meaningless to ask, from a position external to these frameworks, whether there "really" exist things in themselves. To do so is effectively to question the reality of the frameworks themselves, which doesn't make sense because frameworks aren't the sort of things that can be "real." In the framework of science it's *useful* to talk about the reality of electrons, and in the framework of ordinary language it's *useful* to talk about the reality of tables, and that's all that can be said. So the difference between the positivists and Berkeley is that the former consider the *question* of things in themselves meaningless, while the latter considers the realist/materialist *answer* meaningless. But then they both come out on the side of idealism, since all they recognize are sense-data and language. (The positivists consider objects and the world to be logical constructions out of sense-data. Again, Berkeley.) You see: metaphysics can't be avoided, even by those who think they're avoiding it. And Lenin is right that Ernst Mach and his disciples are derivative of Berkeley.

Ironically, (some of) the positivists were, in a way, even more idealistic than Berkeley. For Berkeley thought that the existence of "objects" even when we're not perceiving them is guaranteed by the existence of God, who perceives them at all times. But the positivists rejected the question entirely, which, given their other doctrines, effectively meant that reality consists only of sense-data and "logical constructions" and language. It's a very paradoxical, i.e. stupid, doctrine.¹ And it makes natural science a mystery, and (ironically!) a sort of delusion. For science *does* postulate things in themselves. —Fucking philosophers. The ones who most pride themselves on their clarity and precision are the most confused of all.

I simply fail to understand how a phenomenalist, someone like Ernst Mach or Ayer and Carnap in their early years, can accept scientific explanations literally. How can he accept that the nervous system constructs experience? The nervous system, like all external things, is mind-independent! If only sensations and logical constructions out of them exist, then there *is no nervous system* (independent of our sensations)! And so consciousness and sense-data, being effectively the only things that exist, become a permanent mystery, as does science itself. Is it possible for thinkers to be so confused?? Lenin shares my befuddlement. "...Sensation, then," he paraphrases, "exists without 'substance,' i.e., thought exists without brain! Are there really philosophers capable of defending this brainless philosophy? There are!"

I asked Chomsky about this. He answered: "Carnap wasn't a phenomenalist in the usual sense. In his *Logische Aufbau der Welt* he did take sense data as a basis for his constructions, but that is because it

¹ One problem: solipsism. If there are no mind-independent things, then there are no people besides me. Berkeley at least had a theory to address this problem.

seemed to him to work, as opposed to taking physical objects. And he accepted scientific explanations. There's no inconsistency. We can believe, with Russell, that the most trustworthy evidence we have is our own immediate experience and that science is the organized effort to make sense out of it, and still regard the whole edifice of science, including postulation of the nervous system, as the best explanation, with no inconsistency." Obviously the last sentence is right. But if we don't countenance the existence of mind-independent matter, surely we can't accept scientific explanations. From everything I've read by and about them, the logical positivists—at least, most of them—rejected not only the existence of theoretical entities but even the meaningfulness of the statement that matter exists independently of its being perceived. (Thus, Ayer said that "The chair exists when I'm not looking at it" *means only* that I would have certain sense-perceptions if I looked in 'its' direction. (Reminds me a little of Berkeley.)) But science is committed to the mind-independence of matter. So it seems that Ayer and others, if my characterization of them is correct, can't consistently believe in the literal truth of scientific hypotheses.

I sent that to Chomsky. He wrote, "That's Ayer, a vulgarization of logical positivism. Carnap wouldn't have agreed. He was a physicist – as many of the Vienna Circle were – and a large part of his goal was to provide means for physics to carry out its work more clearly and successfully." Yes, I know, which is what confuses me. Carnap was obviously more sophisticated and subtle than Ayer, but I can't agree with him that *all* ontological questions are meaningless. Questions about numbers, classes, properties and propositions are, but not questions about ordinary objects and theoretical entities like atoms, since these are supposed by most physicists themselves to have real existence in spacetime. More generally, there either *is* (mind-independent) matter or there *isn't*. That can't be a pseudo-question, because common sense and science are both committed to the position that there *is* matter. Period. (Nothing about "linguistic frameworks" here.) Which means it's a substantive position. Carnap wanted to navigate between realism and instrumentalism (anti-realism, a kind of idealism), but that's hard, maybe impossible, to do. Was he some sort of "structural realist"? Did he reject realism about theoretical entities but accept it vis-à-vis the *mathematical structures* of physical theories? Perhaps. But then, if so, he was an anti-realist in a sense—and a realist in another—which means he took a "metaphysical" position.

I'm always suspicious of philosophies that can't be stated in plain English. All this talk about "linguistic frameworks" and this refusal to be pinned down to one position, at times adopting the language of realism, at others the language of idealism, and at others saying that the whole issue is misguided—makes me suspicious.

The second Trio from Bach's Brandenburg Concerto No. 1 in F, the duet between the horns and the oboe near the end. Simply unique. Nothing like it. Indescribable.

Another irony.— In a nihilistic age, it's the nihilism-hating fanatics [such as fascists or terrorists] who finally become the greatest nihilists of all.

Chasing tail.— My chasing after women is as irrational, confused, frantic, self-vitiating, and *circular* as a dog's chasing its tail. (Panting, tongue hanging out, twisting around in circles, the object always just beyond my reach—and it's basically a *part of myself* that I'm chasing but can never coincide with.)

I met Meng this evening, a Chinese grad student I had previously met at a barbecue. What a great girl! A truly intelligent, friendly, considerate person, three qualities that are rarely found together. She suggested I take dancing lessons as a way to meet people, and go to a couple of churches she mentioned. My mom also recently suggested this humanistic church near Harvard; I think I'll try that one too. [...]

I'm reading *American Pragmatism: Peirce, James, and Dewey*, by Edward Moore.

In pitying the human species one is pitying an abstract entity, which is senseless. To feel sorry for humanity... is to feel sorry for an idea. Mankind doesn't have a Hegelian Spirit; there are only individuals. Some people are happy, some are unhappy. It's the same fallacy as that involved in hating Jews or women,

or in obsessively seeking fame: the collective entity that is one's intentional object doesn't exist. It is but a confused projection of the Other in oneself. —Of course, the drive for recognition (or confirmation) itself is based on a confused projection of this Other. It is the self's lifelong quest to reach itself and unite with itself.

—The socialized body (the self) wants to unsocialize itself, to transcend self-consciousness, the subject-object division in itself; it undertakes this unfulfillable project with the help of art, philosophy, music, love, friendship, sex—in fact, most activities. *Activity* is the self's projecting itself into the world, which also means into *itself* (because it has internalized the world).

Everything that makes us human grows out of our self-separation from the immediate, our mediating of experience, which is simultaneously our universalizing of it. (There is nothing between the particular and the universal. Through abstraction, one universalizes.) But there is an element of falsity in all abstraction, all reification, all mediation and universalization. There is a lack-of-union-with-reality. So, everything distinctively human is deluded. *Untrue* in some sense. The belief in words and concepts is a delusion; so is the (substantial) self; so is the self's desire for confirmation, in all its permutations—because they are not what they seem and cannot be consummated. All these beliefs and implicit self-conceptions incorporate *abstraction*: concepts *are* abstractions (from experience), which means they don't exist *per se*;¹ the self-substance is an abstraction from the body's past experiences and interactions with other bodies, and it includes, or presupposes, the abstract Other, which is involved in the desire for recognition and ultimately vitiates it. The very nature of the human mind is abstractive—except in its lower realms, its appetitive and sexual realms. They're governed by concreteness, although of course they come into contact and tension with the higher abstract mental functions. (For instance, while the male sex drive gets 'taken up' by the desire for recognition in such a way that sex becomes, for men at least, another means toward recognition, the drive also *conflicts* with the desire for recognition. Were it not for this desire, after all—which is intimately connected with the inculcation of social norms—men would grab a pretty woman on the street and have their way with her. But because of the mind's internalization of other people's viewpoints and its desire for approval from people, the sex drive gets frustrated.)

I'm sick of Obama already. My skepticism was well-founded. I just want this world-system to end, a system that has made life miserable for the many and meaningless for the few—or the many.

It's misleading to say that concepts are "fictions." The unicorn is fictional; concepts aren't, at least not in the same way. "Consider the perceptual judgment, 'This stove is black.' On the basis of this judgment we make the abstraction of 'blackness'; that is, we consider blackness in itself. This blackness as considered in itself is not a fiction; it is not a product of my imagination. It is real. It has an external counterpart, namely the blackness that is in the stove. All that is meant by saying that blackness is real is that there is something which has blackness in it; that is, something that is black. Since this is so, blackness is not a fiction but a reality. 'It is perfectly true [writes Peirce] that all white things have whiteness in them, for that is only saying, in another form of words, that all white things are white; but since it is true that real things possess whiteness, whiteness is real.'" All this is obvious. If Quine would contest it, he's contesting common sense. But nominalism grasps a truth too: a concept itself is essentially *nothing*. It is not an existent, because everything that exists is a particular, it has a spatiotemporal location. There are no "general" or abstract *entities*. The notion doesn't even make sense. But it can be said to be presupposed by natural languages, by advanced communication, which predicates properties, or abstract objects, of things, and constantly uses abstract entities/objects like numbers and propositions. But when you look closely at these abstract objects you see that they're nothing, they're just...semantic rules that facilitate social behavior and thought. Kant's analysis of them is basically right. (Rules for uniting representations, or whatever he said.) *There is nothing*

¹ "The concept 'shoe'" doesn't exist. There is not one such thing existing in a Fregean third realm, though we necessarily implicitly assume there is. We do have to use 'concepts' in order to communicate—which is why they're necessary fictions—but their *existence* has no place in a scientific account of the world. 'Where' would they exist? [See a few paragraphs below.]

there. Whenever you analyze the foundations of consciousness and meaning, you find that it's all basically, and disturbingly, empty. It's all behavioral, or half-behavioral and half-'mental.' But we want something more than this emptiness—we think we *are* more than this emptiness—and so philosophers keep returning to the same questions about meaning and the self, hoping to find something beneath it all, something to ground it all. —All these thoughts are what I was trying to communicate in my papers on ontology and the analytic/synthetic distinction.

Sent Chomsky another email:

Since I respect your opinion on everything, I'd like to pose an ethical question—which might seem rather academic and pointless. But I'm undecided between a 'natural rights' approach to morality and a sort of non-Benthamite utilitarianism, perhaps a utilitarianism tempered with a natural rights approach, if that makes sense. So, for example, killing a person in itself is immoral. But if that person himself is killing some arbitrary number of people—say, a Hitler or a Saddam Hussein or some such character—is it justifiable to kill him, or him and his bureaucratic enablers? Surely Kant is right that that act 'in itself' is immoral—but, on the other hand, it seems 'justifiable.' It's both morally justifiable, at least *prima facie*, and yet 'absolutely' immoral (on the natural rights and Kantian conception) because one is taking a human life. So do you agree that the proper way of looking at morality is to 'combine' utilitarianism with 'natural rights' in this way? (The utilitarianism presumably comes into play with the justification given for killing Hitler, namely that it will increase the sum total of happiness and justice in the world.)

I don't think the natural rights approach tells us much in this case. It tells us that it is immoral to take a human life, but it is also not to save lives when we can. I don't think utilitarianism gives answers either, for reasons that John Rawls discussed. Frankly, I don't think we can hope to find sound foundations for morals that will lead to conclusions in hard cases, any more than we can find sound principles for scientific inquiry that reach to difficult problems. We can do no more than use our critical faculties, evaluate the circumstances as best we can, and then arrive at necessarily uncertain judgments—in both domains.

His response is the reasonable answer, the one I've always subscribed to. If killing Hitler, as opposed to merely imprisoning him, is the only option and one can foresee that the result will be positive, it's morally justifiable—in fact, obligatory—to kill him. But it isn't easy to predict the future. For all you know, killing him might make the situation worse. [Um, in the case of Hitler, that's unlikely.]

No more of that book on pragmatism.
