I'd note here, by the way, that there's a lot of truth in the earlier interpretations too. As Wood indeed acknowledges. While the key transition may have happened in the English countryside, as Brenner and Wood argue, it was substantially dependent on earlier developments like the rise of trade, the existence of urban markets, the slow and partially interstitial erosion of feudal dominance across Western Europe. (So my comments in the book on cooperatives were basically valid.)

Throughout recorded history, of course, there has been commerce on a very wide scale. But insofar as it wasn't "subjected to the pressures of competitive production and profit-maximization, the compulsion to reinvest surpluses, and the relentless need to improve labor-productivity," it wasn't really capitalist *per se*. Capitalist competition necessitates the continual transformation of production, its continual "revolutionizing." The kind of trade that created great commercial powers tended to be "carrying" trade, with merchants buying goods in one location to be sold for a profit in another, or "commercial arbitrage between separate markets." "But even within a single, powerful, and relatively European kingdom like France, basically the same principle of non-capitalist commerce prevailed. There was no single and unified market, a market in which people made profit not by buying cheap and selling dear, not by carrying goods from one market to another, but by producing more cost-effectively in direct competition with others in the

same market.” Nor was there a *mass market* for cheap everyday consumer products such as the market that would later drive industrial capitalism in Britain.

Even such advanced commercial societies as Florence during the Renaissance and the Dutch Republic during the sixteenth and seventeenth centuries weren’t “capitalist” in the strictest sense. The success of Florentine trade depended on extra-economic factors like monopoly privileges and other types of “politically constituted property.” The Dutch were even more commercial than Florence, but they too were dependent on the (European) market in luxury goods and subject to its limitations. They also relied on “extra-economic superiority in negotiating separate markets, rather than on competitive production in a single market: on dominance in shipping and command of trade routes, on monopolies and trading privileges, on an elaborate network of far-flung trading posts and settlements, on the development of sophisticated financial practices and instruments.”

Capitalism really began in the agrarian sector in early modern England. Wood doesn’t go into as much detail as I’d like, but she sketches some of the conditions that made England unique. No other country was as effectively unified as England by the sixteenth century: it had a much more centralized state than even France and Spain, made possible by an impressive network of roads and water transport. London was becoming the hub of a national market, and agriculture was the foundation of this emerging national economy. The English ruling class was distinctive in two respects: first, it was demilitarized before any other aristocracy in Europe, and so did not possess “extra-economic” power or “politically constituted property” to the same degree as its continental counterparts.

On the other hand [Wood continues] there was what might be called a trade-off between the centralization of state power and the aristocracy’s control of land. Land in England had for a long time been unusually concentrated, with big landlords holding an unusually large proportion, in conditions that enabled them to use their property in new ways. What they lacked in “extra-economic” powers of surplus extraction they more than made up for with increasing economic powers.

This distinctive combination had significant consequences. On the one hand, the concentration of English landholding meant that an unusually large proportion of land was worked not by peasant-proprietors but by tenants... On the other hand, the relatively weak extra-economic powers of landlords meant that they depended less on their ability to squeeze more rents out of their tenants by direct, coercive means than on their tenants’ success in competitive production. Agrarian landlords in this arrangement had a strong incentive to encourage—and, wherever possible, to compel—their tenants to find ways of reducing costs by increasing labor-productivity.

...As for the tenants, they were increasingly subject not only to direct pressures from landlords but also to market imperatives that compelled them to enhance their productivity. English tenancies took various forms, and there were many regional variations, but a growing number were subject to economic rents—rents fixed not by some legal or customary standard but by market conditions. There was, in effect, a market in leases. Tenants were obliged to compete not only in a market for consumers but also in a market for access to land.

The effect of this system of property relations was that many agricultural producers (including prosperous “yeomen”) became market-dependent in their access to land itself, to the means of production. Increasingly, as more land came under this economic regime, advantage in access to the land itself would go to those who could produce competitively and pay good rents by increasing their own productivity. This meant that success would breed success, and competitive farmers would have increasing access to even more land, while others lost access altogether...

In short, “it was unfixed, variable rents responsive to market imperatives that in England stimulated the development of commodity production, the improvement of productivity, and self-sustaining economic

development.” Even tenants (or, in some cases, landowners working their own land) who enjoyed some sort of *customary* rent that gave them more security might have to sell their produce in the same markets as farmers who were responding more directly to the pressures of the market. So if they weren’t productive enough to compete with other producers’ low prices they wouldn’t be able to sell their produce. Ultimately they might go under and join the poorer classes.

So, as competitive market forces established themselves, less productive farmers lost their property. Market forces were, no doubt, assisted by direct coercive intervention to evict tenants or to extinguish their customary rights... The famous triad of landlord, capitalist tenant, and wage-laborers was the result, and with the growth of wage-labor the pressures to improve labor-productivity also increased. The same process created a highly productive agriculture capable of sustaining a large population not engaged in agricultural production, but also an increasing propertyless mass that would constitute both a large wage-labor force and a domestic market for cheap consumer goods—a type of market with no historical precedent. This is the background to the formation of English industrial capitalism.

Wood contrasts these developments with what happened in France around the same time, as the absolutist state, in the process of resolving the crisis of feudalism, *strengthened* old forms of peasant possession to preserve and expand the kingdom’s tax-producing base while simultaneously reviving feudalism. (Because of this persistence of feudalism, moreover, France had to await the Napoleonic era to remove internal barriers to trade, whereas in England a competitive national market emerged much earlier.)

By the seventeenth and, especially, eighteenth centuries (the latter of which was the heyday of English agrarian capitalism), a practice and ideology of agricultural “improvement”—enhancing the land’s productivity for profit—emerged on a broad scale across England. Scientists, landowners, tenants, eventually politicians, etc. grew intensely interested in new techniques of farming, technological innovations, and new forms and conceptions of property that would yield more productive agriculture. Thus arose the enclosure movement and the increasing privatization of land.

Wood’s discussion of bourgeois revolution, and her distinction between bourgeois and capitalist, is of interest. Personally, I’ve always used the concept of “bourgeois revolution” in a somewhat ambiguous way, to designate both a country’s long transition to capitalism and a particular moment of political revolution, such as the Glorious Revolution or (in some respects) the French Revolution. In the latter sense, capitalism has necessarily already made progress before the dramatic political clashes, which serve to sweep away some remaining obstacles to its further advance. Wood is semi-critical of the concept of bourgeois revolution, and I take her point that we should be more careful and analytical in how we use it. Anyway, the differences between the French Revolution and the English Revolution of the mid-seventeenth-century are indeed striking. The latter revolution consolidated the position of a capitalistic landed class that was already dominant both in society and in the state. “The revolution was not a class struggle that gave victory to a capitalist bourgeoisie against a ruling class thwarting its progress. The class struggle that certainly did take place within the Revolution was between that ruling class and subordinate popular forces, whose class interests had as much to do with opposing as promoting the progress of those capitalist landlords or their bourgeois collaborators.”

The French Revolution of 1789, on the other hand, was (she says) much more of a “bourgeois revolution” than the English case, if that’s supposed to mean it was a major struggle between bourgeoisie and aristocracy. But it wasn’t very *capitalist*, inasmuch as the revolutionary bourgeoisie (city-dwellers, etc.) was, by and large, not capitalist even in its aspirations, being more concerned with civil equality between the Estates and the elimination of aristocratic privilege. But Wood does admit that in the long run the Revolution probably facilitated the development of capitalism by unifying the state and eliminating internal barriers to trade. —I’m inclined to think that Jean Jaurès’ classic history of the Revolution partially refutes Wood’s “problematizing” interpretation.

As agrarian capitalism progressed, an entirely new kind of commercial system was born, centered in England and especially London. For one thing, England developed its own distinctive banking system,

which wasn't just a more sophisticated version of ancient and medieval banking systems like in other European countries—specializing in money-changing operations, public banks dealing with state finances, and mechanisms for financing long-distance trade—but was organized around *domestic* trade. Specifically, it facilitated a network of distribution from London outwards throughout the country “by means of ‘factors’ or agents who operated on commissions and credits.” This sort of banking made possible the integrated national market that sustained a growing non-agrarian population. And the national economy became the center of an international commercial system different from any other in history, which replaced “the infinite succession of arbitrage operations between separate, distinct, and discrete markets that had previously constituted foreign trade.”

Another unusual thing about the new British economy was that the poverty of its mass of consumers, namely the propertyless wage-laborers who had become dependent on the market for their survival, *impelled* rather than *hindered* development of the forces of production. For it was necessary to produce cheaply in order for all these people to afford the basic necessities of life. So the masses' poverty reinforced the systemic compulsion to reduce costs of production in order to compete with other producers. (It's ironic that the *limitations* of the market stimulated development and reinforced the economy's dynamism.)

Agrarian capitalism made industrial capitalism—which is to say the maturation of the capitalist mode of production—both possible and probable (if not inevitable). The reasons should be obvious by now: it was agrarian capitalism that created a dispossessed mass forced to sell its labor-power for a wage, a mass that also constituted a consumer market for the cheap everyday goods (food, textiles) that drove industrialization in England. The outcome of the logic of agrarian capitalism was industrialization.

The chapter on the origins of capitalist imperialism is another enlightening one. Wood starts out by critiquing the view common among anti-Eurocentrists like J. M. Blaut that it was imperialist ventures in the New World, Africa, and Asia that made possible the “primitive accumulation” of wealth that led to Europe's capitalism. One obvious problem with this view is that while several European powers, such as Spain, Portugal, Holland, and France, were imperialistic/colonialist, only England made the leap to capitalism and then industrial capitalism. Moreover, England was a relative latecomer to the colonization game, and “its acquisition of colonial wealth lagged behind its own domestic capitalist development.” Later, it wasn't only Britain that accumulated enormous wealth from slavery, but it *was* only in Britain that that wealth was converted into industrial capital (as Marxist historians like Eric Williams have argued). So why was colonialism associated with capitalism in one case but not in others? Evidently because the necessary transformations in property relations had already occurred in Britain but not elsewhere. “The wealth amassed from colonial exploitation may have contributed substantially to further development, [but] it was not a necessary precondition of the *origin* of capitalism.”

“We can, nevertheless, identify a specifically capitalist form of imperialism, an imperialism that was more the result than the cause of capitalist development and stands in contrast to other European forms.” Pre-capitalist imperialism is just the usual stuff: seizing territory and resources, capturing and enslaving people (thus the Spanish *encomienda* system and the slave plantation), using military power to squeeze taxes and tribute out of subject territories, etc. Or, in other cases, it was done in the interests of commerce, to secure trade routes, impose monopolies, gain exclusive rights to some precious commodity, and so on. The new capitalist imperialism, by contrast, amounted to the world's first “structural adjustment programs.” England's conquest of Ireland in the sixteenth and seventeenth centuries was arguably the first case. For a long time England had tried to subdue Ireland by direct military means, but the Tudor state embarked on an aggressive new policy of colonization. “The effort to exert extra-economic control by a more effective military conquest was supplemented by an attempt to impose a kind of *economic* hegemony, using military force to implant a new economic system, as well as a new political and legal order.” In 1585, for instance, a plan was enacted to grant expropriated lands in Munster to settlers who would introduce English agriculture to the region. The goal was to establish an English-style commercial order—not to turn Ireland into a commercial competitor but to make it an economic dependency of England. This aggressive colonialism “was the chief legacy of late Elizabethan Ireland to English colonization in the New World.”

In the New World, of course, the establishment of property relations governed by market imperatives was even more brutal, involving genocide. It wasn't quite so brutal in other regions, such as India—but it was certainly brutal enough there too.

The book's last chapter, on "modernity and postmodernity," makes useful distinctions between various features of modernity. The tendency to equate *bourgeois* with *capitalist* and both with *modernity* is, Wood argues, analytically imprecise and misguided. If modernity is, in part, supposed to mean *rationalization* (as Weber said)—bureaucratic organization, the spread of education, industrial capitalism, the decline of superstition, and the progress of science and technology—capitalism isn't solely responsible for it. Neither in its sense of *market imperatives* nor as a *mode of production* is capitalism the only force that has propelled rationalization. Consider the Enlightenment, which is associated with science, rationalism (and empiricism), universalism, a belief in linear progress, the freedom of the individual, and other "modern" phenomena. In some respects it was produced by *non-capitalist* (not only *pre-capitalist*) social relations. The French Enlightenment in particular belonged to the absolutist state in France, which wasn't only a political form but also an economic resource for a substantial section of the ruling class. "In that sense, it represents not just the political but also the economic or material context of the Enlightenment." She continues: "The absolutist state was a centralized instrument of extra-economic surplus extraction, and office in the state was a form of property that gave its possessors access to peasant-produced surpluses." In an overwhelmingly rural society there were also other, feudal forms of extra-economic appropriation; and the internal market, which was limited and fragmented, operated on (strictly speaking) non-capitalist principles. The bourgeoisie wasn't really a capitalist class—and for the most part wasn't even a *commercial* class, since it consisted largely of professionals, office-holders, and intellectuals.

I'd reply that while all this may be true, it was nevertheless a mainly urban and commercial context, and a context integrally tied to England's emerging capitalism, that produced the characteristic achievements of the Enlightenment. Western Europe wasn't structured by a competitive system of market imperatives, but even so, market relations, internal and external trade, colonialism, etc. were pretty fundamental to the context of the Enlightenment. Insofar as people loosely understand "capitalism" to mean something like widespread commercialism, it certainly was part of the context of the Enlightenment.

But sure, one can agree that *capital-ism*, in the strict sense, had relatively little to do with the Enlightenment. In fact, of course, the inherent nature of capitalist exploitation, compulsion, and privatization is quite opposed to the liberatory, republican, democratic, humanistic values and achievements of the Enlightenment. In this sense, *modernity* and *capitalism* are by no means synonymous. Capitalism is merely one aspect of modernity, an aspect that isn't the source of all others but even contradicts and tends to crush some of them (e.g., democracy). (But, again, it is popular struggle in the context of capitalism that has given us liberal democracy.) Other aspects, such as "rationalization," progressed even under the absolutist state in France; and the later bourgeois revolution only completed the centralizing and bureaucratizing project of absolutism.

A comparison of France with England makes Wood's point forcefully. The characteristic cultural and ideological expressions of English capitalism in the seventeenth and eighteenth centuries weren't Cartesian rationalism or rational planning (as under Richelieu and Colbert) but the "invisible hand" of classical political economy and the philosophy of British empiricism. (But this philosophy was taken up by French thinkers and used fruitfully in their battles against authority. In this sense, then, one aspect of the ideology of British capitalism was rather integral to the French Enlightenment, which undercuts Wood's argument.) "What set England apart from other European cultures was above all the ideology of 'improvement': not the Enlightenment idea of the improvement of *humanity* but the improvement of *property*, the ethic—and indeed the science—of profit, the commitment to increasing the productivity of labor, the production of exchange value, and the practice of enclosure and dispossession." Again, the point is that capitalism produced very specific ideologies and practices, only a limited subset of the rich panoply of the Enlightenment.

Anyway, the central lesson of Wood's book is well taken: we must appreciate the *specificity* of capitalism and not naturalize it as the inevitable result of—or even as *defined by*—increasing commerce or an urban society (or pre-capitalist imperialism, or a declining feudalism, or whatever). It was the product

of a unique set of circumstances in early modern England. And if it had such a definite and even implausible beginning, the possibility of its end suddenly becomes much more thinkable.

[However, I do think Brenner and Wood tend to overestimate the “radical,” “qualitative” leap away from previous commercialism that supposedly happened with English agrarian capitalism. I’m skeptical that modern capitalism is as totally different from the early-modern growth of markets and trade as they argue. It just doesn’t seem very plausible that a phenomenon wholly new in world history, *radically* different from anything that had ever come before, would suddenly appear in the English countryside around the sixteenth century.]

Happened to come across Chris Bambery’s book *The Second World War: A Marxist History* (2014), so am reading it now. Should have taken notes on Mandel’s book on the same subject; I’ll rectify that mistake with this one. It seems pretty good. It agrees with Mandel, of course, that the war was largely “a continuation of the 1914–18 conflict—a struggle to re-divide the world between the world’s great powers.” It acknowledges, though, that for tens of millions of people the war was much more than that.

As you know, the Great Depression led to a harmful protectionism on the part of the great powers. “...The US and France followed Britain in attempting to create their own protected trade areas, together with a degree of state direction of the economy. Germany, Japan and Italy did not control overseas territories and looked to military expansion to secure markets and raw materials. For the German economy this global shift to protectionism was a catastrophe. Britain, France, the US and the USSR all had ample supplies of raw materials within their economic zones [including their colonies]. Germany did not. Nearly half of Britain’s trade was with its dominions and colonies and a third of French exports went to its colonies; Germany had none. Germany’s economic revival [after World War I] had been based on exports, but now they were excluded from key markets, and key raw materials had to be bought with dollars, sterling or francs... Before Hitler took power, sections of Germany’s ruling circles began to argue that its export problems and lack of raw materials could only be solved by domination of Eastern and South Eastern Europe. They found ready allies in the military command.”

Interesting: “The idea that the British state was fighting fascism during the Second World War ignores the warm relationship that existed between the fascist dictators and sections of the British ruling class, dating back to October 1922 when Benito Mussolini and his Blackshirts came to power in Italy.” Newspapers, politicians (such as Churchill), aristocrats, and businessmen supported Mussolini—as did many in the U.S., including Roosevelt, who called him “that admirable Italian gentleman.” Of course, in general the West’s ruling class was at least very sympathetic towards fascism before World War II, if not during it. (And the *structure* of Western economies was formally fascist, characterized by deep and extensive ties between big business and the state.) The fascist Oswald Mosley was just a little more extreme and buffoonish than his peers.

Likewise, in the thirties “the dominant view in British ruling circles was that Germany should be encouraged to satisfy its expansionist ambitions to the east”—not least because this would threaten Russian Communism. Bambery gives some detail on how fond rich Brits were of Hitler, for instance some of the royals. Like the Duke of Windsor, formerly King Edward VIII. The dominant view in the ruling class was that Hitler ought to be appeased, although some went further and would have welcomed Britain’s inclusion in the Third Reich. Material support was even given Germany. “The City of London continued to provide the German economy with a vital line of credit all the way up to the outbreak of the war. This policy of economic appeasement of Hitler matched Baldwin and Chamberlain’s policy of political appeasement.”

As for Churchill, “What Churchill grasped early on was that the Führer was aiming at German hegemony in Europe and that that was a direct threat to British imperialism, which had always manoeuvred between the various European powers to stop any one becoming too dominant. Unlike Chamberlain, Churchill was prepared to ally Britain with the US against Germany. The overwhelming message propagated by historians and politicians, on the right and the left, is that this was a war against fascism and for democracy. But fighting fascism was never the main concern of Churchill. He was opposed to Germany from the mid 1930s onwards because he recognised that it threatened Britain’s position in Europe and the world. He had no problem with the Italian fascist dictator, Mussolini.” (Had nothing against Mussolini’s

invasion of Ethiopia.) This is true, of course, since it's well-known Churchill was a fanatical imperialist (and racist). He even supported Franco in Spain.

One reason Chamberlain and others wanted to appease Hitler is that they knew that if a war broke out, victory would be possible only if the U.S. and the Soviet Union entered it; and the price of that would be to further reduce Britain's position as a world power. Meanwhile Britain built up its armed forces in case of war, hoping it could impose an economic blockade on Germany (as in 1914–18) and France would be able to hold out. In the end, of course, things didn't go as planned, and in return for financial and material assistance from its two major allies it had to acquiesce to the dismantling of its empire, "the very thing Winston Churchill held so dear."

In France, fascism was a force to be reckoned with. But the Popular Front of Republicans, Socialists, and Communists triumphed in May 1936—to the horror of "the comfortable classes," many of whose members now looked to Hitler for salvation. By 1940, much of big business and the leadership of the French military had no heart for a war against Hitler, while the workers and peasants "were sullen in mood and unenthusiastic about a government that they saw as having betrayed the promises of the Popular Front." So the German victory wasn't long in coming.

The U.S., needless to say, "was dismayed by the Japanese invasion of China [in the 1930s]," and increasingly came to see Hitler as a major threat to U.S. power as well. Harry Truman, incidentally, may have been an exception, since as late as June 1941 he was quoted by the press as saying, "If we see that Germany is winning we ought to help Russia and if Russia is winning we ought to help Germany and that way let them kill as many as possible." (The cold logic of the imperialist.)

In Germany, as industry collapsed it advocated protectionism less than it traditionally had and came to favor a policy of expanding control of markets and raw materials. Soon, the need for *Lebensraum* (e.g. in Hungary, Yugoslavia, and Romania) "became the rising demand among industrialists, financiers, and the generals." As one historian has said, "The expansionist *Lebensraum* ideology enunciated by Hitler in *Mein Kampf* must have been regarded as manna from heaven by the profit-strapped German business class. That Hitler meant *Lebensraum* in the USSR, i.e., the Ukraine, and not in South Eastern Europe, few noticed." So Hitler began to get more and more support from industrialists and bankers, especially as he wooed them.

...The Nazis and big business shared common aims. Firstly, to use repression to smash working-class organisation and to reverse welfare measures in order to increase exploitation. Beyond that, both looked to expand production, to plunder, geographical expansion and war. Nazi political dominance sat comfortably with the continued economic dominance of big capital. A section of industrialists and bankers, whose mouthpiece was Hjalmar Schacht, moved towards accepting Hitler as chancellor. That month the steel magnate and Nazi Party member Fritz Thyssen, together with Schacht, organised a letter signed by business leaders urging Hindenburg to appoint Hitler as chancellor.

...In the meantime von Papen played on Hindenburg's hatred of the Social Democrats to undermine the president's support for [Chancellor] Schleicher and to urge the old man to appoint a coalition government involving the right-wing parties and politicians. The president was a Prussian landowner and the agricultural lobby was also pressing for a coalition government of right-wing nationalists and the Nazis. Hitler's confidence was such that in this swirl of negotiations he held out for the chancellorship. Hindenburg dismissed Schleicher and on 30 January 1933 appointed Hitler as chancellor, heading a coalition government in which the Nazis initially took just two cabinet positions. The Nazi accession to power rested on a pact between the Nazis, leading sections of big business and the German high command. This bloc would remain in place until the end.

Unsurprising tidbits on the Spanish civil war: Texaco and Standard Oil supplied over three million tons of oil to Franco on credit, while Ford, Studebaker, and General Motors gave him 12,000 trucks, three times more than the Axis powers did. The chemical firm Dupont sent 40,000 bombs via Germany to avoid

contravening the U.S. Neutrality Act. Much of Britain's ruling class supported Franco, but the country confined itself to just giving no aid to the Republican forces and pressuring the French to do the same. A Tory member of Parliament remarked that "the propertied classes in this country [Britain] with their insane pro-Franco business have placed us in a very dangerous position." Indeed, for the Spanish war emboldened Hitler.

After Neville Chamberlain became prime minister he appointed the pro-fascist Sir Neville Henderson as ambassador to Germany. This guy's views—and the views of a large segment of the Western ruling class—are encapsulated in his statement, "I would view with dismay another defeat of Germany, which would merely serve the purposes of inferior races."

In 1938, France and, especially, Britain were not terribly keen to defend Czechoslovakia from Hitler, in part because that would put them in an alliance with Russia, which pledged military help to Czechoslovakia. Nor did it help that Czechoslovakia was alone in Eastern Europe in being a democratic state with a strong and vibrant left and labor movement. That did nothing to endear it to capitalist powers.

Even after Germany invaded Poland, Britain and France did effectively nothing for seven months, during the "Phony War." There weren't even air attacks against Germany, since the British air minister was loath to bomb armaments plants or other locations on the grounds that they were private property! Instead the RAF dropped propaganda leaflets. Bambery argues that much of the reluctance to fight Germany was due to the fear that an anti-fascist war might unleash left-wing popular unrest across Europe. After all, the ruling class was still haunted by the memory of the revolutionary wave that had broken out in Europe at the close of World War I. (And by more recent shocks, like the 1926 General Strike in Britain, the 1936 strike wave in France, and the 1936 revolution in Spain.)

Anyway, France fell—Bambery has fun describing the incompetence and lack-of-commitment-to-the-war-effort of the British and French early on—and the fascist regime of Vichy was founded. According to one historian, it was "largely a reaction against the revolution that the Popular Front had represented in the eyes of much of the French bourgeoisie." Pétain implemented anti-Semitic and fascist measures without orders from Berlin, and voluntarily collaborated with the Nazis.

Meanwhile, the British government was far from unified. Churchill, a few colleagues, and the Labor party were fully committed to fighting Hitler, but the Conservative appeasers (Lord Halifax, Chamberlain, and others) were working behind the scenes to negotiate with Hitler. Frankly, there was some treason going on. Most of the Conservative party was against Churchill. And its attitude had some rational basis, for the Battle of Britain was progressively radicalizing the populace. As Bambery says, "There was a radical spirit of resistance in that summer of 1940, but in the absence of any radical force to give conscious expression to it, that spirit would fuel the growing desire for a Labour government pledged to construct a welfare state"—which, of course, came to pass immediately after the war.

America, ever the selfless, noble nation, gave Britain no free help. An American journalist summed it up in December 1940:

In heaven's high name, how have we aided England? When? Whose sacrifice produced the aid?... We have sold England an indeterminate number of military airplanes. She has paid cash. She has come and got them. We have sold England, I understand, some old rifles and various shipments of ammunition. She paid cash. She came and got them... Finally, in a moment of benign generosity, we traded England some rotting destroyers for some air and naval bases so valuable to our defence that even Mr Churchill had difficulty justifying the deal to his Parliament. We are going to sell her more and more planes, if our factories will just decide to produce them fast enough. We are going to sell England practically anything she wants—if we don't want it first... And Napoleon called England a nation of shopkeepers!

Britain soon went bankrupt, but even then we found a way to fleece it of more money: without notifying London, we sent a warship to South Africa in late 1940 to take 50 million pounds of gold, Britain's last tangible assets.

Lend-Lease was passed in early 1941, but we attached onerous conditions to that too: Britain was barred from exporting to new markets or existing markets such as Argentina. And a year later it had to pledge that the Sterling Bloc (a protective trade zone) would be dissolved after the war.

It can seem as though Hitler might have easily won the war but for a few mistakes he made, such as invading Russia before knocking out Britain. Bamberg makes a good point, though: “In simple economic terms the outcome of the Second World War should not have been in doubt. In 1936–38 a third of the world’s industrial production took place in the US. Add in the USSR’s and Britain’s shares and the figure was over half. Together the Axis powers’ share was 17 per cent. In 1941 and 1942 the UK was out-producing Germany in military materiel. By 1942 the US alone was exceeding the combined output of all the Axis states. The Allies controlled 90 per cent of the world’s oil output, with the US producing two-thirds of the world’s oil in 1943; the Axis states controlled just 3 per cent.” Had Hitler conquered Russia and Britain early on (which certainly wasn’t out of the question), the calculus would have changed. But it’s hard to believe he could have defeated the U.S., or, eventually, an alliance of the U.S. with most of the world. And he still would have had to pacify Russia, which wouldn’t exactly have been easy.

On top of all this, there’s no way Nazism could have kept control over all the territories it conquered. It was just too brutal. It wouldn’t have had the resources to *constantly* be smashing resistance movements *everywhere*. –In short, the Third Reich was doomed, by its very nature, not to last long. It simply wasn’t sustainable, especially on an international scale. Thank god!

One thing I didn’t fully appreciate before was just how incredibly incompetent Stalin was. Practically the only thing he did right was to sometimes let his subordinates do what they wanted. His earlier purge of the military leadership was, of course, disastrous and monumentally stupid, but even during the war he repeatedly made costly and idiotic mistakes. Not the least of which was to *blindly trust that Hitler wouldn’t invade* (Hitler wouldn’t break his promise to me!), despite information from intelligence agencies. He did zilch to prepare for the invasion, except to ship huge amounts of resources to the Nazis as per their 1939 pact. In fact, from the late 1920s through the 1940s, Stalin’s career is virtually a record of mistakes and disasters—mistaken foreign policy, mistaken military policies, mistaken paranoia, mistaken judgments of people, etc. What a guy.

The chapter on the popular Resistance in Europe is interesting. Predictably, the Allies were deeply ambivalent towards it, at times even hoping the Germans would defeat the partisans (and indirectly assisting them in doing so!). Why? Because the partisans were left-wing, and you can’t have that sort of thing. But the successes—and the heroism—of the Resistance in certain countries were remarkable. For instance, one could say, perhaps, that Italy has had two eras of genuine glory: the Renaissance, and the Resistance. 1943–45. It was far more effective than the French Resistance, liberating large swathes of the country on its own. There is nothing comparably heroic in American history.

Here’s a historian’s comment on the political situation in France:

Early in 1941, the prefect of the Lot [department] noted that collaboration [with the Nazis] was supported by the bourgeoisie, the peasants showed no open hostility, and the workers were against it. In December of the same year, the prefect of the Limoges region reported: ‘Very striking hostility to the [Vichy] government from most workers, small farmers, small shopkeepers and artisans; unreserved support from big business and big shopkeepers, magistrates and notables.’

The usual story: patriotism and bravery from the lower classes, treason and cowardice from the upper.

“The United States had a number of aims in the Second World War. They included the dismantling of the British and French trade blocs, achieving a permanent military presence in Europe, and control of Middle East oil. But there was another—hegemony over China. Washington championed an ‘open door’ to China, meaning it wanted free trade which would benefit the sale of American goods and the purchase of raw materials from China. To that end Washington opposed the ceding of Chinese territory to the European powers (such as Britain’s control of Hong Kong) and more importantly Japanese attempts to control the

country.” In the end, of course, it wasn’t the Japanese but the Communists who foiled America’s hopes for an open door in China.

We’re taught that one of the unspeakable crimes of the Soviet Union was its imposition of famines in the Ukraine and elsewhere during the 1930s. We’re not taught that Churchill and Britain were guilty of the same thing. British-controlled India had seen many man-made famines; one of the worst was in Bengal in 1943:

Between 3.5 and 5 million people died from starvation, malnutrition and related illnesses during the Bengal famine of 1943. The famine was not a natural catastrophe, it was man-made. The British were stockpiling food for the Indian army and rice was exported to the Middle East to feed British soldiers and to Sri Lanka where the British-run South East Asia Command was based. The loss of Burma cut rice supplies from there while a ‘scorched earth’ policy was implemented in the region nearest the Burmese border.

Overall there was no fall in the rice harvest in 1943, but the rural labourers, peasants and fishing families of Bengal had seen their incomes fall by two thirds since 1940 while the price of rice had soared. Bengal had enough rice and other grains to feed its population, yet millions of people were too poor to buy it. The British authorities failed to implement normal peacetime famine relief measures and were more concerned with quelling the Quit India movement [a rebellion against British rule]. The Bengal government failed to prevent rice exports, and made little attempt to import surpluses from elsewhere in India, or to buy up stocks from speculators to redistribute to the hungry. Starving people flocked into Calcutta, many dying in a city with well-stocked markets. The British authorities removed (at times forcibly) tens of thousands of destitute, starving people from Calcutta and other urban areas in late 1943. These people were relocated to die in the countryside. Churchill repeatedly opposed food for India and specifically intervened to block provision of 10,000 tons of grain offered by Canada, because he saw that as weakening British rule. The US declined to provide food aid in deference to the British government. The British government rejected the Viceroy Lord Wavell’s request for 1 million tons of grain in 1944 and also rejected his request that the US and the United Nations Relief and Rehabilitation Administration (UNRRA) be approached for assistance.

Churchill: what a guy.

So what was the overall meaning of the war? “Ernest Mandel argued that ‘the Second World War was in reality a combination of five different wars’. He lists the wars as first, ‘an inter-imperialist war’ fought between the Axis and Allied powers; second, ‘a just war of self-defence by the people of China, an oppressed semi-colonial country, against Japanese imperialism’; third, ‘a just war of national defence of the Soviet Union, a workers’ state, against an imperialist power’; fourthly, ‘a just war of national liberation of the oppressed colonial peoples of Africa and Asia...launched by the masses against British and French imperialism, sometimes against Japanese imperialism, and sometimes against both in succession, one after the other’. Mandel’s fifth and last war was ‘a war of liberation by the oppressed workers, peasants, and urban petty bourgeoisie against the German Nazi imperialists and their stooges’, which was fought ‘more especially in two countries, Yugoslavia and Greece, to a great extent in Poland, and incipiently in France and Italy’.” A perceptive interpretation. Different facets of the war had different meanings.

But “the imperialist nature of the war shaped everything. Churchill, Roosevelt and Stalin succeeded in containing the forces of the anti-fascist resistance in Europe. In Asia they were only able to keep the lid on it for a brief time before it boiled over again [with the postwar decolonization movements].”

Reading Robert Wiebe’s classic *The Search for Order, 1877–1920* (1967), a book that heralded the “maturation” of Progressive Era historiography. Not Marxist, but insightful and a pleasure to read. Its thesis is contained in the title: whereas the Gilded Age meant chaos, fragmentation, innumerable pockets of parochialism and particularism (both rural and urban), wild competition, dislocation and bewilderment, a

scattered and disunited society that lacked a core, the Progressive Era meant a deepening search for order. The search for order began in the Gilded Age, of course (or even earlier), and took many different forms. Some were preoccupied with purity and unity, among them the temperance movement and prohibition, the hope for salvation in Protestantism, campaigns to instill patriotism (through worship of the Constitution, the flag, etc.) and cleanse school curricula and textbooks of alien influences, nativist drives to control, exclude, or Americanize immigrants, and patricians' and professionals' efforts to cleanse cities of vice and corrupt urban machines (through, respectively, repressive legislation and civil service reform). Collectively, it was a flailing around for social control. I suppose you could interpret some of the reactions in terms of Hofstadter's idea of "status anxiety" among a middle class (rural and urban), and even segments of the upper class, overwhelmed by a perceived loss of autonomy and security. But in the end, as usual, what matters most is which 'movements' or ideas could be used by big business to control society for its own ends, and which were useful to workers (and poor farmers) as they tried to control society for *their* ends.¹ The former movements tended to lead in the direction of fascism, while the latter led in the direction of social democracy (or, more ambitiously, socialism). Some movements, needless to say, were acceptable to both capitalist and worker, such as efforts to improve sewage and transportation systems and install indoor plumbing.

Well, on second thought, reading this book isn't the most productive use of my time. There are a million other things I can read that are more interesting. And maybe I should start writing again... The problem, as I've said before, is that I seem to have lost whatever talent I once had. It would be nice to know inspiration again.

Oh well, if I'm no longer capable of creating, I might as well keep reading. Georg Lukács' classic *The Destruction of Reason* (1952). A brilliant history of "irrationalism" from Schelling to Hitler—which, as a Marxist work, doesn't make the mistake of arguing that earlier intellectual trends inevitably culminated in Nazism but instead only argues that no philosophy is "innocent." "Reason itself [or a rejection of reason] can never be something politically neutral, suspended above social developments." Not strictly true—I don't see how there are any social implications in a debate between Chomskian linguistics and structural linguistics—but in general it's a reasonable statement.

"Thus the subject-matter which now presents itself to us is Germany's path to Hitler in the sphere of philosophy. That is to say, we mean to show how this concrete path is reflected in philosophy, and how philosophical formulations, as an intellectual mirroring of Germany's concrete development towards Hitler, helped to speed up the process. That we are therefore confining ourselves to portraying the most abstract part of this development by no means implies an over-estimation of philosophy's importance in the turbulent totality of concrete developments. But we believe it is not superfluous to add that to underestimate the philosophical driving forces would be at least as dangerous and as little in accordance with reality." Yep, philosophies and ideologies do matter.

"...Sorel's myth was so exclusively emotional, so empty of meaning that it could pass without difficulty into the demagogically exploited myth of fascism. Mussolini wrote: 'We have created a myth for ourselves. Myth is a faith, a passion. It does not have to be a reality. It is real by virtue of the fact that it is a spur and a faith, and signifies valour.' This is pure Sorel, and in it the epistemology of Pragmatism and Bergsonian intuition has become the vehicle of fascist ideology." Perceptive. Regarding pragmatism: it's "whatever works." We all need our faiths or myths, whether religious myths or scientific myths or whatever. The will to believe. We all have our own truths, beliefs that stimulate us or inspire us. Decadent relativism.² And with Bergson you get the vitalism, intuition (a sort of irrationalist intuition), *durée*, hostility to the

¹ This simplified polarized perspective is only an abstract model that facilitates clarity. I don't mean that businessmen necessarily cunningly manipulated certain social agendas for ulterior purposes.

² Later in the book (pp. 778–779) he remarks, "pragmatism is an ideology of capitalist agents consciously anchored in capitalist immediacy, a Babbit philosophy." Basically true. Like liberal capitalist apologetics, it remains on the surface of phenomena and doesn't try to penetrate to their deeper essence. Because that would contradict its relativistic spirit, its rejection of the effort to find an objective essence that differs from appearance.

objective character of natural science, hostility to objective reason. All these cultural expressions, and many more of a less 'disinterestedly philosophical' character, belong to a particular zeitgeist. To understand their significance, the Marxist method is necessary.

And Lukács is a master of that method. I'll just quote some passages of his long preliminary analysis of the German social, political, and economic experience that was sublimated into an infinitely variegated ideological irrationalism.

We have located one of the most important weak points of the 1848 revolution in the lack of democratic experience and tradition, in the want of a democratic training of the masses and their ideological spokesmen through major internal class struggles. It is understandable that events after 1848, the conditions [in Prussia] of 'Bonapartist monarchy,' the creation of German unity 'from the top' through Prussian bayonets, again failed to provide any conditions favourable to the origin of revolutionary democratic traditions or a revolutionary democratic training of the masses. As a result of its impotence, the German Parliament was automatically condemned to sterility. And since every single bourgeois party had its basis in a compromise with 'Bonapartist monarchy,' the extra-parliamentary struggles of the masses, as far as they could spring up in the first place, were similarly doomed to sterility...

An important ideological obstacle to the origin of democratic traditions in Germany was the ever-increasing, large-scale falsification of German history. It was—to summarize very briefly—a matter of idealizing and 'Germanizing' the retarded sides of the German development, i.e., of a version of history which extolled precisely the retarded character of Germany's development as particularly glorious and in accord with 'Germany's essence.' It criticized and repudiated all the principles and products of Western bourgeois democratic and revolutionary developments as un-German and contrary to the character of the German 'national spirit'...

The most important factor of all is the average German's underdog mentality, a mentality by no means affected by the 1848 revolution, and also that of the intellectual however highly placed. We have noted that the major upheavals at the start of the modern era, which laid the foundations for democratic developments in the West, ended in Germany with the establishment, for centuries to come, of petty tyrants, and that the German Reformation founded an ideology of submission to them [in the form of Lutheranism, Pietism, etc.]. Neither the struggles for liberation from the Napoleonic yoke nor the year 1848 could alter this intrinsically. And since the German nation's unity was created not by way of revolution but from 'the top' and, according to historical legend, through 'blood and iron,' the 'mission' of the Hohenzollerns and the 'genius' of Bismarck, this side of the Germans' mentality and morals remained virtually unchanged. There sprang up large cities in place of often semi-medieval small towns; the big capitalist with his agents replaced the shopkeeper, artisan and small entrepreneur; world politics superseded parish-pump politics—but during this process the German people's subservience to its 'authorities' underwent only the slightest of changes... [He then quotes the following passage written by a German in 1919:]

The most easily governed nation in the world is the German...meaning a lively and active nation of average proficiency and intelligence with a developed critical bent for argument; a nation, however, which in public affairs is neither accustomed nor willing to act spontaneously without or against the will of authority; a nation which thus is excellently ordered and acts under official guidance almost as though it were only performing its own common will. This readiness to be organized, along with its efficiency, does indeed provide incomparably fine material for an organization, the purest form of which is of course the military type.

Here we have the immediate, subjective source of pre-imperialist German irrationalism. Whereas the Western Democracies—by and large—considered the State, State policies and so on to be largely their own work, expected rationality from them and saw their own rationality reflected

therein, the German attitude—again, by and large—was the complete opposite... [It is] ‘authority’ alone which acts, and does so on the basis of an intuitive reading of inherently irrational facts... [Think of the celebration of Bismarck’s ‘genius,’ etc.] ...Certainly there was already arising—in the [early-19th-century] Romantic movement and its offshoots—an idealization of German backwardness which, in order to defend this position, was forced to interpret the course of events in a radically irrationalist way and to contest the idea of progress as an allegedly shallow, dim and misleading conception. Schopenhauer went farthest in this respect, and that accounts for both his total lack of influence before 1848 and his world-wide effect after the revolution was defeated.

...The German development [as opposed to France’s, England’s, and so on] was rated the higher one precisely because, as a result of the conservation of older (non-rational) forms of governance, it could solve various problems (ethical, cultural, etc.) for which the society and social thinking of the rationally oriented West could never find a solution. It goes without saying that here, the effective combating of socialism played a decisive role.

Irrationalism and a hostility to progress therefore go together. In this very togetherness they formed an effective ideological defence of the social and political backwardness of a Germany rapidly developing in the capitalist sphere...

Later, Lukács mentions that “Schopenhauer’s Buddhist quietism matched petty-bourgeois apathy after the 1848 revolution,” and that “the transformation requested by Nietzsche of the relationship between capitalists and workers into one between officers and soldiers corresponds to specific capitalist-militaristic wishes in the imperialist age.” Neither of these thinkers could have achieved the influence they did if their philosophies hadn’t served useful apologetic purposes. (The fact that they personally had no such intentions is irrelevant.)

On “irrationalism”:

Irrationalism is merely a form of reaction (reaction in the double sense of the secondary and the retrograde) to the dialectical development of human thought. Its history therefore hinges on that development of science and philosophy, and it reacts to the new questions they pose by designating the mere problem as an answer and declaring the allegedly fundamental insolubility of the problem to be a higher form of comprehension. This styling of the declared insolubility as an answer, along with the claim that this evasion and side-stepping of the answer, this flight from it, contains a positive solution and ‘true’ achievement of reality is irrationalism’s decisive hallmark... Now what constitutes the specific quality of modern irrationalism? It is chiefly the fact that it arose on the basis of capitalist production and its specific class struggles—first the progressive battle for power against feudalism and absolute monarchy waged by the bourgeois class, and later the bourgeoisie’s reactionary defensive struggles against the proletariat. Throughout this book we will show in concrete terms the decisive changes which the various stages of those class struggles wrought in the development of irrationalism in both form and content, determining equally the propositions and the solutions, and we will show how they altered its physiognomy.

Interesting: “Pascal in relation to Cartesianism and F. H. Jacobi in relation to the Enlightenment and classical German philosophy may be regarded as precursors of modern irrationalism. In both, we can clearly see the flinching from social and scientific progress as dictated by their period’s pace of development and against which the pair, Pascal especially, formed a kind of romantic opposition, criticizing its results from a Rightist angle.” Pascal, of course, anticipated existentialism in his emphasis on the “hopeless and irremediable isolation and loneliness experienced by the human being left to his own devices in a God-forsaken world.” He even anticipated Schopenhauer in some respects, as in his analysis of deadly boredom as “the chronic malady of the ruling classes” (Lukács).

The discussion of Schopenhauer is very good. After 1848 a climate of reaction set in across most of Europe, which set the stage for the international reception of Schopenhauer (though he was especially popular in Germany). “It is with Schopenhauer that German philosophy starts to play its fateful role as the

ideological leader of reactionary extremism,” which became more pronounced later with Nietzsche and others. Actually, Kierkegaard, Schopenhauer, and Nietzsche were somewhat ahead of their time, anticipating (so Lukács says) decadent trends that later became universal.

If we have called Schopenhauer the first irrationalist standing on a purely bourgeois foundation, it is not too difficult to perceive the associated personal traits in his social being. His biography distinguishes him quite sharply from all his German predecessors and contemporaries. He was a ‘*grand bourgeois*’ in contrast to the others’ petty-bourgeois status, which in Fichte’s case was even semi-proletarian. Accordingly Schopenhauer did not experience the normal straits of petty-bourgeois German intellectuals (private tutoring, etc.) but spent a large part of his youth on journeys all over Europe. After a brief transitional period as a business trainee he lived a peaceful existence on private means, an existence in which even his university link—the teaching post in Berlin—played a merely episodic role.

Thus he was the first major instance in Germany of a writer with private means, a breed which had become important to the bourgeois literature of capitalistically advanced countries long before. (It is significant that Kierkegaard and Nietzsche also enjoyed an independence stemming from a private income which much resembled Schopenhauer’s.)...

...Schopenhauer’s high-minded withdrawal from all politics was only how he behaved in normal times, when State machinery automatically safeguarded the fortunes and incomes of private investors against any possible attack. But there were times—and Schopenhauer experienced them in 1848—when this automatic protection of fortunes was thrown in question or at least—as then, in Germany—appeared to be. At such moments Schopenhauer’s aloof ‘independence’ vanished, and our philosopher made haste to hand his opera-glasses to a Prussian officer for a better view of the rioters at whom he was shooting...

Schopenhauer’s originality lies in the fact that at a time when the ordinary form of [capitalist] apologetics had not yet even developed fully, let alone become the leading trend in bourgeois thinking, he had already found the later, higher form of capitalist apologetics: *indirect apologetics*.

And so on. I could quote the whole discussion. By ‘indirect apologetics’ Lukács means that the bad sides of capitalism are acknowledged but explained as attributes of all human existence. “From this it necessarily follows that a struggle against these atrocities not only appears doomed from the start but signifies an absurdity, viz., a self-dissolution of the essentially human.” One might object here that capitalism was still hardly hegemonic when Schopenhauer was writing, and that the philosopher certainly didn’t have it in mind when penning his rhapsodies of pessimism, but this is irrelevant. The question is why his philosophy became so popular in the second half of the nineteenth century. The answer, or part of it, is that his pessimism suited the needs and the mood of bourgeois society at that time. Non-Marxists will object that this explanation is absurdly reductive, but in so doing they only betray their intellectual shallowness. No philosophy can become accepted by the mainstream, can be internationally celebrated, unless entities with resources propagate it and find it useful. Schopenhauer’s ideas were entirely acceptable, in fact useful, to bourgeois culture in the 1850s and later.

It was directly through his pessimism that Schopenhauer became the leading thinker of the second half of the nineteenth century. Through it he founded the new type of apologetics. To be sure, he did no more than lay the foundations. Later, and particularly when dealing with Nietzsche, we shall see that the Schopenhauerian form of indirect apologetics represents only the initial stage of this philosophical genre. The chief reason for this was that its conclusion—the abstention from all social activity (seen as senseless) and certainly from any effort to change society—sufficed only to answer the needs of the pre-imperialist bourgeoisie; it sufficed only during a period when, because of the universal economic boom, this rejection of political activity matched the position of the class struggles and the needs of the ruling class. The social task which reactionary philosophy was set in the imperialist period went further, although this trend was far from dying out altogether:

now the task was to mobilize active support for imperialism. In this direction Nietzsche surpassed Schopenhauer, although, as an indirect apologist at a riper stage, he remained his pupil and continuation in the methodological sense.

So pessimism means primarily a philosophical rationale of the absurdity of all political activity. That was the social function of this stage in indirect apologetics. In order to reach this conclusion, the chief necessity is to devalue society and history philosophically [as Schopenhauer did]...

Going along with his pessimism was his egotistic philosophy of man, and of everything in nature. In his ethics he does condemn this egotism—but he still says it's inevitable and cosmically universal (or nearly so). (His moral condemnation of it, incidentally, served the cause of popularizing his philosophy, since it amounted to a secularizing of the dominant Christian morality—dominant only in the sense that people paid lip-service to it, not that it genuinely governed people's conduct.) Moreover, he also defends a 'higher' sort of egotism than the universal vulgar one when he praises aesthetic enjoyment, saintly asceticism, and so on. He ends up celebrating the individual's self-sufficiency, which is a decidedly bourgeois conception.

This contrast which Schopenhauer draws between two types of egotism is one of the subtlest features of his indirect apologetics. Firstly, he bestows on this attitude the sanction of aristocratic perspicacity as opposed to the plebeian's blind attachment to the world of phenomena. Secondly, this elevation above ordinary egotism entails no obligations on account of its 'sublime,' mystico-cosmic generality: it discredits social obligations and replaces them with empty emotional promptings, sentimentalities which may on occasion be reconciled with the greatest crimes against society. In the excellent Soviet film *Tchapyev*, the bestially cruel counter-revolutionary General keeps a canary, feels cosmically united with it—in the true spirit of Schopenhauer—and plays Beethoven sonatas in his leisure time, thus fulfilling all the 'sublime' commandments of Schopenhauerian morality.

Schopenhauer does himself another favor as regards the mainstream world's attitude towards him when he exempts himself, and thereby others, from following his own morality. "In general," he says, "it is a strange thing to ask of a moralist that he should commend no virtue unless he possesses it himself." Lukács elaborates: "This guarantees the decadent bourgeois intelligentsia the maximum of spiritual and moral ease: it has at its disposal a morality liberating it from all social duties and elevating it to a sublime height above the blind, uncomprehending riffraff, but a morality whose very founder exempts the intelligentsia from obeying it (where it becomes difficult or even just inconvenient)."

Lukács is perceptive also in his discussion of Schopenhauer's atheism. It was quite unlike the atheism of, say, the French materialists—for Schopenhauer was the exact opposite of a materialist. Rather, it was meant to serve as a substitute for religion, "to create a new—atheistic—religion for those who had lost their old religious faith as a result of social evolution and progress in the knowledge of nature." Schopenhauer is quite Christian in many respects, as in his defense of the dogma of original sin. (He's also semi-Buddhist, of course.) "Again serving as a model for decadent developments later, there came into being that religious atheism which assumed, for a large section of the bourgeois intelligentsia, the function of the religion which had become intellectually untenable among this class." Lukács goes on:

[But here again] Schopenhauer did not round something off but only paved the way. His social starting-point in the restoration period [after Napoleon] dictated the fact that his atheism—like the religion of this era—inculcated a social passivity, a mere turning aside from social action, whereas his later successors, above all Nietzsche and the subsequent fascists, expanded these points of departure morally in the direction of an active, militant underpinning of imperialist reaction, which again ran parallel to the course taken by the Churches in the imperialist world wars and civil wars. (The complex stratification of capitalist society and the harsh changes in the course of the imperialist period's class struggles necessarily meant that religious atheism during this age could—

without needing to hark back directly to Schopenhauer—have quietist variations as well, e.g., Heidegger’s existentialism.)

It hardly needs pointing out that idealism in all its forms is always a useful tool of reaction. So in a reactionary age it will be popular. (Again, this is why postmodernism has been dominant since the 1970s.) Schopenhauer’s idealism went as far as one can go in denying the reality of the world of “phenomena,” which certainly militates against social engagement. To care passionately about this illusory world and to struggle mightily to improve it is idiotic from Schopenhauer’s perspective. (Here is another point of contact between him and religion.) There is no such thing as progress or development; time and causality don’t apply to the thing-in-itself. “For Schopenhauer, history does not exist... Hence for him there exists no difference in history between important and trivial, major and minor; only the individual is real, whereas the human race is an empty abstraction.” I’ll quote the end of Lukács’ discussion:

Thus only the individual, isolated in a world without meaning, is left over as the fateful product of the individuation principle (space, time, causality). An individual, certainly, that is identical with the world-essence by virtue of the aforesaid identity between microcosm and macrocosm in the world of things-in-themselves. This essence, however, located as it is beyond the validity of space, time and causality, is consequently—nothingness. Hence Schopenhauer’s *magnum opus* logically ends with the words: ‘Rather we freely acknowledge that what is left after the complete annulment of the will is, for all those who are still full of will, assuredly nothingness. But conversely also, for those in whom will has turned round and denied itself, this very real world of ours with all its suns and Milky Ways is—nothingness.’

And at this point, with our survey of the most important problems in Schopenhauer’s philosophy completed, we ask once again: what is the social task it fulfils? Or, to put this question from another angle: what is behind its widespread and lasting influence? Here pessimism is not by itself an adequate answer, for first pessimism requires a further concretization in addition to that we provided earlier. Schopenhauer’s philosophy rejects life in every form and confronts it with nothingness as a philosophical perspective. But is it possible to live such a life?... If we consider Schopenhauer’s philosophy as a whole, the answer is undoubtedly yes. For the futility of life means above all the individual’s release from all social obligations and all responsibility towards men’s forward development, which does not even exist in Schopenhauer’s eyes. And nothingness as the pessimist outlook, as life’s horizon is quite unable, according to Schopenhauer’s ethics as already expounded, to prevent or even merely to discourage the individual from leading an enjoyable contemplative life. On the contrary: the abyss of nothingness, the gloomy background of the futility of existence only lends this enjoyment an extra piquancy. Further heightening it is the fact that the strongly accented aristocratism of Schopenhauer’s philosophy lifts its adherents (in imagination) way above the wretched mob that is shortsighted enough to fight and to suffer for a betterment of social conditions. So Schopenhauer’s system, well laid out and architecturally ingenious in form, rises up like a modern luxury hotel on the brink of the abyss, nothingness and futility. And the daily sight of the abyss, between the leisurely enjoyment of meals or works of art, can only enhance one’s pleasure in this elegant comfort.

This, then, fulfils the task of Schopenhauer’s irrationalism: the task of preventing an otherwise dissatisfied sector of the intelligentsia from concretely turning its discontent with the ‘established order,’ i.e., the existing social order, against the capitalist system in force at any given time. This irrationalism thereby reaches its central objective—no matter how far Schopenhauer himself was aware of it: that of providing an indirect apologetic of the capitalist social order.

Masterful analysis.

The analysis of Kierkegaard, on the other hand, as of Schelling earlier, is...well, rather mystifying. Whenever Lukács gets going on “dialectics” and whatnot, an impenetrable fog descends over my brain. I

still don't really know what he means by dialectics, since he never defines the term. There's more than a little brilliance in these dissections of Kierkegaard, but it isn't worth it to try to digest it all.

"In Kierkegaard we encounter the mode of feeling, spontaneously expressed, of an intellectual bourgeois stratum which had become deracinated and parasitical. How little this was to do with a personal problem, or with a narrowly Danish one, is evident not only from Kierkegaard's later international influence but also from the fact that, wholly independently of him, similar versions of religious atheism were starting to spring up and to take effect all around him."

The chapter on Nietzsche is very good. In a sense, Lukács' task is too easy: there's an abundance of material in Nietzsche's writings that is eminently serviceable to imperialists and fascists, including plenty of passages on noble races and a race of masters, slave morality, the glory of war, the will to power, the Übermensch, the evils of socialism and democracy and "equal rights," slavery's desirability, and on and on. Politically, Nietzsche was obviously a reactionary. (His struggle between masters and the rabble was just a decadent-reactionary culturalist version of the class struggle.) Lukács is largely right that the appreciation both he and Schopenhauer showed for the Enlightenment, or at least certain Enlightenment thinkers, was superficial and based on distortions or confusions, since the Enlightenment was nothing if not enamored of the *moral progress* (and the *struggle* for progress) for which the two Germans had contempt. Of course there are innumerable contradictions in Nietzsche, and innumerable statements of his that are totally incompatible with the fascist or Nazi way of thinking; but one consistent thread running through his work is his utter hatred of socialism. Anyway, he bears a lot of the blame for the nefarious uses to which his writings were later put. He *did* contribute to the "destruction of reason" by being so elitist, anti-democratic, anti-socialist, individualistic and frequently racist, enamored of the "will to power" (a term he should have known would be interpreted in the most vulgar way possible) and an amoral master morality, enamored of war and strength and aristocratic egotism and "barbarians" or "beasts." If there was ever a non-"innocent" philosopher, it's Nietzsche.

...It was just at the time of Nietzsche's activity that the class decline, the decadent tendencies reached such a pitch that their subjective evaluation within the bourgeois class also underwent a significant change. For a long while, only the progressive opposition critics had been exposing and condemning the symptoms of decadence, whereas the vast majority of the bourgeois intelligentsia clung to the illusion of living in the 'best of all worlds,' defending what they supposed to be the 'healthy condition' and the progressive nature of their ideology. Now, however, an insight into their own decadence was becoming more and more the hub of these intellectuals' self-knowledge. This change manifested itself above all in a complacent, narcissistic, playful relativism, pessimism, nihilism, etc... [Think, again, of postmodernism.]

...Nietzsche's philosophy performed the 'social task' of 'rescuing' and 'redeeming' this type of bourgeois mind. It offered a road which avoided the need for any break, or indeed any serious conflict, with the bourgeoisie. It was a road whereby the pleasant moral feeling of being a rebel could be sustained and even intensified, whilst a 'more thorough,' 'cosmic biological' revolution was enticingly projected in contrast to the 'superficial,' 'external' social revolution. A 'revolution,' that is, which would fully preserve the bourgeoisie's privileges, and would passionately defend the privileged existence of the parasitical and imperialist intelligentsia first and foremost. A 'revolution' directed against the masses and lending an expression compounded of pathos and aggressiveness to the veiled egotistic fears of the economically and culturally privileged...

One of the problems with Nietzsche is that he lived and thought mainly in the realm of myth. He was addicted to mythicizing, and his critiques, analyses, and ideals were not *sober* but *poetic*. Figurative, mythical, lyrical. He lived and thought at a fever pitch, and so couldn't see that if he ever had the misfortune of encountering, say, one of his beloved blond beasts—"the kind of exuberant monsters," he wrote, "that might quit a horrible scene of murder, arson, rape and torture with the high humour and equanimity appropriate to a student prank"—he would be horrified and revolted. There was no down-to-earth *realism* in his thinking; instead, there was only *aesthetics*. There were frequent flashes of intuitive genius, but in

the end even his most fascinating psychologizing (for instance about Socrates or Christians or Wagner) was merely suggestive, and more often than not aesthetical. As Lukács says, all this myth-making was extremely useful to imperialists and fascists, who as ideologists were even more addicted than Nietzsche to glorious-sounding myths. Pretty disguises of reality have always been useful to reactionaries.

More insights: “Nietzsche turned the whole problem of decadence firmly on its head when he defined as its most important sign the view that ‘we are fed up with egotism.’ For patently the predominance of individualist-egotistic propensities over social ones was among the movement’s [or the era’s] most significant features. But it was possible for Nietzsche to ‘salve’ the decadents, i.e., to induce in them absolute self-confidence and give them a clear conscience without fundamentally altering their psychological-moral structure. And he did so precisely by suggesting that they were not over-egotistic but rather lacking in egotism, and that they must—with a good conscience—become more egotistic still.”

There’s also a thoughtful analysis of Nietzsche’s atheism. His war against Christianity, of course, was very opposed in spirit to Voltaire’s war against the Church. The Enlightenment opposed the Church as an enemy of progress, reason, freedom, science, the individual; Nietzsche opposed Christianity primarily as having birthed (supposedly) the modern democratic, egalitarian, socialist nonsense. His attitude was practically the opposite of the Enlightenment’s. Voltaire hated the Church’s authoritarianism; Nietzsche hated Christianity’s egalitarianism. After quoting a passage from Nietzsche, Lukács summarizes: “The basic thinking is patent: out of Christianity came the French Revolution, out of this came democracy, and out of this came socialism. When, therefore, Nietzsche takes his stand as an atheist, the truth is that he is out to destroy socialism [and all slave moralities].” As with Schopenhauer, his atheism is different in spirit and motivation from that of materialists and socialists.

Next, Lukács discusses vitalism (*Lebensphilosophie*), “the dominant ideology of the whole imperialist period in Germany.” Not so much a sharply distinguished philosophy as a general trend pervading or influencing nearly all schools of thought (including the social sciences and the history of literature and art). Especially after World War I. For instance, “both neo-Hegelianism and the Husserl school in its advanced stage became entirely guided by vitalism.” That term may be unfortunate, since in English ‘vitalism’ has a technical meaning. But evidently there’s an affinity between vitalism in its technical sense and *Lebensphilosophie*—which, Lukács says, was present not only in Germany but also Bergson in France, the pragmatists in the U.S., etc. Nietzsche was very influential as regards this whole emerging tendency.

Some more lengthy quotations:

The struggle against materialism also governed the philosophical development of imperialism. Thus it was unable to detach itself from the epistemology of subjective idealism. It made no difference whether it was chiefly oriented towards Kant, as in Germany, or towards Hume and Berkeley: the unknowability, indeed the nonexistence, the unthinkable nature of an objective reality independent of consciousness was the implicit axiom of every philosophy of this age.

...The key to all these difficulties, it was thought, could be located in the concept of ‘life,’ especially if this was identified, as always in vitalism, with ‘experience.’ Experience, with intuition as its organon and the irrational as its ‘natural’ object, could conjure up all the necessary elements of *Weltanschauung* without renouncing, *de facto* and publicly, the agnosticism of subjective idealist philosophy and without revoking that denial of a reality independent of consciousness which had become crucial to anti-materialism. Outwardly, to be sure, this struggle now acquired other forms. On the one hand, the appeal to the richness of life and experience, as opposed to the barren poverty of the understanding, permitted philosophy to counter the materialist inferences from social and scientific developments in the name of a natural science, biology... On the other hand, the appeal to experience gave rise to a pseudo-objectivism, an apparent self-elevation above the antithesis of idealism and materialism.

The tendency to be raised above the allegedly false dilemma of idealism and materialism was a universal endeavour of philosophy in the imperialist age. To the bourgeois conscience, both ‘isms’ seemed compromised in various ways: idealism because of the sterile academicism of its

advocates (with, as its background, the collapse of the great idealist systems); and materialism chiefly because of its association with the worker movement... Thus on the eve of the imperialist period, a philosophical ‘third road’ came into being with Mach, Avenarius and Nietzsche almost simultaneously. In fact, however, this amounted only to a revival of idealism. For whenever the mutual inseparability of being and consciousness is posited, there necessarily arises an epistemological dependence of the first on the second—which is idealism. As long, therefore, as the philosophical ‘third road’ remained purely epistemological, it differed not at all or barely from the old subjective idealism (Mach-Avenarius in relation to Berkeley)...

Right. I’ve made that point many times with regard to logical positivism, which was far more idealist than materialist.

To continue:

In the intelligentsia, one can sense a constant growth of anti-capitalist attitudes. During the final Bismarck crisis, the time of the repeal of the anti-socialist laws, when the Naturalist ferment was taking place in German literature, the vast majority of the young and gifted intellectuals, for instance, was to be found in the social democrat camp. Therefore these tendencies had to be assimilated in the philosophical world outlook so as to combat the intelligentsia’s socialist tendencies more effectively than was possible for ordinary reactionary ideology. With its contrast between the living and the dead, petrified and mechanical, vitalist philosophy took over the task of ‘deepening’ all concrete problems to such an extent that they created a major diversion from these imminent social consequences.

...There is the additional point that the central position of experienced life in vitalistic epistemology necessarily nurtured an aristocratic feeling. An experiential philosophy can only be intuitive—and purportedly it is only an elect, the members of an aristocracy, who possess a capacity for intuition. In later times, when the social contrasts emerged more strongly still, it was overtly stated that the categories of understanding and reason belonged to the democratic crowd, whereas the truly eminent appropriated the world only on the basis of intuition. Vitalism had in principle an aristocratic epistemology.

...We intend, in these studies, to trace in its main phases the development beginning at this point and ultimately leading, in its consequences, to ‘National-Socialist philosophy.’ Of course the line we are tracing does not mean that German fascism drew its ideas from this source exclusively; quite the contrary. The so-called philosophy of fascism based itself primarily on racial theory, above all in the form developed by Houston Chamberlain, although in so doing, to be sure, it made some use of vitalism’s findings. But for a ‘philosophy’ [the fascist] with so little foundation or coherence, so profoundly unscientific and coarsely dilettantish to become prevalent, what were needed were a specific philosophical mood, a disintegration of confidence in understanding and reason, the destruction of human faith in progress, and credulity towards irrationalism, myth and mysticism. And vitalism created just this philosophical mood.

The “founder and most important forerunner” of *Lebensphilosophie* was Dilthey. (Although Nietzsche played at least as important a role.) His philosophy ran parallel to phenomenology, “whose vitalistic advances Dilthey anticipated and influenced more than anybody,” and also Bergson and pragmatism. And it promoted the rebirth of neo-Romanticism and neo-Hegelianism. I won’t summarize Lukács’ whole discussion of Dilthey, but here’s a passage that gives the flavor of Dilthey’s thinking:

Dilthey’s epistemological rationale of vitalism proceeds from the thesis that experiencing the world is the ultimate basis of knowledge. “Life itself, liveliness, behind which I cannot penetrate, contains structural connections from which all experiencing and thinking is explained. *And this is the decisive factor for the whole possibility of knowing.* There is a knowledge of reality only because the full structural coherence which emerges in the forms, principles and categories of thinking is

contained in life and experience, and because this coherence can be shown analytically in life and experience.”

Anyway, you’re probably familiar with Dilthey’s “idealism” and “subjectivism,” his division between explanation and understanding and his focus on the latter—intuition, hermeneutics, ‘description,’ etc. Closely related to phenomenology. Brought forth a psychological and historical typology of philosophical outlooks that amounted to a sort of historical relativism. *Gestalts*, mutually incommensurable. “Dilthey as a historian of philosophy could substantiate only a complete relativism—an unceasing battle of rival philosophies in which a specific selection is made, but there is no single choice: ‘[Philosophy’s] major types stand beside one another, autonomous, unprovable and indestructible.’” A decadent relativism that leads, by way of Heidegger, to the even more decadent relativisms of twentieth-century Continental philosophy and postmodernism.

Next: Simmel. More idealistic and relativistic than Dilthey.

Simmel no longer acknowledged any actual object-world, but only various forms of the vitalistic attitude to reality (knowledge, art, religion, eroticism, etc.), each of which produced its own world of objects: ‘The coming into effect of certain fundamental spiritual forces and impulses means that they create an object for themselves. The meaning of the object of this function of love, art or religious feeling is only the meaning of the functions themselves. Each of these enlists its object for its own world by thereby creating it as its own...’

The consequence of this position was a relativism still more radical than Dilthey’s had been... And it is characteristic of vitalism, as the chief philosophical bias in the imperialist era, that the central content of the relativistic thought process was always a depreciation of the scientific method, a creating of space for faith and a subjective religious feeling without a definite object, using just this relativistic scepticism as a weapon...

Lukács proceeds to quote a passage from Simmel that amply makes his case:

Despite the stress on the ever-advancing and immeasurable progress of our knowledge, it should not be overlooked that at the other end, so to speak, much that we formerly possessed as 'sure' knowledge is sinking into doubt and recognized error. How much mediaeval man 'knew', and the enlightened thinker of the eighteenth century or the materialistic scientific researcher of the nineteenth, which for us is either completely obsolete or at least completely dubious. How much of that which is now undoubted 'knowledge' will suffer the same fate sooner or later! The effect of man's whole spiritual and practical disposition is that—*cum grano salis* and speaking of the broad basis—he apprehends only that which matches his convictions and simply overlooks the counter-examples however startling: a fact totally inexplicable to later eras. Proofs no less 'factual' and 'convincing' were adduced for astrology and miracle cures, for witchcraft and the direct efficacy of prayer as are now adduced for the validity of universal laws of nature. And I by no means exclude the possibility that later centuries or millennia, perceiving as the core and essence of each individual phenomenon its indissoluble, unified individuality, not ascribable to 'universal laws', will declare such generalities to be as much of a superstition as the aforesaid articles of faith. Once we have abandoned the idea of the 'absolutely true', which is likewise only a historical construction, we might arrive at the paradoxical idea that in the continuous process of perception, the standard of the truths newly adopted differs only in degree from the standard of the errors we have abolished; that, as in a never-halting procession, just as many 'true' perceptions mount the front steps as 'illusions' are cast down the back steps.

Pretty egregious. But pretty useful for the purposes of reaction. “Modern relativistic scepticism was directly undermining objective scientific knowledge and, no matter whether its begetters intended this or not,

providing scope for the wildest reactionary obscurantism, for the nihilistic mysticism of imperialistic decadence.”

A long discussion of Simmel’s subjectivism and anti-Marxism follows. For example his reducing the problems of contemporary society to a “tragedy of culture in general,” which rested on the antithesis of soul and mind (*Geist*), “the antithesis of the soul and its own products and objectifications.” Such ideas were useful in diverting intellectuals’ discontent and alienation from capitalism into less dangerous channels.

Vitalism developed in new ways with the outbreak of World War I. “The old basic antithesis of ‘life’ versus ‘rigidity’ and ‘the moribund’ was naturally preserved, but it acquired a new and seasonable content. The ‘German character’ (*das deutsche Wesen*) which was to ‘restore the world’s health’ now constituted the ‘life’ conception, and the national character of other peoples (chiefly the Western democracies and especially England) was what was moribund and rigid. And in particular, there arose the new equations and antitheses of war as equalling life, and of peace as the rigid and moribund.” Lots of pseudo-philosophical war pamphlets were put out. In one by Max Scheler, for instance, war was affirmed in a Nietzschean vitalistic way: “The true root of all war lies in the fact that a tendency towards ascent, growth and development is inherent in all life itself... Everything that is moribund and mechanical seeks only to ‘maintain’ itself... whereas life is growing or decaying.” You can see glimmers of fascism here.

After the war—and after the Russian Revolution, which added a portentous new element into the cultural porridge that would produce fascism—came Spengler’s *Decline of the West*, which was “a veritable, direct prelude to fascist philosophy.” To quote Lukács: “Basically, vitalism’s new phase [as exemplified by Spengler] was distinguished by the fact that the degrading of the scientific method, which was hitherto partly half-conscious, partly tactfully concealed and at first sought only to obtain room for vitalism’s intuitive-irrationalist world-view alongside the established, materially unquestioned individual sciences, now went over to an open attack upon the scientific spirit in general, upon the competence of reason adequately to treat of important human questions.” Intellectual standards sank. Spengler went farther along the path that Dilthey had pioneered, the path that elevated intuition, feeling, “perception through men of genius,” a rejection of causal explanations in favor of description, analogizing, and the like. Lukács: “This shallow and arbitrary epistemology in which everything boiled down to experience, to intuition, was Spengler’s way of asserting the undisputed mastery of historical relativism. Everything is historical: with Spengler that meant that everything was historically relative, purely relative.” Including our knowledge of nature. And even mathematics.

...Number, for instance, was for [Spengler] a purely historical category: ‘*A number in itself does not and cannot exist.* There are several worlds of numbers because there are several civilizations. We find an Indian, Arabic, ancient and occidental type of number each at bottom unique, each the expression of a different course of events... Accordingly there is more than one kind of mathematics.’ This ridiculously consistent denial of all objectivity Spengler took to the point where he was capable of saying of causality that it was ‘an occidental and more precisely a Baroque phenomenon.’

For Spengler, history took precedence over nature as a general rule: ‘Thus history is the original world-form and nature a late one which only men of a mature culture may fulfil, not the reverse as a prejudice in urban scientific understanding tends to assume.’ And so the whole science of physics along with its object was a myth of the late occidental ‘Faustian’ culture. The atom, speed of light and gravitation were just as much the mythical categories of ‘Faustian man’ as poltergeists and household demons were categories of the period that believed in magic. (If we recall Simmel’s statements on the historical relativity of knowledge we can see how Spengler was merely drawing all the conclusions of pre-war imperialist vitalism and popularizing them.) For those reasons, culture was for Spengler ‘the primary phenomenon of all past and future world-histories.’

Reminds me of postmodernism. What a surprise. Decadent minds think alike.

Culture was a “primary phenomenon.” Each culture had its own *Gestalt*, which was the basis for all of that culture’s manifestations. “The automatic result was that these self-enclosed *Gestalts* were necessarily ‘monads without windows’: only within its unique essence could each be intuitively grasped and described.” You see the fascistic origins of later postmodernist dogmas. Even the promiscuous use of the word ‘culture’ by contemporary academics has an essentially reactionary significance and origin. (You also see, incidentally, that Heidegger wasn’t particularly original.)

One of the benefits of extreme historical relativism is that it denies there is any progress in history, thus denying a proposition that had become an article of faith for socialists and Marxists. It also presents science and materialism as mere provincial prejudices, thereby undermining an outlook that can serve as an immovable foundation for revolutionary politics.

Spengler regarded the various cultural *Gestalts*, such as the German and the Western democratic one, as basically ‘solipsistic,’ alien, hostile, impervious to communication with each other. (A sublimation of the solipsism of the imperialist age’s parasitical classes.) This paralleled and reinforced the racial ideology that had already emerged with Gobineau and Chamberlain, that the different races were alien and hostile to one another. Thus “we notice in Spengler the fulfilment of Nietzsche’s barbarizing tendencies, [and also] we see the deep-seated concurrent development of the various streams of reactionary imperialist philosophy, and their tendency to merge in theoretical preparation for the barbaric ideas and actions of Hitler and Rosenberg.” The reactionary nature of vitalism is evident from its culmination in Spengler.

Similarly, it is patent that the construction of this irrationalist, solipsistic myth of history had as its ultimate, crucial purpose another attempt to resist the socialist perspective on social evolution. Nietzsche, the first to take up this philosophical challenge, was still obliged to present the whole of world-history, which was unitary in his eyes, as a contest for leadership between masters and rabble. Therefore he had to lay stress on awakening the masters’ ‘will-to-power’ with all the available means in order that their struggle might end in the future defeat of socialism. Spengler entertained hopes that were far weaker than Nietzsche’s. His conception was a consoling melody rather than a battle-hymn, an opiate rather than a stimulus. The cyclical life of the cultural spheres, he thought, had repeatedly given rise to dangers similar to the contemporary one, namely the proletarian threat to capitalism. This danger, however, had been dismissed from every cycle, and each culture had died a ‘natural’ death of superannuation, of cultural paralysis. Why should a different fate befall the Faustian civilization of capitalism? There was, after all, intuitive-analogical morphology, the only sure knowledge of history, and this indicated that destiny was about to introduce the rule of the ‘Caesars’ (i.e., the monopoly capitalists). The fact that this rule signified the beginning of the end of the culture concerned did not interest any capitalist or parasitical intellectual. We shall manage to survive—*après nous le deluge*: that was Spengler’s song of consolation, and very effective it was.

But in another work, *Prussianism and Socialism*, Spengler took a different approach to the problem of socialism, an approach that would later be adopted by Hitler. Lukács describes it as follows:

Every civilization, according to Spengler, has its socialism (Zeno, Buddhism, etc.; present-day socialism is the Faustian form of these manifestations). But this generalization did not satisfy Spengler’s analogy hunt. He had, in addition, to discover the ‘real’ socialism, namely Prussianism; the types of the military officer, civil servant and worker. The adversary of this ‘socialism’ was not capitalism but England. (Here Spengler was enlarging on the ideas in Scheler’s war pamphlets and Sombart’s *Dealers* [English] and *Heroes* [Germans].) Prussians and Englishmen represent two major types in the development of civilization. There are ‘two moral imperatives of a contrasting kind, slowly evolved from the Viking spirit and the code of the Knights of the Teutonic Order. The one group carried the Germanic idea within them, the others felt it over them: *personal independence and supra-personal commonalty*. Today they are called individualism and socialism.’ Karl Marx and working-class socialism have only complicated this question and are

being thrust aside by the fateful logic of world-history. The victor will be 'Prussian socialism,' the 'socialism' founded by Friedrich Wilhelm I. The true Internationale will also be built on this basis: 'A genuine Internationale is possible only through the triumph of the idea of a single race above all others... *The genuine Internationale is imperialism.*' The worker, in this 'socialism,' becomes an economic officer, and the entrepreneur a responsible administrative official. The German working class will be bound to realize that only this 'socialism' has real possibilities. No ideology is needed, only 'a brave scepticism, a class of socialistic master-natures.'

Thus you get National Socialism.

Lukács next proceeds to a subtle critique of Max Scheler, Husserl, and phenomenology, but I'll pass over that. His section on Heidegger and Jaspers is even better—much better. Brilliantly diagnoses the illness that was existential philosophy, and critiques Heidegger's ideas. With this thinker, phenomenology "turned into the ideology of the agony of individualism in the imperialist period." I have to copy some passages again, since they're too pithy to summarize.

The grim years of the First World War, which were full of abrupt changes of fortune, and the ensuing period brought a marked change of mood [in philosophy and culture]. The subjectivistic tendency remained, but its basic tenor, its atmosphere was completely altered. No longer was the world a great, multi-purpose stage upon which the I, in ever-changing costumes and continually transforming the scenery at will, could play out its own inner tragedies and comedies. It had now become a devastated area. Before the war, it had been possible to criticize that which was mechanical and rigid about capitalist culture from a lofty vitalistic angle. This was an innocuous and safe intellectual exercise, for the being of society appeared to stand undisturbed and to guarantee the safe existence of parasitical subjectivism. Since the downfall of the Wilhelmine regime the social world had started to constitute something alien to this subjectivism; the collapse of that world which subjectivism was continually criticizing, but which formed the indispensable basis of its existence, was lurking at every door. There was no longer any firm means of support. And in its abandoned condition, the solitary Ego stood in fear and anxiety.

As a rule, relatively similar social situations produce relatively similar tendencies in thought and feeling. Before the outbreak of the 1848 revolution, which was an international, European event, Romantic individualism went to pieces for good. The most important thinker during its crisis and fall, the Dane Soren Kierkegaard, formulated in the most original way the philosophy of the then current Romantic-individualistic agony. No wonder that now, when this depressed mood was already starting to make itself felt—years ahead of the actual crisis [of the 1930s]—as a foreboding of future gloomy events, a renaissance of Kierkegaard's philosophy was proclaimed by the new phase's leading minds, Husserl's pupil Heidegger and the former psychiatrist Karl Jaspers. Of course they did so with up-to-date modifications. Orthodox Protestant religiosity and Kierkegaard's strictly Lutheran faith in the Bible were of no use to present needs. But Kierkegaard's critique of Hegelian philosophy, as a critique of all striving for objectivity and universal validity by reasoned thought, and of all concepts of historical progress, acquired a very strong contemporary influence. So did Kierkegaard's argumentation of an 'existential philosophy' from the deepest despair of an extreme, self-mortifying subjectivism which sought to justify itself in the very pathos of this despair, in its professed exposure of all ideals of socio-historical life as mere vapid and vain ideas, in contrast to the subject, which alone existed. The altered historical situation did, of course, dictate far-reaching changes. Again, these lay chiefly in the fact that Kierkegaard's philosophy was aimed against the bourgeois idea of progress, against Hegel's idealist dialectics, whereas the renovators of existential philosophy were already principally at odds with Marxism, although this seldom found overt and direct expression in their writings; at times they attempted to exploit the reactionary aspects of Hegelian philosophy on behalf of this new campaign. That in Kierkegaard existential philosophy was already no more than the ideology of the saddest philistinism, of fear and trembling, of anxiety, did not stop it conquering wide intellectual circles in Germany on the eve of Hitler's

seizure of power and the nihilistic period of so-called heroic realism. On the contrary: this pretentiously tragic philistinism was precisely the socio-psychological reason for the influence of Heidegger and Jaspers.

One indication of the change in mindset was that the catchword of earlier vitalism had been “life,” whereas now the word was “existence.” “The emphatic stress on ‘life’ signified the conquest of the world through subjectivity; hence the fascist activists of vitalism, who were about to succeed Heidegger and Jaspers, revived this catchword, although they gave it a new content once more. ‘Existence’ as a philosophical leitmotif implied the rejection of a great deal that vitalism had elsewhere approved as ‘alive,’ and this was now presented as inessential, non-existential.” To talk about abstract *existence* instead of concrete *life* is to be more alienated from society and oneself, to be separate from or outside of life, to be acutely anxious.

As for Heidegger’s philosophy itself, I’ll say only that in essence it isn’t much different from subjective idealism. It’s dressed up in the garb of objectivity, “ontology,” etc., but it’s purely idealistic. How else can you describe a philosophy that claims “*Ontology is only possible as phenomenology*”? In reality, of course, ontology is only possible as natural science, since it is science that tells us (or tries to tell us) what the ultimate constituents of the world are.

More quotations:

Bourgeois man's sense of becoming inessential, indeed a nonentity, was a universal experience among the intelligentsia of this period. Hence Heidegger's complicated trains of thought, his laborious phenomenological introspections struck upon the material of experiences widespread among this class and found an answering chord. Heidegger was here preaching a retreat from all social dealings just as much as Schopenhauer, in his time, had proclaimed a withdrawal from the bourgeois idea of progress, from the democratic revolution... [But] the human emotional emphasis in the withdrawing process was totally different, indeed opposed, in Schopenhauer and Heidegger. With the latter, the feeling of despair no longer left the individual free scope for a 'beatific' aesthetic and religious contemplation as in Schopenhauer. His sense of peril already encompassed the whole realm of individual existence. And although the solipsism of the phenomenological method may have distorted the depiction of it, it was still a social fact: the inner state of the bourgeois individual (especially the intellectual) within a crumbling monopoly capitalism, facing the prospect of his downfall. Thus Heidegger's despair had two facets: on the one hand, the remorseless baring of the individual's inner nothingness in the imperialistic crisis; on the other—and because the social grounds for this nothingness were being fetishistically transformed into something timeless and anti-social—the feeling to which it gave rise could very easily turn into a desperate revolutionary activity. It is certainly no accident that Hitler's propaganda continually appealed to despair...

There follows a long analysis of various facets of Heidegger’s philosophy, including his philosophy of time and history, the upshot of which is basically that social action and so forth are “inauthentic.” More authentic are the negative features of existence, such as anxiety, despair, etc. (You also see this negativity and individualism in Sartre, of course, with the emphasis on anguish, absolute freedom, bad faith, and the like.)

And then there’s Jaspers. A neo-Kierkegaardian. “Every doctrine formulated of the whole,” he writes, “becomes a shell devoid of the original experiencing of the ultimate situations, and it thwarts those energies which are actively seeking the meaning of future existence in self-willed experience. For this it substitutes the calm of a fully perceived and perfected, soul-appeasing world of eternally present meaning.” For Kierkegaard the opponent was Hegel, for Jaspers it’s Marx. “With the assertion of the one truth as universally valid for all men... *falsehood* immediately sets in.” The main threat was in democratic rule by the masses. Lukács: “Only with the ‘inwardly’ turned, purely self-reliant individuum (in the intellectual philistine rejecting all public life) could, Jaspers believed, truth, integrity and humanity be found; and—in true German petty-bourgeois style—he represented all mass influence as falseness and barbarity.” What a surprise: an intellectual who doesn’t trust democracy.

As an aside, here's a paragraph from Jaspers that reminds us of how totally derivative Sartre was (but then so was Jaspers):

Existential philosophy would be *lost* at once if it *believed it knew again what man is*. It would again provide the basic outlines for an investigation of human and animal life in its types, and would revert to being anthropology, psychology, sociology. It can have meaning only if it remains without a base in its concreteness. It awakens that which it does not know; it illuminates and activates, but it does not pin down... Because it remains without a concrete object, illumination of existence does not yield any results. The clarity of awareness contains the demand without fulfilling it. As observers we must be content with that. For I am not that which I perceive, and I do not perceive what I am. Instead of observing my existence I can only set in motion the process of clarified awareness.

Lukács' final judgment of Heidegger and Jaspers is suitably harsh (although it's possible he attributes too much importance to them):

Heidegger and Jaspers carried the most extreme individualistic, petty-bourgeois-cum-aristocratic relativism and irrationalism to their farthest logical limits. They ended up with an ice age, a North Pole, a world become empty, a senseless chaos, a nought as man's environment, and a despair about oneself and one's inescapable loneliness as the inner content of their philosophy. They thus provided an accurate picture of what was widely going on within the German intelligentsia at the end of the twenties and the start of the thirties. But they did not stop at description. Their account was at the same time interpretation: an exposition of the meaninglessness of any action in this world. Their partisan attitude is manifest in the fact that they related the negative features of what they called the 'world' exclusively to democratic society. And that, on the eve of the crisis and during it, was tantamount to a decisive *parti pris*. For it deepened the general mood of despondency among broad sections of the German bourgeoisie, above all, its intellectuals, side-tracked potential rebellious tendencies and thus afforded significant assistance, in a negative way, to aggressive reaction. If fascism could inculcate a more than benevolent neutrality in broad sections of Germany's intelligentsia, this was due in no small measure to the philosophy of Heidegger and Jaspers.

Such is the danger of all relativistic and nihilistic philosophies.

The last section in the chapter on "Vitalism in Imperialist Germany" is the one on pre-fascist and fascist vitalism, which surveys the writers Klages, Jünger, Baeumler, Boehm, Krieck, and Rosenberg (although of course there were many others—also internationally). Again, a brilliant analysis. The creation of historical myths and mythical types; the explicit repudiation of intellect and reason as dead or moribund; the elevation of intuition, which finally became the infallibility of the *Führer*; the contempt for lifeless bourgeois culture, etc. (See my old paper on fascism, and the works of Zeev Sternhell.) Near the end, Lukács reminds us of the indirect guilt of Dilthey and Simmel (however much they would have despised the fascist so-called philosophers): "...the Baeumler-Krieck-Rosenberg philosophy would not have been possible without Spengler, and Spengler's would not have been possible without Dilthey and Simmel." And here's the chapter's last paragraph:

This barbaric cul-de-sac [of "National-Socialist philosophy"] thereupon appears a necessary climax to the self-dissolution of German imperialistic ideology in vitalism (*Lebensphilosophie*), whose earliest philosophical forerunners we traced to the irrational reaction of German feudal absolutism to the French Revolution. And this climax was by no means fortuitous, but the merited fate of the immanent tendencies of vitalism itself. Hegel, who came to vitalism when it was not yet far advanced, when it was a doctrine of 'direct knowing,' prophetically wrote of it: 'From the thesis that *direct knowing* must be the criterion of truth it follows...that all superstition and idolatry are

declared to be true, and that the most wrongful and indecent content of the will is justified... Natural desires and inclinations automatically deposit their interests in the consciousness, and the immoral purposes are directly located in the same.'

The next chapter, on neo-Hegelianism, is less interesting, so let's skip it. (It does, however, indicate yet again the astounding breadth of Lukács' learning.) Of far more interest is the chapter on German sociology, on how it contributed to a climate of "irrationalism." Consider Toennies, in the late nineteenth century. He did much to popularize the distinction between culture and civilization that later was very important to Spengler and others. "This antithesis arose spontaneously out of the bourgeois intelligentsia's feeling of discontent with capitalist, and especially imperialist, cultural development." Since the intelligentsia, tied in many ways to capitalism, couldn't become genuinely revolutionary, it expressed its discontent by elevating "culture" at the expense of "civilization." The latter, denoting techno-economic development, was constantly ascending, but at the expense of the former. Culture became increasingly impoverished, commercialized, vulgar, decadent. A "tragic, unbearable tension" would finally break out between the two. As Lukács comments, this conception was but the expression of an unrigorous Romantic anti-capitalism; but it had the advantage of militating against socialism. "For since socialism was developing further the material forces of production (mechanization, etc.), it too was unable to solve the conflict between culture and civilization. It was rather perpetuating the conflict—consequently, the argument ran, the intelligentsia afflicted by this dichotomy would be wasting its time by contesting capitalism for the sake of socialism." The odd and rather senseless distinction between culture and civilization was essentially backward-looking.

The more strongly that *Lebensphilosophie* tendencies, especially Nietzsche's, took hold of sociology and social studies in general, the stronger the emphasis became on the contrast between culture and civilization, the more energetic the turning to the past, and the more unhistorical, antihistorical the propositions. And the internal dialectic of ideological developments after the war inevitably meant that the dismissive attitude was extended more and more to culture as well. Culture and civilization alike were rejected in the name of the 'soul' (Klages), of 'authentic existence' (Heidegger), and so on.

A more and more spiritualized-individualistic philosophy emerged, which, in rejecting the *social* sphere, collective action, economic and political progress, and so forth, necessarily aided the development of fascism and its ideologies.

With Toennies you also get a contrast between community and society, the latter equated, in effect, with capitalism. The "living" vs. the "mechanized." What resulted, again, was an effective diversion of intellectual discontent from anti-capitalism to...anti-modern-civilization in general.

And then there's Weber, the most sophisticated and ambitious of the German sociologists.

For German sociology, the central problem in pre-war imperialism was to find a theory for the origin and nature of capitalism and to 'overcome' historical materialism in this sphere through a theoretical interpretation of its own. What constituted the real bone of contention was the original accumulation, the forcible separation of the employed from the means of production. (As adherents to the marginal utility theory, the majority of German sociologists regarded the doctrine of surplus value as settled scientifically.) New hypotheses and theories were set up by the dozen as a sociological substitute for original accumulation... With regard to later developments, however, Max Weber's conception became the most influential. Weber, as we have seen, started out from the interaction between the economic ethics of religions and economic formations, whereby he asserted the effective priority of the religious motive. His problem was to explain why capitalism had come about only in Europe. In contrast to the earlier view of capitalism as any accumulation of wealth, Weber was at pains to grasp the specific character of modern capitalism and to relate its European origin to the difference between ethico-religious development in the East and West. To achieve this

his principal step was to de-economize and ‘spiritualize’ the nature of capitalism. This he presented as a rationalizing of socioeconomic life, the rational calculability of all phenomena. Weber now devised a universal history of religion in order to show that all oriental and ancient religions produced economic codes constituting inhibiting factors in the rationalization of everyday life. Only Protestantism (and within Protestantism, chiefly the dissident sects) possessed an ideology agreeable to this rationalization and encouraging it. Time and again Weber declined to see in the economic codes a consequence of the economic structures. Of China, for example, he wrote: ‘But here this lack of an ethically rational religiosity is the primary factor and seems, for its own part, to have influenced the constantly striking limitation in the rationalism of her technology.’ And in consequence of his identification of technology and economics—a vulgarizing simplification that acknowledged only mechanized capitalism as the authentic variety—Weber then arrived at the ‘decisive’ historical ‘argument’ that the Protestant economic ethos which speeded up and fostered capitalist development was already there *‘before the “capitalist development.”*’ In this he saw a refutation of historical materialism.

In some respects Weber wasn’t as conservative as many of his peers. Whereas they criticized Western democracy as dysfunctional and inferior and so on—in order to argue for the superiority of German conditions—Weber favored democracy...as “the form most suited to the imperialist expansion of a major modern power,” to quote Lukács. “He saw the weakness of German imperialism as lying in its lack of internal democratic development.” Lukács then quotes Weber: “*“Only a politically mature people is a ‘master race’ ... Only master races are called upon to intervene in the course of global developments... The will to [anti-democratic] powerlessness in home affairs that the writers preach is irreconcilable with the ‘will to power’ abroad which has been so noisily trumpeted.”* Weber was an imperialist like all the others, but a “democratic imperialist,” so to speak.

Lukács also criticizes the formalism of Weberian sociology, which paralleled the formalism of contemporary philosophy. “As a result of its formalism, subjectivism and agnosticism, sociology, like contemporary philosophy, did no more than to construct specified types, set up typologies and arrange historical phenomena in this typology. (Here Dilthey’s later philosophy had acquired a decisive influence on German sociology. Its real blossoming—after Spengler—we can witness in the post-war period.)” He continues:

With Max Weber this problem of types became the central methodological question. The setting up of purely constructed ‘ideal types’ Weber regarded as a question central to the tasks of sociology. According to him a sociological analysis was only possible if it proceeded from these types. But this analysis did not produce a line of development, but only a juxtaposition of ideal types selected and arranged casuistically.

A rather just criticism, I think.

Lukács finishes his discussion of Weber with a nuanced analysis of how even this rigorous thinker inadvertently accepted and contributed to the climate of irrationalism in German intellectual culture. In brief, the point is that by striving for a value-free sociology, he left the field open to irrationalism, mysticism, and faith. He had to become a relativist, since supposedly science wasn’t relevant to values or ends. (In a sense, this Humean argument is right. But Marxism shows that a sort of integration of values and “science” is nevertheless possible.) Values are arbitrary. So then it’s sort of legitimate to have a separate, non-scientific sphere of irrationalism—much as Weber on some level would have contested that (and did contest the vulgar irrationalism of his day).

Later, in the midst of a long and compelling critique of Weber’s younger brother Alfred (another sociologist of some importance), Lukács observes that the celebrated Weberian concept of “charisma” is in fact of little interest:

As is well known, Max Weber in his sociology regarded the chosen state of the democratic leader in particular as 'charisma', a term already expressing the conceptually unfathomable and incomprehensible irrational character of leadership. For Max Weber this was not to be avoided. For if—following the Rickertian methodology of history, which only recognizes individual phenomena—we ask why it was that Pericles or Julius Caesar, Oliver Cromwell or Marat became leaders and try to find a sociological generalization covering the separate historical answers, there will arise the concept of 'charisma', which roughly pins down in a pseudo-concept our ignorant amazement, i.e., something irrational. When, on the other hand, Hegel spoke of the 'world-historical individual', he was proceeding not from the individual but from the historically allotted task of an age, a nation, and regarded as 'world-historical' that individual who could solve this task. Hegel well knew that the question of whether, among those with the potential awareness and capacity for action needed in this situation, it is the individual X or Y who does in fact become 'world-historical' conceals within it an element of irreducible chance. Max Weber posed the question precisely from the angle of this unavoidable chance element and sought an 'explanation' for it. Hence he was sure to land up with the partly abstract, partly mystical and irrational pseudo-concept of 'charisma'.

Characteristically acute insights. It's like...okay, sure, charisma is important. And one can, if one wants, elevate that concept into something more pithy than its ordinary humdrum meaning to express some sort of unrational mystical connection between the masses and a leader. But...so what? How far-reaching is the explanatory payoff of that concept? Not very. It's just more description and typologizing. More pseudo-explaining, superficial explaining.

Worse, the Weberian notion of charisma helped prepare the ground for the fascist theory of the *Führer*, and helped it gain credence among the intelligentsia. —For all these reasons and more, Weber, like the many other thinkers Lukács is discussing, has a bit of blood on his hands. In fact, any intellectual (or really any person—but the intellectuals and the elite first and foremost) who doesn't take a firm stand with the Left is complicit.

Okay; on to Karl Mannheim and his "sociology of knowledge" (which continues to find expression in postmodernist currents). Its logical conclusion, of course, is relativism, since all knowledge is supposed to be totally situation-bound, no more than an expression of a particular situation and the interests, desires, perceptions, perspectives, etc. embedded in that situation.

Like all agnostics and relativists of the imperial period, Mannheim protested against the accusation of relativism. He solved the question with a new term and called himself a relationist. The difference between relativism and relationism is about the same as that between the yellow and the green devil in Lenin's letter to Gorky. For Mannheim 'overcame' relativism by pronouncing obsolete and discarding the old epistemology, which at least put forward the demand for objective truth and termed the denial of it relativism. Modern epistemology, on the other hand, was to 'proceed from the thesis that there are areas of thought where uncommitted, unrelated cognition is quite unimaginable'. Or, more radically as regards the realm of social knowledge: 'But primarily, each of us gets to see that aspect of the social whole to which he is oriented in terms of the will.' Here Mannheim's source is obvious: it was historical materialism's theory of ideologies. But, like all the popularizers and popular opponents of this doctrine, he failed to observe that in it, the relative and absolute mesh in a dialectical reciprocal relationship, and that this gives rise to the approximative character of human knowledge, for which objective truth (the correct reflection of objective reality) is always an inherent element and criterion. Thus the theory involved a 'false consciousness' as a complementary pole to correct consciousness, whereas Mannheim conceived his relationism as the typification and systematizing of every possible kind of false consciousness.

'Historical materialism is itself an ideology just like all the others, and therefore a kind of false consciousness! Ha ha, I win!' But as I was writing as long ago as my senior thesis in college, you simply *have* to acknowledge the possibility of objective truth/knowledge and that not *everything* is only an

expression of a particular situation or perspective. For even in the moment of making such a relativistic claim, you're implicitly stating that *it*, at least, is an objective truth. It's the old "performative contradiction" of relativism: the very act of stating a thoroughgoing relativism contradicts the content of your statement.

Anyway, Lukács has some fun exposing the hollowness of Mannheimian sociology. For example: how does Mannheim get himself out of the performative contradiction? How does he get himself out of the total relativism he disavows? Well...

To the *'floating' intelligentsia* [Lukács writes] was imputed the chance and the role of ascertaining the truth that met the present situation from the totality of standpoints and attitudes linked to these standpoints. This intelligentsia, according to Mannheim, stood outside social class: 'It forms a centre, *but not a centre in terms of class.*' Now why the thinking of the 'floating intelligentsia' was no longer 'situation-bound,' and why relationism did not now apply its own tenet to itself, as it was asking historical materialism to do, is known only to the sociology of knowledge. Mannheim asserted of this social group that it possessed a social sensibility enabling it to 'share the feelings of the dynamically conflicting forces,' but that was a hollow claim without proof. That this group had the delusion that it was standing above social class and the class struggles is a well-known fact. Historical materialism not only repeatedly described it, but also deduced it from the social Being of this group. Here it was Mannheim's duty to point out that the bond with social Being, with the 'situation' which, in his new epistemology, defined the thinking of every man living in society, was absent from this group or present in a modified way. But he did not even attempt to show this, and simply had recourse to the 'floating intelligentsia's' illusions about itself...

'We floating intellectuals, angelically hovering above society, are the exception to everything I've been arguing!' Ugh. Why must bourgeois thinkers invariably be such mediocrities? Well, I guess the question answers itself.

Enough about Mannheim and all these middling ideologists. Lukács sums up: "The sociological movement emanating from Max Weber was profoundly sterile." Intellectual and political sterility is what you get when you're committed to a middle position in a time of social crisis. These liberals couldn't countenance fascism but wouldn't commit themselves to a decisive democratic program to resist it—for they feared socialism even more than fascism—so they ended up vacillating pathetically, criticizing mass democracy while (sort of) defending it, fecklessly counseling moderation, thereby enabling ultra-reaction.

I'm reminded of recent U.S. history: the feckless, vacillating liberalism of Obama & Co. prepared the way for the semi-fascism of Trump & Co. Just as the feckless, vacillating liberalism of Jimmy Carter & Co. ushered in the reactionary age of Reagan & Co. Whether among intellectuals or politicians, centrist liberalism serves but to clear the ground for reaction.

I'll pass over the section on fascist and pre-fascist sociologists like Hans Freyer and Carl Schmitt. Moving on to the chapter on "Social Darwinism, Racial Theory, and Fascism": it was in the eighteenth century that racial theory sprouted, out of (e.g.) the French nobility's struggle to maintain its dominance against an ascendant bourgeoisie. "As early as the start of the eighteenth century, Count de Boulainvilliers wrote a book (1727) in which he tried to prove that in France, the nobility represented the descendants of the old Frankish ruling class, whereas the rest of the population were heirs of the subject Gauls. Therefore two qualitatively different races were confronting one another..." At the time of the French Revolution the polemicizing advanced to a new plane, as bourgeois ideologists like Volney and Sieyès ridiculed the nobility's claim to represent a superior and pure race.

"Thus racial theory—in its first rudimentary form—was already scientifically discredited at the time of the French Revolution. But the class forces behind it did not disappear in the revolution; the struggle against democracy continued and constantly took new forms. Thus racial theory was bound to flare up again in various forms. Its further vicissitudes were determined by the class struggles—partly by the varying amount of influence which feudal or semi-feudal reaction gained in the crisis-beset development of bourgeois democracy, and partly by the ideological needs of a reactionary bourgeoisie turned anti-democratic. For the latter looked to the remnants of the feudal age for political support, and in this

connection appropriated elements of its ideology...” Once the chief enemy had become the working class and not the feudal aristocracy, the bourgeoisie was willing and eager to ally with the latter against the former, including on the ideological plane.

For a long time, though, there was no particular need for racial theory in Germany. All the way up to the second half of the nineteenth century, under Bismarck, the Prussian Junkers were secure enough in their power not to have to invoke their racial superiority as a desperate defense of their privileges. It was instead in France that racialism was first reinvigorated, by Gobineau, whose book *The Inequality of the Human Races* gradually attained influence in the era after 1848. Gobineau wrote from a feudal-aristocratic perspective, but given that in France it had become utterly hopeless to return to the age of feudal dominance, it was through the interests and agency of the bourgeoisie that his ideas spread. For instance, American slaveholders loved them, and Gobineau was initially much more popular in the U.S. than France.

Gobineau’s principal animus, of course, was against democracy and the “unnatural” idea of the equality of men. Equally predictably, he thought the white race, more specifically the Aryan, was the highest, and he was cast into despair by its modern mongrelization and bastardization. It was no longer a pure race, and so was doomed to decline, ossification, and ox-like stupefaction. Lukács comments:

It is chiefly this fatalistic pessimism that distinguishes Gobineau from his important successors, Chamberlain, Hitler and Rosenberg. With these, racial theory was to a mounting degree the organ of an actively militant reactionary demagogy. And this demagogy, likewise, increasingly cast off the old feudal confines of reaction to become an obscurantist ideology of reactionary monopoly capitalism. Here, of course, we must not forget that Gobineau’s successors preserved elements of his racialist pessimism in a specific sense, namely in the view that development always means deterioration (racial mixture is necessarily a corruption of the species). Thus the activism of later racial theory sprang from the same pessimistic, anti-evolutionary basis as with Gobineau. The only difference was that a desperate, ambitious activism supplanted fatalistic despair...

Later fascists considered Gobineau backward in some respects, as in his attempt to reconcile racial theory with Christianity (everyone is equal in the eyes of God), but they did draw a lot from him. “Above all, he was the first to produce a really effective pseudo-scientific pamphlet contesting democracy and equality, on a racialist basis. Moreover, his book marked the first large-scale attempt to reconstruct the whole of world-history with the aid of racial theory, and to do so by tracing back to racial questions all historical crises, social conflicts and differences.”

Several decades passed before a new racial theory appropriate to the age of imperialism emerged, with Chamberlain. (But of course racial thinking was rampant everywhere in the second half of the nineteenth century, a fact that Lukács doesn’t sufficiently acknowledge.) Social Darwinism played a decisive role in bridging the earlier and later stages of racism. I won’t summarize Lukács’ long discussion of its leading exponents, but a few points are worth making. Regarding the Social Darwinist Gumpłowicz, for instance: “with his primitive biologist view of history, his mysticizing of the facts of class struggle into a racial struggle ‘ordained by nature’ and the anti-democratic attitude permeating this whole conception, he was paving the way for the fascist view of history.”

I mostly won’t summarize the long discussion of H. S. Chamberlain, since racism is of less than zero intellectual interest, but parenthetically Lukács makes an insightful critical remark on liberal intellectuals of that decadent age, a remark that applies to liberal intellectuals of our own decadent age: “Relativistically-minded modern liberal thinkers, while becoming very sharply opposed to the ‘dogmatic’ aspect of materialism, were extremely patient towards and indeed full of sympathetic understanding for the most obscurantist intellectual trends of the time [such as vitalism and strains of racialism]. Here again we see that objectively, this relativism of theirs was assisting the birth of fascist ideology.” Today too: materialism is ridiculously dogmatic and reductivist! It’s barely worth engaging with, it’s so simplistic! Its much more sophisticated to focus on *culture*—race, gender, discourses, subjectivities—than the *economy*!

–Ugh. Oh well, I guess in some respects it’s not as bad as it used to be, since contemporary political correctness, as silly as it is in many ways, is better than the racialism and reactionary obscurantism of the past.

I have to give Lukács credit for wading through all the racist dreck and devoting substantial intellectual energy to analysis of it. I couldn’t do that. Here’s one paragraph that I find of somewhat more intellectual interest than the others (which isn’t Lukács’ fault, given his subject-matter):

Chamberlain expressed this philosophical allegiance to German imperialism with the most brutal cynicism: ‘Nobody can prove that Germanic supremacy is a blessing for all the Earth’s inhabitants; from the beginning right up to the present, we have seen the Germans slaughtering whole tribes and peoples...so as to procure room for themselves.’ Here Chamberlain was perpetuating the Nietzschean line of indirect imperialist apologetics, the ‘blond beast’ line that so many of Nietzsche’s liberal admirers would prefer to regard as nonexistent or inessential to him. But at this juncture it is plain how necessary and how central this particular line was to both of them, to Nietzsche as well as Chamberlain. In other respects they may have greatly differed, and a big difference in stature may have separated Nietzsche the literary stylist and psychologist of culture from Chamberlain. But both stood out from the other vitalists and racialists in that they strove to provide a historical perspective for the imperialist age on the basis of a pessimistic cultural critique. But what kind of perspective might that be, if not an imperialist one? And if it was an imperialist one, then what else could it contain—as its essential tenet—but the [‘glorious’] myth of imperialist aggression and inhumanity? Where this perspective was lacking, all that could emerge was a scepticism bordering on nihilism, a state of despair or of resignation as the final wisdom,’ as reflected in the history of vitalism from Dilthey and Simmel to Heidegger and Klages. [Think also of, say, the final line of Eliot’s “The Waste Land”: *Shantih shantih shantih*. Resignation, appropriate to Eliot’s complicit conservatism. And that of a galaxy of like-minded intellectuals.] Objectively considered, the imperialist period could follow one of only two courses: it could either approve imperialism along with its world wars, its subjugation and exploitation of colonial peoples and its own masses, or else imperialism could be effectively repudiated, the masses could revolt and destroy monopoly capitalism. The thinking man had to side openly and firmly, either for or against. Otherwise his life, no matter whether he sympathized with imperialism as with fascism or disliked them, could only end without prospects, in despair. (We have already repeatedly illustrated the objectively positive service to fascism of the philosophy of despair.) [Many thinking men, however, refused to take a stand, in effect choosing passive compliance with the worst trends of the age. Complicit cowards, both morally and intellectually.] Nietzsche and Chamberlain, to be sure, differed not only in stature but also in their closeness to the concrete realization of imperialism. Nietzsche was merely its prophet; hence the general, abstract, ‘poetic’ form of his imperialist myth. Chamberlain was already more active, a direct participant in the ideological preliminaries to the First World War. Hence we can already clearly discern in him the outlines of bestial imperialism à la Rosenberg and Hitler.

Anyway, onward to the final section, on the National Socialist synthesis. “National Socialism was a major appeal to...those bad qualities [of the German people] formed in the course of centuries as a result of *failed revolutions* and *the lack of a democratic German development and ideology*.” (My italics.) That’s the reason in a nutshell. Most of the other Western countries benefited from a democratic tradition; Germany didn’t. So you got a decades-long explosion of reactionary irrationalism, even more than in France, England, and the U.S. And in the end it achieved far more political power. Because of how useful it was to the ruling class, and how ineffectual the democratic resistance was. (Here, other factors played a role too. For instance, Stalin’s catastrophic foreign policy.)

Let us also not forget the essential role of American capitalism: “Hitler’s ‘originality’ lay in the fact that he was the first to apply techniques of American advertising to German politics and propaganda. His object was to stupefy and defraud the masses...” The U.S. was rather marginal in winning World War

II—that was done mostly by the Soviets—but it did provide invaluable assistance, on many levels, in causing it.

More on this topic:

This fusion of German vitalism and American advertising was no accident either. Both are manifestations of the imperialist age. Both appealed to the desolation and disorientation of the people of this age, to their imprisonment in a fetishized category system belonging to monopoly capitalism. They played on men's numb suffering under the system and their inability to break free from it. But the American system of advertising was aimed at the man in the street, appealing to his most immediate daily needs, and in these the objective standardization through monopoly capitalism was mingled with a vague desire—within this framework—to stay 'personal.' Vitalism, on the other hand, reached out via extremely circuitous routes to the intellectual elite, where the inner resistance to standardization was much more fiery, albeit—objectively speaking—equally hopeless. Hence advertising techniques were cynically demagogic from the outset, an immediate expression of monopoly capitalism, whereas vitalism was for a long time pursued bona fide or at least with indirect, quasi-scientific and quasi-literary means. But for all their differences they were united—objectively considered—in distracting attention from all objectivity, in a one-sided appeal to feelings, experiences, etc., and in trying to eliminate and pour contempt on reason and independent, rational judgement. There was, therefore, a specific social necessity which explains why the products and the method of vitalism were conveyed to the streets with the tools of American advertising.

Inasmuch as Hitler combined in his own person vitalism and monopoly capitalism, the latter's most advanced techniques, i.e., American techniques, were coupled with its most advanced imperialist reactionary ideology, i.e., the German ideology. The very possibility of this parallel, this unity indicates that we can only understand and criticize all the barbarity, cynicism and so forth of the Hitler period by considering the economics, social structure and social trends of monopoly capitalism. Any attempt to interpret Hitlerism as a revival of some barbarism or other will miss the most crucial specific features of German fascism.

It is only from the angle of these cynical, unscrupulous advertising techniques that we can accurately portray the Hitler fascists' so-called ideology. For all that they ever asked was: what use is this idea, what advantage does it have?—in total independence of objective truth which, indeed, they vehemently and scornfully rejected. (In this they were in complete agreement with modern philosophy from Nietzsche via pragmatism up to our own day.) Now, however, these coarse and muscular advertising techniques joined forces with the products of imperialist vitalism, the philosophy of the most 'refined' minds of this period. For that agnosticist irrationalism which had gone on developing in Germany from Nietzsche, Dilthey and Simmel to Klages, Heidegger and Jaspers had as its final outcome a repudiation of objective truth no less vehement than that which Hitler voiced from other motives and with other arguments. Thus vitalist irrationalism's relevance to fascist 'philosophy' did not hang on individual epistemological findings; these, difficult and subtle, were only meant for small intellectual circles. It had to do with a general spiritual mood of radical doubt concerning the possibility of objective knowledge and the value of reason and understanding, as also with a blind faith in intuitive, irrational 'prophecies' contradicting reason and understanding. In short, it had to do with an atmosphere of hysterical, superstitious credulity whereby the obscurantism of the campaign against objective truth, reason and understanding appeared to be the last word in modern science and the 'most advanced' epistemology.

This is one of the greatest books I've ever read. A work of near-genius. In a sense, despite its many flaws, it almost achieves the level of Chomsky in its reverence for pure reason, science, and the traditions of the Enlightenment.

I'm sorry, but I have to include another long quotation, this time on why all the fascist bestiality was able to happen in Germany:

...As we know, Germany in the modern age developed on lines different to those taken by Western Europe as also Russia. Whereas everywhere else, the dissolution of feudalism gave rise to unified nation-states, in Germany it led to a political fragmentation. Hence Lenin was right in saying that the central issue of the bourgeois revolution in Germany was the creation of national unity. In the development of Germany, this situation produced various results which were peculiar to the country, but always unfavourable and connected with the reinforcement of reactionary ideas. Firstly, absolutism in Germany lacked those progressive features that were visible wherever it was the organ for establishing the political unity of a nation. Secondly, this line of development was connected with a belated and feeble development of the bourgeois class and with a long retention of relics of feudalism and the political predominance of the nobility. Thirdly, the bourgeois democratic revolution was weaker, less clear-cut and more susceptible to reactionary distractions than elsewhere, since its chief task was the setting up of a missing central power and not the progressive democratic transformation of one that already existed.

The ideas are sketchy—although earlier in the book he had elaborated on them in great detail—but they're suggestive and pithy. Later he adds, "Thus in other countries the ideology of absolutism, even if it turned the State into a 'leviathan,' distinctly reflected class struggles and class interests, as also the position and function of the State in these conflicts—albeit by no means fully or consciously. But in Germany, because of that backwardness we have outlined, there arose the theory of the State as the embodiment of the absolute idea, a theory which degenerated into a State mystique and idolatry. (This is also clearly visible in Hegel's law philosophy.)"

To read this book is a bracing, exhilarating experience. And its final pages—before the long epilogue—are characteristically magnificent, infused by a humanism that remains life-affirming and hopeful even in the aftermath of World War II. It begins with the following sentences and builds to a Goethe-quoting climax:

One thing is certain: 1945 was not a repeat of 1918. The collapse of Hitler's Germany was no straightforward defeat, however crushing, no mere change of system, but the end of a whole line of development. It ended that falsely based German unity which started with the defeat of the 1848 revolution and was complete by 1870-1; it posed this central issue of the German nation entirely afresh once again. Indeed, one may say that the whole misguided history of Germany became due for revision. A hundred years before, Alexander von Humboldt—who was really not inordinately radical—had already seen that with the defeat of the Peasants' War, Germany had lost her way. She needed to retrace her steps to that date in order to find the right direction; what had happened since was the result of it...

And so Lukács issues a call to arms for humanism, democracy, and reason. His whole book, all 850 pages of it, is such a call, perhaps the most eloquent and urgent such call in history, considering the circumstances that brought it forth. It will never be surpassed.

In the very long epilogue he takes the story up to the early 1950s, focusing on the U.S., which was now the principal imperialist power. With the defeat of fascism and the discrediting of racism, irrationalism and capitalist apologetics now mainly (as, frequently, before) took the appearance of a disinterested rational investigation. "With regard to form, mode of presentation, and style we are here [in the case of mainstream American liberals and conservatives] dealing with purely conceptual, scientific deduction. But this is only so in appearance." In reality, such writers as Walter Lippmann—and innumerable others—are vulgar superficialists who refuse to analyze in any depth the workings of society because of the left-wing conclusions they'll come to. For instance, they say it's necessary to pass laws to break up the concentration of capital. But they don't ask how that can be achieved, what social forces must be mobilized to bring about such laws and make sure they're enforced. There is no real investigation of the relation between the economy and the politico-legal superstructure. There's just a shallow adherence to surface phenomena. (For

a contemporary analogue, see Paul Krugman's writings. He nearly always stops just before he gets to really substantive questions of political economy and the distribution of power, and of how actually to achieve the reforms he advocates. (Because that necessitates bringing in unions and building radical popular movements.) This is a type of irrationalism, though a more subtle and, perhaps, effective type than the Hitlerian variety.

Some thoughts on analytic philosophy of the time:

But in semantics and neo-Machism also—their dividing-lines are often blurred—there has arisen a vigorous further development of the earliest Machism in accordance with the ideological requirements of modern American imperialism. The early Machist show of 'strict scientific thinking' has been preserved unaltered, but at the same time the departure from objective reality has gone far beyond the earlier standards. Philosophy's task is now no longer an 'analysis of sensations' but only one of word-meanings and sentence-structures. And parallel with the formal-academic total loss of substance which this has entailed, overt direct apologetics have emerged far more prominently than ever before. Machism came about originally as a philosophical weapon against materialism, chiefly in the field of the epistemology of natural science. The modern agnostic forms which were elaborated in the process naturally constituted a good starting-point for many an irrationalist current, and Machism was always of philosophical assistance to irrationalism. Now, a general direct apologetic has plainly emerged. Semantics examine energetically and systematically the general concepts of social and economic life, only to find them trivial, empty word-formations. What follows? The English Marxist Maurice Cornforth tells us very clearly in a quotation from Barrows Dunham's *Man against Myth*: 'As we clearly see, there are no dogs in general, no human race, no profit system, no political parties, no fascism, no undernourished peoples, no shabby clothes, no truth, no social justice. With things standing thus there is no economic problem, no political problem, no fascist problem, no nutrition question and no social question... By simply breathing out,' he continues, 'they have spirited out of the world every important problem to have tormented the human race during its entire history.'

And in addition, Cornforth showed most lucidly the social consequences of such a philosophy. He stated: 'To take a simple example, let us consider the kind of discussion that occurs very frequently between workers and employers. What is the semantic prescription for solving the dispute? It is expressed very clearly in the words of the boss who says: "Let's forget all this twaddle about labour and capital and profit and exploitation, which is only the meaningless invention of political agitators who are playing on your emotions. Let's speak man to man, as Adam to Adam, and let's try and understand each other." That is actually the way in which employers very often argue. They learnt to be semanticists before semantics was even invented.'

Recall my thoughts years ago on E. P. Thompson's *The Poverty of Theory*, where he discusses the great use of, e.g., Karl Popper's nominalistic positivism to maintenance of the political status quo. (It's no wonder the conservative W. V. O. Quine—who once told Chomsky that the Great Depression had never happened—was an empiricist, nominalist, behaviorist, etc.) While the conscious motivation of these people might not be to hinder leftist radicalism and organized labor—they may be too dull to see it has that effect—the point is that the reason their philosophies can become mainstream is that they're useful to power-structures (or at least benign towards them).

In general, I don't find the epilogue of much interest. But it has its moments. Such as when Lukács has this to say about the famous historian Arnold Toynbee: "Philosophically, his now famous *oeuvre* offers nothing new whatever. On all the main issues Toynbee is a straightforward epigone of the vitalist epigone Spengler, from whom he has borrowed all his important concepts, such as opposition to the unity of history, the equating of all civilizations, the denouncing of progress as illusory, and so on. His so-called originality is expressed in wholly trivial details; for however many such 'culture cycles' either one of them constructs—with equal arbitrariness—they result in as few concrete differences as exist between, to recall

Lenin's joke, a red devil and a blue one, i.e., none at all." Yep, that seems pretty accurate. I recall not being impressed by Toynbee when I read about him years ago.

The epilogue, too, ends on a note of hope: an invocation of the worldwide peace movement as a sign of things to come. "[The movement's] mere existence has a world-historical significance for human thought: the *protection of reason as taking the form of a mass movement*. After a century of the increasing dominance of irrationalism, the defence of reason and the restoration of subverted reason is starting on its triumphal march among the masses..." As we know, the Cold War continued and humanity survived only by the skin of its teeth. And now we're in a new age of even greater peril. But Lukács's hope is as 'rational' now as it was then, for the vast majority of humanity remains opposed to the most destructive trends of the time. Irrationalism is again on the ascendancy, but the democratic resistance is numerically greater and may yet triumph in the end.

*

Reading Maurice Cornforth's *Marxism and the Linguistic Philosophy* (1965). A good book, not dogmatic or closed-minded in the old Marxist way. It starts off with a historical overview of philosophical empiricism (which eventually led into the "linguistic philosophy" of the mid-twentieth century). Summaries of Francis Bacon, Hobbes, Locke, and so on. The end of the first chapter makes a few useful points, starting with this statement: "In the contrast between the theories of Hobbes and Locke there appeared for the first time that dilemma which has troubled bourgeois philosophy ever since—how to follow the paths of science without abandoning bourgeois illusions." Cornforth sees Hobbes as having "carried things to their logical conclusions in a way that was unacceptable to the bourgeoisie of his own or any subsequent date. For this reason he was, and has remained, the odd man out of bourgeois philosophy." More specifically,

He carried Bacon's conception of "man the interpreter of nature" to its logical conclusion in atheistical materialism. And he carried the refutation of the idea of the divine sanction of government to its logical conclusion in the doctrine that the authority of the state rests [solely] on its possessing the material means of coercion.

The bourgeoisie didn't and doesn't want to get rid of religion, for it's socially useful. Nor does it want the realities of power—the role of naked violence—to be laid bare in the Hobbesian way. The highly useful state should be thought to possess some moral and democratic legitimacy.

So Hobbes' intellectual integrity had only a negative use, not a positive one:

The great intellectual and social impact of the writings of Hobbes did not consist in their founding any new school of thought, still less in their serving any political or class interests, revolutionary or counter-revolutionary. There have never been any Hobbists or Hobbesites. Hobbes' power lay in repulsion rather than attraction. His writings served as a warning, a red light signaling danger ahead.

The promotion of the sciences is part of the very life-blood of the bourgeois social order. The dilemma presented to all bourgeois thinkers consists of this—that either you take your stand by the sciences and sacrifice your illusions, or else you take your stand by your illusions and sacrifice the sciences. But they are prepared to do neither the one thing nor the other. And so some third way has to be found.

...The most fruitful, the most plausible, and at once the simplest and most flexible way was that discovered by Locke.

...The essence of Locke's approach was to find how understanding could be extended by first examining its limitations. And he laid it down that the human understanding is "fitted to deal" with no more than the ideas, impressions or appearances of things implanted in the mind. With these alone we are "conversant," and no science can ever make us conversant with anything else. The scientific approach, whether in the natural sciences or in matters of morality and government, must

always be content to argue about things only as they affect us, its object being not the things [in themselves] but the ideas of them in our minds.

Locke thus limited the sphere of possible scientific inquiry, and denied that it could penetrate to “the substance” of things. To try to do that meant pushing inquiry beyond our capacities, and could only result in difficulty and error. [An anticipation of Kant.]

This “way of ideas” has, as we shall see, been persistently explored from the time of Locke right up to the present day. Its virtue is that it enables the explorers at one and the same time to accept the empirical approach and the discoveries of the natural sciences, and to reject all materialism (such as that of Hobbes or, more to the point later, of Marx) and keep the discussion of social and moral problems on a plane where the real contradictions and motive forces operating in society, behind the façade of social consciousness, remain hidden and are never allowed to intrude.

But Locke was, in a sense, inconsistent. He said the “immediate objects” of our knowledge were not external objects but only our ideas—and yet that our ideas of *primary qualities* are genuine copies of the qualities of external objects. But if we don’t have direct knowledge of external reality, how can we know which ideas resemble objects and which don’t? This (purported) weakness permits of two opposed lines of criticism. On the one hand you can argue that if at least some of our ideas are accurate or semi-accurate reflections of reality, we’re evidently able to make progress towards understanding things in themselves. This was the line of criticism followed by the revolutionary French materialists—Holbach, Helvetius, and Diderot. On the other hand, you can argue that if we’re immediately aware only of our ideas, we have *no* knowledge of the external material world. This was the path followed by Berkeley.

But Berkeley, too, was inconsistent, when he inferred the existence of God as a spiritual being who produced in us the sensations and ideas we have. “For if it is illegitimate to infer the existence of the material world as the ground of our experience, it must be equally illegitimate to infer the existence of God. If all knowledge is derived from sense, how can knowledge of God and the soul be allowed? Or if we are allowed a ‘notion’ [as opposed to a more definite *idea*] of spirit, why is it absurd to have a ‘notion’ of matter? If the words ‘material substance’ are meaningless, surely the same must go for ‘infinite spirit?’” Enter David Hume, who set about removing these inconsistencies. After his work of demolition was done, there were (supposedly) no longer philosophically respectable (or “demonstrable”) reasons to believe in matter, spirit, soul, God, causality, or in fact anything besides “those perceptions which are immediately present to consciousness” (quoting Hume). Starting from Locke’s doctrine of ideas we’ve arrived at solipsism. “I am at first affrighted and confounded,” Hume said, “with that forlorn solitude in which I am placed in my philosophy.” Even the existence of the past and future is thrown into doubt.

Be that as it may, just as all proofs of God and the like, and of matter, were now refuted, so were all proofs of their *nonexistence*. Hume was compelled to be agnostic about all this, since it’s inadmissible to make inferences beyond sense-perceptions.

Though this was not his intention, Hume in fact continued and completed the work of Berkeley in the matter of the reconciliation of science and religion. He agreed that the object of scientific knowledge is nothing but our own sense-impressions. He corrected the extravagance of Berkeley, who had tried to make out that the observable order in our sense-impressions was proof of the existence of God. But equally, he reinforced Berkeley’s own refutation of extravagant claims made on behalf of science. Men of science were deluded if they supposed that their investigations led to the discovery of material causes which were “the ultimate and operating principle as something which resides in the external object.”

Science, therefore, can discover nothing that can possibly conflict with religion. A scientist can be religious or not, as he chooses—his researches simply throw no light at all on the truth or otherwise of religious faith. On the other hand, the religious man has no cause to fear or quarrel with science.

In the first period of the development of modern natural science, it took up arms against religious obscurantism. The philosophy which Hume developed from Berkeley meant that science was now to be disarmed. It was to lay aside any claim to represent a true and expanding picture of the real nature of things, of natural history, the forces at work in the world, and the explanation of events.

Hume's spirit of skepticism and distrust of all certainty and "zeal" led to his being a Tory in politics. It's best to let well enough alone, only making occasional modest reforms. "Let us cherish and improve our ancient government as much as possible, without encouraging a passion for novelties." "An established government has an infinite advantage, by that very circumstance, of its being established... To tamper, therefore, in this affair merely upon the credit of supposed argument and philosophy, can never be the part of a wise magistrate... and though he may attempt some improvement for the public good, yet he will adjust his innovations as much as possible to the ancient fabric, and preserve entire the chief pillars and supports of the constitution." Cornforth comments: "This is exactly the same argument as Burke afterwards produced, with more prolixity, against the French Revolution, and as still serves today as the foundation-stone of British Conservatism."

Again, then, Humean empiricism and skepticism were useful to capitalism and the status quo.

Then came the nineteenth century and the revolutionary development of industry and science. After a short discussion of dialectical materialism—the world is a complex of dynamic processes, not things, and contradictory relationships leading to development, and quantitative changes resulting in qualitative changes—Cornforth remarks that, by contrast, the classical doctrine of empiricism (that sense-perceptions, not the external material world, are the objects of knowledge) continued to be maintained by bourgeois thinkers. Despite the incredible advances of science. For example, according to Mill, T. H. Huxley, and others, "what the sciences achieve is [simply] the methodical prediction of the ordering of sense-impressions. [These thinkers] explained that when science refers to material objects and material causes, what it actually does is predict what groupings and sequences of sensations to expect. A material object, as Mill put it, is a 'permanent possibility of sensation.'" You can see the long reach of these positivists in later arguments by Karl Popper and others that the point of science is to predict, and that any theory that can't make testable predictions is unscientific. Chomsky, by contrast—as a competent thinker—remarks that *explanation* is different from *prediction*. There's no contradiction in being able to explain past and present events while being unable to predict future ones.

And then there was Ernst Mach. "Bodies do not produce sensations," he declared, "but complexes of elements (complexes of sensations) make up bodies." "For us, the world does not consist of mysterious entities, which by their interaction with another, equally mysterious entity, the ego, produce sensations, which alone are accessible. For us, colors, sounds, spaces, times, are provisionally the ultimate elements, whose given condition it is our business to investigate. It is precisely in this that the exploration of reality consists." But he wasn't an idealist, he insisted! Reality isn't mental or spiritual. Rather, "the antithesis between ego and world, between sensation (appearance) and thing, vanishes, and we have simply to deal with the connection of the elements." The "elements" are neither mental nor material. They're "neutral." (Cf. Russell's neutral monism.) The science of psychology deals with one sort of "order" of the elements, and then we call them mental. The science of physics deals with another sort of "order," in which case we call them physical. But really they're neither.

After reading the *Stanford Encyclopedia* article on neutral monism I'm reminded of my own (obvious) thoughts from years ago about how a given 'object' or sensory appearance is physical from one point of view—an actual thing 'out there'—and mental from another—a perception 'in here.' So, sure, that's true. These "elements" can be called "neutral," since their ontological status depends on what stance you adopt towards them. But none of this entails there are no mind-independent physical entities or processes.

Cornforth has a nice critique of the deeply impoverished view of science that Hume's empiricism leads to. To argue, as the scientist Sir Arthur Eddington did, that "the whole subject-matter of science consists of pointer-readings and similar indications" is to misunderstand the essence and purpose of science,

which is far richer than that. I'm reminded of Chomsky's remark that to talk of "the behavioral sciences" (as opposed to the *cognitive* sciences or some such) is like interpreting physics as nothing but "meter-reading science," which every minimally rational person knows is an absurdly thin view, just laughable. But that's how positivists literally saw it!

The thinker should take it as a rule of thumb that insofar as something is mainstream or widely accepted, it's probably wrong. First because philosophies become *ideologies* the more popular they are—and the role of ideologies is but to serve the interests of the powerful and to intellectually sublimate institutional norms—and second because most people are not competent thinkers.

One advantage of idealistic empiricism, incidentally, was supposed to be that it adheres to Occam's Razor. As Russell said in one of his phases, "whenever possible, logical constructions are to be substituted for inferred entities." For then you're being more parsimonious in your ontology. But while Occam's Razor is a useful principle, it shouldn't be the be-all and end-all (or so it seems to me).

Anyway, while the positivist philosophy of science misunderstood science, "it fitted in far better with the methods and postulates which were at the same time being adopted for the investigation of society." While a genuinely "scientific" analysis of society has to proceed in the Marxian way, getting beneath appearances to uncover the processes of exploitation, the production of surplus-value, class conflict, etc., the imperatives of bourgeois social science forbade this method. Instead, it was argued that science should stick to the observed facts, and that the Marxian idea of real value and its objective measurement is a metaphysical invention. The point of bourgeois social science was, as Marx said, merely the task of "describing, cataloguing, expounding and bringing under classifying definitions the external phenomena of the process of everyday life in their outward manifestation and appearance." (Thus you get the obsession with typologizing that Lukács discusses, as manifested everywhere from philosophy to sociology.)

"Bourgeois economic theory studied to formulate laws connecting such observational variables as supply and demand, costs of production, wages, prices, rents, rates of interest, etc. This conception of 'law' [as having to do only with regularities and correlations between observed phenomena] was precisely that formulated in the positivist philosophy; and the task which bourgeois economic theory set itself was precisely the task allotted to science by the positivist philosophy."

The positivist philosophy of science was, then, in its actual development the philosophy which enunciated the principles of the methodology of bourgeois social science... Most of the effort of positivist philosophers went into the interpretation of the natural sciences—and especially of physics. It was presented as a philosophy of natural rather than of social science. This meant, in effect, that what was being done was to misrepresent the methods and findings of the natural sciences in such a way as to represent the officially recognized social sciences as practicing the same scientific method, and to represent scientific socialism as unscientific.

It does not seem likely that the misinterpretation of the natural sciences could have become so persistent, or gained so much social prestige, had it not been for this evident, but never stated, service which positivist philosophy performed for bourgeois social science.

At the same time, insofar as stress was laid on the limitations of scientific knowledge—"which, after all, revealed nothing but laws of combination and sequence of sense-impressions"—the effect was to leave scope for religious dogma and every other kind of obscurantist authority. Another useful service for capitalist society.

The chapter on the *Principia Mathematica* (and logicism, logical atomism, etc.) is a bit more dense and difficult than the others. The upshot is that the new methods of analytic philosophy, taken from the successes in analyzing mathematics and formal logic, gave positivism a new lease on life. Just as propositions in mathematics and logic had been analyzed into more primitive elements, so concepts like "external material things" and the like were supposed to be analyzed in terms of sense-data. As they already had been, by Mach and others. Russell's attempts, in *Our Knowledge of the External World*, *The Analysis of Matter*, and *The Analysis of Mind*, to work out a conception of the world by taking sense-data as his starting-point were not particularly original, aside from their "new terminology for setting forth the

conclusions of Mach's *Analysis of Sensations*." Nor, as Cornforth says, "did Russell even find new grounds for these conclusions. The grounds were the old [Humean] ones: all that we know with certainty to exist is our own sense-impressions, and all knowledge is therefore to be interpreted as referring to these sense-impressions."

More to the point is that Russell was wrong to say his analysis was "verifiable" and to compare it to Galileo's advance in physics. For how, e.g., is it to be "verified" that the same objects that constitute a body (sense-data) also constitute a mind? In fact, despite his protestations, his whole theory is a product of *a priori*, "unverifiable" reasoning.

Cornforth also expounds and critiques G. E. Moore's version of analytic philosophy, arriving at a similar conclusion: what Moore demonstrated (even more than Russell) was that "when an analytic philosopher sits down to do a philosophical analysis, all sorts of different analyses, each more complicated and far-fetched than the last, present themselves; but the method gives no means of deciding which of them, if any, is the right one, that is, the one which actually corresponds to the facts." And later he introduces his discussion of Wittgenstein and logical positivism this way:

The chief difficulty in the method of logical analysis, as practiced originally by Russell and Moore, lay in the lack of any criterion or principle for deciding what was the right analysis. The conclusions, therefore, appeared arbitrary and speculative. It was this difficulty, above all, that led to the theorizings of the philosophers known as logical positivists and, in particular, to the first or original philosophy of Wittgenstein.

But before I get into that I just want to note down some points made about British absolute idealism in the late nineteenth century, since they're reminiscent of *The Destruction of Reason*. It was the age of imperialism, colonialism, the increasing incorporation of the working class into the state, in general the growth of the state and of a more interventionist policy domestically and internationally. Not surprisingly, then, mystical idealism sprang up even in Britain. "It was above all Bosanquet who translated into English the the Hegelian doctrine that the State is the manifestation in human life of the Moral Idea, that the individual exists only through the State and receives everything he needs through the State, that his good lies in obeying the State, and that the State itself is a spiritual entity, a spiritual unity more real than the fragmentary individual selves of its citizens. All this was put forward with a great show of moral fervor, of class reconciliation, and of contempt for mere science and empirical calculation." The analytic philosophers performed an important service in demolishing all this irrationalist, authoritarian nonsense, a victory that hindered the progress of fascism in Britain. In this respect, Germany could have used a few dozen Bertrand Russells and G. E. Moores.

Well, I was going to follow Cornforth into the tangles of Wittgenstein and logical positivism, and then "the linguistic philosophy," but I've read too much about these subjects in the past and by now they're dated anyway. On top of that, I always start to feel guilty when I spend too much time on philosophy. The world is falling apart, so I should focus on that.

Well, I will focus on it, I promise—and I am: I'm writing an article about spending 24 hours in jail back in February—but I'm also reading a book by Rom Harré called *Cognitive Science: A Philosophical Introduction* (2002). Early on he makes this useful statement:

The positivist [idealist] philosophy of science was [originally, in the seventeenth and eighteenth centuries] often motivated by religious scepticism. By setting a very stringent standard for legitimate knowledge claims, it was felt that theology could be set aside as a source of knowledge superior to all others. In time this sceptical attitude modulated into an attack on all metaphysics, legitimate or speculative. Science was to be pruned of all claims to knowledge that went beyond those that could be verified by the use of the human senses alone.

The progressive, anti-medievalist philosophy of empiricism, which for Francis Bacon and others was the philosophy of science (that was precisely its progressive aspect), ended up, by the time of Berkeley and in later centuries, limiting the claims, ambitions, and power of science, by being anti-realist. Ironic! The progressive impulse to demolish obscurantist metaphysical systems in favor of science—by emphasizing sense-perception above all—led later to a critique of science’s pretensions to explain the world beyond the senses...which, as we saw from Cornforth’s book, in turn had the effect of reconciling religion with science and reinstating the validity of the former! For science didn’t describe the world in itself! Profound “dialectical” irony in this ideological development. In fact, even as thinkers like Berkeley were using empiricism to *defend* religion, materialists in France were using it to *attack* religion! Ha! What a funny world.

For Hume, the real meaning of an idea was the sense-perceptions from which it was derived. So, for instance, the idea of causation, which supposedly comes from regular patterns of correlations between events, just means an experienced regularity. Thus you get the positivist notion that both causation and laws of nature are merely statements of the correlations between observable states of affairs—nothing ‘deeper’ than that. Since the content of ideas comes from experience, ideas can refer only to experiences (and relations between them). –That argument seems fallacious, so the logical positivists probably wouldn’t have endorsed it, but surely something like it was a motivation for their idealist positions.

Harré seems like a sensible thinker:

The positivist point of view has had an enormous and largely malign influence in psychology. If the domain of legitimate objects of knowledge is restricted to what can be publicly observed, psychology must be restricted to a science of public behavioral responses to stimuli imposed from the external environment. This was the ontological basis of the classical behaviorism advocated by Watson (1930). It followed that the only legitimate results of psychological research would be correlations between types of stimuli and types of responses. B.F. Skinner (1974) widened the ontology of psychology to include private, subjective experiences. Thoughts could be admitted as response correlates of stimuli. However, his radical behaviorism retained one of the main principles of positivism. Neither unobservable mental processes nor neural processes of any kind were to be introduced in an explanatory role into scientific psychology.

After a lot of preliminaries on the scientific method and so on he introduces a distinction between what he calls the First Cognitive Revolution of the 1950s and afterwards, and the more recent Second Cognitive Revolution (which “has turned to a more advanced computational model, connectionism, to link psychological phenomena with their neural groundings.” Having read Gallistel and others, I’m skeptical of the value of connectionism).

A useful way to introduce the deep differences between the First Cognitive Revolution and the Second is to contrast causal explanations with normative.

The causal picture: the First Cognitive Revolution. Psychological phenomena are linked by cause–effect relations, presupposing the existence of (unobservable) causal mechanisms. A one-dimensional version of this picture, such as Hume’s associationist psychology, has cognitive states, or ideas, causing subsequent cognitive states with which they have been associated. La Mettrie’s proposal and its descendants presuppose a linear causal sequence of bodily states, each of which causes a correlative mental state, a two-dimensional version of the Causal Picture. In the first version, it is presupposed that thoughts can cause thoughts. In the second version, it is presupposed that neural states can cause other neural states and thoughts and feelings as well... In the Causal Picture, a person is just a place where causal processes occur, a site for one psychological event to cause another.

The agentive picture: the Second Cognitive Revolution. Psychological phenomena are attributes of the flow of public and private actions by means of which persons are actively engaged, usually with real or imagined others, in carrying through various cognitive and practical projects.

The flow of actions is orderly because actions are linked into sequences by the demands of meaning, and by the local standards of correctness to which people generally try to conform. In the agentic picture a person is the prime inaugurator of meaningful actions. Psychological phenomena are the products of human beings actively engaged in carrying through, or trying to carry through, their projects.

The proper way is to use both the causal and the agentic picture to construct a hybrid psychology.

In a historical chapter on psychology, Harré says, “I will discuss three variants of seventeenth and eighteenth-century mentalism, that of Descartes, that of Locke and that of Hume. As this program developed, a common thesis about the mechanism of cognition emerged, the association of ideas. Mentalism became increasingly positivistic. However, the principle of association was taken up by David Hartley, and used to sketch a realist psychology. In Hartley’s scheme, unobservable brain processes explained observable associations of ideas, the association of material ‘vibrations’ exactly matching the associations of ideas.”

Decided not to continue with that book, so have been reading other stuff. For instance, Wolfgang Streeck’s *How Will Capitalism End?* (2016). (There’s going to be a long “interregnum.”) And Ha-Joon Chang’s *Economics: The User’s Guide* (2015).

Useful point against conservatives: “Adopting the Behaviouralist perspective, we begin to see our economy in a way that is very different from the dominant Neoclassical one. The Neoclassical economists usually describe the modern capitalist economy as the ‘market economy’. The Behaviouralists emphasize that the market actually accounts for only a rather small part of it. Herbert Simon, writing in the mid-1990s, reckoned that something like 80 per cent of economic activities in the US happen inside organizations, such as the firm and the government, rather than through the market. He argued that it would be more appropriate to call it the *organization economy*.” From this perspective, the term ‘market economy’ is just ideological.

Well, the book isn’t as useful as I’d hoped, so forget it.

Reading *Literary Theory: A Complete Introduction* (2017), by Sara Upstone. Came across it in the bookstore. It’s a pretty good book, systematically going through a remarkable number of schools of thought, including, e.g.: aestheticism, practical criticism, new criticism, formalism, reader response theory, Marxism and post-Marxism, structuralism, psychoanalytic criticism (Freudian, Jungian, Lacanian), existentialism, poststructuralism, deconstruction, Deleuze, postmodernism, feminism(s), queer theory, postcolonial criticism, cultural studies, cultural materialism, humanism, ethical criticism, genre theory, and ecocriticism. But I’m left with my old impression that, while literary theory and literary criticism can be very intriguing, insightful, and suggestive, in the end it’s all just an infinity of *interpretations*, playful interpretations. Here’s one way of interpreting a text, here’s another way, here’s another way, here’s another way... You can choose this interpretation if you prefer, or that one, or that one, or this other one if you find it more interesting; and you can choose this approach (or ‘method’), or that approach, or this approach. Some of the approaches/interpretations might have more value than others—a Marxian interpretation might be more fruitful or illuminating (or reasonable) than a Freudian interpretation—but they all might have something to say. But you’re left thinking...so what?

I don’t know, I’m conflicted between recognizing the potential value of literary/cultural theory—and criticism—and thinking it’s quite masturbatory. (And sometimes just silly or nonsensical or totally self-indulgent.) Some ideas of Bourdieu, for instance, might give insight into the subtle workings of power and authority in culture, and might be construable as additions to or refinements of useful Marxian ideas. But I’m suspicious of the endless proposing of new conceptualizations seemingly for their own sake. Like, in Bourdieu, *habitus*, *doxa*, *disposition*, *field*—notice the characteristic borrowing of terminology from natural science, a practice that comes perilously close to pretentiousness (puffing up ideas as more substantive and necessary/useful than they are; and also trying to benefit from the intellectual prestige of science, by positioning oneself, more or less meretriciously, in its shadow). Inventing jargon that might, perhaps, be mildly thought-provoking but doesn’t add much of substance to old, simple insights. Or the new vocabulary might even serve to distract from and dilute pithy, punchy intuitions that challenge the ruling

class's legitimacy; in this case, it will, naturally, become popular in institutions propped up by the ruling class.

It all seems so damn decadent.

Now reading Kautsky's *Communism in Central Europe in the Time of the Reformation*. As with his history of the origins of Christianity, it's less "sophisticated" and "polished" than modern bourgeois scholarship but more profound and timeless.

December, 2023

Well, it's been an interesting few years. In large part because of my ex-wife, who is also mother of my child Aidan. Who turned 2 on December 18. Far too much insanity has happened since 2017 for me to relate here. But it's all turned out okay so far, since Aidan is an adorable little guy who has made my life more meaningful. I see him on the weekend every three weeks, when I go to Pennsylvania to visit him and his—very difficult—mother. His presence in this terrible world doesn't leave my conscience unaffected, though. To live is to be guilty, and to create life is to be even more guilty, but life isn't *only* suffering, thank God. With any luck, Aidan will have a good life.

Here are some articles I've published in the last few years, in various left-wing outlets and, in a few cases, on my website. The first sixteen are from 2018. I'm getting tired of writing and don't much see the point of it anymore.

(Also published a book version of my dissertation with Anthem Press: *Popular Radicalism and the Unemployed in Chicago during the Great Depression*. It's a pretty good book but not a great one.)

Privatization Is Killing Us: Dispatches from the War on Society

As the capitalist elite continues to pour ever more resources into its crusade to dismantle society, it's important to keep a tally of the damage done—if only to direct popular attention to where it's needed most, and to where the Left's own resources are needed most. High on the list of capitalist priorities, and thus of priorities for left-wing resistance, is the goal to privatize everything from education to nature to policing and soldiering. With that in mind, here's a list of some recent "negative externalities" of privatization that I've culled from news sources.

Children, teachers, and rat feces

Let's start with Rahm Emanuel's Chicago, jewel of neoliberalism. In February 2014, the Chicago Public Schools decided to outsource management of custodians to Aramark and SodexoMAGIC. The rationale for privatization is supposed to be that it cuts costs and improves "efficiency" or effectiveness. Left unsaid is the means by which costs are cut: primarily from the fact that private companies have a freer hand than government in treating employees viciously. It's easier for corporations to lay off employees, reduce wages and benefits, degrade working conditions, and destroy unions than it is for governments to do so, since corporations are totalitarian institutions. Whether the overall deal is a net financial gain for government is a difficult question, to which studies have given conflicting answers. Some have found that it actually ends up costing more money in the long run, while others have concluded privatization may in some cases yield savings of about 10 percent. But these reports don't factor in all the extra costs, such as the time and money it takes to review proposals by companies, negotiate contracts, review contract terms, deal with the inevitable lawsuits, etc.

And then there are the costs to the public, which, of course, don't count.

Tim Cawley, the chief administrative officer behind CPS's decision to outsource custodial management, claimed it would indirectly improve "family and community engagement"—which in a sense it did, since parents have felt compelled to volunteer to clean up bathrooms and classrooms. Because of

cutbacks in the number (and the pay) of janitors, it has been left to parents and teachers to clean up pools of urine in bathrooms, feces smeared on walls (in preschools), clogged toilet bowls, enormous amounts of trash, rat droppings, and the like. Toilet paper and soap supplies have repeatedly run out in many schools, forcing teachers to buy supplies themselves. (In some schools, students have been asked to bring in their own toilet paper, tissues, soap, and paper towels.) Leaky ceilings, cockroach infestations, rotting floors, outbreaks of bed bugs, exposed asbestos, the presence of dust and grime aggravating respiratory illnesses, and rotting garbage do not exactly “result in an enhanced learning environment,” despite Cawley’s assurances.

“It’s gross and disgusting and my health is being affected,” one teacher says. “I want to be outside the minute I’m in here. It smells. Everything smells and I can’t focus. If I can’t focus to teach, how can kids focus to learn?”

While these conditions have been known about for years, only a recent exposé by the *Chicago Sun-Times* has finally persuaded CPS to act—by hiring an extra 200 janitors this summer, of whom 100 will remain in the fall. The janitors’ union had asked for 500 more permanent hires.

There is good news on the legislative front, though: on April 10, the Illinois House Labor and Commerce Committee voted favorably on a bill that would allow members of the Chicago Teachers Union to bargain over non-salary issues such as crowded classes and filthy schools. (This is a right denied only to Chicago teachers.) The bill now heads to the House.

Barbarism, Inc.

Few business models can be as morally putrid as private prisons. The government pays the company a per diem rate per prisoner, so shareholders make more money the more people are incarcerated. Which gives them an incentive to lobby for harsh laws, as they have done effectively in recent decades. The company also has an incentive to keep conditions as bad as possible for both prisoners and employees, since, of course, cost-cutting is good for profit-making. Study after study has revealed the obvious and outrageous moral hazards of the private prison industry.

But with a creature in the White House who supports the expansion of this sociopathic industry, it’s useful to be reminded of just how horrible it is. A few weeks ago the *New York Times* published an article on the East Mississippi Correctional Facility, a privately run prison in which gang members have been allowed to beat other prisoners (for extended periods of time), a mentally ill man on suicide watch hanged himself, and inmates have to protect themselves with crudely made knives and other weapons because there aren’t enough guards to maintain order. And the ones who are there aren’t well-trained. One prisoner was charged by a man with a knife and a long section of pipe while he was being escorted to his jail cell; the two guards escorting him just ran away, and he was stabbed and hit for several minutes before other guards arrived. “They laughed and told [the assailant] not to do it again,” the victim recalled. The medical staff did effectively nothing for his wounds.

Meanwhile, the recent “crackdown” on undocumented immigrants has meant a bonanza for the profits of certain corporations. According to the Southern Poverty Law Center, a private prison company called CoreCivic, Inc. that runs the Steward Detention Center in Georgia has been making money off people detained by Immigration and Customs Enforcement. The scheme is to force immigrants to work for as little as \$1 a day cleaning, cooking, and maintaining the detention center, which would otherwise have to be maintained by actual employees. Those who refuse to work are “threatened with solitary confinement and the loss of access to basic necessities, like food, clothing, products for personal hygiene, and phone calls to loved ones, in violation of federal anti-trafficking laws.” Lawsuits have been filed in several states to challenge these sorts of work practices.

For-profit Medicaid-hindrance

Under the perpetual pretext of cutting costs and increasing efficiency, a number of states, including (among others) Illinois, Iowa, North Carolina, Florida, Mississippi, Oklahoma, and Kansas, have in recent

years partly or wholly privatized Medicaid. The “efficiency” pretext, incidentally, is ironic, given the likely truth of David Graeber’s “Iron Law of Liberalism,” that “any market reform, any government initiative intended to reduce red tape and promote market forces will have the ultimate effect of increasing the total number of regulations, the total amount of paperwork, and the total number of bureaucrats the government employs.” The explosion of bureaucracy in the market-obsessed neoliberal era bears out this law.

What have been the consequences of these privatizations? Iowa is an illustrative case. According to a series of editorials for which Andie Dominick of the *Des Moines Register* won a 2018 Pulitzer Prize, the results have not been pretty. Since April 2016, three for-profit insurers have taken over management of health care for more than 500,000 Iowans, many of whom have, as a result, now lost access to services, equipment (such as wheelchairs), and even nutritional supplements. Against the advice of medical professionals, the insurers simply refuse to pay for needed care.

Healthcare providers have been underpaid or not paid at all. A nursing home was forced to borrow \$150,000 while waiting for reimbursements; a mental health facility was owed \$300,000; a family planning clinic had to close. To take only three examples. The state has had to bail out the insurers and assume financial risk—which is ironic, since the supposed point of privatization was to provide state budget predictability in Medicaid spending. Before the privatization debacle, Iowa’s Medicaid had lower per-person spending than many other states and provided reliable reimbursements to providers and consistency in coverage for vulnerable people.

Because of problems similar to Iowa’s, Connecticut in 2012 fired the insurance companies managing its Medicaid programs and transitioned back to the traditional “fee for service” model, according to which the state reimburses providers directly. The results were what you’d expect: the monthly cost of care per patient dropped \$718 in 2012 to \$670 in 2015; the number of doctors willing to accept Medicaid patients increased; and administrative costs dropped from 12 percent to 5 percent.

Turns out market forces aren’t so “efficient” after all.

Nature for sale

Already in his short tenure in office, Interior Secretary Ryan Zinke has shown he can privatize with the best of them. There isn’t space here to list all the creative ways he’s trying to destroy the natural environment or restrict its enjoyment to a select few, but we can consider a few examples.

In December 2017, on Zinke’s recommendation and at the behest of the fossil fuel industry, Trump announced he was going to reduce Bears Ears National Monument by 85 percent and Grand Staircase Escalante National Monument by 50 percent. Legal challenges to these orders are currently winding through the courts.

Zinke has ordered the Bureau of Land Management to hold oil and gas lease sales of public lands every 90 days, in addition to “eliminating burdensome regulations” related to oil and natural gas development. He has started the process of opening the Arctic National Wildlife Refuge to oil and natural gas drilling, and is pushing for an expedited timeline of leasing land by 2019. Meanwhile, he’s trying to make drilling less safe by reversing safety regulations that were put in place after the 2010 Deepwater Horizon disaster.

In January 2018 Zinke proposed an offshore drilling plan that would open 90 percent of the U.S. Outer Continental Shelf for oil and gas lease sales. By comparison, the current program puts 94 percent of the OCS off-limits. (Zinke said he’d exempt Florida from the plan, as a favor to his friend Governor Rick Scott, but it appears that this exemption wasn’t a formal action and that Florida is in fact being considered for offshore drilling.) Zinke’s draft plan also proposes the largest number of lease sales in U.S. history.

Selling land to corporations is one method of privatization; another is to restrict enjoyment of public parks to those who can afford to pay. Zinke is pursuing this second path as well. In 2016 the National Park Service offered 16 free-admission days at national parks; in 2017 the number was down to 10; this year it’s down to four. The Interior Department had also planned to massively increase entrance fees at the country’s most popular parks—from \$25 to \$70—but scrapped the plan due to public backlash. Instead, the department will enact a more limited increase at all parks that charge an entrance fee.

With the Trump administration's term less than half over, we can expect a slew of similar predatory plans in the coming years.

Business as usual

None of these trends is at all surprising, since they emerge from tendencies fundamental to capitalism for centuries. These tendencies have simply been unshackled from prior restraints in the neoliberal era. The destructive, antisocial essence of capitalism has been given free rein, like a raging bull that has broken free of its yoke, such that society is approaching the literal realization of capitalism's misanthropic *telos*.

In the long run, two outcomes seem possible. Either humanity will find itself in the Hobbesian state of nature—which is the inner logic and meaning of capitalism—or the crises into which we are fast plunging ourselves will call forth such massive global resistance that a revolutionary social transformation will, at length, come to pass. What it will look like can't be foreseen (though informed speculations can be useful). All that can be predicted with certainty is that unless the generations now living devote their very existence to the Resistance, humanity won't have much of a future.

Business as usual is no longer an option.

Our Passive Society

Sitting alone in my room watching videos on YouTube, hearing sounds from across the hall of my roommate watching Netflix, the obvious point occurs to me that a key element of the demonic genius of late capitalism is to enforce a crushing *passiveness* on the populace. With social atomization comes collective passiveness—and with collective passiveness comes social atomization. The product (and cause) of this vicious circle is the dying society of the present, in which despair can seem to be the prevailing condition. With an opioid epidemic raging and, more generally, mental illness affecting 50 percent of Americans at some point in their lifetime, it's clear that the late-capitalist evisceration of civil society has also eviscerated, on a broad scale, the individual's sense of self-worth. We have become atoms, windowless monads buffeted by bureaucracies, desperately seeking entertainment as a tonic for our angst and ennui.

The old formula of the psychoanalyst D. W. Winnicott is as relevant as it always will be: *"It is creative apperception more than anything that makes the individual feel that life is worth living."* If so many have come to feel alienated from life itself, that is largely because they don't feel creative, free, or active.

We don't often consider society from this perspective, but it may be of interest to adumbrate the ways in which modern capitalism tends to stifle human capacities of creativity and individuality. This stifling can seem ironic, given that so many apologists of capitalism, or "the free market," have celebrated its liberating dynamics, its unleashing of human potential, its apotheosis of freedom and competition. In his bestseller *The Reactionary Mind*, Corey Robin explains the logic of conservatives, from the nineteenth century to the present, who have seen the market as embodying the ancient agonistic ideal:

[P]ower is demonstrated and privilege earned...in the arduous struggle for supremacy. In that struggle, nothing matters, not inheritance, social connections, or economic resources, but one's native intelligence and innate strength. Genuine excellence is revealed and rewarded, true nobility is secured... Though most early conservatives were ambivalent about capitalism, their successors [came] to believe that warriors of a different kind [than soldiers] can prove their mettle in the manufacture and trade of commodities. Such men wrestle the earth's resources to and from the ground, taking for themselves what they want and thereby establishing their superiority over others.

Aside from this quasi-Nietzschean aesthetic ideal, which has attracted capitalists and intellectuals of fascist persuasion, thinkers have defended capitalism on moral grounds: most (in)famously, Milton Friedman's writings exemplify the argument that the market is "free, voluntary, and non-coercive" and thus a highly liberal, indeed libertarian, and *moral* institution. For ideologists like this, it would sound paradoxical to condemn capitalism and its culture as dehumanizing or as turning people into passive atoms.

We know what to think of such conservative arguments, though. They are of little intellectual or moral interest. The economist Robin Hahnel, for example, has no trouble demolishing Friedman's apologetics by pointing out that the market is hardly voluntary or non-coercive if people come to it with different amounts of capital. In a sense, yes, employees have freely chosen to work for some corporation, perhaps even in a hideous sweatshop. But they have been coerced into making that decision by their relative lack of capital. It's either rent yourself out or starve.

In general, reactionary ideologies like Friedman's or those that Robin dissects function by substituting for gritty reality, forged in the crucible of conflict-ridden material institutions, an appealing, idealistic myth. In some cases the myth is heroic: free individuals, virtually bereft of socioeconomic context, battling for supremacy, bending the earth and the masses to their will; nations or races waging a similar but more apocalyptic war; or the Nietzschean notion of masters and the rabble locked in perpetual conflict, the fate of humanity and the collective will to power at stake. In other cases the myth is ethical: the United States spreads freedom and democracy abroad by invading countries; the philanthropy of the wealthy legitimates capitalism, in Andrew Carnegie's formulation; "a rising tide lifts all boats," as the typical American liberal declares, etc. All these ideologies are merely pretty disguises of political-economic realities, and can be dismissed. (For an acute analysis of the role of irrationalist myths in capitalist culture, see Georg Lukács's magnificent polemic *The Destruction of Reason*, summarized here.)

The truth, of course, is that after two centuries of the evolution of industrial capitalism, the individual is hemmed in by gigantic bureaucratic structures of social control and economic exploitation. Starting from puny embryos in England in the late eighteenth century, industrial capital has remade the world in its own image, as Marx foresaw: the image of universal commodification, social "reification" and depersonalization, mass regulation of labor, mass markets, mass privatization, mass administration of society for the benefit of capital.

The early stages of this process have been analyzed by social historians in the tradition of E. P. Thompson, who, before Foucault (and more acutely than him), showed how "the modern subject" is a product of *subjection*, how workers and citizens have had to be relentlessly *disciplined* for the sake of capital accumulation. In his classic *The Making of the English Working Class*, Thompson reveals the Herculean efforts of early British manufacturers and their state to impose mechanical industrial rhythms on a workforce that had from time immemorial lived by the pastoral rhythms of the countryside. These "lazy" ex-peasants just could not get it through their heads that it was their sacred duty to God, country, and employer to submit to the clock and the overseer in a cotton sweatshop every day from 5:00 a.m. to 9:00 p.m. Only if they were trained from the age of six and indoctrinated *en masse* with a submissive Methodism that preached the blessedness of poverty and hard labor and a compensation for their miseries in the hereafter was there any hope of widespread docility—although even then it was, as always, necessary to back up indoctrination with something a little more reliable, namely state-sanctioned killing. (The death penalty for Luddism, the occasional military massacre, etc.) And so it continued for many decades.

Women were subject to even more policing than men, in accordance with authorities' belief (since before ancient Greece) that female sexuality, maenadic and riotous, threatens social order. It has to be controlled. In her book *"More Than Mere Amusement": Working-Class Women's Leisure in England, 1750–1914*, Catriona Parratt gives a sense of just how much energy and how many resources authorities devoted to this effort through the nineteenth and early-twentieth centuries. Their task was monumental, after all—they had to kill an "almost Rabelaisian" popular culture:

Throughout the eighteenth century and into the nineteenth, women were visible and vital participants in popular recreational culture. In their cottages and workshops, in urban streets and on village greens, in alehouses and on farms, they worked and socialized

alongside men. In the daily ebb and flow of labor and release from labor, and in the seasonal and annual round of celebrations, feasts, and holidays...they shared in an array of amusements that were gregarious and open. They gossiped and gambled...got drunk and got rowdy at private parties and public assemblies...and trekked out into open fields and onto moors to listen to ranting preachers...

Decade by decade, magistrates, justices of the peace, and new police forces got the upper hand: "Alehouses were closed, fairs were suppressed, wakes and other customary holidays were 'tamed.'" Later, middle- and upper-class women promoted the "moral elevation" of the nation in their own way, by organizing "rational recreation" schemes that channeled young working-class women's vitality into safe institutions like classes (in "domestic science"), lectures, and chaperoned dances. It was a steeply uphill battle for the forces of domestication, but by the twentieth century they had made immense progress.

In fact, they were already making significant progress by the mid-nineteenth century, and even in the less industrialized United States. In 1840s' New York, Democratic politician Mike Walsh lamented that "a gloomy, churlish, money-worshipping spirit has swept nearly all the poetry out of the poor man's sphere. Ballad-singing, street dancing, tumbling, public games, all are either prohibited or discountenanced, so that Fourth of July and election sports alone remain." By the turn of the century, the U.S. was becoming the world center of pacification of the working class, which is to say suppression of its freedoms and bacchanalian tendencies.

This campaign was carried out at least as vigorously inside the workplace as outside it. The historian David Montgomery has described the epic, decades-long struggle between skilled workers, who were proponents of workers' control within the factory (collective control over their specific productive tasks), and management, which sought to strip workers of all vestiges of control. The businessman's goal, of course, was to increase productivity, lower wages, and in general create a more compliant workforce. The explosive labor unrest from the 1870s until after World War I was in large part a response to this crusade to deskill work, to turn management into the brain and the worker into an appendage of the machine. The working-class ethic of "mutualism," too, had to be undermined, by hiring African-Americans as strikebreakers (to foment racism), giving higher wages to certain ethnicities (to foment resentment), destroying unions, planting spies in factories, etc. Frederick Winslow Taylor's ideology of scientific management was a quintessential, and very influential, expression of all these tendencies, for by breaking down work processes into their smallest components and transferring knowledge to the ranks of management it effectively dispossessed workers of the remnants of their autonomy. And in fact, from that time up to the present, the capitalist agenda to deskill, monitor/regulate, mechanize, and finally automate has continued almost without interruption.

The one time there was something like an interruption was when the mechanisms of the capitalist economy ground almost to a halt, during the Great Depression of the 1930s. This was a remarkable time, which we might look to for lessons about the future (about organizing the unemployed, building communal support systems, resurrecting *public space*, building a workers' political party, and so on). It was the only time in the twentieth century when the drive to marketize and privatize everything, including nature and the nation-state itself, met sufficient resistance to be not only halted but even, in some respects, reversed. Because of the economic collapse, people were no longer only consumers and employees, only nodes in a network of buyers and sellers; to some extent they became actual people, with the revitalization of community, generosity, and shared struggles. Historians of that time are well aware of the glowing reminiscences of many who experienced it. Rose Chernin, for example, who was a Communist organizer in the Bronx, observed that

This struggle of people against their conditions, that is where you find the meaning in life. In the worst situations, you are together with people. If there were five apples, we cut them ten ways and everybody ate. If somebody had a quarter, he went down to the corner and bought some bread and brought it back into the council. Life changes when you are

together in this way, when you are united. You lose the fear of being alone... In those years I was happy.

The labor movement saw a tremendous resurgence, and working-class culture, which was quite different from the ruling-class culture of individualism, acquisitiveness, and greed, experienced one last flowering before it was finally suppressed in the postwar and then neoliberal eras.

After World War II, mass bureaucratization and corporatization came of age. The corporate counteroffensive against the leftist legacies of the 1930s and the New Deal was remarkably successful and far-reaching, such that politics and culture as a whole became, arguably, more conservative and “regimented” than ever. The colossal industrial unions, such as the United Autoworkers and the United Steelworkers, that had been formed in the 1930s purged themselves of the radicalism that had so excited Rose Chernin and were integrated into the “corporate-liberal” political order, serving, ironically, as enforcers of properly subordinate behavior on the part of their members. The domestication of women reached new levels as working-class conditions became middle-class conditions and millions of housing-units sprouted on suburban lawns, manicured and garnished with little gardens, across the country. Meanwhile, that great instrument of atomization, pacification, and indoctrination began its conquest of the American mind: television.

Noam Chomsky, in the tradition of Marx, is fond of saying that technology is “neutral,” neither beneficent nor baleful in itself but only in the context of particular social relations, but I’m inclined to think television is a partial exception to that dictum. I recall the *Calvin and Hobbes* strip in which, while sitting in front of a TV, Calvin says, “I try to make television-watching a complete forfeiture of experience. Notice how I keep my jaw slack, so my mouth hangs open. I try not to swallow either, so I drool, and I keep my eyes half-focused, so I don’t use any muscles at all. I take a passive entertainment and extend the passivity to my entire being. I wallow in my lack of participation and response. I’m utterly inert.” Where before one might have socialized outside, gone to a play, or discussed grievances with fellow workers and strategized over how to resolve them, now one could stay at home and watch a passively entertaining sitcom that imbued one with the proper values of consumerism, wealth accumulation, status-consciousness, objectification of women, subordination to authority, lack of interest in politics, and other “bourgeois virtues.” The more one cultivated a relationship with the television, the less one cultivated relationships with people—or with one’s creative capacities, which “more than anything else make the individual feel that life is worth living.”

Television is the perfect technology for a mature capitalist society, and has surely been of inestimable value in keeping the population relatively passive and obedient—distracted, idle, incurious, separated yet conformist. Doubtless in a different kind of society it could have a somewhat more elevated potential—programming could be more edifying, devoted to issues of history, philosophy, art, culture, science—but in our own society, in which institutions monomaniacally fixated on accumulating profit and discouraging critical thought (because it’s dangerous) have control of it, the outcome is predictable. The average American watches about five hours of TV a day, while 60 percent of Americans have subscription services like Netflix, Amazon Prime, and Hulu. Sixty-five percent of homes have three or more TV sets.

Movie-watching, too, is an inherently passive pastime. Theodor Adorno remarked, “Every visit to the cinema, despite the utmost watchfulness, leaves me dumber and worse than before.” To sit in a movie theater (or at home) with the lights out, watching electronic images flit by, hearing blaring noises from huge surround-sound speakers, is to experience a kind of sensory overload while being almost totally inactive. And then the experience is over and you rub your eyes and try to become active and whole again. It’s different from watching a play, where the performers are present in front of you, the art is enacted right there organically and on a proper human scale, there is no sensory overload, no artificial splicing together of fleeting images, no glamorous cinematic alienation from your own mundane life.

Since the 1990s, of course, electronic media have exploded to the point of utterly dominating our lives. For example, 65 percent of U.S. households include someone who plays video games regularly. Over three-quarters of Americans own a smartphone, which, from anecdotal observation, we know tends to occupy an immense portion of their time. The same proportion has broadband internet service at home, and

70 percent of Americans use social media. As an arch-traditionalist, I look askance at all this newfangled electronic technology (even as I use it constantly). It seems to me that electronic mediation of human relationships, and of life itself, is inherently alienating and destructive, insofar as it atomizes or isolates. There's something anti-humanistic about having one's life be determined by algorithms (algorithms invented and deployed, in many cases, by private corporations). And the effects on mental functioning are by no means benign: studies have confirmed the obvious, that "the internet may give you an addict's brain," "you may feel more lonely and jealous," and "memory problems may be more likely" (apparently because of information overload). Such problems manifest a passive and isolated mode of experience.

But this is the mode of experience of neoliberalism, i.e., hyper-capitalism. After the upsurge of protest in the 1960s and early '70s against the corporatist regime of centrist liberalism, the most reactionary sectors of big business launched a massive counterattack to destroy organized labor and the whole New Deal system, which was eating into their profits and encouraging popular unrest. The counterattack continues in 2018, and, as we know, has been wildly successful. The union membership rate in the private sector is a mere 6.5 percent, a little less than it was on the eve of the Great Depression, and the U.S. spends much less on social welfare than comparable OECD countries. Such facts have had predictable effects on the cohesiveness of the social fabric.

Meanwhile, as government has become less concerned with popular well-being and business has had a freer hand in how badly it can treat employees, bureaucracy has—contrary to the predictions of conservatives—only expanded. We're told by free-marketeers that the penetration of market relations into ever more spheres of life is supposed to reduce bureaucracy and increase "efficiency." The opposite is the case (especially if "efficiency" is defined in terms of the actual well-being of people). In *The Utopia of Rules*, David Graeber states his "Iron Law of Liberalism" as follows: "any market reform, any government initiative intended to reduce red tape and promote market forces will have the ultimate effect of increasing the total number of regulations, the total amount of paperwork, and the total number of bureaucrats the government employs." He continues:

English liberalism [in the nineteenth century], for instance, did not lead to a reduction of state bureaucracy, but the exact opposite: an endlessly ballooning array of legal clerks, registrars, inspectors, notaries, and police officials who made the liberal dream of a world of free contract between autonomous individuals possible. It turned out that maintaining a free market economy required a thousand times more paperwork than a Louis XIV-style absolutist monarchy.

With the spread of privatization and marketization over the last generation, public and private bureaucracies, intermeshing, have hypertrophied. Graeber calls this the age of "total bureaucratization" (or alternatively, "predatory bureaucratization"). We all know from our own lives, from (the necessity of) our continual interactions with corporate and government bureaucracies, how maddening this development has been. No wonder that when an irate 75-year-old woman went to a local Comcast office ten years ago and smashed it up with a hammer, she became something of a folk hero.

Speaking of Graeber, his notion of "bullshit jobs" is apropos here. The kinds of jobs that were first springing up in large numbers around the time of Taylorism in the early twentieth century, namely "administrative" jobs like human resources, public relations, and corporate law (but also, more recently, academic and health administration, financial services, telemarketing, and the like), have attained unprecedented numerical heights. Millions of people fill these positions, which seem to become more numerous every year. The tragedy is that untold numbers of these people see no point to their jobs. "How can one even begin to speak of dignity in labour," Graeber asks, "when one secretly feels one's job should not exist?" Such a response signifies a particularly acute condition of what Marx called "alienated labor." (One wonders how many people would identify with the central character in the movie *Office Space*, a classic expression of workplace alienation.)

In short, in less than two centuries we've gone from being free-spirited, unpolished, semi-rebellious plebeians and immigrants to being dutiful, docile, lonely bureaucrats administering fellow administrators

who are administering the people who, obediently, do the actual productive work and get paid a pittance for it. We've become a society of units, a society almost perfectly "legible" to both the state and the corporate sector. Even in our forms of entertainment, we tend to be isolated and *receptive* rather than creative.

The nightclub culture, for instance, plays an important function in permitting young people to let off steam from all their weekdays of repressive rule-following. So once or twice a week they stand in a line at one of various designated spots in the city where they can go inside and let loose. In the safe anonymity of darkness, pressed against hundreds of bodies, they can lose themselves in the sensory overload of drunken dance-humping to a heavy pulsing beat under booming hip-hop music interrupted only by screams in each other's ears. There may be little or nothing wrong with this sort of mass-produced, capitalist-friendly Dionysian recreation, but, whatever it is (and I find it mysterious), it's symptomatic.

And what of love and sex in this brave new world of ours? It turns out that the most common way to meet people is in the privacy of one's room, with the help of algorithms written by dating websites. In 2017, online dating became the most popular way for newlyweds to meet one another, 19 percent of brides saying they had met their spouse online. I don't mean to bash internet-searching-for-soulmates, but there is something pathological about a society in which people are "together" with others when they're physically alone and are alone when they're in the physical presence of others. Nor is the Tinder-originated phenomenon of swiping-right and swiping-left through an endless series of faces anything but the ultimate infiltration of the consumerist mentality into the ideally most *human* of spheres, that of romance and sex. Which is becoming practically the *least* human—with the help of an infinite supply of internet pornography, which encourages the attitude of treating people as but vulgar means to one's own pleasure. There is a disturbing tendency for us all to be sex-objects for one another. Ours is a society of objects, not subjects.

Perhaps the most poignant expression of this state of affairs, and of the desperate loneliness that results from it, is the latest "revolution" in artificial intelligence: sex robots that can get aroused, can have orgasms, and have customizable personalities. One of them, Solana, has an app for a phone or tablet with which you can "drag her face around to make her move her head, give her commands to make her smile at you, and type in sentences for her to say." Another one, Samantha, "is programmed to want romance first, then get comfortable before getting sexual." She has different "modes of interaction": romantic, family, and sexy. "The objective," her creator says, "the final objective of the sexual mode is to give her an orgasm." Sex-doll brothels already exist, which are proving more popular than brothels with actual women—even when the women are available for the same price. But not all the new dolls are only for sex, we're assured: some of them "can have conversations about anything, from history to science to politics." This capability "lends itself to bonding," another sex-doll-maker says, "and I think a simulated male that you can talk to and bond with will appeal to women too." Some customers have fallen in love with their dolls and married them.

Thus we reach the *reductio ad absurdum* of trends that began with, or perhaps long before, the British Industrial Revolution, as people have become objects and objects have become people.

In the meantime, and correlatively, humanity continues to do next to nothing (compared to what ought to be done) about climate change and the threat of nuclear holocaust, either of which may do us in sooner than we think.

What is to be done? Now that we're approaching the literal manifestation of the capitalist *telos*, is there any hope? Or has our collective passiveness already doomed us to moral and physical oblivion?

The only hope is that, collectively, we will act to *create* rather than to *let happen*. We have to create and expand "public spaces," for there is rationality in the public and irrationality in the private. As the activists of Occupy Wall Street understood, we have to bring back sit-ins on a mass scale, on a larger scale than in the 1930s and 1960s. We have to sit in at universities, and in public parks, and in legislative chambers; we have to sit down on highways and bridges and city streets. We have to flood the centers of power with wave after wave of popular rage. We have, in short, to *disrupt*, for that is how change happens. We should emulate the Luddites, pioneers of a sophisticated anti-capitalism, and totally resist our final reduction to the status of appendages to the Machine.

In a society of exquisite bureaucratic subservience, we become free and active by acting as, say, the teachers in West Virginia, Oklahoma, Kentucky, and Arizona have. That's how we become people, as opposed to institutional automatons programmed to serve the powerful (who themselves are automatons programmed to accumulate profit). The necessity is to act directly contrary to every norm of privatization, which is always in the interest of reactionaries.

But protest isn't enough. Nor is it enough to force governments to pursue more progressive policies. In the long run, it's necessary to create a new system of social relations, starting with new economic relations. I've addressed this matter in *Worker Cooperatives and Revolution: History and Possibilities in the United States*, and can't go into any depth here. Suffice it to say that a new, sustainable world will have to be grounded in economic democracy, which is to say cooperatives of all types, public ownership and control of major industries, public banking, divestment from the military sector and massive investment in public works and public education, and in general a "socialistic" transformation of the nation-state system. The vision embodied in the British Labour Party's manifesto is an excellent place to start, for, with modifications, it can apply to every country that has had capitalism foisted on it.

In the coming years, the opportunity to seize our humanity again will present itself. The crisis of the old regime will lead to the birth of the new. Institutional breakdown will open up the space for radical experimentation in new modes of production and politics, modes responsive to the popular will. And it will become possible for the disenfranchised to take the initiative again.

There is indeed hope. We have only to reject despair in order to realize that hope.

The Significance and Shortcomings of Karl Marx

I often have occasion to think that, as an "intellectual," I am very lucky to be alive at this time in history, at the end of the long evolution from Herodotus and the pre-Socratic philosophers to Chomsky and modern science. One reason for my gratitude is simply that, as I wrote years ago in a moment of youthful idealism, "the past is a kaleidoscope of cultural achievements, or rather a cornucopian buffet whose fruits I can sample, choosing which are my favorite delicacies—which healthiest, which savory and sweet—and invent my own diet tailored to my needs. History can be appropriated by each person as he chooses, selectively employed in the service of his self-creation!" But while this Goethean ideal of enlightened self-cultivation is important, perhaps an even greater advantage of living so late in history is that, if one has an open and critical mind, it is possible to have a much more sophisticated and correct understanding of the world than before. Intellectual history is littered with egregious errors, myths and lies that have beguiled billions of minds. Two centuries after the Enlightenment, however, the spirit of rationalism and science has achieved so many victories that countless millions have been freed from the ignorance and superstition of the past.

Few thinkers deserve more credit for the liberation of the human mind than Karl Marx. Aside from the heroes of the Scientific Revolution—Copernicus, Galileo, Newton, Boyle, and others—and their philosophical 'translators'—Francis Bacon, Descartes, Spinoza, Voltaire, Diderot—hardly any come close. But not only did Marx contribute to our intellectual liberation; he also, of course, made immense contributions to the struggle for liberation from oppressive power-structures (a struggle that, indeed, is a key component of the effort to free our minds). These two major achievements amply justify the outpouring of articles on the bicentennial of his birth, and in fact, I think, call for yet another one, to consider in more depth both his significance and his shortcomings.

My focus in this article is going to be on his ideas, not on his life or his activism. He was certainly an inspiration in the latter respect, but it is his writings that are timeless. The fanatical and violent hatred they have always elicited from the enemies of human progress, the spokesmen of a power-loving, money-worshipping misanthropy, is the most eloquent proof of their value.

*

The central reason for Marx's importance and fame is, of course, that he gave us the most sophisticated elaboration of the most fundamental concept in social analysis: class.

He was far from the only thinker to emphasize class. One might even say that the primacy of class verges on common sense. In his *Politics*, Aristotle already interpreted society according to the divergent interests of the poor and the rich. The semi-conservative James Madison, like other Enlightenment figures, agreed, as is clear from his famous *Federalist No. 10*:

[T]he most common and durable source of factions has been the various and unequal distribution of property. Those who hold and those who are without property have ever formed distinct interests in society. Those who are creditors, and those who are debtors, fall under a like discrimination. A landed interest, a manufacturing interest, a mercantile interest, a moneyed interest, with many lesser interests, grow up of necessity in civilized nations, and divide them into different classes actuated by different sentiments and views.

Could anything be more obvious than this proto-historical materialism?

But Marx was unique in systematically expounding this materialism and grounding it in rigorous analysis of production relations—the concept of which he practically invented, or at least self-consciously elevated to a determining status and analyzed with exhaustive thoroughness. As everyone passingly familiar with Marxism knows, such notions as exploitation, surplus, surplus-value, and class struggle acquired a quasi-scientific—which is to say exact and precisely explanatory—character in the context of Marx's investigation of production relations, particularly those of capitalism.

Given that historical materialism is often ridiculed and rejected, it isn't out of place here to give a simplified account of its premises, an account that shows how uncontroversial these premises ought to be. This is especially desirable in a time when even self-styled Marxists feel compelled, due to the cultural sway held by feminism and identity politics, to deny that class has priority over other variables such as gender, sexuality, and race.¹

The explanatory (and therefore *strategic*, for revolutionaries) primacy of class can be established on simple *a priori* grounds, quite apart from empirical sociological or historical analysis. One has only to reflect that access to resources—money, capital, technology—is of unique importance to life, being key to survival, to a high quality of life, to political power, to social and cultural influence; and access to (or control over) resources is determined ultimately by class position, one's position in the social relations of production. The owner of the means of production has control over more resources than the person who owns only his labor-power, which means he is better able to influence the political process and to propagate ideas and values that legitimate his dominant position and justify the subordination of others. These two broad categories of owners and workers have opposing interests, most obviously in the inverse relation between wages and profits. This antagonism of interests is the “class struggle,” a struggle that need not always be explicit or conscious but is constantly present on an implicit level, indeed is constitutive of the relationship between capitalist and worker. The class struggle—that is, the structure and functioning of economic institutions—can be called the foundation of society, the dynamic around which society tends to revolve, because, again, it is through class that institutions and actors acquire the means to influence social life.

These simple, commonsense reflections suffice to establish the meaning and soundness of Marx's infamous, “simplistic,” “reductionist” contrast between the economic “base” and the political, cultural, and ideological “superstructure.” Maybe his language here was misleading and metaphorical. He was only sketching his historical materialism in a short preface, the famous Preface to his *Contribution to the Critique of Political Economy*, and could hardly have foreseen that generations of academics would later pore over his words, pick at them, cavil at them, fling casuistries at each other until a vast scholarly literature had been produced debating Marxian “economic determinism.” As if the relative primacy of economic

¹ For example, see Peter Frase, “Stay Classy,” *Jacobin*, June 26, 2014.

institutions that are, by definition, directly involved in the accumulation and distribution of material resources and thus power, isn't anything but a truism, and can be seen as such on the basis of such elementary reasoning as in the preceding paragraph.

The *Communist Manifesto's* epoch-making claim, therefore, that the history of all complex societies has been the history of class struggles is *not* ridiculous or oversimplifying, contrary to what has been claimed a thousand times in scholarship and the popular press. It is, broadly speaking, accurate, if "class struggle" is understood to mean not only explicit conflict between classes (and class-subgroups; see the above quotation from Madison) but also the implicit antagonism of interests between classes, which constitutes the structure of economic institutions. Particular class structures/dynamics, together with the level of development of productive forces they determine and are expressed through, provide the basic institutional context around which a given politics and culture are fleshed out.¹

Thus, to argue, as feminists, queer theorists, and confused Marxists like Peter Frase are wont to, that class is of no special significance compared to group identities like gender and race is quite mistaken. Neither feminism nor anti-racist activism targets such institutional structures as the relation between capitalist and worker; or, to the extent that these movements do, they become class-oriented and lose their character as strictly feminist or anti-racist. If you want a society of economic democracy, in which economic exploitation, "income inequality," mass poverty, imperialism, militarism, ecological destruction, and privatization of resources are done away with, the goal of your activism must be to abolish capitalist institutions—the omnipotence of the profit motive, the dictatorial control of capitalist over worker—and not simply misogyny or terrible treatment of minorities. These issues are important, but only *anti-capitalism* is properly revolutionary, involving a total transformation of society (because a transformation of the *very structures* of institutions, not merely who is allowed into the privileged positions).

Moreover, as plenty of feminists and Black Lives Matter activists well know, you cannot possibly achieve the maximal goals that identity politics pursues while remaining in a capitalist society. Most or all of the oppression that minorities experience is precisely a result of capitalism's perverse incentives, and of the concentration of power in a tiny greedy elite. This ties into the fact that, since the time of Marx and Engels, a colossal amount of empirical scholarship has shown the power of the Marxian analytical framework. Even ideologies of race, nation, and gender are largely a product of class—of slavery and its aftermath in the U.S., of European imperialism, of attempts by the Victorian upper class to control working-class women's lives and sexuality.

In the case of religious fundamentalism in the U.S., for example, historians have shown that since early in the twentieth century, and especially since the 1970s, conservative sectors of the business community have subsidized right-wing evangelical Christianity in order to beat back unionism and liberalism, which have been tarred and feathered as communist, socialist, and godless.² More generally, for centuries the ruling class has propagated divisive ideas of race, religion, nationality, and gender in order, partly, to fragment the working class and so control it more easily and effectively. By now, leftists see such arguments, rightly, as truisms.

On the other hand, most intellectuals, including many academically trained leftists, also see Marxian "economistic" arguments as overly simplifying and reductive. Mainstream intellectuals, particularly, consider it a sign of unsophistication that Marxism tends to abstract from complicating factors and isolate the class variable. "Reality is complicated!" they shout in unison. "You also have to take into

¹ In my summary (on Academia.edu) of G. E. M. de Ste. Croix's 1981 masterpiece *The Class Struggle in the Ancient Greek World, from the Archaic Age to the Arab Conquests*, I added the following thoughts to the foregoing account: "Class struggle is central to history in still more ways; for instance, virtually by analytical necessity it has been, directly or indirectly, the main cause of popular resistance and rebellions. Likewise, the ideologies and cultures of the lower classes have been in large measure sublimations of class interest and conflict. Most wars, too, have been undertaken so that rulers (effectively the ruling class) could gain control over resources, which is sort of the class struggle by other means. Wars grow out of class dynamics, and are intended to benefit the rich and powerful."

² See, for example, Ken Fones-Wolf and Elizabeth Fones-Wolf, *Struggle for the Soul of the Postwar South: White Evangelical Protestants and Operation Dixie* (Chicago: University of Illinois Press, 2015).

account the play of cultural discourses, the diversity of subjective identities, etc. Class isn't everything!" Somehow it is considered an intellectual *vice*, and not a *virtue*, to *simplify* for the sake of *understanding*. It is true, after all, that the world is complex; and so in order to understand it one has to simplify it a bit, explain it in terms of general principles. As in the natural sciences, a single principle can never explain *everything*; but, if it is the right one, it can explain a great deal.

Noam Chomsky, with characteristic eloquence, defended this point in an interview in 1990.¹ I might as well quote him at length. Since he is in essence just an idiosyncratic and anarchistic Marxist—in fact one of the most consistent Marxists of all, despite his rejection of the label—his arguments are exactly those to which every thoughtful materialist is committed.

Question: But you're often accused of being too black-and-white in your analysis, of dividing the world into evil elites and subjugated or mystified masses. Does your approach ever get in the way of basic accuracy?

Answer: I do approach these questions a bit differently than historical scholarship generally does. But that's because humanistic scholarship tends to be irrational. I approach these questions pretty much as I would approach my scientific work. In that work—in any kind of rational inquiry—what you try to do is identify major factors, understand them, and see what you can explain in terms of them. Then you always find a periphery of unexplained phenomena, and you introduce minor factors and try to account for those phenomena. What you're always searching for is the guiding principles: the major effects, the dominant structures. In order to do that, you set aside a lot of tenth-order effects. Now, that's not the method of humanistic scholarship, which tends in a different direction. Humanistic scholarship—I'm caricaturing a bit for simplicity—says every fact is precious; you put it alongside every other fact. That's a sure way to guarantee you'll never understand anything. If you tried to do that in the sciences, you wouldn't even reach the level of Babylonian astronomy.

I don't think the [social] field of inquiry is fundamentally different in this respect. Take what we were talking about before: institutional facts. Those are major factors. There are also minor factors, like individual differences, microbureaucratic interactions, or what the President's wife told him at breakfast. These are all tenth-order effects. I don't pay much attention to them, because I think they all operate within a fairly narrow range which is predictable by the major factors. I think you can isolate those major factors. You can document them quite well; you can illustrate them in historical practice; you can verify them. If you read the documentary record critically, you can find them very prominently displayed, and you can find that other things follow from them. There's also a range of nuances and minor effects, and I think these two categories should be very sharply separated.

When you proceed in this fashion, it might give someone who's not used to such an approach the sense of black-and-white, of drawing lines too clearly. It purposely does that. That's what is involved when you try to identify major, dominant effects and put them in their proper place.

But instead of trying to systematically explain society by starting from a general principle and evaluating its utility, then proceeding to secondary factors like race or sex and using them to elucidate phenomena not explained by the dominant principle, the approach that tends to prevail in the humanities and social sciences is a sort of methodological relativism. In social history, for example, you are generally expected just to describe things from different perspectives. You should discuss gender, and race, and class, and various relevant discourses, and how people identified themselves, how they reacted to given developments, and perhaps issues of sexuality and the body, etc. Some knowledge may be gained, but such work amounts to

¹ Adam Jones, "The Radical Vocation: An Interview with Noam Chomsky," February 20, 1990, at znetwork.org.

unanchored description seemingly for its own sake—description, often, from an *idealist* perspective, not a materialist one. The anti-Marxian idealism is a common quality of this mainstream writing.

*

On the bicentennial of Marx's birth, it is intellectually shameful, though predictable, that idealism is still the primary tendency in scholarship and journalism.

What idealism means, of course, is an emphasis on ideas or consciousness over material factors, whether “social being”—economic conditions, institutional imperatives (the need to follow the rules of given social structures), *interests* as opposed to ideals or ideologies, and the necessities of biological survival—or, in the context of philosophical idealism such as that of Berkeley, Schopenhauer, and the logical positivists of the mid-twentieth century, the existence of mind-independent matter. Philosophical idealism, while no longer as respectable as it once was, persists in forms less honest and direct than that of Berkeley, especially in postmodernist circles and schools of thought influenced by the Continental tradition (e.g., phenomenology) and even American pragmatism. **[Give examples in a footnote.]** More important, though, is the type of idealism that disparages class and social being.

This idealism comes in different varieties. Its most common manifestation is the uncritical tendency to take seriously the rhetoric and self-interpretations of the powerful. As Marx understood and Chomsky likes to point out, humans are expert at deceiving themselves, at attributing noble motives to themselves when baser desires of power, money, recognition, and institutional pressures are what really motivate them. The powerful, especially, love to clothe themselves in the garb of moral grandeur. They insist that they are invading a country in order to protect human rights or spread democracy and freedom; that they are expanding prisons to keep communities safer, and deporting immigrants to keep the country safe; that by cutting social welfare programs they are trying honestly to reduce the budget deficit, and by cutting taxes on the rich they only want to stimulate the economy. When journalists and intellectuals take seriously such threadbare, predictable rhetoric, they are disregarding the lesson of Marxism that *individuals* aren't even the main actors here in the first place; *institutions* are. The individuals can tell themselves whatever stories they want about their own behavior, but the primary causes of the design and implementation of political policies are institutional dynamics, power dynamics. Political and economic actors represent certain interests, and they act in accordance with those interests. That's all.

An example of academics' idealism is Odd Arne Westad's celebrated book *The Global Cold War: Third World Interventions and the Making of Our Times*, which won the prestigious Bancroft Prize in 2006. Its thesis is that “the United States and the Soviet Union were driven to intervene in the Third World by the ideologies inherent in their politics. Locked in conflict over the very concept of European modernity...Washington and Moscow needed to change the world in order to prove the universal applicability of their ideologies...” It is a remarkably unsophisticated argument, which is backed up by remarkably unsophisticated invocations of policymakers' rhetoric. It rises to the level of farce. At one point, after quoting a State Department spokesman on George W. Bush's invasion of Iraq—“I believe in freedom as a right, a responsibility, a destiny... The United States stands for freedom, defends freedom, advances freedom, and enlarges the community of freedom because we think it is the right thing to do”—Westad states ingenuously that the Iraq invasion was a perfect example of how “freedom and security have been, and remain today, the driving forces of U.S. foreign policy.” As if gigantic government bureaucracies are moved to act out of pure altruism!¹

Related to this idealism is the faith of liberal intellectuals that ideals truly matter in the rough-and-tumble of political and economic life. John Maynard Keynes gave a classic exposition of this faith in the last paragraph of his *General Theory of Employment, Interest, and Money*, which has stroked academic egos for generations:

¹ Odd Arne Westad, *The Global Cold War: Third World Interventions and the Making of Our Times* (New York: Cambridge University Press, 2005), 4, 405.

...[T]he ideas of economists and political philosophers, both when they are right and when they are wrong, are more powerful than is commonly understood. Indeed the world is ruled by little else. [?!] Practical men, who believe themselves to be quite exempt from any intellectual influences, are usually the slaves of some defunct economist. Madmen in authority, who hear voices in the air, are distilling their frenzy from some academic scribbler of a few years back. I am sure that the power of vested interests is vastly exaggerated compared with the gradual encroachment of ideas... [S]oon or late, it is ideas, not vested interests, which are dangerous for good or evil.

These are backward fantasies, which grow out of a poor sociological imagination. The point is that the ideas that come to be accepted as gospel are *those useful to vested interests*, which are the entities that have the resources to propagate them. (In the typically bourgeois language of impersonal ‘automaticity,’ Keynes refers to “the gradual encroachment of ideas.” But ideas do not spread of themselves; they are propagated and subsidized by people and institutions whose interests they express. This is why “the ruling ideas of a society are the ideas of its ruling class,” which has the resources to spread them.)

Keynes’ famous book itself contributed not at all to the so-called Keynesian policies of Franklin Roosevelt and Hitler and others; in fact, such policies were already being pursued by Baron Haussmann in France in the 1850s, because they were useful in giving employment to thousands of workers and raising aggregate demand and thereby economic growth. Is it likely that had Keynes not published his book in 1936, the U.S. government during and after World War II would have pursued radically different, un-Keynesian economic policies? Hardly. Because they were useful to vested interests, those policies were bound to be adopted—and economists, tools of the ruling class, were bound to systematize their theoretical rationalizations sooner or later.

But liberals continue to believe that if only they can convince politicians of their intellectual or moral errors, they can persuade them to change their policies. Paul Krugman’s columns in the *New York Times* provide amusing examples of this sort of pleading. It is telling that he always ends his analysis right before getting to a realistic proposal: he scrupulously avoids saying that for his ideas to be enacted it is necessary to revive unions on a systemic scale, or to organize radical and disruptive social movements to alter the skewed class structure. Such an analytic move would require that he step into the realm of Marxism, abandoning his liberal idealism, and would thus bar him from being published in the *New York Times*.

If I may be permitted to give another example of liberal idealism: I recall reading Richard Goodwin’s popular book *Remembering America: A Voice from the Sixties* (1988), a memoir of his time as speechwriter and adviser to John F. Kennedy. It’s a flabby centrist whitewashing of history, a nostalgic apotheosis of Kennedy and America and democracy, not worth reading on its merits. However—to quote a review I wrote—

The book is enlightening as a window into the mind of the Harvard liberal, revelatory of the sort of thoughts this person has, his worldview. Liberalism from the inside. A prettified ideology, bland but appealing, with the reference to spiritual truths, reason, ideals of harmony and peace, a rising tide lifting all boats, the fundamental compatibility of all interests in society (except for those we don’t like, of course), the nonexistence of class struggle, government’s ability to solve all social ills, history as a progressive battle between knowledge and ignorance, light and darkness, reason and unreason, open-mindedness and bigotry, and any other set of binary abstractions you can think of. The whole ideology hovers above reality in the heavenly mists of Hope and Progress. It’s all very pretty, hence its momentary resurgence—which succumbed to disillusionment—with Barack Obama. And hence its ability to get through the filters of the class structure, to become an element in the hegemonic American discourse, floating above institutional realities like some imaginary golden idol one worships in lieu of common sense. It serves a very useful purpose for business, averting people’s eyes from the essential incompatibility of class

interests toward the idea of Gradual Progress by means of tinkering at the margins, making nice policies.

Such is the function of liberal idealism for the ruling class.

One other type of idealism that must be mentioned is the postmodernist variety (or rather varieties). It is ironic that postmodernist intellectuals, with their rejection of “metanarratives” and the idea of objective truth, consider themselves hyper-sophisticated, because in fact they’re less sophisticated than even unreflective doctrinaire Marxists. They are not so much post-Marxist as pre-Marxist, in that they haven’t assimilated the important intellectual lessons of the Marxist tradition.

In both its subjectivism and its focus on “discourses,” “texts,” “meanings,” “vocabularies,” “cultures,” and the like, postmodernism is idealistic. Foucault’s *Discipline and Punish*, for example, is highly abstract and pseudo-philosophical, tending to ignore class and the concrete realities of both state institutions and socioeconomic contexts. (Far better—more instructive, lucid, and illuminating—is Georg Rusche and Otto Kirchheimer’s Marxist classic *Punishment and Social Structure*, published in 1939.) Things didn’t get better later, as is illustrated by, say, the heralded essay collection *Tensions of Empire: Colonial Cultures in a Bourgeois World* (1997), edited by Frederick Cooper and Anna Laura Stoler. Suffice it to say that this book, like much of postmodernism, consists essentially of playing around with ideas of cultural “contestation” and the tensions involved in people’s “negotiations” of disparate identities. The analyses are so particularistic and so purely *descriptive*, focusing, say, on (the *cultural* dimensions of) some village in Senegal or some protest movement in Ecuador, that no interesting conclusions can be drawn. Instead there is a fluctuation between hyper-particularity and hyper-abstractness, as in the typical—and utterly truistic—“arguments” that the colonized had agency, that colonized cultures were not totally passive, that “colonial regimes were neither monolithic nor omnipotent” (who has ever said they were?), that “meanings” of institutions “were continually being reshaped,” and so on. After all the analysis, one is left asking, “Okay, so what?” It’s all just masturbatory play undertaken for the sake of itself. No wonder this sort of writing has been allowed to become culturally dominant.¹

The postmodern, Foucauldian focus on the body, too, is, ironically, idealistic. Which is to say it is more politically safe than Marxism, since it eschews the language of class. Any intellectual who finds himself being accepted by mainstream institutions, as hordes of Foucault-loving postmodernists, feminists, and queer theorists have—contrary to the treatment of materialists like Gabriel Kolko, Thomas Ferguson, Jesse Lemisch, David F. Noble, Staughton Lynd, Rajani Kanth, Norman Finkelstein, Noam Chomsky, Glenn Greenwald, and many others—should immediately start to question whether his ideas get to the heart of the matter or do not, instead, distract from the workings of power.

Said differently, the problem with identity politics is that it doesn’t completely reject Margaret Thatcher’s infamous saying, “There is no such thing as society.” It takes a semi-individualistic approach to analysis and activism. A revolutionary answers Thatcher with the statement, “There is no such thing as the individual”—in the sense that the focus must be on institutional structures, which mold us and dominate us. To the degree that the focus turns toward the individual, or his identity, his body, his subjectivity, the radicalism becomes more anodyne (while not necessarily ceasing to be oppositional or important).

There is a great deal more to be said about postmodernism. For instance, I could make the obvious point that its particularism and relativism, its elevation of fragmentary “narratives” and its Kuhnian emphasis on the supposed incommensurability of different “paradigms,” is just as useful to the ruling class as its idealism, since it denies *general truths* about class struggle and capitalist dynamics. (See Georg Lukács’ masterpiece *The Destruction of Reason* (1952) for a history of how such relativism and idealism contributed to the cultural climate that made Hitler possible.) Or I could argue that the rationalism and universalism of what Jonathan Israel calls the Radical Enlightenment, which found its fulfillment in

¹ See <https://www.wrightswriting.com/tensions> for a longer critique of the book.

Marxism, is, far from being dangerous or containing the seeds of its own destruction—as postmodernists and confused eclectic Marxists like Theodor Adorno have argued¹—the only hope for humanity.

Instead, I'll only observe, in summary, that idealism is not new: it is as old as the hills, and Marx made an immortal contribution in repudiating it. Idealism has always afflicted mainstream intellectual culture, all the way back to antiquity, when Plato viewed the world as consisting of shadows of ideal Forms, Hindus and Buddhists interpreted it in spiritual terms and as being somehow illusory, and Stoics were “telling the slave in the mines that if he would only think aright he would be happy.”² Idealism persisted through the Christian Middle Ages, Confucian China, and Hindu India. It dominated the Enlightenment, when *philosophes* were arguing that ignorance and superstition were responsible for mass suffering and a primordial conspiracy of priests had plunged society into darkness. Hegel, of course, was an arch-idealist. Finally, a thinker came along who renounced this whole tradition and systematized the common sense of the hitherto despised “rabble,” the workers, the peasants, the women struggling to provide for their children—namely that *ideas* are of less significance than class and material conditions. The real heroes, the real actors in history are not the parasitic intellectuals or the marauding rulers but the people working day in and day out to maintain society, to preserve and improve the conditions of civilization for their descendants.

Had there been no Marx or Engels, revolutionaries and activists would still have targeted class structures, as they were doing before Marxism had achieved widespread influence. Unions would have organized workers, radicals would have established far-left organizations, insurrections would have occurred in countries around the world. Marx's role has been to provide clarity and guidance, to serve as a symbol of certain tendencies of thought and action. His uniquely forceful and acute analyses of history and capitalism have been a font of inspiration for both thinkers and activists, a spur, a stimulus to keep their eyes on the prize, as it were. His prediction of the collapse of capitalism from its internal contradictions has given hope and confidence to millions—perhaps *too much* confidence, in light of the traditional over-optimism of Marxists. But having such a brilliant authority on their side, such a teacher, has surely been of inestimable benefit to the oppressed.

As for the narrow task of “interpreting the world,” the enormous body of work by Marxists from the founder to the present totally eclipses the contributions of every other school of thought. From history and economics to literary criticism, nothing else comes remotely close.

*

Marx did, however, make mistakes. No one is infallible. It is worth considering some of those mistakes, in case we can learn from them.

The ones I'll discuss here, which are the most significant, have to do with his conception of socialist revolution. Both the timeline he predicted and his sketchy remarks on how the revolution would come to pass were wrong. I have addressed these matters in *Worker Cooperatives and Revolution: History and Possibilities in the United States*, but they deserve a more condensed treatment too.

Regarding the timeline: it has long been a commonplace that Marx failed to foresee Keynesianism and the welfare state. His biggest blind spot was nationalism, and in general the power of the capitalist nation-state as an organizing principle of social life. Ironically, Marxism is crucial to explaining both, since both are largely grounded in conditions of class conflict, the social pathologies and disorders that arise out of such conflict, and the development and needs of the maturing capitalist economy.³

¹ See his (and Max Horkheimer's) book *Dialectic of Enlightenment* (1947), which, in effect, puts much of the blame for the violence, authoritarianism, and barbarism of modern society on rationality and science themselves. This argument is very idealistic and un-Marxian.

² W. W. Tarn, *Hellenistic Civilisation* (London: Edward Arnold & Co., 1952), 360.

³ A large literature explores these themes. On Franklin Roosevelt's New Deal, for instance, one might consult G. William Domhoff and Michael J. Webber, *Class and Power in the New Deal: Corporate Moderates, Southern Democrats, and the Liberal-Labor Coalition* (Stanford, CA: Stanford University Press, 2011), and Thomas Ferguson,

In essence, while Marx was right to locate a capitalist tendency toward relative or, sometimes, absolute immiseration of the working class, he was wrong that this tendency could not be effectively counteracted, at least for a long time, by opposing pressures. That is, he underestimated the power of tendencies toward integration of the working class into the dominant order, toward “pure and simple trade-unionism,” toward the state’s stabilizing management of the economy, and toward workers’ identification not only with the abstract notion of a social class that spans continents but also with the more concrete facts of ethnicity, race, trade, immediate community, and nation. These forces have historically militated against the revolutionary tendencies of class polarization and international working-class solidarity. They have both fragmented the working class and made possible the successes of reformism—the welfare state, social democracy, and the legitimization of mass collective bargaining in the wake of the Great Depression and World War II. Like other Enlightenment thinkers, Marx was too optimistic.

On the other hand, he was right that capitalism is not sustainable—because of its “contradictions,” its dysfunctional social consequences, and also its effects on the natural environment. No compromises between capital and wage-labor, such as the postwar Keynesian compromise, can last. The market is simply too anarchic, and capital too voracious. Permanent stability is not possible. Sooner or later, with the continued development of the productive forces, capital mobility increases, markets—including labor markets—become more integrated worldwide, elite institutional networks thicken worldwide, and organized labor loses whatever power it had in the days of limited capital mobility. In retrospect, one can see that these tendencies were irresistible. Genuine socialism on an international or global scale never could have happened in the twentieth century, which was still the age of oligopolistic, imperialistic capitalism, even state capitalism. In fact, it was not until the twenty-first century that the capitalist mode of production was consolidated across the entire globe, a development Marx assumed was necessary as a prerequisite for socialism (or communism).

The irony, therefore—and history is chock-full of dialectical irony—is that authentic revolutionary possibilities of post-capitalism could not open up until the victories of the left in the twentieth century had been eroded and defeated by hyper-mobile capital. The corporatist formations of social democracy and industrial unionism, fully integrated into the capitalist nation-state, had to decline in order for class polarization in the core capitalist states to peak again, deep economic crisis to return, and radical anti-capitalist movements to reappear (as we may expect they’ll do in the coming decades). Many Marxists don’t like this type of thinking, according to which things have to get worse before they get better, but Marx himself looked forward to economic crisis because he understood it was only such conditions that could impel workers to join together *en masse* and fight for something as radical as a new social order.

The best evidence for the “things have to get worse before they get better” thesis is that the relatively non-barbarous society of the postwar era in the West was made possible only by the upheavals of the Great Depression and World War II, which mobilized the left on such an epic scale and so discredited fascism that the ruling class finally consented to a dramatic improvement of conditions for workers. Similarly, it is possible that generations from now people will think of neoliberalism, with its civilization-endangering horrors, as having been a tool of (in Hegel’s words) the “cunning” of historical reason by precipitating the demise of the very society whose consummation it was and making possible the rise of something new.

But how will such a revolution occur? This is another point on which Marx tripped up. Despite his eulogy of the non-statist Paris Commune, Marx was no anarchist: he expected that the proletariat would have to seize control of the national state and then carry out the social revolution from the commanding

Golden Rule: The Investment Theory of Party Competition and the Logic of Money-Driven Political Systems (Chicago, IL: University of Chicago Press, 1995). On fascism, relevant works include Robert A. Brady, *The Spirit and Structure of German Fascism* (London: Victor Gollancz, Ltd., 1937); Daniel Guérin, *Fascism and Big Business* (New York: Pathfinder Press, 1973); and Nicos Poulantzas, *Fascism and Dictatorship* (New York: Verso, 2018 [1974]). For a classic semi-Marxist analysis of various types of state formation, see Barrington Moore Jr., *Social Origins of Dictatorship and Democracy: Lord and Peasant in the Making of the Modern World* (Boston: Beacon Press, 1993 [1966]).

heights of government. This is clear from the ten-point program laid out in the *Communist Manifesto*—the specifics of which he repudiated in later years, but apparently not the general conception of statist reconstruction of the economy. It is doubtful, for example, that he would have rejected his earlier statement that “The proletariat will use its political supremacy to wrest, by degree, all capital from the bourgeoisie, to centralize all instruments of production in the hands of the State, i.e., of the proletariat organized as the ruling class.” Moreover, he seems to have endorsed Engels’ statement in *Anti-Dühring* that “The proletariat seizes state power, and then transforms the means of production into state property.” It appears, then, that both he and Engels were extreme statist, even though, like anarchists, they hoped and expected that the state would (somehow, inexplicably) disappear eventually.

In these beliefs they were mistaken. The social revolution cannot occur *after* a total seizure of state power by “the proletariat” (which isn’t a unitary entity but contains divisions)—for several reasons. First, this conception of revolution contradicts the Marxian understanding of social dynamics, a point that few or no Marxists appear ever to have appreciated. It exalts a centralized *conscious will* as being able to plan social evolution in advance, a notion that is utterly undialectical. According to “dialectics,” history happens behind the backs of historical actors, whose intentions never work out exactly as they’re supposed to. Marx was wise in his admonition that we should never trust the self-interpretations of political actors. And yet he suspends this injunction when it comes to the dictatorship of the proletariat: *these* people’s designs are supposed to work out perfectly and straightforwardly, despite the massive complexity and dialectical contradictions of society.

The statist idea of revolution is also wrong to privilege the political over the economic. In supposing that through sheer political will one can transform an authoritarian, exploitative economy into a liberatory, democratic one, Marx is, in effect, reversing the order of “dominant causality” such that politics determines the economy (whereas in fact the economy “determines”—loosely and broadly speaking—politics).¹ Marxism itself suggests that the state cannot be socially creative in this radical way. And when it tries to be, what results, ironically, is overwhelming bureaucracy and even *greater* authoritarianism than before. (While the twentieth century’s experiences with so-called “Communism” or “state socialism” happened in relatively non-industrialized societies, not advanced capitalist ones as Marx anticipated, the dismal record is at least suggestive.)

Fundamental to these facts is that if the conquest of political power occurs in a still-capitalist economy, revolutionaries have to contend with the institutional legacies of capitalism: relations of coercion and domination condition everything the government does, and there is no way to break free of them. They cannot be magically transcended through political will; to think they can, or that the state can “wither away” even as it becomes more expansive and dominating, is to adopt a naïve idealism.

Corresponding to all these errors are the flaws in Marx’s abstract conceptualization of revolution, according to which revolution happens when the production relations turn into fetters on the use and development of productive forces. One problem with this formulation is that it is meaningless: at what point exactly do production relations begin to fetter productive forces? How long does this fettering have to go on before the revolution begins in earnest? How does one determine the degree of fettering? It would seem that capitalism has fettered productive forces for a very long time, for example in its proneness to recessions and stagnation, in artificial obstacles to the diffusion of knowledge such as intellectual copyright laws, in underinvestment in public goods such as education and transportation, and so forth. On the other hand, science and technology continue to develop, as shown by recent momentous advances in information technology. So what is the utility of this idea of “fettering”?

In fact, it can be made useful if we slightly reconceptualize the theory of revolution. Rather than a conflict simply between production relations and the development of productive forces, there is a conflict between *two types of production relations—two modes of production—one of which uses productive forces in a more socially rational and “un-fettering” way than the other*. The more progressive mode slowly develops in the womb of the old society as it decays, i.e., as the old dominant mode of production succumbs

¹ In reality, of course, political and economic relations are interlinked. But analytically one can distinguish economic activities from narrowly political, governmental activities.

to crisis and stagnation. In being relatively dynamic and ‘socially effective,’ the emergent mode of production attracts adherents and resources, until it becomes ever more visible and powerful. The old regime cannot eradicate it; it spreads internationally and gradually transforms the economy, to such a point that the forms and content of politics change with it. Political entities become its partisans, and finally decisive seizures of power by representatives of the emergent mode of production become possible, because reactionary defenders of the old regime have lost their dominant command over resources. And so, over generations, a social revolution transpires.

This conceptual revision saves Marx’s intuition by giving it more meaning: the “fettering” is not absolute but is *in relation to* a more effective mode of production that is, so to speak, competing with the old stagnant one. The most obvious concrete instance of this conception of revolution is the long transition from feudalism to capitalism, during which the feudal mode became so hopelessly outgunned by the capitalist that, in retrospect, the long-term outcome of the “bourgeois revolutions” from the seventeenth to the nineteenth centuries was never in doubt. Capitalism was bound to triumph after it had reached a certain level of development.

But the important point is that capitalist interests could never have decisively “seized the state” until the capitalist economy had already made extensive inroads against feudalism. Likewise, socialist or post-capitalist interests surely cannot take over national states until they have vast material resources on their side, such as can only be acquired through large-scale participation in productive activities. As the capitalist economy descends into global crisis and stagnation over the next twenty, fifty and a hundred years, one can predict that an “alternative economy,” a “solidarity economy” of cooperative and socialized relations of production will emerge both in society’s interstices and, sooner or later, in the mainstream. In many cases it will be sponsored and promoted by the state (on local, regional, and national levels), in an attempt to assuage social discontent; but its growth will only have the effect of hollowing out the hegemony of capitalism and ultimately facilitating its downfall. And thereby the downfall, or radical transformation, of the capitalist state.

I cannot go into the detail necessary to flesh out this gradualist notion of revolution, but in my abovementioned book I have argued that it not only radically revises the Marxian conception (on the basis of a single conceptual alteration), in effect updating it for the twenty-first century, but that it is thoroughly grounded in Marxian concepts—in fact, is truer to the fundamentals of historical materialism than Marx’s own vision of proletarian revolution was. The new society has to be erected on the foundation of emerging production relations, which cannot but take a very long time to broadly colonize society. And class struggle, that key Marxian concept, will be essential to the transformation: decades of continuous conflict between the masters and the oppressed, including every variety of disruptive political activity, will attend the construction—from the grassroots up to the national government—of anti-capitalist modes of production.

I’ll also refer the reader to the book for responses to the conventional Marxian objections that cooperatives, for instance, are forced to compromise their principles by operating in the market economy, and that interstitial developments are not revolutionary. At this point in history, it should be obvious that a socialist revolution cannot occur in one fell swoop, one great moment of historical rupture, as “the working class” or its Leninist leaders storm the State, shoot all their opponents, and impose sweeping diktats to totally restructure society. (What an incredibly idealistic and utopian conception that is!) The conquest of political power will occur piecemeal, gradually; it will suffer setbacks and then proceed to new victories, then suffer more defeats, etc., in a many-generations-long process that happens at different rates in different countries. It will be a time of world-agony, especially as climate change will be devastating civilization; but the sheer numbers of people whose interests will lie in a transcendence of corporate capitalism will constitute a formidable weapon on the side of progress.

As for the details of what this long process will look like, we must follow Marx, again, in shunning speculation. He is sometimes criticized for saying too little about what socialism or communism would look like, but this was in fact very democratic and sensible of him. It is for the people engaged in struggles to hammer out their own institutions, “to learn in the dialectic of history,” as Rosa Luxemburg said. Nor is it possible, in any case, to foresee the future in detail. All we can do is try to advance the struggle and leave the rest to our descendants.

*

Marx is practically inexhaustible, and one cannot begin to do him justice in a single essay. His work has something for both anarchists and Leninists, for existentialists and their critics, cultural theorists and economists, philosophers and even scientists.¹ Few thinkers have ever been subjected to such critical scrutiny and yet held up so well over centuries. To attack him, as usefully idiotic lackeys of the capitalist class do, for being responsible for twentieth-century totalitarianism is naïve idealism of the crudest sort. Ideas do not make history, though they can be useful tools in the hands of reactionaries or revolutionaries. They can be misunderstood, too, and used inappropriately or in ways directly contrary to their spirit—as the Christianity of Jesus has, for example, and, not rarely, the Marxism of Marx.

But in our time of despair and desperation, with the future of the species itself in doubt, there is one more valid criticism to be made of Marx: he was too sectarian, too eager to attack people on the left with whom he disagreed. In this case, Chomsky's attitude is more sensible: the left must unite and not exhaust its energy in internecine battles. Let's be done with all the recriminations between Marxists and anarchists and left-liberals, all the squabbling that has gone on since the mid-nineteenth century. It is time to unite against the threat of fascism and—not to speak over-grandiosely—save life on Earth.

Let's honor the memory of all the heroes and martyrs who have come before us by rising to the occasion, at this climactic moment of history.

The Stupefying Mediocrity of Barack Obama

As a Marxist, I'm not very interested in the psychology of the powerful. I don't think it matters much, and it tends to be pretty uniform and predictable anyway: self-overestimation, self-justification, moral rationalizations for every horrendous decision made, brutal callousness to human suffering beneath (at best) a veneer of concern, energies directed to machinations for increased power, cowardly accommodation to the path of least political resistance, a collective insularity of the golden-boy culture gilded with sycophants, etc. On the other hand, as a despiser of the complacent powerful, I enjoy belittling their grandiose pretensions. So sometimes I do like to wade into the muck of their psychology.

A *New York Times* article on May 30 entitled "How Trump's Election Shook Obama: 'What if We Were Wrong?'" provided an opportunity to indulge in this sordid pastime. According to one of his aides, after the election Obama speculated that the cosmopolitan internationalism of enlightened intellectuals like him had been responsible for the stunning outcome. "Maybe we pushed too far," he said. "Maybe people just want to fall back into their tribe." In other words, we were too noble and forward-thinking for the benighted masses, who want nothing more than to remain submerged in their comforting provincial identities. We were too ambitious and idealistic for our flawed compatriots.

"Sometimes I wonder whether I was 10 or 20 years too early," Obama sighed. The country hadn't been ready for the first black president and his lofty post-racial vision.

These quotations are all the evidence one needs to understand what goes on in the mind of someone like Barack Obama.

In fact, the last quotation is revealing enough in itself: it alone suggests the incredible dimensions of Obama's megalomania. It is hardly news that Obama is a megalomaniac, but what is moderately more interesting is the contemptible and deluded nature of his megalomania. He clearly sees himself as the culmination of the Civil Rights Movement—he who participated in no sit-ins, no Freedom Rides, no boycotts or harrowing marches in the Deep South, who suffered no police brutality or nights in jail, who attended Harvard Law and has enjoyed an easy and privileged adulthood near or in the corridors of power. This man who has apparently never taken a courageous and unpopular moral stand in his life decided long

¹ See Richard Levins and Richard Lewontin, *The Dialectical Biologist* (Cambridge: Harvard University Press, 1985).

ago that it was his historic role to bring the struggles of SNCC and the SCLC, of Ella Baker and Bob Moses, of A. Philip Randolph and Martin Luther King, Jr. to their fruition—by sailing into the Oval Office on the wave of millions of idealistic supporters, tireless and selfless organizers. With his accession to power, and that of such moral visionaries as Lawrence Summers, Hillary Clinton, Timothy Geithner, Eric Holder, Arne Duncan, Robert Gates, and Samantha Power, MLK’s dream was at last realized.

Obama was continuing in the tradition of Abraham Lincoln and the abolitionists when his administration deported more than three million undocumented immigrants and broke up tens of thousands of immigrant families. He was being an inspiring idealist when he permitted arms shipments to Israel in July and August 2014 in the midst of the Gaza slaughter—because, as he said with characteristic eloquence and moral insight, “Israel has a right to defend itself” (against children and families consigned to desperate poverty in an open-air prison).

He was being far ahead of his time, a hero of civil rights, when he presided over “the greatest disintegration of black wealth in recent memory” by doing nothing to halt the foreclosure crisis or hold anyone accountable for the damage it caused. Surely it was only irrational traditions of tribalism that got Trump elected, and not, say, the fact that Obama’s administration was far more friendly to the banking sector than George H. W. Bush’s was, as shown for instance by the (blatantly corrupt) hiring of financial firms’ representatives to top positions in the Justice Department.

And it’s only because the masses are stupid and prejudiced that they couldn’t see the glorious benefits they would have received from the Trans-Pacific Partnership, one of the few issues in which Obama seems genuinely to have been emotionally invested. What primitive tribalists they are to be worried about the loss of millions of manufacturing jobs, the increase of prices for medicines, inadequate protection of the environment, and in general massive empowerment of corporations.

Taken together, the two quotations above that constituted Obama’s initial explanation of Trump’s victory—“we pushed too far” and “I was too ahead of my time”—also confirm the not very surprising fact that the moral issue of *class* doesn’t exist for him, as (by definition) it doesn’t exist for any centrist politician. Obama may have paid lip-service to it in his rhetoric, but what he cared about more was a threadbare type of identity politics, cultural inclusivity, symbols and spectacles of the post-racial, post-nationalist millennium, of which he saw himself as the great exemplar. If Trump was elected it can only be because people aren’t ready for this millennium quite yet. But that doesn’t affect Obama’s own place in history: he is certain he’ll be vindicated, indeed will be viewed as even more remarkable for having come too soon.

This perception probably also explains his general reluctance to publicly criticize Trump or other politicians. He simply doesn’t *care* enough to do so—he has nothing like a deep outrage against the continuous injustices of Trumpian politics—because his task has already been accomplished: he has written himself into the history books by being the U.S.’s first black president. That achievement is what matters, that and his eight years of (supposed) attempts to “heal the country’s divides.” Again, it’s too bad the country wasn’t ready for him, but that isn’t his fault.

Thus, rather than getting involved in any real resistance to neofascism—which might exacerbate cultural divisions, horror of horrors, and wouldn’t be decorous or “presidential” (for the powerful shouldn’t criticize each other)—the Obamas are now planning to produce shows on Netflix that will be unpolitical and “inspirational.” This new project of theirs is symptomatic. Powerful people like to propagate “uplifting” stories, for anything else might prick their conscience, challenge the legitimacy of the social order from which they benefit, and inspire resistance movements. Better to focus on feel-good stories that reassure people about the essential justness of the world, or that inculcate the notion that anyone can improve their situation if they only try. This is the same reason that Bill Gates’ new favorite book is Steven Pinker’s *Enlightenment Now*, which argues that things are far better now than they’ve ever been, so we should all be grateful.

I happened to watch a video recently in which Norman Finkelstein psychoanalyzed Obama, and his interpretation stuck with me. Not because the pathetic person who was being analyzed is of any intrinsic interest, but because the *type he represents* is always with us—and will always be popular, and will always be morally and intellectually vacuous. Finkelstein had learned from reading David Garrow’s biography

that, as president of the Harvard Law Review, Obama had a very conciliating style. Whenever arguments arose between the conservatives and the liberals he approached the problem in the same way: he took the interlocutors aside and said, “Don’t get so excited, it’s not such a big deal. Why are you getting so excited? There are bigger things in life.” “Because for Obama,” Finkelstein explains, “there was only one big deal in life: *me*. Everything else was just small change, except him.”

That’s the key. When your overriding value in life is self-glorification, what you tend to get is the moral cowardice and fecklessness of people like Obama, the Clintons, and, in truth, all centrist politicians. They’ll do whatever they have to do to rise to power, so they can realize their “destiny”—of being powerful. They’ll always try to please “both sides”—a binary notion that leaves out the genuine left, which is to say the interests of the large majority of people—because that is the safest and surest road to power.

Which brings us to Obama’s real legacy, as opposed to the one he imagines. The moment he committed himself to a life of pale centrism in a time of escalating social crisis, he determined what his place in history would be. I’m reminded of Georg Lukács’s analysis of Germany’s waffling liberal intelligentsia during the 1920s in his book *The Destruction of Reason*. The elite liberals of the Weimar Republic couldn’t countenance fascism but wouldn’t commit themselves to a decisive democratic program to resist it—for they feared socialism even more than fascism—so they ended up vacillating pathetically, criticizing mass democracy while on occasion semi-defending it, fecklessly counseling moderation, thereby enabling ultra-reaction.

While the U.S. is certainly not Weimar Germany, and the risks of full-blown fascism are not as great now as they were then, one can see parallels. Just as the feckless, vacillating liberalism of Jimmy Carter ushered in the reactionary age of Reagan, so the vacillating liberalism of Obama prepared the way for the semi-fascism of Trump and the reinvigoration of white supremacy. (So much for Obama’s supposed furtherance of the Civil Rights Movement. He is arguably one of the worst things to have happened to minorities since the end of Jim Crow.) You can’t be neutral on a moving train. If you try, you’re actually on the side of the reactionaries.

Congratulations, Barack. You’ve written yourself into the history books.

Imprisoned for a Day: A Personal Reflection

In a world defined by social atomization, bureaucratization, and ant-like regimentation along institutionally sanctioned channels that exist but to uphold hierarchies of power, it is practically a moral obligation for anyone who wants to be fully human to seek empathic understanding of “the other.” In particular, of those without a voice. If we privileged ones cannot literally shed our privilege, we ought at least to imaginatively inhabit other perspectives, say by reading primary sources or watching documentaries, or simply by talking to people from a different walk of life than our own. The result might be not only education but even, perhaps, inspiration.

A few months ago I had the opportunity to experience a bit of life from a perspective I’m not accustomed to: the inside of a jail cell. I was left with a kind of insight that an academic like me doesn’t always achieve, an experiential insight. And I thought it would be worth communicating my impressions, if only to play some minuscule part in giving a voice to the “voiceless.” For, as much abstract knowledge as we may have about the evils of the system bearing the Orwellian name “criminal justice,” the matter appears in a different and darker light from within the dungeon cages underground.

The reason for my 24-hour incarceration is too trivial to mention, scarcely more than a petty misunderstanding. And the experience itself was, of course, a mere joke compared to what others experience, just a stroll in a sunlit park compared to what the 23 million or so imprisoned and released felons in this country—in addition to millions of those guilty of misdemeanors (not to mention millions of immigrants detained for weeks and months)—have gone through. But it was memorable enough, and perhaps worth relating.

I was struck, first of all, by the insidious psychological effect of having to place your hands behind your back so they can be handcuffed. This coerced action performed in the presence of onlookers instantly manipulates you into an unwonted self-categorization: you can't help but see yourself as others now see you, an *offender*, a *criminal*, a *bad 'other*. ' Or rather, while rejecting the value-judgment, you're aware that that's the category into which you've been placed, by the officers, the onlookers, and especially the handcuffs. All of a sudden you don't unproblematically belong to society anymore; your personhood has been qualified and thrown into question. You're now half-person and half-ominous-question-mark. ("What did he do? What crime did he commit?")

I was careful to obey every command to the letter, since, as we know, there is nothing a police officer likes less than being contradicted, so my treatment was far better than it could have been. Still, I was puzzled by the length of time I had to sit in the car while the officers talked outside in what seemed a rather nonchalant way, given my shackled hands. That's another insidious technique of control for which you have a heightened appreciation when you're on its receiving end: the power to elongate time. It truly becomes impressive once you're behind bars.

After making it to the precinct, the trial-by-paperwork begins. More waiting, and more unscratchable itches on your back and face, as initial reports are filed. I came to have a better understanding of the social role of the police as I saw throughout the evening how much "paperwork," or electronic work, they have to file whenever an arrest is made. I had already understood that the police's true function isn't so much to protect *people* (as is claimed) as to protect "*order*," the given system of social relations, which is to say the power of the powerful. The police officer—in addition to being simply a personification of state violence—is the "bouncer" for society, whose job it is to keep out the undesirables, those who either refuse to conform or have committed the crime of being poor and dark-skinned.

But now I saw more clearly that, in effect, what the police are is just bureaucrats—with guns. Bureaucrats who dress up in blue and walk among us to make sure we're following the rules, and who take us in to be processed and labeled and categorized if we violate some rule or other (or even if we don't), and ideally to be frightened into never violating that rule again (if, that is, we're lucky enough to be released at all). None of this is to say there is no value in such a role; surely there can be, particularly with regard to addressing violent crime. But, given the amount of paperwork and the continuous human "processing" the job entails, to belong to the "force" is to be a fancy-dressed bureaucrat-in-the-trenches.

At length, after being divested of various items of clothing and whatever is in your pockets, the shackles are taken off and you're safely behind bars. Your company is your cellmates (if you have any), your worries, and time. Lots of time. I sat there for about eight hours, which seemed even longer, due to the human brain's self-flagellating tendency to dwell lugubriously on moments of nothingness (while speeding through moments of joy). I was fortunate soon to have a couple of talkative cellmates, both of whom were there for having thrown a punch or two; but even their presence was of limited use in accelerating the ticking of the clock.

We were waiting to be transferred to the Brooklyn Detention Complex, where we would wait till the next day to see the judge. If all went well, we'd be free, at least provisionally, by that evening.

So after a suitably punishing length of time, the handcuffs were snapped back on and we were transported to our luxury accommodations for the rest of the night. Actually, the precinct was a far more agreeable place, as you might expect, being less populated and less redolent of sweaty unwashed bodies crammed together in tiny spaces lacking ventilation and windows. The initial holding pens, in particular, were noisome: it would be cruel and inhumane to pack pigs into those enclosures, much less dozens of humans. At least one's nose grew numb to the smell.

Finally we were herded into the main area to be processed again (to have the mug shots taken and so on). Though it was around 1:00 in the morning there were serpentine lines, scores of shackled men and women shuffling along—nearly all of them African-American or Hispanic. A dreary semi-silence punctuated by commands from officers. Dull-looking bureaucrats from a Kafka novel sitting at desks, directing us where to go. It was a subterranean world we had entered.

At last the intake process was finished and we were taken down dark corridors to the cellblock area, in the bowels of the earth. You can imagine the conditions in each cell: a vomitous toilet in the corner, a

metal sink next to it, benches against the concrete wall...and that's all. So there we were, about thirteen of us in a cramped cell, as the bars shut behind us. I recalled Malcolm X's admonition:

Any person who claims to have deep feeling for other human beings should think a long, long time before he votes to have other men kept behind bars—caged. I am not saying there shouldn't be prisons, but there shouldn't be bars. Behind bars, a man never reforms. He will never forget. He never will get completely over the memory of the bars.

To be sure, it's easy to get over the memory when you're confined for only a day. Still, the contrivance of the steel bars is an effective contribution to the psychological function of jails and prisons, viz. to dehumanize, to animalize, to infantilize.

Some of us claimed a bit of space on a bench; the rest sat or lay on the floor, settling in for a long night of sleeplessness. One guy made a pillow out of several inedible cheese sandwiches in little bags he had found strewn around the cell. (That's the food we're given, in addition to a small portion of cereal in the morning.) Those of us on the floor spent the night trying to avoid collisions between legs.

Sleep would likely have been impossible for me anyway, but it was made even more so by a few cellmates who had an impressive talent for remaining animated hour after hour, in a most vocal way. The guffaws were frequent. I listened to interesting conversations about, for example, the relative merits of an astonishing galaxy of hip-hop artists, quite intelligent music criticism being expounded at great length, even to the point of heated debate. Later, conversation extended to those in the cage across the hall, questions being shouted as to where they lived, what acquaintances they all had in common, what they had been talking about over there, etc. "What's your name, man? Oh, you live on Broadway? Me too! Monroe? I'm a couple blocks away, at Jefferson! You know Malik? He's on Madison—works at the Subway there." The irony wasn't lost on me that this institution, meant to segregate and isolate, could also bring people together.

In fact, through the night and the next day I observed how easy it was for a camaraderie to develop among the inmates, the first inklings of a solidarity against the cops. While profanity-laced tirades against guards occurred occasionally—due to ignoring requests for food or for the time, or for being granted a phone call—more often the attitude was informal respect and easygoing familiarity. But that didn't preclude a definite collective identity, an "us vs. them" mentality, based on a sense of shared injustice and oppression (or, more generally, shared interests). Everyone I talked to took it for granted that the criminal justice system is wildly racist—they were surprised that a "white boy" was in there with them. But the race factor, or any other divisive factor, didn't really matter: when requests or demands or complaints were made to the guards, it was far more common to hear the words "we" and "us" than "I" or "me."

Of course, this isn't to deny that vicious divisions between inmates or groups of inmates emerge in prisons. It was merely striking to observe the spontaneous appearance of a collective consciousness even despite, and because of, the radically anti-social environment we were trapped in.

What I found even more striking, and poignant, was the casual familiarity with jail that most of the men displayed. None of them seemed particularly discomfited by it, except the next day when the waiting, prolonged hour after endless hour despite previous assurances of speed and efficiency, grew intolerable. More than a few guys took me under their wing, as it were, and explained how the system worked and why legally I had nothing to fear. "What did you do? Oh, that's the lowest level of misdemeanor. You'll be fine—they'll release you and you'll be on probation, and then the case will be dismissed. You have nothing to worry about." Their expertise reminded me of Dave Chappelle's bit: "Every black dude in this room is a qualified paralegal. If one of us even started to do something wrong, an old black man would pop out of nowhere—'Nigga don't do that, that's five to ten!'"

It was clear that jail, and its ever-present possibility, was just a part of their lives, as, say, being paid very little is a part of the life of an adjunct professor. I tried to imagine what that would be like, how different all my frames of reference would be. I would literally perceive the world differently: my perceptions would incorporate and embody utterly different value-judgments than they do, different expectations from moment to moment, and I'd have to be cognizant of entire dimensions of experience—

fears, worries, possibilities, factors to be taken into consideration—that are currently beyond my horizons. The understanding sank in on a visceral level of my privilege.

But more than that: I could see my own views of the world changing somewhat. After all, to sit on a floor against steel bars for twelve hours, and then several hours more when I was moved up to the even more crowded holding pen we wait in until the court is ready to see us, is an experience that encourages introspection. The situation felt both surreal and much more real than ordinary life. I thought of my daily routines, the mindless reading of news in the morning and evening, the pleasantries exchanged with fellow professors and students, the YouTube-watching at night in between grading and perusals of academic journals. I thought of the throngs that flood the streets of Manhattan every day on their shopping missions or sightseeing missions, and the bar-socializing with acquaintances—the trivialities shouted across the table over the din. It all seemed more hollow than ever.

Millions of us chatting happily outside or going to movies, averting our gaze from every unpleasantness, while other millions rot in steel-enclosed windowless misery—for throwing a few punches or having marijuana on them, or not legally being an American, or being poor and black in a white society. At this point I could say that our usual complacent behavior is contemptible and unconscionable, but what hit me most forcefully was just how *false* and *empty* it is. We live in and through illusion; our entire quotidian existence is grounded in denial. We have a pathetically *partial* view of the world, a parochial little outlook conditioned by frivolity and routine, blind to the very foundation of society underground in these cages that police the “dangerous classes.” I felt that *here* was the truth, the beating heart of America.

For, as we know, we live in an overwhelmingly bureaucratized society, a world increasingly shorn of human connections—sacrificed on the altar of marketization and privatization—which is precisely why it’s hurtling towards doom. Humanity is simply a non-factor in the political-economic equation. In fact, for a long time I’ve thought that the Holocaust, the apotheosis of bureaucratic inhumanity, is the clue to the moral essence of capitalist modernity, the perfect symbol. But on a less murderous scale, mass confinement in cages is an equally apt emblem. The prisoners are almost totally helpless, totally at the mercy of bureaucratic diktats and the whims of guards and wardens. And we know how helpless we all tend to feel with regard to any bureaucracy—government bureaucracies, insurance bureaucracies, workplace bureaucracies, bank bureaucracies. We’re completely subordinated to power, with hardly any recourses. The arbitrary power over life and death is only more pronounced in the case of the “criminal justice” bureaucracy.

The prison bureaucracy takes the alienating tendencies of capitalist institutions to their logical and literal conclusion, in the separation of people into their own concrete cells and the enforcement of this isolation by armed guards. Actually, in a sense, jail or even prison might, perversely, be less isolating than the broader capitalist civilization they reflect, given that the basic unit of society is no longer the community or the family but really the lone individual with his computer and his smartphone—and, for his social context, the bureaucracy in which he is embedded (as employee, consumer, and citizen). At least in jail a “collective consciousness” can emerge, together with real sympathy and empathy. And the human interactions tend to have a stripped-down quality, a directness and rawness, very different from the impersonal fakeness outside.

By around 11 a.m. the remaining conversations in the cellblock had died down. By 12:00, and then 1:00, and then 2:00, an absolute listlessness had settled on us, except for periodic ejaculations of disgust at whatever incompetence or malice was keeping us down there. Time had stopped. I began to wonder if I’d ever be released; the thought of freedom seemed too good to be true. Maybe I’d be stuck here another day, or longer. Would I have to miss work on Monday? Some of the guys had missed work that day, putting their jobs in jeopardy. I looked at the bodies sprawled on the floor and thought, *This is what matters in the world. The rest is a lie, as long as this exists*. The way I’d lived, immersed in thoughts of self, seemed absurd and shameful. All that mattered was to fight against this, and all suffering. I had to make changes, drastic changes in how I lived. That *this* could exist, or conditions far worse than this, was intolerable.

At long last the moment of deliverance arrived: my name was called. Full of hope, I left the cell...to be transferred to another cell. In which there were perhaps thirty people, though it was scarcely larger than the one I’d spent the night in. But at least I was closer—so I hoped—to freedom. I was also trepidatious,

not knowing what to expect when I faced the judge, for instance whether he would set bail, or whether the DA would prosecute despite the triviality of the incident that had landed me there. Soon after I was in the new cell, a man came in cursing the judge, whom he had just seen. “That motherfucker set bail even higher than they asked for! \$2000. As soon as I saw him look down at the sheet, I knew it was over. They said I had an old warrant for littering, so they went after me.”

To be sure, others had committed more serious crimes than littering. One middle-aged guy, a jovial fellow, had been caught shoplifting at Macy’s (to sell the items later). “I know what I did wrong now,” he said. “I gotta be more careful when there aren’t crowds. In the holiday season it was different—I probably took \$20,000 worth. Easy. There are so many people it’s easy.” I noticed that they all drew a distinction between stealing and taking. “You don’t *steal*,” one guy said. “You *take*. A woman steals, I take. You gotta take it, just take what you need, it’s yours, and walk out of there.” Earlier I had talked to a pregnant young woman, attractive, confident, and articulate, who said she regularly steals—no, *takes*—expensive items from Macy’s (again, to sell them on the street). It isn’t really theft because she thinks she’s entitled to it, in light of how much the government takes from her and how cruelly the System treats people like her. She has a job, but the pay isn’t enough for her to provide for her family. It was clear to me that this sort of theft is widespread.

The situation, then, is predictably absurd: people are denied the ability to earn a living, and, in addition, government steals money from them when they can find work—yes, *steals*, for the logic of government is, arguably, no different from that of a protection racket—so they have to turn to illicit means of surviving; but in that case, if discovered, they’re sent to prison. So it’s Scylla or Charybdis. Deprivation or—deprivation in prison.

Meanwhile, my own brief period of deprivation was about to come to an end. The last couple of hours weren’t particularly eventful, aside from when one of the inmates had a seizure, complete with foaming at the mouth. I can’t say if it was due to negligence by the authorities, but my guess is not, since they acted fairly promptly to get him medical assistance. At any rate, by this point I was more than ready for freedom. Not to mention food. The thought of both was sweeter than I had ever known.

In the early evening my name was called for the last time, and I made my way to the courtroom. Whence to freedom, a half-hour later. Having no criminal record, I was let off easy. What happened to the others, I don’t know. What I do know is that as I walked outside into the drizzling rain, the taste of freedom in the air, people in handcuffs were being ushered into the back entrance of the building, out of the rain-scented air and into the sweat-stinking holding pens. Many of them would be repeat offenders, and this latest arrest might have dire effects on their lives. It would be harder to get a job, which would tempt them to *take* what they needed, which would raise the possibility of another arrest, and so the cycle would continue. The System would continue to be fed fresh meat, and it would grow bigger in scale, and ever more lives would be ground up in its gears. The System would continue to dominate a diabolically *regimented* society—unless its victims and their advocates could, somehow, throw a wrench into its gears and grind them to a halt.

I didn’t know how that could be done, but, newly inspired, I knew I had to take part.

The American Oligarchy: A Book Review

Consumers of left-wing media are well aware that America is an oligarchy, not a democracy. Everyone with a functioning cerebrum, in fact, should be aware of it by now: even mainstream political scientists recognize it, as shown by a famous 2014 study by Martin Gilens and Benjamin I. Page. Nevertheless, it is important to continue to publicize the oligarchical character of the United States, in order to delegitimize the institutions that have destroyed democracy (insofar as it ever existed) and inspire people to take action to restore it. Ron Formisano’s book *American Oligarchy: The Permanent Political Class* (2017) is a valuable contribution to this collective project.

“*American Oligarchy* has been written,” Formisano says, “not to propose a path out of the New Gilded Age, but to discredit the political class by raking its muck between covers in black and white.” Formisano certainly achieves his goal: the “political class” comes out stinking of, yes, a swamp, a putrid moral bog. This “networked layer of high-income people and those striving for wealth including many politicians in and out of office, lobbyists, consultants, appointed bureaucrats, pollsters, television celebrity journalists (but not investigative reporters), and the politically connected in the nation’s capital and in the states” calls to mind in its hedonism, corruption, money-worship, and giddy myopia the decadent Senate-attached aristocracy of the late Roman Republic, greedy beyond the dreams of avarice.

The term ‘aristocracy’ is apt, for Formisano argues convincingly that the U.S. is headed beyond oligarchy to an aristocracy of inherited wealth, complete with all the ideological and cultural trappings of aristocracy. Our exalted rentiers and their service-providers have the usual attitudes of aristocratic entitlement to all good things in this world (and exclusion of the non-rich), sputtering rage at the occasional prospect of losing a particle of their preferential tax treatment, and the valorization of nepotism as first among the virtues. “The rampant nepotism of the political class fuels the galloping socioeconomic inequality of the twenty-first century.” The main differences between the American aristocracy of today and, say, the French aristocracy of the eighteenth century seem to be that the former has incomparably lower cultural (and architectural) tastes than the latter and is incomparably more destructive of society and the natural environment.

The circles in which the nation’s political leaders and their thousands of well-heeled minions travel are indeed reminiscent of some enormous eighteenth-century court. Over half the members of Congress are millionaires, with a total worth in 2013 of \$4.3 billion; but even the ones whose income is of a mere six figures are able to live like millionaires. The reason is that the gears of Washington are greased by a “gift economy,” which, to quote ex-lobbyist Jack Abramoff, amounts to “a system of legalized bribery. All of it is bribery, every bit of it.”

In 2007 Congress passed a law prohibiting lobbyists from giving gifts to representatives, but, as Abramoff says, in effect “they just reshuffled the deck... They’re still playing the same game.” Campaign committees and “Leadership PACs” pay for the many luxurious trips legislators take around the world, as do lobbyists and donors. Golf outings, lavish “conferences,” fishing in the Florida Keys, skiing in Colorado, trips to Paris or Vienna or Hawaii, innumerable expensive parties and receptions and breakfasts with lobbyists and donors—all are paid for by either tax dollars or various committees, lobbying firms, corporate interests, etc. Aside from the obviously corrupting influence of all this legalized bribery, it matters a great deal that “politicians have no experience of poverty.” In fact, from 1998 to 2008 only 13 members of Congress came from blue-collar backgrounds, and they had long ago left behind that experience. No wonder policy almost never favors the working class.

Meanwhile, while in 1970 only 3 percent of members leaving Congress moved into lobbying, now well over half do. As do thousands of congressional aides. In addition to reinforcing the insularity and chumminess of the Beltway culture, this “accelerating exodus of staffers to K Street...has had the effect of increasing the power of lobbyists by shortening the overall tenure of staffers.” As the latter group becomes younger and less experienced, lobbyists take on an ever-greater role in crafting legislation—increasingly byzantine legislation that is difficult even for staffers to understand, which further enhances the power of lobbyists.

Formisano documents with admirable thoroughness the fact that the foremost concern of politicians and the politically connected in both the nation’s capital and the states is to look out “for me and mine.” The most obvious and common means of doing so is to monetize one’s public service, but almost as common is the practice of nepotism. “[T]he political class practices nepotism routinely, brazenly, and shamelessly, giving their ‘nephews’ plum jobs, promotions, a place at the head of the line.” Donald Trump may (unsurprisingly) be even more shameless than most, with his political use of his daughter, his son-in-law, and his sons—one of whom has remarked candidly that nepotism “is a beautiful thing.” But the second Bush administration took nepotism to a high art, given, for example, the important roles of Liz Cheney, her husband, and her son-in-law; the Mehlman brothers, the McLellans, the Powells, and Ted Cruz and his wife; the Martins, the Ackerlys, and the Ullmans, etc. The Obama administration was hardly innocent

either, though it didn't go to quite the extremes of its predecessor. Children of governors and members of Congress fare well too, whether serving in politics, in law firms, in businesses that benefit from political connections, or as lobbyists.

The media are almost as riddled with nepotism as politics. When her mother was Secretary of State, Chelsea Clinton was hired by NBC as a television journalist, making \$600,000 a year (\$26,724 for every minute she was televised). CNN's Andrea Koppel, Anderson Cooper, Jeffrey Toobin, and Chris Cuomo are beneficiaries of nepotism, as are (at other channels and publications) Douglas Kennedy, Chris Wallace, Mark Halperin, Mika Brzezinski, Bill Kristol, Ronan Farrow, Luke Russert, Meghan McCain, Jenna Bush, Jackie Kucinich, and others. Formisano concludes, "Whether the field is literature, television, entertainment, or politics, the hallmark of this New Gilded Age of Inequality is 'naked, unabashed favoritism,' and the shameless effrontery of those who give and receive it."

American Oligarchy also contains long discussions of the nonprofit world, specifically of its contributions to rising income inequality. The nonprofit sector employs 10 percent of the U.S. workforce, and in 2010 corporations, government, and individuals donated \$300 billion to charitable enterprises. At least \$40 billion every year is lost to "fraud, theft, personal enrichment of executives, and misappropriation." In general, the culture of large nonprofits is approximately that of the permanent political class in Washington.

University presidents and hospital CEOs, for instance, can make millions of dollars a year, and that doesn't include such perks as bonuses, deferred compensation, auto allowances, and financial planning. In the same years as student debt has soared and state funding has declined, university foundations have been used as slush funds for big payouts and personal expenses for presidents and other administrators. Even more egregiously, nonprofit hospitals have initiated hundreds of lawsuits against patients who couldn't pay and have routinely had arrest warrants issued and jailed debtors. Conversely, lawsuits have been filed against hundreds of hospitals in seventeen states for gouging the poor.

In other cases, nonprofits have in effect become allies of the forces they're supposed to be challenging. A particularly outrageous instance is that of The Nature Conservancy, "by far the wealthiest green group with well over \$6 billion in assets." On its governing board and advisory committees sit executives of oil and chemical companies, mining and logging businesses, auto manufacturers, and coal-burning electric utilities, who have influence over the group's policies. Even while preserving millions of acres, The Nature Conservancy has logged forests, drilled for natural gas under the last breeding ground of an endangered bird species, invested millions in energy companies, cultivated relationships with such polluters as ExxonMobil and BP, and sold its name and logo to companies that then claim undeserved credit for being green. Similarly, the World Wildlife Federation has close relationships with both Monsanto and the rainforest-destroying palm oil company Wilmer.

At any rate, the evidence Formisano amasses proves that the moral corruption of the American aristocracy has utterly polluted the ostensibly selfless and charitable world of nonprofits. From museums, public libraries, and human rights organizations to symphony orchestras, veterans' groups, and environmental organizations, excessive executive compensation, corporate ties, and outright corruption have perverted the public mission of nonprofits.

American Oligarchy is not an uplifting read. Its chapter on Kentucky, a case-study of political corruption in a poor state, is, despite the detached analytical tone, at times wrenching, in particular when you reflect on all the human suffering that is the corollary of the aristocracy's venality and greed. On the one hand are profits for Purdue Pharma in the billions of dollars, and power and money for a complicit political class; on the other hand are numberless opioid deaths and lives ruined by addiction.

But books such as this are indispensable in their bleakness, since we live in bleak times that call for unstinting exposés. Perhaps as the backlash against Donald Trump grows, *American Oligarchy* and books like it will acquire a wide readership and so contribute to the radicalization of a generation.

Glimmers of Hope: The Death of the Old and Arrival of the Young

If there is a silver lining in Donald Trump's sadistic presidency, we saw it on vivid display on June 26. The victories of Alexandria Ocasio-Cortez and Ben Jealous against establishment candidates confirm what many have been saying since last year, that Trump is one of the greatest recruiting tools the left has ever had. He is, as it were, a personification and distillation of all the evils of neoliberal capitalism, all the decadence, the corruption, the awe-inspiring greed and misanthropy, the savage disregard for humanity and all things living in the cause of a debased and orgiastic self-glorification whose telos is the self-immolation of civilization itself. Combined with the success of Bernie Sanders' campaign, the barbarity of the Trump administration is inspiring a new generation of leftists.

Let's just take a moment to revel in and reflect on the victories of June 26. In themselves they might not seem like much, at least in light of the enormity of the crises we're facing, but it's clear, at any rate, that Nancy Pelosi is wrong: it isn't just one or a few districts we're talking about, it's a nationwide groundswell of activism against the kind of politics she symbolizes, namely obedient service to the corporate sector. She and her elderly colleagues at the summit of the centrist power-hierarchy are on their way out, both politically and even existentially.

The 'age' factor is of interest and importance. On one side there are the old representatives of business, corrupted from decades at the center of power: Pelosi, 78; Steny Hoyer, 79; Jim Clyburn, 77; Maxine Waters, 79; Diane Feinstein, 85; Chuck Schumer, an impressively young 67; Patrick Leahy, 78; Dick Durbin, 73; Bill Nelson, 75; Richard Blumenthal, 72. You get the point. The 115th Congress is among the oldest in history, with an average age in the House of 58 years and an average age in the Senate of 62. (The Republican House leadership is over two decades younger than the Democratic House leadership. Fascism is a youthful, virile creed.) Given the senescence of the Democrats, the stillborn quality of their leadership is hardly a surprise.

On the other side, with the notable exception of Bernie Sanders, is relative youth. Ocasio-Cortez is 28; Jealous is 45; Kshama Sawant in Seattle is 44; Keith Ellison is 54; Dana Balter, who defeated the DCCC-supported Juanita Perez Williams in a race in New York, is 42; Chokwe Antar Lumumba, left-wing mayor of Jackson, Mississippi, is 35; and in general, a tidal wave of millennials is poised to engulf local and state politics. National organizations have sprung up to help young progressives run and win, and groups like Indivisible and the Democratic Socialists of America are proving effective in their advocacy of candidates. Young women are running in record numbers.

However fatuous it sounds, I can't help remarking that leaders of past revolutions have tended to be quite young. Robespierre, Danton, Mirabeau, Desmoulins, Saint-Just, Brissot, and their colleagues were between their twenties and (in one case) early forties; so were Jefferson, Madison, the two Adamses, Hancock, Hamilton, and most of the other "Founding Fathers" during the American Revolution. Trotsky and most Bolsheviks were not yet 40 in 1917. Such has always been the pattern, from Thomas Müntzer in the German Peasants' War to Castro and Che Guevara in the Cuban Revolution. America, of course, is nowhere near a revolution—in fact, some such seizure of power is likely hopeless in conditions of advanced capitalism—but with the mass entrance onto the political stage of a younger generation not jaded from a lifetime of disappointment or brainwashed from old propaganda about socialism or the virtues of centrism, American politics may be at the beginning of a long march to the left. Or at least away from the center, to both the semi-fascist right and, on a broader scale among the sane majority, the left.

The Democratic Party's leadership for the last generation has served its heinous historic function of overseeing, in partnership with Republicans, the shredding of the postwar social contract, the decimation of organized labor, the global triumph of the capitalist mode of production, and the inauguration of a new Gilded Age. That was the service rendered by the likes of the Clintons, Obama, Biden, Pelosi, Schumer, Harry Reid, Tom Daschle, the whole rotten lot of them. It was an almost wholly negative service, except in that—as Marx might see it—the class struggle has been brought to a screaming pitch of intensity and the door to radical change has once again been opened. At the nadir of the neoliberal era, with a buffoonish man-child capitalist-poster-boy at the helm of the ship of state, popular movements are beginning—one hopes—to point the way to a new political economy. Leaders can, it seems, be elected even without funding from the corporate sector, which makes them beholden only to their popular constituency. The worse things

get under Trump and afterwards, the more people will be radicalized, and the better things may get in the long run.

Again, it's worth pausing at this moment of the changing of the guard—a moment that will, of course, last years, as we wait for the old guard to die off or lose elections—to consider just how *abject* the leadership of the Democratic Party is. Insofar as it was ever even nominally committed to helping the poor, the working class, and minorities, it has failed abysmally. It gave us Bush and it gave us Trump, and it gave us the Bush-lite and the Trump-lite administrations of Bill Clinton and Obama. Obama wanted to be a transformative figure, and in a sense he succeeded: he transformed millions of hopeful idealists into disillusioned cynics.

But in substance the Democrats were never committed to anything like genuine populism, so their “failures” are in reality a reflection of their priorities. By their fruits ye shall know them. (It's also true, though, that there is a remarkable amount of incompetence at the top of the Democratic Party. Hillary Clinton's campaign, for instance, was stunningly incompetent.)

Whether the party can, even on local or state levels, be transformed from an agent of reaction to one of democracy remains to be seen. The strategy of “boring from within” has, historically, yielded disappointment after disappointment, from the Populists of 1896 to countless attempts by organized labor to push the party left. On the other hand, one cannot simply extrapolate the future from the past. History is not a science; with changed circumstances can come changed outcomes. In all likelihood, left-wing leaders will emerge in the context both of third parties and of the Democratic Party, which in the long run will itself become more leftist—while at the same time full of internal conflict (much as the Labour Party of Jeremy Corbyn has been—and the Republican Party, for that matter).

But for now, I think we're entitled to some savoring of Joe Crowley's defeat and some cautious optimism about the future. God knows we could use a bit of hope, after decades of defeat.

Thoughts on Overcoming Despair

As a leftist, I'm used to despair. How many hours have I, like so many others with an ounce of humanity in them, sat alone in my room miserably reading about global warming, horror-struck at the scorching hellscape we're leaving our descendants? How many times have I sat frozen in rage and disgust as I thought of the impunity of the “masters of war” sheltered behind piles of money, protected from the just comeuppance due them for their genocidal war-games—for it's all a bureaucratic game for them, a very serious game involving clever political maneuvers geared to the sole objective of conquering even greater power and wealth. On the one hand are the Henry Kissingers (who of course live forever) and Barack Obamas making the cocktail-party rounds, being fêted by a fetid power-worshiping culture of amoral sycophants and groupthinking herd-people, the social climbers never disturbed by a twinge of conscience despite the most unspeakable of crimes. On the other hand are their victims: the thousands of young people, mercenary instruments of the powerful, drawing their last agonized breath in muddy blood-puddles on the battlefield; the children clinging to their mother's mutilated corpse, looking around the street for her arms blown off her body when the bomb exploded; the father who comes home to find that his house and his family no longer exist. How can one not *grieve—forever—*from all this, and from the absurdity and meaninglessness of such a tragic, farcical world?

It's so easy to see no hope whatsoever. Or to recoil misanthropically into one's cocoon away from the stupidity and evil of late capitalism. It would seem that almost everywhere, the signs portend doom. There is no need to interpret them all, yet again. Others have done so with great eloquence, and one has but to read the daily news or contemplate mass obsessions with pop celebrities and the latest video games to come in danger of losing all vestiges of faith in humanity.

But then, after I turn away from the overwhelming bleakness, a contrary impulse enters my mind and I remember Goethe and Nietzsche: life-affirmation, despite everything, is a more profound truth than pessimism and despair. The latter are exactly what the bureaucrats-in-chief, the rulers of the world, want

you to feel, so that you'll do nothing and let them go on getting richer. Few states of mind are less revolutionary than the collapse of the will, than apathy or absolute hopelessness. It's more challenging, more productive, and, in a sense, more *beautiful*—even more moral—to affirm and not only to negate.

So I find it important to take breaks from the dreary reading and remind myself of simple joys and hope. It's essential to periodically rejuvenate the will, an imperative I personally can fulfill only by purging my mind of everything remotely bureaucratic, institutional, and authoritarian. For instance, it's very difficult for me to listen to, say, a festive Irish fiddle while thinking of peasants dancing outside in the spring air, shouting, cheering, and clapping, without at the same time feeling deep gratitude for being alive. Just imagining the scene, this bucolic antithesis of bureaucracy and authority, is enough to melt away the contempt and despair. Or I might listen to Beethoven, the greatest of all life-affirmers, whether in one of his exuberant moods or in a ravishingly lyrical one. Or Schubert, or Mozart. Good classical music is perhaps the most left-wing of all music, in its ennobling sublimity, its emotional accessibility, its democratic appeal to everyone from the age of 1 to 101, its rationalistic spirit, its humanism, its being the very opposite of everything commodified, artificial, machine-like, and money-produced. Nothing is less stained than Mozart.

This is the spirit that ought to, and tends to, animate the left, this freedom-loving anarchistic spirit of sheer creative individuality. Which of course goes along with the creative and democratic *collective*, since in a truly human society “the free development of each is the condition for the free development of all.” We should leave everything that vitiates hope and vitality to the right-wing, since the right-wing is defined, in effect, by its commitment to the anti-human: hierarchy, capital accumulation, profits over people, privatization and atomization, ecological destruction, hatred of the Other, bigoted nationalism, imperialistic savagery, etc. Apathy and hopelessness are appropriate right-wing emotions; bureaucracy and institutional thinking are right-wing phenomena (notwithstanding the usual reactionary attacks on “government bureaucracy”). Joy and empathy are inherently left-wing, because deeply human, connecting, and empowering.

In the task of purging oneself of right-wing traits and maintaining a positive outlook, it's essential also to cultivate open-mindedness. One would expect those on the right to be closed-minded, not only because of the closed-off nature of the “authoritarian personality” but also because the essence of reactionary ideologies is commitment (explicit or implicit) to hierarchy and authority. The left-wing valorization of reason, dialogue, democracy, and empathy, however, should entail willingness to consider opposed perspectives on their merits rather than reflexively attacking them. It's unfortunate and ironic, then, that there's so much closed-mindedness on the left, so much sectarianism. Whether among Marxists, anarchists, Leninists, feminists, left-liberals, or any of the countless other schools and sub-schools of thought, the hostility to potentially challenging ideas is deplorably common. That Marx and Engels themselves were highly sectarian is no argument in favor of it. One has but to reflect on how much damage sectarianism inflicted on the New Left in the 1960s, not to mention the Old Left in the first half of the twentieth century, to realize that it's a pretty stupid way to behave. With greater openness to, and willingness to ally with, other non-reactionary perspectives comes greater political efficacy, a broader sense of solidarity and consequently “empowerment,” a less narrow, crabbed, bitter, misanthropic individual character, and a more expansive and generous view of humanity and life itself. This is quite apart from the *principled* nature of such a stance, the fact that it is itself a realization of leftist morality.

Another way to overcome jaundice and despair is to appreciate the degree to which left-wing ideals are already manifest in ordinary life. For human nature has a solid anarchistic and communistic component. (See Kropotkin's classic *Mutual Aid: A Factor of Evolution*.) As David Graeber has argued, if communism means “from each according to his ability, to each according to his need,” then it is the foundation of human sociability—“the raw material of sociality, a recognition of our ultimate interdependence that is the ultimate substance of social peace.” The only reason society is able to function at all is that it's held together by a dense anti-capitalist fabric of sharing, helping, and cooperating, i.e., giving to others in need what you're able to give them, even simply advice, sympathy, assistance at some task, or a bit of money. In effect, to be a leftist means to want to elevate this “baseline communism” to a more determining principle of social organization, not only for its own sake but also because that would further the goals of popular freedom

and power. Rousseau may have been wrong that human beings are naturally “good” (though neither are they naturally bad; they’re both), but at least we can appreciate and be grateful for the spontaneous communism and sympathetic happiness that continually well up from humans’ psychic depths.

All these considerations and pleasures help me avoid a relentlessly dreary attitude, but in the age of Trump a new factor has come into play: genuine hope that a popular backlash against neoliberalism is developing. Finally! After forty years, it’s about time. And since neoliberalism is just capitalism on steroids, capitalism itself is becoming a target for increasing numbers of people—to the horror of “moderate Democrats.” The once-vital center is disintegrating, as a semi-fascist right and a semi-socialist left rise from its ashes. Such a historical moment certainly presents dangers, but it also presents opportunities not available during quiescent or “centrist” periods. In fact, history teaches us that progress can happen most rapidly in moments of crisis, when people are open to radicalization. The Great Depression in the U.S. is an obvious example, for it bred popular movements that birthed both the welfare state and mass industrial unionism. The inevitable next economic crash will have a similarly galvanizing effect on social movements, strengthening and radicalizing the “Resistance” that is currently in its infancy.

We are, indeed, embarking on an era second to none in historic importance. As I’ve argued in *Worker Cooperatives and Revolution: History and Possibilities in the United States*, it is only in the twenty-first century that a post-capitalist “revolution”—in whatever protracted, global form it will take—has finally been placed on the historical agenda. Marx, not foreseeing state capitalism and the welfare state, got the timeline wrong. But the basic idea of a final colossal confrontation between capital and the majority of humanity was accurate. Only, this ‘final’ confrontation will last generations. And it is beginning now, not a hundred years ago. With the stakes so large, this epoch really amounts to the climax of human history.

We can’t know how the struggles will play out; we can only wage them, and analyze the historical tendencies that bear fruit in them. In the meantime, we have to ward off hopelessness—by remembering that bleak times are nothing new, that progress has been made even in darker times than the present, that life is full of joys and pleasures we too easily take for granted, that it’s necessary to unite with all comrades on the left even when we disagree on particulars, and that even non-leftists or not-yet-leftists can be appealed to on the basis of their communal urges and sympathies. It’s a tremendous responsibility we bear—we’re responsible for the fate of the species, and of life itself—but it’s a tremendously exciting era we’re entering.

Capitalism vs. Freedom

Being run by business, American culture suffers from an overwhelming preponderance of stupidity. When a set of institutions as reactionary as big business has a virtual monopoly over government and the media, the kinds of information, entertainment, commentary, ideologies, and educational policies on offer will not conduce to rationality or social understanding. What you’ll end up with is, for instance, an electorate 25 percent of whose members are inclined to libertarianism. And the number is even higher among young people. That is to say, huge numbers of people will be exposed to and persuaded by the propaganda of the Cato Institute, the magazine *Reason*, Ayn Rand’s novels, and Milton Friedman’s ideological hackery to express their rebellious and anti-authoritarian impulses by becoming “extreme advocates of total tyranny,” to quote Chomsky. They’ll believe, as he translates, that “power ought to be given into the hands of private, unaccountable tyrannies,” namely corporations. They’ll think that if you just get government out of the picture and let capitalism operate freely, unencumbered by regulations or oversight or labor unionism, all will be for the best in this best of all possible worlds. And they’ll genuinely believe they’re being subversive and anarchistic by proposing such a program.

The spectacle of millions adhering to such a breathtakingly stupid ideology would be comical if it weren’t so tragic. I’m an atheist, but Christianity strikes me as a more rational—and moral—religion than this “libertarian” (really totalitarian) one of absolute faith in universal privatization, marketization, corporatization, and commoditization. To be a so-called libertarian is to be deplorably ignorant of modern

history, economics, commonsense sociology, human psychology, and morality itself. (Regarding morality: if the Golden Rule is an essential maxim, then the communist slogan “From each according to his ability, to each according to his need,” which is basically a derivative of the Golden Rule, is fundamental to any humane social organization. Greed and Social Darwinism—every man for himself—are hardly morally luminous principles.) Given this reactionary philosophy’s intellectual sterility and the fact that it’s been refuted countless times, it’s tempting to simply ignore it. And most leftists do ignore it. But that’s a mistake, as the frightening figure quoted a moment ago (25 percent of the electorate) indicates. It’s necessary to challenge “free market” worship whenever and wherever it appears.

The economist Rob Larson has performed an important service, therefore, in publishing his new book *Capitalism vs. Freedom: The Toll Road to Serfdom*, the more so because the book’s lucidity and brevity should win for it a wide readership. In five chapters, Larson systematically demolishes the glib nostrums of Milton Friedman and Friedrich Hayek (in the process also dispatching those other patron saints of the right wing, Ludwig von Mises, Ayn Rand, and Murray Rothbard). Even the book’s title is highly effective: the message “*capitalism vs. freedom*” should be trumpeted from the hills, since it challenges one of the reigning dogmas of our society. Liberals and leftists themselves sometimes buy into the view that capitalism promotes freedom, arguing only that socialist equality and justice are more important than capitalist freedom. But this is a false framing of the issue. The fact is that socialism, which is to say workers’ democratic control of the economy, not only means greater equality and justice than capitalism but also greater freedom, at least for the 99 percent. It is freedom, after all, that has inspired anarchists and even Marxists, including Marx himself.

Larson begins with a brief discussion of two concepts of freedom, negative and positive (a distinction that goes back, as he notes, at least to Isaiah Berlin). Crudely speaking, negative freedom means the absence of external constraint, of a power that can force you to act in particular ways. Positive freedom is the ability or opportunity actually to realize purposes and wishes, to “control your destiny,” so to speak. It involves having the means to satisfy desires, as when you have the means to assuage hunger, be adequately clothed and sheltered, and have adequate sanitation. Positive freedom can be thought of as “freedom to,” whereas negative freedom is “freedom from.” Classical liberals like John Stuart Mill and modern conservatives like Friedman and Hayek are more concerned with negative freedom, which explains their desire for a minimal state; socialists are concerned also with positive freedom, sometimes believing that a stronger state (e.g., a social democracy) can help ensure such freedom for the majority of people.

Friedman and Hayek argued that free-market capitalism, with minimal intervention by the state, is the surest guarantee of negative liberty. Larson’s book is devoted mainly to refuting this belief, which is widely held across the political spectrum; but it also defends the less controversial claim that capitalism is incompatible with widespread positive liberty too. “Capitalism,” Larson writes, “withholds opportunities to enjoy freedom (required by the positive view of freedom) and also encourages the growth of economic power (the adversary of liberty in the negative view of freedom).” That concentrations of economic power in themselves threaten negative liberty might be challenged, but this is a weak argument, among other reasons because it’s clear that centers of (economic) power will tend to dominate and manipulate the state in their own interest. They’ll construct coercive apparatuses to subordinate others to their power, which will itself enable further accumulations of power, etc., until finally the society is ruled by an oligarchy. Thus, from “pure” capitalism you get an oligarchy with the power to coerce.

However obvious this point may seem to those possessed of common sense, it’s far from obvious to libertarians and most conservatives. According to Friedman, “the kind of economic organization that provides economic freedom directly, namely, competitive capitalism, also promotes political freedom because it separates economic power from political power and in this way enables the one to offset the other.” Here we encounter the typical naïve idealism of conservatives (and, indeed, of centrists and liberals), which I’ve discussed at length here. Rather than analyzing the real conditions of real social structures, conservatives traffic in airy abstractions about “freedom,” “the separation of political and economic power,” the lofty virtues of “competitive capitalism,” and so on. Evidently it doesn’t occur to Friedman that economic power will tend to confer political power, and therefore that, far from offsetting each other, the two will be approximately fused. The economically powerful might not directly hold political office, but

because of the resources they possess, they'll have inordinate power and influence over political leaders. This is intuitively obvious, but it's also borne out by empirical research.

It's worth pointing out, too, something that Larson doesn't really focus on: *within* corporations, freedom, even negative freedom, is severely curtailed. In the absence of a union, the employee has hardly any rights. There's no freedom of expression, for example, and the boss can threaten you, manipulate you however he wants, verbally abuse you, behave horrendously towards you with probably no repercussions for himself. Capitalism in fact is a kind of fragmented totalitarianism, as privately totalitarian corporate entities proliferate all over society and constitute its essential infrastructure, its foundation. The more oligopolistic they become, to some degree even fused with the state, the less "fragmented" and more dangerous the totalitarianism is. Eventually the "libertarian" millennium might be achieved in which all countervailing forces, such as unions, are eradicated and the population is left wholly at the mercy of corporations, reveling in its sublime freedom to be totally dominated.

Anyway, to resume the thread: Larson is right that "in portraying [the] concentration of money in society as a reasonable development"—e.g., as a reward for successfully competing against other capitalists—"the libertarian tradition completely dismisses the *power* of concentrated money." Hayek, for example, claims that in a "competitive society" (a meaningless abstraction: different kinds of societies can be "competitive") nobody possesses excessive power. "So long as property is divided among many owners, none of them acting independently has exclusive power to determine the income and position of particular people." Okay, fine, maybe not *exclusive* power, but to the degree that property is divided among fewer and fewer owners, these people can achieve *overwhelming* power to determine the income and position of others. Such as by acquiring greater "positive freedom" to dominate the state in their interests and against the interests of others, who thus proportionately lose positive freedom and possibly (again) even negative freedom, e.g. if the wealthy can get laws passed that restrict dissidents' right to free speech or free assembly.

More generally, it goes without saying that positive freedom is proportional to how much money you have. It apparently doesn't bother most libertarians that if you're poor and unable to find an employer to rent yourself to (in the gloriously "free, voluntary, and non-coercive" labor market), you won't be able to eat or have a minimally decent life. Hopefully private charities and compassionate individuals will come forward to help you; but if not, well, it's nothing that society as a whole should care about. Strictly speaking, there is no *right* to live (or to have shelter, food, health care, education, etc.); there is only a right not to be interfered with by others (except in the workplace). What a magnificent moral vision.

Libertarians admit that concentrations of wealth emerge in capitalism, but they deprecate the idea that capitalism leads to competition-defeating market concentration in such forms as oligopolies, monopolies, and monopsonies (like Wal-Mart). Usually these are created, supposedly, by government interference. But most businessmen and serious scholars disagree, pointing, for instance, to the significance of economies of scale. The famous business historian Alfred Chandler showed that many industries quickly became oligopolistic on the basis, in large part, of economies of scale. Historian Douglas Dowd observes that large-scale industrial technology has made it both necessary for firms to enlarge and possible for them to control their markets, while Australian economist Steve Keen argues that "increasing returns to scale mean that the perfectly competitive market is unstable: it will, in time, break down [into oligopoly or monopoly]."

Larson might have gone further in this line of argument by emphasizing just how much capitalists *hate* market discipline—i.e., the "free market"—and are constantly trying to overcome it. They're obsessed with *controlling* markets, whether through massive advertising campaigns, destruction or absorption of their competitors, price-fixing and other forms of collusion, or the formation of hundreds of trade associations. The historian Gabriel Kolko's classic study *The Triumph of Conservatism: A Reinterpretation of American History, 1900–1916* revealed that the hatred of market anarchy is so extreme that Progressive-Era oligopolists were actually the main force behind government regulation of industry (to benefit business, not the public), as with the Meat Inspection Act of 1906, the Pure Food and Drug Act, the Federal Reserve Act, the Clayton Antitrust Act, and the Federal Trade Commission Act. Andrew Carnegie and Elbert H. Gary, head of U.S. Steel, even advocated government price-fixing! So much for the corporate propaganda about how wonderful free markets are.

If government regulation is primarily responsible for monopoly elements in industries, as Friedman and Hayek argue, then you'd think that the deregulation tsunami of the neoliberal era would have led to greater competition across the economy. Did it? Not exactly. Larson quotes a *Forbes* article:

Since freight railroads were deregulated in 1980, the number of large, so-called Class I railroads has shrunk from 40 to seven. In truth, there are only four that matter... These four superpowers now take in more than 90% of the industry's revenue... An estimated one-third of shippers have access to only one railroad.

Quod erat demonstrandum. But there are many other examples. The deregulatory Telecommunications Act of 1996 was supposed to throw open the industry to competition; what it accomplished, according to the *Wall Street Journal*, was “a new phase in the hyper-consolidation of the cable industry... An industry that was once a hodgepodge of family-owned companies has become one of the nation's most visible and profitable oligopolies.” These trends have occurred throughout the media, on a global scale.

The same consolidation is found in the airline industry, where deregulation “set off a flurry of mergers” (as the *Journal* notes), “creating a short roster of powerful giants. And consumers are, in many cases, paying the price.” In fact, it's well known that deregulation has facilitated an enormous wave of mergers and acquisitions since the 1980s. (Similarly, the big businesses, and later the mergers, of the Gilded Age appeared in a time of little public regulation.) All this market-driven oligopolization has certainly not increased consumer freedom, or the freedom of anyone but the top fraction of one percent in wealth.

Speaking of communications and the media, another classic libertarian claim is hollow: far from encouraging a rich and competitive diversity of information and opinion, the free market tends to *narrow* the spectrum of opinion and information sources. When Hayek writes of totalitarian governments that “The word ‘truth’ ceases to have its old meaning. It describes no longer something to be found, with the individual conscience as the sole arbiter... it becomes laid down by authority,” referring to the “spirit of complete cynicism as regards truth...the loss of the sense of even the meaning of truth,” it is easy to think he's describing the mass media in the heavily capitalist United States. For one thing, because of scale economies and other market dynamics, over time fewer and fewer people or groups can afford to run, say, a successful and profitable newspaper. Across the West, in the twentieth century competition eventually weeded out working-class newspapers that had fewer resources than the capitalist mass media, and the spectrum of information consumed by the public drastically narrowed. “Market forces thus accomplished more than the most repressive measures of an aristocratic state,” to quote the authors of an important study.

At the same time, the sources of information became less and less independent, due to the development of the advertising market. Advertisers “acquired a de facto licensing power because, without their support, newspapers ceased to be economically viable.” As Edward Herman says, it wasn't the final consumer's but the *advertiser's* choices that determined media prosperity and survival, and hence the content (broadly speaking) of the news and opinion pieces. Moreover, the media increasingly consisted of giant corporations who had basically the same interests as advertisers anyway. The result corresponded less to Friedman's slogan Free to Choose than to Edward Bernays' slogan Free to Imagine That We Choose (because what we're choosing from is a narrow range of corporate and government propaganda).

Capitalism vs. Freedom also has a chapter on “political freedom,” and another on the “freedom of future generations”—which is nonexistent in a strictly capitalist society because future generations have no money and therefore no power. They have to deal with whatever market externalities result from their ancestors' monomaniacal pursuit of profit. Including the possible destruction of civilization from global warming, a rather large externality. Even in the present, the IMF has estimated that the “external” costs of using fossil fuels, counting public health effects and environmental ramifications, are already \$5 trillion a year. Again, this should suggest to anyone with a few neurons still functioning that markets aren't particularly “efficient.” Especially considering the existence of major public goods that are undersupplied by the market, such as roads, bridges, sanitation systems, public parks, libraries, scientific research, public education, and social welfare programs. What do Friedman and Hayek think of these things? Well, Hayek was writing for a Western European audience, so he had to at least pretend to be reasonable. “[T]he

preservation of competition [is not] incompatible with an extensive system of social services,” he wrote, which leaves “a wide and unquestioned field for state activity.” Okay. But that’s a significant concession. Apparently his “libertarianism” wasn’t very consistent.

For Friedman, public goods should be paid for by those who use them and not by a wealthy minority that is being taxed against its wishes. “There is all the difference in the world,” he insists, “between two kinds of assistance through government that seem superficially similar: first, 90 percent of us agreeing to impose taxes on ourselves in order to help the bottom 10 percent, and second, 80 percent voting to impose taxes on the top 10 percent to help the bottom 10 percent.” Thus, the wealthy and powerful shouldn’t have to pay taxes to maintain services from which they don’t directly benefit. We shouldn’t subtract any of the positive freedom from people who have an enormous amount of it (i.e., of *power*, the concentration of which libertarians are supposed to *oppose*) in order to give more positive freedom to people who have very little of it. That would be unforgivably compassionate.

Most of Larson’s chapter on political freedom consists of salutary reminders of how politics actually works in the capitalist United States. Drawing on Thomas Ferguson’s investment theory of party competition, Larson describes the political machinations of big business, the concerted and frequently successful efforts to erode the positive and negative freedoms of the populace, the permanent class war footing, the fanatical union-busting, the absurdly cruel austerity programs of the IMF (which, again, serve but to crush popular freedom and power), and the horrifying legacy of European and U.S. imperialism around the world. Readers who want to learn more about the dark side of humanity can consult William Blum’s *Killing Hope*, Naomi Klein’s *The Shock Doctrine* (which also describes Hayek and Friedman’s love-affairs with neo-Nazi Latin American generals), Robert Fisk’s *The Great War for Civilization*, and most of Noam Chomsky’s books. In light of all these practices and policies that have emerged, directly or indirectly, out of the dynamics of the West’s market economy, to argue that capitalism promotes human freedom is to be a hopeless intellectual fraud and amoral minion of power.

(If that judgment sounds harsh, consider this gem from Hayek, directed against measures to ensure worker security: “It is essential that we should relearn frankly to face the fact that freedom can be had only at a price and that as individuals we must be prepared to make severe material sacrifices to preserve our liberty.” More exactly, working-class individuals have to make severe sacrifices to preserve the liberty of the capitalist class.)

In fact, to the extent that we have freedom and democracy at all, it has been achieved mainly through decades and centuries of popular struggle *against* capitalism, and against vicious modes of production and politics (including slavery and Latin American semi-feudalism) that have been essential to the functioning of the capitalist world-economy. Göran Therborn’s classic article “The Rule of Capital and the Rise of Democracy” gives details, as does Howard Zinn’s famous *People’s History of the United States*.

Larson, unlike the charlatans whose work he reviews, actually does believe that “concentrated power is opposed to human freedom,” so he dedicates his final chapter to briefly expositing a *genuinely* libertarian vision, that of socialism. Here I need only refer to the work of such writers as Anton Pannekoek, Rudolf Rocker, Peter Kropotkin, Errico Malatesta, Murray Bookchin, and others in the anarchist and/or left-Marxist tradition. There’s a lot of talk of socialism these days, but few commentators (except on the left) know what they’re talking about. For instance, like Hayek and Friedman, they tend to equate socialism with state control, authoritarianism, the Soviet Union, and other boogymen. This ignores the fact that anarchism, which reviles the state, is committed to socialism. So virtually all mainstream commentary on socialism is garbage and immediately refuted from that one consideration alone. The basic point that conservatives, centrists, and liberals refuse to mention, because it sounds too appealing, is that socialism means nothing else but worker and community control. Economic, political, and social democracy. It is, in essence, a set of moral principles that can theoretically be fleshed out in a variety of ways, for instance some preserving a place for the market and others based only on democratic planning (at the level of the neighborhood, the community, the firm, the city, the nation, etc.). The core of socialism is *freedom*—the absence of concentrated power—not absolute equality.

Whether a truly socialist, libertarian society will ever exist is an open question, but certain societies have approached the ideal more closely than others. The Soviet Union was, and the U.S. is, very far from

socialism, while Scandinavian countries are a little closer (since the population generally has more freedom and power there than in the U.S. and the Soviet Union). The Bolivian Constitution of 2009 is vastly closer to socialism, which is to say morality and the ideal of human dignity, than the reactionary U.S. Constitution. On a smaller scale, worker cooperatives—see this book—tend to embody a microcosmic socialism.

Larson ends his book on the note sounded by Rosa Luxemburg a century ago: *socialism or barbarism*. Margaret Thatcher’s infamous declaration “There is no alternative” can now be given a more enlightened meaning: there is no alternative to socialism, except the destruction of civilization and maybe the human species. Morality and pragmatic necessity, the necessities of survival, now coincide. Concentrated corporate power must be dismantled and democracy substituted for it—which is a global project that will take generations but is likely to develop momentum as society experiences ever-greater crises.

In the end, perhaps Friedman, Hayek, and their ilk will be seen to have contributed to the realization of a truly libertarian program after all, albeit indirectly. For by aiding in the growth of an increasingly authoritarian system, they may have hastened the birth of a democratic opposition that will finally tear up the foundations of tyranny and lay the groundwork for an emancipated world. Or at least a world in which Friedmans and Hayeks can’t become intellectual celebrities. For now, I’d settle for that.

On “Bullshit Jobs”

Referring to cultural Marxism, especially the Frankfurt School, Noam Chomsky once said, “I don’t find that kind of work very illuminating... The ideas that seem useful also seem pretty simple, and I don’t understand what all the verbiage is for.” While I think there is much of value in the so-called Western Marxist tradition—for instance, I’m partial to Georg Lukács (more so than to Adorno and others in the Frankfurt School)—I have to admit I strongly sympathize with Chomsky. But his criticism generalizes, and is even truer in other areas: since well before the mid-twentieth century, a large amount of work in the humanities has been prone to unnecessary and sometimes incomprehensible verbiage. Later this tendency came to be associated with postmodernism, for it was most pronounced in the writings of such luminaries as Derrida, Lacan, Kristeva, Deleuze, and Foucault, as well as their hordes of epigones. By the end of the twentieth century, a vast field of “Theory” had reached maturity, encompassing much of philosophy, anthropology, psychoanalysis, and literary, film, and cultural studies.

As an anthropologist, David Graeber works in this broadly conceived “interpretive” tradition (I call it that because it consists essentially of endless cultural and social “interpretations” or “theories,” often playful and highly verbose conceptual exercises). He has an advantage over many of his peers in that, while not a particularly great writer, he can at least write clearly and informally enough to be widely read. Presumably this lucidity helps account for his fame—as do, more importantly, his heterodox ideas, his ability to capture a cultural mood even in the titles of his books (*Debt*, *The Utopia of Rules*, *Bullshit Jobs*), and his impressive productivity. Perhaps he’s *too* productive: while reading his latest book, I couldn’t help thinking it would have packed a greater punch if he had shortened it by a third. It meanders and meanders, repeats and repeats, and, well, I didn’t understand what all the verbiage was for.

The full title of his book is *Bullshit Jobs: A Theory*. I wasn’t able to find the “theory,” unless it be that bullshit jobs do in fact exist. And Graeber marshals abundant evidence to test and confirm that theory. The most entertaining, and probably the most valuable, parts of the book are the many testimonies he presents from poor souls who spend their lives in a bullshit job, which is to say a job they think shouldn’t exist because it contributes nothing to the world. The numbers of people who believe this are incredibly high. One poll in the United Kingdom found that only 50 percent of people with full-time jobs were sure their job made a meaningful contribution to the world, while 37 percent were sure theirs didn’t. A poll in Holland put the latter number at 40 percent. Even jobs that aren’t bullshit, like nurses and professors, are being increasingly bullshitized, as paperwork, meetings, and other administrative duties crowd out more meaningful tasks like taking care of patients and teaching. (Nurses reported to Graeber that as much as 80

percent of their time is now taken up with meetings, filling out forms, and the like.) Considering these facts, as well as the existence of many second-order bullshit jobs (jobs done in support of those directly engaged in bullshit), Graeber estimates that well over half of all work being done in society could be eliminated without making any real difference.

What sorts of jobs are we talking about? Not most lower-tier jobs: not street cleaners, bus drivers, repairmen, restaurant workers, store clerks, gardeners, construction workers, etc. These people make a contribution to the world. Graeber suggests a rough five-fold classification of bullshit jobs. First are flunkies: jobs that exist “only or primarily to make someone else look or feel important.” This includes doormen, many receptionists (those who have hardly anything to do and find the job oppressively dull), some HR assistants, and the like. Second are “goons,” jobs that have an aggressive element but “exist only because other people employ them.” For instance, most lobbyists, PR specialists, telemarketers, corporate lawyers (“I contribute nothing to the world and am utterly miserable all of the time,” one said), and national armed forces, which exist only because other countries have armies. “If no one had an army, armies would not be needed.” As for PR specialists, one of them probably spoke for many when he opined that every person who works in or for the entire advertising industry simply “manufactur[es] demand and then exaggerat[es] the usefulness of the products sold to fix it.” He concluded, “If we’re at the point where in order to sell products, you have to first of all trick people into thinking they need them, then I think you’d be hard-pressed to argue that these jobs aren’t bullshit.”

Third is the category of “duct tapers,” people whose jobs exist only because of a glitch in the organization, “who are there to solve a problem that ought not to exist.” Often this includes underlings who have to fix mistakes made by incompetent superiors. Or do nothing but deal with customers irate because something went wrong. Fourth are “box tickers,” who allow an organization to be able to claim it’s doing something it actually isn’t doing. One testimony is from a guy who was Senior Quality and Performance Officer in a local council in the United Kingdom; most of what he did involved ticking boxes, “pretending things are great to senior managers, and generally ‘feeding the beast’ with meaningless numbers that give the illusion of control. None of which helps the citizens of that council in the slightest.”

The fifth category is taskmasters, people who do nothing but assign work to others, create bullshit tasks for others to do, or supervise bullshit. Middle management frequently falls under this category, as when managers oversee workers who could perform just as well, or sometimes better, without oversight. “I just got promoted to this job,” one manager says, “and I spend a lot of my time looking around and wondering what I’m supposed to be doing.” That’s a common complaint: being forced to supervise people who don’t need supervision. (Readers of Harry Braverman’s classic *Labor and Monopoly Capital* won’t find this complaint surprising at all.) Frequently positions with the word ‘strategic’ in their names—Strategic Dean, Vice President of Strategic Development, Strategic Officer—are bullshit. “All I could do,” one such person said, “was come up with a new strategy that was in effect a re-spin of already agreed-upon strategies.” But these people are given their own staff, which they have to try to find work for.

Graeber’s classification system is somewhat interesting, although, as he acknowledges, it leaves out a lot. One huge area of bullshit it leaves out he doesn’t mention at all: bullshit academic research. Surely the large majority of academic research makes essentially no contribution to the world, except to pad CVs and advance careers. Endless conferences, “calls for papers” sent out for yet another conference, thousands upon thousands of scholarly articles published every year most of which are read by hardly anyone (more often simply glanced over). Much of the writing isn’t only irrelevant and uninteresting, superficial and unchallenging, but even perverse: again, one thinks of postmodernist obscurantism, relativism, and idealism. In the case of postmodernism and, more generally, the idealism (and centrism) of bourgeois scholarship and journalism, the bullshit serves an obvious purpose for the establishment: it distracts from structures of class and power, obscures understanding of how society works, and does nothing to advance left-wing dissent.

Graeber devotes a couple of chapters to what it’s like to work in a bullshit job and why people so often report themselves miserable. According to bourgeois psychological theories, after all, it might seem that some of these jobs are great. You hardly have to work, you have barely any real responsibilities, you can spend hours playing computer games or surfing the web. You can (in many cases) be almost as lazy as,

supposedly, you want to be just by virtue of being human. But of course humans are not, in fact, lazy by nature, creatures who have to be *driven* to work, as bourgeois ideologies proclaim. They *want* to work, but on creative and enjoyable tasks. Their fundamental desire is not to slack off but to have a *meaningful life*, full of purpose, creativity, exploration, and love, a life of contributions to the world. To work in an utterly pointless job, therefore, day in and day out, month after month, can be maddening, soul-killing torture. It seems that the respect and prestige these people might be accorded can make it even worse, heightening their sense of being frauds or parasites.

Many of the testimonies Graeber has compiled are both sad and hilarious. Most are too long to quote here, but I'll quote one, from a security guard:

I worked as a museum guard for a major global security company in a museum where one exhibition room was left unused more or less permanently. My job was to guard that empty room, ensuring no museum guests touched the...well, *nothing* in the room, and ensure nobody set any fires. To keep my mind sharp and attention undivided, I was forbidden any form of mental stimulation, like books, phones, etc.

Since nobody was ever there, in practice I sat still and twiddled my thumbs for seven and a half hours, waiting for the fire alarm to sound. If it did, I was to calmly stand up and walk out. That was it.

One might think of this guard's job as a literal realization of the metaphorical meaning of thousands of positions filled by tens of millions of people. The colossal waste of human potential is beyond comprehension.

The natural question, aside from how to change this terrible collective situation, is how all these worthless jobs started proliferating in the first place. Why aren't we all working fifteen-hour weeks? If we got rid of the pointless jobs and the pointless aspects of the real jobs, the resulting work could easily be taken care of by our working fifteen- or twenty-hour weeks. In fact, back in 1930 John Maynard Keynes predicted that in a hundred years the problem of scarcity would have been solved, and the major problem of the age would be to find ways to prevent ourselves from going insane with boredom. So what happened?

This is a complicated historical question that gets to the heart of how capitalism has evolved over the last century, so it isn't to Graeber's discredit that he doesn't fully answer it. He first dispatches two answers conservatives give: that the world has become so complicated we need all these jobs, and they aren't really as pointless as they seem; and that even if there are bullshit jobs, it's only because government regulations have led to a growing number of useless bureaucrats. These answers are on the intellectual level of most conservatism, and Graeber refutes them with ease. With one piece of evidence. He points out that between 1985 and 2005 the proportion of administrators and their staff in American universities shot up even though the number of teachers per students remained largely constant. Teaching and writing certainly haven't become so complicated they suddenly need far more administrators and staffers—so why the bullshitization of universities? It isn't because of the big bad government either, since the number of administrators at private institutions has increased at *more than twice the rate* it did at public ones. So there goes the "libertarian" notion of government wastefulness. "In fact," Graeber comments, "the only reasonable interpretation of these numbers is precisely the opposite: public universities are ultimately answerable to the public, and hence, under constant political pressure to cut costs and not engage in wasteful expenditures."

Graeber's own answer is that capitalism has changed its character since the days when it somewhat approximated conditions of perfect competition. When capitalism was mainly about producing things competitively, the argument that free-market enthusiasts give against the notion that corporations would ever hire unnecessary workers to do bullshit jobs made sense: maximizing profits meant paying the least number of workers the least amount possible. To hire a large number of redundant workers would be absurd. But, as Graeber argues, the logic of the economy has changed in the last forty years, with the rise of financial capitalism and the FIRE sector (including insurance and real estate). The main object now is not to produce goods competitively but to distribute large sums of money, to distribute the proceeds from enormous

amounts of debt, to create money (by giving loans) and then move it around in very complex ways while extracting fees with every transaction. “The results often leave bank employees feeling that the entire enterprise is...pointless.”

So, “when a profit-seeking enterprise is in the business of distributing a very large sum of money, the most profitable thing for it to do is to be as inefficient as possible.” It can then find pretexts to take more cuts, even acting against the interests of its clients, and using its profits to hire more people and grow bigger. There seems, indeed, to be a tendency inherent in large bureaucracies, whether corporate or political, to expand, to suck up more resources as an end in itself. Graeber gives a name to the “new” dynamic that has emerged in capitalism: managerial feudalism. It’s supposed to be analogous to the creation of hierarchies of nobles and officials in medieval Europe through a process of devolution called “sub-infeudation,” in which a king would grant land to a duke, who would use the resources from that land to support a huge retinue of courtiers and vassals, many of whom would be granted their own plots of land that could support their own retinues, and so on down to local knights and lords of the manor.

“The rise of managerial feudalism has produced a similar infatuation with hierarchy for its own sake.” Managers manage other managers, each with their own staff; various levels of managers market things to one another, especially in “creative industries” like publishing, the visual arts, and film and television. It’s particularly bad in the latter industry, where there are untold numbers of producers, sub-producers, executive producers, consultants, etc., “all in constant search for something, anything, to actually do.” But even in more traditional manufacturing industries, white-collar workers are hired seemingly for the sake of having more white-collar workers. Graeber uses the example of the Elephant Tea factory outside Marseilles, France. Years ago it was bought up by Unilever, which pretty much left its old organizational structure intact. Meanwhile the workers, on their own initiative, managed to speed up production by more than 50 percent, markedly increasing profits. So what did Unilever do? Rather than hiring more workers or buying new machinery to expand operations, it hired a bunch of white-collar bureaucrats to wander around trying to think of something to do. “They’d be walking up and down the catwalks every day,” an older worker said, “staring at us, scribbling notes while we worked. Then they’d have meetings and discuss it and write reports. But they still couldn’t figure out any real excuse for their existence.” Finally they just suggested that the company shut down the whole plant and move operations to Poland—whereupon the workers took over the factory and kicked their employers out.

Even when corporate executives are presented with ways to automate tasks that white-collar employees are doing by hand, they often resist. One testimony was from a guy who was hired by a large bank to do risk management, which meant he was able to have a panoramic view of the bank’s internal processes and suggest fixes for incoherencies, vulnerabilities, and redundancies. He concluded that, conservatively, 80 percent of the bank’s 60,000 employees were unnecessary, because their jobs either could be performed by a program or were in support of “some bullshit process” to begin with. But when he presented executives with programs that would solve inefficiencies, he always faced severe hostility. Not a single one of his recommendations was ever adopted. “Because in every case,” he said, “fixing these problems would have resulted in people losing their jobs, as those jobs served no purpose other than giving the executive they reported to a sense of power.” In case after case that Graeber reports, it was clear that the higher-ups prided themselves on their bloated staffs.

The notion of managerial feudalism is evocative, and Graeber is clearly onto something with his suggestion that “there seems to be an intrinsic connection between the financialization of the economy, the blossoming of information industries, and the proliferation of bullshit jobs.” What exactly that connection is, though, is hard to tease out. The precise *mechanisms* are hard to tease out. His “iron law of liberalism,” formulated in *Utopia of Rules*, is also apropos: “any market reform, any government initiative intended to reduce red tape and promote market forces will have the ultimate effect of increasing the total number of regulations, the total amount of paperwork, and the total number of bureaucrats the government employs.” Such reforms have been abundant in the neoliberal era, and they have certainly contributed to the explosion of bureaucracy, in both the private and public sectors.

But Graeber neglects to mention the more deep-rooted forces that have made bullshitization a steadily growing phenomenon since at least the time of Frederick Winslow Taylor. Ever since management

began to take control of production away from workers, to centralize knowledge in its own ranks and reduce the worker to mere appendage of the machine—but an appendage that has to be closely monitored and supervised—whole layers of unnecessary bureaucracy have existed. Much of the bureaucracy has existed only to control and monitor the direct producers, to strip power from them and keep it in the hands of capitalists or their agents. In other words, its purpose has been largely political, not directly economic or “efficiency”-related.

At the same time, it became ever more necessary to control markets and the public mind, through political and advertising propaganda. Hence the rise of the public relations industry from around the time of World War I. And hence whole new layers of massive bureaucracy, which have continued to expand for a hundred years. Meanwhile, government bureaucracies expanded exponentially in order to improve society’s “legibility” to the state and administer it for the benefit of capital. Corporate capital and the state constantly strengthened their ties, effectively intertwining, collecting practically infinite amounts of data on the population for the usual purposes of surveillance, control, and profit-making; and the processing of such data inevitably was used to justify further growth of bureaucracies, even beyond what was strictly necessary. All this was happening long before the neoliberal era, though it attained new heights of wastefulness under the impact of “deregulation,” privatization, financialization, globalization, and the information economy.

It’s significant, too, that the proliferation of bullshit jobs is itself a form of population control, of keeping people subordinate in hierarchical structures, socialized into submission, atomized and alienated from one another. African American men are kept under control by being locked up in prisons, while whites are funneled into pointless jobs where they can be supervised and indoctrinated. The system hasn’t been consciously designed for this purpose, but the reason it’s able to expand is that it serves the interests of power-structures.

So is there any way out of our bullshit society? Can it be reformed so that half the work being done is no longer pointless? Graeber doesn’t focus on this question, since his book is supposed to be about diagnosing the problem rather than proposing solutions, but he does suggest that Universal Basic Income would help. Unlike many reforms that social movements are proposing, UBI would likely reduce the size and intrusiveness of government, not increase it. If everyone automatically received, say, \$25,000 or more a year, huge and intrusive sections of government could simply be shut down (even if social welfare programs continued or expanded). Millions of bureaucrats would lose their jobs, but they would also receive an annual income allowing them to pursue other projects that interested them.

“A full Basic Income would eliminate the compulsion to work, by offering a reasonable standard of living to all, and then either leaving it up to each individual to decide whether they wished to pursue further wealth, by doing a paying job or selling something, or whether they wished to do something else with their time.” Bosses might start treating their employees better, since it would be a less frightening prospect for the latter to quit, and conditions in crappy low-paying jobs would have to improve in order to attract workers. Many pointless jobs would cease to exist, since few people would want them. The social changes would be so radical and far-reaching it’s impossible to fully anticipate them.

Graeber doesn’t delve into the technicalities of UBI, but he’s right it’s a proposal worth seriously thinking about. It could be a step on the road to even more radical changes.

All in all, *Bullshit Jobs* is a good book that’s worth reading, despite its irritating prolixity and meandering structure. It usefully highlights and names a major social malady that afflicts tens of millions of people but that few talk about, except in informal conversations among their fellow sufferers. We should all be talking about the meaningless-jobs crisis and proposing solutions that will end the rampant spiritual misery it has caused. UBI, if designed well, could be a huge step in the right direction. But ultimately, I don’t see any thoroughgoing cure except an end to capitalism itself, which is to say a (necessarily protracted) revolution that finally establishes the old socialist ideal of economic democracy. Democracy is the only real cure for all of humanity’s current ailments.

An Updated and Improved Marxism

It is the rare intellectual who can withstand the pressures of groupthink. This is a fundamental truth, or a truism, borne out not only by daily experiences in an academic or other “intellectual” context (e.g., the newsroom or editorial board of any establishment media outlet) but also by critical scholarship from the likes of Ed Herman and Noam Chomsky. Left-wing intellectuals tend to be vigilantly aware of irrational groupthink among mainstream, establishment types, or even among other leftist sects with which they don’t identify; but, like all intellectual cliques—indeed, like nearly all individual intellectuals—they’re reluctant to turn their critical gaze on themselves. They imbibe certain ideas and ideologies in their formative years and perhaps refine them as they mature, but on the whole their commitment to the ideology is apt to become rigid and uncritical.

This complacency has always most disturbed me with regard to Marxists, whose system of thought, if correctly formulated, is precisely the most critical, the most *self*-critical, the most democratic and revolutionary ideology ever devised. I expect intellectual laziness from most “postmodernists,” from liberals and centrists, from all witting or unwitting servants of power. I’m disappointed, though, when I see it in Marxists and semi-Marxists. There’s a pronounced dogmatism in most Marxist circles. Personally, I’ve tried to stimulate some critical rethinking of Marxism in various publications, including my book *Worker Cooperatives and Revolution: History and Possibilities in the United States* and this distillation of some of its arguments (though disregard the editor’s oversimplified summary at the top of the page), but I haven’t had much success. These writings appear to have been ignored.

Which is unfortunate, because I’m convinced it’s necessary in the twenty-first century to revise the Marxian conception of revolution. Conditions have changed from what they were a hundred or a hundred and fifty years ago; Marx would likely be appalled by the lack of creative rethinking that has met these altered conditions. It’s an unfortunate situation when millions of activists across the world are struggling to build new modes of production, new modes of politics, and Marxist scholars and thinkers still confine themselves, more or less, to quoting staid formulations from the nineteenth and early twentieth centuries. (This fact, ironically, supports Marx’s argument that old ideologies tend to hang on doggedly even as changing material conditions make them progressively irrelevant.) Writers and ‘critical ideologists’ can play an important role in the construction of a new society from the ground up, but instead they’re usually content with elaborating on old slogans about seizing the state or smashing it, establishing the dictatorship of the proletariat, creating a vanguard party, and so on.

An article that *Jacobin* recently published provides an example of this stubborn immersion in the past, as well as an opportunity to propose a more critical and up-to-date interpretation of revolution. The article in question is actually an essay by the famous British Marxist Ralph Miliband, entitled “Lenin’s *The State and Revolution*,” published in 1970. In itself it’s a perfectly respectable and sophisticated meditation on Lenin’s classic work, indeed counseling a proper critical attitude towards it. But the reposting of it on the website of a “cutting-edge” left-wing journal almost fifty years later highlights just how stagnant (in some respects) Marxist thinking continues to be, especially given the editorial comment with which *Jacobin* introduces the piece:

Marx famously proclaimed the need to “smash” the bourgeois state. But what does that mean in practice? If our aim is a democratic, non-bureaucratic socialism, what kind of state should we be striving for?

Those looking for answers have often turned to Lenin’s *State and Revolution*, where the famed revolutionary confidently speaks of transforming “a state of bureaucrats” into “a state of armed workers.”

In the following essay, Ralph Miliband...offers a critical appraisal of Lenin’s pamphlet and explains why “the exercise of socialist power remains the Achilles’ heel of Marxism.” ...[T]he essay is still the sharpest reading of *State and Revolution* available.

The accuracy of this introduction is rather sad. In 2018 we're still looking for inspiration to a brief critical analysis written in 1970 of a short work written in 1917—in completely different conditions than prevail today—that itself was but a commentary on sketchy ideas put forward in the mid-to-late-nineteenth century. (One can argue, moreover, that *State and Revolution* was intended as little more than cynical propaganda for the Bolshevik party, in light of its deviation from Lenin's earlier party line and his later authoritarian practice.) Surely we can do better than this.

Miliband is still right, though, that “the exercise of socialist power remains the Achilles' heel of Marxism.” This is true not only of practice but of theory—which is to say, as I've argued in my paper “The Significance and Shortcomings of Karl Marx,” that the concept of proletarian revolution is Marxism's main weakness. In the rest of this article I'll again summarize, very briefly, some of the points from my book, in the hope of shedding a little light on an old problem.

*

The conceptual revisions I proposed in the book offer two main advantages: first, they bring the strategic or prescriptive aspect of Marxism up to date, incorporating the increasingly popular idea and practice of the “solidarity economy” (while simultaneously providing a systematic theoretical framework to interpret the latter's potential); second, they correct certain inconsistencies and logical errors that Marx's sketchy proposals on revolution introduced into the theory of historical materialism. That is, with my “revisions,” Marxism has been made more logically defensible and consistent with itself. And the road is cleared for even orthodox Marxists to engage creatively with the burgeoning alternative economy of cooperatives, public banks, and other experimental ideas/institutions.

We can start with Marx's formulation of revolution in the following four sentences from the famous Preface to *A Contribution to the Critique of Political Economy*:

At a certain stage of development, the material productive forces of society come into conflict with the existing relations of production or—this merely expresses the same thing in legal terms—with the property relations within the framework of which they have operated hitherto. From forms of development of the productive forces these relations turn into their fetters. Then begins an era of social revolution. The changes in the economic foundation lead sooner or later to the transformation of the whole immense superstructure.

One problem with this classic statement is that its notion of “fettering” is meaningless. And nowhere else in his writings does Marx flesh it out with sufficient content. Capitalist production relations, especially in the last hundred years, are in fact constantly fettering the use and development of productive forces—and yet no post-capitalist revolution has happened. Recessions and depressions certainly “fetter” the productive forces; so do legal obstacles to the dissemination of knowledge, such as intellectual copyright laws; so do ideologies and practices of privatization, which hinder the public sector's more socially rational and dynamic use of science and technology. On the other hand, even in decadent neoliberalism the productive forces continue to develop in various ways. So it seems wrong or meaningless to say that production relations fetter productive forces and then revolution breaks out.

A slight revision can remedy the problem, and at the same time changes the whole thrust of the Marxist theory of revolution. Rather than a conflict simply between production relations and the development of productive forces, there is a conflict between *two types of production relations—two modes of production—one of which uses productive forces in a more socially rational and “un-fettering” way than the other*. The more progressive mode slowly develops in the womb of the old society as it decays, i.e., as the old dominant mode of production succumbs to crisis and stagnation. In being relatively dynamic and democratic, the emergent mode of production attracts adherents and resources, until it becomes ever more visible and powerful. The old regime can't eradicate it; it spreads internationally and gradually transforms the economy, to such a point that the forms and content of politics change with it. Political entities become its partisans, and finally decisive seizures of power by representatives of the emergent mode

of production become possible, because reactionary defenders of the old regime have lost their dominant command over resources. And so, over generations, a social revolution transpires.

This conceptual revision saves Marx's intuition by giving it more meaning: the "fettering" is not absolute but is *in relation to* a more effective and democratic mode of production that is, so to speak, competing against the old stagnant one. The most obvious concrete instance of this notion of revolution is the long transition from feudalism to capitalism, during which the feudal mode became so hopelessly outgunned by the capitalist that—*after the emergent economy had already broadly colonized society*—bourgeois "seizures of the state" finally became possible.

You see that the simple conceptual revision I've proposed changes the Marxian theory from advocating a statist "dictatorship of the proletariat" to advocating a more grassroots, *gradual*, unambiguously democratic transformation of the economy that proceeds at the same time and to the degree that the old society deteriorates. This change of emphasis is itself an advantage, since the old overwhelmingly statist theory (notwithstanding Lenin's semi-anarchistic language in *State and Revolution*) was idealistic, un-dialectical, and utopian. Which is to say un-Marxist.

In the orthodox account of the *Communist Manifesto* and later writings, the social revolution occurs *after* a seizure of state power by "the proletariat" (which, incidentally, isn't a unitary entity but contains divisions). But this account of revolution contradicts the Marxian understanding of social dynamics—a point, oddly, that few or no Marxists appear ever to have appreciated. It exalts a relatively unitary *conscious will* as being able to plan social evolution more or less in advance, a notion that is utterly undialectical. According to "dialectics," history happens behind the backs of historical actors, whose intentions never work out exactly as they're supposed to. Marx was wise in his admonition that we should never trust the self-interpretations of political actors. And yet he suspends this injunction when it comes to the dictatorship of the proletariat: *these* people's designs are supposed to work out perfectly and straightforwardly, despite the massive complexity and dialectical contradictions of society.

The statist idea of revolution is also wrong to privilege the political over the economic. In supposing that through sheer political will one can transform an authoritarian, exploitative economy into an emancipatory, democratic one, Marx and Lenin are, in effect, reversing the order of "dominant causality" such that politics determines the economy (whereas in fact the economy "determines"—loosely and broadly speaking—politics).¹ Marxism itself suggests that the state can't be socially creative in this radical way. And when it tries to be, what results, ironically, is overwhelming bureaucracy and even *greater* authoritarianism than before. (While the twentieth century's experiences with so-called "Communism" or "state socialism" happened in relatively non-industrialized societies, not advanced capitalist ones as Marx anticipated, the dismal record is at least suggestive.)

Fundamental to these facts is that if the conquest of political power occurs in a still-capitalist economy, revolutionaries have to contend with the institutional legacies of capitalism: relations of coercion and domination condition everything the government does, and there is no way to break free of them. They can't be magically transcended through political will; to think they can, or that the state can somehow "wither away" even as it's forced to become more expansive and dominating (to suppress capitalist resistance), is to adopt a naïve idealism and utopianism.

In short, the interpretation of revolution that contemporary Marxists have inherited is backward. It is standing on its head; we have to turn it right-side up in order to comprehend our activism and our goals properly. Of course this isn't to deny the importance of engaging in political work, whether it takes the form of constructing a workers' party, electing socialists under the aegis of the Democratic Party, or lobbying for particular laws. As during the transition from feudalism to capitalism, it's essential to target the state at every step of the way. We simply have to recognize that a *paramount* strategy is to take advantage of openings and divisions in the capitalist state to politically facilitate the long-term construction of new relations of production, on the foundation of which the new society will gradually emerge. The revolution can't happen in any other way. Certainly not through a historical *rupture* in which "the working

¹ In reality, of course, political and economic relations are fused together. But analytically one can distinguish economic activities from narrowly political, governmental activities.

class” dramatically seizes power, suppresses (somehow) all its opponents, and organizes a new economy on the basis of utopian blueprints. In the twenty-first century, any such *ruptural* conception, even if moderated by realism on some point or other, is astoundingly naïve.

The truth is that revolutionaries have to dig in for the long haul: a global transition to a post-capitalist society will take a century or more. Cooperative and socialized relations of production (in forms that it’s futile to predict at this point) will spread through generations of bitter struggle. Meanwhile, the conquest of political power will occur piecemeal—at different rates in different countries—suffering setbacks and then proceeding to new victories, then suffering more defeats, etc. It will be a time of world-agony, especially as climate change will be devastating civilization; but the sheer numbers of people whose interests will lie in a transcendence of capitalism will constitute a formidable weapon on the side of progress.

*

As Chomsky has said on more than one occasion, the job of intellectuals, or one of their jobs, is to make simple things appear complicated. You’re supposed to think that in order to understand anything about the world, you have to be able to read and write long articles or books full of citations and arcane terminology and long discussions of other writers, delving into the intricacies of their arguments, minutely dissecting the meanings of their favored terms, spinning out paeans to verbiage like a crafty spider trying to snare the unwary. This is how intellectuals protect their territory and ward off democratic challenges to their status. But the truth is that old-fashioned commonsense reasoning can get you pretty far. It only takes a bit of reading and a bit of critical thought to find approximate answers to classic questions about the nature of society, the nature of a *good* society, and the revolutionary path to the latter. And in fact, in the sociological domain, you’re never going to do much better than approximate answers. With interactions between billions of people to take into consideration, too little will always be understood.

So, to get back to the old question that Lenin and Miliband tackled: what does it mean to “smash” the bourgeois state? What kind of democratic state should we be striving for? Well, the notion of “smashing” the state is just a pithy metaphor that provides no guide to action. We should stop being bewitched by old and unhelpful imagery. In conditions very different from those that confronted Marx and Lenin, we should simply focus on the matters at hand rather than endlessly poring over what the god Lenin said. Keeping in our mind the Marxist and anarchist ideal of a stateless, non-coercive, economically democratic society, we should just do what we can to make the state we’re immediately confronted with more democratic and more just. We do what we can to expand democracy in the real world, and step by step we find ourselves approaching the distant moral ideal that guides us. It’s hopeless to try to spell out the ideal in detail. Marx understood this, which is why he was so reluctant to get bogged down in these kinds of questions, confining himself to some vague suggestions that, not surprisingly, turned out to be largely mistaken.

The task of Marxists now, aside from continuing to critically analyze society, is to rethink the old prescriptions and abandon tired formulations. In so doing, they’ll not only make themselves more relevant to the contemporary world, a world teeming with democratic and nonsectarian initiative; they’ll also, in effect, finally rid Marxism of its lingering traces of irrational dogma, internal inconsistency, and parochial nineteenth-century ideology. The system will at last have realized the old ambition of being a genuine science of society.

The Working Class Strikes Back

Reading the daily headlines, it’s easy to forget that the corollary of a civilization in precipitous decline is a world of creative ferment, a new world struggling to be born. If you could have a God’s-eye view of all the creative resistance rending the fabric of political oppression from the U.S. to Indonesia to

Colombia, you would surely be persuaded that all hope is not lost. This conclusion is borne out in detail by a book published earlier this year, *The Class Strikes Back: Self-Organised Workers' Struggles in the Twenty-First Century*, edited by Dario Azzellini and Michael G. Kraft. The chapters, each dedicated to a different case-study, survey inspiring democratic activism in thirteen countries across five continents. The reader is left with the impression that the global working class, while facing an uphill battle in its fight against imperialism, business and state repression, and conservative union bureaucracy, may yet triumph in the end, if only because of its remarkable perseverance generation after generation. Its overwhelming numerical strength, too, bodes well.

In their introduction, the editors concisely state the book's purpose: "this volume aims to examine how new, anti-bureaucratic forms of syndicalist, neo-syndicalist and autonomous workers' organisation emerge in response to changing work and production relations in the twenty-first century." Traditional unions, which they observe have been "part of the institutional setting to *maintain* capitalism" (my italics), have deteriorated on a global scale. In their place have sprung up more radical and democratic forms of resistance, such as blockades, strikes, and workplace occupations and recuperations. Workers' actions have even made decisive contributions to the toppling of governments, as in Egypt in 2011.

In this article I'll summarize several of the most compelling case-studies. Unfortunately I'll have to pass over many interesting chapters, including ones on the workers' movement in Colombia, the solidarity economy and radical unionism in Indonesia, the sit-ins and ultimately the worker cooperative at a window factory in Chicago (about which I've written [here](#)), and the South African miners who were attacked by police and massacred in August 2012. The book is too rich to do justice to.

Greece

The crisis in Greece that followed the economic crash of 2008 and 2009 saw a savage regime of austerity imposed on the population, which resulted in a "diffuse precariousness" across the labor force. Conventional unionism and national collective bargaining have been among the victims of this neoliberal regime. And yet the general strikes that the trade union bureaucracy was compelled to declare early on, particularly between 2010 and 2012, were the most massive and combative of the past forty years. "Long battles with the police, crowds which refused to dissolve and regrouped again and again, the besieging for hours of the house of parliament, self-organisation and solidarity in order to cope with tear gas and take care of the wounded—all have become part of the normal image of demonstrations during strikes, replacing the nerveless parades of the past."

Outside the framework of conventional unionism there have arisen exciting new forms of struggle. Since early 2013, the [Vio.Me](#) factory has operated under worker self-management, after its initial owners abandoned the site. Aside from the lack of hierarchy, the job rotations, and the directly democratic structure of the business, one innovative practice has been to run the factory in cooperation with the local community and, indeed, the whole society. After taking over the factory the workers consulted their community about what they should produce; they were asked to stop making poisonous building chemicals and instead to manufacture biological, eco-friendly cleaning products. A "wide network of militants and local assemblies" around the country has supported the effort from the start, which has enabled even the distribution of the firm's products to be done in a completely new way, "through an informal network of social spaces, solidarity structures, markets without intermediaries and cooperative groceries."

In general, labor struggles in Greece have become more intertwined with social movements. Early in the crisis, structures of mutual aid sprang up everywhere:

Throughout the country collectives have established community kitchens and peer-to-peer solidarity initiatives for the distribution of food, reconnected electricity that was cut down to low-income households, organised "without middlemen" the distribution of agricultural produce, established self-organised pharmacies, healthcare clinics and tutoring programmes and organised networks of direct action against house foreclosures.

Later on, grassroots initiatives became more political, in an effort to create institutions that would be long-lasting and relatively independent of capital and the government. The Greek squares movement of 2011 spread to almost every city and village in the country, leaving behind a legacy of local assemblies and social centers. It also “unleashed social forces which boosted the social and solidarity economy and the movements for the defence and the promotion of the commons.”

All this flowering of alternative institutions has not occurred without significant problems and defeats. There has been little success in establishing solid organizations of the unemployed, and grassroots labor struggles have failed to form durable structures that can challenge institutionalized unionism. Certain victories, nevertheless, have been impressive. Social movements were able to prevent the government’s privatization of public water corporations in 2014. Even more remarkably, after the government closed down the influential public broadcaster ERT in 2013, ERT employees, together with citizens and activists, took over the production of television and radio programs by occupying premises and infrastructure. For almost two years the self-managed ERT transmitted thousands of hours of broadcasting on the anti-austerity struggle, serving as an important resource for the resistance. When Syriza came to power in 2015, it reestablished the public broadcaster.

Worker and consumer cooperatives exist all over the country. Cooperative coffee shops and bookshops, for example, exist in most neighborhoods of Athens and Salonica, functioning “as the cells of the horizontal movements in urban space and the carriers of alternative values and culture.” Broadly speaking, labor identities are becoming more socialized, “because more embedded in local communities and grassroots struggles.”

The Greek experience is of particular interest in that other Western countries, including the U.S., are likely to replicate important features of it in the coming years and decades, as economic crisis intensifies. We ought to study how Greek workers and communities have adapted and resisted, to learn from their failures and successes.

Egypt

The mass movement that felled Mubarak’s regime in 2011 received sympathetic coverage from the establishment media in the West, but the key role of workers’ collective action was, predictably, effaced. Strike waves after 2006 not only destabilized the regime but also gave rise to the April 6th Movement in 2008, which would go on to catalyze the 2011 rebellions. Even after the fall of Mubarak, the flood of labor actions didn’t let up.

As everywhere around the world, neoliberalism meant decades of pent-up grievances against working conditions, privatizations, low wages, and economic insecurity. Finally in December 2006, 24,000 textile workers went on strike at Misr Spinning. Within a few weeks, “similar strikes were spreading between public and private sector textile producers, and from there to civil servants, teachers, municipal refuse workers and transport workers.” In the next couple of years, many more strikes occurred, frequently taking the form of mass occupations of workplaces.

Workers even managed to form the first independent unions in more than fifty years, beginning with the Real Estate Tax Authority Union (RETAU), established in December 2008. The conservative and bureaucratic Egyptian Trade Union Federation was unable to cope with all the sit-ins, strikes, and waves of democratic organizing, and saw its influence over the labor movement wane. RETAU’s consolidation “accelerated the development of other independent unions and proto-union networks among teachers, public transport workers, postal workers and health technicians,” raising their expectations of what could be achieved through collective action.

After the steadily rising wave of worker and popular resistance crested with the resignation of Mubarak in early February 2011, labor actions didn’t cease. In fact, Mubarak’s fall was followed by “a new tidal wave of strikes and workplace occupations, with nearly 500 separate episodes of collective action by workers recorded in the month of February 2011 alone.” Strike waves ebbed and flowed over the following two years, and did much to undermine the military and Islamist governments that succeeded each other before the crisis of the summer of 2013, when, after Mohammed Morsi fell, a successful

counterrevolutionary offensive was launched by the Armed Forces, the Ministry of the Interior, the judiciary, and the media.

After the fall of Mubarak, a ferment of self-organization resulted in the founding of many new independent unions, which often engaged in intense battles for *tathir*, or the “cleansing” from management positions of the ruling party’s cronies. This was especially the case in public institutions. Public hospitals in Cairo, for example, “were the scene of attempts to assert workers’ control over management to a much greater degree than had been possible before the revolution.” These experiments weren’t always successful, but in a number of cases they did at least force the resignation of old directors and were able to establish, temporarily, democratic councils to oversee work.

In the end, the workers’ movement was unable to impose its demands on the agenda of national politics. Its leaders “did not score victories at that level on the question of raising the national minimum wage, or forcing a lasting retreat from privatization, or even of securing full legal recognition for the independent unions themselves.” Still, the authors comment that the nationwide revival of self-organization was an astonishing feat. “Factory and office workers created thousands of workplace organisations, despite conditions of acute repression and the lack of material resources. There have been few examples on this scale of a revival of popular organisation in the Arab world for decades.” Memories of these uprisings will not be erased easily, and will inspire the next generation of activists.

Venezuela

Venezuela differs from the other cases in that its Bolivarian revolution has entailed a commitment to elevating the position and the power of workers. So how successful has this process been? In recent years, of course, Venezuela’s severe economic crisis has undermined the Bolivarian process, with increases in poverty and less money going to social programs. But the achievements have not all been destroyed. The account in the book goes up to early 2016, well into the crisis years.

Until 2006, the Chavez government focused on promoting cooperatives (in addition to nationalizing the oil industry and expropriating large landowners). In nationalized medium-sized companies, for example, workers became co-owners with the state. Whereas Venezuela had had only 800 registered cooperatives in 1998, by mid-2010 it had 274,000, though only about a third were determined to be “operative.” It had been hoped that these businesses would produce for the satisfaction of social needs rather than profit-maximization, but the mixed-ownership model, according to which the state and private entrepreneurs could be co-owners with workers, vitiated these hopes.

By 2006 a new model was spreading, which was more communally based. Its political context was that “communal councils” began to be recognized as a fundamental structure of local self-government: in urban areas they encompassed 150 to 400 families, while in rural areas they included a minimum of 20 families. “The councils constitute a non-representational structure of direct participation, which exists alongside the elected representative bodies of constituted power. Several communal councils can come together to form a commune. By the end of 2015, over 40,000 communal councils and more than 1,200 communes existed.” Councils and communes can receive state funding for their projects, which now began to include community-controlled companies instead of cooperatives. “In these new communal companies, the workers come from the local communities; these communities are the ones who, through the structures of self-government...decide on what kind of companies are needed, what organisational form they will have and who should work in them.”

In 2008 a new model for these companies emerged, the Communal Social Property Company (EPSC). “While different kinds of EPSCs can be found in the communities today, their principal areas of activity correspond with the most pressing needs of the *barrios* and rural communities: the production of food and construction materials, and the provision of transport services. Textile and agricultural production companies, bakeries and shoemakers, are also common.” Under the initiative of workers, even some state enterprises are partly under community control, at least regarding their distribution networks.

Despite Chavez’s commitment to workers’ control, it has not been easy to shift the orientation of a state and a private sector deeply hostile to workers. Workers’ councils and struggles for worker participation

can be found in almost all state enterprises and many private ones—and workers have taken over hundreds of private businesses, sometimes after the state’s expropriation of the original owners—but even in the *chavista* state bureaucrats were apt to undermine the Bolivarian process. Whether through corruption, mismanagement, obstruction of financing to state companies with worker-presidents, or other means, ministerial bureaucracies and even corrupt unions impede workers’ control. In many state enterprises the situation is ambiguous: workers don’t control the company or even participate in management, but “they control parts of the production process, they decide on their own to whom they will give access to the plant, [and] they are in a full-scale conflict with the management.”

Despite all the advances made under Chavez, the fact is that the economy’s social relations of production have not really changed and capitalist exploitation remains the norm. Private interests are still too powerful and have too much influence over the government, promoting mismanagement and corruption. It is still a rentier economy. But a revolutionary process has begun and is being carried forward by communities and workers across the country. The transformation of a society from authoritarian to democratic does not happen overnight.

Bosnia-Herzegovina

Like the rest of the post-Soviet world, Bosnia-Herzegovina has suffered terribly from the privatizations, asset-stripping, marketization, and rampant corruption that have attended its transition to capitalism since the mid-1990s. Unemployment and economic insecurity are at epidemic proportions. In 2014, workers in Tuzla, Bosnia’s third largest city, organized a massive mobilization against their deteriorating conditions, the first since the 1992–95 conflict. While the movement didn’t last, its legacy may inspire further mobilizations in the future.

The 2014 demonstrations were a response to the wretched situation of workers in a laundry detergent factory, DITA, which at one time had provided 1,400 jobs. After its privatization in 2005, things started to go downhill. The company paid them minimal wages, issued meal vouchers only in bonds rather than cash, and eventually stopped paying them pension funds and health insurance. In 2011 they began a long strike, but in December 2012 the firm closed, having ignored all their demands.

Picketing the factory and filing lawsuits didn’t secure justice for the workers, so in February 2014 they teamed up with their counterparts from four other nearby factories to stage demonstrations in front of Tuzla’s canton court. All five workforces had similar demands: investigation of the questionable privatization processes that had destroyed their livelihoods; compensation for unpaid wages, health insurance, and pensions; and the restarting of production. Their demands didn’t get a very sympathetic hearing: during one of the demonstrations, riot police secured the entrance of the canton building and fired teargas and rubber bullets. This brutality only further inflamed the workers, who kept up their resistance the following couple of days. The number of demonstrators rose to 10,000 as students and other citizens joined the protests, finally setting the government buildings on fire.

Chiara Milan’s summary of the ensuing events is worth quoting:

The action [of burning government buildings] resonated throughout the country. Within days, rallies in solidarity with Tuzla’s workers took place across Bosnia-Herzegovina. Increasing discontent among the social groups suffering under government policies led tens of thousands to join in the main cities of BiH [i.e., Bosnia-Herzegovina]. Like a domino effect, the rage spread and the revolt escalated. On 7 February the government buildings of the cities of Mostar, Sarajevo, and Zenica were set ablaze by seething protesters. While politicians tried to hide the plummeting economic conditions of the country by constantly playing the ethnic card, the workers of Tuzla triggered wider social protests, arguing that rage and hunger do not recognise ethnic differences. The protests spawned a mass movement of solidarity that overcame the ethno-national divisions inside the country, travelling across the post-Yugoslav space. Rallies in support of the workers were reported in nearby Croatia, Montenegro, Serbia and Macedonia...

Soon, directly democratic assemblies called plenums were set up across the country. “The citizens gathered in leaderless, consensus-based assemblies where everybody had the right to one vote and nobody could speak on behalf of other people.” Each plenum had working groups addressing such issues as media, education and culture, and social problems. “Demands that arose during the plenums were collected and delivered to [these] working groups, in charge of reformulating them in a coherent way. Once reformulated, the demands typically returned to the plenum for a final vote [after which they were submitted to the cantonal government]. All the plenums were coordinated through an organisational body called interplenium...”

A new labor union was also formed in the wake of the protests, called Solidarnost, which quickly reached 4,000 members from dozens of companies. It was intended as an alternative to the conventional unions that had so signally failed to protect the interests of their rank and file. While it didn’t succeed in winning the battle for the workers, it did keep fighting for years afterwards, as by staging weekly protests in front of the canton court.

The moment of collective outrage slowly faded away, especially after the flood that hit the country in May 2014 turned into a national emergency. The workers at the DITA factory, however, still did not give up: in March 2015 they occupied the factory and restarted the production of cleaning products, publicly appealing for international support. Shops and retail chains decided to sell the “recuperated factory’s” products, and groups of activists volunteered to help the workers optimize production.

In general, Milan comments, the uprisings left a legacy of solidarity and activist networks, which challenge “the dominant rhetoric of ethnic hatred” and may be drawn on in future struggles.

*

The path forward for the working class in an age of neoliberal crisis is tortuous and uncertain. Given the near-collapse of mainstream trade unionism and many left-wing political parties, it’s necessary for people the world over to forge their own institutions, their own networks, to fight back against the rampaging elite and construct a new, more equitable society. The stories collected in *The Class Strikes Back* are an encouraging sign that workers everywhere are already waging the war, that democratic institutions can germinate in even the most crisis-ridden of societies, and that the ruling class’s hold on power is in fact, ultimately, rather tenuous. The next generation of activism is sure to bring major changes to a morally corrupt civilization.

Two Cheers for the Decline of the Middle Class

I realize how callous the title of this article sounds. The decline of the middle class, which in recent years has been the subject of innumerable articles, books, and movies, entails a terrible increase in human suffering. The descent of millions of families into relative poverty is beyond appalling, not something to be celebrated. However, the perverse Marxist in me feels obliged to complicate the narrative of unmitigated catastrophe that dominates all journalism and scholarship on the subject. The fact is that “progress,” like God, works in mysterious ways, paradoxical, inhuman, “dialectically contradictory” ways. And the contemporary decline of the West’s middle class may end up advancing, indirectly, the banner of humanity that the Left has carried forward since the seventeenth century.

The point isn’t a very deep one. Consider the gravest threat that life on Earth faces today: global warming. This threat cannot be adequately confronted in the framework of capitalism, which indeed is responsible for it; it demands a systemic socio-politico-economic revolution, a social transformation that systematically elevates human needs above capital’s needs. The most realistic way to address the crisis is for governments to nationalize the fossil fuel industry and shift resources toward renewable energy, which should be produced and distributed through publicly owned utilities. And this is only the beginning. There

have to be international reforestation and afforestation programs, for instance, and massive deployment of carbon sequestration methods and technologies. The very dynamics of the political economy have to be altered.

How can society ever get to this point? Evidently only through upheavals so painful that it becomes clear there is no other option. Revolutionary change on such a scale happens only by means of unprecedented crisis, which is to say social discontent so extreme that half-measures are cast aside as pitifully inadequate. As long as a large middle class exists to serve as a bulwark of social stability and relatively conservative politics, the requisite crisis will not happen. Society has to polarize between a tiny minority of ultra-rich and a huge majority of unprotected, insecure, ecologically vulnerable, politically desperate people whose violent discontent propels the “revolution” forward. Systems have to be radically disrupted, on a scale greater than during even the Great Depression, which led to the welfare state. If history has taught us anything, it’s that the middle class is an effective barricade against revolution.

We might also reflect that, climatically speaking, the best thing that can happen in the short term is a global economic depression. Carbon emissions in the U.S. dropped by 11% between 2007 and 2013, mostly because of the Great Recession. A deeper economic collapse would have an even more positive effect, quite apart from the contributions it would make to the sort of systemic breakdown that would facilitate radical change.

Karl Marx recognized that class polarization and economic crisis present unique opportunities for systemic disruption, opportunities that activists must seize. That’s the imperative, after all: to disrupt the smooth functioning of powerful institutions, and to create new institutions in their place. The more polarization, the more opportunities there are for revolutionaries. There are also more dangers, as we’re seeing by the rise of the far-right across Europe and the U.S. But these dangers aren’t necessarily insurmountable, if only the Left can get its act together and organize the drifting masses.

Millions of people are out there waiting to be organized. We can only hope that by the time of the next economic crash, the Left will be ready to seize the initiative.

On the Use and Abuse of Rage for Life

“These are the times that try men’s souls.” How much truer is that statement now than in 1776! We’re poised on the precipice, peering over into the crocodile pit below, where fascists swarm and writhe in sanguinary anticipation. Humanity is on the verge of losing its footing and plunging headfirst into the open maw of reptilian sadism. Where you stand, in this climactic moment of history, determines whether you are reptile or hominid.

We know where the majority of the ruling class stands, in their contempt for the poor, for the future, for democracy, the working class, the natural environment, the impartial rule of law, social cooperation, community, and a rational public discourse: they’re on the side of the reptiles. Whether it’s the boorish, amoral mediocrity of a Brett Kavanaugh, the rank hypocrisy of a Lindsey Graham or a Susan Collins, the naked cupidity of a Jeff Bezos, the proud Israel-fascism of a Chuck Schumer, the unfettered evil of a Mitch McConnell, or the undisguised corporatism of a Nancy Pelosi, a Barack Obama, and virtually every other politician on the national stage, the ruling class despises morality and law as an insolent threat to its unchecked power. Almost as offensive as these people’s lack of all principles besides unwavering loyalty to the rich is their aggressive *mediocrity*, their transparent conformism and cowardice. One is stunned at the gall of such insipid nonentities to believe themselves superior to the rest of us.

Even from the perspective of their intelligence, these elitists don’t exactly distinguish themselves. Consider one of the more honored and allegedly intellectual specimens: Anthony Kennedy. In what I suppose constituted an attempt at self-criticism, he recently offered the following rueful analysis of the state of the nation: “Perhaps we didn’t do too good a job teaching the importance of preserving democracy by an enlightened civic discourse. In the first part of this century we’re seeing the death and decline of democracy.” The lack of self-awareness takes your breath away. The man responsible for the supremely

anti-democratic decisions in *Bush v. Gore*, *Citizens United v. FEC*, *Shelby County v. Holder* (which gutted voting protections for minorities), and *Janus v. AFSCME* (which by harming unions harms democracy), and who vacated his seat during the term of a president who prides himself on his authoritarianism and disrespect for the rule of law, is chagrined and apparently puzzled that democracy is declining.

Evidently the man is an imbecile, devoid of the capacity for self-critical reflection and empathic understanding of opposing arguments. And yet he's an esteemed member of the ruling elite. (Precisely *because*, one might maliciously suggest, of his incapacity for critical thought.)

How maddening it is that such indoctrinated fools have power! It's the blind leading the sighted!

Anyway, it's for the rest of us to decide where *we* stand. Will we stand idly by, cynical and apathetic, while what's left of society is dismantled, piece by piece, as a sacrificial offering to the great god Mammon? Or will we, fueled by sheer rage, stand up as one to the orgiastic misanthropy of our "leaders" and smash their petty little self-aggrandizing ambitions into dust? Will we march in the streets, occupy offices, organize mass strikes, take over workplaces, and confront our political "representatives" wherever they turn and wherever they are at every moment of the day? Or will we remain the domesticated dogs we've become under the long-term impact of corporatization, bureaucratization, and privatization?

In a time of universal atomization and a zombified-consumerist public life, the redemptive power of collective rage shouldn't be scoffed at. It is in fact key to the recovery of our humanity, our de-robotization, and to the very survival of humanity itself. We should embrace our rage, cultivate it as though it were the tree of life, cherish it, for its power of both motivation and social transformation is prodigious.

The plaintive cries of establishmentarians to restore "civility" in the public sphere are laughably self-serving and shouldn't be taken seriously. "You don't call for incivility," Megyn Kelly says in response to Representative Maxine Waters' call for exactly that. Angry left-wing responses to Trumpism are "unacceptable," according to Nancy Pelosi. "We've got to get to a point in our country," says Cory Booker, "where we can talk to each other, where we are all seeking a more beloved community. And some of those tactics that people are advocating for, to me, don't reflect that spirit." And poor, long-suffering Sarah Sanders sent out a tweet of Solomonic wisdom after the owner of a restaurant had asked her to leave because of her noxious politics: "[The owner's] actions say far more about her than about me. I always do my best to treat people, including those I disagree with, respectfully and will continue to do so."

In short: let institutions operate as they're supposed to, and don't enforce accountability on public officials outside the electoral process. By all means vote us out of office if you don't like our policies, but don't make life uncomfortable for us.

The truth is that, from more than one perspective, the decline of civility or politeness in the "political dialogue" is a sign of *progress*, not retrogression. Politeness upholds the politics of "respectability," which is the politics of conservatism, hierarchy, and the status quo. It coddles the powerful, even as they're enacting *substantively* uncivil, which is to say destructive, policies aimed at everyone who lacks the money to buy influence. The essence of politics, which is but war by other means, has always been "incivility"—struggle over resources, competing agendas, bribery, corruption, the defense of privilege against the unprivileged and the latter's struggle to wrest power from the former. There is a "beloved community" only in the milquetoast liberal imagination of a Cory Booker. The task for actual democrats is to bring the war to the doorstep of the privileged, to make them viscerally aware of the stakes involved, even if it means directly acquainting them with the wrath of the dispossessed. They've been sheltered far too long.

Even from the other side, the side of the reptiles, there is something to be said for Trumpian insult-flinging and demagoguery. At least it serves to take the fig leaf of high principles and public-spiritedness off the reactionary policies of almost fifty years. When Obama deported millions of immigrants and separated tens of thousands of families, it seemed as if no one cared. Now that Trump is doing it (arguably in even more sadistic ways), even the establishment media expresses outrage. The vulgarity and blatant evil, in short, tend to radicalize everyone who still has a vestige of moral consciousness in him. That's useful.

Ultimately, though, it hardly needs arguing that Trumpian "incivility" is disastrous, for example, in its promotion of white rage and white supremacy. But this is exactly why the time has come for the

politics of *extreme disruption*, as expounded and defended in that classic of sociology *Poor People's Movements: Why They Succeed, How They Fail*, by Frances Fox Piven and Richard A. Cloward.

The Usefulness of Violence

As Piven and Cloward show, mass social disruption and civil disobedience were essential to the victories of several major popular movements in the twentieth century: the 1930s' unemployed workers movement (which indirectly brought forth the modern welfare state), the industrial workers movement that unionized the core of the economy, the civil rights movement, and the welfare rights movement of the 1960s that forced huge expansions of welfare programs. Even the scores of urban riots between 1964 and 1968 had a partially constructive impact. In the violent summer of 1967, for example, the Pentagon established a Civil Disturbance Task Force and the president established a Riot Commission. Seven months later, the commission called for "a massive and sustained commitment to action" to end poverty and racial discrimination. "Only days before," the authors note, "in the State of the Union message, the president had announced legislative proposals for programs to train and hire the hardcore unemployed and to rebuild the cities."

Without going into further detail, the lesson is already clear: not only "disruption" but even rioting can, potentially, be constructive, given the right political environment. This doesn't mean riots ought to be encouraged or fomented, of course; they should be avoided at almost all costs. But when conditions become so desperate that waves of riots begin to break out, we shouldn't too quickly condemn them (or the rioters) as hopelessly irresponsible, self-defeating, primitive, immoral, etc. The state's immediate response might be repression, but its longer-term response might well be reform.

Other scholars go further than Piven and Cloward. Lance Hill, for instance, argues in *The Deacons for Defense: Armed Resistance and the Civil Rights Movement* that the tactic of nonviolence wasn't particularly successful in the civil rights movement. SNCC's peaceful local organizing in the early 1960s didn't bring about many real, tangible gains: months-long campaigns succeeded in registering minuscule numbers of voters. White power-structures, racism, and Klan violence were just too formidable. Martin Luther King Jr.'s "moral suasion," his hope to shame Southern whites out of racism, failed utterly. So the strategy shifted to provoking white violence in the full view of television cameras—and, as with the Deacons for Defense in Louisiana, *inflicting* violence as well (mostly in self-defense). By 1964 things were threatening to get out of control, with riots and some white deaths, so the government was able to pass the Civil Rights Act—which it proceeded to enforce only sporadically, usually when compelled to by violence or its threat.

Nonviolence was a useful tactic for getting white liberal support, but without the threat of black violence always lurking in the background it would have accomplished little. "One of the great ironies of the civil rights movement," Hill says, "was that black collective force did not simply *enhance* the bargaining power of the moderates; it was the very *source* of their power."

In general, the point is that people have to act in such a way that authorities will feel compelled to give them concessions lest social hierarchies be threatened. In the long run, needless to say, the goal is to replace the authorities, to empower people who actually care about people. But in the meantime it's necessary to extract concessions—by putting the fear of God, or, far more frighteningly, of revolution, into the heads of the thugs at the top. The credible threat of violence can bring results, as history shows.

In 2018, after the consolidation of a reactionary regime on the Supreme Court, it is long past the time for organized collective violations of "law and order" and "property rights." It's time to badger elected officials at every moment of every day, and to foster political polarization so that the ground caves in beneath the feet of the "centrists." Conditions aren't yet desperate enough for collective looting and rioting—since, after all, the economy is booming! (right?)—but it's necessary at least, in the coming years, to stoke such fears in the minds of the rich. Monolithic, sustained, savage repression cannot work for long in a nominally democratic country like the U.S. Radical reforms are inevitable—if, that is, we rise up *en masse*.

A “Crisis of Legitimacy”

The one good thing about Kavanaugh’s confirmation to the Supreme Court is that it completes the delegitimization of the most undemocratic and typically reactionary institution at the federal level. Having an obvious perjurer, sexual harasser, overgrown frat boy, and overtly partisan hack on the Court strips away whatever patina of honor and impartial dignity that farcical institution still had. It has now lost all pretense of representing not only the will of the people but even the rule of law. This fact, too, will facilitate radicalization.

The entire political economy, and the august institutions that protect it, are being thrown into question.

The whiff of revolution is in the air, just starting to float, here and there, on the breezes blown back from the future into the present. The scent is positively revivifying.

It’s a good time to be angry. And to translate your anger into action.

The Necessity of “Lesser-Evil” Voting

It’s election season again, that joyous time of the biennium, and you know what that means: a renewal of the perennial left-wing debate over “lesser-evil voting.” Is it wrong to vote for a Democrat, rather than someone on the genuine left, in order to keep a reactionary or a fascist out of power? Or, on the contrary, is it wrong to vote for a leftist who has apparently no chance of victory, thereby denying a vote to the Democrat and so increasing the odds that the reactionary candidate will win? The most famous advocate of “lesser-evil” voting is Noam Chomsky, who argues that the most immediate moral imperative is to prevent the worst possible electoral outcome from occurring. Critics of lesser-evil voting are legion, as a simple Google search indicates.

The writer Nick Pemberton recently contributed to this debate in a *Counterpunch* article entitled “Reflections on Chomsky’s Voting Strategy: Why the Democratic Party Can’t Be Saved.” It’s a long and rambling article most of which isn’t worth responding to. Nevertheless, since Pemberton has resurrected the issue, I’d like to weigh in on the side of reason and morality. Maybe a miracle will happen and I’ll reach one or two people.

It’s to the credit of Pemberton and many of his allies in this debate—e.g., B. Sidney Smith and Andrew Smolski—that they acknowledge it’s a risky proposition to disagree with Chomsky. The man has a preternatural ability to be rational and right about nearly everything. And on this issue too, I think, he’s absolutely right, and his critics are wrong. Now, if Chomsky can’t convince the critics then I certainly can’t, but hopefully I can at least provide a bit of food for thought.

One way to approach the issue is to list policy differences between Democrats and Republicans that leftists should care about. The claim is often made that the two parties are effectively indistinguishable, but this is hardly the case. Consider net neutrality, an issue leftists care about. Where do the parties stand on it? Obama’s FCC voted in favor of it on party lines, while Trump’s FCC ended it. Not exactly indistinguishable.

On global warming: Obama was pathetically inadequate, but during his term the U.S. did at least join the Paris Agreement. Trump withdrew from it. Obama’s EPA introduced rules to cut pollution from vehicle tailpipes, while Trump’s is rolling those rules back. Trump is enamored of coal; Obama wasn’t. Trump’s EPA has proposed to dramatically weaken regulations concerning mercury, posing a threat to the nervous systems of children and fetuses. The differences go on and on.

On the Supreme Court: how likely is it that Hillary Clinton would have nominated judges as reactionary as Brett Kavanaugh and Neil Gorsuch? Clinton cares about *Roe v. Wade* and would certainly have nominated people likely to protect its legacy. This is a major issue, not a trivial difference between the parties. In general, the liberals on the Court are hardly “indistinguishable” from the conservatives, as

this list of some major decisions in 2018 shows. (The entire twentieth-century history of the Court indicates the same thing, most notably from the New Deal on.)

What about workers' rights? The Democratic Party has little loyalty to organized labor—as evidenced by NAFTA and the TPP, among innumerable other betrayals—but Obama did at least sign the Lily Ledbetter Fair Pay Act of 2009 (in addition to a number of pro-worker executive orders), to which McCain was opposed. And Obama's Labor Department and National Labor Relations Board were far friendlier to workers than Trump's administration has been.

The foreign policies of the parties are much more similar than their domestic policies, being in fact virtually identical on issue after issue. I'm not going to defend the Democratic Party's foreign policy. But it's worth noting that George W. Bush's Iraq War probably would not have occurred had Al Gore been president, since Gore had fewer ties to neoconservatives and the oil industry than Bush and Cheney did. That is, a world-historic catastrophe that resulted in hundreds of thousands of deaths, millions of refugees, and the destruction of a country quite possibly could have been avoided had more people voted for Gore over Bush in swing states in 2000. Is such a cataclysmic war worth preventing? I think so. Apparently critics of "lesser-evil" voting disagree.

Speaking of the 2000 election, the frequent denials that Ralph Nader contributed to Bush's victory are nonsense. Bush defeated Gore in Florida by 537 votes. Nader received 97,421 votes in Florida. Had only 538 of the people who voted for Nader voted for Gore instead, there would have been no Bush administration and quite possibly no Iraq war. It's a matter of simple arithmetic and shouldn't be controversial. Of course there were thousands of additional reasons why Gore lost, including perhaps the Monica Lewinsky scandal, his blandly centrist political positions, decisions his campaign made, and so on. But it's mathematically provable that one of the reasons was Nader's campaign in Florida.

The reason-defying power of ideological thinking is such that people are able to deny not only elementary morality (that you should prevent the worst possible outcome) but even elementary arithmetic. It's remarkable.

I won't continue listing differences between the two main parties, though there are many more. Instead, let's consider some of the other arguments. A common formulation is that "the lesser evil is still evil." To which I'd reply: sure, you can phrase it that way if you want, and maybe you're right to do so. But the point is that there are degrees of evil. Indeed, that's all we're confronted with in politics: greater and lesser evils. You shouldn't look for moral and ideological purity in the messy realm of politics. Even far-left candidates will almost never be perfect reflections of your values: there will be political sins in their past, they'll take stands on issues that you won't agree with, and if elected they'll almost inevitably make compromises that will disappoint you. The designation "lesser-evil voting" is misleading, because *all* voting is lesser-evil voting. Even if you vote for the most radical Green Party candidate you're still choosing (what you think is) the "lesser evil," because no candidate is absolutely perfect. You vote for the one who will do the least damage, or will serve your moral values most effectively.

And, again, one of your values should be to prevent the worst possible outcome. You can pretend you're being "pure" somehow by voting against the Democrat (or not voting at all), but, depending on the political context, what your feel-good voting strategy is accomplishing might only be to empower the candidate who will, say, pull the U.S. out of the Paris Agreement, step up the war on immigrants, end net neutrality, ratchet up the capitalist war on humanity and the environment, and give white supremacy a prominent platform.

I'm not saying you should necessarily actively campaign for a Democrat just to prevent the Republican from winning. (Although that's quite a reasonable thing to do if you don't want the fascist to win.) But surely it isn't too much to ask that on one day every two years you cast a vote against fascism and on every other day get back to the task of building a socialist movement.

The claim is often made that lesser-evil voting has enabled the rightward drift of U.S. politics since the 1980s. This claim would have more merit if there had existed a third party with even a remote chance of electoral success. But the fact is that the rightward drift of politics has overwhelmingly resulted from the business community's multidimensional mobilization against democracy, not merely from people's voting for a Democrat every two or four years. Incomparably more important than voting, at least as long as viable

third parties don't exist, is, on the one hand, the work of challenging and pressuring Democrats once they're in power, and on the other hand, the work of building a radical social movement *outside* the voting booth. The latter task takes decades. Not until it has been accomplished does it make much sense to embrace the sort of electoral strategy Nader has followed.

One argument I haven't heard Chomsky make is that having Democrats in power is useful because it shows people the flaws of the Democratic Party, and thus the necessity of building a socialist movement. If only Republicans were ever in power, people might think all problems could be solved just by electing Democrats, any Democrat. And that's the goal they would focus on. When Democrats in power show how corrupt and oligarchical they, too, are, then anti-capitalist movements like Occupy Wall Street and the current widespread activism for "democratic socialism" can emerge to push for systemic changes in the political economy.

In this sense, Obama's presidency advanced the political education of millions of Americans, who realized that electing centrist Democrats wasn't enough.

In the end, one's opponents or interlocutors will always have some stock answer to every argument, no matter how logical the argument is. Leftists who loathe the Democratic Party with apparently every fiber of their being will always have some rationale, however specious, to justify *never voting for a Democrat*. Even for a Democrat like, say, Alexandria Ocasio-Cortez, who is (or seems) manifestly better on most issues than nearly all Democrats. The very word "Democrat" is, for many leftists, little more than a term of abuse, a curse word, as it is for so many Republicans, a term so value-laden that the idea of voting for such a person is nauseating. But investing political labels with primarily emotional content is neither useful nor rational, and can lead to demonstrably stupid, even totalitarian thinking and acting. We should try to step back from our visceral hatreds and aversions and consider dispassionately what course of action is likely to ameliorate the most human suffering. And that's really all that should matter.

If you think letting the House or Senate remain in Republican hands is a price worth paying for voting for an ideologically "correct" candidate who has no chance of winning, so be it. But I'd bet a lot of immigrants who are finding it much harder to get a visa now than under Obama would disagree with you. As would, perhaps, quite a few environmental activists who are now desperately working overtime to prevent Ryan Zinke's Department of the Interior from stripping yet another national park or monument of federal protection.

When (semi-)fascism is appearing on the horizon or is already in power, the imperative is to build a united front against fascism. The Communist Party in the period of the Popular Front was right about this. It's time to apply the hard-won lessons of the past.

An Ode to Chomsky

[I don't like this article because it's so meandering and personal. But here it is anyway.]

Ninety years old and still going strong. Almost twenty years after the age when that other great left-wing public intellectual Jean-Paul Sartre was already utterly frail, uncommunicative, pliable in the hands of his handlers, and prone to haplessly spilling egg and mayonnaise on his face while eating, Noam Chomsky is still constantly giving interviews, traveling to distant countries to give talks on the political issues of the day, and in general is just as lucid as he always has been. It's an unusual constitution that guy has.

A few years ago I wrote a long article about why I find Chomsky important, but that piece didn't succeed in communicating what he has meant to me, and to many others. So I thought that on the occasion of his ninetieth birthday I'd take another stab at it. A lot has been written about him, but little from the "personal" perspective I'll adopt. My hope is that some readers will identify with my own encounter with Chomsky.

I'm well aware of Chomsky's aversion to personalizing things, and to an extent I share his taste. There is something inegalitarian about singling people out and praising them to the sky, something anti-

democratic and anti-anarchistic about treating them as authorities (particularly if they're perceived as nearly infallible). Even aesthetically one might object to doing so, if one prefers the coolly rational and objective aesthetic of classicism, of Bach and Mozart, the purity of a vision elevated above the spots and blemishes of the concretely existing. I've always much preferred the realm of ideas and perfection to that of personality and politics. It's so much *cleaner*, so much nobler and more sublime, timeless, transporting, this realm of philosophy, science, intellectual and art history, music from the Baroque and Classical eras, all things not merely time-bound or *particular*. The universal is what's healthy; the particular slides into decadence.

But this is exactly why I can't help but be fascinated by Chomsky. For he seems, at least from afar, to be a unique fusion of the particular and the universal, of personality and reason, a person who exists above the personal. I've never seen anyone so reluctant to say a word about himself or his private life, his personal grievances or feelings or experiences, so completely self-effacing that it's hard even to believe he has a family or a life at all. He seems to be the disembodied voice of reason, compassion, and morality. [...]

I can think of no one else as intellectually, morally, and humanly *clean* as Chomsky (or as his persona, at least). And we should all, I think, strive for such "cleanliness," a concept, incidentally, that moral theorists might expound on for its pithiness and evocativeness.

In any case, while there are dangers in personalizing or in hero-worship, there can also be gains. And insofar as humans are oriented towards humans and not only abstract principles, personalizing can never be wholly escaped. From childhood onwards, we enjoy putting certain people on a pedestal and perhaps emulating them; and this can be a quite important means of self-development, of the youth's sculpting of his own identity—in the likeness of his hero. Chomsky is wrong to dismiss—if he does—the importance of role-models, and of his own status as a role-model, in his conviction that each person should follow his own inner light, realize his creativity in his own peculiar way unencumbered by subordination to an authority. On this point, at least, Nietzsche was nearer the mark, for Nietzsche saw that sometimes to revere an "authority" can serve precisely to liberate, not to enslave:

Your true nature lies [he wrote], not concealed deep within you, but immeasurably high above you, or at least above that which you usually take yourself to be. Your true educators and formative teachers reveal to you what the true basic material of your being is, something in itself ineducable and in any case difficult of access, bound and paralyzed: your educators can be only your liberators.

By fixing your gaze on a star and struggling to raise yourself to its height, you unwittingly find your way to your true self and perhaps, in the end, even become your own star, shining confidently apart from the distant celestial body you once worshiped. For it's true you should never simply copy another; you should only use others to liberate yourself from the dreck and slime of your surroundings and finally, using what you have learned, "become who you are."

Even Chomsky shouldn't be followed everywhere. He may be the least decadent person in history, the least culturally polluted—"he's a pencil-and-paper theoretician who wouldn't know Jabba the Hutt from the Cookie Monster," Steven Pinker has said—but sometimes a little decadence can be a good thing, can add depth and richness to life. To be as perfectly masculine, as rock-like, as Chomsky, nothing but the Enlightenment, can be limiting; there is also a place for the feminine, for, say, existentialism, phenomenology, popular music, dancing, receptiveness. And even Chomsky is just plain wrong from time to time. (For instance, he's wrong to rarely mention particular left-wing organizations that could use donations or members.)

In the following, though, since it's his birthday, I'll focus on the positives. In particular, I'll argue that adopting Chomsky as a "role-model" can help us lead lives relatively free of misanthropy, groupthink, intellectual dishonesty, "decadence," and, in short, excessive selfishness and self-immersion.

In fact, to be blunt, with this article I'm in the myth-making business. Again as Nietzsche understood, human life has need of illusions and is even grounded in them. The necessary illusion of our own importance, of the great value of our own little contributions, of the very existence of oneself as a substantial self, some coherent and enduring entity called "Chris Wright" or whatever (an illusion Buddhists, and not only they, have recognized as such—but can nonetheless not fully escape)—these and other lies are in some sense ineluctable. Easier to escape is the lie of traditional religion, but we still need values despite the death of God. The death of the human species itself is now a glimmer on the horizon, and yet we still, somehow, have to ward off nihilism. In a time of monsters and "morbid symptoms" (to quote Gramsci), of triumphant relativism and mass degeneracy, we need an anchor. My thesis is that Chomsky can serve as that anchor.

"Some people say, 'What would Jesus do?'" remarks Lawrence Krauss. "I say, 'What would Noam do?'" Myths, by inspiring and vivifying, can help ward off the rot and decay that creeps underground and far above ground in the White House, to seize on the living and sap their will to resist.

Living in this society, many years ago I woke up to find myself hemmed in and threatened on all sides by mediocrity. And in myself too I was more than disconcerted to see layer upon layer of mediocrity. But it was mostly the external mediocrity that troubled me, because it seemed so over the top. Everywhere I looked I saw stupidity, irrationality, meanness, proud ignorance, thoughtless conformity, an impossible lack of empathy, self-deception, hypocrisy, status-worship, an unbelievable amount of flakiness—in general a world governed by assholeishness and idiocy. And cowardice. [...]

But I'm not finished with the mediocrity yet. A few days ago I was in a car that grazed the door-handle of another car as it pulled out of a parking spot. We stopped to make sure there was no damage to either, and were about to leave when out of the other vehicle, originally hidden by tinted windows, stepped a gorilla of a man livid with murder in his eyes. "You bumped my car!" We apologized profusely and pointed out there wasn't a scratch anywhere. No matter. He was inconsolable. So we left, lamenting that such creatures as this gorilla existed—by the millions.

"It's mine! You can't touch it!"

[...]

Wherever there is atomization, there is sickness. It might be the sickness of "Don't step on my lawn!" or it might be the sickness of "Don't blame me, I'm just following the rules." Or the sickness of hating the Other—the Jew, the Muslim, the immigrant, the liberal—or of pursuing profit at the expense of workers, communities, the natural environment, and life itself. The manifestations of alienated atomization are infinitely varied, from the pointless, stupid honking of car horns in cities to the bureaucratic mass murder of "the unpeople" by the U.S. and its client states. I ought to be numb to it by now, but somehow whenever I encounter the sickness again, every day, I still shake my head at the cruelty and predictability of humans.

In general, I've lived much of my life in a state of resentment at the *smallness* of our species, the moral and intellectual smallness. There's a cognitive and affective dissonance that arises when you spend a large amount of time immersed solitarily in "high culture," overawed by the mysteries of life and the universe, by the grandeur and inconceivable beauty of the human brain, of existence itself, and then look up from your reading to see a world in which, say, the most embarrassing fools can become intellectual celebrities—Ayn Rand, Thomas Friedman, William F. Buckley, Ann Coulter, Sam Harris, Jordan Peterson—or in which luck and subservience determine destiny, and rationality and courage are almost always punished. Not to mention the stupefying small-mindedness that, for example, sentences a teenager (black, of course) to 65 years in prison for having participated in a robbery when he was 15 that resulted in a police officer shooting his friend to death. Life comes to seem utterly picayune and pointless, the very opposite of majestic and beautiful, when it's lived in such a world as this. A world in which the fate of millions can be determined by the merest accident, like a 5-4 decision by the U.S. Supreme Court that installs the reactionary Bush rather than the centrist Gore in the presidency. How can anything really matter in such a farcical, *accidental* world?

And then one starts to sympathize with, e.g., George Carlin's nihilism and misanthropy. Late in his life, Carlin said the following in an interview:

We're on a nice downward glide. I call it circling the drain. And the circles get smaller and smaller, faster and faster... And we'll be gone. And that's fine, I welcome it. I wish I could live a thousand years to watch it happen. From a distance, so I could see it all.

Interviewer: Does it depress you?

No, it lifts me up. It lifts me up because I gave up on this stuff. I gave up on my species and I gave up on my fellow Americans. Because I think we squandered great gifts... And that's why I'm divorced from it now. I see it from a distance... I said, "George, emotionally you have no stake in this, you don't care one way or another. So watch it! Have fun!"

It's all a farce, so just enjoy the spectacle!

That's the temptation, the "sinful" temptation. And it seems that many, many people have succumbed to it, have become wholly cynical and apathetic.

I might have succumbed to it too, feeling alone, embittered, if it weren't for my discovery of...yes, Chomsky. He helped prevent my "downward glide" into the depths of Carlinian cynicism. In finding someone who validated nearly all my instincts and intuitions, but who sharpened them and elevated them to a level of virtually complete objectivity, I felt both vindicated and somewhat forgiving of others' faults. For it was clear that Chomsky was far above me in most respects, and yet was well-disposed toward humanity and hadn't "lost faith"—so who was I to lose faith or wallow in disgust? I didn't have the right to. And since then, Chomsky has served as a moral and intellectual guide—not an infallible one, but a pretty reliable one.

*

I suppose part of the explanation of my "hero-worship" is that I have a somewhat religious temperament, a mind oriented towards transcendence and desirous of objectivity, and I've never fully made my peace with the nonexistence of God. I've wanted objective confirmation of my worth—as we all do, only I was especially preoccupied with the ideal of objectivity or truth. Simply living in the world wasn't enough; I wanted to transcend it, to penetrate mere appearances and understand, or even coincide with, something timeless and absolute. Something like "God."

To say it in more mundane language, perhaps the only thing I find fundamentally interesting is objectivity or rationality. Or truth. Error and mere subjectivity are everywhere, predictable and boring. People are so certain of themselves, and they're so wrong, it becomes difficult to take them seriously. But a genuine commitment to rationality, and an ability to follow through, to be consistently logical, open-minded, reasonable, concerned only to know truth even at the expense of "fitting in"—this quality is rare and precious.

For these reasons, I found it more than refreshing to come across Chomsky. He was, as Lawrence Krauss said or implied, the closest approximation to something transcendent or to pure reason that humans could hope for. In a world of rampant and rampaging self-indulgence, here was someone totally disciplined, fanatical about evidence, virtually masochistic in his devotion to principle, embodying moral and intellectual integrity in apparently every act and every utterance, a warm and kind person, and on top of it all, a genius with few peers in history who was right about seemingly everything. I felt that, well, if *homo sapiens* is capable of Nazism, at least it's also capable of Chomsky.

[...]

The sparkling objectivity and impersonality of Chomsky's analyses leads to one of his greatest contributions, his making a *science*, so to speak, of leftist philosophy. Marx, in a sense, had already accomplished this, but Marx made mistakes in his predictions and was a bit analytically sloppy on key questions (as I explain [here](#)). Chomsky, in essence an anarchist Marxist, dropped the ideological baggage of Marxism but implicitly kept most of the theoretical framework—which, after all, is just common sense, insofar as class struggle, conflictual relations of production, the capitalist state, imperialism, and other basic

concepts can hardly be denied except by vulgar ideologists. The factually rigorous interpretations of politics that Chomsky gave, backed up by overwhelming detail and an apparent command of almost the entire scholarly and journalistic literature, were and are of immense utility in substantiating the claim that to be on the far left is not just to be ideological or biased; it is to be scientific and rational, if the values you hold include democracy, human freedom, and human welfare. I had sometimes wondered if I was too left-wing; Chomsky convinced me I wasn't nearly left-wing enough, nor consistent enough.

As I suggested earlier, there was something else I appreciated about Chomsky's Olympian objectivity, or his focus on institutions rather than individuals: I liked the aesthetics of it. For one thing, I liked the withering contempt it expressed for functionaries of power, media figures, and intellectuals. Occasionally Chomsky would directly state what he thought of most intellectuals, as when calling them "specialists in defamation," or the American intellectual community a "gang of frauds," or the liberals at *The American Prospect* "pathetic, frightened, cowardly little people"; but ordinarily it was just the tone of savage irony, and the refusal to treat most intellectuals as anything more than *expressions of institutional interests*—not people to be taken seriously in their own right—that made clear his attitude.

And he was exactly right, both morally and scientifically. It's an obvious point that goes back to Marx: social behavior is overwhelmingly constrained by institutional context. Nearly everyone internalizes the norms appropriate to his institutional location—intellectuals maybe even more so than most, since they're more educated and therefore more indoctrinated. So their self-expressions tend just to be sublimated expressions of power-structures and hierarchies, institutional jealousies and conflicts, often mere class interests or rationalizations of class interests. When interacting in academic contexts, I've frequently had the uncanny feeling that I'm not talking to a person so much as to a node in the network of institutional norms. An institutional automaton, so to speak. There were limits to what I could say: for instance, if I mentioned Chomsky or Norman Finkelstein, or if I said some critical words about Foucault or some other postmodernist hero, the atmosphere grew a little tense and uncomfortable. "Chomsky lacks academic bona fides," I would be told. Or (after asking why Chomsky is rarely mentioned among scholars of Latin America) "Chomsky just borrows from scholars without producing original research," or something along those lines. It was clear that these remarks were mere rationalizations of the desire to ignore him—since, after all, he draws on every conceivable source and puts forward compelling interpretations—and that what was really being said was "He's not one of us, so we don't mention him. But I'll forgive you this time because you're new." It was interesting, in any case, to realize that at that moment I was talking to an institution, not a person.

As for the morality of it, well, to the extent that one lets one's humanity be submerged underneath institutional norms, one is abdicating responsibility and ceasing to be a moral agent. It becomes perfectly legitimate, then, to treat such a person as "beneath contempt," to use a term Chomsky is fond of.

But there was another aspect of the aesthetics of objectivity that I liked: as I said above, I appreciated the absence of any hint of cultural decadence. This was not a minor consideration. For whatever reason, for a long time my antennae have been hyper-attuned to indications of decadence. I've always thought, for example, that the greatest and healthiest music ever written was during the era of Bach to Schubert: after Beethoven and Schubert, decline set in—enervation, emotionalism, romanticism, self-indulgence, excess, stupefaction, a lack of discipline, etc. This isn't to say I don't love an enormous amount of Romantic music, from Chopin to Rachmaninoff; but I know it isn't as spiritually healthy or creatively disciplined as Mozart and Beethoven. And with the twentieth century—impressionism, atonality, Mahler, Stravinsky, and then eventually the indeterminacy of John Cage, and minimalism, and all the academic noise-crap that gets written today by classical composers—things got truly, repulsively decadent. There was still some great music, but it was on a lower order of greatness than the Holy Trinity Bach-Mozart-Beethoven.

I could discuss whole swathes of culture, from philosophy to poetry, explaining how and why there was a decline from the vigor of the eighteenth century (and Marx, its disciple) to the lassitude and fragmentation of the twenty-first, but that would take me rather far afield. The point is that Chomsky, the last great Enlightenment thinker, was the most significant exception to this trend of ever-increasing

decadence. He struck me in fact as the most purely autonomous person ever, impervious to unhealthy influences or impulses.

Philosophically, for instance, I was pleased to see my contempt for behaviorism validated by two brilliant essays, the famous 1959 review of Skinner's *Verbal Behavior* and a lesser-known critique of Skinner that appeared in Chomsky's *For Reasons of State*. From the first moment I had come across behaviorism, the notion of interpreting humans and all animals in terms of stimulus and response, conditioning, reinforcement, and so on struck me as ludicrously impoverished. Empiricism in general, the tradition emanating from John Locke and David Hume, who deprecated the rich innate endowment of the human mind in favor of interpreting it as virtually a passive absorber of sense-perceptions and the like, I was never able to take seriously. It was just too contrary to common sense, and too scientifically primitive.

More clearly "decadent," though, was the whole "paradigm" of postmodernism that Chomsky has consistently rejected, and that actually has some connections to the empiricism he has fought against his whole life. This isn't the place for a systematic discussion of postmodernism—i.e., the cultural tradition emanating from Derrida, Foucault, Lacan, Deleuze, Lyotard, and their acolytes—so hopefully I'll be forgiven if I just refer passingly to its general thrust of interpreting the world, in the vein of empiricism and idealism, as formed and structured by "discourses," "vocabularies," "epistemes," "imaginaries," social constructions, mutually incommensurable and incommunicable paradigms, and other such idealistic notions.

I've never been able to understand why intellectuals and activists who operate in this relativistic, *discourse*-obsessed tradition can consider themselves to be exemplary leftists, since the leftist tradition has for a long time been associated with materialism. Its goal has been to change the objective world that constrains us, the institutions that govern our behavior, and thus the class structures that allocate resources. What's so radical or transformative about withdrawing into the spheres of literary and cultural theory? What's so radical about relativism, the denial of objective truth, a focus on subjectivity, denial that natural science can give us access to the nature of the mind-independent world, denial that there even *is* a mind-independent world? Doesn't that tend to imply that power and oppression are only in the mind, that they aren't objectively real, and so that people can free themselves from oppression if they only change how they think and talk?

But that, of course, is the point. The idealism serves two purposes: it allows intellectuals to pretend they're important, since they're the ones who produce the ideas and discourses that supposedly constitute reality; and it takes attention away from things that matter in the real world, like wages, working conditions, the natural environment, and living conditions, thus serving the interests of business. So the whole postmodern paradigm is allowed and encouraged to become culturally dominant, and colossal sums of money are directed to fund "research" in these academic fields. It certainly is no coincidence that the era of the triumph of postmodernism was the era of the triumph of conservatism.

It's also worth noting that, as György Lukács describes in his masterpiece *The Destruction of Reason*, an idealism and relativism quite similar to the spirit of postmodernism pervaded German culture, and European culture generally, in the early twentieth century, and did much to prepare the ground for fascism—which itself was an idealistic and relativistic ideology and movement. So the postmodernists aren't in great company.

Wherein consists the decadence of postmodernism? In brief: (1) its frequently obscurantist and impenetrable prose, which serves to give the impression of incredible profundity and also protects writers from criticism (since "you're misunderstanding them!"); (2) its navel-gazing subjectivism and focus on language or terminology (or subjective identities, one's relationship with one's body, etc.), which discourages active, confident, productive engagement in/with the real world; (3) its agenda to deconstruct, tear down, "problematize," refute, fragment, rather than confidently create and synthesize; (4) its relativism, pessimism about the possibility of mutual understanding—or even the existence of meaning itself—and ultimately its nihilism; (5) its supposed hyper-sophistication, its cynicism, its weariness with all the great philosophies and achievements of the past, which is the opposite of a healthy, youthful, strong naïveté; (6) its fetish of the particular over the general; (7) its extreme pretentiousness, which dresses up simple ideas in over-inflated, turgid prose and presents truisms as if they're important discoveries; (8) its rejection of

commonsense realism and the very notion of objectivity or truth; (9) its intellectual sloppiness and many self-contradictions (e.g., “[it’s objectively true that] there is no objective truth”); (10) its cloistered, elitist, hyper-academic nature; (11) its political cowardice, as in its refusal to confront class-structures; (12) its lack of seriousness and urge to just fecklessly *play* (with words, concepts, images, collages—*bricolage*); (13) its goal to provoke for the sake of provoking, to be outrageous for the sake of being outrageous, and in the end to just garner attention for oneself because nothing else matters in a world in which nothing matters. Etc. *ad nauseam*. Postmodernism is the very apotheosis of decadence, the kind of thing that happens just before the world ends.

So Chomsky has generally ignored it. And even this reaction is the healthiest and least decadent possible, because postmodernism is so *obviously* rotten, so clearly masturbatory, so vitiating, so polluted with intellectual, aesthetic, and moral vice, and in the end so unimportant compared to the crimes constantly being committed by the state and the business community, that one might as well focus on something else, something that truly matters. Just ignore these intellectuals as the self-promoting parasites and poseurs they are.

I’ve also appreciated Chomsky’s tendency to ignore another symptom of decadence: postmodern feminism, queer theory, gender theory, all the discussion of sexuality and bodies and so on that proliferates among liberal and leftist academics and activists. Practically the only time he ever acknowledges feminism is when describing progress that has been made since the 1960s. And he’s right, of course: the progress that has been made in women’s rights and sexual equality, as in gay rights, in the last two generations is of immense importance, and has had a civilizing effect on the culture. Moreover, this sort of activism remains urgent, as states roll back abortion rights, a conservative majority exists on the Supreme Court, the Trump administration tries to make it more difficult for sexual assault survivors to speak out, etc. Feminism will always be of great moral significance, because there will always be room for improvement in relations between the sexes.

But the specifically postmodernist aspects of contemporary feminism are of far less moral importance than the general goal to empower women. In fact, there’s an enormous amount of intellectual confusion and shallow thinking among feminists. I’ve discussed the matter here, and won’t delve into it now. Suffice it to say that, for many feminists, the idealistic mantra “Social constructions!” substitutes for thought, and for open-minded perusal of the relevant scientific and psychological literature—not all of which (to say the least) supports favored politically correct dogmas. The radical empiricism of postmodern feminism, according to which the minds of males and females are a blank slate at birth onto which social expectations are written—such that genes, hormones, brain structures and such make no contribution to the differences in behavior and psychology between men and women—is scientifically very problematic.

But it’s an example of a common and unfortunate, and quite anti-Chomskian, human tendency: the tendency to believe something not on the basis of evidence but simply because one *wants* to believe it. Most people evidently are prone to thinking on the level of “I like” and “I don’t like,” not “The evidence suggests...” They think according to value-judgments, not disinterested investigation of evidence. This explains how religious belief can be so widespread despite being irrational: people want to believe in God, so they do. This phenomenon is such a “fundamental dishonesty and fundamental treachery to intellectual integrity,” to quote Bertrand Russell, that I find it hard to understand. But it’s present everywhere, among feminists, conservatives, liberals (“Obama was a great and moral president!”—despite his drone terrorism campaign, aggressive deportation of immigrants, refusal to prosecute bankers, slavish support of Israel, refusal to bail out homeowners after the 2008 crash, support for the 2009 military coup in Honduras, relatively meager actions on climate change, catastrophic intervention in Libya, support for dictators all over the world, and generally his abject subservience to the oligarchy that runs the U.S.), free-market fundamentalists, Leninists, and so forth.

Regarding Leninism, for instance, Chomsky is right to criticize both the theory and the practice (before, during, and after the Russian Revolution). Recent scholarship, such as that of Christopher Read and Orlando Figes, validates the old criticisms of Lenin by anarchists, left-Marxists like Rosa Luxemburg, and Chomsky himself, in showing how Lenin ended the experiments with workers’ control of factories in 1917 and established dictatorial control over the state and society. One can argue that he had to, given the

conditions that prevailed; but it's striking that his undemocratic, semi-Blanquist practice was wholly consistent with his earlier ideas, his vanguardism and elitism. But even apart from this, there is something at least prima facie odd in still worshiping and looking for profound lessons from a figure, or figures, who dealt with conditions that could hardly be more different from the U.S. in the twenty-first century. What does Russia in 1917 (and earlier, when Lenin was formulating his ideas) have in common with the U.S. in 2018? Why not stop obsessing over how Lenin seized power in a shattered late-feudal, early-capitalist country, or what his strategies were to seize power in such a country, and instead focus on conditions and problems that confront us now?

One other point about feminists, and many other young leftists today: conservatives' criticisms of their totalitarian tendencies are not wholly off the mark. Free speech is, after all, an important value, however much feminists and others might not want to hear things that hurt their feelings. To give a trivial personal example: I was once invited to give a talk on worker cooperatives at a university, but the invitation was rescinded after some students came across the [page on feminism](#) I linked to above. They were offended, you see, by what they had read. I found the incident more amusing than anything, but it was disconcerting to have it vividly confirmed that even the sorts of obvious truths and mild provocations they had read are considered beyond the pale, so much so that it's necessary to cancel a talk on a completely unrelated subject. Nothing less than absolute uniformity of thought is permitted.

Again, though, Chomsky's attitude is right: however stupid and immoral the totalitarian intolerance of young leftists might be—and also self-defeating, because it risks alienating people who basically share their values and want to fight for a better society—the threat to free speech posed by such people is so minuscule compared to the colossal suppression of truth and free speech by government and the corporate media that it makes no sense to focus on the silly young leftists.

Moreover, Chomsky's general reluctance to criticize the left, especially as compared with the fierce criticisms he levels against dominant groups, is precisely right. “The most important word in the language of the working class is ‘solidarity,’” Harry Bridges said. Privately, yes, one should criticize the actions or beliefs of fellow leftists if that might have a constructive effect. But one should be wary of making severe public criticisms, since that might serve only to foment resentment and thereby fragment and undermine the left. No living leftist better exemplifies solidarity than Chomsky. (On this point, he is far superior to the sectarian Marx.)

To sum up, Chomsky has been able to avoid all the decadence that has afflicted intellectual and cultural life for well over a hundred years. I have yet to come across instances in his writings and talks of sloppy thinking, intellectual dishonesty, a lack of commitment to principle, or the groupthink and status-consciousness that condition how virtually all “intellectuals” (and, in fact, nearly all people) think, write, and act. How common it is for people to take something seriously just because it's taken seriously by others! Or to act in a certain way only because others do, and condemn those who act or think differently. Instead, one should step outside one's own little subjectivity, one's personal feelings and impulses, and evaluate every thought and act in the light of cold reason and warm compassion.

*

Another unusual quality of this *Übermensch* I'm over-praising is that he doesn't waste words. His manner of speaking and writing is notably pithy and economical—which sounds odd, since he's famously long-winded. He talks and talks, and could probably talk for days, until he collapsed from inanition, just following a train of thought where it led him. In general, though, every word seems necessary, every sentence furthers the argument or usefully illustrates it with examples. This economy of expression is, to put it mildly, unusual among intellectuals, as among everyone else. People love to hear themselves talk, and they'll frequently talk for the sake of talking. It's a phenomenon readily observable during most kinds of “meetings” (of activists, for example), academic seminars, and question-and-answer sessions during talks (in which audience members asking their questions frequently expatiate unnecessarily, and often incoherently, on all manner of topics, until the moderator has to interrupt them).

Again, I'm led back to the theme of decadence, and of particularity vs. generality. People are immersed in themselves: when talking at great length unnecessarily, they're being self-indulgent, unempathetic, undisciplined, and just plain stupid. (Stupidity is utterly immersed in itself, whereas intelligence incorporates others. Particularity vs. generality.) In communicating, one should try to stick to the point. Even more importantly, one should *have* a point.

Chomsky's practice in this respect holds some lessons for academics. He doesn't describe for the sake of describing, recounting things that happened just because it's interesting to tell stories or to probe the experiences of people from certain analytical perspectives (the perspectives of gender, race, sexuality, or whatnot). While there is value in doing so, in the manner of social historians for example, he prefers to take a more scientific approach to the study of society. As he says in [this interview](#) (near the end), if your goal is to *explain*, rather than just to describe, you have to apply general principles to particular phenomena and try to explain the latter in terms of the former. You don't simply wade around in the particularity and remain on that level; and you certainly don't celebrate the particular for its own sake, as postmodern scholarship—which rejects general principles like class conflict as either oversimplifications or of no special priority—often does. The whole point of science is to simplify, to explain the chaotic mess of reality in terms of simple principles like Boyle's Law or Newton's laws of motion. You abstract from complicating factors and isolate dominant forces; then you try to account for unexplained factors by using secondary principles, and so on. Throughout, the point is to test the *general idea*, not to say, in effect, "Reality is incredibly complex, but here are various ways of describing it and interpreting it (using gender, race, sexuality, class, individual psychology, etc.)."

As I've explained in [this essay](#), in the case of society, the dominant principle has to be class conflict. Or historical materialism more generally. Of course, society is different from nature: it's not deterministic. So the "science" is of a different character than physics, and the explanatory principles are of a different character than Newton's laws of motion. Still, the people who criticize Chomsky or Howard Zinn or Marx for being reductivist, oversimplifying, partisan, etc. are wide of the mark. The truth is that it's the establishment intellectuals who are being far less scientific than the "partisan" leftists, because the latter recognize how science, or understanding, works. It isn't "neutral." It is *grounded in "reductivist" principles*.

A new book by the respected liberal historian Jill Lepore serves to illustrate the point. [*These Truths: A History of the United States*](#) has received the usual acclaim that establishment writers get, and in many ways it is an impressive achievement. But not as providing a framework of explanation for U.S. history. Insofar as the narrative is guided by general ideas at all, they're the wrong ideas. "The United States rests on a dedication to equality, which is chiefly a moral idea, rooted in Christianity, but it rests, too, on a dedication to inquiry, fearless and unflinching." "The American experiment rests on three political ideas...political equality, natural rights, and the sovereignty of the people." It's the tiresomely conventional liberal idealism, which, incidentally, is grounded in value-judgments just as much as Zinn's *People's History of the United States* is. Lepore has given [the usual criticisms](#) of Zinn, that he simply reverses old value-judgments about the gloriousness of America, a reversal that, analytically, "isn't an advance; it's more of the same, only upside-down." She fails to see that her own history is just a more subtle return to the narrative about how great and unique "the American experiment" is. She acknowledges that lots of bad things have happened in U.S. history, but then immediately qualifies this admission by saying it's true of every other country too (which it is). And then the next sentence: "But there is also, in the American past, an extraordinary amount of decency and hope, of prosperity and ambition, and much, especially, of invention and beauty." This sentence isn't followed by acknowledgement that the same value-judgment is true of other countries, because Lepore, as a good patriotic liberal American, still implicitly subscribes to the old notion of American exceptionalism (which Zinn, being a deeper thinker, rejected—and this *was* an "analytical advance"). Her agenda is to celebrate the U.S.—to defend it against "critics" like Zinn—as a French historian might celebrate France, a British historian might celebrate Britain, etc. There isn't much explanatory value in this sort of patriotic narrative history.

[...]

One of the reasons for Zinn's sophistication is that he doesn't adopt a naïve idealism that tries to "explain" history using principles that aren't robust enough to really explain anything. He uses truly explanatory principles, which, like a scientist would, he tests by deeply exploring the past. These "principles" amount to the single, commonsense statement that Chomsky makes in the film *Requiem for the American Dream*: "The history of the United States is a constant struggle between these two tendencies: pressure for more freedom and democracy coming from below, and efforts at elite control and domination coming from above." It's a history of power struggles, which amounts to a history of class conflict (including racial and other forms of conflict, conditioned in myriad ways by class). This is a realistic and substantive hypothesis that provides a framework of understanding, and that is backed up by a colossal body of world historiography.¹

Nathan Robinson of *Current Affairs* has devastatingly criticized Lepore's book, pointing out that it mostly ignores the history of working-class struggle, among other things that are central to the American story. But this is what happens when you don't have much of an overall point except to tell particular stories that you rather arbitrarily judge to be important. If you lack a weighty analytical anchor, you lose your way.

I've always found it ironic that the idealists, whether liberal, conservative, or postmodernist, are bad at ideas, far worse than the materialists.

The fact is that you don't need the endless verbiage of academics, the (usually hyper-specialized) books and articles *ad infinitum*, in order to understand the world. Essential truths can be expressed in a few words, as Chomsky shows. You state the hypotheses, and then you provide the factual documentation. Of course, we intellectuals have to get our paychecks, so it is necessary for us to constantly come up with new research proposals and new stories to tell for their own sake, and to discuss unendingly in conferences and so forth, repeating and slightly reformulating old insights or "problematizing" them for the sake of problematizing them, pompously "theorizing" and pontificating, but little of our activity has much of a 'scientific'—and certainly not a moral—payoff. It's just how the institutions work, and how the political economy keeps educated people occupied who might otherwise spend their time on dangerous pursuits like challenging power-structures.

*

This article has gotten long enough, but there are a couple more points I want to make before putting an end to the "endless verbiage" to which I'm subjecting the reader.

[...]

In the end, it's this (relative) absence of ego that sets Chomsky (relatively) apart. He obsesses over politics not because he enjoys it—he surely finds it very dreary—but because, given his abilities, he has a duty to. I think we all could be a little more conscious of our duties to each other, insofar as we subscribe to the Golden Rule (as we should). Duties to be kind, to answer emails, to not be too quick to judge harshly, to imagine ourselves in the other person's shoes, to give people the benefit of the doubt while yet taking a clear stand when certain moral lines have been crossed, and in general to strive for relative selflessness (because that is intellectually, aesthetically, and morally elevated).

It's easy to be misanthropic and nihilistic, but there is something a little self-indulgent, even decadent, about that. A more "clean" and virile response is to recognize the horrendous evils and absurdities of the world, indeed to take them for granted, but to imagine oneself as an objectively detached being who is committed, no matter what, to realizing certain universal values. Nothing can make you stray from your path. However stupidly and disgustingly people act, you continue to act kindly and respectfully because it's

¹ But you really only need to read one book in order to get the rudiments of an education: *Understanding Power: The Indispensable Chomsky*. I don't think I'm exaggerating when I say that, together with its extraordinary footnotes, this may be the greatest book ever published in the fields of political philosophy and political science. I think it also suggests one of the reasons that intellectuals loathe Chomsky: he knows and understands so much more than they, despite lacking all professional credentials in these fields, that his existence is something of an embarrassment. Even worse, it's hopeless to argue against him. All you can do is smear him.

a principle you're committed to, your own categorical imperative. You keep working to improve the world in whatever small ways you can, because that's the law you've given yourself. You try not to emotionally dwell on the negative, since there's so much of the negative in the world that you'll end up in suicidal despair. You remember there is also plenty of the positive, and the only healthy thing is to increase the aggregate amount of the positive.

In a sense, don't take the world seriously. Don't take the farce, or the "freak show," as George Carlin called it, seriously. We're here for a few decades, can observe and try to mitigate the freak show for a few decades, and then vanish into the oblivion from whence we came. Nothing really makes sense, not our existence and, especially, not what we've collectively done with our existence. The brutal Chomskian irony/sarcasm is appropriate. But you still make of life what you can, do what you can to live in a healthy way, not being surprised or overly depressed by all the cruelty and absurdity but impressed by the many positive qualities you encounter.

Nietzsche's *amor fati* is perhaps unattainable, but Chomsky's stoicism and good humor are the next best thing.

In short: happy birthday, Noam, and may you have many more.

Free Speech, Hassan Nasrallah, and Other Victims of Internet Censorship

The fact that we live in a world in which the distribution of information is largely under the control of private corporations (and of governments overwhelmingly influenced by corporations) is itself a sufficient indictment of our civilization. Even if, impossibly, no other crimes ever occurred anywhere and systems of power were by and large benevolent, private control and distribution of information would justify attempts to reconstruct society on a new foundation. Such control is simply too contrary to the principles of free expression and free access to information to be tolerated by a people who value democracy, truth, and rational, unimpeded communication. How much worse is it, though, when corporate control of information is an essential precondition for the non-stop commission of systematic crimes against humanity by these very corporations and governments. If the public knew everything that's going on, it is unlikely they would tolerate it for long.

As it is, we're living in a planetary practical joke, victims of some malevolent cosmic intelligence with a sick sense of humor: in order to organize political dissent, struggle for social progress, and spread knowledge of corporate and government crimes, we're dependent largely on networks that are run and policed by these criminals themselves. We function at the mercy of their good will. Internet service providers can, whenever they feel like it, deny service to some "dangerous" individual or group; media platforms like Facebook and YouTube can suspend a user as soon as they decide they don't like what he's saying, or if he runs afoul of some algorithm; Google can steer traffic away from particular websites, as it has lately been doing with regard to left-wing sites like the World Socialist Website, AlterNet, Democracy Now, and CounterPunch. And the victims of this censorship have, in effect, no recourse, except to appeal to the public to pressure the censors.

Facebook has censored countless users who didn't deserve it, as when disproportionately targeting activists of color, suspending livestreams of police shootings, temporarily deleting TeleSur's English page, and deleting VenezuelAnalysis's page (until the ensuing public outcry got that decision reversed). Its army of content reviewers is constantly censoring individual posts in accordance with a 27-page set of rules, resulting in the suppression of posts about, e.g., Indian atrocities in Kashmir, Geronimo and Zapata as heroes in the "500-year war against colonialism," and a left-wing counter-rally on the anniversary of the violence in Charlottesville, Virginia.

The political censorship (of both the left and, sometimes, the right) is out of control: this past year, hundreds of accounts and pages have been deleted on the pretext that they're fake or "inauthentic." Or, as always, "extremist." Not surprisingly, many have been quite legitimate, run by real people who were using pseudonyms for the sake of safety, or whose perspectives are just designated as unacceptable because

they're contrary to official narratives. After deleting dozens of "inauthentic" accounts and pages last summer, Facebook stated that the culprits had "sought to inflame social and political tensions in the United States, and said their activity was similar—and in some cases connected—to that of Russian accounts during the 2016 election." In other words, users are now forbidden to "inflame tensions" or to act "similarly" to Russian accounts.

At least we're still allowed to share cat memes and baby photos.

But the main victim of this creeping McCarthyism has been, of course, the cause of the Palestinians, and more generally anyone who objects to Israel's decades-long orgy of bloodlust. Whether on Twitter, YouTube, Facebook, or other platforms, entities resisting Israel are regularly denied a voice. Hamas's armed wing isn't permitted an account on Twitter, while the Israeli army is. Facebook blocks Palestinian groups so often—including Fatah and leading media outlets in the West Bank—that they have their own hashtag, #FBCensorsPalestine. Given that these media near-monopolies are an essential means of reaching followers and spreading a message, such censorship has a very destructive effect.

Recent outrages concern suppression of the voice of Hezbollah's Secretary-General, Hassan Nasrallah. A year ago YouTube suspended a popular channel that broadcast, and provided translations of, speeches of Hassan Nasrallah, among other "anti-American" leaders (Putin, Assad, etc.). The channel, which had over 400 videos, had 10,000 subscribers and had racked up more than six million views, and was growing in popularity. YouTube's pretext for its suspension was "violation of the rules concerning graphic or violent content." More specifically, three videos of Nasrallah's speeches were deemed offensive: one was titled "ISIS is Israel's ally and aims [at] Mecca and Medina," the second was titled "We are about to liberate Al-Quds (Jerusalem) and all of Palestine," and the third was called "The next war will change the face of the region." It would be hard to argue that anything in these speeches was particularly "graphic or violent," for they contain little but sensible political analysis and exhortations to resist a brutally violent neighboring state.

The owner of the channel then created a Facebook page to post similar content, called Resistance News Unfiltered. A year later, just a few weeks ago, it was deleted. With no explanation. It had over 6,000 subscribers and was providing an important service by translating the speeches of a highly perceptive political analyst. Norman Finkelstein recently released a statement on all this censorship of Nasrallah:

It is a scandal that the speeches of Hassan Nasrallah are banned on youtube. Whatever one thinks of his politics, it cannot be doubted that Nasrallah is among the shrewdest and most serious political observers in the world today. Israeli leaders carefully scrutinize Nasrallah's every word. Why are the rest of us denied this right? One cannot help but wonder whether Nasrallah's speeches are censored because he doesn't fit the stereotype of the degenerate, ignorant, blowhard Arab leader. It appears that Western social media aren't yet ready for an Arab leader of dignified mind and person.

The *New York Times* has reported that "Israeli security agencies monitor Facebook and send the company posts they consider incitement. Facebook has responded by removing most of them." In fact, typically over 90 percent of them. Meanwhile, as Glenn Greenwald notes, "Israelis have virtually free rein to post whatever they want about Palestinians," including calls for genocide and the most grotesque celebrations of the torture and murder of Palestinian children.

All this is perfectly predictable, for the economically powerful will always cooperate with the politically powerful to suppress dissent. Companies like Facebook and Google (which owns YouTube) will always be inclined to do the bidding of the U.S. government and its allies. This fact nevertheless constitutes a terrible, proto-fascist danger to free speech that ought to be resisted as energetically as any crime against humanity concealed by such corporatist collaboration.

Only if we flood Google, Facebook, Twitter, and the others with complaints is there a chance for necessary voices like Hassan Nasrallah's to be heard. Our endgame should be to eliminate these corporations themselves and transfer the media infrastructure they own to the public, but on the way to that goal we have to keep poking holes in the corporate blackout to let in some sunlight.

The Coming of American Fascism, 1920–1940

Fascism is usually thought of as a quintessentially and almost exclusively European phenomenon, as having begun with Mussolini, culminated with Hitler, and been eradicated in World War II. The U.S., in particular, is thought to have been largely immune to it, given the absence of mass movements similar to Nazism or Italian Fascism. But there exists a different narrative, or at least there did in the 1930s, before it was buried under an avalanche of patriotic American propaganda and liberal historiography. According to this alternative understanding, the U.S. was falling victim to fascism already in the 1920s—though a different sort of fascism than in Europe. Long-forgotten Marxist journals such as *The Communist*, *The New Masses*, and *Labor Notes* (unrelated to the [current publication](#) of the same name), and newspapers like the *Daily Worker* and the *Industrial Worker*, analyzed with great insight the nature of this distinctive American fascism, until the struggle against the Nazis shifted their priorities to supporting a more liberal and “patriotic” Popular Front.

In a new book entitled [The Coming of the American Behemoth: The Origins of Fascism in the United States, 1920–1940](#), Michael Joseph Roberto has resurrected the old Marxian conception. Aside from its interest as a work of history, the book is also quite relevant to the present, as the old structures of American fascism have deepened in the last generation and colonized much of the world.

The essence of fascism

Roberto’s project, in brief, is to reconstruct the arguments given in such pioneering, albeit now ignored, works as Lewis Corey’s [The Decline of American Capitalism](#), Mauritz Hallgren’s *Seeds of Revolt*, Robert Brady’s *The Spirit and Structure of German Fascism and Business as a System of Power*, Carmen Haider’s *Do We Want Fascism?*, and A. B. Magil and Henry Stevens’ *The Peril of Fascism*, all published in the 1930s or early ’40s. These authors and others, whose insights were not taken up by generations of liberal scholarship, understood that fascism was not uniquely European, that it could easily happen in the United States. In fact, they understood it was happening: as Brady noted in 1938, “business is going political as it never has before, and it has learned to funnel its funds and pressures through highly centralized, interest-conscious, informed and exceedingly well-manned, united front organizations.”

Evidently these writers had a different concept of fascism than most of us do today. As Paul Baran wrote in 1952, according to the liberal understanding, for a political system to qualify as fascist “it has to display the German or Italian characteristics of fascism. It must be based on a fascist mass movement anchored primarily in para-military formations of brown shirts or black shirts. It must be a one-party regime, with the party headed by a Führer or a Duce... It must be violently nationalist, racist, anti-Semitic...” While it’s perfectly reasonable to consider such a phenomenon as one manifestation of fascism, the analysis tends toward superficiality insofar as it obscures the class roots and class functions of the regime. The Marxist approach, which looks beneath the surface, is more penetrating, resulting in a “dynamic definition of fascism,” Roberto summarizes, “as an inherent function of monopoly-capitalist production and relations whose telos was and remains the totalitarian rule of capitalist dictatorship.”

Incidentally, this wasn’t only a Marxist notion. It was widespread in the 1930s, including in the very centers of power. “Many persons strategically placed in American business,” Brady wrote, “confidentially argue that [fascism] is already here in both spirit and intent.” Harold Ickes, Franklin Roosevelt’s Secretary of the Interior, gave a speech in 1937 arguing that “fascist-minded men” had “a common interest in seizing more power and greater riches for themselves, and ability and willingness to turn the concentrated wealth of America against the welfare of America. It is these men who, pretending that they would save us from dreadful communism, would superimpose upon America an equally dreadful fascism.” Other Roosevelt advisors trumpeted the same message. And finally Roosevelt himself broadcast the “Marxist” idea, when he announced in a speech in 1938 that “I am greatly in favor of decentralization,

and yet the tendency is, every time we have [a recession] in private industry, to concentrate it all the more in New York. Now that is, ultimately, fascism.”

It was widely understood, then, that the essence of fascism was, in Carmen Haider’s pithy formulation, the “attempt to introduce a collective form of capitalism in the place of individualism.” It was the fusion of big business with politics, the war on democracy by a public relations industry in the service of capital, the myth-making and “business evangelism” that is so integral to the propaganda industries of monopoly capitalism (and so reminiscent of the myth-making central to Fascism and Nazism). Whether the classic seizure of power through middle-class support was present was ancillary to the dictatorial rule of capital.

The New Deal’s corporatism

Roberto tells the history of the American political economy in the 1920s and ’30s through this lens, exploring how the fascist structures of our own day were forged between the two world wars. Much of his book, in particular the long expositions of Marxian economics, will be familiar to readers versed in left-wing literature. He devotes a chapter to the ideologists of fascism, or business rule, in the conservative 1920s, notably Thomas Nixon Carver, Harvard professor of economics, and Charles Norman Fay, vice-president of the National Association of Manufacturers and author of *Business in Politics*. Inevitably, we encounter Edward Bernays, father of public relations and believer in the necessity of “regimenting the public mind every bit as much as an army regiments the bodies of its soldiers.” These were the prophets and soothsayers, the heralds of the New Era of untrammelled capitalism.

But by 1930, the fascist millennium had succumbed to its economic contradictions, with the Great Depression. It turns out that when all the money goes to the top, the people on the bottom don’t have enough money to keep the economy growing. What was the way out of this dilemma? Well, according to the leaders of business and politics—more fascism. Many of them pined for a Mussolini, and even liberal newspapers like the *New York Times* advocated “some sort of Council of State” that could rule by decree. In the end, the oligopolists only partially got their way, with the establishment of Roosevelt’s National Recovery Administration in 1933.

It may seem absurd now, but in the mid-1930s it was usual for Marxists and socialists to argue that the New Deal was simply a higher stage of fascism. In fact, they had a point. “Conceived as a means to create common ground between government and industry,” Roberto writes, “the NRA marked a decisive move toward state monopoly capitalism in the United States.” The real power was left in the hands of big business, which wrote hundreds of “codes” to regulate prices, wages, work hours, etc., all to restore profits and eliminate overproduction. It was a move towards a planned, state capitalist economy, of which big business was the sole beneficiary. Small businesses suffered, workers were not really empowered, income was not redistributed, and the economy remained sluggish. But the profits of big business recovered.

The early New Deal “bore strong resemblances,” Roberto notes, “to the corporatist state established in Italy in its approach to reconciling the antagonism between capital and labor. Both Mussolini and Roosevelt had made clear their commitment to maintain and strengthen capitalism in their respective nations. Consequently, the fascist character of the New Deal could not be easily dismissed...” Roosevelt himself admired Mussolini: “I don’t mind telling you in confidence,” he wrote a friend, “that I am keeping in fairly close touch with the admirable Italian gentleman.” It’s ironic that a few years later Roosevelt was denouncing fascist tendencies in the U.S.

Huey Long and Charles Coughlin

Roberto is on shakier ground in his chapter on the “small-fry fascisti” who populated America’s political landscape during the Depression, particularly in his argument that Huey Long and the “radio priest” Father Coughlin were reactionaries and fascists. Long was a famously progressive, albeit dictatorial, governor of Louisiana in the early 1930s who later became a U.S. senator, from which perch he criticized the New Deal for its conservatism and proposed his own wildly popular “Share Our Wealth” program. Had

he not been assassinated in 1935, he might have posed a serious challenge to Roosevelt's reelection. [Coughlin](#), on the other hand, was never a political leader, though through his radio broadcasts he was a political force in his own right. He, too, became intensely critical of the New Deal for its conservatism—although, like Long, he denounced Marxism and communism as well.

My own [research](#) on the subject led me to conclude that, despite what some historians (including Roberto) have argued, they were more left-wing than right-wing, at least until Coughlin in later years turned decisively toward anti-Semitism. The two men certainly were politically ambiguous, and had Long become president, it is impossible to know how he would have governed. But it's inarguable that their massive following was due to the far-left character of their rhetoric—as may be judged by the [Principles](#) Coughlin laid out for the National Union of Social Justice, the political organization he founded. He went so far as to condemn the economic system itself: "Capitalism is doomed and not worth trying to save."

The reason I cavil with Roberto on this point isn't that I care much about defending Long or Coughlin. Rather, I disagree with his characterization of the millions of "petty bourgeois" who were attracted to the two figures:

Angry at the ruling class for robbing it of livelihood and status, [the petty-bourgeoisie] also stood fast against the masses that they believed threatened them more. Amid the swirl of change, dislocation, and anxiety about the present and fears for the future, they made up the great wave of political reaction during the mid-1930s... Not understanding how and why those above them were responsible for the crisis that threatened them, they blamed most of it on the enemies lurking below, the Negroes, Jews, Catholics, Mexicans, anarchists, socialists, and, of course, the communists—all enemies of True Americanism.

This is a facile interpretation for which, in effect, no evidence is given. In its over-generalizing it reeks of the lazy old Marxist condescension towards the middle classes. I can't go into much detail here, but [elsewhere](#) I've [argued](#) that there was no "great wave of political reaction" in the mid-1930s except among big business, that the middle and lower classes were generally far to the left of Roosevelt—and pushed him to the left in 1935, with the so-called Second New Deal that partially repudiated the fascist tendencies of the first. Long and Coughlin themselves played an important part in this swing to the left, since Roosevelt's popularity was waning in 1934 under the barrage of left-populist criticism. As a result, in 1935 he supported the Wagner Act, the Social Security Act (which was, however, more conservative than most Americans wanted), and the establishment of the Works Progress Administration. And in 1936 he ensured his overwhelming reelection by taking a page from Long's book and denouncing "economic royalists" who were callous to the suffering of Americans.

The truth, then, is that Long and Coughlin, together with the influential Communist Party and other leftist organizations, helped save the New Deal from becoming genuinely fascist, from devolving into the dictatorial rule of big business. The pressures towards fascism remained, as they always will in the context of corporate capitalism, and reactionary sectors of business began to have significant victories against the Second New Deal starting in the late 1930s. But the genuine power that organized labor had achieved by then kept the U.S. from sliding into all-out fascism (in the Marxist sense) in the following decades, during the Cold War.

The struggle to come

The Coming of the American Behemoth is an interesting book with lessons for the present, as we confront a polarized and oligarchical political economy so redolent of that which precipitated the Depression. All the debate about whether Donald Trump is fascist, or whether society is in danger of succumbing to fascism, can be seen, from one perspective, as missing the point. Fascism in the materialist sense has been increasingly with us, especially (though not only) with Americans, for the last forty years, as the political economy has returned to something like its state in the 1920s. It is here now, already, and would be here even if Hillary Clinton had won the presidency.

The danger isn't so much that "paramilitary formations of brown shirts or black shirts" will take over society as that we will fail to overturn the *class* foundations of fascism that are at this moment racing to destroy life on Earth. Roberto is right to emphasize this deeper structural reality.

In short, while the American Behemoth was rising in the 1920s and '30s, in the 21st century "the beast is at full strength." It will take a revolutionary struggle of the working masses to destroy it.

A Little Misanthropy Can Be a Healthy Thing

[A blog post]

This is from a letter Sigmund Freud wrote to his pastor friend Oskar Pfister:

I do not break my head very much about good and evil, but I have found little that is 'good' about human beings on the whole. In my experience most of them are trash, no matter whether they publicly subscribe to this or that ethical doctrine or to none at all. That is something that you cannot say aloud, or perhaps even think, though your experiences of life can hardly have been different from mine. If we are to talk of ethics, I subscribe to a high ideal from which most of the human beings I have come across depart most lamentably.

He expressed the thought more concisely in another letter: "In the depths of my heart I can't help being convinced that my dear fellow-men, with a few exceptions, are worthless."

Misanthropy has tempted "great thinkers" from Heraclitus to Nietzsche and beyond, and I suspect it tempts most people in general, at least sometimes. All they have to do is look at how cruel, [stupid](#), inconsiderate, selfish, greedy, vulgar, and so on their fellow humans are! The irony is that most people who periodically feel this revulsion are themselves more than capable of being cruel, stupid, inconsiderate, etc. Freud, for example, was [very far from a model human being](#).

Personally, I'm not above the occasional misanthropic mood. There have been times I've identified so little with the nasty, stupid species called *Homo sapiens* that I've whimsically speculated I must come from another planet. I remember fantasizing at 12 or 13 that I was an alien who had been dropped on Earth to live among humans for a while, write a long report on what he saw, give it to the human species for its benefit (so it would have the opinion of a third party), and then return to Mars or wherever it was I was from. What has kept me from actually being a "misanthrope," I think, is that I was lucky enough to be born with a cheerful nature and a sense of humor. Observing how ridiculous people are, in the ironical mode of a George Carlin, can be a diverting pastime.

"When you're born, you get a ticket to the freak show," Carlin remarked. "When you're born in America, you get a front row seat."

In a post several years ago called "[Subversive common sense](#)" I gave a few examples of the absurdity of our usual ways of thinking and acting, but I'm in that impish mood again and think I'll continue the list here. Sorry if it offends or upsets anyone. It's mostly just meant in jest (I think). Life, after all, would be hard if we didn't have a sense of humor. We shouldn't take ourselves so seriously!

Where to begin? How about with that old Freudian chestnut, sex? Freud's fetishizing of sex was a little extreme, but the sex instinct certainly does take up a lot of space in the mind. And a good deal of behavior that seems more or less innocent is shot through with a not-very-high-minded significance. To take an obvious example: feminine clothing. Imagine what an outside observer, like a Martian, would think if he were to investigate our species. He would see the females dressing skimpily and seductively, baring their skin and breasts, as the males frequently stared or tried to avert their gaze; and he would likely be puzzled as to why the males didn't simply grab one of these tempting females whenever they wanted. "What's holding them back?" he'd wonder. "What a strange species! The males have an irrational amount

of self-restraint. From their behavior it's clear they're frustrated, and it seems the females like to taunt them. Perhaps in this species the females are dominant?"

He'd watch men and women sit in public settings and would see men spreading their legs and women closing theirs. "The males' pose is sexually inviting, but the females invariably either cross their legs or simply keep them closed, obviously to cover their vaginas. This custom, at least, makes sense from the standpoint of evolutionary psychology." (That's the *Martian's* point of view, not the *true* one.) Suppose he observed gymnastics, figure skating, or ballroom dancing. "It's all very beautiful and impressive, but certainly one of the meanings of these rituals must be sexual. Why else would the females wear such revealing clothing, showing even their buttocks and breasts, when the males don't? [Why else would they keep spreading their legs wide open](#), twirling them around the males, who are touching them and grabbing them in the most private areas? The crowd seems mesmerized by these sexual displays." If he happened to see the Rockettes perform, the significance of the high kick routine would be evident: "The point, obviously, is that the females are giving everyone a series of momentary views of their genital area. It's a sexually suggestive, flirtatious performance."

What he probably wouldn't know, from his external perspective, is that a vast conspiracy of silence among humans systematically pushes such "naughty" interpretations as his off to the margins of consciousness. Or maybe after lengthy observation he'd have an epiphany: "My god, is it possible they're actually just living in denial? They keep sexuality repressed -- so repressed they might even be outraged if someone pointed out these obvious truths! Are they perhaps ashamed of sex?"

"In general," he would conclude, "this species shows dazzling ingenuity, really inexhaustible imaginativeness, in both its expressions and its concealments of the sexual impulse. Wherever humans go and whatever they do -- whether watching images on their electronic devices or walking in the streets or sitting on the underground trains -- they're viewing females flaunting their sexuality, or else trying to conceal it. In this sense, the male sex is clearly dominant and determines social behavior. And yet most males are terribly frustrated, it seems. Fascinating!"

Sometimes you get a truer perspective, or at least a more interesting one, if you imagine how a Martian would interpret humans. This is why Noam Chomsky likes to use this conceptual device. To paraphrase him: "A Martian would see us exacerbating global warming, i.e., racing to destroy ourselves, and would conclude humans are an evolutionary error. Self-destruction must be programmed into them somehow. That would be a rational [though not necessarily a *correct*] conclusion."

On the whole, people are much too prone to self-deception. They tell themselves pretty stories to think well of themselves and to hide the real significance of their behavior. Suppose a woman falls in love with a man. "He's so kind and smart, caring and funny. He's my soulmate." Okay, but what if he were three or four inches shorter? Or, God forbid, actually shorter than you? Would he still be your "soulmate"? Not likely. What if he had a lazy eye? Or an unsightly mole on his face? Would his kindness and intelligence mean so much to you then? Doubtful. You would have rejected him in favor of some taller or better-looking guy, just as men are apt to reject women for not being pretty or thin enough or subservient enough or giggly enough.

"Affairs of the heart" are largely accidental. Like most things in life. They're not so meaningful. If the guy had chosen a different bar for the first date, a noisier or seedier bar, the dynamics of the conversation would have been different and the girl might well have decided, for whatever reason, not to see him again -- and so their marriage, their children, their grandchildren, none of it would have happened. All because he took her to the wrong bar. Or to a place with bad lighting or a rude bartender or some other little thing that could muck up the "chemistry." Or if he had worn an outfit she didn't like; or maybe he wasn't muscular enough, or he had a bad haircut, whatever. It's all bullshit. Life is a series of stupidities and accidents.

All this is obvious, but people seem to forget it. Understandably, I suppose. But it's salutary to keep it in mind, so we don't take ourselves too seriously.

And we definitely shouldn't take seriously collective or institutional phenomena like culture or politics or [individuals' status](#). The tendency is that high social, professional, economic, or cultural status indicates moral and intellectual mediocrity (though there are exceptions). "In an amoral world, the amoral man is best qualified to succeed," to quote the historian Albert Prago. But not only the amoral man: also

the obedient, cowardly, groupthinking, and incurious man. It always strikes me as pathetic and immoral that some people, such as celebrities, billionaires, and successful intellectuals, are treated as superior to everyone else. It's a farce: they're just *people*, after all. Except that in most cases they're more unpleasant and morally compromised than others.

Sometimes an article published in a mainstream newspaper or magazine will cause a big splash and the author will get a lot of attention, will be interviewed a lot, and will perhaps have changed how hundreds of people think about the world. It's a joke. Any number of articles published on left-wing sites like *Counterpunch*, *Current Affairs*, *In These Times*, *Jacobin*, *Consortium News*, and dozens of others would have had a much bigger impact if only the editors and publishers of liberal outlets weren't too cowardly to print anything really challenging. I can't help being disgusted by the whole show, in fact by [many things that have a collective dimension](#). In the "collective" is not only stupidity but also fakeness, [pretentiousness](#), amorality, and cowardice.

I sometimes even find it hard to reconcile the desire to be influential with the knowledge that most "influential" people are pretty contemptible. Or that influential books and articles are often *terrible*. Think of the writings of "libertarians" like Ayn Rand, op-ed columnists like [Thomas Friedman](#), or intellectual hucksters like Ben Shapiro and Jordan Peterson. If *that* is what it means to be influential, well then screw it, who cares! Of what value is "recognition" if such pathetic people as this have so much of it? Why do I care about influencing or being "recognized" by the sorts of uncritical fools who are capable of worshiping low-caliber "public intellectuals"? I should care about that desire not much more than I care about influencing other apes in the human family tree -- chimps, bonobos, gorillas, orangutans. In the end, are most people really so far removed from *Homo neanderthalensis*? (Just think of most white supremacists, ICE agents, fascists, reactionaries, [inhumane bureaucrats](#), politicians, "bro"-y corporate types, money-grubbers of all stripes, empathy-deficient egotists, uncritical dogmatists anywhere on the political spectrum, and so on.)¹

I'm reminded, again, of what Chomsky said once. When [his assistant asked him](#), "How do you keep from getting angry at all the nasty emails you get from enraged people?," he simply said, "Do you get angry with a hurricane? [No, she replied.] Well, people are hurricanes." I don't know what he meant by that, but, in less-than-sympathetic moods, I've assumed he meant people tend to have little control over themselves, they're guided more by emotions than reason, don't have a lot of free will in some respects, are scarcely even responsible for their actions. They're like forces of nature, not rational moral agents.

But this type of thinking is too one-sided and misanthropic to be the whole truth. And even if frauds, idiots, and assholes are frequently respected or even revered (in fact, it's safe to say that nearly all people who are widely respected -- [including Mohandas Gandhi](#), by the way -- are profoundly flawed), that doesn't mean you shouldn't keep trying to make the world a better place and appreciate whatever recognition you get for doing so. And if you get none, so be it. In such an unjust world as ours, that's really what you should expect: either no recognition at all, or active punishment of various sorts. What matters is that you respect yourself. Take it as a badge of honor that you're not celebrated -- you're not low enough for that.

But however important it is to do all you can to help people, don't make the mistake of taking them (or 90% of them) seriously.² They're not Chomskys; they're wrong about most things, and deeply flawed. The most passionately believing people are liable to be the most wrong. Even well-intentioned liberals and leftists almost always have gaping blind spots they plug up with all manner of delusions. Take anti-nuclear environmental activists, people like [Helen Caldicott](#). Since the 1970s, thousands of activists have devoted much of their lives to fighting against nuclear energy, which they consider polluting and dangerous. Some have achieved great fame, and are utterly convinced they've made the world a better place. Turns out they've

¹ Needless to say, scientifically speaking, the comparison between humans and Neanderthals is surely unfair to both. Who's to say Neanderthals weren't gentle, peaceable creatures? And humans are, after all, more intelligent than Neanderthals, even if it often seems they aren't. At least humans have language, which Neanderthals probably didn't.

² More accurately, help them, improve them, listen to them, reason with them, but don't get frustrated by them. *Expect* them to disappoint you -- and then you won't really be disappointed. You might even be pleasantly surprised, if they defy your expectations.

not only wasted their lives but have actually made the world worse. I've written [elsewhere](#) about how the conventional wisdom on nuclear power is [dead wrong](#). By advocating the closure of nuclear power plants and making it more costly to build new ones, these people have helped cause the deaths of thousands from coal plant emissions (which have replaced nuclear plants) and have exacerbated global warming. Future generations can thank environmentalists for helping to wreck the environment.

The same is true of most anti-GMO activists. While there are plenty of reasons to fight against Monsanto and other such corporations, the war against GMOs as such [has only harmed people](#) across the developing world. Many activists who pride themselves on their morality and humanitarianism are devoting their lives to keeping millions hungry and poor.

These are the ironies human life is full of, the ironies you can avoid only by educating yourself dispassionately, observing the world objectively, and thinking critically about everything you do and believe. Don't get too attached to particular beliefs; always be willing to rethink everything.

One significant irony is that intellectuals, or in general highly educated people, are usually [more deluded](#) about themselves and the world than the less educated are. They've been more indoctrinated, so their beliefs are less sensible. [Certain aspects of feminism are a good example](#). Many feminists are certain that physical and biological facts about men and women have no causal relation to gender identities -- everything is socially constructed -- but in fact this belief, far from being correct, is hardly even coherent. After all, gender identity incorporates beliefs about and attitudes toward one's body, and toward the biological processes that occur in one's body. Processes like, in men, the pubescent growth of the penis and testes, ejaculation, increasing muscle mass, and greater size and height than women; and in women, processes like menstruation, the growth of breasts, pregnancy, and nursing. If norms of femininity include norms about nursing children, or even staying at home during pregnancy and motherhood as your partner provides for you, evidently this is (in part) because it's women, not men, who get pregnant, give birth, and nurse children. So, lo and behold, it appears that biological facts do partly determine gender, and "social construction" is only one piece of the puzzle.

Why is masculinity associated with physical activity, athletic prowess, and muscular strength? You don't have to be a genius to see it's because men tend to be faster, stronger, and have more endurance than women. (*This isn't a value-judgment!* It's just a fact!) And so, given that the sexes naturally define themselves in relation to each other, masculinity ends up being defined as more athletic than femininity. Whoops: it seems, again, that biology semi-determines gender norms. And the whole vast feminist literature arguing against this idea is refuted, by a couple of sentences.

It's easy to go on in this vein, refuting postmodern idealism about gender.

Feminist academic writings also provide illustrations of intellectuals' extreme *pretentiousness*. Even Wikipedia articles, hardly as pretentious as most "theoretical" writings, can verge on self-parody. Here's a random [example](#):

Gender, according to West and Zimmerman, is not simply what one is, but what one does -- it is actively produced within social interactions. Gender is an accomplishment: 'the activity of managing situated conduct in light of normative conceptions of attitudes and activities appropriate for one's sex category.' People do not have to be in mixed gender groups or in groups at all for the performance of gender to occur; the production of gender occurs with others and is even performed alone, in the imagined presence of others. 'Doing' gender is not just about conforming to stereotypical gender roles -- it is the active engagement in any behavior that is gendered, or behavior that may be evaluated as gendered.

The performance of gender varies given the context: time, space, social interaction, etc. The enactment of gender roles is context dependent -- roles are 'situated identities' instead of 'master identities.'

So one's actions are relevant to one's gender. "Gender isn't only what one is but what one does." What a profound insight. It never would have occurred to me that gender has to do with behavior. Or that gender

roles vary with context and are "situated" in given contexts or circumstances. I'm in awe of such intellectual acuity.

And then there's the great [Judith Butler](#). [Here she is](#) on the distinction between performance and performativity:

When we say gender is performed, we usually mean that we've taken on a role, we're acting in some way, and that our acting or our role-playing is crucial to the gender that we are and the gender that we present to the world. To say that gender is performative is a little different, because for something to be performative means that it produces a series of effects. We act and walk and speak and talk in ways that consolidate an impression of being a man or being a woman... We act as if that being of a man or that being of a woman is actually an internal reality or something that is simply true about us, a fact about us. Actually, it's a phenomenon that is being produced all the time and reproduced all the time. So to say gender is performative is to say that nobody really is a gender from the start.

I have to admit I don't see what's so earth-shaking or original about these ideas. Of course, she dresses them up in much more jargonized prose in her writings, but here she explains them fairly lucidly. The point is that there is no "internal reality," that a person *is* not a gender but *acts out* a gender. Through repetition of acts, a gendered reality is created. You see it's the old idealism, the old denial of objectivity or truth or "essence," which I've written about elsewhere.¹ In the fragmented, alienated, hyper-commodified, nihilistic social conditions of postmodernity, it's been fashionable to deny the existence of the self, and of objective truths in general. (The spectacular successes of natural science constitute a rather embarrassing problem for this anti-realist, relativistic ideology.) But, well, I don't see why it's necessary to deny that there is a "masculine" or "feminine" *self*, an "*internal reality*" of some sort that may well be (in fact certainly is) influenced by the kinds of objective biological facts scientists study, having to do with hormonal and many other physiological differences between the sexes. Feminist theorists like to disregard or explain away this whole realm of natural science, since they're constrained to respect disciplinary boundaries -- their field is culture/literature, not biology, so they'll leave the biology to the biologists and pretend it has no bearing on their subject (or, alternatively, is irredeemably sexist, patriarchal, whatever) -- but that theoretical stance shows no intellectual integrity.

And sure, gender is "a phenomenon that's being produced and reproduced all the time," in part through one's acts (and internal thoughts, which Butler characteristically doesn't mention because internal = bad) and also one's "situatedness" in institutional, political, cultural, etc. contexts, and yes we're all heavily influenced by the social world and various "discourses" (or rather practices) we've been socialized into, and the *specific* expressions of gender obviously differ between societies (although certain cross-cultural commonalities are striking), etc. But Christ, what a mountain of pretentious ideological crap is produced by these hordes of self-serious academics!

Sorry to go on at such length. I only wanted to give an example that ties into my general theme of "Humans are ridiculous and take themselves too seriously." It would be easy to give other examples of pretentious and pointless intellectualizing, for instance [among Marxists](#). Actually, it's too easy. So let's move on.

Incidentally, the really striking and ironic thing about most intellectualizing isn't its pretentiousness but the combination of its pretentiousness and its *stupidity*. I confess I've never been able to understand why most intellectuals are so stupid/irrational (though I've speculated about it [here](#)). They're frequently quite skilled at talking, writing, reading, footnoting, even teaching, but beneath all the fireworks I often perceive a lack of critical intelligence, of analytic sense, of a *sturdy realistic mind*.

¹ Among postmodernist leftists it's considered very enlightened to reject "essentialism" about any given thing. In some contexts, maybe this rejection is progressive. But not always: the *essence* of capitalism, for example, is unjust in the ways Marxists have described. "Essences" are everywhere. *Homo sapiens* itself has a biological "essence," a "nature," like every other organism. Science deals with essences. So does philosophy.

E.g., in the context of politics, why do leftists have to be so damned sectarian? Every little school of thought fights against every other, with the result that everyone loses and the reactionaries win. It's stupid. Get over yourselves, people! Work together! Purity of doctrine matters less than changing the world. (Have you never heard the word "solidarity"?)

And why do leftists so often inveigh against "lesser evilism"? In some cases, [it's very important to keep the worst candidate out of office!](#) Again, doctrinal purity matters less than preventing the absolute worst things from happening! I agree with Chomsky that this principle is common sense.

How is it possible there are intellectuals who reject historical materialism? The materialist interpretation of society is so [blindingly obvious](#) it almost requires genius to be obtuse enough to reject it. [Idealistic liberals](#) like Paul Krugman, and to some extent even John Maynard Keynes, are not impressive critical thinkers.

In philosophy, why are confusion and superficiality so common? I recently read a book by Susan Blackmore called *Consciousness: A Very Short Introduction*. It's rife with confusions. I've [written about the mind-body problem](#), but here I'll just say I find it odd that philosophers are so reluctant to accept the conclusion that the human mind isn't capable of understanding exactly how consciousness emerges from electrochemical processes in the brain. There is an unbridgeable gap between private subjectivity -- intentions, feelings, phenomenal qualities like colors, sounds, and tastes -- and objective physical processes like electrochemical impulses traveling across millions of neurons. The mystery is a *deep conceptual problem* that thinkers have agonized over for centuries. Why not simply accept the natural conclusion that the human mind is limited, just as the mind of every other animal is limited, and there are certain problems it will never be able to solve? This position seems very obvious to me.

Why have so many philosophers and linguists resisted Chomsky's idea of a Universal Grammar that is genetically hardwired into humans? As he says, UG means nothing but *the initial state of the language faculty*. Humans surely have a language faculty, meaning an aspect of the cognitive architecture of their brain that predisposes them to "grow" a language in the first few years of life as they encounter verbal sounds produced by adults in their environment. No other animal grows a language in this way; only humans have such a capacity. And this capacity is precisely UG, which therefore *must* exist, since humans have language! Yet the Chomskian position is controversial! I find it mystifying. Surely the burden of proof is on those who reject his perfectly natural, almost self-evident, theory.

I've already touched on the inadequacies of postmodernist thinking about sex and gender, and elsewhere on this website I've written about how postmodern thinkers are wrong (or superficial) about most other subjects as well. So I won't go into that here. The intellectual shallowness, in some respects even self-contradictoriness, of postmodernism is stunning.

Etc. In the humanities and social sciences, it isn't always easy to find sensible thinking. But these are ideological professions, after all, where the pressures of groupthink and subordination to power are extreme. So the lack of acuity and honesty isn't surprising.

Moreover, for academics the rule is "publish or perish." So they have to keep writing, keep publishing, keep thinking of new little arguments to make, however trivial or silly, in order to advance their careers. It's perfectly understandable. They have to "problematize" for the sake of problematizing, so to speak, since this is how you can keep having things to say (maybe not interesting things, but what matters is only that you say *something*). It's important to quibble and quarrel over every little point, because otherwise you'll be out of a job. Indeed, this is probably why philosophers are so reluctant to accept that the mind-body problem (among others) can't be resolved! If they were to accept this position, then there would be little else to say on the matter, and they wouldn't be able to publish anymore about a big subject that has advanced thousands of careers.

"Stupidity" is therefore -- actually in many ways -- built into the academic bureaucracy, and is inevitably and continuously produced by it. Not a surprise, because *all* bureaucracies, by their very nature, manufacture stupidity and inhumanity.

Speaking of Chomsky, I must say I even find it hard to understand that so many people who encounter his work, whether in philosophy and linguistics or in politics, think nothing of strenuously disagreeing with him. This strikes me as itself a form of stupidity (however understandable it might be in

the context of their career, which may *require* that they disagree with him). All you have to do is read his writings or watch videos of him to see he's a uniquely acute, informed, and serious thinker. If you're going to disagree with him about something, well, you'd better think long and hard before doing so.

If I were really going to be serious about arguing that human life consists largely of illusions and self-deceptions, I'd go deep, all the way down to what it means to be a self in the first place. While we certainly do have an internal sense of self, we do *not* exist in the way we think we do, as some sort of ego-substance named "Chris Wright" or "John Smith" or whatnot, a Person or a Soul or a Self with a Will and an Identity, etc. What "I" am, in effect, is just a body infused with consciousness, self-consciousness specifically, consciousness of being conscious. There is no Ego in the grand, substantival sense we like to think. Again, I've written about this subject [elsewhere](#). We're just *conscious bodies* running around fighting and playing, mating and talking, bodies with advanced brains that can construct the sense of an integral self based on things that have happened and are happening to the body -- sensations, perceptions, memories, and responses to other bodies (or rather to *embodied selves*, for that's how each human body perceives itself and other bodies). There is no "John Smith": the entity denoted by a name is an illusory construct.

To get a better idea, an *intuitive* idea, of the magnitude of the illusion, I can only suggest you go to a mirror and look at the pupils in your eyes very closely. Ordinarily we "see" pupils as some kind of *substance*, like a direct expression of, or a gateway to, the self that we are. But of course the pupil is a hole -- an absence, not a presence. When I glance at the bathroom light in the mirror and then look back at my pupils, I find it pretty disconcerting to see them dilate. I can then vividly see they're merely deep black holes, vacant, nothing, and it's as if right at the center of my self is an emptiness, a soullessness. I see myself as just a biological robot or a zombie. But then when I back away from the mirror the impression dissipates and everything is back to normal, I'm back to being a substantive self/soul named "Chris Wright."

Anyway, the broader point is that we're not categorically different from other animals, as we like to think; we're merely stupid, self-deceiving, "soulless" animals genetically not far removed from Neanderthals, mammals like any dolphin or elephant, mammals among whom the females *lactate* -- [feeding their baby with their body!](#) -- and the males clumsily, gruntingly ejaculate fluids into the female or onto their own hand as they stare at moving images of naked females mating with other males. That's our essence -- grossly corporeal, instinctual, comical, in most cases not especially rational or intelligent.

But ultimately, if you scratch the surface a little, even the evident differences between individuals -- differences in intelligence, kindness, compassion, courage, honesty -- start to disappear and it becomes clear we're all pretty much the same. The same in that we perceive (our brains synthesize) the same physical world, we have the same kinds of bodies, the same desires and fears, we suffer and yearn, regret mistakes we made or things we said, we change and evolve between moments and years, we live on the same planet moving in a vast impersonal universe. It isn't hard to dislike or have contempt for each other, but at bottom we're all flawed, we're all mere variations on the same genetic code. We might as well try to overcome, to the extent we can, our frequent mutual antipathy.

Sure, indulge in "misanthropy" from time to time, but, as a good Stoic and Skeptic, don't take even *that* too seriously. Understand that the world is absurd, our very existence is absurd, and have a sense of humor about it all even as you do what you can to lighten the burden for others. But don't expect to be rewarded for that, or for anything good you do. Rewards are accidental and indicate nothing anyway: the most highly rewarded people have often done the most harm. Rewards aren't the point.

The point is to make the world a less insane place.

***The "Jacobin" Vision of Social Democracy Won't Save Us:
A Review of "The Socialist Manifesto"***

The title of Bhaskar Sunkara's [new book](#) is both bold and smart, from a marketing perspective at least. It's eye-catching in its reference to *The Communist Manifesto*. I'm actually a little surprised that apparently no previous book has had that title, since it seems so obvious. The reason may be that other

writers have been more humble than Sunkara, and less willing to elicit inevitable comparisons between their work and Marx's. For no writer will fare well under such a comparison.

But I don't want to be too harsh on the founder of *Jacobin*, whose magazine has (whatever one thinks of its particular political line) performed very useful services for the American left. Sunkara is not an original thinker, but he's an effective popularizer—and in an age of mass ignorance, there is much to be said for popularizations. The book is written for the uninitiated, and if it succeeds in piquing young readers' interest in socialism then it has served its purpose.

The title is a misnomer, however, for the book is no manifesto. It is essentially a critical history of socialism with a couple of chapters at the beginning and the end on the present and possible future of the left. The scope is ambitious: it ranges over the German Social Democratic Party up to World War I, the triumphs and tragedies of Leninism and Stalinism in Russia, Swedish social democracy, the record of "socialism" in China and the Third World, and the history of socialists in the U.S., in the process touching on the Labour Party in Britain, the Popular Front period in France, the impact of neoliberalism on the working class, and other subjects. It also has a chapter on fifteen lessons to be gleaned from the history, as well as a whimsical, speculative chapter (the first one) on what it might be like to live in a socialist society and what the transition from a social democratic to a socialist society might look like. Sunkara's interpretations and ideas come from respectable scholars such as Michael Harrington, Vivek Chibber, and David Schweickart, in addition to younger writers for *Jacobin*.

Through most of the book, the arguments are anchored in sturdy common sense, however much one might contest a point or emphasis here and there. On "Third World socialism," for example, whether in China or Africa or the Americas, Sunkara is right that it turned Marxism on its head, so to speak: "revolutionaries embraced socialism as a *path* to modernity and national liberation. Adapting a theory that was built around advanced capitalism and an industrial proletariat, they struggled to find 'substitute proletariats'—from peasants to junior military officers to deprived underclasses—to achieve these ends." None of it was socialism in the Marxist sense, as coming from the breakdown (literal or not) of capitalism and signifying the liberation of humanity from alienated and exploitative production. It was a "socialism" subordinated to nationalistic ends.

As for social democracy, Sunkara is clearly right that it always faces a "structural dilemma," in that it exists within capitalism and depends on capitalist profitability. Historically it was safe only as long as there was an expanding economy. "Expansion gave succor to both the working class and capital. When growth slowed [in the 1970s] and the demands of workers made deeper inroads into firm profits, business owners rebelled against the class compromise." The era of neoliberalism began.

Sunkara's conclusion to his survey of twentieth-century socialism is appropriate: "The best we can say about socialism in the twentieth century is that it was a false start." Personally, I would even argue (and have, in *Worker Cooperatives and Revolution*) that attempts to introduce socialism—which is to say workers' democratic control of production—exclusively through the bureaucratic initiative of the state, in an international economic environment still completely dominated by the dynamics and the hierarchies of corporate capitalism, were always misconceived. If a transition to genuine socialism ever happens, it will necessarily take generations, generations of struggle around the world directed at everything from the interstitial construction of solidarity economies to the mobilization of millions on behalf of radical political parties.

What Sunkara envisions is that a new kind of "class-struggle social democracy," of the sort that Jeremy Corbyn and Bernie Sanders advocate, may be achieved after years of popular struggle. But rather than being content with this achievement and possibly letting it be undermined by the capitalist class, as happened to classical social democracy, socialists have to keep pressing for more radical transformations, such as expansion of the cooperative or publicly owned sector of the economy.

Democratic socialists must secure decisive majorities in legislatures while winning hegemony in the unions. Then our organizations must be willing to flex their social power in the form of mass mobilizations and political strikes to counter the structural power of capital and ensure that our leaders choose confrontation over accommodations with elites.

Eventually, this new social democracy will evolve into socialism, as the state and/or workers take over ownership and control of the remaining private firms.

Sunkara fleshes out these predictions a bit in his first chapter, but I think some skepticism is in order. Social democracy was appropriate to an era of industrial unionism and relatively limited mobility of capital. In a “globalized” age, it’s hard to see how social democracy can simply be reconstructed—in a more radical form, even, than before. History doesn’t work in this way, in which previous social formations are resurrected after they have succumbed to the universal solvent of capitalism. We can’t just return to conditions that no longer exist. That is a key lesson of Marxism itself.

In the U.S., to enact Medicare for All, safe and secure housing for all, free child care, decent public education at all levels, and other reforms Sunkara mentions would require, as he says, that socialists have strong legislative majorities. Given the power of the capitalist class, I don’t see this happening, at least not in the next twenty or so years. It took reactionaries decades of organization to achieve their current power—and they had enormous resources and existed in a broadly sympathetic political economy. It’s hard to imagine that socialists will have better luck.

Predicting the future isn’t exactly easy, especially not at this moment when humanity is poised on a precipice overlooking climate change, mass extinction of flora and fauna, economic crisis, complete political dysfunction, and general social breakdown. But my own prognosis would be more pessimistic than Sunkara’s. Neoliberalism has brought to its consummation the fracturing and atomizing of civil society that capitalism has entailed. The nation-state system itself seems in danger of decaying from within, from social crisis. There is no return of vitality and integration on the horizon. There is only a long period of crisis, a period of political flailing and confrontation, of stagnation and polarization, a period that will see lots of little left-wing victories and lots of defeats but few epochal triumphs. (If Sanders or Corbyn achieve power, for example, they will face a business community determined to destroy them.)

Whatever will be happening at the level of the national state, on smaller scales initiatives in the solidarity economy will be spreading around the nation and around the world, from people’s sheer necessity to survive. Activists will be pressing for changes in state policy to facilitate the growth of this non-capitalist economy, and states will be increasingly forthcoming if only because such local and decentralized projects are seen as relatively unthreatening to capitalist power. As left-wing parties acquire more influence, they will press for the expansion of this cooperative sector of the economy—along with other policies that are more directly and immediately threatening to capitalism. The reactionaries can’t control everything forever (otherwise society would completely collapse), and the left will begin to have more political victories to approximately the degree that a cooperative sector invested in the left grows. As repeated economic crises will be destroying huge amounts of wealth and thinning the ranks of the capitalist hyper-elite, a new society and economy will gradually emerge in the womb of the old regime.

In my abovementioned book I argue that this scenario, which will unfold over many decades, is the only truly Marxist or materialist conception of socialist revolution, notwithstanding most Marxists’ hostility to any conception hinting of “gradual change.” The *Jacobin* social democratic scenario is naïve and ahistorical.

Nevertheless, Sunkara’s book is of value. Little in it will be new to long-time leftists, but American political culture could certainly use more popularizations like *The Socialist Manifesto*. We have a long, long war ahead.

It’s Time to Embrace Nuclear Energy

It is a tragic irony of the contemporary environmentalist movement that in its opposition to nuclear energy, it is doing the bidding of the fossil fuel industry and increasing the likelihood of climate apocalypse. This is the inescapable implication of the new book *A Bright Future: How Some Countries Have Solved Climate Change and the Rest Can Follow*, by Joshua S. Goldstein and Staffan A. Qvist. The anti-nuclear

stance to which Green Parties, for example, are so fervently committed may seem enlightened, but in fact it is dangerous and destructive. What an informed environmentalist movement would demand above all is a rapid and globally coordinated acceleration of nuclear power plant construction, ideally at a rate of 500 or even 750 new reactors a year. This would set us on track to completely eliminate fossil fuels from the world's electricity generation within a couple of decades, as well as displacing coal as a heat source for buildings and industrial use. We would be well on the way to making the planet livable for our descendants.

A Bright Future is hardly the only recent book to make the case for nuclear power. Others include Gwyneth Cravens' *Power to Save the World: The Truth About Nuclear Energy*, Charles D. Ferguson's *Nuclear Energy: What Everyone Needs to Know*, and Scott L. Montgomery and Thomas Graham Jr.'s *Seeing the Light: The Case for Nuclear Power in the 21st Century*. What these and other books make clear is that the "green" shibboleths about nuclear energy's being dangerous, polluting, proliferation-prone, wasteful, vulnerable to terrorist attack, and excessively expensive are vastly overstated. The truth is closer to the opposite—although in the United States, because of the byzantine regulatory environment and the multiplicity (rather than standardization) of reactor designs built and operated by private companies, the economic costs of building a reactor are indeed very high.

The advantages of nuclear power

A Bright Future is framed by two contrasting stories: that of Sweden and that of Germany. From 1970 to 1990, due to its construction of nuclear power plants, Sweden was able to cut its carbon emissions by *half* even as its economy expanded and its electricity generation more than doubled. Germany has taken a different path, which has led to its emitting about twice as much carbon pollution per person as Sweden despite using one-third *less* energy per person and having approximately the same per capita GDP.

What Germany has done is to install large capacities of renewables, mostly wind and solar power, such that by 2016 they made up more than a quarter of electricity production and 15 percent of total energy production. At the same time, however, Germany cut nuclear power by roughly an equivalent amount, which means it only substituted one carbon-free source for another. CO₂ emissions have hardly decreased at all, in fact going up slightly in recent years. German energy remains dominated by coal, and greenhouse gas emissions remain around a billion tons a year.

Decades of anti-nuclear propaganda have colored public attitudes in the West, but, as Goldstein and Qvist explain, nuclear energy has many advantages. For one thing, like renewable sources, it produces no carbon emissions (although over its entire life-cycle, from mining materials to decommissioning the plants, there are some emissions—as with renewables). Unlike solar and wind but like coal, it provides baseload power, which is to say it reliably and cheaply generates energy around the clock to satisfy the average electricity demand. Renewable sources can be more flexibly deployed to match changes in demand, so they have an important role to play during periods of peak energy use, but they also tend to be intermittent and unreliable, unlike nuclear.

Goldstein and Qvist give abundant evidence for the latter claim. "As a rule of thumb," they note, "nuclear power produces at 80–90 percent of capacity on average over the year, coal at around 50–60 percent, and solar cells around 20 percent." In 2013, Europe saw an entire month in which solar produced at only 3 percent of capacity because of the lack of sunshine. Wind is somewhat more reliable than sunlight: at a massive 2,700-acre wind farm in Romania, for example, which has 240 wind turbines each as tall as a fifty-story skyscraper, production in 2013 was a little less than 25 percent of capacity. And the total capacity of this enormous wind farm was 600 megawatts, a fraction of a large nuclear power plant.

In fact, the amount of space and material needed for a solar or wind farm to produce as much energy as a large nuclear plant is mind-boggling. Take the example of Ringhals, a plant in Sweden. On just 150 acres it can produce up to 4 gigawatts of electricity, 24/7. A wind farm that was to produce as much energy would require three times the power capacity because wind is so variable. That is, it would require about 2,500 wind turbines 650 feet high, spread over 400 square miles. And its energy production would be intermittent, sometimes much higher than demand and sometimes much lower.

A solar farm equivalent to Ringhals would need a capacity of at least 20 gigawatts and would cover 40 to 100 square miles. “Imagine driving down a highway at 65 mph, with solar cells stretched out for a mile to the right of you and a mile to the left. It would take you about half an hour before you got to the end of the solar farm.”

Think of the environmental (and aesthetic) costs of building scores of such immense wind and solar farms to replace both coal and nuclear.

Waste and safety

Another advantage of nuclear energy is how little waste it produces. Public fears about radioactive waste are absurdly disproportionate to the reality. In the United States, “the entire volume of spent fuel from fifty years of nuclear power—a source that produces one-fifth of U.S. electricity—could be packed into a football stadium, piled twenty feet high.” Spent fuel rods can be safely stored in water for several years, becoming less radioactive, and then transferred to dry storage in concrete casks that contain the radiation. They can remain in these casks for over a hundred years. Longer-term storage, for hundreds of thousands of years, can involve burying material deep underground, as the U.S. military does for its waste from nuclear weapons.

To rebut the hysteria about radioactive waste, it surely suffices to point out that spent fuel has been stored around the world for almost 70 years with apparently no adverse health effects at all.

Other energy sources produce waste as well. When the life of solar cells is over after twenty-five years, their waste remains toxic for many decades and requires special handling for disposal. Coal waste, both solid and airborne, is not only orders of magnitude more voluminous than nuclear waste—as is true of solar waste, too—but is also toxic for centuries, and contains radioactive elements. Goldstein and Qvist observe, in fact, that if you live next to a coal plant you’ll get a higher dose of radiation than if you live next to a nuclear power plant. (Humans are continually exposed to small doses of radiation that have zero or negligible health effects.)

In general, nuclear power is incredibly safe. Three famous nuclear accidents have occurred: Three Mile Island in 1979, which had no health effects because of the containment structure that surrounded the partially melted core; Chernobyl in 1986, which caused a few dozen deaths in the short term (though possibly 4,000 in the long term, according to the International Atomic Energy Agency) and was the product of terrible reactor design, terrible on-site errors by operators, and terrible bureaucratic incompetence and secretiveness by the Soviet government; and Fukushima in 2011, which caused *no deaths* from radiation exposure. (The authors investigate this question in depth and conclude that, on the worst possible assumptions, several people *might* eventually get cancer because of the accident.)

How does this record stack up against other energy sources? Coal kills at least a million people every year from particulate emissions that lead to cancer and other diseases. It also has a terrible safety record, including toxic wastes that are usually located near poor communities and coal-mining accidents that still happen multiple times a year around the world.

Methane, or natural gas, not only emits about half as much carbon dioxide as coal but also is liable to explode from time to time, killing anywhere from several people to hundreds (as when 300 children were killed in an explosion at a Texas school in 1937). And fracking, to extract oil or gas, has negative impacts on public health and the environment.

Oil, too, is less safe than nuclear (leaving aside Soviet incompetence). It spills and it blows up, as with the *Deepwater Horizon* disaster in the Gulf of Mexico in 2010, and oil trains can derail and explode, as happened in Canada in 2013, when 47 people were killed.

Hydroelectric dams are not at all safe. If a dam fails, thousands of people downstream can die. In Banquiao, China in 1975, for example, 170,000 people died when a dam burst. Dam failures have killed thousands in the U.S.; just in 2017, crises in California and Puerto Rico forced the evacuation of hundreds of thousands of people.

Imagine if nuclear energy had a record remotely comparable to coal or hydropower! Worldwide, the whole industry probably would have been shut down long ago.

An uncertain future

A Bright Future is far too rich to do justice to in a single article, but Goldstein and Qvist also address the issues of possible terrorist attacks on power plants and, in more depth, nuclear proliferation. Regarding the latter, the record over the decades since nuclear technology was developed is reassuring, due in large part to the very effective IAEA and the Non-Proliferation Treaty.

But even if nuclear energy weren't as remarkably safe as it is, we should ask ourselves if it would still be worth including as a major part of a "diversified portfolio" of clean energy. Why are we willing to tolerate so many deaths and risks from coal, oil, hydropower, and natural gas while demanding *none* from nuclear? (And even then, nuclear has a bad reputation!) Even if a fatal accident occurred from nuclear power every year or every few years, might that not be an acceptable cost if the benefit were a massive mitigation of climate change? We accept risks in every other sphere of life, as when driving cars, living near seismic fault lines, riding airplanes, etc. It's odd that we rail against nuclear energy because it isn't 100 percent risk-free.

The simple fact is that we can't solve climate change without accelerating the construction of nuclear power plants. Since the energy in nuclear fuel is millions of times more concentrated than wind or solar power, nuclear power can "scale up" much faster than renewables. "What the world already knows how to do in ten to twenty years using nuclear power," the authors write, "would take more than a century using renewables alone."

And yet in the U.S., *reverse* action is being taken. Nuclear power plants are being shut down prematurely for political reasons, as in Vermont, California, and Massachusetts, and producers are often abandoning plans to build new plants after facing endless litigation, regulation, opposition from anti-nuclear groups, and competition from cheap and highly subsidized fossil fuels. When a plant is shut down, what that means, first, is that renewables that are introduced afterwards are not contributing to decarbonization but are simply replacing a clean (and far more powerful) energy source. Second, fossil fuels have to fill most of the gap, which causes a rise in carbon emissions.

For example, after the Vermont Yankee nuclear power plant closed in 2014, carbon dioxide emission rates rose across New England, reversing a decade of declines. When Massachusetts' last remaining nuclear power plant, Pilgrim, closed last month, much more electricity generation was lost than the state generates with all its solar, wind, and hydropower combined. Several new fossil fuel plants will mainly take the place of Pilgrim.

Thus, Greenpeace and other anti-nuclear groups with money and political clout can congratulate themselves on exacerbating climate change.

Globally there are bright spots for nuclear energy, mostly in the developing world. Goldstein and Qvist discuss this topic in detail, placing some hope in Russia, China, and India, which are much friendlier to nuclear power than the U.S. They also devote a chapter to "next-generation technologies" that are being developed, such as thorium reactors, which have advantages over uranium, and fusion, which has advantages over fission.

But despite these (and other) bright spots, and despite the book's overall optimism, after I had finished reading I couldn't help feeling very, very worried about the future. We know how to address climate change. But the vast funds of the fossil fuel industry and the anti-nuclear movement, together with mass ignorance, may yet doom us in the long run. We have, it seems, a decade or two to wake up and demand government action.

Renewables, yes. But even more important: nuclear power.

Renewable Energy Is Not the Answer; Nuclear Is

“It’s always a good idea to start by asking about the facts.” So advises Noam Chomsky. “Whenever you hear anything said very confidently, the first thing that should come to mind is, ‘Wait a minute, is that true?’” *De omnibus dubitandum*—doubt everything—was Karl Marx’s motto and should be the motto of every thinking person. Question even or especially what the tribe most takes for granted.

In the era of climate change, when fossil fuels are known to be driving civilization straight into the ocean, the idea that liberal and left-wing tribes take most for granted is “Renewable energy!” It is shouted confidently from every public perch. Renewable energy, scaled up to replace fossil fuels and even nuclear, is declared the only possible salvation for humanity. It has such obvious advantages over every other energy source that the world has to go 100% renewables ASAP.

Obviously!

But wait a minute—is that true?

Let’s try to shed the religious thinking, look objectively at the facts, and come to a conclusion about this most important of subjects: how to power the future and hopefully save the world.

Renewable energy emits greenhouse gases

First, consider the claim that renewable energy has no carbon emissions. This is true, in a sense, for wind and solar farms (as it is for nuclear energy), which in themselves emit virtually no greenhouse gases. It isn’t true for hydropower, however, which in 2016 produced 71% of all electricity generated by renewable sources. According to one study, hydroelectric dams worldwide emit as much methane (a potent greenhouse gas) as Canada, from decaying vegetation and nutrient runoff. Another study concluded they produce even more carbon dioxide than methane.

“These are massive emissions,” one expert comments. “There are a massive number of dams that are currently proposed to be built. It would be a grave mistake to continue to finance those with the impression that they were part of the solution to the climate crisis.”

And yet in every scenario projected by renewables advocates, hydropower is absolutely essential. For instance, Stanford Professor Mark Jacobson’s famous—and deeply flawed—proposal to run the U.S. on 100% renewables by 2050 assumes the country’s dams could add turbines and transformers to produce 1,300 gigawatts of electricity, over 16 times their current capacity of 80 gigawatts. (According to the U.S. Department of Energy, the maximum capacity that could be added is only 12 gigawatts, 1,288 gigawatts short of Jacobson’s assumption.)

The International Energy Agency projects that by 2023, wind and solar together will satisfy a mere 10% of global electricity demand, while hydroelectric power will satisfy 16%. Nearly all the rest will be produced by fossil fuels and nuclear energy.

Burning biomass, too, which is a renewable energy source, releases large amounts of carbon into the atmosphere. “It does exactly the opposite of what we need to do: reduce emissions,” says an expert in forest science and management.

Even leaving aside hydropower and biomass, the use of wind and solar dramatically increases greenhouse gas emissions compared to nuclear energy. This is because, given the intermittency and the diluted nature of solar and wind energy, a backup source of power is needed, and that source is natural gas. Robert F. Kennedy, Jr., a guru of the renewables movement, himself acknowledges this fact:

We need about 3,000 feet of altitude, we need flat land, we need 300 days of sunlight, and we need to be near a gas pipe. Because for all of these big utility-scale solar plants—whether it’s wind or solar—everybody is looking at gas as the supplementary fuel. The plants that we’re building, the wind plants and the solar plants, are gas plants.

The burning of natural gas, i.e. methane, emits about half as much carbon dioxide as the burning of coal. So natural gas is better than coal, but not nearly good enough if we want to solve climate change. Even worse, many millions of tons of unburned methane are leaked every year from the American oil and

gas industry—and methane is more than 80 times as potent a greenhouse gas as carbon dioxide. So these leaks cancel out much of the environmental good that wind and solar farms are supposedly doing.

In other words, the fact that wind and solar farms typically operate far below their capacity (because of seasonal changes and the unreliability of weather) necessitates that a more reliable power source “supplement” them. In fact, as researchers Mike Conley and Tim Maloney point out, strictly speaking it is the renewable source that acts as a supplement for the oil or natural gas plants linked to the renewables. A solar farm with a capacity of one gigawatt, for instance, will on average operate at only about 20% of its capacity, which means that if a gigawatt of energy is really to be produced, the majority will have to be provided by the “backup” fossil fuel plant(s).

The upshot is that an anti-nuclear and pro-renewables policy means an increase in greenhouse gas emissions.

California is a good example. Like other states in the U.S and countries in the Western world, it has been closing its nuclear power plants—despite their safety, reliability, effectiveness, and environmental friendliness. The carbon-free nuclear plants have been replaced with renewables + natural gas, which is to say, they’ve been replaced mostly with natural gas (prone to methane leaks). After it closed the San Onofre nuclear plant in 2013, California missed its CO₂ emissions targets as a result.

In New England, after the premature closing of the nuclear power plant Vermont Yankee in 2014, CO₂ emission rates rose across New England, reversing a decade of declines. When Massachusetts’ last remaining nuclear plant, Pilgrim, closed last month, much more electricity generation was lost than the state generates with all its solar, wind, and hydropower combined. Several new fossil fuel plants and a couple of small solar and wind farms will take the place of Pilgrim, increasing carbon dioxide emissions.

In their new book *A Bright Future: How Some Countries Have Solved Climate Change and the Rest Can Follow*, Joshua Goldstein and Staffan Qvist give other examples. Between 1970 and 1990, due to its construction of nuclear power plants, Sweden was able to cut its carbon emissions by half even as its electricity consumption more than doubled. Germany, by contrast, emits about twice as much carbon pollution per person as Sweden despite using one-third *less* energy per person, because it has chosen to phase out its nuclear power while introducing renewables.

This means that Germany has simply substituted one (relatively) clean energy source for another, while doing virtually nothing to decarbonize. Its energy production remains dominated by coal, and greenhouse gas emissions are around a billion tons a year.

A more sensible policy would have been to build more nuclear plants and phase out coal. Or at least to let the existing nuclear plants continue to operate while adding renewables, which then would have displaced coal.

ExxonMobil likes renewable energy

The fact that renewable energy directly and indirectly causes far more greenhouse gas emissions than nuclear should already tell us it isn’t a solution to climate change.

Indeed, the willingness of the oil and gas industry in recent years to promote and invest in renewables is itself significant. Over the last three years, the five largest publicly traded oil and gas companies have invested over a billion dollars in advertising and lobbying for renewables. “Natural gas is the perfect partner for renewables,” ads say. “See why #natgas is a natural partner for renewable power sources,” Shell tweets.

By pretending to care about the environment, these companies not only burnish their reputations but also are able to associate natural gas with clean energy, which it very much is not. The formula “renewables + natural gas” thus serves a dual purpose. In fact, it serves a triple purpose: it also distracts from nuclear power, which, unlike renewables, is an immediately viable alternative to oil and gas.

Nuclear power, not renewable energy, is what the fossil fuel industry really fears. The reason is simple: the energy in nuclear fuel is orders of magnitude more concentrated than the energy in oil, gas, coal, and every other source. (Which is why nuclear reactors produce vastly less waste than everything from coal to solar.) If governments invested in a global Nuclear New Deal, so to speak, they could make fossil fuels

largely obsolete within a couple of decades. Not even Mark Jacobson's wildly unrealistic \$15-20 trillion 100% renewables plan envisions such a fast transition.

Because of the diffuse and intermittent nature of wind and solar energy, all the world's investment in renewables didn't prevent the share of low-carbon power in generating electricity from declining between 1995 and 2017. Western countries' shuttering of nuclear power plants in these decades was a disaster for the environment.

Another way to appreciate the disaster is to consider that global carbon emissions are actually rising, even as the world spent roughly \$2 trillion on wind and solar between 2007 and 2016. (This is similar to the amount spent on nuclear in the past 55 years.) So much for the gospel of renewable energy!

Meanwhile, the fossil fuel industry has been smiling on the sidelines, giving millions of dollars to groups like the Sierra Club, the Natural Resources Defense Council, the Environmental Defense Fund, and many others that work to kill nuclear power and thus exacerbate climate change. (Greenpeace and Friends of the Earth are particularly active in the war on nuclear—and they refuse to disclose their donors. Could it be because they receive an unseemly amount from oil and gas companies?)

We have eleven years

According to the Intergovernmental Panel on Climate Change's 2018 special report, we have eleven years left to avoid potentially irreversible climate disruption.

António Guterres, the Secretary-General of the United Nations, has called on global leaders to “demonstrate how to reduce greenhouse gas emissions by 45 per cent over the next decade and achieve net zero global emissions by 2050.” They're supposed to meet in New York in September 2019 to answer this call.

The only conceivable way to reduce greenhouse gas emissions on the scale called for is to aggressively embrace nuclear power. It is cost-competitive with all other forms of electricity generation except natural gas—although if you take into account the long-term environmental costs of using natural gas (or oil or even renewables), nuclear is probably the cheapest of all.

A worldwide rollout of nuclear power plants on the scale necessary to save civilization would certainly take longer than eleven years, but we can at least make substantial progress by then. If, that is, we pressure our governments to stop subsidizing oil, natural gas, and the renewables they go hand-in-hand with and instead massively invest in nuclear.

It's time to stop doing the bidding of fossil fuel interests and get serious about saving the world.

“Critical and Informed Thinking Is Dangerous to the Powerful”

Interview of Chris Wright by Mohsen Abdelmoumen

Mohsen Abdelmoumen: You wrote “*Worker Cooperatives and Revolution*” where you talk about workers' cooperatives. In this fascinating book, we note your optimism about the coming of a new era where the human is at the center. You give the example of the cooperative New Era Windows, in Chicago. In your opinion, are we in a new era where the union of workers in the form of a cooperative will shape the future of the world?

Dr. Chris Wright: I think I may have been a little too optimistic in that book about the potential of worker cooperatives. On the one hand, Marx was right that cooperatives “represent within the old form the first sprouts of the new.” They're microcosmic socialism, since socialism is just workers' democratic control of economic activity, which is essentially what cooperatives are. Even in the large Mondragon firms that have seen some conflicts between workers and the elected management, there is still vastly more democracy (and more equal pay) than in a typical large capitalist enterprise.

Moreover, there's an expanding movement in the U.S and elsewhere to seed new cooperatives and promote the transformation of existing capitalist firms into co-ops (which, incidentally, are often more productive, profitable, and longer-lasting than conventional businesses). Countless activists are working to spread a cooperative ethos and build a wide range of democratic, anti-capitalist institutions, from businesses to housing to political forms like participatory budgeting. (Websites like Shareable.net and Community-Wealth.org provide information on this movement.) This whole emerging "solidarity economy" is really what interested me when I was writing the book, though I focused on worker co-ops. I was struck that the very idea of a socialist society is just the solidarity economy writ large, in that all or the majority of institutions according to both visions are supposed to be communal, cooperative, democratic, and non-exploitative.

It's true, though, that a new society can't emerge from grassroots initiative alone. Large-scale political action is necessary, since national governments have such immense power. Unless you can transform state policy so as to facilitate economic democratization, you're not going to get very far. Cooperatives alone can't get the job done. You need radical political parties, mass confrontations with capitalist authorities, every variety of disruptive "direct action," and it will all take a very, very long time. Social revolutions on the global scale we're talking about take generations, even centuries. It probably won't take as long as the European transition from feudalism to capitalism, but none of us will see "socialism" in our lifetime.

Marxists like to criticize cooperatives and the solidarity economy for being only interstitial, somewhat apolitical, and not sufficiently confrontational with capitalism, but, as I argue in the book, this criticism is misguided. A socialist transformation of the country and the world will take place on many levels, from the grassroots to the most ambitiously statist. And all the levels will reinforce and supplement each other. As the cooperative sector grows, more resources will be available for "statist" political action; and as national politics becomes more left-wing, state policy will promote worker takeovers of businesses. There's a role for every type of leftist activism.

Do you not think that the weakening of the trade union movement in the USA and elsewhere in the world further encourages the voracity of the capitalist oligarchy that dominates the world? Does not the working class throughout the world have a vital need for a great trade union movement?

The working class desperately needs reinvigorated unions. Without strong unions, you get the most rapacious and misanthropic form of capitalism imaginable, as we've seen in the last forty years. Unions, which can be the basis for political parties, have always been workers' most effective means of defense and even offense. In the U.S., it was only after the Congress of Industrial Organizations had been founded in the late 1930s that a mass middle class, supported by industrial unions with millions of members, could emerge in the postwar era. Unions were important funders and organizers of the American Civil Rights Movement, and they successfully pushed for expansion of the welfare state and workplace safety regulations. They can serve as powerful allies of environmentalists. It's hard to imagine a livable future if organized labor isn't resurrected and empowered.

But I don't think there can be a return of the great postwar paradigm of industry-wide collective bargaining and nationwide social democracy. Capital has become too mobile and globalized; durable class compromises like that aren't possible anymore. In the coming decades, the most far-reaching role of unions will be more revolutionary: to facilitate worker takeovers of businesses, the formation of left-wing political parties, popular control of industry, mass resistance to the global privatization and austerity agenda, expansion of the public sphere, construction of international workers' alliances, etc.

Actually, I think that, contrary to old Marxist expectations, it's only in the 21st century that humanity is finally entering the age of the great apocalyptic battles between labor and capital. Marx didn't foresee the welfare state and the Keynesian compromise of the postwar period. Now that those social forms are deteriorating, organized labor can finally take up its revolutionary calling. If it and its allies fail, there's only barbarism ahead.

Your book "*Finding Our Compass: Reflections on a World in Crisis*" asks a fundamental question, namely, do we live in a real democracy?

We certainly don't. None of us do. The U.S. has democratic forms, but substantively it's very undemocratic. Even mainstream political science recognizes this: studies have shown that the large majority of the population has essentially zero impact on policy, because they don't have enough money to influence politicians or hire lobbyists. Practically the only way for them to get their voices heard is to disrupt the smooth functioning of institutions, such as through strikes or civil disobedience. We've seen this with the *gilets jaunes* protests in France, and we saw it when air traffic controllers refused to work and thus ended Donald Trump's government shutdown in January 2019. We live in an oligarchy, a global oligarchy, which isn't constrained much by the normal "democratic" process of voting.

But voting *can* be an important tool of resistance, especially if there are genuine oppositional candidates (like Alexandria Ocasio-Cortez, for example). In that case, society can start to become a little more democratic. So it remains essential for the left to organize electorally, even if it will take a while for there to be a big policy payoff.

Do you not think a new crisis of capitalism is in progress? Does not the capitalist system generate crises?

I'm not an economist, but anyone can see that capitalism has a deep-rooted tendency to generate crises. There's a long tradition of Marxist scholarship explaining why crises of overproduction and underconsumption (among other causes) repeatedly savage capitalist economies; David Harvey, Robert Brenner, and John Bellamy Foster are some recent scholars who have done good work on the subject. A lot of it comes down to the fact that "excessive capitalist empowerment," to quote Harvey, leads to "wage repression" that limits aggregate demand, which constrains growth. For a while the problem doesn't really appear because people can borrow, and are forced to borrow more and more. But accumulation of debt can't go on forever if there's no growth of underlying income. Huge credit bubbles appear as borrowing gets out of control and capitalists invest their colossal wealth in financial speculation, and the bubbles inevitably collapse. Then things like the Great Depression and the Great Recession happen.

As horrible as economic crises are, leftists should recognize, as Marx did, that at least they present major opportunities for organizing. It's only in the context of long-term crisis and a decline of the middle class that there can be a transition to a new society, because crisis forces people to come together and press for radical solutions. It also destroys huge amounts of wealth, which can thin the ranks of the hyper-elite. And the enormous social discontent that results from crisis can weaken reactionary resistance to reform, as during the 1930s in the U.S. (On the other hand, fascism can also take power in such moments, unless leftists seize the initiative.)

There is no hope without crisis. That's the paradoxical, "dialectical" lesson of Marxism.

You wrote an article about Obama's mediocrity. Don't you think that the current US President Donald Trump is competing with Obama in mediocrity?

In the competition over who's most mediocre, few people hold a candle to Trump. He's just a pathetic non-entity, an almost impossibly stupid, ignorant, narcissistic, self-pitying, cruel, vulgar little embodiment of all that's wrong with the world. He's so far beneath contempt that even to talk about him is already to lower oneself. So in that sense, I suppose he's a suitable 'leader' of global capitalism. Obama at least is a good family man, and he's intelligent. But he's almost as lacking in moral principles as Trump, and he has no moral courage at all. I don't know what to say about someone who announced in 2014, as Israel was slaughtering hundreds of children in Gaza, that Israel has a right to defend itself, and went on to approve the shipment of arms to that criminal nation right in the midst of its Gaza massacre. He's a self-infatuated megalomaniac without morality.

You wrote in one of your articles that the US government considers its citizens as enemies by using generalized surveillance. Does not the real danger come from this system which spies on everyone?

I think Glenn Greenwald is right that few things are more pernicious than an expansive "national security" state. Surveillance is a key part of it, facilitating the persecution of protesters, dissenters, immigrants, and Muslims. The so-called "law and order" state is a lawless state of extreme disorder, in which power can operate with impunity. It begins to approach fascism.

One danger of the surveillance state is that it might operate like Jeremy Bentham's panopticon: because people don't know when they're being watched or targeted, they monitor and regulate themselves all the time. They avoid stepping out of line, being obedient drudges and consumers. Any misstep might sweep them up in the black hole of the police state's bureaucracy. So they internalize subservience. Of course, in our society there are many other ways of making people internalize subservience. Surveillance is only one, though a particularly vicious and dangerous one.

Another reason to be concerned is that internet companies' ability to "spy" on users allows them to censor content, whether on their own initiative or from political pressure. Google, Facebook, Twitter, and other such companies are constantly censoring leftists (and some on the right) and deleting their accounts. Critics of Israeli crimes are especially vulnerable, but they're hardly alone. The only real way to solve this problem would be to make internet companies publicly owned, because private entities can do virtually whatever they want with their own property. It's absurd that leftists can connect and coordinate and build movements only subject to the approval of Mark Zuckerberg and other corporate fascists. It's also terrifying that a surveillance alliance can develop between corporate behemoths and governments. That's another feature of fascism.

How do you see the inhuman treatment of Julian Assange and the persecution of him by the British and American administrations?

As left-wing commentators have said, the persecution of Assange is an assault on journalism itself, and on the very idea of challenging the powerful or holding them to account. In that sense, it's an assault on democracy. But that's pretty much always what power-structures are doing, trying to undermine democracy and expand their own power, so the vicious treatment of Assange is hardly a surprise. But I doubt that the U.S. and Britain will be able to win their war on journalism in the long run. There are just too many good journalists out there, too many activists, too many people of conscience.

This capitalist society is based on consumption but boasts of concepts such as "freedom of expression," "human rights," "democracy," etc. Don't we live rather in a fascist system?

I wouldn't say the West's political economy is truly fascist. It has fascist tendencies, and it certainly cares nothing for freedom of expression, human rights, or democracy. But civil society is too vibrant and gives too many opportunities for left-wing political organizing to say that we live under fascism. The classical fascism of Italy and Germany was far more extreme than anything we're experiencing now, especially in the U.S. or Western Europe. We don't have brownshirts marching in the streets, concentration camps for radicals, assassinations of political and union leaders, or total annihilation of organized labor. There's still freedom to publish dissenting views.

But major power-structures in the U.S. would love to see fascism of some sort and are working hard to get there. And they have armies of useful idiots to do their bidding. American "libertarians," for example, of whom there are untold millions, are essentially fascist without knowing it: they want to eliminate the welfare state and regulations of business activity so as to unfetter entrepreneurial genius and maximize "liberty." They somehow don't see that in this scenario, corporations, being opposed by no

countervailing forces, would *completely* take over the state and inaugurate the most barbarous and global tyranny in history. The natural environment would be utterly destroyed and most life on Earth would end.

In one sense of fascism, Marxists from the 1920s and 1930s would, as you suggest, say we do live in a rather fascist system. For them, the term denoted the age of big business, or, more precisely, the near-fusion of business with the state. Insofar as society approached a capitalist dictatorship, it was approaching fascism. We don't literally live under that kind of dictatorship, but without determined resistance it could well be our future.

Isn't there a need to reread Karl Marx? How do you explain the disappearance of critical thinking in Western society?

I actually think there's a lot of critical thinking in Western society. The rise of "democratic socialism" in the U.S. is evidence of this, as is the popularity of Jeremy Corbyn in Britain. The left is growing internationally -- although the right is too. But insofar as society suffers from a dearth of critical thinking, the reasons aren't very obscure. Critical and informed thinking is dangerous to the powerful, so they do all they can to discourage it. Lots of studies have probed the methods of corporate and state indoctrination of the public, and the enormous scale of it. Noam Chomsky is famous for his many investigations of how the powerful "manufacture consent"; one of the lessons of his work is that the primary function of the mass media is to keep people ignorant and distracted. If important information about state crimes is suppressed, as it constantly is, and instead the powerful are continually glorified, well then people will tend to be uninformed and perhaps too supportive of the elite. It's more fun, anyway, to play with phones and apps and video games and watch TV shows.

The mechanisms by which the business class promotes "stupidity" and ignorance are pretty transparent. Just look at any television commercial, or watch CNN or Fox News. It's pure propaganda and infantilization.

As for Karl Marx: there's always a need to read Marx, and to reread him. He and Chomsky are probably the two most incisive political analysts in history. But Marx was such an incredible writer too that he's a sheer joy to read, and endlessly stimulating and inspiring. He rejuvenates you. (His political pamphlets on France, for instance, are stylistic and analytic masterpieces.) Besides, you simply can't understand capitalism or history itself except through the lens of historical materialism, as I've argued elsewhere.

Of course, Marx wasn't right about everything. In particular, his conception and timeline of socialist revolution were wrong. The "revolution," if it happens, will, as I said earlier, be very protracted, since the worldwide replacing of one dominant mode of production by another doesn't happen in a couple of decades. Even just on a national scale, the fact that modern nations exist in an international economy means socialism can't evolve in one country without evolving in many others at the same time.

I can't go into detail on how Marx got revolution wrong (as in his vague but overly statist notion of the "dictatorship of the proletariat"), but in *Worker Cooperatives and Revolution* I devote a couple of chapters to it. It's unfortunate that most contemporary Marxists are so doctrinaire they consider it sacrilege if you try to update or rethink an aspect of historical materialism to make it more appropriate to conditions in the 21st century, which Marx could hardly have foreseen. They're certainly not honoring the Master by thinking in terms of rigid dogma, whether orthodox Marxist or Leninist or Trotskyist.

You are a humanist and the human condition is central in your work. Are you optimistic about the future of humanity?

Frankly, no, I'm not. The forces of darkness just have too much power. And global warming is too dire a threat, and humanity is doing too little to address it. It's worth reflecting that at the end of the Permian age, 250 million years ago, global warming killed off almost all life. If we don't do something about it very soon, by the end of the century there won't be any organized civilization left to protect.

And then there's the problem of billions of tons of plastic waste polluting the world, and of the extinction of insects "threatening the collapse of nature," and of dangerous imperialistic conflicts between great powers, and so on. I don't see much reason for optimism.

We know how to address global warming, for example. But the fossil fuel industry and, ironically, environmentalists are acting so as to increase the threat. According to good scientific research, as reported in the new book *A Bright Future* (among many others), it's impossible to solve global warming without expanding the use of nuclear power. (Contrary to popular opinion, nuclear power is generally very safe, reliable, effective, and environmentally friendly.) Renewable energy alone can't get the job done. The world has spent over \$2 trillion on renewables in the last decade, but carbon emissions are still rising! That level of investment in nuclear energy, which is millions of times more concentrated and powerful than diffuse solar and wind energy, could have put us well on the way to solving global warming. Instead, the crisis is getting much worse. Renewables are so intermittent and insufficient that countries are still massively investing in fossil fuels, which are incomparably more destructive than nuclear.

But the left is adamant against nuclear power, and it's very hard even to publish an article favorable to it. It's usually biased and misinformed articles that are published, with some exceptions. So the left is, in a way, working to exacerbate global warming, just as the right is. Why? Ultimately for ideological reasons: most leftists like the idea of decentralization, dispersed power, community control of energy, and anti-capitalism, and these values seem more compatible with solar and wind energy than nuclear. The nuclear power industry isn't exactly a model of transparency, democracy, or political integrity.

But the *Guardian* environmental columnist George Monbiot is right: sometimes you have to go with a lesser evil in order to avoid a greater one, in this case the collapse of civilization and probably most life on Earth. Is that a price environmentalists are willing to pay so they can preen themselves on their political virtue? So far, it seems the answer is yes.

We humans have to break free of our tribal ways, our herd-thinking ways. We have to be more willing to think critically, *self*-critically, and stop being so complacent and conformist. The younger generation, actually, seems to be leading the way, for instance with the Extinction Rebellion and all the exciting forms of activism springing up everywhere. But we still have a terribly long way to go.

I haven't lost hope, but I'm not sanguine. The next twenty or thirty years will be the most decisive in human history.

Political Correctness Is Getting Out of Hand

On June 28, the *New York Times* published an article by Bari Weiss that wasn't moronic.

Entitled "San Francisco Will Spend \$600,000 to Erase History," it was about the school board's unanimous decision to destroy a New Deal-era mural by the famous Communist painter Victor Arnautoff that's painted on the walls of a local high school. Called "Life of Washington," the mural depicts Washington's slaves picking cotton at Mount Vernon as a group of colonizers walks past a dead Native American. The painting is clearly meant to oppose the sanitized versions of American history that are taught in most schools.

So you'd think "progressives" would support it. Instead, some of them, at least, find it so offensive they want it gone. "A grave mistake was made 80 years ago to paint a mural at a school without Native American or African-American input," the school board's vice president told Weiss. "For impressionable young people who attend school to have any representation that diminishes people, specifically students from communities that have already been diminished, it's an aggressive thing. It's hurtful and I don't think our students need to bear that burden."

It seems that most students object to the mural's removal, though a number of community members support the board's decision. "We know our history already," a recent high school graduate and member of the Tohono O'odham tribe said. "Our students don't need to see it every single time they walk into a public school."

Predictably, Weiss's article confines itself to admonishing liberals and leftists for being "un-American" snowflakes, failing to point out that conservatives are typically far more eager to censor than the left is. Bashing hyper-sensitive leftists seems to be Weiss's favorite activity, aside from hyper-sensitively complaining about supposed instances of anti-Semitism that are usually nothing more than criticisms of Israel's horrifying militarism and near-genocidal policies towards Palestinians. (I didn't see her write a column bewailing what a "snowflake" Los Angeles Mayor Eric Garcetti was for advocating the destruction of an "anti-Semitic" mural in L.A. that depicts Israel as the Grim Reaper.)

But leaving aside Weiss, who's nothing but a vulgar propagandist, her column does raise an important issue. Censorship, the destruction of art, and the sanitizing of history are appropriate agendas for reactionaries and establishment-types like Weiss; progressives and radicals should certainly oppose them. And yet, in the age of "political correctness," there's a disturbing tendency for those on the left to adopt the repressive tactics of their enemies.

Whether on social media, on university campuses, or in cultural spaces of whatever sort, people are shunned, shamed, and silenced for not adhering wholeheartedly to a party line. A whiff of dissent brings down the wrath of the mob; a statement or an image that someone, somewhere, might find hurtful is enough to end your career or ruin your life. Magazine editors are fired for defending "cultural appropriation," as in 2017 when an editor in Canada lost his job for the crime of defending the right of white authors to create characters from other backgrounds. Safe spaces, trigger warnings, microaggression reporting systems, call-out culture, and other such devices become ever more ubiquitous, threatening to neuter culture and intimidate even fellow leftists into silence.

In the end, all this excess reaches truly farcical extremes: political correctness eats itself, as a wonderful old mural that tells a people's history of the United States is destroyed for being "degrading." A paradigm of identity politics that celebrates and weaponizes victimhood brings forth practitioners who claim they're being victimized by having to be reminded of their history as victims. In the name of "empowerment," they want to whitewash a mural whose existence is a blow against whitewashed history, which is the very thing to which identity politics indignantly objects. Political correctness chokes on itself and coughs up self-refuting paradoxes.

In this grotesque autosarcophagy we see the *reductio ad absurdum* of this whole mode of aggressive liberalism: it becomes a kind of void, a black hole of infinitely dense inhumanity, the postmodern left's version of cultural totalitarianism. It becomes kitsch, virtually without content except to prevent members of "vulnerable" groups from ever feeling the slightest pang of discomfort. That's the universal standard, the standard of acceptable art, acceptable speech, acceptable politics, and acceptable thought. And if you stray outside the bounds of acceptable thought, we'll "cancel" you, hopefully most aspects of your identity: career, social life, public life, especially internet life, since the beautiful anonymity and atomization of the internet are what allow us to besiege you and call out your transgressions against orthodoxy. Ultimately it isn't permitted—or at least it's testing our good will—even to state manifest truths, such as that men on average are taller and physically stronger than women, or that, e.g., women tend to be attracted to male dominance (e.g., men taller than they) and the dominant male. No such truths we consider insulting to "marginalized" people can be acknowledged.

Now, as I said, these totalitarian trends are only the *reductio ad absurdum* of political correctness, and do not invalidate the entire phenomenon known as PC culture. Historically, this multicultural politics that emerged from the radical movements of the 1960s and '70s has had very constructive effects on society. It has been integrally tied to the collective recognition of *real* history, the history of Native Americans, African-Americans, immigrants, women, and European colonialism. In educational curricula, it has effectively challenged the supremacy of the Western canon of white male writers, such that students now encounter voices from many different cultures and traditions.

Feminism has raised consciousness to a far more civilized level than in the 1960s, when Betty Friedan could write about "the feminine mystique" that dehumanized women. The MeToo moment is just the latest front in a long war to advance women's rights. Similarly, we have identity politics to thank for the historic victories of the gay rights movement, which have at long last made homophobia disreputable.

Even the much-derided concept of “microaggressions” denotes a real situation that minorities and women face. Nathan Robinson of *Current Affairs* gives examples. When a female physician wearing a stethoscope is repeatedly mistaken for a nurse, that surely gets irritating and can be seen as offensive. When a white woman clutches her purse as a black or Hispanic man approaches, that’s a racist microaggression. A particularly egregious example is the time when a black student asked her academic advisor for information about majoring in biology and, “without being asked about her academic record (which was excellent), was casually directed to ‘look up less-challenging courses in African American Studies instead.’” Whatever the Supreme Court thinks, the U.S. is still saturated with racism, and unconscious racism is constantly revealing itself in trivial interactions in every social context.

Identity politics and political correctness are far from being the unmitigated evils Donald Trump and Bill Maher apparently think they are. And it’s true that in popular movements, excess is inevitable. From the French Revolution to the New Left—and now to the new New Left—popular enthusiasm has been apt to get out of control and become absurd and even violent (as with Antifa). But that doesn’t mean the excess shouldn’t be fought when it becomes truly damaging. When a mode of politics starts to ruin the lives of innocent people, discourage independent and honest thinking, and advocate the destruction of valuable works of art, it’s time to rein it in.

One of the most striking features of the extreme fringe of political correctness—a fringe that seems to dominate culture more and more—is one of the least talked about: often, it is just a sublimation of the very conditions of neoliberal capitalism that leftists hate. Interpersonal atomization and alienation, gleeful cruelty, schadenfreude run amok, censorship and suppression of dissent, a universal leveling that valorizes groupthink as the highest virtue, and surveillance of daily life and every interaction: these tendencies of late capitalism are somehow refracted into left-wing forms and concerns. The mechanism, actually, of this ironic ‘refraction’ is probably quite simple: society has become so inhuman and depersonalized, so bureaucratized and anonymized, that people all across the political spectrum—not only leftists—are made pettier, more insecure, sensitive to perceived slights, and mean-spirited (especially online).

We see the “Other” as oppressing us—however each of us defines the Other—and we lash out to punish it or those who we think manifest it at any given moment. This punitive mentality at least gives us little malicious pleasures that partly compensate for the indignities we’re constantly suffering.

But while it might be understandable, it’s hardly appropriate for people on the left to be so corrupted by the anti-humanism of a fragmented and paranoid capitalist society. From Karl Marx to Eugene Debs, from A. J. Muste to Noam Chomsky, the left has devoted itself to far more elevated causes than vindictively shaming people for, e.g., using the word *fútbol* despite not being Hispanic, or quietly telling a “sexist” joke to a friend within earshot of a woman who doesn’t like such jokes, or in general policing the world so that every space is “safe” and people are never uncomfortable. Some such policing, within reason, can be productive and important: people should be educated, to the extent possible, out of their unconscious biases and prejudices. But those who identify with the left should also identify with the tradition’s compassion and self-critical inclinations. Perhaps a little less puritanism is called for, and a little more understanding that even good people are imperfect and have lapses. And that no one, including the most eager shamer, is perfect.

Indeed, I’m tempted to say that the hyper-moralistic mindset doesn’t belong to the left at all. Its demand for purity is uncomfortably close to the puritan obsessions of the religious right, so vigilantly attuned to the merest indication of atheism, sex, homosexuality, coarse language, and humanism. At best, leftist puritanism represents an attenuated, enervated, decadent left, a strain of the left that has lost its love of people and become thin and narrow as a reed. Brittle, misanthropic, crabbed, ungenerous, ultra-judgmental, whiny, sickly—these are the words that come to mind to describe such a “left.”

How different from the humanism, compassion, and spiritual capaciousness of a Debs or a Chomsky!

The destruction of a left-wing mural for being “hurtful” may seem like a pretty minor affair, and compared to the catastrophes occurring every day all over the world, it is. But if the cultural tendencies that have eventuated in this crime against art are not checked, we’ll continue to see more such crimes, and not

only against art. Against people, too, people who don't deserve to be publicly shamed or ruined. The left should take care lest it lose its humanity and adopt the censorship-fetish of the fascist right.

It's Important to Always Ignore Thomas Friedman

Whenever I read a column by the pustule called Thomas Friedman, I don't know whether to laugh or cry. To laugh at the hilarious attempts of an anthropoid carbuncle to sound vaguely human and Serious, or to cry at the fact that this abscess on the body politic is admired and deemed Serious by...all the polyps and tumors that run the media, the government, the corporate sector, the country, and the world. Even decent people who are influenced by the mass media are tricked into thinking that the incoherent ravings of an anti-human make sense! "I think Tom has made some excellent points here!" a friend of mine emails me, in reference to his recent column "Trump's Going to Get Re-elected, Isn't He?"

Ugh, where to begin? I know I'm a little slow on the uptake regarding this latest Friedmanite obscenity—it was published on July 16—but I had refrained from reading it. "For once, be stronger than your masochism!" But I finally read it and decided it provided an opportunity to refute the fascist fallacies of the Moderates who run the Democratic Party and virtually everything else.

Now, it goes without saying that most Moderates, at least the powerful ones, are not acting in good faith. Their commitment to Moderation is less a function of their desire to unseat Trump ("The average voter is a moderate!") than of their desire to maintain their power and avoid upsetting the status quo. When a Friedman says to Democrats, "please, spare me the revolution! It can wait. Win the presidency, hold the House and narrow the spread in the Senate, and a lot of good things still can be accomplished," it's clear that the bedrock of his Moderateness—which is just another word for conservatism, which is just another word for fascism—is his revulsion at the prospect of radical change. Not his pious hope to get rid of Trump.

"Dear Democrats," little Tommy writes, as if he's addressing his diary: "This is not complicated! Just nominate a decent, sane person [i.e., not a leftist], one committed to reunifying [?] the country and creating more good jobs [you mean like Bernie Sanders?], a person who can gain the support of the independents, moderate Republicans [who don't exist] and suburban women who abandoned Donald Trump in the midterms and thus swung the House of Representatives to the Democrats and could do the same for the presidency. *And that candidate can win!*"

Oh, like Hillary Clinton won? That was your model moderate, moron. Remember how well she did against the Orange Blob, who should have been the most easily defeated candidate in recent history?

It would be surprising how slow some people are, if we didn't already know it's hard to get someone to understand something when his salary depends on his not understanding it.

But while the Friedmans of the world don't make arguments in good faith and shouldn't be taken seriously, there doubtless are Moderates out there who should and can be convinced of the error of their ways. Both the strategic and the moral error. Strategically, for example, one might point out that, whatever this or that poll says on this or that issue, Americans tend to respect strong, committed, proud leadership with a clear vision for the future—even if they don't necessarily agree with every aspect of that vision. The projection of self-certainty, moral clarity, honesty, and genuine concern for ordinary people is telegenic and polls well, as attested by Bernie Sanders' greater popularity than Trump and Clinton in 2016. A hemming and hawing, "flip-flopping," vacillating, calculating Moderate like the Clintons and John Kerry in 2004 often evokes contempt. (Obama was an exception because of his charisma, his "symbolic" skin color, and his hopey-changey rhetoric that people were hoodwinked into believing.)

In 2016, both the Moderate Republicans (Jeb, Rubio, Christie, Kasich, etc.) and the Moderate Democrat were dismally defeated by a shouting blubbering giant orange infant racist sex abuser who knew nothing about anything. Why? Newsflash: people want change. Radical change. They're screaming for it. Trump was change (they hoped), like Obama was change (they hoped). In 2020, guess what: people will still want change, especially those who have been disappointed or disgusted by Trump.

This desire, by the way, is one reason that the horrifyingly “radical” Medicare for All polls well, and would likely poll even better if more people understood it (e.g., the fact that Sanders’ version would eliminate premiums and deductibles and bring down overall costs).

In short, let’s put to rest the notion that the Average Voter wants Moderation. A poll here and there might suggest that, just as other polls don’t. Questions about the Average Voter’s preferences cannot be answered in any precise or scientific way, and anyone who claims he knows how people will vote is a fraud. What we do know is that the (relative) left had significant victories in 2018 and came close to winning in other races (Stacey Abrams, Andrew Gillum, Beto O’Rourke), in several instances likely losing because of Republican foul play.

The pundits were wrong in 2016, and there’s no reason to believe they’re right this time around.

Even more important than electoral strategy is something that the Friedman anthropoid has little knowledge of: morality. “I was shocked,” he writes, quivering in righteous indignation, “that so many [in the June Democratic presidential debates] were ready to decriminalize illegal entry into our country. I think people should have to ring the doorbell before they enter my house or my country.” The usual nuanced analysis.

“I was shocked,” he continues, bemoaning the injustice of the world, “at all those hands raised in support of providing comprehensive health coverage to undocumented immigrants. I think promises we’ve made to our fellow Americans should take priority, like to veterans in need of better health care.” How noble of you. Too bad you haven’t explained why the two goals are mutually exclusive.

This lack of concern for the downtrodden exposes the hollowness of the characteristic appeal to radicals to “wait.” “You’re going too fast!” the Moderate says. “You’re going to screw everything up if you don’t learn to be patient. Be reasonable! Act like the 1960s’ white liberals whom Martin Luther King Jr. excoriated in his Letter from a—oh, wait. Um... No. Yes. Act like them: he was wrong and they were right.”

The Moderate is either unaware or doesn’t care that every worthy political goal has been achieved only because “radicals” were clamoring for a revolution (or at least a mild Sanders-type “political revolution”). American independence? Those despised radicals Jefferson, Washington, Adams, and the rest—and even more so the ordinary farmers, artisans, sailors, laborers, and women—got fed up with “patience” and severed their ties with the imperial power, heedless of the sage counsel of conservatives.

White male suffrage? Agitators in the mode of Thomas Skidmore and Thomas Wilson Dorr *demand*ed that it be granted. Patience and politeness would have got them nothing.

The end of slavery? Fiery abolitionists like William Lloyd Garrison, Frederick Douglass, and John Brown had the courage to ignore the Thomas Friedmans of their day and finally, after decades of struggle, stirred a nation to action.

Women’s suffrage? The Elizabeth Cady Stantons and Susan B. Anthonys, the Emmeline Pankhursts and Carrie Chapman Catts, organized and organized until the powerful could no longer ignore them.

The birth of the U.S. welfare state? Millions of unemployed in the Great Depression marched in the streets, resisted evictions, terrified authorities, demanded action, until the ruling class consented to the Social Security Act as a necessary concession to forestall revolution.

The civil rights movement? You can imagine what would have happened if activists had agreed to “wait”: Jim Crow would still exist today.

And so it goes, time and again, always and forever. Feudalism collapsed not “automatically” from the spread of capitalism but because millions of peasants and urban workers resisted it and fought against it, from the 14th to the 20th centuries, until it was gone.

Today, if activists and political figures don’t talk ceaselessly and heedlessly about Medicare for All, a \$15 national minimum wage, the abolition of ICE, abolition of student debt, free education for all, radical action to tackle global warming, demilitarization of the U.S. budget, and a dozen other urgent issues, *nothing good will happen*. The status quo will continue, and society will, in the end, collapse. Wild misery and injustice will only spread and consume the country and the world.

In order to “normalize” “radical” ideas, you have to talk about them. Wherever and whenever you can. The more you talk about them, the more likely it is that people will understand them, accept them, and eventually demand them. They’ll *always* be “too radical” if you put them on the back burner and focus on more “immediate” goals that are supposedly—but not really—in conflict with them.

Both strategically and morally, it is imperative for Democrats to move to the left, much further than they have. The more of them adopt the policies of “the Squad” (or rather more left-wing policies than the Squad’s), the more hope there is for the country. Ultimately, of course, the Democratic Party will likely remain “history’s second-most enthusiastic capitalist party,” but individual Democrats at least can try to break the mold and galvanize resistance.

As for little Tommy Friedman (he’s still learning how to write) and his Moderate pundit playmates, I’d only say to them: your grotesque amorality is rivaled only by your intellectual immaturity. Had you been writing in the 1850s, you’d be shameful little “compromise”-obsessed historical footnotes. As, indeed, you will undoubtedly be seen decades from now.

Don’t Mourn, Organize

A Review of *Beaten Down, Worked Up*, by Steven Greenhouse

We live in a paradoxical time. On the one hand, workers and organized labor are in their worst state since the early 1930s. Only 6.4 percent of private-sector workers belong to unions; average hourly pay is below what it was in 1973; 40 percent of adults lack the savings to pay for a \$400 emergency expense. On the other hand, there is more excitement and organizing potential on the left, and among many workers, than there has been in generations. The Fight for \$15 has been remarkably successful; hundreds of thousands of teachers have gone on strike illegally and won; innovative new forms of organizing are reinvigorating both labor and the left.

Steven Greenhouse, longtime labor correspondent for the *New York Times*, surveys this extraordinary terrain in his new book *Beaten Down, Worked Up: The Past, Present, and Future of American Labor*. While he doesn’t provide a detailed history of labor, he does cover some of its most dramatic moments and significant phases from the early twentieth century to the present, with a journalistic flair for personal stories often absent from academic accounts. Much of the narrative, particularly of the neoliberal attack on unions, is bleak, but in the end Greenhouse’s argument is compelling: labor’s present weakness is not engraved in stone. A renaissance is possible.

The most interesting parts of the book are those that lend support to this argument. Too few people are aware, for example, of the spectacular successes of Culinary Workers Union Local 226 of Las Vegas. “Its membership has more than tripled since the late 1980s,” Greenhouse writes, “soaring from eighteen thousand to sixty thousand today, making it one of the most powerful and fastest-growing union locals in the nation.” Dishwashers, waiters, and hotel housekeepers—immigrants, blacks, refugees—have been raised to the middle class.

The trick has been to reject the union’s old “business unionism” model and make it a rank-and-file union, starting in the 1980s. With the help of large and long-lasting strikes at casino-hotels—one lasted over six years—the Culinary forced one hotel after another to accept “card check” neutrality (meaning it would recognize the union after a majority of workers signed cards supporting it). Even the very anti-union MGM finally changed its tune, after public demonstrations were held and the union distributed reports to MGM’s investors warning them that a Culinary strike could damage the company’s precarious finances.

Other unions could also learn from the Culinary’s dedication to politically mobilizing its members. In 2016, it was decisive in switching Nevada from ‘red’ to ‘blue’: its members knocked on 350,000 doors, got thousands of people to register to vote, and brought tens of thousands of early voters to the polls. In 2018, similarly, the union was instrumental in flipping a U.S. Senate seat from red to blue, along with the governor’s mansion and two House seats.

Greenhouse is especially interested in how activists and a “militant minority” of workers have adapted to the adverse conditions of neoliberalism. In chapters on app-based work (Uber, TaskRabbit, Mechanical Turk, etc.), the Fight for \$15, viciously exploited farmworkers in Florida, the teacher strikes of 2018, and “how Los Angeles became pro-labor,” he explores the novel strategies and tactics that have been used—in some cases outside the framework of any traditional union at all.

For tomato pickers in Immokalee, Florida, for instance, conditions have approximated slavery. In 1993, activists founded the Coalition of Immokalee Workers (CIW) to educate and entertain workers by means of leadership training sessions, a low-power radio station, weekly skits about farmwork and social justice (with the immigrants as actors), and other programs. By the mid-90s the Coalition was organizing strikes to press growers for higher pay and better working conditions. But the strategy wasn’t working.

So they switched their focus: they began to pressure tomato-buying chains like Taco Bell and later McDonald’s and Burger King. They had two demands: that these companies require their suppliers to adopt a code of conduct, and that they pay their suppliers a penny more per pound, money that would be passed on to the pickers. With the help of university and high school students, the National Council of Churches and other religious organizations, federal prosecutions of forced labor on Florida farms, and highly visible tactics like a hunger strike outside Taco Bell’s headquarters, the CIW organized a boycott of Taco Bell until the corporation would agree to its demands. In 2005, it finally did. A few years later, other companies followed.

As a result, 35,000 farmworkers have had their wages and working conditions significantly improved. A workplace-monitoring program, which experts have called the best in the U.S., ensures that violations are investigated and punished. “[T]he tomato fields in Immokalee,” one researcher says, “are [now] probably the best working environment in American agriculture.”

Such stories as these make *Beaten Down, Worked Up* an inspiring read. The final chapter is particularly interesting, for Greenhouse gives concrete advice on “how workers can regain their power.” Perhaps there could be a major national workers’ group comparable to AARP, called something like the American Association of Working People, to which members would pay dues and which would advocate for their interests. Activists could champion a system of worker representation on company boards, similar to Germany’s. Union leaders should be incentivized to do more organizing. If the federal government won’t act, states could implement new laws Greenhouse outlines.

Readers familiar with labor history and the recent corporate attacks on unions might find the book’s treatment of these subjects a little superficial, but Greenhouse’s purpose, in any case, is to contribute practically to the struggle for workers’ rights. And at this he will surely succeed admirably.

Capitalism, Socialism, and Existential Despair

Decades ago, Edward Said remarked that contemporary life is characterized by a “generalized condition of homelessness.” Decades earlier, Heidegger had written that “Homelessness is coming to be the destiny of the world.” Around the same time, fascists were invoking the themes of blood and soil, nation, race, community, as intoxicating antidotes to the mass anonymity and depersonalization of modern life. Twenty or thirty years later, the New Left, in its Port Huron Statement, lamented the corruption and degradation of such values as love, freedom, creativity, and community:

Loneliness, estrangement, isolation describe the vast distance between man and man today. These dominant tendencies cannot be overcome by better personnel management, nor by improved gadgets, but only when a love of man overcomes the idolatrous worship of things by man...

Over a hundred years earlier, Karl Marx had already understood it was capitalism that was responsible for all this collective anguish. “All fixed, fast-frozen relations...are swept away,” he wrote in

the *Communist Manifesto*, “all new-formed ones become antiquated before they can ossify. All that is solid melts into air, all that is holy is profaned...” Home, community, the family, one’s very relation to oneself—all are mediated by money, the commodity function, “reification,” exploitation of one form or another.

And now here we are in 2020, when the alienation and atomization have reached such a state that it seems as if the world is in danger of ending. The phenomenology, the “structure of feeling,” of living in this society is that everything is transient and “up in the air,” human survival itself is in question, a hectored, bureaucratized anonymity chases us from morning till night, nothing really matters, no one gets their just deserts. Young people are refraining from having children. There is certainly no collective sense of *belonging*—that’s long gone. We’re *les étrangers*, passively consuming distractions as we wait for the other shoe to drop.

Meanwhile, we read of little else but agonized suffering, from children in cages to rainforests burning, from opioid epidemics to rampaging neofascists.

As always, it’s socialism or barbarism

The case for socialism is usually made, rightly, from the perspective of its justice. It would be just to have economic and social democracy, for one thing because it is intrinsically right that people not be forced to rent themselves to a business owner who exploits them for profit but instead that they collectively control economic activities and distribute rewards as they see fit. Moreover, economic democracy, whether in the form of worker cooperatives or democratic government control, would make impossible the extreme income inequality that corrodes political democracy and ultimately unravels the social fabric.

But it’s also worth broadcasting the message that even from an existentialist point of view, our only hope is socialism. Certain types of conservatives (usually religious) like to complain about the demise of the family, the community, non-hedonistic interpersonal ties, and the sense of meaning in our lives, a demise for which they blame such nebulous or imaginary phenomena as secularism, “humanism,” “communism,” and liberalism. That is, they blame everything except what really matters: capitalism, the reduction of multifaceted life to the monomaniacal pursuit of profit, property, and power. So these conservatives end up in the realm of neofascism, which promises only to complete the destruction of family and community.

The truth is that only socialism, or an economically democratic society in which there is no capitalist class, could possibly usher in a world in which the existentialist howl of Camus and Sartre didn’t have universal resonance. Mass loneliness, “homelessness,” and the gnawing sense of meaninglessness are not timeless conditions; they’re predictable expressions of a commoditized, privatized, bureaucratized civilization. Do away with the agent of enforced commoditization, privatization, and bureaucratization—i.e., the capitalist class—and you’ll do away with the despair that arises from these things.

Optimism of the will

It’s true that the current suicide epidemic in the U.S. and the mental illness epidemic around the world have more specific causes than simply “capitalism.” They have to do with high unemployment, deindustrialization, underfunded hospitals and community outreach programs, job-related stress, social isolation, etc. In other words, they have to do with the particularly vicious and virulent forms that capitalism takes in the neoliberal period. But long before this period, widespread disaffection and mental illness characterized capitalist society.

And then, of course, there is the “material foundation” of the civilization that has sprouted such globalized despair. How much *more* unhappy would we privileged people be if we didn’t live in our little spiritual cubicles walled by Netflix and Amazon, Youtube and Facebook, shopping and video games, but instead could see with a God’s-eye view the inconceivable physical suffering and oppression, the *literal* homelessness, of billions! As Mike Davis wrote years ago, it’s a planet of slums. The vast dimensions of the exploitation of humanity—for those who are “lucky” enough to be exploited, as opposed to simply being made economically redundant and cast aside to subsist on whatever leavings or charity or extra-legal opportunities they can find—are unfathomable. A social order in which even the richest nation in world

history leaves 40 percent of its adult citizens without the means to afford a \$400 emergency expense cannot justify its existence, and is begging to be torn down and rebuilt.

Now, in light of global warming and ecological destruction, it's possible that humanity won't last much longer anyway, in which case capitalism will never be overcome and our collective existential anguish is perfectly appropriate. But nothing is certain at this point. Except that we have a moral imperative to do all we can to fight for socialism. "By any means necessary." It is what justice demands, and it offers the only hope that even we privileged people—not to mention the less privileged majority—can know what it is to truly have a home.

The Life and Times of Jimmy Hoffa

Jimmy Hoffa used to say he'd be forgotten ten years after his death. This was an uncharacteristically unintelligent judgment. Forty-four years after his murder on July 30, 1975, Hoffa is still famous enough that one of the most celebrated movies of the year is about the man who claims to have killed him, Frank Sheeran. Called *The Irishman*, the film, directed by Martin Scorsese, stars Robert De Niro as Sheeran, Al Pacino as Hoffa, and Joe Pesci as Russell Bufalino, the Mob boss who approved the killing. For a labor leader, such a level of fame is not only extraordinary; it is unique.¹

Of course, the reasons for Hoffa's fame are not entirely to his credit. He is seen as the dictatorial and corrupt union leader who was close friends with gangsters and allied his union, the International Brotherhood of Teamsters (IBT), with the Mafia. Bobby Kennedy went after him for years, starting with the famous McClellan Committee hearings of 1957–59 (for which Kennedy was the chief counsel), and finally got him convicted in 1964 on charges of jury tampering and fraud, for improper use of the Teamsters' pension fund. His appeals having failed, Hoffa went to prison in 1967, but was released in 1971 when Richard Nixon commuted his sentence. As described in Charles Brandt's bestseller *I Heard You Paint Houses*, on which Scorsese's movie is based, Hoffa's subsequent campaign to regain the presidency of the Teamsters was sufficiently threatening to the Mafia that they had him killed.

The Irishman focuses on this seedier side of Hoffa's life, thus perpetuating the image of a wholly amoral and self-serving criminal with which the McClellan hearings made Hoffa's name synonymous. Most articles published in popular media, such as Steve Early's recent piece "The Ghost of Jimmy Hoffa Won't Go Away," express a similarly one-sided view. The truth is that Hoffa's Mob connections were hardly the defining feature of his life. Rather, he deserves to be known, in large part, as the preternaturally effective and hard-working—20-hour days six days a week—leader of what was then the largest union in American history, responsible for raising millions of truck drivers, warehousemen, laundry workers, retail clerks, and others into the middle class.

With the possible exception of John L. Lewis, no twentieth-century union leader was as beloved by the members as Hoffa. He made it a point to be approachable and endlessly responsive: in speeches, for example, he regularly gave out his office phone number and insisted that members call him at any hour of the day or night if they had problems. The contracts he secured were remarkably generous—and yet, ironically, even employers profoundly admired him, considering him a master negotiator, a "genius," more

¹ This article relies primarily on the following books: Thaddeus Russell, *Out of the Jungle: Jimmy Hoffa and the Remaking of the American Working Class* (New York: Alfred A. Knopf, 2001); Arthur A. Sloane, *Hoffa* (Cambridge: The MIT Press, 1991); Ralph C. James and Estelle Dinerstein James, *Hoffa and the Teamsters: A Study of Union Power* (Princeton, New Jersey: D. Van Nostrand Company, Inc., 1965); James R. Hoffa, *The Trials of Jimmy Hoffa: An Autobiography* (Chicago: Henry Regnery Company, 1970); Charles Brandt, *I Heard You Paint Houses: Frank "The Irishman" Sheeran and Closing the Case on Jimmy Hoffa* (Hanover, New Hampshire: Steerforth Press, 2004); Robert F. Kennedy, *The Enemy Within* (New York: Popular Library, 1960); and Dan La Botz, "The Tumultuous Teamsters of the 1970s," in *Rebel Rank and File: Labor Militancy and Revolt from Below in the Long 1970s*, eds. Aaron Brenner, Robert Brenner, and Cal Winslow (New York: Verso, 2010), 199–226.

knowledgeable about the trucking industry than anyone, all in all “a great statesman” who was scrupulously honest and realistic in bargaining.

Indeed, the fundamental reason for the perennial fascination with Jimmy Hoffa may be not so much his ties to the Mafia as his sheer power and success. No other industry was more critical to the nation’s economy than trucking, and Hoffa did more than anyone to rationalize and stabilize conditions in this chaotic, competitive industry (a service for which employers were grateful). Bobby Kennedy may have exaggerated when he said Hoffa was the second most powerful man in the country, but he certainly did have a degree of power unimaginable for a union official in the twenty-first century. And that’s what’s so interesting about him: Hoffa symbolizes a political economy long gone, an era when a union leader could strike fear and loathing in the hearts of senators and presidents, when the old industrial working class, millions strong and capable of bringing the economy to its knees if it so desired, was still the foundation of the social order. Certain sectors of the working class were even defiantly independent of the corporate-liberal “consensus” of the Cold War establishment, having carved out their own self-policed political economy with the help of organized crime, informal deals, and a willingness to meet violence with violence. The Teamsters epitomized this independent working class, and Hoffa epitomized the Teamsters.

It was the *aesthetic*, so to speak, of the Teamsters and their form of unionism to which Bobby Kennedy and other “corporate liberals” objected (together with “socially responsible” unionists like Walter Reuther of the United Autoworkers). As historian Thaddeus Russell argues, “the confrontation [between Kennedy and Hoffa] represented a cultural conflict between the rising, respectable professional class of the prosperous postwar years and the uncultured, unassimilated, and unruly industrial working class of the Depression.” To have such an untamed and independent social force right at the heart of society—in the age of triumphant liberalism—was an embarrassment.

That working class is dead now. But in its heyday, it was one hell of a force to be reckoned with.

The Rise of Jimmy Hoffa

Years later, Hoffa formulated the moral philosophy he had imbibed from his early days in Indiana and Detroit:

Every day of the average individual is a matter of survival. If by chance he should go from home to work and have an accident, lose an arm or an eye, he’s just like an animal wounded in the jungle. He’s out. Life isn’t easy. Life is a jungle... Ethics is a matter of individualism. What may be ethical to you may be unethical to someone else... But my ethics are very simple. Live and let live, and those who try to destroy you, make it your business to see that they don’t and that they have problems.

It was in Detroit in the Depression years that Hoffa learned the law of the jungle. As a dockloader at Kroger’s warehouse, Hoffa led a strike against the sadistic foreman, which resulted in a temporary agreement with the company that improved conditions and pay. When he was fired a couple of years later, in 1935, for dropping a crate of vegetables on the loading dock, he was immediately hired by a Teamsters official to be an organizer (or “business agent”) with Local 299. He was only 21, but with his boundless energy and intelligence he proved effective.

Across much of the country, the IBT was beginning a sustained offensive in these years. In 1934 its members played a decisive role in two successful general strikes: one in San Francisco, where they joined the longshoremen’s union to shut down the city, and one in Minneapolis, where the Trotskyists in charge of Local 574 led a strike that elicited shocking violence from the police and thugs hired by employers. The Teamsters’ almost total victory in this strike, leading to the unionization of thousands of “unskilled” workers, began its transformation from a small conservative craft organization to a national industrial union encompassing over two million members.

The more politically conservative Detroit Teamsters were, in their own way, just as militant as the Trotskyists in Minneapolis. To organize the increasingly numerous—and abysmally paid—intercity freight

drivers, Local 299's organizers favored a strategy much simpler than signing up workers and petitioning for elections that would be overseen by the newly established National Labor Relations Board. Instead, they approached an employer: "either enroll your workers with the union or we'll bomb your trucks." If he refused, they bombed his trucks. And sometimes his home. In a violent, lawless city, this strategy worked well. (They had likely learned it, in fact, from having their own cars bombed by "hired thugs.") Combined with frequent strikes and strike threats, such intimidation resulted in an influx of new members into the local and steadily rising wages.

Hoffa and his several union colleagues didn't limit themselves to organizing drivers; anyone who worked on a loading platform was fair game too. "We'd go out," Hoffa later recalled, "hit the docks, talk to drivers, put up picket lines, conduct strikes, hold meetings day and night, convince people to join the union." It was treacherous work: "My scalp was laid open sufficiently wide to require stitches no less than six times during the first year I was business agent of Local 299. I was beaten up by cops or strikebreakers at least two dozen times that year." During one strike he was jailed eighteen times within a 24-hour period, since he kept returning to the picket line after being released. In these years he also had a list of arrests "that's maybe as long as your arm" for fighting with strikebreakers, hired thugs, and members of rival unions who were trying to organize the same workers the Teamsters were.

In 1938 two developments occurred that would later facilitate Hoffa's centralized control over the entire union. First, Dave Beck, an organizer from Seattle (who went on to become president of the IBT in 1952), formed the Western Conference of Teamsters, an administrative body covering the eleven western states and British Columbia. Such a higher-level body was necessary for coordinating organizing and bargaining in a fragmented industry that had thousands of small employers and hundreds of local Teamster unions. That very year, two thousand employers in the eleven states signed an agreement to bring higher wages to intercity ("over-the-road") drivers.

Around the same time, Farrell Dobbs was achieving a similar ambition in the Midwest. One of the Trotskyists who had led the 1934 Minneapolis strike, Dobbs realized it was inefficient and mutually damaging for locals to separately negotiate different wage scales for their own over-the-road drivers. So he and his comrades, with the cooperation of the IBT leadership, created the Central States Drivers Council (CSDC) to bargain for all unionized over-the-road drivers in the twelve Midwestern states. To force reluctant—and widely scattered—employers to come to the bargaining table, Dobbs gave them the kind of ultimatum that Hoffa used to great effect in later years: all firms with lines ending or beginning in Chicago (which meant most firms in the Midwest) would have to negotiate an areawide contract or face a devastating strike. They quickly complied, and over two weeks they and the CSDC hammered out the most ambitious and important contract the IBT had ever negotiated. Establishing uniform minimum wages, maximum hours, seniority rights, safety guarantees, a grievance committee, and a closed shop (all drivers had to belong to the Teamsters), the contract covered 125,000 workers at 1,700 companies.

Hoffa worked with Dobbs in this historic campaign, specifically as a leader of Dobbs' effort to organize those long-distance Midwestern drivers who hadn't yet been recruited into the union. Whatever qualms he felt about Dobbs' Trotskyism, Hoffa was profoundly impressed by the man's strategic and organizational genius. "I was studying at the knee of a master," he reminisced later.

He also learned from Dobbs the usefulness of the secondary boycott. Some employers in Omaha and Sioux City had refused to accept the CSDC contract and locked out their unionized employees. Dobbs and other Teamster leaders studied the companies' routes and decided that the best way to force them to capitulate was to threaten a strike against employers in Kansas City, who made shipments for the Omaha and Sioux City operators, unless they suspended their dealings with the latter. This would cut off the holdouts in Nebraska and effectively force them to sign the contract. The plan worked—and Hoffa was made vividly aware of the power of the secondary boycott, a tactic he would never be afraid to use. (After the Taft-Hartley Act of 1947 made such boycotts illegal, Hoffa found a legal loophole and defiantly continued to use them.)

This tactic also inspired a broader strategy that helped the Teamsters organize industries contiguous to trucking, thus increasing the IBT's membership considerably. Any company that depended on Teamsters for deliveries and pickups could be compelled to unionize its employees simply by being refused service

and thereby shut down. “Warehouses, canneries, laundries, retail stores, bakeries, and breweries fell to this tactic,” one historian writes, “which Hoffa used to make the Detroit Teamsters and ultimately the entire IBT into a boundless, multi-industry union.”

Hoffa’s triumphant future might have been quite different if not for a fateful decision Farrell Dobbs made in 1940: he resigned from the Teamsters to devote all his time to the Socialist Workers Party. Daniel Tobin, head of the IBT, pleaded with him to reconsider, to drop his Trotskyist politics and continue working with the union, even promising him the first available vice-presidency. Which could have been a stepping-stone to the presidency. But it was to no avail: Dobbs resigned his union positions, including negotiating chairman of the powerful CSDC. This is what made possible Hoffa’s rise to national prominence, as he wrote later in his autobiography:

I was chosen to replace Dobbs as negotiating chairman. I didn’t realize, when I accepted the job, along with a vice-presidency [of the CSDC, not the IBT] the following year, that it was the post that would project me into the national limelight as far as the International Brotherhood was concerned, but that job really paved the way to the General Presidency. As a rung in the ladder of my career, it provided a giant step upward.

Hoffa’s star was rising on other fronts too. He had been de facto leader of Local 299 since 1936—overseeing its financial stabilization (after near-bankruptcy) and recruitment of several thousand new members—and was gradually becoming de facto leader of the Joint Council of all Detroit locals. In 1942 he was elected to the board of directors of the Wayne County Federation of Labor, but more importantly, he established the Michigan Conference of Teamsters to centralize in his hands bargaining for all locals in the state. Weaker locals regularly negotiated subpar contracts for their intracity members, which exerted downward pressure on wages across the state. With Hoffa negotiating a uniform statewide contract, the wages of thousands of workers were raised, and increasingly many members became familiar with him and intensely loyal to him.

But it was his achievements with the CSDC that ultimately made him wildly popular across the country. During World War II Hoffa’s ambitions were confined within the straitjacket imposed by the National War Labor Board, but starting in 1945 he was able to negotiate contracts that contained wage increases as high as 20 percent or even 50 percent. He brought tens of thousands more drivers into the Midwestern agreement and established a Central States health and welfare program funded entirely by employer contributions. And he did what the CIO failed to do with its postwar Operation Dixie: he organized the South. Using the secondary boycott, it wasn’t particularly challenging (at least in principle). He ordered warehousemen and dockworkers to boycott Southern trucking companies crossing into the Midwest unless they hired union members, which after a few years forced the large majority of Southern employers to sign with the union. And then, by the mid-1950s, he forced them to raise wages and improve working conditions to the level of the CSDC.

At the same time, the CSDC (renamed the Central States Conference) had undertaken two gargantuan projects: to negotiate uniform contracts for *local* workers—as opposed to over-the-road drivers—in the 22 states the Conference now covered, and to complete the unionization of all trucking companies in these states. By 1957, these goals were achieved.

Hoffa’s meteoric rise in the IBT was cemented at the 1952 convention, when he was unanimously elected a vice-president of the union, the youngest ever (at 39). He quite possibly could have been elected president, but he preferred to engineer Dave Beck’s election in return for Beck’s promise not to interfere in his activities. Aside from the president, Hoffa was the most powerful union officer at the time, controlling the Southern and Central Conferences, and by the middle of Beck’s brief reign (ending in 1957) he was certainly the dominant force in the entire IBT.

How did Hoffa rise so high so fast? Part of the answer, which will be explored below, is that he allied himself with a lot of useful people. But much of his success was due simply to his personality and intelligence. According to people who knew him, he had an “almost hypnotic” charisma, was a “master psychologist,” “the smartest guy I know,” “like an elephant with his memory—it’s beyond belief,” and

expert in the minutiae of labor law. In the 1960s he would often give talks at universities or business executive lunches, discoursing perceptively on the history of labor legislation or jousting with economists and lawyers, leaving initially hostile audiences so impressed they would give him a standing ovation (as on one occasion at the Harvard Law School Forum). He was supremely confident and supremely competent.

In addition to all this, of course, he was infinitely ambitious.

He wanted the union to be millions strong. It's almost as if he shared the old IWW dream of One Big Union for the entire working class—even as he rejected the concept of social-movement unionism associated with both the political left and, in a diluted way, liberals like Walter Reuther. Just before Hoffa was elected president in 1957, he wrote a “policy statement” that included earmarking at least 25 percent of the IBT's income to organizing. This was at a time when the AFL-CIO, to which the Teamsters belonged, was (myopically) devoting about 5 percent of its revenue to organizing. A year later, even as the McClellan hearings—broadcast on televisions around the country—were making his name synonymous with corruption and criminality, Hoffa announced a plan to bring every policeman in the U.S. into the IBT. “It is a piece of unmitigated gall,” one political official responded, speaking for multitudes. Hoffa also planned to establish a “Conference on Transportation Unity,” under his leadership, that would bring together the IBT, the International Longshoremen's Association, the National Maritime Union, railroad brotherhoods, airline unions, in total more than fifty organizations in the transportation sector. Both of these projects had to be scuttled because of public opposition. But they indicate the scope of Hoffa's dreams, which the union continued to pursue by organizing everyone from egg farmers to airline flight attendants.

The other ingredient of Hoffa's personality that was crucial to his success was the one that also led to his downfall: his contempt for bourgeois respectability, bourgeois hypocrisy, and liberal pieties.

Hoffa vs. Kennedy

Jimmy Hoffa was a contradictory man, but one quality, at least, was foundational to his character: brutal realism. He saw the world in terms of power relations; he rejected all ideological illusions and mystifications (as he saw them), from communism to liberalism to his wife Josephine's Christianity. This is how he could both support Republican politicians and frequently sound like a Marxist. It was all in the name of realism, whatever was necessary to get ahead and help certain others get ahead.

His attitude towards the legal system was characteristic. As a couple of academic observers who knew him well wrote, “To Hoffa law is not something to respect, but rather a set of principles designed to perpetuate those already in power, and something for others to ‘get around.’ Thus, Hoffa feels clear of conscience about his expertise in devising legal loopholes and practicing legal brinksmanship.” In effect, he thought the state was a capitalist state; therefore, he had little respect for the idealistic liberal corporatism of a Reuther or the Kennedy brothers. While he recognized the value and necessity of having a welfare state, at bottom he thought the working class had to take care of itself, do whatever was necessary to survive, and constantly fight against a hostile world.

His public statements at the time of the McClellan Committee reflected this perspective. “The working man is being shortchanged every day in America.” “Twenty years ago [i.e., in 1939] the employers had all the hoodlums working for them as strikebreakers. Now we've got a few, and everybody's screaming.” Speaking to a television audience:

Now, when you talk about the question of hoodlums and gangsters, the first people that hire hoodlums and gangsters are employers. If there are any illegal forces in the community, he'll use them, strong-arm and otherwise. And so if you're going to stay in the business of organizing the unorganized, maintaining the union you have, then you better have a resistance.

In short, Hoffa was working-class through-and-through, the very symbol (at least to the public) of anti-establishmentarian defiance in a relatively conformist age, closer to the rank and file than probably any other major labor leader. “As he walks down the street,” one observer wrote in 1964, “he often halts passing

trucks for a moment's discussion with a couple of members. When away from Washington, D.C., he takes time out to tour the local trucking terminals, where he jokes, wrestles, and swears with the workers." Nothing was more apt to provoke his legendary temper than an aspersion cast on the dignity of the truck driver's occupation.

Hoffa's connections to the criminal world dated back to the 1930s and were, arguably, a natural product of operating in a violent, cutthroat environment. If Local 299 and others hadn't made alliances with unsavory people, they likely would have been gobbled up by employers and/or rival unions. In the late 1930s, for instance, a jurisdictional war erupted between the Detroit Teamsters and the United Brewery Workers, both of which unions claimed the right to represent the city's beer drivers. Vicious street battles broke out while higher-level administrative bodies and even federal courts tried to mediate the dispute. The Teamsters developed a network of allies from local saloons to the Michigan statehouse, including members of the East Side Sicilian Mob and other criminals. With their help, and by bribing or intimidating some bar owners into only accepting beer delivered by Teamsters, the latter managed to keep their foot in the brewery industry.

More broadly, David Witwer points out in *Corruption and Reform in the Teamsters Union* that the IBT had both been victimized by and benefited from criminal associations for decades, but especially starting in the 1930s. Chicago and New York were the great hubs of extra-legal activity. The sociologist Daniel Bell explained long ago why trucking was particularly susceptible to crime: "racketeers were able to enter only into small, unit-sized industries where chaotic competition prevailed," meaning that "the greatest potential for racketeering is in the Teamsters union."

It isn't known for sure when the Detroit Teamsters first made really durable and extensive connections with organized crime. Some writers, such as Dan Moldea, argue it was in the early 1940s, when Hoffa's union was facing an existential threat from well-funded CIO unions that were raiding the (AFL-affiliated) IBT's turf to steal its members. Supposedly Hoffa was compelled to turn to the Mob for manpower and political influence in his many battles against the CIO.

Thaddeus Russell, on the other hand, argues the decisive events weren't until later in that decade, in connection with Hoffa's attempts to control the local liquor industry (made up of breweries, bars, groceries, liquor stores, and the state Liquor Control Commission) and to defend it from CIO incursions. By 1946 the Teamsters had organized nearly all of the industry's workers, except for those in a group of businesses owned by the Mafia. The president of the largest Mob-owned company, Bilvin Distributing Company, was William Bufalino, who was a close associate of (among others) Russell Bufalino, underboss of one of the most powerful crime families in the northeast. To break the resistance of the Detroit Mob to unionization, Hoffa hired William as president of Local 985, which covered jukebox workers. This created the first *institutional* alliance between the Detroit Teamsters and the Mafia, who now accepted unionization and in fact engaged in a violent campaign against scores of bar owners who didn't sign with the gangster-owned, Teamster-organized firms.

William Bufalino went on to become one of Hoffa's most important attorneys in his later legal battles. And these new (or not-so-new) connections to organized crime in Detroit facilitated IBT connections to Mob figures all over the country. In 1951, for example, Hoffa placed the Central States health and welfare fund with the Union Casualty Life Insurance Agency of Chicago, which was owned by Allen Dorfman. Allen was the son of Paul Dorfman, who was a useful ally to have in Chicago: he was friends with the city's political bosses, President Truman, leaders of the Chicago Federation of Labor, and AFL president George Meany. He was also connected to organized crime in both New York and Chicago.

In general, one of the key reasons for Hoffa's alliances with gangsters is one of the reasons politicians' later attacks on him tended to be hypocritical: the Mafia was politically influential (in addition to being inextricably intertwined with the "legitimate" business community). "The mobsters have always been wedded to the political system," one criminologist observed decades ago. "That's how they survive. Without that wedding, they'd be terrorists—and we'd get rid of them."¹ As Thomas Repetto has written, "in both politics and business [the Mafia] managed to link the underworld to the upper world," becoming

¹ Arthur Sloane uses this quotation in *Hoffa*, but he doesn't cite the source and I haven't been able to locate it.

immensely powerful in the process. In the 1940s and '50s, if businessmen, politicians, and corrupt law enforcement were all linked to organized crime, it would have been odd for an ambitious union leader operating in a viciously competitive environment not to reach out for protection and advantage to those same powerful “underworld” figures.

In an ABC News interview in the early 1970s Hoffa justified his relationships with alleged criminals and ex-convicts in terms that were, while self-serving, not wholly implausible: “these [organized crime figures] are the people you should know if you’re going to avoid having anyone interfere with your strike. And that’s what we know them for... Know who your potential enemies are and neutralize ’em.” To another reporter he insisted, “I’m no different than the banks, no different than insurance companies, no different than the politicians. You’re a damned fool not to be informed what makes a city run when you’re tryin’ to do business in the city.” On the other hand, a majority of politicians could have justly pointed out they had no ties to the Mafia. Whether they had no ties to *any* corrupt individuals or businesses, or even themselves weren’t morally and legally compromised in numerous ways, is another question entirely.

Hoffa was certainly unusual, though, in his willingness to thumb his nose at propriety. Being convinced of the moral turpitude of the entire political-economic system, he saw no reason to take seriously the self-serving outrage—directed at unions, not corporations or politicians—of its guardians. So he dug himself deeper, as it were, even flaunting his relationships with notorious people. The Central and Southern States Pension Fund (CSPF), for example, which he browbeat employers into creating and funding in 1955, got him into trouble some years later. With millions of dollars flowing into it every month, retired union members received some of the most generous pensions in the country. (Teamsters were also, by now, receiving some of the most generous wages: there were stories of professors at elite universities quitting their jobs to become long-distance truck drivers because they could double their pay.) But all this money, hundreds of millions of dollars, had to be invested, and Hoffa was in charge of the investment decisions, as he was in charge of almost everything. The Fund gave out countless loans to a bewildering variety of people and institutions, but some were given to mobsters such as Russell Bufalino, Carlos Marcello, Santo Trafficante, Johnny Dioguardi, and Morris Dalitz, one of the Mafia figures who used CSPF money to build Las Vegas casinos. While these loans may have been legal, in the context of the McClellan hearings they were provocative.

Meanwhile, since at least the 1940s Hoffa had found it expedient to bribe public officials, including in law-enforcement and regulatory agencies, prosecutors’ offices, and state legislatures. “Every man has his price,” he was wont to say. No doubt he thought bribery, a well-established practice among businesses and (less so) unions through the entire industrial age (in a sense, even up to the present), was necessary to secure the cooperation of typically anti-labor governments. But its widespread practice by unions contributed to the stench of corruption that had, in the public mind, settled on organized labor by the early 1950s.

The history of the public revulsion against ostensibly corrupt “Big Labor,” crystallized in the award-winning 1954 film *On the Waterfront*, is too well known to need retelling here. Grand jury investigations, congressional hearings as early as Senator Estes Kefauver’s Special Committee to Investigate Organized Crime in Interstate Commerce in 1950–51, and negative media coverage hounded some of the nation’s largest unions for years. This was the era, after all, when big business was conducting a colossal political, legal, and public-relations campaign to beat back the left-liberalism spawned by the popular movements of the 1930s. As Elizabeth Fones-Wolf argues in *Selling Free Enterprise: The Business Assault on Labor and Liberalism, 1945–60*, there was a “unity of purpose within much of the business community on... the necessity of halting the advance of the welfare state and of undermining the legitimacy and power of organized labor.” The more that unions could be tarred and feathered for connections to organized crime (as if business itself lacked such connections, or were selflessly devoted to the common weal and knew nothing of legal infractions!), the better it would be for the corporate offensive against labor.

Needless to say, the personal motive of self-designated crusaders against organized crime and union corruption was not necessarily to do the bidding of big business. Bobby Kennedy, for instance, who emerged as the most ferocious enemy of both the Mafia and Jimmy Hoffa, was a highly religious man who seems to have considered it his Catholic duty to cleanse organized labor of racketeers. Unions, he thought,

should be sacred institutions, a movement of the oppressed—hence his embrace of Cesar Chavez in the 1960s. According to Arthur Schlesinger, this millionaire son of a successful businessman, brother of a senator and president, “came to identify himself with workers who were expelled, beaten, murdered.” The point, however, is that whatever Bobby’s motives were, his long obsession with crushing Hoffa and other despised union officials fit neatly into the political agenda that had been set by business. This fact, doubtless, is why he was given all the resources he needed to pursue his obsession.

In retrospect, the Kennedy–Hoffa war from 1957 to 1964 has symbolic, sociological significance. It was a clash of two opposite types, two personifications of diametrically opposed philosophies and social strata. On one side was the liberal “do-gooder,” the (anti-Marxian) idealist, the educated, elite professional who thinks society should be run by idealistic educated professionals who are noble and objective enough to have the public interest at heart. He may be inclined to think in terms of moral absolutes—“as Mr. Hoffa operates it,” Bobby wrote, “[the Teamsters union] is a conspiracy of evil”—and is certain he is on the side of Good. This idealist is motivated by whatever lofty ideas he chooses, but his actual role in the political economy is typically to be a smooth-talking technocrat who enforces the rule of the capitalist class. Objectively, so to speak, he is on the side of business.

On the other side is the working-class materialist, the realist, the person whose training in the art of survival has taught him that what matters above all is the struggle for resources. He may share Hoffa’s lack of interest in broad social reform, as well as his belief that a union is in essence just a business to sell its members’ labor at the highest price. He may, therefore, somewhat accommodate himself to society as it is. But the reality of this person’s existence is a kind of class struggle, a struggle to wrest what he can however he can. Doubtless the liberal professional finds him—and his class—vulgar, uneducated, crassly materialistic, and potentially threatening. As Kennedy found Hoffa. But the working-class realist doesn’t have the luxury (nor the liberal hypocrisy) to sneer at “materialism.”

These two types tend to loathe each other.

Incidentally, there is an irony here: in some respects Hoffa had a “purer” character than Kennedy. He never drank or smoked—didn’t even want people to drink in his presence—and would never have dreamed of cheating on his beloved wife, contrary to the perennially philandering Kennedy brothers (whose sexual addictions, including White House orgies, revolted him). At a San Francisco nightclub once, he was so embarrassed by a stripper’s performance he turned his chair away so as not to see her. While he cursed incessantly—except around his family, where he was a paragon of a doting, gentle father and husband—he hated off-color jokes. Far from using the union as a means to enrich himself, Hoffa lived modestly, rarely even upgrading his (somewhat shabby) wardrobe, and constantly gave away large sums of money to anyone who asked for it. “He was probably the most generous, open-handed guy I’ve ever met,” an associate recalled, being a “sucker for any sad song or hard-luck guy.”

As for the Kennedys, their aversion to the Mafia didn’t prevent them from hiring its members to kill Fidel Castro, as part of the secret terrorist program called Operation Mongoose. Seymour Hersh even reports in *The Dark Side of Camelot* that the Mafia, rather stupidly, got John F. Kennedy elected president by manipulating the vote in Illinois. Their reward was that Attorney General Bobby Kennedy devoted unprecedented resources to destroying them.

In effect, what Kennedy and his fellow liberals who administered the Cold War corporatist state wanted was a fully assimilated, “civilized,” obedient population that wouldn’t have any shadowy groups opaque to the state. Communists were illegitimate and had to be persecuted, as they were from the late 1940s on; unions that forged their own way, not consenting to political assimilation, were also illegitimate. Hoffa’s Teamsters, the most powerful union of all and the most “independent”—it even supported Republicans!—was first on the list of offenders.

Dave Beck, sybarite extraordinaire, was the first big fish to be caught in the net cast by Senator McClellan’s Select Committee on Improper Activities in the Labor and Management Field. But right around the same time he was exposed as corrupt, in early 1957, Hoffa was caught allegedly bribing a lawyer involved with Bobby Kennedy’s investigation. And then began Hoffa’s streak of good luck: to Kennedy’s shock, a jury found him not guilty. So later that year he went on to be overwhelmingly elected General President of the IBT. Kennedy was certain the election had been rigged, and publicly said so; it turned out

he was wrong. Hoffa was incredibly popular with the members, and grew more so the more he was vilified in the press. “When the government came after him,” a union member said years later, “a lot of us wanted to take our trucks and run ’em over certain people... Everyone I knew thought Hoffa was a great man.”

His election did result in the Teamsters being expelled from the AFL-CIO. But legally his troubles were overcome one after the other, infuriating Bobby, “the only member of our family who doesn’t forgive,” his father said. A trial on Hoffa’s alleged wiretapping of union offices ended in acquittal. An indictment for perjury before the McClellan Committee had to be dropped when the Supreme Court ruled that wiretap evidence obtained by state officials couldn’t be used in federal court. Over three years, the committee subpoenaed hundreds of Teamster officials and mobsters, filled fifty-odd volumes with witness testimony, interrogated Hoffa many times, charged him with more than eighty improper activities, but in the end, remarkably, proved nothing (as regards Hoffa, that is—other targets weren’t so lucky). Organized labor’s national reputation had been damaged, but legally, Hoffa had weathered the greatest congressional onslaught against a single individual in history.

The committee’s activities did stimulate the passage, in 1959, of the Landrum-Griffin Act, officially known as the Labor-Management Reporting and Disclosure Act. Consistent with the committee’s almost exclusive focus on union corruption and blithe disregard of management corruption, this act largely ignored management and instead regulated the internal affairs of unions. For instance, people convicted of robbery, bribery, extortion, aggravated assault, or embezzlement were barred from holding a union office for five years after conviction. The act also outlawed the principal means by which Hoffa had built the Teamsters since the 1930s: picketing to force employers to recognize a union; certain forms of secondary boycotting that the Taft-Hartley Act had left legal; and “hot cargo” arrangements whereby employers would agree not to deal with another employer involved in a labor dispute. This law thus revealed what, on the broadest scale, was really at stake in the McClellan hearings, namely the business class’s desire to control, hobble, and discredit unions.¹

The Teamsters membership seemed to understand this fact, judging by delegates’ behavior at the IBT convention in 1961. Russell describes Hoffa’s reception:

On the day the convention opened, an airplane trailing a banner with the message “Re-Elect Hoffa” circled overhead as more than 2,000 delegates, nearly all wearing Hoffa hats and saucer-sized buttons, flooded into the Deauville Hotel in Miami Beach. After Hoffa was nominated by John English, who called the incumbent “the man with the most guts in America,” the delegates responded with a fifteen-minute ovation and a continuous chant of “Hoffa, Hoffa, Hoffa.”... The delegates then mocked the government’s attempts to impose Spartan living on their leaders by passing with roaring unanimity a resolution raising Hoffa’s salary to \$75,000—the highest of any American union official at the time...

As for Bobby Kennedy, he “had long been the target of the members’ insults as a ‘pantywaist’ and ‘hatchet man’ bent on taking away the comforts they had gained from the union.” Except for some dissidents scattered around the country, Hoffa acquired nearly mythic status among members as he continued to grow the union and systematically raise wages in the 1960s, even as he was facing his greatest legal threats yet.

Bobby hadn’t forgiven him for escaping his clutches earlier, so as soon as he became Attorney General in 1961 he formed the Get Hoffa Squad (as it was known), consisting of sixteen attorneys and thirty FBI agents. By any means necessary, including methods of questionable legality (such as wiretapping, bugging, and planting spies), they were going to destroy their target. They empaneled fifteen grand juries to investigate Hoffa. In 1962 he went on trial in Nashville, Tennessee for accepting payments from an

¹ During the hearings, for example, the National Association of Manufacturers and the United States Chamber of Commerce “initiated a ferocious anti-union drive,” Thaddeus Russell writes, “and used as one of its selling points the issue of union corruption.” See David Witwer, *Corruption and Reform in the Teamsters Union* (Chicago: University of Illinois Press, 2003), chapter nine.

employer in violation of the Taft-Hartley Act. The government meticulously prepared its case, and yet, once again, Hoffa bested Kennedy: the trial ended in a hung jury.

Six months later, however, he was indicted yet again, this time for jury-tampering in the Nashville case. The Justice Department had uncovered evidence that he had attempted to buy some of the jurors' votes. The trial took place in early 1964, and this time, at last, Bobby got his revenge: Hoffa was found guilty and sentenced to eight years in prison. Just a few weeks later he went to trial once more, on charges of defrauding the CSPF in an alleged scheme that was so complex and technical it took him some time even to understand what he was being charged with. In this case, too, he was convicted, on one count of conspiracy and three counts of mail and wire fraud. His sentence was five years in prison, to run consecutively after the other eight years. Five days after the verdict, his great obsession finally consummated, Kennedy resigned as Attorney General to run for the Senate.

Thus, the Cold War state had won a major battle against a union that had stepped out of line and gotten too powerful for its own good. "The International Brotherhood of Teamsters," Senator McClellan had written in 1962 for the *Reader's Digest*, "is now powerful enough by itself to put a stranglehold on our nation's economy... If they called a nationwide strike, you could not get ambulances to take sick people to the hospital, nor hearses to carry the dead. Farmers could not get produce to urban areas; food manufacturers could not send in canned goods..." McClellan exaggerated Hoffa's power, but his fear was shared by many people and did reflect, however hyperbolically, the very real power of the IBT. Corruption and outright lawlessness existed all over society, not least within the federal government itself.¹ It is hardly a coincidence that officials empowered to hunt down corruption attacked, first and foremost, the largest union in the country.

Indeed, in the very year that Hoffa was convicted, the IBT was attaining new heights of power. In January of 1964, Hoffa achieved the dream both he and his mentor Farrell Dobbs had cherished since the 1930s: a National Master Freight Agreement that covered hundreds of thousands of intercity and local truck drivers. It wasn't entirely complete, not being wholly uniform and not covering all the trucking-relevant occupations of the IBT membership. But it was a magnificent achievement nonetheless, 25 years in the making.

In the years when Bobby Kennedy and his colleagues were almost single-mindedly focused on, in effect, disciplining and defaming organized labor (however they personally interpreted their actions), Hoffa was patiently laying the foundations for realizing his dream. Year by year he was consolidating his power over the two regions he didn't yet control, the East and West. Bargaining was highly fragmented in the East, wage diversity prevailing everywhere. Both employers and local union leaders, fearful, as Hoffa said, that "they would no longer be kings of their individual little isolated area," resisted standardization. But through threats and cajolery, strikes and other kinds of leverage, Hoffa gradually imposed uniformity on West Virginia and Pittsburgh, upper New York state and New England, then Philadelphia, Delaware, and southern New Jersey, finally the troublesome New York–New Jersey metropolitan area. All these places saw conditions begin to approximate the privileged Central States area for which Hoffa had long been bargaining.

It was a similar story in the West, although in a sense his task was easier there because bargaining was less fragmented. By 1961 he had achieved near-uniformity, in the process greatly raising wages in some areas, including Los Angeles.

Having engineered a common expiration for contracts from coast to coast in 1964, Hoffa was able to bargain with employers across the country at the same time. The 47-page contract, "the most complicated one ever worked out between a union and employers" (in Hoffa's opinion), covered 450,000 drivers. For most, the generous fringe benefits and across-the-board increases of 28 cents per hour over three years and three-quarters of a cent per mile were a significant improvement over their previous contracts. In just a few decades, then, the trucking industry had gone from being completely decentralized, low-paying, and

¹ For examples, see William Blum, *Killing Hope: U.S. Military and CIA Interventions Since World War II* (Monroe, ME: Common Courage Press, 2004).

characterized by utterly inhumane working conditions to being highly centralized, high-paying, and relatively humane.

For the next couple of years Hoffa worked towards achieving the same goal of relative uniformity for other occupations in his union, such as warehousemen. But by early 1967 his appeals of his convictions had run out, and it was time for him to report to federal prison in Lewisburg, Pennsylvania. “The last couple of weeks before he went to jail were hellish,” said a staffer who was with him during this time. “He was on the verge of a nervous breakdown. He would lie on the floor and yell, ‘I’m not gonna go!’” But in early March, he went.

The End

It’s easy to imagine that for a man with the energy of Jimmy Hoffa, prison would not be easy. In fact, one of his favorite expressions became “Prison is hell on earth, only hell couldn’t be this bad.” When he was released, after 58 months in an overcrowded, rape-plagued, drug-infested, violent penitentiary, his description of the experience didn’t mince words: “I can tell you this on a stack of Bibles: prisons are archaic, brutal, unregenerative, overcrowded hell holes where the inmates are treated like animals with absolutely not one humane thought given to what they are going to do once they are released. You’re an animal in a cage and you’re treated like one.”

During his confinement he constantly suffered little indignities, such as having his anus inspected for drugs after returning from the visiting room, having to wear shoes and pants that didn’t fit, and getting nosebleeds from his job assignment of unstuffing and restuffing old mattresses forty hours a week.

But even in prison, the labor leader found opportunities to organize. He became quite popular with the prisoners, for whom he formed and headed a committee that brought grievances to the attention of the warden. Since officially he remained president of the IBT until just before he was released, he was able to find jobs for many parolees, as well as sending money every year to his former Teamster assistants so they could buy Christmas cards for the families of his fellow prisoners. Guards and prisoners of all racial, religious, and educational backgrounds were, by all accounts, very fond of him.

Meanwhile, his power in the IBT was waning. He had appointed the rather dull but loyal Frank Fitzsimmons as acting president in the belief that he would willingly step aside when Hoffa was released (hopefully early, on parole). But Fitzsimmons gradually began to show signs of developing an independent identity and wanting to remain in power. Not that his leadership was beneficial for the union. He was too weak to impose his will on the vast bureaucracy, so he restored decentralization to local and regional officials. Since this allowed them to build their own structures of power—not always to the benefit of the rank and file—they found Fitzsimmons’ presidency quite congenial to their taste. They also began to increase their involvement with the Mafia, which, in addition, was finding it easier to get loans from the pension fund than under Hoffa.

In contract negotiations Fitzsimmons had skills, but they weren’t on the level of Hoffa’s. The renewals of the National Master Freight Agreement (NMFA) in 1967 and 1970 disappointed thousands of workers, who went on strike in cities across the country. Considerable violence broke out as governors mobilized the National Guard, employers sent hired goons to attack pickets, and the union sent its own officials for the same purpose. Employers were finding it easier to coordinate resistance to employee demands, in part because the NMFA had, ironically, forced unity on them, but also because the IBT’s leadership was increasingly ineffectual and corrupt. Wage growth slowed at the very moment when inflation was rising (as it continued to do through the 1970s). By the early ’70s, rebel rank-and-file groups were springing up in almost every major city.

In fairness to the Fitzsimmons regime, in the long run even Hoffa could hardly have been up to the challenges. The political economy that had allowed a Hoffa to seize the reins and dominate an entire industry was already coming to an end. Facilitated by technological change, employers were embarking on a productivity push that threatened Teamsters’ traditions of workplace control, as Dan La Botz argues. More companies were using pallets and forklifts; truck trailer lengths were growing longer; radio dispatch increasingly directed drivers; mechanized systems of conveyor belts distributed packages. The organization

of work was changing. Teamsters “worked harder and under worse conditions as new equipment and new management techniques eliminated jobs while forcing those still employed to pick up the slack.”

Hoffa had foreseen the inevitability of technological change and done what he could to ease the transition for suffering workers, forcing employers, for example, to pay for new job training and the costs of workers’ relocation. But just as he left the picture, change was accelerating. His departure from the scene, however adventitious, was symbolic.

As economic and political crisis gripped the country in the 1970s, the transition to a neoliberal economy began. Neither strike waves in industry after industry nor the formation of union reform movements such as the important Teamsters for a Democratic Union (founded in 1976) could prevent the economic transition, though they could, at least, discipline and even eliminate corrupt leadership that was often in league with employers. With profit-rates under attack from heightened international competition, the overriding business agenda to cut costs, no matter the consequences for workers and communities, soon became the national political agenda. Industries began to be deregulated, a trend that has continued, with interruptions, up to the present. Trucking was deregulated when Jimmy Carter signed the Motor Carrier Act in 1980. Dan La Botz summarizes the consequences:

As intended, new non-union trucking firms swarmed into the industry, union firms went bankrupt en masse, and a series of buyouts and mergers pushed the industry toward oligopoly. Part and parcel of the same processes, the IBT lost tens and eventually hundreds of thousands of unionized truck drivers and dockworkers, and within a decade the Teamsters Union had been obliged to cede its long-standing position as the dominant force in American over-the-road truck operations. Since the freight industry had been the heart of the union and freight workers the most political and active union members, the cost to the union as a fighting organization went far beyond mere numbers...

The stage was set for the Reagan years, so disastrous to the labor movement.

Hoffa was released from prison late in 1971, but Nixon had imposed a restriction on his parole, probably at the request of Fitzsimmons: he couldn’t engage in union activity until 1980. He hadn’t known about the restriction when agreeing to be released, and was quite bitter when a reporter told him of it. “Jimmy, do you want to be president of the Teamsters again?” he was asked. “Jack, do you like to breathe?” Hoffa replied. But, not wanting to violate the terms of his parole, for a couple of years he laid low and gave the impression of accepting the terms of his freedom.

Instead, he pursued a new passion: prison reform. He went on television shows, talked to journalists, testified before Congress, gave speeches, and did whatever he could on behalf of a new organization called the National Association for Justice, dedicated to reforming prisons. Using his negotiating skills, he was instrumental in averting several prison riots and improving conditions in an Ohio penitentiary. Meanwhile, he was deluged with letters and physical greetings from well-wishers, thousands of drivers who treated him “like the Messiah,” according to one observer. All this can only have whetted his appetite to return to power.

Which opens the curtain on the final act of his life: his legal battle to get Nixon’s parole restriction overturned, together with his public campaign to take back the presidency into which Fitzsimmons had been elected at the 1971 IBT convention (while Hoffa was still in prison). Ever the fighter, reckless to a fault, in 1974 Hoffa began publicly attacking both Fitzsimmons and the Mafia. The terms in which he did so certainly opened him to the charge of hypocrisy: he accused Fitzsimmons of “selling out to mobsters and letting known racketeers into the Teamsters.” “I charge him with permitting underworld establishment of a union insurance scheme,” he declared. “There will be more and more developments as time goes on and I get my hands on additional information.” Such statements could hardly have pleased his Mob associates.

Nor did these associates want a change of administration in any case. The union was more corrupt than ever, and they were perfectly happy with that. It was starting to look like Hoffa intended to kick them out of the union’s affairs, to clean things up and get revenge on everyone he thought had betrayed him.

“I’m going to take care of the people who’ve been fucking me,” he told Russell Bufalino, according to Frank Sheeran. “Everybody wants Hoffa to back down. They’re all afraid of what I know.”

And so, in the end, Hoffa was done in by one of the deepest traits of his character: reckless defiance. His union career had ended because of his defiance of the law—the law of a government he didn’t respect—and now his life ended because of his defiance of the Mafia. On July 30, 1975 he stood waiting in a restaurant parking lot just outside Detroit. A car pulled up; inside were his foster son Charles O’Brien, his hitman friend Frank Sheeran, and Salvatore Briguglio, an associate of the vicious mobster Anthony Provenzano. The friendly faces of O’Brien and Sheeran reassured him, so he got into the car, which O’Brien—not knowing what was in store—drove to a small suburban house nearby. The meeting to “make peace” was, as far as Hoffa knew, to take place in this house. Hoffa and Sheeran got out and walked up to it as the car drove away. Once inside, Sheeran put two bullets in the back of Hoffa’s head, after which two men waiting in the house brought the body to a local Mob-connected funeral parlor, where it was cremated.

At least, that’s how Frank Sheeran tells the story. And a lot of knowledgeable people (Arthur Sloane, Joe Pistone, Bryan Burrough, William D’Elia, and others) find it credible.

So, in such an anticlimactic way did the remarkable life of a remarkable person come to an end, a life lived at the very center of the most dramatic events of the age.

Hoffa’s disappearance did have one positive result: it jolted the federal government into systematic action against organized crime, action not just in the context of a battle against a single individual and his unacceptably powerful union but as the beginning of a decades-long war of attrition. In the following years, the FBI hunted down the men it knew were involved in the murder and imprisoned them all on one charge or another (except for those who were themselves killed). The Mafia continued to infest the Teamsters until the late 1980s and even 1990s, but federal prosecution, assisted by Teamsters for a Democratic Union and a reformist president in the 1990s (Ron Carey), finally succeeded in almost completely ridding the IBT of its ancient ties to racketeers. Today, the Teamsters isn’t the awe-inspiring force it used to be, but it is still one of the largest unions in the United States, with 1.4 million members.

As for its greatest leader, Jimmy Hoffa, he’ll always be something of an enigma. On the one hand, he was no saint, nor was he a hero. He sometimes acted in amoral, brutal ways. While his biographer Arthur Sloane is right that the more lurid accusations (that he ordered murders, for instance, or even the assassination of JFK) have never been proven, and also that he was more independent of the Mafia than is generally supposed, Hoffa was not the kind of man or labor leader who should be copied in every particular. What he was was a concentrated, brilliant reflection of his environment, differing from other ruthless power players of his age and ours chiefly in that the side he chose was that of the working class, not the business class. He helped create the postwar middle class, in the process becoming arguably the most popular and the most reviled labor leader in U.S. history.

But perhaps his greatest legacy can be summed up in the inscription on a plaque he displayed on his desk: *Illegitimi non carborundum*. Don’t let the bastards grind you down.

Is Bernie Sanders Electable?

In his 2007 classic *Deer Hunting With Jesus: Dispatches from America’s Class War*—a book that, in the age of Donald Trump, is more relevant than ever—Joe Bageant makes an observation that cuts to the nub of the matter. America, he says, isn’t composed of some great middle class; it is an overwhelmingly working-class country. “If we define ‘working class’ simply as not having a college degree, then fully three-quarters [or at least two-thirds] of all Americans are working-class.” He continues:

“Class,” however, is defined not in terms of income or degrees but in terms of power. Especially regarding labor. If you define “working class” in terms of power—bosses who have it and workers who don’t—at least 60 percent of America is working class, and the

true middle class—the journalists, professionals and semiprofessionals, people in the management class, etc.—are not more than one-third at best.

In fact, professionals, such as journalists and teachers, live increasingly precarious, disenfranchised lives, as revealed by the upsurge of teacher strikes in the last couple of years. Many professionals belong right next to truck drivers, medical technicians, retail workers, and the chronically unemployed and underemployed in the exploited, low-paid working class.

Among the Democratic candidates for president, there is one person who speaks for this vast, long-suffering working class, this beating heart of America: Bernie Sanders. Whether or not all his legislative goals are achievable in the short term, he is the one fighting most aggressively for the interests of workers. It is hard to argue, after all, that his proposals for “workplace democracy,” the cancellation of student debt, tuition-free higher education, a federal jobs guarantee, Medicare for All, and so on are against the interests of the large majority of Americans.

So what does it mean to say, as so many do, that he is unelectable?

One possible meaning is that most Americans are unaware of their true political interests. They might be swayed, say, by pundits’ or Republicans’ demonization of Sanders as a socialist—even though true socialism means popular control of the economy and abolition of the capitalist class, which Sanders hasn’t advocated. Disinformation campaigns like this (and there are many other examples) are crucial to convincing working-class Americans to vote against a candidate who has spent most of his life fighting for the working class.

Another possibility is that Democrats who support Sanders will convince themselves that in the general election he would never win, so voters in the primaries will choose someone supposedly more “electable” like Elizabeth Warren or Joe Biden. On this understanding, the primaries may pose more of a challenge for Sanders than the general election, in that the prediction of his unelectability could become a self-fulfilling prophecy.

But primary voters shouldn’t single out Sanders for their worry; the fact is that neither Warren nor Biden is obviously more electable than Sanders. Both have weaknesses Trump could exploit: for instance, Warren could be mocked for her “elitist” Harvard resumé, her claims to Native American ancestry, and (like Sanders) her “ultra-left” program. Biden, on the other hand, is prone to gaffes, is just as much an “establishment” candidate as Hillary Clinton was, and lacks “the vision thing” that Sanders and Warren have in spades.

As for Sanders, the argument that he’s far to the left of the electorate is belied by polls. Nationally, he is consistently more popular than Trump, while among Democrats he is competitive with Warren and Biden. Support for the two left-wing candidates together trounces support for the centrist Biden.

On issues, the electorate—consistent with its largely working-class composition—tends to be left-wing. A majority favors Medicare for All, the Green New Deal, worker representation on corporate boards, a wealth tax, and other leftist goals. If Sanders were given the sort of universal media coverage Trump was in 2016—as opposed to being regularly ignored—it’s likely that support for him would increase. After all, people tend to like politicians with a simple, consistent, populist message, the message that “I’ll fight for you.” No one delivers this message more forcefully than Sanders.

Attempts to predict election results are a fool’s errand, but it should be clear, at least, that in a working-class country such as the U.S., a candidate whose essence is his appeal to the working class has a definite shot at winning. The question is whether he and his millions of supporters can neutralize the corporate chorus of disinformation.

In an age of working-class desperation, this question, too, may prove to have an affirmative answer.

Rambling Reflections on Camille Paglia

[A blog post]

I've been reading Camille Paglia's collection of essays [Sex, Art, and American Culture](#) (1992). I disagree with a lot of Paglia's opinions, in this book and elsewhere, but, if it came to a choice between her and the establishment—including the "left-wing" side of the establishment, in academia and the postmodern-leftist circles that swirl around it—I wouldn't hesitate to stand by her side. Her battle against groupthink is necessary. In any case, her writing is so scintillating, spirited, witty, contemptuous of orthodoxies, and joyfully defiant that I can't help but be partial towards her—again, despite her absurdities and excesses.

In some respects I identify with her. (Though not with her dazzling writing talent or work-ethic.) I'm completely on the left, the far-left—more so than she—but my commitment to reason keeps me something of an outsider. To give some random examples: while I wholly agree with the left that even Sanders, not to mention Biden, is much too conservative, I agree with Chomsky that "[lesser-evil voting](#)" is, in some circumstances, a moral truism, so obviously right in many cases that it hardly even deserves discussion. (There are other ways to move the political system left than by voting for the most marginal far-left candidate, thus using your vote to help the reactionary candidate.) I find much academic feminism—which has increasingly become mainstream feminism—intellectually dishonest and uninteresting. I share Paglia's bewilderment with the academic left's worship of Foucault, Derrida, and the other French decadents, together with their decadent American disciples (the whole constellation of postmodern "theorists" in the humanities, from Judith Butler to, I don't know, [Ann Laura Stoler](#)). Like her, I dislike the snobbery and careerism of academia, along with the superficiality and emptiness of fashionable discourses.

But Paglia is too fond of pop culture for my taste. Her "worship" of television I find silly. While I appreciate her impulse to defend the cultural tastes of "the masses" against left or pseudo-left academic snobs, I think the "snobbish" (as she calls it) Marxist critique of mass culture pretty much hits the nail on the head. (But I still have to read Neil Postman's classic [Amusing Ourselves to Death: Public Discourse in the Age of Show Business](#).) I consider her love of astrology laughable and her admiration for Freud a little misguided, but I like her willingness to face dark truths about humanity—about sex, the aggressive side of male sexuality, ineradicable interpersonal conflict—and her rejection of bland left-wing utopianism. (Not least the utopianism of feminists. "Academic feminism is lost in a fog of social constructionism. It believes we are totally the product of our environment. This idea was invented by Rousseau. [Actually not; it was around before him.] He was wrong... Aggression and eroticism are deeply intertwined. Hunt, pursuit, and capture are biologically programmed [*to some extent*] into male sexuality. Generation after generation, men must be educated, refined, and ethically persuaded away from their tendency toward anarchy and brutishness.") We'll never have a world without conflict (fortunately?), though we should do all we can to try to achieve it, especially to try to abolish class.

On this subject of human "brutishness": while I agree with [Rutger Bregman](#) that most people are inclined towards decency, I'm more conscious than leftists like to be of contrary tendencies in human nature. I'm often struck by the innumerable little unkindnesses I observe in daily life, people's callousness toward each other. Much of this results from environmental influences, but I remain disturbed by the astounding cruelties and stupidities that leap out, by the millions, from every page in the annals of history. It's depressingly easy for unsympathetic, even brutal strains of human nature to manifest themselves, even just in everyday situations. The natural world itself is pretty unkind. I think Paglia overstates how "dark" human nature is—her anti-Rousseauism is too extreme—but at least she's unafraid to defy liberal and leftist groupthink.

It's easy to ridicule the statement that men have a biological "tendency toward anarchy and brutishness," but all it needs is some qualifications to be correct. Men aren't "naturally" brutish, naturally *Lord of the Flies* Hobbesians, but that is *one side* of them, a latent potentiality that it's important to "ethically persuade" them away from. When social order breaks down, one consequence may be an efflorescence of cooperation and community, but another may be an orgy of male bestiality. It is the never-ending task of civilization to limit expressions of violent masculinity and divert them into safe outlets, such as sports.

Here are my conclusions, after a lifetime of observation and reflection. Maleness at its hormonal extreme is an angry, ruthless density of self, motivated by a principle of 'attack'

(cf. 'roid rage,' produced in male bodybuilders by anabolic steroids). Femaleness at its hormonal extreme is first an acute sensitivity of response, literally thin-skinned (a hormonal effect in women), and secondly a stability, composure, and self-containment, a slowness approaching the sultry. [I'm not sure about that sentence. Women don't always strike me as stable, composed, and self-contained.] Biologically, the male is impelled toward restless movement; his moral danger is brutishness. Biologically, the female is impelled toward waiting, *expectancy*; her moral danger is stasis. Androgen agitates; estrogen tranquilizes—hence the drowsiness and 'glow' of pregnancy. Most of us inhabit not polar extremes but a constantly shifting great middle.

I think these reflections have some truth, however unpalatable they may be to liberals and leftists. More broadly, I agree with this paragraph, aside from the one-sidedness of the last sentence:

...The feminist [and generally leftist] naïveté about life, history, and culture must end. We must eliminate social injustice where we can. But all 'human needs' will never be fully met, except in a totalitarian regime of bloated centralized authority. [Actually, they wouldn't be met even there.] Life will never be a utopian paradise of universal happiness, harmony, and good will. Life is combat, strife, limitations, obstacles met and overcome by self-discipline and self-criticism.

This philosophy of life grounds Paglia's criticisms of contemporary feminism. She thinks it encourages and manufactures weakness, infantilism, naïveté, mollycoddling, a fetishizing of victimhood. "Running to Mommy and Daddy on the campus grievance committee is unworthy of strong women."

...The Italian philosophy of life espouses high-energy confrontation. A male student makes a vulgar remark about your breasts? Don't slink off to whimper and simper with the campus shrinking violets. Deal with it. On the spot. Say, 'Shut up, you jerk! And crawl back to the barnyard where you belong!' In general, women who project this take-charge attitude toward life get harassed less often. I see too many dopey, immature, self-pitying women walking around like melting sticks of butter. It's the Yvette Mimieux syndrome: make me happy. And listen to me weep when I'm not.

In another passage, making the point explicit, she says, "my kind of feminism stresses independence and personal responsibility for women." "Blaming the victim makes perfect sense if the victim has behaved stupidly. I doubt that [my critic] would leave her purse on the street or sleep with her doors wide open at night." "It is woman's personal responsibility to be aware of the dangers of the world. But these young feminists today are deluded. They come from a protected, white, middle-class world, and they expect everything to be safe. Notice it's not black or Hispanic women who are making a fuss about this [date rape]—they come from cultures that are fully sexual and they are fully realistic about sex." "If your car is stolen after you [leave your keys on the hood], yes, the police should pursue the thief and he should be punished. But at the same time, the police—and I—have the right to say to you, 'You stupid idiot, what the hell were you thinking?'"

I see her point in all this. It's pretty commonsensical: women, be smart. Be prudent. It isn't "victim-blaming" to say women should be aware of their surroundings and not trust that every man is good. On the other hand, I do think it's necessary to teach men the proper sexual norms. The perpetrator should be blamed a lot more than the victim. As feminists argue, we should do all we can to move society to a different place, a place where violence is seen *automatically* as unacceptable. (Women, too, who not infrequently have bad tempers and inflict physical and verbal violence on children, partners, store clerks, etc. (arguably more often than men), should be educated to control themselves.)

I agree with her that there's something to be said for "strength," "self-reliance," "independence," and the like. She has this quasi-aesthetic, quasi-ethical set of values that informs her ferocious criticisms of

contemporary feminism, academia, and liberalism. She hates the idea that people are being taught to see their own victimization everywhere and to *define* themselves as victims, whether because they're "objectified," harassed, discriminated against, date-raped (and she thinks date rape shouldn't be seen as the scourge that feminists see it as), or whatever. A strong person should rise above these things, learn from them and use them to mature. Identity is forged through conflict, as Freud said, not through coddling and weepy hand-holding or wallowing in victimhood. Besides (she says), there's an inherent *power* in female sexuality, in being "objectified," desired, admired as beautiful. For thousands of years, men and women have been objectified in art, not to mention in sex, courtship, and social life generally. Objectification isn't only passive; beauty exudes power, and cultivating one's physical beauty is a legitimate expression of personality. Nor has Paglia herself ever felt envious or insecure when looking at beautiful models in the fashion industry or wherever; she just admires and appreciates them.¹ Feminists should stop whining endlessly about the world, about men (and don't forget, she admonishes, all the technological conveniences and cultural satisfactions—and *good, protective men*—this male-created civilization has given you!), and take responsibility for themselves.

As usual, there's a lot of sense in these ideas, but I think they can be taken too far. And she probably takes them too far. Too much sexual objectification, or the wrong type of it, is limiting and dehumanizing. Strength of personality is good, but there have to be institutional sanctions on behavior. Young people can be fragile and, given the anxieties of modern life, should be encouraged to accept themselves, not pressured to achieve unattainable ideals—or, at least, only pressured in constructive ways. (Maybe in earlier times such pressure wasn't overly psychologically damaging, but society now is awash in innumerable anxieties that didn't exist a couple hundred years ago.) Pop culture is indeed toxic in many respects, however much Paglia might enjoy it.

But her ridicule of activists who want to censor everything they don't like is completely appropriate. The new left concepts of *microaggressions*, safe spaces, trigger warnings, etc. I don't have much of a problem with, inasmuch as they raise awareness and contribute to recognition of marginalized voices. But campus activists *who want professors fired* if they have mildly unacceptable opinions—that's just lunacy. The viciousness and maliciousness of which these "marginalized voices" are capable are astonishing. Frantically trying to destroy someone's life if they don't completely agree with you—it's incredibly nasty, low, totalitarian. Unsurprisingly, there's another irony here (besides the irony of leftists being totalitarian): the behavior of these zealots validates one of Paglia's broader criticisms of liberalism and academia today, that it lacks historical memory and awareness. The august, and leftist, tradition of *defending free speech* (isn't free speech an anti-authoritarian principle? And isn't the left supposed to be anti-authoritarian?) is being casually, vulgarly dismissed. Four hundred years of intellectual achievement! The Levellers, John Milton, Spinoza, Voltaire, John Stuart Mill, and many others—they're all cis white heterosexual men, fuck them! There's no point in reading them, in fact it can be positively injurious! You might get infected with their cis white heterosexual male ideas! History is bunk—except the history of "the marginalized." That's all that matters. Black, brown, female, gay, trans, queer—those are the only voices that have any moral or intellectual authority. Everything else: burn it all down.

To some extent I'm caricaturing, but that's the extreme to which these ideological currents tend. You can see how they emerge from *postmodernism*, which, again, Paglia loathes (ironically despite her love of much of contemporary, postmodern culture): the rejection of the past, anti-intellectualism, anti-science, the belief that all that really exist are contests of power, the immersion in the faddish present, the elevation of subjective feelings and identities and relative lack of attention to *class* oppression as such (for class oppression includes white men)—it has little in common with the traditional left. The traditional left was rationalistic, scientific, intellectually rigorous, committed to analysis of history, continuous with the Enlightenment, *objectivist*, materialist. It's true there was an authoritarian left, a censoring left, but this had much to do with the decidedly-not-leftist Stalinism and its effects on Communist parties around the world.

¹ "We should not have to apologize for reveling in beauty. Beauty is an eternal human value. It was not a trick invented by nasty men in a room someplace on Madison Avenue." She is, of course, a connoisseur of the arts, and has the values of an artist.

The censorship and authoritarianism were largely an imposition from a deformed politics elsewhere that claimed to be left for its own political reasons. Again, I'll admit that Marxism even "organically," as it developed around the turn of the century, was susceptible to authoritarianism; but this was vigorously contested by other Marxists (anti-Leninists and such). It certainly didn't come from any desire to suppress dissenting views because of how bad they made some people feel or because they represented white male heteronormativity. *This* motivation is postmodernist, post-1960s, postindustrial, post-collapse-of-organized-labor.

And yet, as I said, there are authentic leftist impulses even in the postmodern left. The desire for equality, for freedom, respect, dignity, an end to oppression—this is continuous with the old left, if not institutionally then at least in terms of values (the values of the Enlightenment—notwithstanding some feminists' dislike of the Enlightenment). Meanwhile, a new materialist left is rising amid the ashes of neoliberalism and allying, even fusing, with the identity-politics left. Thus, a broader, all-encompassing left, which in Hegelian fashion is "synthesizing" previous different strains, is on the march. All told, its influence is very beneficial, despite the excesses of campus and Twitter fanatics.

Speaking of postmodernism, maybe I should get into that a little. Paglia is a virtuoso at "deconstructing" it, in particular the Holy Trinity of Lacan-Derrida-Foucault and their thousands of acolytes in American humanities departments. (Still today! This book came out thirty years ago and already she was fed up with the cult! And yet the cult has only grown since then, as has its political expression in subjectivist fanaticism! I've seen the best minds of my generation destroyed by madness.) Or rather, she's a virtuoso at mocking it in learned fashion, albeit without grounding her mockery in the sort of dispassionate analysis necessary to really destroy it. Her prose is luminous, hilarious, sparkingly witty and malicious. Her essay "[Junk Bonds and Corporate Raiders: Academe in the Hour of the Wolf](#)" may be the most vicious and entertaining diatribe I've ever read, outside of Marx (*The Civil War in France*) and Nietzsche. How refreshing it is to read an academic so *exuberantly contemptuous* of the dominant intellectual culture!

The following passage isn't one of the most brilliant, but it's interesting in its characteristic Paglian respect for both science and noble forms of religion:

...Robert Caserio recently said to me, 'The whole profession [various disciplines in the humanities] has become vast mimicry. There is only the Foucault monologue, the Lacan monologue, the Derrida monologue. There is no room for creative disagreement. No deviations from what is approved are tolerated.' These monologues are really one, the monotonous drone of the school of Saussure, which has cast its delusional inky cloud over modern academic thought. Never have so many been so wrong about so much. It is positively idiotic to imagine that there is no experience outside of language. [*Yes, thank you! That's one of the most moronic dogmas I've ever encountered.*] I am in love with language, but never for a moment did I dream that language encompasses and determines all knowledge. It has been a truism of basic science courses for decades in America that the brain has multiple areas of function and that language belongs only to specific areas, injured by trauma and restored only by surgery or speech therapy. For thousands of years, sages and mystics of both East and West have taught us about the limitations of language in seeking truth. When Dante must part from Virgil at the gates of Paradise, he is expressing the ancient insight that faith and vision occur in a realm beyond reason and language. My generation, inheriting the Beatniks' interest in Zen, made a spiritual passage to India, with its flaming avatars. We knew words, names, concepts had to be dissolved and transcended. Lacan, Derrida, and Foucault are termites compared to the art, culture, and archaic topography of India. One remedy for today's educational impasse: more India and less France. The followers of Derrida are pathetic, snuffling in French pockets for bits and pieces of a deconstructive method already massively and coherently presented—and with a mature sense of the sacred—in Buddhism and Hinduism.

Paglia has a vehement hatred of Foucault that itself already distinguishes her as a thinker and scholar from the gray multitudes of American "humanists." All this postmodern intellectual sloppiness-cum-arrogance she loathes, fulminating against it without mercy.

...As a writer, Foucault was an arrogant bastard. He did not believe in truth and so never sought it. [*It is indeed a contradiction: if you don't believe in truth, what is it you're trying to achieve?*] His books, clumsily researched but overconfidently argued, show language-obsessed Parisian parochialism become paranoia, delusional and obsessive-compulsive... American humanists, untutored in sociology, are knocked out by Foucault's daring: analyze crime and punishment, prisons and penal codes! Gee, I wish I'd thought of that! Well, Foucault didn't think of it either. It's in Durkheim's *The Division of Labor in Society* (1893). Foucault extends Durkheim's argument one step further but covers up the influence. Look at Durkheim's *Primitive Classification* (1903), and you will see the shadow of Foucault's phrases about taxonomy. Durkheim is everywhere in Foucault. The intricate complexities of analysis of organizations and power groups in Max Weber make Foucault look like a tyro. It is only ignorance of the social sciences that has allowed Foucault to rise to cult status among pitifully unprepared American humanists... His big squishy pink-marshmallow [?] word is 'power,' which neither he nor his followers fully understand. It caroms around picking up lint and dog hair but is no substitute for political analysis. Foucault's ignorance of prehistory and ancient history, based in the development and articulation of cultures and legal codes, makes his discussions of power otiose. He never asks how power is gained or lost [*right, because that would require attention to class, which he likes to gloss over*], justly administered or abused. He does not show how efficient procedures get overformalized, entrenched, calcified, then shattered and reformed. He has no familiarity with theories of social or biological hierarchies, such as the 'pecking order' universally observed in farmyards and schoolyards. Because, in the faddish French [structuralist, poststructuralist, social constructionist] way, he ridiculously denies personality exists, he cannot assess the impact of strong personalities on events, nor can he, like Weber, catalog different types of authority or prestige. He is inept in comparing different governmental structures. Because he cannot deal with flux or dynamic change [*again, this has to do with his disregard of class*], he is hopeless with protracted power struggles...

The central point of her long essay on academia is that it's lost its way and has to be reformed. Political correctness has mutilated humanistic scholarship: presentist concerns, Foucauldian ideologies, and feminist dogmas have shunted aside the disinterested pursuit of truth. Meanwhile, the profession has been...*professionalized*, bureaucratized, insularized, commercialized (people obsessively selling themselves), overly specialized, and all that. It has to become a center of *learning* again, genuine and deep learning, authentic humanist achievement largely divorced from "presentist" agendas, etc.

To which I say: yes (with qualifications), but good luck with that. The university exists in society, and social tendencies are bound to shape it. The very society she apparently admires, the commercial mass culture of television, rock 'n' roll, overwhelming "presentism" and careerism, inevitably dominates academe, and you can't change the latter without revolutionizing the former. The common sense of Marxism suggests this, but she seems oddly immune to the common sense of Marxism.

[From a speech at MIT:] I am the Sixties come back to haunt the present... The reform of education [in particular, her appealingly 'conservative' vision for what it ought to be] is *not* a neoconservative issue! It is an issue facing the entire nation. So what I'm trying to do is to mobilize and radicalize the liberals who have been silent and who have let academe be taken over by these opportunists, these sickening, disgusting, ass-kissing opportunists...

I'm trying to bring back out of the woodwork all these Sixties people. Come out, come out, wherever you are! Come back. Take over the cultural center again!

An admirable call for change, but very politically naïve. Institutions are *economically and socially embedded*. To change the university system, you have to upset the whole class system. And that takes generations.

Intellectually speaking, the point that most stood out to me in the essay was her repeated criticism of Foucauldian, feminist social constructionism. This school of thought, [as I've always insisted](#), is unserious. For one thing, how can doctrinaire social constructionists account for *individual personality*? If they deny or disregard the influence of biology and insist that every new individual is formed simply by passively internalizing what he encounters in society....why aren't we all approximately the same? How can there be the enormous differences in personality that we observe? Indeed, how can we be anything other than undifferentiated lumps of clay that bear impressions? Manifestly, a person is an active being, constantly responding to new situations in original ways, *spontaneously* acting and reacting—not in some sort of conditioned, repetitive, behaviorist, Pavlovian-dog way but in continuously *creative* and *novel* ways. Our behavior can't be only "constructed": it also constructs, as we impose ourselves on the world. Since each individual evidently has his or her own distinct, creative, spontaneously manifesting nature, "socialization" can be only part of the story. (This is a Chomskyan argument that I've charitably read into Paglia's writing. It can be supplemented with a poverty-of-the-stimulus argument, i.e. that in the first couple years of life the environmental input is too impoverished and degraded to be entirely responsible for the emergence of stereotypical gender roles, which *do* manifest by that time. The comedian Bill Burr [has made some perceptive remarks](#) on this score.)¹

Women's studies is institutionalized sexism. It too must go. Gender studies is no alternative: 'gender' is now a biased, prudish code word for social constructionism. Sexology is an old and distinguished field [which recent academic trends ignore, she thinks]. As sex studies, frankly admitting it is sex we are tirelessly interested in, it would take in the hundred-year history of international commentary on sex; it would make science its keystone; and it would allow both men and women as well as heterosexuals and homosexuals to work together in the fruitful dialogue of dislike, disagreement, and debate, the tension, confrontation, and dialectic that lead to truth. Women's studies is a comfy, chummy morass of unchallenged groupthink.

Yup. But not only Women's Studies. Some random guy's website can have more truth and intellectual integrity than a whole bookshelf of scholarly monographs.

It's clear from this book that Paglia is, or was, desperately nostalgic for the Sixties. Everywhere are scattered references to the glory, as well as the failure, of the Sixties. Its untamed, vital, explosive energy corresponded to Paglia's untamed vitality. (Just watch videos of her, especially in her younger years. She's wild and uninhibited, *manic*, a bull in the china shop of academia.) As I read her, it's everything lifeless, inert, oppressive, constraining, and [pretentious](#) that she hates. Rock 'n' roll, sex, art, psychoanalysis, television, drag culture, astrology, pornography, prostitution, free speech, personal responsibility, personal strength, spirited competition—to her, all these are elemental, creative, beautiful, "primordial," life-giving.

¹ I've found that comedians sometimes are more honest and have more insight into human behavior than academics, who are prevented by the politics of institutions from expressing obvious truths. Bill Burr's explanation, or at least partial explanation, for gender identities in the linked video makes sense to me. Very young boys are (frequently) wild, violent, destructive; the girls observe them and think "well, I can't compete with that; that's not me," so they naturally pursue different modes of self-expression. More "nurturing" modes. It's a simple, unpretentious, sensible explanation, which as a result is unmentionable in academic writings. It's also appealing in that it attributes more creativity, rationality, and freedom to children than dogmas about "social constructions" do, as if children are merely passive imitators of others. There's more truth in Burr's statement than in entire scholarly books on the subject.

I happen to disagree with some of her value-judgments here, and altogether I think she isn't sufficiently Marxist or realistic (she has said flattering things about *Jordan Peterson*, of all people!), but her basic approach to life is one I find attractive. *Écrasez l'infâme!* The motto of the rebel.

So, despite her perversities, but in light of her healthy political values—she has supported Sanders and Jill Stein—and her anti-authoritarianism and aversion to institutionalists, who are the bane of the age ("Authentic leftism is populist, okay? It is based in working-class style, working-class language, working-class direct emotion, in an openness and brusqueness of speech—not this fancy, contorted jargon of the pseudo-leftists of academe, who are frauds. These people who manage to rise to the top at Berkeley, at Harvard, at Princeton, okay? How many of these people are radical? They are career people. They're corporate types, okay, who succeeded in—they *love* the institutional context. They know how to manipulate the bureaucracy, which has totally invaded and usurped academe everywhere, okay? These people are company-players."), she has my respect. We could use more of her barbaric energy today, her rebellious and *affirming* energy—albeit with the political clarity of Marxism.

Capitalism and Colonialism

As I frequently and tiresomely reiterate, academic writing tends toward sophistry, superficiality, and obscurantism. Personally, my aesthetic tastes are offended by the endless rivers of overabundant verbiage one has to wade through in scholarly articles and books. But leave that aside. It sometimes seems as if many writers specialize in missing the point. Consider the typical arguments of liberal and conservative anti-colonialists (or so they characterize themselves) who want to defend capitalism against the charge that it necessitated or directly caused the brutal imperialism and colonialism of the nineteenth and twentieth centuries. There are various arguments you can expect to find in their writings. They will say that colonialism (e.g., the Scramble for Africa of the 1880s) was financially and economically senseless, since, supposedly, it led to the home country's net loss of income and resources as it built up infrastructure in the colonies. Some money and resources flowed home, but even more flowed abroad. Or they will say it was not primarily economic motives that led to colonialism but rather forces like popular nationalism, the vainglorious egos of politicians, irrational racial ideologies, and the political power of the military and diplomatic corps. Strictly speaking, all this colonialism was unnecessary, in fact a terrible and bloody mistake.

So don't blame capitalism for it! Blame those stupid irrational Europeans of a hundred years ago!

The historian Jonathan Daly, a great enthusiast of "free enterprise," is, like his more well-known but embarrassingly vulgar University of Illinois colleague Deirdre McCloskey, one of these writers.¹ Let's take a look at his textbook *The Rise of Western Power*:

...Economics, far from the main driving force, was often only an *ex post facto* argument for retaining colonies. Yet colonies almost never paid for themselves, enriching only some individuals or companies, and did not magically enable merchants to gain access to commodities they could not have otherwise acquired through open trading...

...[T]he intense worldwide struggle for colonies was not even a boon to the competitors. Was there a deeper reason [than economics] for the New Imperialism [of the late 19th century]? The West's raw physical power, apparent scientific mastery of nature, efficient and dynamic economy, and myriad technological advantages provoked a broader moral crisis of Western civilization involving aggressive ideologies justifying and lauding violence and struggle as central to human existence. Sigmund Freud, shocked by the carnage of World War I, hypothesized about the "collective insanity" of Europe. It does

¹ For an illustration of McCloskey's vulgarity, see her article "Socialism for the Young at Heart," *National Review*, June 3, 2019.

indeed seem as if some kind of psychosis drove the European peoples to imperialism and war at the turn of the century.¹

Some kind of psychosis. What a profound explanation.

In response to such arguments, I would say, first, that whatever the economic benefits to Europe at the time were or were not, *in the long run* the colonization of Africa and Asia was enormously beneficial to industrial capitalism and world economic growth. Intervention in these regions on a colossal and brutal scale was necessary in order to thoroughly integrate them into a capitalist world-system. You have to create labor markets there, uproot traditional social structures, dispossess peasants of their lands, implant modern technologies and administrative controls, remake the whole society. Once you have accomplished that, after many decades, you can let the re-socialized natives take political control again and run the new system for the benefit of international capital, as has happened to a greater or lesser degree since the 1960s. That is, once you have created new structures of internal political and economic control, you can put your past and present victims in charge of those structures and rely, most of the time, on less direct means of external control (“neocolonialism”) to make sure the newly “independent” societies stay in line.

Over centuries, imperialism and colonialism created the international division of labor that world-systems theorists such as Immanuel Wallerstein and dependency theorists such as André Gunder Frank and Walter Rodney spent decades exhaustively analyzing. The imperial “core” has specialized in high-value-added production, while “peripheral” countries have largely been consigned to exporting raw materials. This world division of labor has been so advantageous to the imperial core that diplomatic historians like Gabriel Kolko and Thomas McCormick have argued, plausibly, that its maintenance has been an overriding goal of American foreign policy up to the present.² The world system could hardly have been constructed without prolonged and invasive intervention in the economies of non-capitalist regions so as to ineluctably draw them into a Western-dominated capitalist system.³

Aside from the incredible benefits to future capital of the brutal restructuring of Africa, Asia, and South America, such restructuring was inevitable anyway. Not even liberals and conservatives can realistically deny that capitalism is an intrinsically expansionist, dynamic, *growing* system, a system that entails perpetual growth—the hunt for and cultivation of new markets, new raw materials, and new opportunities for investment. This process necessarily continues until the whole world has been transformed in the image of capitalist relations of production, as it finally has by the twenty-first century. As industry and investors extended their tentacles to peripheral regions of the world in the late nineteenth century, it wasn’t exactly *accidental* or *mistaken* that governments were prevailed upon to protect investments and trade and to facilitate the whole process legally, financially, militarily, administratively, and technologically.

So, in effect, we have already dispatched the arguments of capitalist apologists. Imperialism and colonialism were a natural and inevitable product of capitalism, and in the long run (arguably also in the short run) they very much benefited the countries that undertook them, enabling further economic growth, world trade, international investment, and the accumulation of profits and resources. Societies had to be remade in the image of capitalism, and this process was never going to be peaceful or “free.”

But more can be said. Did colonialism really, in most cases, not economically benefit the metropolitan country in the short term? Was it economically irrational? We can concede that it was to the greater advantage of investors, politically connected industrialists, and arms manufacturers, not to mention

¹ Jonathan Daly, *The Rise of Western Power: A Comparative History of Western Civilization* (New York: Bloomsbury, 2014), 338.

² Gabriel Kolko, *Confronting the Third World: United States Foreign Policy, 1945–1980* (New York: Pantheon Books, 1988); Thomas J. McCormick, *America’s Half-Century: United States Foreign Policy in the Cold War and After* (Baltimore: Johns Hopkins University Press, 1995).

³ Even in the absence of formal colonialism, military force was often necessary to compel countries to trade, on disadvantageous terms, with the West. The Opium Wars between Britain and China (1839–1842 and 1856–1860) are well-known examples.

the military and diplomatic establishment, than of the general population. It may, in fact, have somewhat harmed the latter, inasmuch as a portion of their taxes went to pay the costs of having colonies. But this argument is of no help to the defender of capitalism, because it is an inevitable result of the ongoing accumulation of capital that some people and businesses will become much wealthier than others, and that their wealth will confer political power, with which (frequently) to manipulate government towards an imperialistic, militaristic foreign policy.¹ So even if colonialism was not of much immediate benefit to the countries that embarked on it but primarily only to favored businessmen and the upper class, that does not get capitalism off the hook, for capitalism creates the circumstances in which these favored investors can help guide policy.

But I don't think colonialism helped only a tiny greedy elite. Even if huge sums of money did go into administering and developing a colony, it was not as if the metropolitan country got nothing for its investment. For one thing, it provided tens of thousands of men with employment abroad and at home. Government bureaucracies and militaries expanded and techniques of administration, repression, and social control were honed, frequently to later be used domestically.² The expansion of domestic and colonial bureaucracies increased aggregate demand (since bureaucrats have to eat too) and stimulated economic activity, thus growth.³ Raw materials extracted from colonies fed the domestic industrial machine. One can, admittedly, indulge in counterfactual history and argue that colonialism was not necessary for the imperial power to have access to these raw materials. But at a time when Western countries were feverishly competing to industrialize—and there was no United Nations or other international legal bodies to regulate the anarchy of great-power competition—it was rational and highly probable for each to stake out large swathes of territory as *theirs* and keep others out. Leopold II and Belgium made quite a killing, so to speak, in the Congo after taking control of it.

In many cases, it is likely that the access to vital raw materials alone did much to justify the expense of maintaining colonies. (And, again, the mere fact that something is expensive does not mean it is harmful. Government spending, including high levels of deficit spending, can be extremely useful for generating economic growth, as America's participation in World War II proved.) Combined with the growth of colonial markets to absorb admittedly small "surplus" amounts of industrial products that could not be sold domestically—but relatively small amounts of sales abroad can mean the difference between high profits and low profits, a growing industry and a stagnating industry—these economic considerations begin to make it look quite rational to have colonies.

Besides, it is doubtful that countries would have maintained colonies for decades and sought new ones if they really had gained nothing from them or were harmed by them. Surely governments would have figured this out, sooner or later. Governments are self-interested; they act to increase their power. It would be anomalous for them to waste colossal resources on endeavors that, over many decades, yielded little or nothing. The sheer growth of state capacity and war-making attendant in colonization would have benefited national power and industry.⁴

¹ The "revisionist" diplomatic historiography associated with the New Left is full of examples of such business influence on imperialistic policies. See, e.g., William Appleman Williams, *The Tragedy of American Diplomacy* (New York: Dell Publishing Co., 1972); Walter LaFeber, *The New Empire: An Interpretation of American Expansion, 1860–1898* (Ithaca, NY: Cornell University Press, 1967); and Thomas McCormick, *China Market: America's Quest for Informal Empire, 1893–1901* (Chicago: Quadrangle Books, 1967). The Marxist tradition of scholarship, from Bukharin and Lenin on, is similarly persuasive.

² Alfred W. McCoy, *Policing America's Empire: The United States, the Philippines, and the Rise of the Surveillance State* (Madison: University of Wisconsin Press, 2009).

³ This is a point that conservative critics of government bureaucracy consistently fail to appreciate or even think of. Bureaucracies = jobs, and jobs = economic activity. If you massively downsized bureaucracies there would be more unemployment, less demand, and less growth.

⁴ To take one example, Avner Offer argues that "the [British] empire extended considerably Britain's capacity to wage war, by adding to its military, demographic, and economic resources." Avner Offer, "The British empire, 1870–1914: a waste of money?" *Economic History Review*, vol. 46, no. 2 (May, 1993): 215–238.

When you look at good research, it seems that having a colony could be very beneficial indeed. According to one scholar's estimate, Britain drained around 45 trillion dollars from India between 1765 and 1938.¹ Moreover, it has long been a commonplace of historiography that Britain's industrial revolution was made possible in large part by using India and other colonies as captive markets for cotton textiles.² There has been no shortage of excellent scholarship, whether Marxist or dependency theorist or mainstream, arguing that Europe gained immeasurably from colonialism (as from slavery earlier, and from imperialism generally).

As for the argument that nationalist and racist ideologies were important motivators of colonialism, sure, that's true. But, again, it does not get big business or capitalism off the hook. This points to a fundamental error in the usual thinking of liberals and conservatives (and postmodernists): its characteristic idealism. It attributes too much importance to ideas, "culture," and the psychology of the masses and leaders. What matters is that particular ideologies are able to dominate *because they serve the interests of institutions with resources*, which propagate them or at the very least allow them to be propagated and do not feel the need to push back with some contrary ideology. The ruling ideas are, typically, the ideas of the ruling class. Nationalism and racism were, and are, favored by powerful sectors of business, for their own purposes—such as, in the late nineteenth century, imperialist expansionism.³ The only reason such ideologies are allowed to become "hegemonic" at all is that they serve the interests of the institutions with the most resources, namely business; otherwise, they would be crushed by some other, more business-friendly set of ideas. —These *a priori* considerations, based on the most elementary reasoning about how entities act (i.e., to serve their interests), are so obvious you could easily explain them to an eight-year-old. And yet most intellectuals, including postmodern leftists (who usually fixate on "discourses" rather than class dynamics), appear to be blind to them, and therefore embark on misguided and misleading research projects. (Exhibit A, again, is Deirdre McCloskey, an especially egregious and vulgar example of an idealist, given her fixation on a few glorious "bourgeois ideas," rather than material forces, as having ushered in the modern world.)

In general, the excuses and apologetics of intellectuals, Milton Friedmanites and others, who want to absolve capitalism of the sin of colonialism are historically naïve and transparently partisan, motivated by a childish ideology. ("Capitalism = freedom.") These sorts of scholars are rarely to be taken seriously.

On How to Live

[A blog post, like the previous piece]

When I was younger, I used to wonder: should I care what people think of me? I saw arguments on both sides of the question. And I still do (though I don't care as much anymore). It's one of those questions that follows us around our whole lives, because there are always going to be people who don't like us very much. But should that bother us? Or does it not matter at all? Should we follow the advice of those pop psychologists who say, "Don't care what people think of you! Just be you! You're amazing, you're fantastic, etc.?" What a surprise it is that such self-help shallowness has so much commercial success: people like to be told they're amazing and beautiful and everyone who criticizes them is wrong. Taken literally, that self-

¹ See Jason Hickel, "How Britain stole \$45 trillion from India," *Al Jazeera*, December 19, 2018. The scholar who published the research is Utsa Patnaik.

² For example, see Eric Hobsbawm, *Industry and Empire: The Birth of the Industrial Revolution* (New York: The New Press, 1999).

³ A classic expression of the utility of racism to the expansionist goals of business is Senator Albert Beveridge's speech on "the Philippine Question" on January 9, 1900. In support of annexing the Philippines, he first adduces "China's illimitable markets," thus beginning with the economic reason. But then he shifts to the racism: Filipinos "are not capable of self-government. How could they be? They are not of a self-governing race." So it is the white man's burden to civilize them. (What a happy coincidence that our moral duty coincides with our economic interests!)

help stuff is nonsense, though. It's a formula for the self-complacency of the bimbo celebrity who tweets out feel-good nuggets of flaky wisdom that get 100,000 retweets. It's meaningless. But then, to what extent, and when, should you care what people think of you?

First of all, it's important to always remember that most people are not very interpersonally, intrapersonally, or logically intelligent. That's just a fact, evident from daily observations, news articles, internet comments, the fact that the average IQ is 100, etc. As a leftist, I try to see the good in people; but I also try not to delude myself. I wish people were more intelligent, and maybe in a humanely organized society they would be. But, for now, I have to accept that most people, much of the time, aren't terribly insightful in their judgments about others and the world. So, the fact that someone reacts adversely to you is in itself not compelling evidence you've done anything wrong or are a "bad person" (a semi-meaningless judgment). They may have completely misunderstood you. They may have a terrible political ideology and hate you because you don't want to see refugees die of thirst in the desert. *They* may be the awful one; their criticism might be an indication of your moral and intellectual worth.

Personally, like everyone, I've been misjudged and misunderstood too many times to count. Someone might think I acted in a rude way, unaware that the reason I made a mildly rude comment was because a moment earlier *they* had said something insulting to me, which they weren't intelligent enough to recognize as insulting. I, and probably you, am/are constantly kind both overtly and in ways that are too subtle for most people to notice. And yet I've never been one of the "popular" guys. Why not? Doubtless because I'm an introvert (and also have different interests than most). Popular narcissists are everywhere, as are less-popular kind and intelligent types. It's true with regard to the opposite sex too: assholes and flakes (female or male) may be sought-after while kind and intelligent people might be considered less attractive, maybe sometimes because they're more difficult to identify with. So the "substantive" people can end up being relatively ignored while the lowest common denominator is beloved.

In all these cases and contexts, on a deep level you shouldn't care very much what most people think of you (or of others). Their opinion might have no implications with regard to your worth or the truth.

The burden of intelligence is that it's condemned to be misunderstood and rejected by a world of stupidity.

The tricky thing is that judgments of you often *do* have *some* legitimacy. Even if you were misunderstood, maybe you acted in a way conducive to misunderstanding. So you should try to avoid that in the future. Maybe you should refrain from acting rudely even in response to someone else's rudeness. Sometimes being an introvert can make you seem aloof or judgmental, so to counteract that you should make an extra effort to be friendly. On a non-moral level, to increase your popularity it's certainly a good idea to break out of your comfort zone and try to act as the people around you seem to value. Their overall judgments of you may be superficial or wrong, but it's advisable to make tweaks in your personality here and there.

In general, I suppose the only rule of thumb is the cliché that you should be open to others' impressions and judgments but not take them *too* seriously. Be smart about it. When it comes to your worth as a person, what matter most are *principles*, not others' judgments. The Golden Rule matters above all: be kind and compassionate, apply to yourself the standards you apply to others, be self-aware and self-critical. And other common intuitions: be courageous, tell the truth, be rational, etc. Value-judgments in and of themselves are virtually meaningless; they acquire legitimacy only insofar as they accord with principles that have cross-cultural resonance.

What this means is that there's some truth to the cheap self-help wisdom after all. From childhood, we're taught that we should try to make an impact on others, we should want approval, want to be loved, achieve recognition and success; but these in fact are not the deepest values that should guide us. Ben Shapiro, the toxic conservative, has "made an impact" and is beloved by millions, as are many other toxic people, conservative or not. The better goal is that of Socrates and Plato: [live according to reason and morality](#). Don't focus on being loved or popular, except as a side-effect of living rationally, morally, and humanely. It can't be said often enough that popularity, or having loads of friends or lovers, or being "recognized," means nothing, despite the status-fixations of the world we live in. *Principles* are what matter, not people's opinions of you. Don't get down on yourself for what others think of you, unless you think

their (alleged) judgments might have some independent merit and are worth considering. Even then, treat them as an opportunity to grow rather than some sort of objective reflection of your worth.

We tend to think of people like, say, Martin Luther King Jr. as more "valuable" than the rest of us because of how many lives they influenced, how much change they helped inaugurate, and so on. But that's wrong. Even though you should want to make the world a better place and orient your efforts toward that goal, your success at doing so isn't what determines your "[value](#)." How many people have been as courageous and dedicated as MLK but have had less success and/or been forgotten? Millions. What should determine their value is what they did, not how much change they brought about or how many lives they influenced (or the presence or absence of fame). They deserve to be celebrated just as much as MLK. I dislike the kind of thinking that laments one's not having been as influential as others. "Mozart changed so many lives, gave the world so much, and what have *I* done??" I hear this sort of lament sometimes. Yes, Mozart had a particular, unusual talent—just as you might have a particular talent he or others lack(ed). Or you might be admirable in ways he wasn't. "Giving the world so much" isn't the be-all and end-all, in part because it depends to an extraordinary degree on luck. The real test, again, is living in accord with certain principles. That's what you should see when you look in the mirror, and that's what should determine your attitude to yourself. The rest of it, more or less, is secondary.

It does remain frustrating when your goodness or whatever goes unnoticed—as it usually does. It's easy to become contemptuous. That may even be a reasonable attitude, to some extent. How can you not be a little resentful if you're a good person who is treated badly? Still, we should keep those old *principles* in mind and keep regulating our behavior by self-imposed laws, to speak as a Kantian. No matter how ridiculous people are, act so you can look at yourself in the mirror with pride, knowing that all else is a show, a play "full of sound and fury, signifying nothing."

That's what I like about Chomsky, his personification of principle. No one in history, surely, has embodied adherence to reason and morality more than he has. As I've written [elsewhere](#), he's a useful tool to keep yourself on the right path.

Revolution in the Twenty-First Century: A Reconsideration of Marxism

In the age of COVID-19, it's even more obvious than it's been for at least a couple of decades that capitalism is entering a long, drawn-out period of unprecedented global crisis. The Great Depression and World War II will likely, in retrospect, seem less of an upheaval than the many decades of ecological, economic, social, and political crises humanity is embarking on now. In fact, it's probable that we're in the early stages of the protracted collapse of a civilization, which is to say of a particular set of economic relations underpinning certain social, political, and cultural relations. One can predict that the mass popular resistance, worldwide, engendered by cascading crises will gradually transform a decrepit *ancien régime*, although in what direction it is too early to tell. But left-wing resistance is already spreading and even gaining the glimmers of momentum in certain regions of the world, including—despite the ending of Bernie Sanders' presidential campaign—the reactionary United States. Over decades, the international left will grow in strength, even as the right, in all likelihood, does as well.

Activism of various practical and ideological orientations is increasingly in a state of ferment—and yet, compared to the scale it will surely attain in a couple of decades, it is still in its infancy. In the U.S., for example, "democratic socialism" has many adherents, notably in the DSA and in the circles around *Jacobin* magazine. There are also organizations, and networks of organizations, that consciously repudiate the "reformism" of social democracy, such as the Marxist Center, which disavows the strategy of electing progressive Democratic politicians as abject "class collaboration." Actually, many democratic socialists would agree that it is necessary, sooner or later, to construct a workers' party, that the Democratic Party is ineluctably and permanently fused with the capitalist class. But the Marxist Center rejects the very idea of prioritizing electoral work, emphasizing instead "base-building" and other modes of non-electoral activism.

Meanwhile, there are activists in the solidarity economy, who are convinced it is necessary to plant the institutional seeds of the new world in the fertile soil of the old, as the old slowly decays and collapses. These activists take their inspiration from the recognition, as Rudolf Rocker put it in his classic *Anarcho-Syndicalism*, that “every new social structure makes organs for itself in the body of the old organism. Without this preliminary any social evolution is unthinkable. Even revolutions can only develop and mature the germs which already exist and have made their way into the consciousness of men; they cannot themselves create these germs or generate new worlds out of nothing.”¹ The Libertarian Socialist Caucus of the DSA is one group that identifies with this type of thinking, but there are many others, including the Democracy Collaborative, the Democracy at Work Institute, Shareable, and more broadly the New Economy Coalition. Cooperation Jackson has had some success building a solidarity economy in Jackson, Mississippi.²

The numbers and varieties of activists struggling to build a new society are uncountable, from Leninists to anarchists to left-liberals and organizers not committed to ideological labels. Amidst all this ferment, however, one thing seems lacking: a compelling theoretical framework to explain how corporate capitalism can possibly give way to an economically democratic, ecologically sustainable society. How, precisely, is that supposed to happen? Which strategies are better and which worse for achieving this end—an end that may well, indeed, seem utopian, given the miserable state of the world? What role, for instance, does the venerable tradition of Marxism play in understanding how we might realize our goals? Marx, after all, had a conception of revolution, which he bequeathed to subsequent generations. Should it be embraced, rejected, or modified?

Where, in short, can we look for some strategic and theoretical guidance?

In this article I’ll address these questions, drawing on some of the arguments in my book *Worker Cooperatives and Revolution: History and Possibilities in the United States* (specifically chapters 4 and 6).³ Historical materialism is an essential tool to understand society and how a transition to some sort of post-capitalism may occur. Social relations are grounded in production relations, and so to make a revolution it is production relations that have to be transformed. But the way to do so isn’t the way proposed by Marx in the *Communist Manifesto*, or by Engels and Lenin and innumerable other Marxists later: that, to quote Engels’ *Anti-Dühring*, “The proletariat seizes state power, and then transforms the means of production into state property.” Or, as the *Manifesto* states, “The proletariat will use its political supremacy to wrest, by degree, all capital from the bourgeoisie, to centralize all instruments of production in the hands of the State, i.e., of the proletariat organized as the ruling class.”

Instead, the revolution has to be a gradual and partially “unconscious” process, as social contradictions are tortuously resolved “dialectically,” not through a unitary political will that seizes the state (*every* state!) and then consciously, semi-omnisciently reconstructs the economy from the top down, magically transforming authoritarian relations into democratic ones through the exercise of state bureaucracy. In retrospect, this idea that a “dictatorship of the proletariat” will plan and direct the social revolution, and that the latter will, in effect, happen *after* the political revolution, seems incredibly idealistic, unrealistic, and thus un-Marxist.

I can’t rehearse here all the arguments in my book.⁴ In the following I’ll very briefly restate a few of the main points, after which I’ll argue that on the basis of my revision of Marxism we can see there is value in the many different varieties of activism leftists are currently pursuing. No school of thought has a monopoly on the truth, and all have limitations. Leftists must tolerate disagreements and work together—

¹ Rudolf Rocker, *Anarcho-Syndicalism: Its Theory and Practice* (Oakland: AK Press, 2004), 59.

² Cheree Franco, “Building a Solidarity Economy in Jackson, Mississippi,” *The Independent*, October 2, 2019.

³ *Worker Cooperatives and Revolution* (Bradenton, FL: Booklocker, 2014), available for free online. Being an outgrowth of my Master’s thesis, the book over-emphasizes worker cooperatives. It does, however, answer the usual Marxist objections to cooperatives as a component of social revolution.

⁴ For a more concise statement of some of the arguments see Chris Wright, “Rethinking the Concept of Revolution,” at rs21.org.uk.

must even work with left-liberals—because a worldwide transition between modes of production takes an inordinately long time and takes place on many different levels.

I'll also offer some criticisms of each of the three broad “schools of thought” I mentioned above, namely the *Jacobin* social democratic one, the more self-consciously far-left one that rejects every hint of “reformism,” and the anarchistic one that places its faith in things like cooperatives, community land trusts, mutual aid, “libertarian municipalism,” all sorts of decentralized participatory democracy. At the end I'll briefly consider the overwhelming challenge of ecological collapse, which is so urgent it would seem to render absurd, or utterly defeatist, my insistence that “the revolution” will take at least a hundred years to wend its way across the globe and unseat all the old social relations.

Correcting Marx

Karl Marx was a great genius, but even geniuses are products of their environment and are fallible. We can hardly expect Marx to have gotten absolutely everything right. He couldn't foresee the welfare state or Keynesian stimulation of demand, which is to say he got the timeline for revolution wrong. One might even say he mistook the birth pangs of industrial capitalism for its death throes: a global transition to socialism never could have happened in the nineteenth century, nor even in the twentieth, which was the era of “monopoly capitalism,” state capitalism, entrenched imperialism, the mature capitalist nation-state. It wasn't even until the neoliberal period that capitalist relations of production fully conquered vast swathes of the world, including the so-called Communist bloc and much of the Global South. And the logic of historical materialism suggests that capitalist globalization is a prerequisite to socialism (or communism).

All of which is to say that only now are we finally entering the era when socialist revolution is possible. The earlier victories, in 1917, 1949, 1959, and so on, did not achieve socialism—workers' democratic control of the economy—and, in the long run, could not have. They occurred in a predominantly capitalist world—capitalism was in the ascendancy—and were constrained by the limits of that world, the restricted range of possibilities. Which is doubtless why all those popular victories ended up in one or another form of oppressive statism (or else were soon crushed by imperialist powers).

If Marx was wrong about the timeline, he was also wrong about his abstract conceptualization of how the socialist revolution would transpire. As he put it in the Preface to *A Contribution to the Critique of Political Economy*, “At a certain stage of development, the material productive forces of society come into conflict with the existing relations of production... From forms of development of the productive forces these relations turn into their fetters. Then begins an era of social revolution.” The notion of fettering, despite its criticism by exponents of Analytical Marxism as being functionalist and not truly explanatory, is useful, but not in the form it's presented here. For to say that relations of production fetter productive forces (or, more precisely, fetter their socially rational use and development) is not to say very much. How much fettering is required for a revolution to happen? Surely capitalism has placed substantial fetters on productive forces for a long time—and yet here we all are, still stuck in this old, fettered world.

To salvage Marx's intuition, and in fact to make it quite useful, it is necessary to tweak his formulation in the famous Preface. Rather than some sort of “absolute” fettering of productive forces by capitalist relations, there is a *relative* fettering—relative to an emergent mode of production, a more democratic and socialized mode, that is producing and distributing resources more equitably and rationally than the capitalist.¹

A parallel, albeit an imperfect one, is the transition from feudalism to capitalism. Feudal relations certainly obstructed economic growth, but it wasn't until a “competing” economy—of commercial, financial, agrarian, and finally industrial capitalism—had made great progress in Western Europe that the classical epoch of revolution between the seventeenth and nineteenth centuries burst onto the scene.

¹ The state's official censorship may have required Marx to censor himself in the Preface, but I know of nowhere else that he expresses his theory in causal, as opposed to functionalist, terms. That is, he doesn't provide a *mechanism* by which fettering leads to successful revolution. My restatement of his conception in terms of *relative* fettering—relative to an emergent mode of production—is an attempt to provide such a mechanism.

Relative to capitalism, feudalism was hopelessly stagnant, and therefore, once capitalism had reached a certain level of development, doomed.

Crucially, the bourgeoisie's conquest of political power wasn't possible until capitalist economic relations had *already*, over centuries, spread across much of Europe. *There had to be a material foundation for the capitalist class's ultimate political victories: without economic power—the accumulation of material resources through institutions they controlled—capitalists could never have achieved political power.* That is to say, much of the enormously protracted social revolution occurred *before* the final “seizure of the state.”

If historical materialism is right, as it surely is, the same paradigm must apply to the transition from capitalism to socialism. The working class can never complete its conquest of the state until it commands considerable economic power—not only the power to go on strike and shut down the economy but actual command over resources, resources sufficient to compete with the ruling class. The power to strike, while an important tool, is not enough. Nor are mere numbers, however many millions, enough, as history has shown. The working class needs its own institutional bases from which to wage a very prolonged struggle, and these institutions have to be directly involved in the production and accumulation of resources. Only after some such “alternative economy,” or socialized economy, has emerged throughout much of the world alongside the rotting capitalist economy will the popular classes be in a position to finally *complete* their takeover of states. For they will have the resources to politically defeat the—by then—weak, attenuated remnants of the capitalist class.

Marx, in short, was wrong to think there would be a radical disanalogy between the transition to capitalism and the transition to socialism. Doubtless the latter process (if it happens) will take far less time than the earlier did, and will be significantly different in many other respects. But social revolutions on the scale we're discussing—between vastly different modes of production—are always very gradual, never a product of a single great moment (or several moments) of historical “rupture” but rather of *many decades* of *continual* ruptures.¹ Why? Simply because ruling classes are incredibly tenacious, they have incredible powers of repression, and it requires colossal material resources to defeat them—especially in the age of globalized capitalism.

Building a new mode of production

What we must do, then, is to laboriously construct new relations of production as the old capitalist relations fall victim to their contradictions. But how is this to be done? At this early date, it is, admittedly, hard to imagine how it can be accomplished. Famously, it is easier to imagine the end of the world than the end of capitalism.

But two things are clear. First, a significant amount of grassroots initiative is necessary. The long transition will not take place only on one plane, the plane of the state; there will be a tumult of creative energy on sub-state levels, as there was during Europe's transition into capitalism. (Of course, in the latter case it was typically to establish predatory and exploitative relations, not democratic or communal ones, but the point holds.) The many forms of such energy can hardly be anticipated, but they will certainly involve practices that have come to be called the “solidarity economy,” including the formation of cooperatives of all types, public banks, municipal enterprises, participatory budgeting, mutual aid networks, and so on. In a capitalist context it is inconceivable that states will respond to crisis by dramatically improving the circumstances of entire populations; as a result, large numbers of people will be compelled to build new institutions to survive and to share and accumulate resources. Again, this process, which will occur all over the world and to some degree will be organized and coordinated internationally, will play out over generations, not just two or three decades.

¹ If someone will counterpose here the example of Russia, which didn't require “many decades” to go from capitalism and late-feudalism to a “Stalinist mode of production,” I'd reply that the latter was in fact like a kind of state capitalism (as Richard Wolff, for example, has argued), and therefore wasn't so very different in relevant respects from the authoritarian, exploitative, surplus-extracting, capital-accumulating economy that dominated in the West.

In the long run, moreover, this solidarity economy will not prove to be some sort of innocuous, apolitical, compatible-with-capitalism development; it will foster anti-capitalist ways of thinking and acting, anti-capitalist institutions, and anti-capitalist resistance. It will facilitate the accumulation of resources among organizations committed to cooperative, democratic, socialized production and distribution, a rebuilding of “the commons,”¹ a democratization of the state. It will amount to an entire sphere of what has been called “dual power”² opposed to a still-capitalist state, a working-class base of power to complement the power of workers and unions to strike.

The second point is that, contrary to anarchism, it will be necessary to use the state to help construct a new mode of production. Governments are instruments of massive social power and they cannot simply be ignored or overthrown in a general strike. However unpleasant or morally odious it may be to participate in hierarchical structures of political power, it has to be a part of any strategy to combat the ruling class.

Activists and organizations will pressure the state at all levels, from municipal to national, to increase funding for the solidarity economy. In fact, they already are, and have had success in many countries and municipalities, including in the U.S. The election of more socialists to office will encourage these trends and ensure greater successes. Pressure will also build to fund larger worker cooperatives, to convert corporations to worker-owned businesses, and to nationalize sectors of the economy. And sooner or later, many states will start to give in.

Why? One possible response to crisis, after all, is fascism. And fascism of some form or other is indeed being pursued by many countries right now, from Brazil to Hungary to India to the U.S. But there’s a problem with fascism: by its murderous and ultra-nationalistic nature, it can be neither permanent nor continuously enforced worldwide. Even just in the United States, the governmental structure is too vast and federated, there are too many thousands of relatively independent political jurisdictions, for a fascist regime to be consolidated in every region of the country. Fascism is only a temporary and partial solution for the ruling class. It doesn’t last.

The other solution, which doubtless will always be accompanied by repression, is to grant concessions to the masses. Here, it is necessary to observe that the state isn’t monolithically an instrument of capital. While capital dominates it, it is a terrain of struggle, “contestations,” “negotiations,” of different groups—classes, class subgroups, interest groups, even individual entities—advocating for their interests. Marxists from Engels, Kautsky, and Lenin to Miliband and Poulantzas to more recent writers have felled forests writing about the nature of the capitalist state, but for the purposes of revolutionary strategy all you need is some critical common sense (as Noam Chomsky, dismissive of unnecessary “theoretical” verbiage, likes to point out). It is possible for popular movements to exert such pressure on the state that they slowly change its character, thereby helping to change the character of capitalist society.

In particular, popular organizations and activists can take advantage of splits within the ruling class to push agendas that benefit the populace. The political scientist Thomas Ferguson, among others, has shown how the New Deal, including the epoch-making Wagner Act and Social Security Act, was made possible by just such divisions in the ranks of business.³ On a grander scale, Western Europe’s long transition from feudalism to capitalism was accompanied by divisions within the ruling class, between more forward-thinking and more hidebound elements. (As is well known, a number of landed aristocrats and clergymen even supported the French Revolution, at least in its early phases.) Marx was therefore wrong to imply that it’s *the working class vs. the capitalist class, monolithically*. This totally Manichean thinking suggested that the only way to make a revolution is for the proletariat to overthrow the ruling class in one blow, so to speak, to smash a united reactionary opposition that, moreover, is in complete control of the state (so the state has to be seized all at once).

¹ See Peter Linebaugh, *The Magna Carta Manifesto: Liberties and Commons for All* (Berkeley: University of California Press, 2008).

² *ROAR Magazine*, for instance, titled its ninth issue, in August 2019, “Dual Power,” and devoted it to the solidarity economy.

³ Thomas Ferguson, *Golden Rule: The Investment Theory of Party Competition and the Logic of Money-driven Political Systems* (Chicago: University of Chicago Press, 1995).

On the contrary, we can expect the past to repeat itself: as crises intensify and popular resistance escalates, liberal factions of the ruling class will split off from the more reactionary elements in order to grant concessions. In our epoch of growing social fragmentation, environmental crisis, and an increasingly dysfunctional nation-state, many of these concessions will have the character not of resurrecting the centralized welfare state but of encouraging phenomena that seem rather “interstitial” and less challenging to capitalist power than full-fledged social democracy is. But, however innocent it might seem to support new “decentralized” solutions to problems of unemployment, housing, consumption, and general economic dysfunction, in the long run, as I’ve said, these sorts of reforms will facilitate the rise of a more democratic and socialized political economy within the shell of the decadent capitalist one.

At the same time, to tackle the immense crises of ecological destruction and economic dysfunction, more dramatic and visible state interventions will be necessary. They may involve nationalizations of the fossil fuel industry, enforced changes to the polluting practices of many industries, partial reintroductions of social-democratic policies, pro-worker reforms of the sort that Bernie Sanders’ campaign championed, etc. Pure, unending repression will simply not be sustainable. These more “centralized,” “statist” reforms, just like the promotion of the solidarity economy, will in the long run only add to the momentum for continued change, because the political, economic, and ecological context will remain that of severe worldwide crisis.

Much of the ruling class will of course oppose and undermine progressive policies—especially of the more statist variety—every step of the way, thus deepening the crisis and doing its own part to accelerate the momentum for change. But by the time it becomes clear to even the liberal sectors of the business class that its reforms are undermining the long-term viability and hegemony of capitalism, it will be too late. They won’t be able to turn back the clock: there will be too many worker-owned businesses, too many public banks, too many state-subsidized networks of mutual aid, altogether too many reforms to the old type of neoliberal capitalism (reforms that will have been granted, as always, for the sake of maintaining social order). The slow-moving revolution will feed on itself and will prove unstoppable, however much the more reactionary states try to clamp down, murder dissidents, prohibit protests, and bust unions. Besides, as Marx predicted, the revolutionary project will be facilitated by the thinning of the ranks of the capitalist elite due to repeated economic crises and the consequent destruction of wealth.

Just as the European absolutist state of the sixteenth to nineteenth centuries was compelled to empower—for the sake of accumulating wealth—the capitalist classes that created the conditions of its demise, so the late-capitalist state will be compelled, for the purposes of internal order, to acquiesce in the construction of non-capitalist institutions that correct some of the “market failures” of the capitalist mode of production. The capitalist state will, of necessity, be a participant in its own demise. Its highly reluctant sponsorship of new practices of production, distribution, and social life as a whole—many of them “interstitial” at first—will be undertaken on the belief that it’s the lesser of two evils, the greater evil being the complete dissolution of capitalist power resulting from the dissolution of society.

It is impossible to predict this long process in detail, or to say how and when the working class’s gradual takeover of the state (through socialist representatives and the construction of new institutions on local and eventually national levels) will be consummated. Nor can we predict what the nation-state itself will look like then, what political forms it will have, how many of its powers will have devolved to municipal and regional levels and how many will have been lost to supra-national bodies of world governance. Needless to say, it is also hopeless to speculate on the future of the market, or whether various kinds of economic planning will, after generations, mostly take the place of the market.

As for “the dictatorship of the proletariat,” this entity, like the previous “dictatorship of the bourgeoisie,” won’t exist until nearly the end of the long process of transformation. Marxists, victims of impatience as well as the statist precedents of twentieth-century “Communist” countries, have traditionally gotten the order wrong, forgetting the lesson of Marxism itself that the state is a function of existing social relations and can’t simply be taken over by workers in the context of a still-wholly-capitalist economy. Nor is it at all “dialectical” to think that a group of workers’ representatives can *will* a new economy into existence, overcoming the authoritarian, bureaucratic, inefficient, exploitative institutional legacies of

capitalism by a few acts of *statist will*. Historical materialism makes clear the state isn't so radically socially creative!¹

Instead, the contrast that will appear between the stagnant, "fettering" old forms of capitalism and the more rational and democratic forms of the emergent economy is what will guarantee, in the end, the victory of the latter.

An ecumenical activism

In a necessarily speculative and highly abstract and abbreviated way I've tried to sketch the logic of how a new economy might emerge from the wreckage of capitalism, and how activists with an eye toward the distant future might orient their thinking. It should be evident from what I've said that there isn't only one way to make a revolution; rather, in a time of world-historic crisis, simply fighting to *humanize* society will generate anti-capitalist momentum. And there are many ways to make society more humane.

Consider the social democratic path, the path of electing socialists and pressuring government to expand "welfare state" measures. Far-leftists often deride this approach as merely reformist; in the U.S., it is also common to dismiss the idea of electing progressive Democrats such as Alexandria Ocasio-Cortez because supposedly the Democratic Party is hopelessly capitalist and corrupt. It cannot be moved left, and it will certainly never be a socialist party.

According to *Regeneration Magazine*, for instance, a voice of the new Marxist Center network, "Reformism accepts as a given the necessity of class collaboration, and attempts to spin class compromise as a necessary good. One of the more popular strategic proposals of the reformist camp is the promotion of candidates for elected office running in a capitalist party; a clear instance of encouraging class collaboration."

There are a number of possible responses to such objections. One might observe that if the left insists on absolute purity and refuses to work with anyone who can be seen as somehow "compromised," it is doomed to irrelevance—or, worse, it ends up fracturing the forces of opposition and thus benefits the reactionaries. It is a commonplace of historiography on fascism that the refusal of Communist parties in the early 1930s to cooperate with socialists and social democrats only empowered the Nazis and other such elements—which is why the Stalinist line changed in 1934, when the period of the Popular Front began. Then, in the U.S., began Communist efforts to build the Democrat-supported CIO (among other instances of "collaboration" with Democrats), which was highly beneficial to the working class. Leftists, more than anyone else, should be willing and able to learn from history.

Or one might state the truism that social democracy helps people, and so if you care about helping people, you shouldn't be opposed to social democracy. It may be true that the Democratic Party is irredeemably corrupt and capitalist, but the more left-wing policymakers we have, the better. Democrats have moved to the left in the past, e.g. during the New Deal and the Great Society, and they may be able to move (somewhat) to the left in the future. One of the goals of socialists should be to fracture the ruling class, to provoke splits that provide opportunities for socialist organizing and policymaking.

At the same time, the strategy of electing left-wing Democrats or "reformists" should, of course, be supplemented by an effort to build a working-class party, not only for the sake of having such a party but also to put pressure on the mainstream "left." Anyway, the broader point is just that the state is an essential terrain of struggle, and all means of getting leftists elected have to be pursued.

Personally, I'm skeptical that full-fledged social democracy, including an *expansion* of it compared to its traditional form, is possible any longer, least of all on an international or global scale. Thus, I don't have much hope for a realization of the *Jacobin* vision, that societies can pass straight into socialism by resurrecting and continuously broadening and deepening social democracy (on the basis of popular

¹ This is why I claim in my book that my "revisions" of Marxism are really purifications of it, eliminations of mistakes that finally make the *properly understood* Marxist conception of revolution consistent with the premises of historical materialism.

mobilization to combat capitalist reaction).¹ Surely Marxism teaches us that we cannot resuscitate previous social formations after they have passed from the scene, particularly not institutional forms that have succumbed (or are in the process of succumbing) to the atomizing, disintegrating logic of capital. The expansive welfare state was appropriate to an age of industrial unionism and limited mobility of capital. Given the monumental crises that will afflict civilization in the near future, the social stability and coherence required to sustain genuine social democracy will not exist.

But that doesn't mean limited social democratic victories are not still possible. They surely are. And in the long run, they may facilitate the emergence of new democratic, cooperative, ecologically viable modes of production, insofar as they empower the left. Even something like a Green New Deal, or at least a partial realization of it, isn't out of the question.

On the other hand, while mass politics is necessary, that doesn't mean we should completely reject non-electoral "movementism," as Paul Heideman counsels.² As I've argued, the project of building a new society doesn't happen only on the level of the state; it also involves other types of popular organizing and mobilizing, including in the solidarity economy. The latter will likely, indeed, be a necessity for people's survival in the coming era of state incapacity to deal with catastrophe.

Not all types of anarchist activism are fruitful, but the anarchist intuition to organize at the grassroots and create horizontal networks of popular power is sound. Even in the ultra-left contempt for reformism there is the sound intuition that reforms are not enough, and we must always press forward towards greater radicalism and revolution.

Ecological apocalypse?

An obvious objection to the conception and timeframe of revolution I've proposed is that it disregards the distinct possibility that civilization will have disappeared a hundred years from now if we don't take decisive action immediately. For one thing, nuclear war remains a dire threat. But even more ominously, capitalism is turbocharged to destroy the natural bases of human life.

There is no need to run through the litany of crimes capitalism is committing against nature. Humanity is obviously teetering on the edge of a precipice, peering down into a black hole below. Our most urgent task is to, at the very least, take a few steps back from the precipice.

The unfortunate fact, however, is that global capitalism will not be overcome within the next few decades. It isn't "defeatist" to say this; it is realistic. The inveterate over-optimism of many leftists, even in the face of a dismal history, is quite remarkable. Transitions between modes of production are not accomplished in a couple of decades: they take generations, and involve many setbacks, then further victories, then more defeats, etc. The long march of reactionaries to their current power in the U.S. took fifty years, and they existed in a sympathetic political economy and had enormous resources. It's hard to believe socialists will be able to revolutionize the West and even the entire world in less time.

Fortunately, it is possible to combat ecological collapse even in the framework of capitalism, for example by accelerating the rollout of renewable energy. It is far from hopeless, also, to try to force governments to impose burdensome regulations and taxes on polluting industries, or even, ideally, to shut down the fossil fuel industry altogether. Capitalism itself is indeed, ultimately, the culprit, but reforms can have a major effect, at the very least buying us some time.

Climate change and other environmental disasters may, nevertheless, prove to be the undoing of civilization, in which case the social logic of a post-capitalist revolution that I've outlined here will not have time to unfold. Nothing certain can be said at this point—except that the left has to stop squabbling and get its act together. And it has to be prepared for things to get worse before they get better. As Marx understood, that's how systemic change tends to work: the worse things get—the more unstable the system

¹ See Bhaskar Sunkara, *The Socialist Manifesto: The Case for Radical Politics in an Era of Extreme Inequality* (New York: Basic Books, 2019).

² Paul Heideman, "Mass Politics, Not Movementism, Is the Future of the Left," *Jacobin*, April 12, 2020.

becomes—the more people organize to demand change, and in the end the likelier it is that such change will happen.

The old apothegm “socialism or barbarism” has to be updated: it is now socialism or apocalypse.

But the strategic lesson of the “purifications” I’ve suggested of Marxist theory remains: the path to socialism is not doctrinaire, not sectarian, not wedded to a single narrow ideological strain; it is catholic, inclusive, open-ended—both “reformist” and non-reformist, statist and non-statist, Marxist and anarchist, Democrat-cooperating and -non-cooperating. Loath as we might be to admit it, it is even important that, in certain circumstances, we support lesser-evil voting, for instance electing Biden rather than Trump. Not only does it change people’s lives to have a centrist instead of a neofascist in power; it also gives the left more room to operate, to influence policy, to advocate “radical reforms” that help lay the groundwork for new economic relations.

It’s time for creative and flexible thinking. The urgency of our situation demands it.

Learning from the Great Depression

According to Mark Twain (supposedly), history doesn’t repeat itself, but it frequently rhymes. He was right. Donald Trump, for example, rhymes with Mussolini. The decline of organized labor in recent decades rhymes with its decline in the 1920s. And the coming depression will rhyme, in many respects, with the Great Depression.

For decades, in fact, it has been clear that the political economy of neoliberalism “rhymes” with the political economy that caused the Depression. In addition to (and in part because of) the analogous collapses of organized labor, economic inequality skyrocketed in both eras: in 1929 the richest 0.1% of families in the U.S. owned 25% of all wealth, which is almost exactly the same amount as today. Real wages in the last forty years have stagnated or even declined, as in the 1920s. What these trends, coinciding with an explosion of debt, have indicated is a dangerous weakness in aggregate demand, which has heralded an eventual collapse of markets.

Now that markets are imploding (although from an unforeseen trigger, the coronavirus pandemic), we can observe history rhyming yet again: the fiscal policy responses today, especially by states, mimic those of the Great Depression.

It is of interest to consider government policies in that earlier period, for there may be lessons to heed as states and the federal government confront our own generation-defining economic cataclysm. While political officials don’t always learn from the past, at least activists and the public can.

The most striking fact about the fiscal policy of states in the 1930s is that they consistently underfunded unemployment relief, even in the years when many of them, far from being strapped for cash, had budget surpluses. This is a paradoxical and frequently forgotten fact: U.S. states ended the Depression in a much stronger financial position than when it began.

The reason is simple: it was in these years that states discovered the sales tax, and came to rely on it (together with taxes on alcohol, tobacco, gasoline, and soft drinks) for the majority of their revenue. By 1940, they had doubled the amount they collected in 1930. And yet even the wealthiest states, such as Illinois, continued to plead poverty as an excuse not to adequately fund relief for the unemployed.

It is also noteworthy that states typically preferred to enact regressive forms of taxation such as the sales tax rather than raise taxes on property, individual and corporate incomes, estates, and the like.

The very agenda of austerity, which was a near-religion for states and municipalities in the 1930s (except insofar as Franklin Roosevelt’s New Deal counteracted it), was not the “economic necessity” authorities claimed it was. It was hardly unavoidable that governments would—as they did—deeply cut spending on such services as public health, sanitation, education, libraries, and transportation. Instead, they could have collected more taxes from corporations and the wealthy, as liberals, labor unions, Communists, and various popular organizations advocated.

In retrospect, such progressive policies seem both just and economically wise, in that they would have increased purchasing power among lower-income groups and thus expanded markets, incentivizing businesses to invest. But the political power of business groups like Chambers of Commerce, Real Estate Boards, and the National Association of Manufacturers ensured that more regressive fiscal policies were enacted and large proportions of the unemployed were left to fend for themselves.

In short, governments made choices; they were not forced to act as they did. They chose to rely on sales taxes instead of something more progressive; they chose not to spend budget surpluses on relief programs for the unemployed; they chose to cut spending on institutions that disproportionately benefited the working and middle classes.

If any of this sounds familiar, it's because governments are making the same choices today (as they did following the Great Recession).

New York, for example, is cutting billions of dollars in aid to schools and Medicaid, and is sure to make further cuts in the coming months. Even as he pleads poverty, Governor Andrew Cuomo has rejected out of hand the idea of raising taxes on the ultra-rich, which could generate tens of billions of dollars in revenue for the state.

Other states are following the same playbook, making significant cuts without committing to raising taxes on the wealthy.

In the end, what the Great Depression and its solution in the colossal spending for World War II showed is that ultimate responsibility rests with the federal government. A mobilization of society's resources on the level of the 1940s—under the auspices, say, of a Green New Deal—would not only solve the coming economic crisis but lay the foundation for sustained prosperity.

Nevertheless, states are not without their own resources, which they have an obligation to tap in order to mitigate the burden on the most vulnerable.

Let us, for once, avoid making the present “rhyme” with the past and instead set foot on a more enlightened path.

Reflections on Life at 40

...They accuse me -- *Me* -- the present writer of
 The present poem -- of -- I know not what --
 A tendency to under-rate and scoff
 At human power and virtue, and all that;
 And this they say in language rather rough.
 Good God! I wonder what they would be at!
 I say no more than hath been said in Danté's
 Verse, and by Solomon and by Cervantes;

By Swift, by Machiavel, by Rochefoucault,
 By Fénelon, by Luther, and by Plato;
 By Tillotson, and Wesley, and Rousseau,
 Who knew this life was not worth a potato.
 'T is not their fault, nor mine, if this be so --
 For my part, I pretend not to be Cato,
 Nor even Diogenes. -- We live and die,
 But which is best, *you* know no more than I.

Socrates said, our only knowledge was
 "To know that nothing could be known;" a pleasant
 Science enough, which levels to an ass

Each man of wisdom, future, past, or present.
 Newton (that proverb of the mind), alas!
 Declared, with all his grand discoveries recent,
 That he himself felt only "like a youth
 Picking up shells by the great ocean -- Truth."

Ecclesiastes said, "that all is vanity" –
 Most modern preachers say the same, or show it
 By their examples of true Christianity:
 In short, all know, or very soon may know it;
 And in this scene of all-confess'd inanity,
 By saint, by sage, by preacher, and by poet,
 Must I restrain me, through the fear of strife,
 From holding up the nothingness of life?

Dogs, or men! -- for I flatter you in saying
 That ye are dogs -- your betters far -- ye may
 Read, or read not, what I am now essaying
 To show ye what ye are in every way.
 As little as the moon stops for the baying
 Of wolves, will the bright muse withdraw one ray
 From out her skies -- then howl your idle wrath!
 While she still silvers o'er your gloomy path...

That's Byron in *Don Juan*, one of the greatest and wittiest poems in history. (Probably *the* wittiest.) I remember reading it for the first time in my early twenties and falling in love with it. As I wrote in my journal,

Its sentiments are so in tune with mine—its [Ecclesiastical](#) sentiments—and its style—that its genius is but a secondary reason for my infatuation. But what genius! It's a poem unlike any in the English language—any in *any* language—far surpassing even Pope's *Dunciad*. Yes, its power is a negative one, unlike Shelley's or Keats', but I don't consider that a point against it. It's still as timely as it was when written, and it'll *always* be timely, because life, after all, *is* nothingness. And yet beneath the sophisticated cynicism is a heart-rending despair, and an idealism, and a passion for life, and a yearning for salvation.

At the age of 40, I still come back to Byron, as I did at 22. I can't escape him however much I'd like to, because he remains the spirit of modernity—the Faustian spirit of striving, struggle, yearning for beauty and truth and freedom, but hedonistic, nihilistic, disillusioned, self-hating even in his self-love, pathologically self-aware, existentialist (broadly speaking) yet enamored of reason—torn between existentialism and the Enlightenment—in the end *rebellious*. Byron had no home, as modernity, and ultimately humanity, has no home.

I've written [elsewhere](#), and in my [first book](#), about the torment of being too aware of life's ridiculousness. It's always in the back of my mind, that knowledge of meaninglessness, that detachment from life. I don't know what it is about me that makes me fixate on it—maybe the abstractness and [self-consciousness](#) of my mind, and the emotional semi-immaturity. I just can't get over how unreal life seems, how brief and questionable in all its aspects. It can be hard even to be ambitious, to *care* enough, when you find it so difficult to take things seriously. You start to feel like a spectator at a theatrical farce. Sometimes it seems that hardly anything except [stupidity](#), shallowness, cruelty, and randomness (the randomness of being alive at all) confronts you—few experiences are truly, deeply satisfying, especially as you live longer and grow less excitable or impressionable. And all the while there remains the knowledge of death, the

constant passage of time bearing down on you. Your own death will mean as little to people as their deaths mean to you.

To relate a somewhat trivial grievance (of even many middle-aged people): in a world of flakes, *dating* can be frustrating. Relations with the opposite sex are rather important, after all, and if they're unsatisfying you'll find that your whole life tends to be unsatisfying. It's fashionable, even feminist, for women to publish articles inveighing against internet dating, but hardly anyone seems interested in how unpleasant dating can be for men—sending scores of cute little messages and getting few replies, going on innumerable first dates, regularly encountering the most incredible flakiness, all while grappling with the pain of sexual frustration. It's no wonder that young “incels,” millions of them, are driven to despair, suffocated by loneliness and frustration, suicidally sick of mere masturbation. (And then self-righteous liberals and leftists ridicule them, laugh at them, which is a pretty sick reaction to the suffering of another human being—and drives them into the loving arms of right-wing frauds like Jordan Peterson.) It requires strength and native buoyancy not to will a renunciation of life in these atomized conditions, starved of love and, frequently, sex.

On the other hand, that's one of the perks of getting older: you start to care less, since you develop a more full-bodied, self-confident, even good-humored appreciation of the fact that everything is bullshit. (It helps that your hormones begin to take pity on you.) Deep down there remains a certain resentment toward the world for being such a senseless place, so senseless that it seems actually *unreal, illusory*—I sympathize with the Buddhist teaching that life is saturated with illusion—but, to paraphrase Nietzsche, you've grown so used to your diffuse disgust that you're almost fond of it now. “I've given a name to my pain,” Nietzsche said, “and call it ‘dog.’ It is just as faithful, just as obtrusive and shameless, just as entertaining, just as clever as any other dog...”

Anyway, leaving aside post-pubescent hormonal urges that used to afflict me and returning to more pretentious matters of the “intellect”... As a young lad I wanted to get to the *bottom* of things—I wanted to answer all important philosophical and historical questions, I wanted to intellectually tie everything, all of history, up in a bow, even while helping to wage “the revolution” to establish socialism or communism. It was this that would give my life meaning, this quest for and achievement of near-perfection. Life itself was not enough: it was only a means to something greater, something timeless. Actually, I think I did make intellectual progress and answered many questions to my satisfaction, more or less. Still, my “achievements,” such as they were, were far from approaching what I had dreamed of—something like [transcendence](#)—and coming face to face with the mundane reality of my limitations was depressing.

I'm finding it hard, though, to express the source of my restlessness, or even the *meaning* of my restlessness. Compared to most people in the world, I'm ludicrously privileged. But *internally* I can hardly imagine “happiness.” I think it has to do with a peculiar contradiction: the contradiction between my knowledge of the *miraculousness* of being alive—the impossible majesty of the [human brain](#), the wonders of the cosmos itself, the unfathomable mysteries, down to the quantum level, contained in a single eukaryotic cell, the astounding privilege of being *homo sapiens* (the “sovereign of nature,” as Marx said)¹ and capable of listening to a Beethoven symphony or even of playing a Beethoven piano sonata (think of how the brain has to somehow coordinate the activity of ten fingers, exquisitely calibrating every movement according to a continuous flood of sensory input from the tactile, auditory, and visual systems that it first has to instantaneously process, sift through, analyze, compute, at the same time as it attends to innumerable other matters of internal bodily monitoring and regulation, all while processing *memories* of the music that has been practiced repeatedly and anticipating what the next notes are, what the next finger movements are—and remember that all this activity, unconscious and effortless, is on behalf of something totally luxurious and purely *aesthetic*, the creation of music, a capacity only humans have)—and the frequently dull, grim realities of actual life. Each of us is a practically divine miracle, and yet each of us is subject to extraordinary social, physical, and metaphysical indignities. It seems as though every moment of life ought

¹ [In the words of Chomsky](#), another great humanist, “none of the other 50 billion species [that have existed on Earth] can even form a thought, at least any thought that can be formulated in a symbolic system.” The gap between humans and all other animals is vast, and utterly mysterious.

to be transcendently and timelessly beautiful—for that is what nature is and what our existence is¹—but in fact life is shot through with mediocrity, mundanity, disappointment, shattered hopes, and death. Indeed, strictly speaking, the only “meaning” of life, the reason we’re here in the first place, is the exceedingly mediocre and animalistic one of procreating. Richard Dawkins is surely right that we’re mere “survival machines” for our genes, tools of DNA propagation (for that is the basis of evolution, the self-replication of DNA). As reductive as it sounds, we’re organisms that DNA constructs just so it can survive in a harsh environment and replicate itself. We’re driven to do the bidding of this arrogant and selfish molecule without even knowing why—we just crave sex, it’s out of our control, we’re robots programmed to serve our master.

But what a strange master that has given its creation the capacity to rebel and refuse to procreate! Instead, we often devote ourselves to “higher” pursuits like philosophy, like observing life and contemplating its “meaning”—an absurd and comical activity that only serves to increase unhappiness, sometimes to the point that the robot—or, better, the puppet, the human being—kills itself and thereby the chances for its DNA puppeteer to replicate itself! *Homo sapiens* is indeed a paradox!

Be that as it may, the point is that, given my awe at existence itself, even my gratitude, I had a desire to achieve things commensurate with this awe and gratitude. I wanted to intellectually assimilate as much as possible, through intellectual creation that would have a universal significance and be read even after I died. These desires, in a sense, weren’t much different from the dreams of a lot of young men, who boldly leap into life determined to conquer the world and by some means or other overcome their mortality and relative insignificance. Fame is a typical goal, for example. A young man glories in possibility and can tend to be rather self-enclosed—as manifested, for instance, in my naively self-publishing three books at least one of which I could and should have used a traditional publisher for. (It would have been a better book, dammit!)

As you approach middle age, the ambitions subside. Life starts to wear you down. The regrets pile up (although, truth be told, I had [plenty of regrets](#) already at 23); you go unnoticed for things you think deserve notice; you tire of your own mediocrity and the even greater mediocrity of so much that you encounter; you grow more aware of the brevity and *lack of gravity* of life.² The “fulfilling experiences” you longed for fail to materialize, and you realize you’ll never overcome the hollowness, the “ontological emptiness,” at your core. (“Nothingness lies coiled in the heart of being, like a worm,” Sartre said.) At least, that’s been my experience. You’ll write, but people won’t read. You’ll read, but you’ll wonder what’s the point of it when all the reading and writing leaves the world more or less as it is. You’ll still desire intellectual stimulation but you’ll feel guilty when indulging in it because what matters in our era of catastrophe is activism; but you’ll be bored when doing or writing something related to activism because you miss intellectual stimulation. And the years will go by, year after year, and before you know it you’ll be on the verge of death, and your former thrill at the miraculousness of life will seem as if from a quaint, forgotten land.

In short, it’s the *ordinariness* of it all, and the transience, that gradually dissolves the element of inspiration that had once made life interesting. The times I’ve felt most satisfied were when I was writing something I thought had merit, because it was as if I was (“permanently”) putting truth and profundity into the world, as if I was “*beautifully objectifying*” myself—being validated by Reality itself. But that’s only a pleasant conceit, and one that fades as you grow older.

Nor does it help, in my case, that I’ve always been susceptible to depression, and to doubt of my own reality (I’m sort of a detached observer). Still, I can’t be the only one who sometimes thinks that, notwithstanding all one’s experiences and world travels, not enough has really *happened* in life. Not enough moments of deep love; not enough meaningful connections with other people; not enough “adventures” of various sorts. Lately there’s been a lot of “running on autopilot.” I need a change, but what sort of change isn’t entirely clear.

¹ Well, strictly speaking, that isn’t true. [Nothing has positive or negative value in itself](#). But it certainly is easy to think of nature as being beautiful and magnificent in many ways.

² More specifically, *in retrospect* life may seem rather short, though while you’re living it it can seem terribly long.

Well, whether I like it or not, a change is coming by the end of this year: I'm going to be a father. Thanks to a tryst with my ex-wife. I don't know how involved I'll be with raising the child, but conceivably fatherhood will make my life seem more meaningful. And yet, bringing a person into this world... By nature I'm actually quite cheerful, believe it or not, but I recall some hilariously dark thoughts I once wrote:

When you bring someone into this world, you introduce them to suffering. A lifetime of suffering. I don't see how Buddhists are wrong about that. Or how Schopenhauer is wrong. You come into the world in pain and you leave the world in pain. In between, you experience more than your fair share of pain.

At this point in history, there is no need to elaborate on these claims. Just read Schopenhauer or the Buddhists. Or use your common sense. Either you end up with the dull drumbeat of ordinary middle-class unhappiness or you suffer misery. It depends where you were born, in what circumstances, who your parents were, how lucky or unlucky you were in life. Indefinitely many horrible things might happen to you. Or maybe you'll get lucky and you'll merely have a boring career, a couple of annoying children, thousands of lonely hours, and get cancer at an old age and die painfully. That's not so bad compared to some of the alternatives.

The supreme act of love is to refrain from conceiving a child. It is a beautiful, unselfish act of pure kindness.

Think of what a contribution you've made to the world, how much suffering you've subtracted from it (ahead of time, as it were), by not having a child. It is virtually a holy thing, a saintly thing. To save one life is to save the world entire. You save a life by not creating it.

Even if you have children, your not having had more of them is noble. Whenever a man doesn't ejaculate inside a woman, he can imagine the millions of little people in his semen thanking him that they will not exist. To masturbate, far from being immoral (as religious loons sometimes think), is a moral act! Or at least more so than impregnating a woman.

To have an abortion is moral, humane, compassionate...

A one-sided point of view, to say the least, but not without a particle of merit. I hope my child's life doesn't provide more support for those grim thoughts!

Meanwhile, I'll be publishing (*not* self-publishing) a book next year—a version of my Ph.D. thesis—which I suppose will be satisfying.

I'm aware that, in a sense, everything I'm saying here is just a lot of unseemly complaining. I don't have much right to complain. That's one of the many things I like about Noam Chomsky, for example: he is without self-pity, he's a hyper-rational machine who cares only about what is true and what is right. He has remarked that existentialism—which in its concern with subjectivity, anguish, death, and the like is sort of a philosophical expression of human self-pity—doesn't resonate with him, which is exactly what you'd expect from someone who doesn't have an iota of cultural or psychological decadence. He's like a Bach fugue. He's a pure scientist: a scientist of language, of the mind, of society, and, most importantly, a scientist of morality, a rigorous and consistent paragon of morality. Life is what it is, often difficult and sometimes horrible but not in itself an evil, just a neutral thing that we experience and should make the best of. What's the use of whining about it?

Moreover, insofar as I'm unsatisfied, it has more than a little to do with my own issues and is, to some degree, my own fault. I'm not as good a writer as I'd like; I'm not as hard a worker as I should be; my original life goals were wildly unreasonable to begin with (as I knew), and in any case I'm still fairly young; if I find it hard to take pleasure in many things, that's *my* problem, not *yours*; whatever malfunctions there might be in my brain chemistry are, again, my own problem, not something general that should interest others. As a Marxist, I'm perfectly aware that each of us is *situated*: our experiences, perceptions, and thoughts emerge from *particular* conditions, particular economic, social, and psychological conditions that

largely determine our discontent. It isn't necessarily life itself that is the problem; it's the conditions that prevail in any given case.

Okay, fine. But the test is, do these sorts of existentialist thoughts resonate with others? If not, then I'm just a freak; if they do, then the particular conditions are to some extent general, perhaps resulting from the nature of capitalist society. They seem even more general than that, though, since similar grievances have motivated the lamentations of poets, philosophers, theologians, and others for millennia. I do have "my own issues," but it is plausible to suppose I'm just one of those people in whom the general grievances about the human condition are sharpened, because I had the misfortune to be born with a pathological sensitivity to the world's ridiculousness. As for the unbecoming nature of whining about "the human condition" (or "the modern condition"), well, can't we permit ourselves a little bit of whining now and then? I think we're entitled to it.

I'm 40, the age of the midlife crisis. I recall the comedian Jim Gaffigan's [joke](#) about being in your 40s:

It's amazing how our attitude on alcohol changes. Even as a teenager, you know it's wrong. You're like, "You know, I don't like the taste of it, but I want to look cool." And then in your twenties, you're like, "You know what, this kind of gives me confidence to talk to the opposite sex." And then in your forties you're like, "You know what, this is the only thing I like about being alive." [Uproarious laughter from the audience.] It's only funny 'cause it's true.

You still have a lot of living left to do, but you're less excited and interested than you used to be, so you're in an awkward position. How are you going to spend the rest of your life? That's the question that occupies me now, especially considering I'll surely never get a tenure-track job—I don't even know if I want one—and I don't want to spend the rest of my life on year-long contracts or the like. But most non-academic options aren't very attractive either.

Aside from the career questions that plague young generations now, there are the more intimate, sad psychological facts of middle age hinted at by Gaffigan's joke. Once again, I think of Byron:

But now at thirty years my hair is gray—
 (I wonder what it will be like at forty?
 I thought of a peruke the other day)
 My heart is not much greener; and, in short, I
 Have squander'd my whole summer while 'twas May,
 And feel no more the spirit to retort; I
 Have spent my life, both interest and principal,
 And deem not, what I deem'd, my soul invincible.

No more—no more—Oh! Never more on me
 The freshness of the heart can fall like dew,
 Which out of all the lovely things we see
 Extracts emotions beautiful and new,
 Hived in our bosoms like the bag o' the bee:
 Think'st thou the honey with those objects grew?
 Alas! 'twas not in them, but in thy power
 To double even the sweetness of a flower.

No more—no more—Oh! never more, my heart,
 Canst thou be my sole world, my universe!
 Once all in all, but now a thing apart,
 Thou canst not be my blessing or my curse:

The illusion's gone forever, and thou art
 Insensible, I trust, but none the worse,
 And in thy stead I've got a deal of judgment,
 Though heaven knows how it ever found a lodgment.

The freshness of the heart, the freshness of life, is gone. But at least Byron had lived intensely, had had fame, wealth, innumerable love affairs, incredible highs and lows. It's probably more painful for people who feel as if they *haven't* lived enough and yet by their late 30s are weary and bedraggled anyway, the victims of epidemic social atomization, the petty bureaucratic hassles of contemporary life, colossal waste of nervous energy over decades, the weight of *postmodern unreality*—the unbearable lightness of postmodern being. (I just thought of Billy Joel's song "[Running on Ice](#)": not the greatest of songs, but expressive of this existential syndrome, particularly from the urban perspective that dominates life today.) I rarely knew the freshness of the heart, of youthful love, despite being a great romantic who pined for it. And now the time is long past when I could have felt it, so...the only thing is to just move on, cut your losses, keep looking ahead, fight the good fight—whatever cliché you like.

Meanwhile, as Gaffigan said, be grateful that alcohol exists.

The idea of getting older is, perhaps, especially uncomfortable for me because in my essence I'm somewhat of a child. That really is the key to my identity, I think. Not that anyone should be interested in me, but, hypothetically speaking, if they were, they would have to start with my childlikeness. There's a Jim Carrey-esque silliness in me, and it may be this trait, this ingrained humorous attitude, that leads me to see silliness everywhere in the adult world.¹ There's nothing wrong with that, I suppose, but, as I indicated earlier, it does make it hard for me to take seriously the pursuit of professional and worldly [status](#), honors, "success." My youthfulness means that most things that matter to me are internal; whatever is "external," from quotidian responsibilities (e.g., grocery shopping, a dreaded imposition) to professional goals, seems false and unsatisfying. Doubtless this fact, incidentally, is yet another reason I can't help but think "life is a dream," to quote the title of Calderón's famous [play](#).

Childlike interiority: I think that helps explain the difficulties of quite a few people in adjusting to modern life, and to aging. The world can seem external and alien, not only in the ways it does sometimes to everyone but in a deeper, "ontologically insecure" way. The psychoanalyst R. D. Laing used this concept of ontological insecurity to [analyze](#) schizoid and schizophrenic patients, whom he interpreted as being divided between a true, "inner" self and a false, "outer" self. But it isn't only in the extremes of schizophrenia that you find a sort of intense interiority that can interfere with the enjoyment of anything that doesn't emerge organically from one's inner life. A lot of "creative people" likely suffer from this condition—a condition that's largely responsible, by the way, for the popular association of creativity with madness. "No excellent soul is without a tincture of madness," Aristotle said; or in the words of John Dryden, "Great wits to madness sure are near allied / And thin partitions do their bounds divide." Being too much in your own head can take both constructive and destructive forms.

One "destructive" form, for example, is that the process of aging can seem surreal and paradoxical. You still feel rather young and immature (though tired) on the inside, but you're old and decrepit on the outside. Indeed, the continuity of life is disturbing: instead of there being some sort of break between youth and maturity, or some process whereby you wholly shed your immaturity and become a Fully Grown Adult, you really just feel kind of young—at least in my case—your whole life. It's like you're a 25-year-old who

¹ I've given examples of such silliness in other blog posts, but here's (a non-political) one I was just reminded of after seeing a picture of the fat-headed gorilla Donald Trump: *ceteris paribus*, being a man with a large head confers great advantages with respect to social presence, confidence, people's impressions of you, "charisma," sexual success, etc. Think of how often "leaders," for instance American presidents—from FDR to Bill Clinton—have large heads. People tend (though it's only a *tendency*) to be more attracted to big-bodied and big-headed men, because size matters: it communicates dominance. Humans are, after all, mere animals, beastly primates, in some ways more pathetic than any other species because of their self-deceiving pretensions and indescribable idiocies (for which, unlike other animals, they don't have the excuse that they lack the capacity for abstract, symbolic thought).

gets older and older while staying approximately 25, never becoming a “different person.” At 70 I’ll feel like a very old young man, the same person as decades earlier but bizarrely wrinkled, weary, and weak. How different from what I used to imagine aging would be like!

Lest I seem overly negative, however, I should note that whatever disadvantages there are to having a juvenile and abstract cast of mind may be outweighed by the advantages. It can be pleasant to exist on a rarefied plane above daily cares, professional worries, material grievances, the phlegmatic character of the self-serious adult mind. My boyish curiosity gives me more insight into people than they have into themselves, these lumbering mental hippopotamuses who are far more *particular* than *universal*. (Stupidity is particular, utterly immersed in itself; intelligence incorporates others.)¹ It’s also pleasant to have the sort of childlike aesthetic detachment that makes it possible to, say, experience inexpressible joy listening to [Beethoven’s Fourth Symphony](#), a pure love of life that makes you want to dance around the streets just to contain the frantic energy bubbling up from your heart. This aesthetic receptivity, thank God, is something that will never leave me—life would be very gray without my love of music.

Anyway, in the end, whatever advantages or disadvantages there are to my particular “situation”—my own situatedness—my only firm conclusion is that it’s all a mystery to me. Like Socrates and Byron, I know only that I don’t know. Why or how we’re here in the first place, what this thing called “time” is, why people are so callous and cruel, how one is supposed to keep trudging on even into one’s 80s or 90s, what the grim future will look like, what my child’s life will look like...I don’t have answers to any of these, not meaningful answers. I’m still almost as full of wonder and bewilderment as I was in my teenage years.

There are certain pat things I could say here, nuggets of pseudo-wisdom. For instance, it’s clear that the very enterprise I’m engaged in with this blog post is unhealthy, this stance of stepping back from life and abstractly evaluating it: it’s decadent and unnatural, in itself already symptomatic of alienation. You should just *live*, throw yourself into life without fixating too much on its underlying “conditions” (mortality, transience, chance, frequent loneliness, injustice, “absurdity”). As Nietzsche always insisted, the naïve and spontaneous attitude is healthier than the navel-gazing attitude. The latter indeed fosters the discontent that it thrives on! It’s like a self-fulfilling prophecy.

But how a thinking person is supposed to avoid asking these sorts of questions, and sometimes fixating on them, is beyond me.

I don’t know what the future holds for me. I’ve thought about dipping my toe into freelance journalism, likely in the labor sector. I could try to write articles of “commentary” that are more serious than most of what I’ve published. My mind, by its nature, will always be more comfortable with and interested in abstract philosophical questions than concrete political ones, but the latter are of more human significance and infinitely more urgent in the twenty-first century than the former, so I just have to adapt. I might even try to re-embrace academic historical research, although I find it more satisfying and socially relevant to write short pieces that aren’t necessarily read by an academic audience. (An immense amount of work goes into a scholarly paper, but how many people read it?? Its primary use is to be another item on your CV.)

To get even more personal than I’ve already been: last year, feeling a bit discouraged, I tried taking the drug ketamine in the hope that it would jumpstart the rusty old engine in my head and reintroduce me to life. No such luck. The four doses I took over several weeks at least brought on some fascinating experiences. [A recent article](#) in the *New York Times* described the experience well: “the room dissolved around me in a transcendent swirl of lucid dreaming. I traveled backward in time, inhabiting memories in a pleasantly detached manner. I traveled forward, too, and visited places I’d never been. It felt as though I’d shed my corporeal form and was melding into the fabric of the universe.” It was wonderfully trippy, especially as I was listening to a beautiful trippy soundtrack the treatment center had curated. The boundaries of my ‘being’ dissolved as I was suffused by an expansive love for everyone and everything, a longing to show people how sublime life is. Time dilated: ten minutes felt like an hour, or maybe two

¹ But most “intelligent” people are no less deluded, in their own way, than those who are judged unintelligent. The kind of intelligence that is wholly and ironically aware of itself, genuinely self-insightful, is rare.

hours—I really had no notion of time. I felt “enlightened,” albeit disoriented and overwhelmed by the cacophony of thoughts and feelings that flowed together with the music.

Pleasant after-effects lingered for days, perhaps weeks, but no longer. So that was that. It wouldn’t be so easy to jolt me out of my inertia.

But, as with most people, the satisfaction and the dissatisfaction come and go; the contentment and the sadness come and go. Most of us manage to muddle through. We find ways to occupy ourselves for eight or nine decades. At the end we look back and think, “Wow. That was a lot. But it went by rather quickly. And now, whatever it all was, it’s over...” —*How terribly strange to be seventy*, [to quote](#) Simon and Garfunkel. I’ll let those two old poets have the [last words](#):

Time it was, and what a time it was, it was
A time of innocence, a time of confidences.
Long ago it must be, I have a photograph—
Preserve your memories: they’re all that’s left you.

Well, until we’re on our deathbed, we have to push these kinds of thoughts out of our mind, just keep living, keep struggling (“life is struggle,” Marx said), keep being honest with ourselves and others, and keep spreading compassion, of which the world has too little.

***Strikes, walkouts, and sickouts:
How working-class Americans are organizing in the time of Covid-19***
(An interview with *Counterfire*)

Hi Chris, thanks so much for taking time to speak with Counterfire. You’re based in New York City, please can you tell us about the rent strike there? What prompted this action and how has this been organised in the current circumstances?

Most states, including New York, have instituted a moratorium on evictions for a few months, but that’s a pathetically insufficient response. What are tenants who can’t pay supposed to do when the moratorium is over? (In the meantime, by the way, many are still being pressured and intimidated and threatened by landlords.) They’ll have to pay the back rent they owe, without having the means to do so. As a result, tenants all over the country are organizing rent strikes largely as a way to pressure elected representatives to take their plight seriously. Of course, most of these tenants can’t pay their rent anyway—and obviously millions of people who aren’t consciously participating in a strike won’t be able to pay. But organized collective action sends a message, in addition to de-atomizing and “empowering” people who would otherwise feel helpless and alone. It also pressures landlords to collectively bargain with tenants.

Rent strikes—not only in New York—are being organized in all kinds of ways. Some of them are very micro-scale, involving a few dozen tenants in one building or several buildings owned by the same landlord. For example, [in one case in Brooklyn](#), a couple of tenants put up signs in the hallways of their building, which led to a group chat and recruiting people door-to-door. They wrote a letter to the landlord, a large company that was bullying and threatening tenants who couldn’t pay rent. Initially they were ignored, but once the tenants’ union had solidified, a clear set of demands emerged: forgiveness of rent and late fees, the completion of repairs, recognition of their union, etc. Meanwhile, they’ve been in touch with lawyers and politicians.

For a clearer example of a landlord’s nauseating greed, we can turn to Columbia University, the largest private landowner in New York City. Columbia is both employer and landlord for its graduate students, so it has the power to cancel their rent and/or raise their salary. In its infinite wisdom—corresponding to its

nearly infinite endowment—it has declined to reduce or cancel the rent this summer for students who have lost access to various funding sources. This is despite its waiving of April and May rents for commercial (as opposed to residential) tenants. So hundreds of Columbia students have organized a rent strike, with the assistance of social media (e.g., Facebook groups).

On a larger scale, grassroots groups like New York Communities for Change and the Committee Against Anti-Asian Violence have organized virtual meetings with tenants to coordinate rent strikes, the ultimate goal being to put such economic pressure on landlords that legislators will be forced to comprehensively address the crisis. In New York, the Upstate/Downstate Housing Alliance, along with many other groups, has organized tenants in scores of buildings statewide and launched a petition vowing to withhold rent until the state meets three demands: freeze rents, cancel rent for the duration of the public health crisis, and permanently house the homeless. In the aggregate, this appears to be the largest rent strike in nearly a century.

A national organization called Rent Strike 2020 has called for a suspension of rent, mortgage, and utility bill collection in all states. Tenant-rights organizations in cities from L.A. to Philadelphia to Chicago to D.C. are coordinating strikes; a campaign called We Strike Together is trying to keep track of all the action, which has involved hundreds of thousands of households across the country.

The power of social media—Facebook groups, Twitter hashtags, Zoom meetings—to facilitate resistance to the capitalist class that itself owns these media is impressive and encouraging. It's hard to see how governors and legislators will be able to ignore all this mounting pressure.

Here in Britain, it feels as though the pandemic is revealing a lot about society and how it's really organised. On the one hand, the relentless – deadly – drive for profit, but on the other who are the real key workers that keep everything running. As in the UK, it's BLAME people who are suffering disproportionately, which exposes a lot about racism and exploitation. Would you say that people's ideas are being changed by this crisis?

At this early date, it's hard to say for sure how people are responding or will respond. With regard to racism and xenophobia, in the U.S. there's been some of that. On one hand we have Trump's farcical attacks on China for having bred the pandemic or even (so it's said) creating the virus in a Wuhan lab—transparent attempts to shift the blame for his administration's catastrophic response. On the other hand, Asian-Americans have reported a rise in harassment and discrimination. That's a real concern, which could very well lead to a rash of hate crimes around the country. But, broadly speaking, I think only the lunatic-right fringe has promoted anything like racism. For all the problems with identity politics, that's one thing we can be grateful for: racism has become disreputable here, such that only the most vulgar and vicious of political figures will promote it.

On the positive side, it appears that people are indeed growing more aware of how society is organized, for example by seeing the contrast between the federal government's munificence towards the wealthy and miserliness towards everyone else. It's a lesson we learned in 2008–09, and we're learning it again now. Millions of the unemployed have had difficulties receiving the benefits they're entitled to; medical workers have been appalled by governments' inability to provide personal protective equipment, test kits, ventilators, and other supplies; companies have treated their employees with utter callousness, often refusing to grant hazard pay or paid sick leave. Popular discontent is certainly increasing, which tends to bode well for the left.

I don't think most people are “victim-blaming” or blaming Asians. I think they're blaming the Trump administration, the rich, and a dysfunctional political economy.

We've been hearing about strikes, walkouts and stay aways taking place in workplaces that have been notorious for appalling working conditions, from Amazon warehouses to meat processing

plants. Please could you tell us about this and whether this represents a renewed working-class confidence?

I don't know if it represents confidence; I'm inclined to say it represents intense frustration and anger. It will probably be years before confidence and optimism begin to motivate large numbers of workers in their confrontations with bosses. But it's true that the upsurge of strikes in the last couple of years—in 2018, more workers went on strike than in any year since 1986—in addition to Bernie Sanders' presidential campaigns, has begun to shift people's perceptions of what's possible. Five years ago, I doubt there would have been such an eruption of wildcat strikes. It also helps that people in these non-white-collar jobs are being told their work is essential, they're even heroes. And their bargaining power has increased, given that their employers (Amazon, Instacart, grocery stores) are in high demand right now.

The escalating strike wave is remarkable. In the last couple of months, hundreds of strikes, sickouts, and walkouts have occurred. Whole Foods, Target, McDonald's, Taco Bell, Walmart, FedEx, Ford, Uber, and many other big-name companies, in addition to meatpacking plants, agribusinesses, trucking companies, and smaller stores, have seen labor actions. The causes have been various: in many cases, workers haven't been adequately protected from the virus; in others, they have demanded hazard pay or have protested low wages; a common demand is for paid sick leave and compensation for unpaid time off. Unions, workers' rights groups, and organizers with the Fight for 15 campaign have helped coordinate many of these actions, but in other cases workers themselves have organized walkouts, with the help of social media. They've racked up some victories, and it's likely that more will come.

Crises like the pandemic present opportunities for both the exploiters and the exploited, the ruling class and the working class. The coming years will doubtless see a reinvigoration of the same old fiscal austerity and heavy-handed repression. But I'm optimistic that, even in the midst of all this, popular resistance will, at long last, start to shift the momentum to the workers.

One of the other things we've been hearing about, of course, is the staggering and rapidly mounting unemployment figure. How is the left responding to this challenge?

What the left *should* do is what the Communist Party did in the 1930s: organize the unemployed. We should have Unemployed Councils in urban neighborhoods organizing people to demonstrate, to block traffic, to picket outside power centers and politicians' homes, demanding public works projects, generous unemployment insurance, a universal basic income, rent control, etc. Especially once social distancing measures are relaxed, local organizations should devote resources to building tenants' unions that can negotiate with landlords and help lobby governments. And of course national organizations should pressure the government in all possible ways, including by direct action, to launch a Green New Deal or other programs that can employ millions.

The left everywhere is perennially cursed by inadequate resources—which is a major reason for its continual defeats—but I think much of the left has been doing a creditable job of advocating for the unemployed. Left media are doing what they can to highlight the suffering of those who have been laid off, publishing stories about the frequent impossibility of getting unemployment benefits and people's loss of their employer-based health insurance (at the worst of times, during a pandemic). Unions are fighting to limit layoffs and ensure their laid-off members receive the benefits they're due.

Everyone knows the U.S. lacks a visible left on the national stage—except for Bernie Sanders, Alexandria Ocasio-Cortez, and a few other leaders. But these few national leaders, supported, as always, by an army of grassroots organizations, have resisted Republican sociopathy. Sanders and others were able to force Congress to include in the CARES Act some much-needed relief for those out of a job, such as four months of receiving \$600 a week on top of whatever unemployment insurance their state gives them, as well as a one-time payment of \$1,200 for people earning less than \$75,000. They've tried to get much more than this, for example monthly \$2,000 payments, but Republican opposition makes it impossible.

In general, the left seems to be doing what it can to support the sort of agenda Bernie Sanders has publicized. It's also lobbying state governments to raise taxes on the wealthy so as to avoid brutal austerity measures.

In both the US and the UK we have dangerous complacent political leaders who are endangering lives on a mass scale. In December we suffered the blow of the election result which saw probably the most progressive leader ever of the Labour Party ousted and replaced by a centrist who has already proved himself no ally of working people in this crisis. Then, just as the Coronavirus crisis began to explode, we watched as Bernie Sanders pulled out, leaving Joe Biden as the default Democratic candidate. But in the UK, the government's handling of the crisis has prompted widespread opposition and support for workers' rights. Would you say that something similar is happening in the US – that despite what's been happening at the top of politics, there's a real crisis in right-wing ideas and a growing popularity for socialist solutions?

I certainly think socialist solutions are becoming more popular, especially among the young. I see this in the students I teach at the City University of New York, most of whom seem to take it for granted that capitalism is in dire need of radical reforms, if not a systemic overhaul.

One of the ironies of history is that great leaps in moral progress often require that things first get radically worse. The Great Depression and (especially) World War II, which mobilized the left on an unprecedented scale, made possible postwar social democracy, which was a significant improvement compared to what had existed before. Likewise, I think that the coming years of global crisis will create the conditions for growth of the international left and delegitimation of the trite ideas of neoliberals. To speak as a Marxist, neoliberalism, through its contradictions and catastrophic consequences, has prepared the ground for its own “dialectical” transcendence, by means of the agency of working (and unemployed) people. Capitalism is showing its true nature, and fewer and fewer people will continue to be deceived by its apologists.

Fascist and nationalist ideas aren't in the same sort of crisis as center-right ideas, and the right will surely continue to grow internationally. Demonization of minorities, foreigners, “out-of-touch leftists,” etc. never gets old. But, as I've argued elsewhere, the longer the right stays in power, the more popular the left will get. Virtually by definition, right-wing policies lead, sooner or later, to societal collapse. (It was nonsensical propaganda when Margaret Thatcher said, “there's no such thing as society,” but unwittingly she was communicating a truth: the hidden meaning of the right, with its fetish of markets (“externalities” be damned), privatization, and commodification, is that in the end there will be “no such thing as society,” because it will be destroyed.) So there's always a backlash eventually—what Karl Polanyi would call a movement by “society” to “protect itself” (against the market). Less misleadingly: as people get more and more miserable under reactionary regimes, the prestige of left-wing ideas increases.

We can be sure neoliberal ideas will continue to straggle on for years, because the ruling class won't stop propagating them except under the most extreme duress. But the tide is beginning to turn, finally. The legitimacy of the status quo is almost completely shattered at this point.

Adjudicating the Chomsky-Greenwald Dispute on Lesser-Evil Voting

The rituals of the political left are as predictable as they are puzzling. It's an election year, so we leftists have a sworn duty to reignite, for the 10,000th time, the debate about “lesser-evil voting.” Glenn Greenwald recently made some comments on the matter, as did Noam Chomsky, and Bruce Levine weighed in in a Counterpunch column on June 19th, and other corners of the facebooking, tweeting, youtubing, altogether self-flogging left have delved into the dull topic, so I can't resist inserting my two cents too. In accord with my self-identification as #1 Fan of the Great Man, I want to defend the Chomskian point of view.

I won't summarize everything Greenwald, Chomsky, and Levine (who links to the relevant videos) say. What I want to do is just to implore those on the left to heed the suffocating nausea in their gut when, say, watching some such performance as Trump's in Tulsa on June 20th, and vote against the Infant Beast on November 3. Please. For the sake of the climate that Trump is passionate about destroying, and the children he is passionate about torturing, the immigrants he is passionate about excluding (including "legal" immigrants whom Obama and Biden never persecuted), the working class he is passionate about punishing, the public lands he is passionate about privatizing, the *elementary decency* he is passionate about violating—for the sake of all that is still worth salvaging in this broken world of ours, please vote against him. Vote to oust him. Which, by inescapable logic, means vote for Biden.

Are the two political parties the same? No. Are they even approximately the same? No. They're growing farther and farther apart, thanks to, on the one hand, the neofascism of the right, and on the other hand, the "democratic socialist" insurgency that has already elected leftists to Congress. The political center cannot hold; the momentum is on the right and the left, and the left has begun to drag even the most debased corporatists (Pelosi, Schumer, et al.) at least symbolically in its direction. Hence the ludicrous sight of capitalist minions draped in kente cloth kneeling on the floor of the Capitol. Hence Biden's relatively progressive policy platform. Hence the progressive bills the House passed in 2019, even before the left-populist wave became as visible as it has been in 2020.

The Democratic Party belongs to business, but there are different sectors of business. Just read Thomas Ferguson. There is "liberal" business and there is fascist business. Liberal business funded Franklin Roosevelt even after he had signed the Wagner and Social Security Acts in 1935 (in fact, it helped write them)—two legislative achievements that leftists have celebrated ever since. Liberal business supported the Great Society. If you look at history, every law that has significantly benefited the population was—of necessity—supported by some segment of the business community. Otherwise it wouldn't have gotten anywhere. It would be nice if we didn't need assistance or at least acquiescence from the liberal side of the ruling class in order to enact desperately needed reforms, but we're not remotely close to that point yet.

Biden is an obscenity, but he isn't a neofascist. That consideration alone should be decisive. He's done terrible things (so has Sanders, by the way), but the political context is changing. The Democrats of the 2020s will not be the Democrats of the 1990s. They won't be socialists either (except in rare cases), but we have to live in the real world. We have to oust the aspiring fascists before we can make really constructive changes. At the absolute least, we have to prevent things from getting drastically worse—which they will if Trump is reelected, and if Republicans hold the Senate.

What about Greenwald's argument that regularly voting for Democrats causes you to lose any leverage you might have over them? It is a powerful argument, and it is a major reason the Democratic Party has been able to virtually ignore organized labor for decades. But, again, in a time of a newly energized left, there are other ways to pressure politicians than by not voting for them on election day. For one thing, you can try to remove them in the primaries. Or you can—here's an idea—protest in the streets. (I wonder if that might have some success...) Or you can mob their offices or picket their homes or vandalize their neighborhoods or strike workplaces or flood their offices with phone calls or air negative advertisements or hire more lobbyists, etc. In the coming era of social crisis, the left will not lack for means of pressuring elected representatives.

What about the argument one always hears that lesser-evil voting has enabled the rightward drift of the Democratic Party over the last generation? First of all, a few hundred thousand or more votes here and there for a third party wouldn't have changed that, wouldn't have accomplished anything except electing Republicans—as it sometimes did (I find it bewildering that Ralph Nader can sleep at night). Which itself contributed to the rightward drift of politics. So there goes that argument. The overwhelming cause of Democrats' "rightward drift" hasn't been lesser evilism but the business community's massive mobilization since the 1970s against liberal policies. Hundreds of billions of dollars' worth of propaganda, of institution-building and -dismantling, of investment in armies of lobbyists, has moved the whole political system to the right. You think a little non-lesser-evil voting (among the tiny minority of conscious leftists) would have changed all that?

Here are just a few of the almost certain consequences of a Trump re-election: the judiciary will become ultra-reactionary for at least a generation; global warming and ecological destruction will *accelerate*, and may pass a point of no return; nationalism will triumph and the immigration system will be remade such that its sole purpose is to destroy as many lives as possible; higher education will become even more expensive and people will remain debilitated by debt their entire lives; in general, every social policy will veer into the domain of hyper-misanthropy. If you live in a swing state and you don't vote for Biden, even if you don't *want* any of these things to happen, you are increasing their likelihood.

I know it's appalling to contemplate submitting a ballot on which you've indicated support for a sexist, racist, imperialistic, business-loving villain like Biden. But if you want to live in a world of moral purity, take a one-way trip on the SpaceX Starship.

Bruce Levine, using a common talking point on the left, decries "fear-based decision-making." Lesser-evil voting is fear-based decision-making. Horror of horrors. Personally, I think fear is rational when we're faced with aspiring neofascism and the end of civilization in three generations. I freely admit I'm afraid of what Trump and the Republicans might do in the next four years. But I also have hope: I hope a leftist insurgency can pressure the Biden administration to make things better for a lot of people, and even to lay the groundwork for substantive action on global warming. As Chomsky is fond of saying, one can't predict the specifics of what the future will bring. Institutions change and are susceptible to popular pressure.

Levine's praise of the "integrity" of Briahna Joy Gray, among others, for denouncing Biden after Sanders had endorsed him is misplaced. Nothing is easier than to denounce someone like Biden. Look how easy it is: I revile Joe Biden. See? That was easy. It requires more courage to buck the tide of popular opinion (on the left) and plead with people to vote for someone as unappealing as that corrupt old corporatist. There is no loss of "integrity" in doing so, if one of your principles is that you care about the predictable consequences of your actions.

Chomsky's position is vastly more reasonable than Greenwald's.

"Gene Debs, Ralph Nader, and Briahna Joy Gray," Levine writes, "weren't ready to grovel in the dust, and those of us who have any energy should consider expending it supporting courageous people like them, as well as maintaining our own integrity and helping one another from becoming too broken to fight." What on earth is he talking about? Is it "groveling in the dust" to spend a few minutes voting for Biden and other Democrats on November 3? Does doing so make one too broken to fight? Maybe that's not what he meant. But I don't see why it arouses so much cognitive dissonance in so many people when you say: fight like hell all the time but vote to keep out the neofascists. There is nothing remotely inconsistent in that imperative.

There are, at long last, so many newly awakened leftists in this country that in the aggregate they can have a tangible effect on the elections. I hope they're able to swallow their understandable revulsion for Biden—and other corporate Democrats—and vote to kick out the fascists, making possible progressive legislation in the future.

The Revolutionary Beethoven
(Published in *Dissent*)

Two hundred and fifty years after Beethoven's birth, we're faced with something of a paradox: his music is known and beloved all over the world, probably more than that of any other composer, even as its real significance is hardly ever remarked on except in critical studies largely unread by the public. Familiarity, it seems, has bred, not contempt but ignorance. We hear the famous melodies for the thousandth time, whether in movies, commercials, or concerts, melodies from the third, fifth, sixth, ninth or other symphonies, or from piano concertos and sonatas or pieces of chamber music, but the *cutting edge* of this music has been dulled through overuse. That is, we have forgotten, and no longer seem to hear, the intensely

political nature of Beethoven's music—its subversive, revolutionary, passionately democratic and *freedom-exalting* nature.

In the year of the great composer's 250th birthday, it would be fitting to recapture the music's essence, retune our ears to pick up its political and philosophical message. This is especially appropriate in our own time of democratic struggles against a corrupt and decaying *ancien régime*, a time of parallels with the Beethovenian era of revolution, hidebound reaction, and soaring hopes to realize "the rights of man." Beethoven belongs, heart and soul, to the political left. Centuries after his death, his music, especially if properly understood, still retains the power to transform, transfigure, and revivify, no matter how many political defeats its partisans and spiritual comrades suffer.

We might start with the most famous of Beethovenian motifs, the opening notes of the Fifth Symphony (1808). We've all heard the legend that they represent "fate knocking at the door." The source of this idea is Anton Schindler, Beethoven's notoriously unreliable secretary. Sir John Eliot Gardiner, world-renowned conductor, has a different interpretation: he detects the influence of Cherubini's revolutionary *Hymne du Panthéon* of 1794 in the famous notes. "We swear, sword in hand, to die for the Republic and for the rights of man," the chorus sings, to the rhythm of *da-da-da-duuum*. Beethoven was a great admirer of Cherubini, not to mention a devoted republican, so Gardiner's theory is hardly far-fetched. In the stultifyingly conservative and repressive Vienna of 1808, Beethoven issued a clarion call to revolution in the very opening notes of one of his most revolutionary, Napoleonic symphonies. No wonder conservatives detested his music!

Some biographical details are in order. Beethoven was a child of the Enlightenment and remained so his whole life. Bonn in the late eighteenth century was steeped in the most progressive thought of the age: Kant, the philosopher of freedom, was a lively subject of discussion at the university, as was his follower Schiller, the poet of freedom, impassioned enemy of tyrants everywhere. The young Beethoven was heavily influenced by Eulogius Schneider, whose lectures he attended: one of the most important of German Jacobins, Schneider was so radical that in 1791 he was kicked out of the liberal university, whereupon he joined the Jacobin Club in Strasbourg. (There, he was appointed public prosecutor for the Revolutionary Tribunal, enthusiastically sending aristocrats to the guillotine—until he lost his own head a couple years later.) Schneider's republicanism stayed with Beethoven, but it was Schiller whom Beethoven worshiped.

Schiller's poem "An die Freude," of course, impressed Beethoven immensely, given that he planned early on to set it to music and finally did so in the Ninth Symphony. But he was just as enamored of Schiller's idealistic, heroic plays, such as *The Robbers*, *William Tell*, and *Don Carlos*. In marginal notations on the latter play, he jotted down his own thoughts as a young man: "To do good whenever one can, to love liberty above all else, never to deny the truth, even though it be before the throne." Decades later, we find him exclaiming in a letter, "Freedom!!!! What more does one want???" In a similar vein, he once wrote to a friend, "From my earliest childhood, my zeal to serve our poor suffering humanity in any way whatsoever by means of my art has made no compromise with any lower motive. I am thoroughly delighted," he continued, "to have found in you a friend of the oppressed." The historian Hugo Leichtentritt concludes, "Beethoven was a passionate democrat, even in his youth; he was, in fact, the first German musician who had strong political interests, ideals, and ambitions."

Indeed, his first significant composition was his *Cantata on the Death of Joseph II*, a heartfelt and moving tribute to the enlightened reformer who died in 1790. Beethoven, who always disliked hierarchy, was wholly in sympathy with Joseph's attacks on the power of the Catholic Church and the Austrian aristocracy. His contempt for aristocrats was such that, years later, he was able to write an insulting note to his most generous benefactor, Prince Lichnowsky: "Prince, what you are, you are by circumstance and birth; what I am, I am through myself. There are, and always will be, thousands of princes; but there is only one Beethoven." Even his fashion sense was democratic. A woman who knew him wrote a reminiscence of his behavior in aristocratic Viennese salons: "I still remember clearly Haydn and Salieri sitting on a sofa...both carefully dressed in the old-fashioned way with wig, shoes, and silk stockings, while Beethoven would come dressed in the informal fashion of the other side of the Rhine, almost badly dressed." Corresponding to this was the fact that he was "without manners in both gesture and demeanor. He was

very haughty. I myself saw the mother of Princess Lichnowsky...go down on her knees to him as he lolled on the sofa, begging him to play something. But Beethoven did not.”

One reason for Beethoven’s decades-long fascination with Napoleon was that the latter was not an aristocrat, that he was the “little corporal” who had conquered Europe by his own efforts. “He admired Napoleon’s ascent from such a low beginning,” remarked a French officer he befriended in 1809. “It suited his democratic ideas.” On the other hand, Napoleon’s crowning himself Emperor certainly did not suit Beethoven’s ideas, as we know from the anecdote of how he furiously tore up the title page of the *Eroica* Symphony (1803), which he had originally intended—incredibly, given the political repression in Vienna—to title *Buonaparte*. “So he is nothing more than an ordinary man!” Beethoven raged. “Now he too will trample underfoot all the rights of man...and become a tyrant!” And yet twenty years later, in the thick of the Restoration, his views had softened: “earlier I couldn’t have tolerated him [Napoleon]. Now I think completely differently.” However bad Napoleon was, he wasn’t the despised Emperor Francis II—or, even worse, Metternich.

The *Eroica* is arguably the most revolutionary of Beethoven’s symphonies, which may be why it remained his favorite, at least until the Ninth. John Clubbe, author of *Beethoven: The Relentless Revolutionary* (2019), believes the famous first two chords, which crash like cannon shots, are indeed supposed to represent the cannon fired by Napoleon’s armies as they marched across Europe carrying the banner of revolution. “The chords recall the world of the [French] Revolution: exuberant, over-the-top, colossal. They are wake-up calls to jolt [the] somnolent audiences” in Vienna and elsewhere—for Beethoven loathed the complacent, apolitical, frivolous Viennese of his day, intimidated by repression and censorship into sybaritic silence. The symphony is full of the techniques of disruption that have come to be considered quintessentially Beethovenian, including sudden dynamic contrasts, extreme dissonance, colossal noise, massive dimensions, density of ideas, bursting of forms and conventions, even an extra French horn to conjure the atmosphere of revolution. All of it together serves to communicate the abiding essence of Beethoven’s music: *struggle*, ending in triumph. It is not mere personal struggle, such as his struggle against deafness; it is collective, universal, timeless struggle, a war against limits, so to speak—artistic, creative, moral, political, even spatial and temporal. Gardiner’s characterization is apt: Beethoven represents the struggle to bring the divine down to Earth, a struggle he shares with revolutionaries everywhere. (Gardiner contrasts this with Bach and Mozart, the first representing the divine *on* Earth, the second giving us the music you would hear in heaven.)

Theodor Adorno was surely right when he said, “If we listen to Beethoven and do not hear anything of the revolutionary bourgeoisie—not the echo of its slogans, the need to realize them, the cry for that totality in which reason and freedom are to have their warrant—we understand Beethoven no better than does one who cannot follow the purely musical content of his pieces.” The man was so political that, by the end of his life, some of his friends refused to dine with him: either they were bored of his constant politicizing or they feared police spies would overhear him. “You are a *revolutionary*, a *Carbonaro*,” a friend of his wrote in his conversation book in 1823, referring to an Italian secret society that had played a role in various national uprisings. Well past the point that it had become (to his contemporaries) anachronistic, Beethoven kept the Enlightenment faith.

It is beyond the scope of this article to trace Beethoven’s hortatory humanism through all its musical permutations, from the bucolic poetry of the Sixth Symphony (he had a nearly pantheistic love of nature) to the “peace that passeth understanding” of the final piano sonata, with the dazzling variety of forms and content in between. We can hardly ignore, however, the one opera he wrote, whether in its initial form (as *Leonore*) or its final form almost ten years later (1814) as *Fidelio* (which he wanted to dedicate, much like Lord Byron, to the Greek freedom fighters in their war against the Ottoman Empire). Here was a chance for the great democrat to express his convictions in words, not only music. And the words, music, and plot of the opera are unambiguous: in them “the Revolution is not depicted but reenacted as in a ritual,” to quote Adorno.

Fidelio gives free rein to Beethoven’s unalloyed idealism, as the choral movement of the Ninth Symphony would do a decade later. The plot is simple (and ostensibly based on actual events that occurred during the French Revolution). Leonore, disguised as a young man named Fidelio, gets a job at a prison

where she suspects her husband Florestan is being held for political reasons. He is, in fact, being slowly starved to death in the dungeon for having denounced the crimes of the prison's governor, Pizarro. The minister Don Fernando will arrive the next day to investigate accusations of cruelty in the prison, so Pizarro resolves to kill Florestan in order to keep his existence and unjust imprisonment a secret. Fidelio and a few others are sent to the dungeon to dig a grave; meanwhile, they set most of the prisoners free, at least temporarily, to gather in the courtyard and see the sun once again. At last the time is come for Pizarro to kill Florestan: he approaches with a dagger, but Fidelio leaps between him and Florestan and reveals herself, to everyone's shock, as Leonore. She threatens Pizarro with a pistol, but at that moment a distant bugle is heard, announcing the arrival of the benevolent minister. Pizarro ends up imprisoning himself, as Leonore frees Florestan from his chains and is celebrated for her heroism by the crowd of emancipated prisoners.

The symbolism and allegorical meanings of the opera are not hard to discern. Beethoven believed in the courage and heroism of women just as much as men, and was just as affected by its contemplation and depiction. He was, in fact, a lifelong child, as sincere and pure in his values—as well as in his “utterly untamed personality” (quoting Goethe)—as a naïve boy reading Schiller for the first time. Doubtless it is this quality that so moves audiences, that inspires flash mobs with millions of views on YouTube, and that has made his music immortal. The greatest art is always *affirmative* in spirit, and no one is more profoundly affirmative—or more entitled to affirmation, in light of his terrible suffering—than Beethoven.

The spirit of his music is as simple as the spirits of his models (he insisted) Socrates and Jesus: good will triumph over evil; cherish freedom but live with moral seriousness, always challenging authority; love your fellow human beings, not parochially, as in the mode of nationalism, but universally; never compromise your ideals or integrity; above all, *struggle for emancipation*. “Freedom remained the fundamental motif of Beethoven's thought and music,” Clubbe writes.

Lest a political conservative misinterpret this last point, I must insist that “freedom” for Beethoven did not mean the freedom to try to start a business, to rent yourself to a corporation (on pain of starving), or to enjoy the wealth you have inherited. These are deeply impoverished “freedoms,” however glorified they may be in the rhetoric of modern conservatism. Richer is the republican freedom to participate actively in politics, or the freedom to create and think and speak what you will, where you will. Politics “as the art of creating society, a society that will express a richer and fuller life,” was Beethoven's favorite theme, according to his biographer W. J. Turner. Indeed, there is something incongruous about the attendance of the lavishly dressed moneyed elite at public concerts of Beethoven symphonies or concertos, given the music's expression of the revolutionary, democratic, humanitarian spirit the elite's existence is premised on crushing. But such are the ironies that result when the historical specificity of art is denied or forgotten and all that is left is a vague feeling of aesthetic enjoyment.

Still, even the pure aesthetic enjoyment is significant. The music is exquisitely beautiful in the mode of *invigoration*: no composer in history is more humanistic than Beethoven. As Leonard Bernstein once said,

No composer has ever lived who speaks so directly to so many people, to young and old, educated and ignorant, amateur and professional, sophisticated and naïve. To all these people, of all classes, nationalities, and racial backgrounds, this music speaks a universality of thought, of human brotherhood, freedom, and love.

That even our modern aristocrats and reactionaries can love Beethoven, however perversely, suggests just how universal his music is.

Let us, then, turn again with fresh ears and open minds to “the first great democrat of music,” in the words of Ferruccio Busoni. Let us draw inspiration from him in our own struggles to humanize and democratize the world. And let's be sure not to forget, in the cultural wasteland that is twenty-first-century America, the nobler aspects of our civilization's heritage.

Admirers of Richard Wagner's music have been known to call it the “Music of the Future.” Let's hope that Beethoven's is the real Music of the Future, and that humanity one day will be free.

Personal Reflections on Anarchism

Anarchism (anti-authoritarianism, love of freedom) is an essential thing, an essential guide for our thinking and action, but I have to admit I'm sometimes struck by what I see as the lack of acuity of a lot of anarchist thinkers. I've been reading the massive book *Demanding the Impossible: A History of Anarchism*, by Peter Marshall (second edition published in 2008)—a very good book—and came across this paragraph in the Epilogue:

Post-modernist thinkers tend to be libertarians [*not* in the right-wing American sense] rather than anarchists. Michel Foucault for one maintains that power in the sense of "a mode of action upon the action of others" is everywhere and cannot be escaped, whether in the arena of society or in the realm of knowledge. While the relations of domination can be changed, the relations of power will always remain. Where anarchists seek to dissolve the structures of power, for Foucault it is senseless to try to create a world outside power: "there are no margins for those who break with the system to gambol in." Indeed, in his view power does not emanate from the State but the State from power: the State is thus a congealed assemblage of power relations.

Ugh. This is why Chomsky insists the social sciences have little intellectual content. These claims are merely truisms, and yet they're seen as controversial and even original. (Actually, the very idea of "originality" is yet another simplistic and artificial scholarly convention. No one is really original, and everyone is. All "thinkers" get ideas from a vast array of sources, and even profound writers like Kant or Marx or Chomsky are less original than we're inclined to think. Thinkers can be more or less *insightful*. *That's* a more meaningful designation than "original.")

As I've written elsewhere, it's sadly obvious that we can't achieve the anarchist goal of doing away with power. Even in the most egalitarian tribal societies, there have always been subtle relations of power and status based on force of personality, physical strength, intelligence, age (a child has less power than an adult, a younger adult often has less power than an older adult), and other non-institutional factors. That's part of the human condition. Women, for example, have always lived to some degree at the mercy of men, since men are typically much stronger and larger than they. That's a power relation. —Sorry if that's an "un-woke" thing to say, but it's true.

As for complex modern societies, no matter how decentralized or democratic or communistic we try to make them, there will always have to be institutions of *some* sort. And whenever you get an institution of some size, you're going to get roles that aren't all equal in status or power. Moreover, it's hard to imagine that in a complex, highly technological world civilization, even a future "democratic" or "socialist" one, there won't be institutional hierarchies anywhere. Surely, they'll be all over the place. Direct democracy, being sometimes impracticable, won't be able to govern *everything*; there will still have to be *representatives* in various contexts—political (or "administrative" if you prefer), economic, and so on. The principle of *delegation*. And you can't do away with an elaborate division of labor except in the simplest of societies. Large worker cooperatives will have to have elected directors of some sort, elected managers, "hierarchies" (albeit democratically grounded) of some form or other.

Various types of power, authority, and domination permeate every set of complex social circumstances. Why Foucault is respected and controversial for insisting on this trivial point, I have no idea.

But, characteristically, he had to fuse his "insight" with wrongheadedness: I see no reason to rule out the possibility that we can make society more libertarian (free), or that small groups of people can escape "the system" and live in more egalitarian circumstances than prevail all around us. We aren't all "prisoners" to the same degree. There are *different* systems of power in our civilization, some of them more egalitarian and libertarian than others. Foucault's pessimism, or at least his particular brand of pessimism,

is unwarranted. History offers countless examples of people freeing themselves from systems of oppression—even if it's true we can't free ourselves from power altogether.

Despite my skepticism that genuine anarchy on a large scale can ever be achieved, I'm a thorough and instinctual anarchist in my personality. Actually, I'm interested in probing this fact, so if I might indulge (self-indulgently) in some self-description for a moment.... I'm pretty much a lover of solitude, a hyper-individualist, largely set apart from society and all groups and organizations. To my frequent cost, I don't seem to really fit in anywhere. As a young leftist in the late 1990s I had no interest in the usual cultural tastes of young leftists, such as punk rock (awful!) or other "subversive" brands of popular music, or postmodern theory, etc. I was enamored of classical music, from Bach to, say, Tchaikovsky. (I had no use for twentieth-century classical music.) I was, and am, an arch-traditionalist, generally more appreciative of and interested in the eighteenth and nineteenth centuries than anything that came later. I adored Marx, having discovered his writings in my dad's office. I'd wager that no one in my town shared my adoration, and that at my high school graduation quite a few people in the audience were nonplussed or worse when I referenced Marx several times in a speech I gave. I was really a naïve boy who lived in his head.

I have a reflexive aversion to all things *institutional*. This aversion isn't entirely reasonable, but I've often felt vaguely suffocated in the academic environment, where freedom of thought isn't always encouraged. Academic events and writings are frequently celebrations of pretentiousness, groupthink, and intellectual perversity. (Leftists are as guilty of these things as everyone else, because most academic leftists have internalized the "proper" norms.) I'm usually quite polite and pleasant to authority figures, especially in academia, but something about the authority principle instinctively grates on me. Which is one reason I try to avoid all bureaucracies and bureaucrats like the plague.

But I also avoid aggregations of people, even, usually, small social groups, like at parties. I dislike the dynamics of domination that emerge in such situations, where you have to compete for attention lest you be ignored. Individuality isn't very respected in those circumstances; you become a group-creature who has to adhere to the (usually vulgar) interests and tastes of the group. People become remarkably stupid, insensitive, and cruel in groups. Power, domination, charisma, loudness—loutishness—and the like are too respected. I'm interested in people as individuals, not as members of a group.

Intellectually, I've never been able to respect disciplinary boundaries. I'm not a specialist by nature, and I find it terribly boring and limiting not to range widely over history, philosophy, psychology, and the natural sciences. (Unfortunately, in order to get anything done, it's necessary to specialize somewhat.) This is one reason I like Chomsky, whose polymathy totally flouts academic norms. I'm no genius, but you can see from this website that I enjoy writing/speculating about everything from the history of capitalism to the philosophy of mind to human psychology. And I don't think you need special credentials to write perceptively—more perceptively than many of those with credentials—on these matters.

So I'd say in most respects I'm by nature a nearly perfect anarchist. That is, a democrat, a "humanist" (as opposed, e.g., to an institutionalist), and a communist who would like to see the withering away of private property, to the extent possible. We should all be anarchists in the sense of "the anti-authoritarian personality." We should value creativity, freedom, individuality, self-expression, authentic community, non-hierarchy, democracy, free and honest communication, and rational inquiry and persuasion. As a set of values, anarchism is pure common sense! I'll even admit that, theoretically, it would be wonderful if we could do away with government or "the state." Governments are pretty monstrous, as history teaches us.

But I part ways with most anarchists not only in my belief that power/domination/authority, in various forms, has always been with us and will always be with us but also in my doubt that government, even centralized government, can be abolished (unless civilization collapses). It's just too hard to imagine systematic decentralization and "localization" of all administrative structures in an advanced technological global society. Nor does it seem possible to do away with *laws*, as Kropotkin, William Godwin, and others have dreamed of, relying instead on public opinion and custom to regulate social behavior. Look at how complex the world is! Can such an infinitely complex world operate purely through the force of public opinion and the fear of public censure, with no need of coercive or hierarchical institutions to enforce compliance? Can we do away with jails and prisons in even their *most humane forms*? Of course prison

systems could be massively downsized compared to their extent now, but it's hard to believe that even a "classless" society of billions of people wouldn't require *some* law enforcement.

The state is in many of its functions a horrifyingly destructive entity, but it also comprises constructive functions. You can consult Mariana Mazzucato's *The Entrepreneurial State* for an analysis of some of these functions. All the advanced technologies we enjoy today, such as plastics, electronics, the internet, nanotechnology, biotechnology, pharmaceuticals, and green technologies, have relied overwhelmingly on state funding and state "direction" of research at most stages of their development. Without large and well-resourced governments, these technologies wouldn't have come into being. (The same is true of mass production, electric power, aviation and space technologies, and nuclear energy. See Vernon Ruttan's *Is War Necessary for Economic Growth?: Military Procurement and Technology Development*. The doctrines of free-market enthusiasts are mostly fantasies: government planning and funding are primarily what have ensured economic growth and relative societal well-being.)

Moreover, insofar as the state is a destructive entity, that is mostly because of the private sector's influence over it. Sociopathically structured corporations, voracious for profit, are the engine behind our civilization's self-immolation. If we could "socialize" the private sector or make it worker-run, thus making government more democratic and egalitarian, the state would become far less harmful than it is today. It still wouldn't be ideally democratic—it would still consist mostly of bureaucratic hierarchies—but its worst, most murderous and militaristic abuses would be significantly curtailed. It's true that the state has its own authoritarian interests, but it is also used as an instrument by outside forces. The more beneficent the outside forces are, the more beneficent the state will be.

There is something attractive about the "purity" and idealism of anarchist goals and sketches of a future society, but there is something naïve about them too. Leftists in general are often guilty of naïveté. The fact is that to be alive is to be in a "fallen" condition, which is to say a condition of suffering and struggle. It has always been this way, for every animal in the history of life. Nature is not an ethical or a just place, and there is little reason to think we can achieve a truly moral or just society (on a large, least of all a global, scale). For instance, there is no precedent for a large-scale, populous society that lacks a "government." Even in the urban Italian communes, or city-states, of the Middle Ages there were smallish bureaucracies and power-structures and every non-anarchist phenomenon you can imagine. Of course, there were classes too. Maybe a classless society wouldn't require a government? Well, as I've said, even if someday we manage to achieve "classlessness"—that is, abolition of differential ownership and control of the means of production, workers and communities democratically deciding how to plan economic activity and allocate resources—complex administrative structures analogous to "governments" will surely be necessary.

Anyway, I'm repeating myself, coming dangerously close to academics' characteristic sin of long-windedness. Let me just say I can't help having deep doubts about the future of a species capable of, say, Nazism, nor being deeply skeptical, therefore, of all idealism. I'm reading a book called "*The Good Old Days: The Holocaust as Seen by Its Perpetrators and Bystanders*," and once again it's been brought home to me how profoundly objectionable *homo sapiens* is, from a moral and intellectual point of view. What is one to think of such a species as ours, which finds it so easy to plumb the abyss of depravity? Sometimes I wonder if those people who are endowed with a high degree of empathy and outrage at injustice—among whom are many leftists—simply misjudge the moral character, the moral potential, of their fellow humans. I at least am continually appalled by what I see of humanity—not only by institutions, which are blatantly amoral, but by individuals themselves. The cruelty and lack of intelligence of individuals, billions of individuals.

Nevertheless, the optimism of anarchism will always be refreshing and inspiring. I see no end to the struggle to realize its ideals—I think the struggle will go on until the last members of our species have perished and the nightmare of history comes at last to a close. But at least the anarchist ideal of freedom and dignity gives us something to struggle for in the first place.

Interview: If Unions Had Organized the South, Could Trump Have Been Avoided?
(published in *Labor Notes*)

At a time when activists and commentators are puzzling over the United States' enduring conservatism, Michael Goldfield's new book *The Southern Key: Class, Race, and Radicalism in the 1930s and 1940s* (Oxford University Press, 2020) provides some perspective. Goldfield argues that the old question "Why no socialism in the U.S.?" reduces to "Why no liberalism in the South?", which itself is answered, in large part, by unions' failure to organize the region in the early and middle twentieth century. The book consists of case-studies defending this thesis and exploring what went wrong and how things might have turned out differently. I interviewed Goldfield in early November about his arguments and his thoughts on the labor movement today.

CW: One of the major theses of your book is that the failure of the CIO in the 1930s and 1940s to organize certain key industries in the South, such as woodworkers and textile workers, has shaped U.S. politics and society up to the present. For example, the "liberal"—as opposed to laborite—character of the civil rights movement, Republicans' racist "Southern Strategy" (influenced by George Wallace's presidential campaigns in 1964 and 1968), businesses' relocation to the South in the postwar and neoliberal periods, and in general the conservative ascendancy of the last fifty years were all made possible by the CIO's earlier missteps. How did these failures to organize a few industries have such far-reaching effects?

MG: Underlying my argument is the unique ability of workers organized at the workplace to engage in what I call civil rights unionism, including demands inside the workplace for more hiring and upgrading of non-whites, especially women, desegregation of facilities, etc. Secondly, this involves broader struggles for desegregation, access, and other issues, in the community at large. Of special importance here is the ability of workers at the workplace to resist and successfully fight against right-wing, racist repression, something that was so successful in silencing and destroying individual white liberals in the South. I discuss a number of such examples in the book, including the Farm Equipment Workers (FE) at International Harvester in Louisville and Local 10 of the ILWU in San Francisco. These instances, though vitally important in their limited impact and providing clear templates for future struggles, were too isolated to affect the general course of events.

There is a clear contrast here with the UAW and the NAACP, the liberal civil rights organization. By 1945-46, the autoworkers union with Walter Reuther at the head had become very bureaucratic. They were on record as supporting civil rights, and Reuther was allied with the NAACP. But what did they actually do? In Detroit, for instance, there were restaurants and bars around auto plants that were segregated, not allowing Blacks in. Reuther and the NAACP sent letters to all the bars and restaurants saying that they should integrate—and of course nobody did anything. At left-wing locals, on the other hand, workers organized. Interracial picket lines went up around the restaurants and bars; the workers told the owners that if they didn't allow Blacks in, they would have no business from anybody in the union. Instantly, owners changed their policy—thus demonstrating the effectiveness of civil rights unionism.

I can give you an example from my own experience, when I worked at an International Harvester plant outside Chicago. We had a Black worker in our plant who bought a house in a racist all-white community; his house was firebombed twice. Our group controlled the Fair Practices Committee, and we got the union local to vote to support a round-the-clock picket line at the house. Immediately, all the violence stopped. Our plant was about a third African-American, and there were probably quite a few workers who were not sympathetic to what we were doing. But if any of us had been attacked, the whole local would have gone berserk. That type of strength that unions had when they were fighting for civil rights was different from most of what existed across the South.

The organizing, then, of over 300,000 woodworkers (an industry that existed across the deep South, 50% of whose workers were African-American) had the potential to make a tremendous difference. And if

the USWA and other unions had maintained their civil rights focus, the course of the civil rights struggle and of history might have been altered.

You're very critical of the leadership of both the CIO and the Communist Party in the 1930s–40s. Briefly, what mistakes did they make? Why did organizations that, for a time, showed such militancy and effectiveness in organizing particular industries (such as steel, automobiles, and meatpacking, among many others) fail so dismally to organize large swathes of the South?

This is discussed extensively in the book. I analyze in detail how the Stalinization of the Comintern and the U.S. Communist Party undermined many of their laudatory efforts. I also agree with Nick Fischer's argument in *Spider Web*, that liberal anti-communism, as practiced by the UAW under Reuther and the USWA under Philip Murray, aligned itself with racists and fascists. In order to defeat the CP leadership of the Mine, Mill and Smelter Workers, Murray and the USWA allied themselves de facto with the KKK in Birmingham, destroying a progressive civil rights unionism (or at least weakening and limiting its influence) in Alabama. The CIO did the same in destroying the Winston-Salem Food, Tobacco, Agricultural and Allied Workers local. The United Packinghouse Workers did not do this and continued to be a civil rights union. Auto, steel, and meatpacking actually were organized in the South. As Matt Nichter's forthcoming article in *Labor* shows (entitled "Did Emmett Till Die in Vain? Organized Labor Says No!"), the UAW and USWA had no rank-and-file civil rights presence, while the UPWA sent an interracial male and female southern delegation to the Emmett Till trial in Mississippi.

Broadly speaking, the failure of interracial unionism in the South is attributable to three primary causes. First, the right-wing leadership of the CIO—the forefathers of the leadership of the contemporary labor movement—refused to seriously confront white supremacy in the South, squandering golden opportunities to organize Black workers in a number of large southern industries. Second, the left-wing of the labor movement—which had been the major goad behind interracial class unity in the first place—liquidated itself at the behest of the Soviet Union, which demanded labor peace during WWII, then limited their civil rights activity during the Cold War. Third, the postwar red scare—including the 1947 Taft-Hartley Act—dealt a crippling blow.

You argue that in order for workforces to successfully organize, they generally need either “structural power” or “associative power” (or both). For instance, coal miners during the period you write about had immense structural power and therefore tended to serve as a “vanguard” of the labor movement. Textile workers, by contrast, lacked structural power, so they had to rely—or should have relied more than they did—on associative power, making alliances with other organizations and social forces. Today, do you see any industries that have notable structural power and should be a prime target for organizers? Or do you think most workers now are compelled to rely primarily on associative power, on making connections with other groups and social movements?

Miners had structural power in part because they were providing the main fuel to the economy, which they don't anymore. There are hardly any coal miners left in the United States, despite all the rhetoric. But other people have the power to bring the economy to a halt, like truck drivers and others in the transportation industry. Airline workers could potentially—they could have done it during the air traffic controllers' strike, but of course the unions wouldn't have considered that. It's interesting that workers in the food production industry and the warehouse and logistics industries are suddenly realizing how important they are, given the pandemic, and are mobilizing around their terrible treatment. There have been 44,000 cases of Covid-19 in the hundred-plus meat processing plants and over two hundred deaths. People are not happy about this. In Detroit, where I am, bus drivers have struck over the lack of safety. It seems to be a generalized phenomenon that's taking place, but I don't know how to gauge it. I read *Labor Notes* and I subscribe to it, but its reporters are always seeing a new upsurge taking place. The United States is a big country and there are always strikes happening somewhere, but it doesn't necessarily mean that a large movement is in the offing.

Still, we're seeing people in places that were historically difficult to organize getting more upset and taking action. Many of the logistics hubs, for instance, are in the South. One of the biggest in the country is in Memphis, there's a big one in Louisville, etc. These are urban, interracial workforces. The South, of course, is very different now than it was in the 1930s and 1940s: it has much more economic dynamism, including a significant percentage of the auto industry, particularly transplants (foreign plants that have their production facility in the U.S.). While Detroit still has more auto production and more parts, there are huge parts corridors in states across the South.

Public service workers, too, are getting screwed really badly. The reason we had so many teachers' strikes in so-called red states is that the budget cuts were much more severe there. When these people struck, they had broad associative power and huge amounts of public sympathy. The Chicago Teachers Union organized parents and others in the community to support them, which hadn't previously been done as much by teachers' unions. In West Virginia, a state that overwhelmingly voted both in 2016 and 2020 for Trump, schoolteachers were militant and had broad support throughout the state. The same was true in Oklahoma, and some of these same things happened in Mississippi. So I think that the possibilities for a Southern upsurge, as well as in the country as a whole, are real. On the other hand, there isn't the same insurgent, radical leadership that there was in the 1930s.

It's obviously hard to generalize over the labor movement, but are you concerned that unions today too often adhere to the same earlier, self-defeating trends of centrism and collaborationism? Or do you see cause for hope that the kinds of errors the CIO made in its Southern campaigns—and that the AFL-CIO continued to make for decades thereafter—are finally being overcome? Do you think organized labor is starting to turn the corner?

No. While there are insurgent parts of the organized labor movement, including those who had threatened a general strike if Trump tried to steal the election, the AFL-CIO and its major unions, short of insurgencies and new leadership, are too sclerotic to lead the next wave of struggle.

Racism and white supremacy are central to your analysis. The CIO's inability to organize the South made possible the extremes of white supremacy we saw in the postwar era and we're seeing today, which have catastrophically undermined class solidarity. What do you think of the current Black Lives Matter movement? Is it wise to place the dominant emphasis on police brutality and defunding the police, or are there more effective ways to challenge white supremacy? Should activists organize around shared class interests with allegedly racist whites rather than the divisive issue of abolition of the police?

The police were established to play the role of repressing labor and communities, as much recent literature documents. This is central to capitalist rule and its function should be abolished. As such, police unions are not unions and do not belong in the labor movement. On the other hand, the demand to abolish the police needs to be sharpened. As many have noted, lots of things the police do, including responding to disturbed people, should be delegated to others, and removed from policing. On the other hand, there are certain types of protective services for which there should be an organization that serves. What to do about rape and violence against women? Who do you go to when your car is stolen? This whole range of concerns and demands needs to be delineated clearly so that people can be sure that we get rid of the police in their anti-labor, racist functioning, but still have necessary services so that we do not merely exist in an anarchic state of chaos, which is the impression that opponents of our demands give.

Many left-wing unions and some others as well combined broad class issues, interracial solidarity, with racial egalitarian demands (I discuss these questions also in *The Color of Politics*). The examples I give of certain civil rights-oriented unions (such as FE and ILWU Local 10) were successful at doing this, too.

The Rise of Right-wing Libertarianism Since the 1950s
(Notes on a dismal history)

Sometimes as I read books I like to simultaneously summarize them in my own words, to facilitate the intellectual digestion. And also to post my notes online later on, in the probably vain hope of diffusing knowledge to young people and non-academics. I've been reading a couple of books on the rise of political conservatism in the last several generations, and since nothing is more important to the future than combating conservatism, I'm going to jot down some notes here. As a historian, I'm familiar with the story and have read quite a few works on the subject. (E.g., this one.) Nevertheless, Kim Phillips-Fein's *Invisible Hands: The Making of the Conservative Movement from the New Deal to Reagan* (2009) and Nancy MacLean's *Democracy in Chains: The Deep History of the Radical Right's Stealth Plan for America* (2017) are interesting enough to warrant some summarizing.

One of the useful functions of the latter book, in particular, is that it brings force and clarity to one's prior knowledge of the dangers of right-wing libertarianism, or more generally anti-government and pro-"free market" thinking. In fact, this sort of thinking is an utter catastrophe that threatens to destroy everything beautiful in the world. I know that sounds like an absurd exaggeration, but it's not. What with society and nature teetering on the brink, it's the literal truth. I suppose the reason leftists don't always take right-wing libertarianism as seriously as it deserves—despite their deep awareness of the evils of capitalism—is simply that it's embarrassingly easy to refute. It's a childish, simplistic, vulgar hyper-capitalist ideology that, once you examine it a little, quickly reveals itself as its opposite: authoritarianism. Or even totalitarianism, albeit privatized totalitarianism. Noam Chomsky, as usual, makes the point eloquently:

...Here [in the United States] the term 'libertarian' means the opposite of what it meant to everybody else all through history. What I was describing [earlier] was the *real* Adam Smith and the *real* Thomas Jefferson and so on, who were anti-capitalist and called for equality and thought that people shouldn't be subjected to wage-labor because that's destructive of their humanity... The U.S. sense [of 'libertarian'] is quite different. Here, every word has taken on the opposite of its meaning elsewhere. So, here 'libertarian' means *extreme advocate of total tyranny*. It means power ought to be given into the hands of private unaccountable tyrannies, even worse than *state* tyrannies because there the public has *some* kind of role. The corporate system, especially as it's evolved in the twentieth century, is *pure* tyranny. Completely unaccountable—you're inside one of these institutions, you take orders from above, you hand them down below...there's nothing you can say—tyrannies do what they feel like—they're global in scale. I mean, this is the extreme opposite of what's been called libertarian everywhere in the world since the Enlightenment...

"Libertarianism," in short, is a bad joke: morally hideous, theoretically flawed, and empirically without merit. (For instance, it's well known among economic historians, or should be, that the only way countries have ever industrially developed is through radical state intervention in the economy, which is also the reason that today we have technologies like electronics, the internet, aviation and space technologies, pharmaceuticals, nuclear energy, containerization in shipping, biotechnology, nanotechnology, green technologies, even mass production and electric power.) Still, the simplistic dogma has to be taken seriously and combated because of the incredible damage it has done worldwide, by, for example, justifying state withdrawal of support for vulnerable populations and deregulation of industries that are consequently destroying the natural environment.

Even people and policymakers who aren't actual libertarians (in the perverted right-wing American sense) have almost always been influenced by pro-market ideologies, because two centuries of global propaganda have made their mark. I don't want to say markets are necessarily and always, even on small

local scales, destructive; I'm only saying that the denigration of government relative to markets is horribly misguided. Besides, what does "the market" even mean? When people talk about "the free market," what are they talking about? Markets, at least national and international ones, have always been shaped and structured and created and manipulated by states. That's a truism of economic history. Just read Karl Polanyi's classic *The Great Transformation* (1944). "The market" is a meaningless abstraction, an idealization that distracts from the innumerable ways states create rules to govern market interactions, rules that favor certain actors and disadvantage others. No national or international market has ever been "free" of political constraints, structures, institutions, rules that are continually contested and shaped by interest groups in deadly conflict with each other.

Conservative ideologues such as most economists, especially so-called libertarians, always prefer to traffic in idealizations (for instance the neoclassical fetish of mathematical models or the "libertarian" fetish of "the market") and ignore history because, well, history is inconvenient. Reality mucks up their dogmas. Actual investigation of labor history, economic history, political history, social history leads to such subversive notions as that if workers had never organized, the mass middle class would never have existed. Or that capitalist states have consistently acted for the (short-term or long-term) benefit of the capitalist class or some section of it. Or that *classes* exist at all! It's much safer to follow the Milton Friedmans and Friedrich Hayeks and talk only about "freedom," "economic liberty," "the market," "the price mechanism," "labor flexibility," and other things that abstract from real-world conditions. It's also less intellectually and morally arduous. Materialism—historical materialism—leads to revolutionary conclusions, so let's stay on the level of abstract ideas!

What an obscenity that capitalism is considered synonymous with freedom! When ideologues prate about "economic liberty" or "the free society," the obvious question is: *whose* liberty? The liberty of a Jeff Bezos to pay a non-living wage is premised on the inability of millions of people to find a job that will pay more. And when, as a result, they're (effectively) *coerced* into taking that minimum-wage job—because the alternative is to starve—their low income vitiates their "liberty" to realize their dreams or have a decent standard of living. Charles Koch, say, has the freedom and ability to influence policymakers at the highest level; in a radically unequal society, most citizens do *not* have that freedom or ability. A billionaire (who likely inherited a great deal of money) has a heck of a lot more "economic freedom" than the rest of us. But he whines about his *lack* of freedom because of burdensome government regulations, taxes, and irritating labor unions. If only he could get rid of these obstacles he'd have *more* freedom—to pay his workers less, fire them for any reason, pollute the environment, and charge consumers more. The "freedom" of the right-wing libertarian is the freedom to dominate others. (More specifically, the freedom of the capitalist to dominate others.)

The truth is that socialism, or popular democratic control of the economy, entails not only more equality but also more widespread freedom. For example, in an economy of worker cooperatives, people would be free from coercion by a boss (because collectively the owners of a cooperative are their own boss). Even in a social democracy, people generally have the means to realize more of their desires than in a neoliberal economy where much of the population lives in poverty. Similarly, the more public resources there are, the more freedom people have to use these resources. Privatization of resources *excludes*, depriving either all or some people of their freedom to use them.

Needless to say, it took a *lot* of indoctrination, backed up by a *lot* of money, to convert untold numbers of people to right-wing libertarianism in the last sixty years. Phillips-Fein starts her story with the famous du Pont brothers who created the Liberty League in the 1930s to fight the New Deal. They didn't have much success: in the depths of the Depression, it was pretty easy for most people to see through vulgar business propaganda. It wasn't until after World War II that business was able to regroup and launch successful offensives against the liberal and leftist legacies of the 1930s. You should read Elizabeth Fones-Wolf's *Selling Free Enterprise: The Business Assault on Labor and Liberalism, 1945–1960* for a broad account of this counterrevolution. Phillips-Fein's focus is more narrow, on the far-right organizations that sprang up to play the long game rather than just immediately beat back unions and Communists and left-liberalism.

One such organization was the Foundation for Economic Education, which “advocated a stringent, crystalline vision of the free market” and disseminated that vision through innumerable leaflets and pamphlets and LP recordings. It was funded by companies both small and large, including U.S. Steel, General Motors, and Chrysler. A couple of the businessmen associated with FEE helped bring Friedrich Hayek, already famous for *The Road to Serfdom*, to the University of Chicago (the libertarian Volker Fund paid his salary) and assisted with his project of building the international Mont Pelerin Society in the late 1940s. The ideas of Hayek and his mentor Ludwig von Mises (who was hired as a FEE staff member) would become gospel to the fledgling libertarian movement.

It’s remarkable, and testament to the power not of *ideas* but of *money*, that a movement that started out with a few scattered malcontents in the business and academic worlds who were fighting a rearguard action against the internationally dominant Keynesian and social democratic paradigm of the 1940s has snowballed to become almost globally hegemonic by the 2010s.

“Over the course of the 1950s,” Phillips-Fein writes, “dozens of new organizations devoted to the defense of free enterprise and the struggle against labor unions and the welfare state sprang into existence.” Ayn Rand, amoralist extraordinaire, had already become “tremendously popular” among businessmen. But some in the business world didn’t like her rejection of Christianity, and they dedicated themselves to shaping religion in a pro-capitalist direction. “We can never hope to stop this country’s plunge toward totalitarianism,” wrote one of them (J. Howard Pew, president of Sunoco and a devout Presbyterian), “until we have gotten the ministers’ thinking straight.” (The usual irony: to avoid “totalitarianism,” we have to get everyone to think like us. Only when every individual is lockstep in agreement, marching behind us, will the danger of totalitarianism be overcome. These ideologues are pathetic, unreflective mediocrities who take it for granted that they have the right to rule—and anything else is totalitarianism.)¹ Pew worked to support an organization called Spiritual Mobilization to get “the ministers’ thinking straight,” and Christian Business Men’s Committees spread in a decade that saw the increasing success of anti-Communist preachers like Billy Graham and the growth of fundamentalism.

One reason for the alliance between religion and capitalism in those years is obvious: they were both anti-Communist. But there are other affinities that are, I think, revealing. What they amount to, at bottom, is the common urge to dominate—an authoritarianism common to both religious and business hierarchies. Most religion by its nature tends to be a rather closed-minded affair (rejection of scientific evidence, doubt, skeptical reasoning), attached to tradition—traditional hierarchies like patriarchy, white supremacy, homophobia. The authoritarian and submissive mindset/behavior it encourages in the faithful can be useful to and coopted by business institutions that similarly demand submission and are authoritarian in structure. (Just as Christianity earlier on was coopted by the Roman authorities (after Constantine), and then by medieval authorities, and then by the early modern absolutist state.)

It’s true that in most respects, market fundamentalism and conservative Christianity are very different ideologies. And their fusion in the modern Republican Party can seem odd. The socially conservative and the economically conservative wings of the party, basically anchored in different constituencies, have by no means always been comfortable with each other. (For instance, libertarian attempts to privatize and destroy Social Security and Medicare have been resisted by the socially conservative popular base.) It’s even more ironic because the religious concern for community, family, and tradition is constantly undermined by capitalism, as has been understood at least since the *Communist Manifesto*. But the reactionary business elite needs an electoral base, so it’s stuck with the rednecks it despises, because of the interests they have in common. And the “rednecks,” or the social conservatives—but we should keep in mind that plenty of people in the business world are themselves socially conservative and religious—end up allying with business for the same reason. For both groups are *opposed to democracy and equality*. They want the federal government to *stay out of their business*, for the federal government has historically done a lot more than state governments to empower the oppressed and undermine

¹ Think of the famous Powell Memorandum in 1971: absolute panic at the fact that business didn’t completely control the country—there was some dissent among the young and a minority of intellectuals—and fervid determination to (re)impose ideological uniformity on the population...for the sake of the “free” enterprise system.

reactionary hierarchies. Whether it's white supremacy, conservative Christian values, or the business desire to avoid taxes and regulation, the federal government has frequently been the enemy—as during the era of the Civil Rights Movement and the liberal Warren Supreme Court. “Small government!” can become the rallying cry for authoritarians if government starts to challenge authoritarianism.¹

Thus you get the seemingly incongruous but immensely revealing cooperation, starting in the 1950s and continuing today, between white supremacists and “libertarians.” Who thereby show their true colors. Nancy MacLean's *Democracy in Chains* is illuminating on this point. Her book describes the career of the influential Nobel laureate economist James M. Buchanan, one of the founders of public choice theory, which is devoted to the impeccably capitalist goal of exposing and explaining the systematic failures of government. MacLean argues that John C. Calhoun, the great nineteenth-century ideologue of slavery, states' rights, limited government, and “nullification” (the idea that states can refuse to follow federal laws they consider unconstitutional), is an important inspiration for right-wing libertarianism.

Both Buchanan and Calhoun...were concerned with the “failure of democracy to protect liberty.” In particular, Buchanan and Calhoun both alleged a kind of class conflict between “tax producers and tax consumers.” Both depicted politics as a realm of exploitation and coercion, but the economy as a realm of free exchange... Both thinkers sought ways to restrict what voters could achieve together in a democracy to what the wealthiest among them would agree to.

Murray Rothbard, among other libertarians, spoke openly of the movement's debt to Calhoun. “Calhoun was quite right,” he said, “in focusing on taxes and fiscal policy as the keystone” of democracy's threat to so-called economic liberty, or property rights. Property rights trump every other consideration, including the right of the majority to vote and determine policy. This is why Buchanan worked with Pinochet's government in Chile to write a radically undemocratic constitution, and why he worked with Charles Koch and others to find ways to limit democracy in the (already very undemocratic) U.S., and why, in general, prominent libertarians have been quite open about their distaste for democracy. The famous economist George Stigler, for example, once told a meeting of the Mont Pelerin Society that “one possible route” for achieving the desired libertarian future was “the restriction of the franchise to property owners, educated classes, employed persons, or some such group.”

The young libertarian movement was energized by the Supreme Court's *Brown v. Board of Education* decision in 1954. Why? Not because they supported it (as *genuine* libertarians, people who authentically value human freedom and dignity, would have), but because, like segregationists, they found it an appalling instance of federal overreach. William F. Buckley and his magazine *National Review* (funded largely by Roger Milliken, a reactionary textile manufacturer)—not totally “libertarian” but very much in that camp²—published articles denouncing the Supreme Court's “tyranny.” Others were excited by the prospect that the South's resistance offered to end public education itself. Buchanan, at the University of Virginia, wrote a proposal to sell off all public schools and substitute for them a system of tax-funded private schools that would admit or reject students as they saw fit. His plan never came to fruition, but in the following years, as the Civil Rights Movement gained steam, libertarians—such as Barry Goldwater—could always be found on the side of “states' rights.” After all, the Civil Rights Act *did* interfere with property rights, by dictating to businesses what their policies had to be!

¹ Notice, however, that reactionaries love big government as long as it supports their agenda. Fundamentalists and anti-abortion types want to use government to impose their values on the country—showing how little they value “freedom”—and big business certainly has no problem with corporate welfare or the national security state.

² The *National Review* is always mentioned in histories of the New Right. As Phillips-Fein says, it is “rightly known for pioneering what the historian George Nash has described as the ‘fusion’ of conservative ideas, joining the Hayekian faith in the market and critique of the New Deal to the larger moral and political concerns” of conservatives who lamented the decline of religion.

Goldwater's campaign for the presidency in 1964 was a precocious moment for the young conservative movement, and his landslide loss to Lyndon Johnson showed the country wasn't ready yet for the mainstreaming of far-right politics. Still, all the organizing during the 1950s, from the John Birch Society to the American Enterprise Association (which became the now-well-known American Enterprise Institute), had clearly made an impact. Goldwater's bestselling book *The Conscience of a Conservative* helped his cause, as did Milton Friedman's *Capitalism and Freedom*. Financial support for his campaign came from conservative businessmen across the country, not only big names like the du Pont family and Walt Disney but also countless small businesses (which are often more conservative than larger ones). The Republican establishment, on the other hand, was hardly fond of Goldwater: Nelson Rockefeller, for example, issued a press release that said, "The extremism of the Communists, of the Ku Klux Klan, and of the John Birch Society—like that of most terrorists—has always been claimed by such groups to be in the defense of liberty."

To try to get white working-class support, the Goldwater campaign pioneered a strategy that Republicans have used to great effect ever since: capitalize on racial and cultural fears. As one official wrote in a memo, Goldwater should "utilize (and build) fully the one key issue which is working for us—the moral crisis (law and order vs. crime and violence)." Instead of talking about the usual libertarian themes of unions, Social Security, the welfare state, and taxes, he should focus on "crime, violence, riots, juvenile delinquency, the breakdown of law and order, immorality and corruption in high places, the lack of moral leadership in general, narcotics, pornography." Phillips-Fein comments: "The issues of race and culture, White [the author of the campaign memo] believed, could easily be joined to the politics of the free market. The welfare state, after all, was the product of just the same unrestrained collective yearnings that produced moral chaos." Exactly. This, then, is another point of contact between free-market ideologues and social conservatives. Both groups want "law and order" and nothing more. (No equality—and no freedom for "undesirables"—only authoritarian hierarchies, whether of class, race, gender, sexuality, or whatever).

As for Buchanan, in the late 1960s, as he was teaching at UCLA at the peak of the New Left, he found himself decidedly unsympathetic to the student protests. To quote MacLean: "Despite 'my long-held libertarian principles,' he said, looking back, 'I came down squarely on the "law-and-order" side' of things. He heaped praise upon one administrator who showed the 'simple courage' to smash the student rebellion on his campus with violent police action."—What a surprise. A "libertarian" who cheers violent police actions. (Buchanan also supported the Vietnam War, except that he thought it should have been fought more aggressively.)

Meanwhile, he co-wrote a book called *Academia in Anarchy* that used public choice theory to explain—abstractly, as usual, with no empirical substantiation—why campuses were in an uproar. It had to do, e.g., with students' lack of respect for the university setting because tuition was free or nearly so. Faculty tenure, too, was "one of the root causes of the chaos" because job security meant professors had no incentive to stand up to radical students. The solution was that students should pay full-cost prices, taxpayers and donors should monitor their investments "as other stockholders do," and "weak control" by governing boards must end. Such measures would facilitate social control. "In essence," MacLean comments, he and his co-author were arguing that "if you stop making college free and charge a hefty tuition...you ensure that students will have a strong economic incentive to focus on their studies and nothing else—certainly not on trying to alter the university or the wider society. But the authors were also arguing for something else: educating far fewer Americans, particularly lower-income Americans who could not afford full-cost tuition." As we now know, the ruling class eventually adopted Buchanan's agenda.

The tumult of the late '60s and early '70s, combined with inflation, recession, and intensifying international competition, is what finally shocked big business into taking action, much broader action than before. The Powell Memorandum, written for the Chamber of Commerce, is symbolic of this panic. Neoconservatives like Irving Kristol argued that, in order to be effective in the sphere of propaganda, businessmen should stop defending only such grubby, uninspiring things as selfishness and the pursuit of money and instead elevate more transcendent things like the family and the church, institutions that (to quote Phillips-Fein) "could preserve moral and social values and had the emotional weight to command true allegiance." (These neoconservatives also became militant advocates of American imperialism under

the slogans of fighting Communism, spreading freedom and democracy, etc.) Nonprofits like the American Enterprise Institute began to get a much more receptive hearing when they pressed businessmen to fund a free-market ideological counteroffensive. The Olin Foundation, among others, disbursed millions of dollars to a variety of conservative think tanks, such as the new Manhattan Institute. The Coors family were the main financers of the Heritage Foundation, created by Paul Weyrich (a conservative young congressional staffer) in 1973, which would take a more pugilistic and *culturally* conservative stance than the AEI. For instance, it attacked “secular humanism” and defended the “Judeo-Christian moral order” at the same time as it was attacking big government, unions, and the minimum wage.

Incidentally, if this fusion of cultural conservatism and defense of capitalism reminds you of European fascists in the 1920s and 1930s, it’s because reactionaries always use the same ideological bag of tricks. Fascists and Nazis defended capitalism and even, sometimes, “Christianity” while attacking “decadent” bourgeois culture, democracy, effete intellectuals, socialists and Marxists, ethnic minorities (not Blacks, as in the case of American conservatives, but Jews and others), economic parasites—think of Buchanan’s attacks on welfare “parasites.” Most of these American conservatives would have been Nazis had they been German in the 1930s.¹

Corporate Political Action Committees sprang up everywhere. Phillips-Fein:

In 1970 most Fortune 500 companies did not have public affairs offices; ten years later 80 percent did. In 1971 only 175 companies had registered lobbyists, but by the decade’s end 650 did, while by 1978 nearly 2,000 corporate trade associations had lobbyists in Washington, D.C. Thanks in part to...the educational seminars sponsored by the Chamber of Commerce and other business organizations, the number of corporate PACs grew from 89 in 1974...to 821 in 1978. They became an increasingly important source of funding for political campaigns, while the number of union PACs stalled at 250.

Meanwhile, the Business Roundtable “was founded on the idea that celebrity executives could become a disciplined phalanx defending the interests of business as a class.” Its membership was open only to the CEOs of Fortune 500 companies. As its executive director said, “Senators say they won’t talk to Washington reps [e.g., lobbyists], but they will see a chairman.” The Roundtable took a less blatantly reactionary (anti-union, etc.) approach to lobbying than many other business organizations.

The Chamber of Commerce was less genteel: it changed its character in the 1970s, becoming much more activist and politicized than it had been. It “believed in mobilizing the masses of the business world—any company, no matter how large or small, could join the organization. The Chamber rejected the Roundtable’s tendency to seek out politicians from the Democratic Party and try to make common ground. It backed the Kemp-Roth tax cuts [based on the new and controversial supply-side economics of Arthur Laffer] long before most other groups...” By 1981 the group had almost 3,000 Congressional Action Committees; at the same time, it was sponsoring all kinds of projects to indoctrinate students and the general public with conservative points of view on capitalism and such issues as civil rights, gay rights, feminism, and school prayer.

The right-wing counteroffensive was so vast it can scarcely be comprehended. New anti-union consulting companies were founded, and employers became more vicious toward unions. Legions of small businessmen, fed up with the costs of complying with the Occupational Safety and Health Administration’s rules, joined the veritable movement to “Stop OSHA” that was coordinated by the American Conservative Union. Colossal efforts were directed, too, at reshaping the nation’s courts so that, as one crusader said, “the protection and enhancement of corporate profits and private wealth [would be] the cornerstones of our

¹ There are obvious differences between Nazis’ statism and right-wing libertarianism, but in power the Nazis were highly supportive of business and profoundly hostile to unions. Since modern conservatives attack unions and social welfare far more than corporate welfare and the national security state (neoconservatives, of course, actively adore the latter), it’s pretty clear that in practice they’re not opposed to business-friendly statism. They would have been very happy with fascists—and at the time, their counterparts were.

legal system.” Entities like the Liberty Fund, the Earhart Foundation, and many businesses funded Henry Manne’s “law and economics” programs to train lawyers in corporation-friendly interpretations of the law. (By 1990, more than 40 percent of federal judges had participated in Manne’s program at George Mason University.) A few years later, in 1982, the Federalist Society was founded—“federalist” because the idea is to return power to the states, as good white supremacists and libertarians (business supremacists) would want. Within several decades it had completely transformed the nation’s judiciary.

The 1970s was also the decade when “the upsurge of religious fervor that has sometimes been called the Third Great Awakening began to sweep the country” (Phillips-Fein), “shifting the balance of the country’s Christian population toward evangelical and fundamentalist churches and away from the old mainline denominations.” Jerry Falwell, Pat Robertson, and other evangelical leaders preached not only the predictable homophobic, anti-pornography, anti-abortion stuff, but also libertarian ideology—anti-unions, anti-government-bureaucrats, anti-welfare-state stuff. As Falwell said when founding Moral Majority in 1979, part of its job would be “lobbying intensively in Congress to defeat left-wing, social-welfare bills that will further erode our precious freedoms.” (*Roe v. Wade*, of course, had helped inflame social conservatives’ hostility to the federal government, providing another reason for the affinity with economic conservatives.) Needless to say, the politicization of evangelicals has had some rather significant consequences on the nation’s politics.

And then, as if all this weren’t enough, there was...Charles Koch. Whom MacLean focuses on, together with Buchanan. He’s become even more influential in the last couple of decades—though MacLean surely exaggerates when she says, “He is the sole reason why [the ultra-capitalist right] may yet alter the trajectory of the United States in ways that would be profoundly disturbing even to the somewhat undemocratic James Madison”—but he was already playing a very long game in the 1960s. The son of a cofounder of the John Birch Society, he’s a true ideologue, a fanatical believer in “economic liberty” and Social Darwinism, fiercely opposed to government largesse dispensed to anyone, apparently including (at least in his early idealistic years) corporations.¹ From the early days to the present, one of his favored institutions to help carry out the revolution has been the ironically named Institute for Humane Studies, successor to the Volker Fund in the mid-1960s. But in the late 1970s he founded, with the assistance of the even more fanatical Murray Rothbard, the Cato Institute, to train a disciplined “Leninist” cadre that, unlike most conservatives, would never compromise, never forsake its anti-government principles in any area of policy. (Rothbard supplied the Leninism.) Abolish the welfare state and all government regulations! Abolish the postal service and public education! Legalize drugs, prostitution, and all consensual sex! Slash taxes across the board! End American military intervention in other countries! Much of this was a bit shocking to mainstream conservatives, but Koch wouldn’t stray from his divine mission.

With a permanent staff and a stable of rotating scholar visitors, Cato could generate nonstop propaganda... Buchanan played a crucial role in such propaganda, for Cato’s arguments generally followed analyses provided by his team. Koch, meanwhile, provided new resources as the cadre brought in recruits with ideas for new ways to advance the cause. They would then be indoctrinated in the core ideas to assure their radical rigor, all of this held together with the gravy train opportunities Koch’s money made available as they pushed their case into the media and public life...

Koch (and his brother David, who was less political) also supported the Reason Foundation (which still publishes the magazine *Reason*), a think tank that soon became “the nation’s premier voice for privatization, not only of public education...but also for every conceivable public service, from sanitation to toll roads.” And in 1984—to give just one more example of many—the Kochs founded Citizens for a Sound Economy, chaired by Ron Paul, to rally voters behind their agenda.

¹ Koch Industries benefits from an array of federal subsidies, but Koch insists (somewhat comically) that he wishes this whole regime of corporate welfare didn’t exist.

The conservative mobilization of the 1970s, combined with the country's economic woes and liberals' feckless policies, got Reagan elected—a pretty impressive achievement when the electorate had overwhelmingly rejected his views just sixteen years earlier, in the form of Barry Goldwater's campaign. But many libertarians were unhappy with his presidency, since he did so little to shrink government. (He did cut taxes, social spending, and regulations, but overall the government continued to expand and, very disappointingly, the welfare state wasn't destroyed.)

The Cato Institute's top priority became the privatization of Social Security. Buchanan helped supply a strategy to achieve this wildly unpopular goal. It would be political suicide to just come out and state it openly; instead, devious measures were necessary. First, a campaign of disinformation would have to convince the electorate that Social Security wasn't financially viable in the long term and had to be reformed. (You may remember this intensive propaganda campaign from the George W. Bush years.) Step two was to “divide and conquer” (in the words of MacLean): reassure those who were already receiving benefits or would soon receive them that they wouldn't be affected by the reforms. This would get them out of the fight to preserve the existing system. Meanwhile, foster resentment among younger workers by constantly reminding them their payroll deductions were providing a “tremendous welfare subsidy” to the aged. And foster resentment among the wealthy, and thus their opposition to Social Security, by proposing that they be taxed at higher rates than others to get their benefits. Etc. Eventually, popular resistance to “reform” would begin to break down. The financial sector could be enlisted in the fight too because of the windfall of money it would get by Social Security's privatization.

As always, the ultimate goal was to eliminate all “collectivism,” all collective action and solidarity, which really means to get people to stop caring for each other. The world should consist of private atoms, because that means “freedom”—but more importantly because that means the elimination of resistance to capitalist power. (Ideologues may convince themselves that they're wonderfully idealistic, but from a Marxian point of view they're only useful idiots serving the objective interests or dynamics of capitalism to expand everywhere. As I wrote in [a brief critique](#) of Corey Robin's *The Reactionary Mind*, power-structures basically ventriloquize certain highly indoctrinated people, animating them to speak for them and rationalize them.) It reminds me of Hannah Arendt's analysis of totalitarianism, according to which the ideal is that everyone is an atom. To shamelessly [quote myself](#):

As someone once said, the closest we've ever come to a society of pure selfishness and individualism was Auschwitz, which was the culmination of a kind of totalitarian collectivism. The ironic parallels between Nazi (and Soviet) collectivism and Randian or Rothbardian individualism are significant: they're due to the profound atomization that each entails. In the latter, the individual is to treat everyone as a means to his end; in the former, the individual is to treat everyone as a means to the *state's* (or the movement's) ends. In both cases, no human connections are allowed, no treating the other as a being with his own value and his own claims on one's respect. Hate, mistrust, and misery are the inevitable consequences of both these dystopian visions.

Cf. Pinochet's regime, beloved by Hayek and Buchanan.

Anyway, the Cato Institute was hardly the only conservative institution fighting to privatize Social Security, but the war was never won. Democracy and “collectivism” proved too resilient. Unexpected outcome! In the 1990s, the Kochs and other funders, Buchanan, Congressman Dick Armey, Newt Gingrich, and the whole 1994 crop of Republicans at the vanguard of the “free market revolution” struggled mightily to shackle democracy by passing a balanced budget amendment to the Constitution (along with cutting Medicare, “reforming” welfare, and so on), but again, alas, they failed.

Buchanan was particularly incensed by the National Voter Registration Act of 1993 (the so-called Motor Voter Act). “We are increasingly enfranchising the illiterate,” he growled, “moving rapidly toward electoral reform that will not expect voters to be able to read or follow instructions.” It bears noting, by the way, that it's really superfluous to argue that market fundamentalists hate democracy, because it hardly requires great insight to see that the accumulation of wealth by a minority is itself totally inimical to

democracy. And such wealth accumulation is not only an inevitable product of “unfettered” markets but openly celebrated by businessmen and ideologues.

In the meantime, George Mason University, conveniently located right next to Washington, D.C., had become a center of the “Kochtopus,” as people took to calling the vast network of institutions the brothers funded. It was the home, for example, of the Institute for Humane Studies, the James Buchanan Center, Henry Manne’s Law and Economics Center, and the important Mercatus Center. Buchanan himself, who had provided so many useful ideas and academic legitimacy, was effectively pushed out of the movement as Charles and his loyal lieutenants (Richard Fink, Tyler Cowen, and others) took control at the university. And now, at last, the long march of the zealots was about to come to fruition.

The last chapter of *Democracy in Chains* is chilling. In the words of the economist Tyler Cowen, the reality that is being fashioned for us will see “a rewriting of the social contract” according to which people will be “expected to fend for themselves much more than they do now.” From public health and basic sanitation to the conditions that workers toil in, the goal is to dismantle government, which is to say democracy. As the most extreme market fundamentalists have preached for centuries, only the police and military functions of government, the authoritarian functions, are legitimate. (Adam Smith, by the way, did *not* advocate this position.)

As hard as it may be to believe, one individual—Charles Koch—really is behind a large part of the destruction that conservatives have wrought in the twenty-first century. He substantially funds Americans for Prosperity, the American Legislative Exchange Council, the State Policy Network, the Mackinac Center in Michigan (worth mentioning only because its lobbying played a significant role in Flint’s water crisis), and, in fact, uncountable numbers of institutions from university programs to legal centers. His loyalists control the Stand Together Chamber of Commerce, a massive conservative fundraising machine, and American Encore, a secretive but powerful nonprofit that funnels money to right-wing causes and advocacy groups. He owns i360, a cutting-edge data analytics company that has precise personal information on over 250 million American adults. It’s so sophisticated it has eclipsed the Republican Party’s voter files, such that the party has had to buy access to it to more effectively bombard voters with personalized messages.

(See this Intercept article by Lee Fang on how Tennessee Rep. Marsha Blackburn used i360 to help “inundate voters with anti-immigrant messages” in her victorious 2018 Senate run. The technology shaped “3 million voter contact calls, 1.5 million doors knocked, \$8.4 million spent on television ads, and 314,000 campaign text messages,” all of which gave her a commanding lead over her Democratic opponent.)

In 2016, the “Koch network” of hundreds of wealthy right-wing donors he heavily influences spent almost \$900 million on political campaigns, which in effect made it a third major political party—and little of that money was for the presidential election, since neither Clinton nor Trump interested the man at the center. Even officials with the Republican National Committee have grown uncomfortable with the power of Koch and his allies: journalist Jane Mayer reports one of them plaintively saying, “It’s pretty clear that they don’t want to work with the party but want to supplant it.”

Ever since the brilliant journalism of Mayer and others brought the Koch underworld out into the open more than ten years ago, much of the politically conscious public has become vaguely aware of the role of this network in funding and coordinating attacks on everything from climate action to unions to public education. But to get a real sense of the radical evil and effectiveness of this “vast right-wing conspiracy,” it’s necessary to read Mayer’s *Dark Money: The Hidden History of the Billionaires Behind the Rise of the Radical Right*.

For example, the hysteria in wealthy right-wing circles after Obama’s election precipitated nearly instant mobilizations to create the Tea Party. Citizens for a Sound Economy had tried to create an anti-tax “Tea Party” movement as early as 1991, but these attempts had led nowhere. In 2004 CSE split up into the Kochs’ Americans for Prosperity on the one hand and FreedomWorks on the other, the latter headed by Dick Armey and funded by, e.g., the Bradley Foundation, the Sarah Scaife Foundation, Philip Morris, and the American Petroleum Institute. In early 2009, operatives from these two groups and a couple of others formed what they called the Nationwide Tea Party Coalition to organize protests across the country, using talking points, press releases, and logistical support provided in part by the Heritage Foundation and the Cato Institute. To help get the word out, FreedomWorks made a deal with the Fox News host Glenn Beck:

for an annual payment of \$1 million, he would read on air content that the think tank's staff had written. Pretty soon, the increasingly frequent anti-government rallies were filled with racist slogans ("Obama Bin Lyin'") and racist depictions of Obama—showing, once again, the deep affinity between pro-capitalist ideologies and racism. It's hard to argue with the Obama aide (Bill Burton) who opined, "you can't understand Obama's relationship with the right wing without taking into account his race... They treated him in a way they never would have if he'd been white."

From these noble beginnings, the Koch network stepped up its funding for and organizing of ever more vicious attacks on Obama's agenda, such as cap-and-trade legislation and even the conservative-centrist Affordable Care Act. With the help of the Supreme Court's *Citizens United* decision in 2010, they met with extraordinary, though not complete, success. And this was in addition to the highly successful efforts to take over state governments. In North Carolina, for instance, Americans for Prosperity (significantly aided by the John William Pope Foundation and other funders, as well as an array of private think tanks) played a large role in the Republican takeover of the state's government and passage of such measures as slashing taxes on corporations and the wealthy while cutting services for the poor and middle class, gutting environmental programs, limiting women's access to abortion, banning gay marriage, legalizing concealed guns in bars and school campuses, eviscerating public education, erecting barriers to voting, and gerrymandering legislative districts for partisan gain. State after state succumbed to such agendas. Just between 2010 and 2012, ALEC-backed legislators in 41 states introduced more than 180 bills to restrict who could vote and how.

Thus, a reactionary political infrastructure generations in the making has finally matured, even as its goal of completely shredding the social compact and leaving everyone to fend for themselves remains far in the future (in fact unrealizable). Economic and cultural polarization, consciously planned and financed since the 1950s, has reached untenable extremes. Daily newspaper articles relate the sordid story of Republican state legislatures' ongoing efforts to decimate the right to vote, as, meanwhile, Koch and his army of allies and operatives frantically work to defeat Democrats' For the People Act (described by the *New York Times* as "the most substantial expansion of voting rights in a half-century"). "The left is not stupid, they're evil," Grover Norquist intones on a conference call with Koch operatives and other conservatives. "They know what they're doing. They have correctly decided that this [voting rights act] is the way to defeat the freedom movement." The class struggle, in short, rages on, with the stakes growing ever higher.

A Marxian, "dialectical" perspective offers hope, however. Being nothing but capitalism's useful idiots, the vast horde of reactionaries whose handiwork I've surveyed is unable to see that history is cyclical. The business triumphalism of the 1920s led straight into the Great Depression, which led to left-populism and the welfare state, which led to the corporate backlash of the 1950s, which helped cause the Civil Rights Movement and the New Left, which bred the hyper-capitalist counterassault of the 1970s–2010s, which is now bringing forth a new generation of social movements. These are still in their infancy, but already they have been able to push even the execrable Joe Biden to mildly progressive positions (though not on foreign policy). To paraphrase Marx, what the radical right produces, above all—in the long term—are its own gravediggers. For Karl Polanyi was right that before society can ever be destroyed by thoroughgoing marketization and privatization, it will always bounce back and "protect itself" (in his words). At long last, we're starting to see the glimmers of this self-protection.

As for libertarianism—yes, in an *authentic* form, a philosophy of freedom must guide us. As Howard Zinn said, Marxism provides the theory and anarchism provides the moral vision. But in order to realize freedom, what we need is the exact opposite of the tyrannical Hayekian model of society. We need an expansive *public* sector, a society of communal and public spaces everywhere, cooperatives and democratic institutions of every variety—libraries and schools and parks and playgrounds in every neighborhood, public transportation and housing and hospitals, free higher education and healthcare, the transformation of corporations into worker cooperatives or democratically run government institutions (whether municipal or regional or national or international). Even in the neoliberal United States, society has (barely) functioned only through hidden economic planning—and corporations embody sprawling planned economies—and without constant local planning, urban planning, scientific planning, political and

industrial planning, everything would collapse. “The market” is nothing but a concept useful to bludgeon popular strivings for dignity and democracy. Its ideologues are the enemies of humanity.

What does it mean to be free? A robust freedom isn’t centered around the property one owns; it’s centered around the individual himself. Every individual should have the right to freely and creatively develop himself as he likes, provided he respects the same right in others. To respect others means to take on certain responsibilities to society—which is already a “collectivist” notion, in a sense. To respect others means to acknowledge their humanity, to treat them as you would like to be treated, to do no harm and in fact to do good—to cooperate, to work to advance and protect a society that allows everyone to live a decent life. Rights are bound up with responsibilities. And substantive, “positive” freedom isn’t possible in an environment of significant material deprivation, especially when others have incomparably greater resources and will use them to consolidate power (further limiting the freedom of the less fortunate). So, to permit the flourishing of freedom and thereby respect others’ rights, we all have a responsibility to advocate and work towards a relatively egalitarian, economically democratic, socialist world.

Reverence for “property” (a concept defined by the state and subject to political negotiation) has little or nothing to do with protecting individual liberty. It isn’t impossible to imagine a world in which private property is marginal, the means of production, the land, perhaps even housing being held in common and managed through procedures of direct or representative democracy. That such a world would end up violating people’s freedoms on a scale remotely comparable to that at which our own world does is far from clear, to say the least.

Nor does the radical right’s objection to “discriminatory” taxes on the wealthy make sense. As Peter Kropotkin lucidly argued in his classic *The Conquest of Bread*, we all benefit from the collective labor of millennia, and of the present. “Millions of human beings have labored to create this civilization on which we pride ourselves today,” he wrote. “Other millions, scattered throughout the globe, labor to maintain it... There is not even a thought, or an invention, which is not common property, born of the past and the present.” Why should a few individuals capture exponentially greater gains from all this labor than everyone else? And if they do capture such gains, why shouldn’t they be compelled to give back more than others to the society that permits them such extraordinary privilege? Right-wing objections are the more absurd in that economists such as Mariana Mazzucato (in *The Entrepreneurial State*) have shown it is overwhelmingly the taxpayer, not the wealthy investor, who drives innovation forward and has therefore, through the mechanism of government funding and coordinating of research and infrastructural development, built the prosperity of our civilization. Capitalist parasites on taxpayers and the collective labor of billions deserve to be driven out of existence through confiscatory taxation—which would give government more resources to invest in *publicly* beneficial research and development.

“Libertarian” arguments are bankrupt, but that hasn’t prevented the movement from doing incalculable harm worldwide since the 1970s. We can only hope that popular movements defeat it before its environmental consequences, in particular, doom us all.

*

Coda. Excerpt from The Great Transformation (p. 76):

...To allow the market mechanism to be sole director of the fate of human beings and their natural environment... would result in the demolition of society. For the alleged commodity “labor power” [which Polanyi argues is a *fictitious* commodity, like land, nature, and money—not real commodities in the way goods are] cannot be shoved about, used indiscriminately, or even left unused, without affecting also the human individual who happens to be the bearer of this peculiar commodity. In disposing of a man’s labor power the system would, incidentally, dispose of the physical, psychological, and moral entity “man” attached to that tag. Robbed of the protective covering of cultural institutions, human beings would perish from the effects of social exposure; they would die as the victims of acute social dislocation through vice, perversion, crime, and starvation. Nature

would be reduced to its elements, neighborhoods and landscapes defiled, rivers polluted, military safety jeopardized, the power to produce food and raw materials destroyed. Finally, the market administration of purchasing power would periodically liquidate business enterprise, for shortages and surfeits of money would prove as disastrous to business as floods and droughts in primitive society. Undoubtedly, labor, land, and money markets *are* essential to a market economy. But no society could stand the effects of such a system of crude fictions even for the shortest stretch of time unless its human and natural substance as well as its business organization was protected against the ravages of this satanic mill...

Few more horrifying visions of society have ever been put forward than the market fundamentalist vision. If you're curious why the world is in such bad shape as it is, you need look no further.

Revolution in East Harlem: A Review of "The Young Lords: A Radical History"

Johanna Fernández's *The Young Lords: A Radical History* could hardly have been published at a more auspicious time. The fateful year 2020 saw not only the outbreak of a global pandemic but also, in the U.S., a rejuvenation of Black Lives Matter and renewed national attention to issues of racial and economic justice. The pandemic and its economic consequences have further skewed a lopsided distribution of income, with U.S. billionaires gaining over a trillion dollars in the last nine months of 2020 even as millions of people were thrown out of work and wages continued to stagnate. Popular resistance, in part inspired by Bernie Sanders' two presidential campaigns, seems to be gaining momentum, as the nation continues its headlong rush into an era of tumult likely reminiscent of both the 1930s and the 1960s-70s. The memory of the Young Lords resonates in our time of troubles.

Others have written about the Young Lords, including members Iris Morales (*Through the Eyes of Rebel Women: The Young Lords 1969–1976*) and Miguel Meléndez (*We Took the Streets: Fighting for Latino Rights with the Young Lords*), but Fernández's work, which focuses on the New York organization, is an exhaustive study grounded in archival research and extensive interviews with surviving Lords. It covers every aspect of the group's history, not least the social and political context that was able to radicalize so many young people of color from Chicago (where the group began) to New York (where it was strongest) to smaller cities around the country. Not only scholars and students but also activists would benefit from reading this book, for, aside from the fascinating history itself, one can glean lessons on how to organize from the failures and successes of the Young Lords. Indeed, Fernández concludes the book by drawing a helpful list of such lessons.

The Young Lords is, in short, the definitive history of "one of the most creative and productive expressions of the New Left" (p. 7), a group that, for its brief existence of several years, was a highly effective heir to the Black Power movement. It may have failed in its goal of sparking revolution among poor communities of color in the U.S. and in Puerto Rico, but its ambitious and militant campaigns won significant reforms that helped push New York's postwar liberalism to its outer limits before colliding with the conservative backlash of the late 1970s and subsequent decades.

The group's humble beginnings hardly foretold such future success. The Young Lords started out as a small Puerto Rican gang in Chicago in the early 1960s, no more "political" than any other local gang. But by early 1969 it was transforming, under the leadership of José "Cha Cha" Jiménez, into an activist organization addressing urban renewal, police brutality, and welfare rights. Very quickly they made connections with the Chicago Black Panthers, which led them to adopt the Panthers' model of organization and its Ten-Point Program, in addition to such practices as building a free health clinic, starting breakfast and dental programs, publishing a newspaper, and even occupying a church briefly in the summer of 1969. As Fernández says, this bold move to emulate the Panthers "was precisely the example that Puerto Ricans in New York needed to propel them into motion" (p. 48).

The New York group had very different origins than the Chicago group. Its founders were not gang members but young activists and college students, particularly from SUNY Old Westbury. Mickey Melendez, a student there, had in January 1969 formed the Sociedad Albizu Campos (named after the iconic leader of Puerto Rico's struggle for nationhood), a small organization devoted to bringing young Puerto Rican activists together. Members of the SAC traveled to Chicago in the summer of 1969 to meet Cha Cha Jiménez after reading an interview with him in the Black Panthers' newspaper. Inspired by what Jiménez had created in Chicago, they returned to New York and set up a Young Lords affiliate in East Harlem, complete with the same Panthers-influenced structure and even similar regalia of purple berets, black military fatigues, and combat boots. The core members of the group, including Felipe Luciano (chairman), Pablo Guzmán, Juan González, Denise Oliver, David Perez, and several others, had already been radicalized by the racism and segregation they encountered in the New York school system, and in some cases had gained valuable training by subsequent work with the Community Action Programs funded by Lyndon Johnson's War on Poverty. Fernández's discussion of these individual backgrounds serves to situate the Young Lords in the context of New York's explosive protests and riots of the late 1960s.

Once the Young Lords Organization (YLO)—later called the Young Lords Party—was formed in New York, it immediately launched its first campaign: the so-called Garbage Offensive, an attempt to draw public attention to the chronic crisis of poor sanitation and “epic garbage accumulation” in East Harlem (which was by far the most densely populated neighborhood in Manhattan). Conversations with local residents had revealed that they saw this problem, rather than police brutality or the independence of Puerto Rico or some other more “sensational” issue, as the most urgent matter to be dealt with. So in August 1969 the Young Lords organized a series of direct action protests: they and other residents piled huge heaps of garbage (in some cases setting them on fire) at busy intersections to block traffic, even overturning cars and casting old refrigerators and other large items into the heaps. Very soon they captured the attention of the city's elite press and political power-players, who realized they could no longer ignore the festering sore of inadequate sanitation in the city. At length, extensive reforms were introduced that did much to alleviate the crisis and make conditions in the city's poorer and darker neighborhoods more livable than before.

Fernández's account of the Garbage Offensive sets the pattern for her discussion of all the other campaigns the YLO embarked on in the following years. Rather than simply giving a factual narrative of what happened, she weaves into her analysis a discussion of the Young Lords' ideological self-understandings, as formed against the backdrop of the tumultuous global politics of that era. For instance, in accord with the group's Maoism (and Leninism), the very name “Garbage Offensive” recalled the Tet Offensive of 1968. The young activists saw themselves as applying to the urban context the tactics of guerrilla warfare, such as “flexibility, mobility, surprise and escape” (e.g., by discarding their uniforms and blending into the crowd as soon as police showed up). They were at war, fighting for the national liberation of an internally and externally colonized people—in fact for the liberation of Blacks, Asians, and Native Americans as well. But their war would not be fought through armed struggle; it was fought through community organizing, issue-based campaigns in the neighborhood, and an effort to build a cadre organization that soon attracted hundreds of young people as volunteers, members, and staff (for the Young Lords rented out an office where they printed a newspaper and other material, manned the phones, planned press conferences, etc.).

A whirlwind of activity ensued, for years, after the Garbage Offensive. The Young Lords were quick to join the welfare rights movement, for instance offering security at civil disobedience actions. Together with the Black Panthers, they collected clothing and distributed it to poor welfare mothers, in addition to establishing a free daily children's breakfast program. Regular political education classes, where classic revolutionary texts (by Mao, Lenin, Ho Chi Minh, Frantz Fanon, Fidel Castro, Che Guevara, and others) were read and discussed, “raised the consciousness” of members and residents. In the fall of 1969 the YLO got heavily involved in campaigns to reform the community's health infrastructure, from protesting impending cuts to staff and health services at Metropolitan Hospital to writing and publicizing (with the assistance of doctors) a Ten-Point Health Program that envisioned such radical changes as a publicly funded healthcare system, direct democratic governance of Metropolitan by staff and residents, and “the creation of small, neighborhood-based clinics” that would facilitate “a comprehensive, ‘door-to-

door' project of medical care and social services that prioritized care for drug users, prenatal care, childcare, and care for the elderly" (p. 142). These proposals were inspired by the Cuban Revolution's mass expansion and democratization of healthcare delivery.

Out of this campaign emerged the Young Lords' "most enduring legacy," the militancy they brought to "a preexisting campaign against childhood lead poisoning that pressured city hall to take action on a silent public health crisis" (p. 135). Fernández notes that in the 1960s, 43,000 old housing tenements that had been deemed "unfit for human habitation" in 1901 continued to house Black, Puerto Rican, and Chinese tenants, whose children were consequently at grave risk of lead contamination. Various groups had brought attention to the issue, but it was the Young Lords' Lead Offensive in late 1969 that finally catalyzed change. They were able to secure 200 lead-testing kits, after which they conducted door-to-door screenings that revealed high rates of contamination. With the help of media publicity, the city government was thus shamed into action. Almost immediately, the Department of Health created the Bureau of Lead Poisoning Control, as well as launching the Emergency Repair Program to remove lead paint from tenement walls. In a campaign reminiscent of the Young Lords' community-based healthcare plan, the city even sent teams of doctors into neighborhoods to test for illnesses and give sickle cell, rubella, and measles immunizations.

Within a few months, in short, the Young Lords had made a name for themselves in New York City. They were about to gain much more notoriety, however. While searching for a new location for their children's breakfast program in the fall of 1969, they came across the First Spanish United Methodist Church. Since its facilities were unused every day of the week except Sunday, it seemed like an ideal candidate to host the program. Unfortunately, the Cuban pastor and the church board adamantly disagreed, and for weeks continued to reject the Young Lords' arguments that they only wanted to help the church fulfill its Christian calling of serving the poor. At last, after an attempt one Sunday to publicly appeal to the congregation resulted in a "police riot" *within the church*—"nightsticks flying all over the place," as one witness recalled, "blood all over the church" (p. 166)—the young activists decided they had no other recourse but to stage an occupation. So on a Sunday late in December they occupied the building, nailing shut all the doors but one and announcing they would leave only after they were granted space for a "liberation school," a daycare center, and the free breakfast program that had originally provoked the conflict.

Fernández's discussion, as usual, brilliantly contextualizes the YLO's Church Offensive, setting it against the backdrop of liberation theology, the teachings of the philosopher of education Paulo Freire, debates between liberal and leftist Americans over the causes of poverty, and the generational conflict between young Puerto Ricans (who tended to support the Lords' militancy) and their elders (who were more wary, though frequently sympathetic). At press conferences, leaders of the occupation calmly and persuasively explained their goals, in fact so compellingly that clergymen, elected officials, and pop stars were driven to express their support. Inside the church, for ten days the activists worked with professionals and community residents to feed children, provide free medical services, and run a liberation school that featured lessons on U.S. imperialism and Black resistance. In the evenings, things loosened up: the strict discipline of the daytime "surrendered to creative revelry" that was audible from a block away, in which participants would perform Puerto Rican folk music, spoken word poetry, and dance. The People's Church thereby "destabilized traditional conceptions of cultural production and one of its major assumptions: that people of color produce lower forms of art" (p. 183). This was the first public staging of the "Nuyorican" identity that was later institutionalized in sites on the Lower East Side, the Bronx, and elsewhere in the city.

The People's Church could hardly last forever; it was impressive, indeed, that it lasted as long as it did, almost two weeks. The Young Lords' attorneys could at best postpone the inevitable arrests. Eventually the church dropped charges and agreed to activists' demands for a daycare center and a drug rehabilitation clinic—though it never followed through on its promises. At least Governor Nelson Rockefeller, directly influenced by the Young Lords and the Black Panthers, started a breakfast program for 35,000 poor children in the city.

By 1970 the Young Lords were expanding significantly, opening branches in the South Bronx, the Lower East Side, Philadelphia, Boston, and other cities. With this expansion it became necessary to deal with issues around race and, especially, gender. Fernández's nuanced account shows that the latter was

much more problematic than the former. While racial prejudice and conflict was hardly unknown within the Young Lords—for many Puerto Ricans had absorbed dominant racist fears of Black men—the group was effective in promoting an inclusive and solidaristic understanding of race, as shown by the fact that 25 percent of its membership consisted of Black Americans. Non-Puerto Rican Latinos were also welcome, though they constituted a small minority of about 7 percent.

Relations between men and women were more fraught. The YLO was almost entirely led by men, even though by early 1970 approximately 40 percent of its members were female. It wasn't as if the men were oblivious to feminism: in the group's founding political document, Point 10 read "We Want Equality for Women. Machismo Must be Revolutionary...Not Oppressive." The problem, as Fernández notes, is that machismo by its nature entails male dominance. Sexism, both subtle and overt, was rife within the organization, as women frequently adopted female-typical ("background") roles and were inappropriately propositioned or disrespected by men. A women's caucus, inspired by white feminists' consciousness-raising circles, was formed in the spring of 1970 to embolden and empower female members, and it had some success. As one young participant said later, "Getting clarity helped me fight my own tendency to sit in the background and bite my tongue and be ashamed to speak because what do I know, you know, I'm just a woman" (p. 255). The Young Lords looked askance at the mainstream of the women's movement, which they viewed as too middle-class and inattentive to the oppression of Third World women, but it heavily influenced them nonetheless.

A men's caucus was formed later in 1970 to continue the process of "reeducating" members, specifically to teach men—in the words of one of the Young Lords' pamphlets—"to cook, to care for children, to be open to cry and show emotions because these are all good things—needed to build a new society" (p. 263). Point 10 of the Thirteen-Point Program was rewritten to state "Down with Machismo and Male Chauvinism." Around the same time, in May 1970, Denise Oliver was the first woman elected to the Central Committee. Soon thereafter, the organization adopted the policy that sexist behavior would be formally denounced and those engaging in it would be charged, tried, and disciplined. The YLO even published a lucid and sophisticated Position Paper on Women that demonstrated its commitment to the goal of raising women's status and challenging sexism, including the distinct forms of sexism in Puerto Rican culture. The Young Lords, therefore, were unusual in the growing Puerto Rican movement for their sincere attempts to address both anti-Black racism and oppression of women. As leader Iris Morales said years later, "Thinking on it now, the Lords made a real contribution. We kept saying if we're gonna change society, we have to change ourselves. I challenge you to study any of the movement pictures of that time in terms of the other organizations and especially the organizations in Puerto Rico, and you will see a total absence of women and Afro-Puerto Ricans in leadership" (p. 265).

The history of the Young Lords was, if anything, even more dense and eventful during and after 1970 than in the organization's first year. In addition to members' usual daily activities of selling the newspaper, leafleting, attending speaking engagements, assisting residents with advocacy at schools or welfare offices, testing door-to-door for tuberculosis, and so forth, they launched several major campaigns and suffered several tragedies that would contribute to the group's eventual downfall. In the summer of 1970, they began a months-long grassroots organizing effort at Lincoln Hospital in the Bronx to expose the deplorable conditions there, the climactic moment of this campaign being a highly public and effective day-long occupation of the hospital. One of the upshots of this long effort was a Patient Bill of Rights—including such demands as the right to refuse treatment, to know what medicine is being prescribed and what its side effects are, to choose your doctor, to have free daycare centers in hospitals, and to receive free healthcare—that has, in many respects, been replicated by hospitals across the country under the same name. Fernández's chapter on this ambitious campaign is one of the richest and most riveting of the book.

Around the same time there occurred a couple of events that ultimately weakened the Young Lords Party. First, beloved chairman Felipe Luciano was demoted to low-level cadre for having been on "unauthorized leave" for one day. When, as a result, he quit the YLP entirely, the organization lost the person best positioned to lead it through the crises it was about to face. One such crisis happened very soon afterwards: the Lords again occupied the First Spanish United Methodist Church—this time, however, *armed*, a highly provocative move Luciano would have vehemently opposed. The decision to brandish arms

was, at least, understandable: member Julio Roldán had just committed suicide (or, according to his comrades, been murdered) in the Manhattan House of Detention because of his barbarous treatment there. As Fernández relates, in these years young people of color across the city and the country were rising up, often explosively and violently, against epidemic brutality inside and outside prison walls. “We are armed,” stated a YLP flyer, “because we must defend ourselves, and we advise all Puerto Ricans in New York to begin preparing for their defense. The U.S. government is killing us, and now we must defend ourselves or die as a nation” (p. 324).

The problem with the armed church occupation was that it increased government surveillance and repression, frequently conducted under the auspices of the FBI’s COINTELPRO. The occupiers were able to escape immediate legal consequences by surreptitiously sneaking their weapons out of the church before police had had a chance to confiscate them. But in the meantime, they had intensified the state’s hostility.

A more damaging move, however, was the YLP’s decision in early 1971 to shift many of its resources to organizing in Puerto Rico for national independence. In the end, this campaign not only proved largely fruitless—organizers often didn’t even speak Spanish, and they faced fierce repression and logistical challenges—but it also contributed to a climate of demoralization, internal party squabbling, and the loss of several crucial members who disagreed with the focus on Puerto Rico. Mass membership began to decline, the YLP offices in East Harlem and the Lower East Side closed (even as the party newspaper continued publication), and the Central Committee grew more authoritarian and intolerant of dissent. COINTELPRO’s infiltration and disruption heightened trends of paranoia and factionalism, tendencies that in fact were common to groups on the left at this time. Fernández also faults the Young Lords’ ever-strengthening Maoism, including its belief—which motivated, for example, the Puerto Rican misadventure—that “sheer will, dedication, and hard work among small groups rather than classes form the motor force of change” (p. 375), in addition to the Lords’ hypercentralization and disconnection from the grassroots beginning in 1971. The YLP straggled on into 1974 (under a new name: the Puerto Rican Revolutionary Workers’ Organization), but it had drastically shrunk in size and influence.

Such, then, was the ignominious demise of what had once been “a profoundly effective, beloved, and exciting socialist organization that fueled the power of the New Left and made a lasting impression on U.S. consciousness and history” (p. 377). *The Young Lords* does ample justice to this history, not least in its extremely sympathetic and even-handed treatment of the vicissitudes and failures the organization experienced. One might have wished the author had said more about the Young Lords’ history in cities outside New York, but this would have increased the book’s length to a truly mammoth size.

The book’s useful Coda summarizes the Young Lords’ achievements and contributions, from helping bring about the construction of a new building at Lincoln Hospital to “anchor[ing] a renaissance in Puerto Rican art and reclaim[ing] the Afro-Taino roots of their culture” (p. 383). As mentioned earlier, Fernández also summarizes some lessons for organizers: for example, “Bold direct action that stops the normal functioning of municipal life captures the attention of media and the public, shifts the terms of political debate, and broadens the public’s understanding of social problems” (p. 384). The Lords were expert at direct action, and at communicating with the public. Activists today would do well to study their strategies, tactics, and messaging.

The U.S. is now entering an era of turbulence that in many respects parallels the 1960s. Struggles around class inequality, racism, police brutality, prison reform, urban housing, the healthcare industry, and U.S. imperialism promise to become as prominent in the years ahead as they were fifty years ago. *The Young Lords* will help to ensure that memory of that earlier time continues to inform the seemingly endless fight for human dignity.

Eleven Theses on Socialist Revolution

How should we think about “socialist revolution” in the twenty-first century? I put the term in scare-quotes because it can be hard to believe anymore that a socialist, or economically democratic,

civilization is even possible—much less inevitable, as Marx and Engels seem to have believed. Far from being on the verge of achieving something like socialism, humanity appears to be on the verge of consuming itself in the dual conflagrations of environmental collapse and, someday perhaps, nuclear war. The collective task of *survival* seems challenging enough; the task of overcoming capitalist exploitation and instituting a politico-economic regime of cooperation, community, and democracy appears completely hopeless, given the overwhelming crises and bleak horizons of the present.

Some leftists might reply that it is precisely only by achieving socialism that civilization can save itself from multidimensional collapse. This belief may be true, but if so, the prospects for a decent future have not improved, because the timeline for abolishing capitalism and the timeline by which we must “solve” global warming and ecological collapse do not remotely correspond. There is no prospect for a national, international, or global transition to socialism within the next several decades, decades that are pivotal for addressing ecological crises. In the United States, for example, it took Republican reactionaries almost a century of organizing starting in the 1940s to achieve the power they have now, and this was in a political economy in which they already had considerable power. It isn’t very likely that socialists, hardly a powerful group, will be able to overthrow capitalism on a shorter timeline. If anything, the international process of “revolution” will take much longer. Perhaps not as long as the transition from feudalism to capitalism, but certainly over a century.

It can seem, then, naïve and utopian even to consider the prospects for socialism when we’re confronted with the more urgent and immediate task of sheer survival. However guilty capitalism is of imposing on humanity its current predicament, the fact is that we can make progress in addressing the environmental crisis even in the framework of capitalism, for example by accelerating the rollout of renewable and nuclear energy, dismantling the fossil fuel industry, regulating pesticides that are contributing to the decimation of insect populations, experimenting with geoengineering, and so on. These goals—and their corollaries, such as defeating centrist and conservative candidates for political office—should be the most urgent priority of left-wing activists for the foreseeable future. If organized human life comes to an end, nothing else matters much.

Nevertheless, we shouldn’t just forget about socialism for now, because it remains a distant goal, a fundamental value, and organizing for it—e.g., “raising the consciousness” of the working class—can improve lives in the short term as well. So it is incumbent on us to think about how we might achieve the distant goal, what strategies promise to be effective, what has gone wrong in the past, and what revisions to Marxist theory are necessary to make sense of past failures. We shouldn’t remain beholden to old slogans and formulations that were the product of very different circumstances than prevail today; we should be willing to rethink revolution from the ground up, so to speak.

I have addressed these matters in a book called *Worker Cooperatives and Revolution*, and more concisely in various articles and blog posts. Here, I’ll simply present an abbreviated series of “theses” (eleven of them, in honor of Marx’s Theses on Feuerbach) on the subject of revolution that strike me as commonsensical, however heterodox some of them may seem. Their cumulative point is to reorient the Marxian conception of socialist revolution from that of a completely ruptural seizure and overthrow of capitalist states—whether grounded in electoral or insurrectionary measures—followed by a planned and unitary reconstruction of society (the “dictatorship of the proletariat”), to that of a very gradual process of economic and political transformation over many generations, in which the character of the economy changes together with that of the state. The long transition is not peaceful or smooth or blandly “reformist.” It is necessarily riven at all points by violent, quasi-insurrectionary clashes between the working class and the ruling class, between international popular movements seeking to carve out a new society and a capitalist elite seeking to prolong the current one. Given the accumulating popular pressure on a global scale, which among other things will succeed in electing ever more socialists to office, the capitalist state will, in spite of itself, participate to some extent in the construction of new economic relations that is the foundation of constructing a new society—even as the state in other respects continues to violently repress dissenting movements.

But the process of building a new economy will not be exclusively statist (despite the statism of mainstream Marxism going back to Marx himself). Transitions between modes of production take place on

more than one plane and are not only “top-down.” In particular, as civilization descends deeper into crisis and government proves inadequate to the task of maintaining social order, the “solidarity economy,” supported by the state, will grow in prominence and functionality. A world of multiform catastrophe will see alternative economic arrangements spring up at all levels, and the strategies of “statist Marxism” will complement, or be complemented by, the “mutual aid” (cooperative, frequently small-scale, semi-interstitial) strategies of anarchism. These two broad traditions of the left, so often at each other’s throats, will finally, in effect, come together to build up a new society in the midst of a collapsing *ancien régime*. Crisis will, as always, provide opportunity.

1

Successful socialist revolution, meaning the creation of a society that eliminates differential ownership and control of economic resources and instead permits democratic popular control of the economy, has happened nowhere on a large scale or a “permanent” (“post-capitalist”) basis. Whether in Russia, China, Cuba, or elsewhere, the dream of socialism—still less of communism—has never been realized. According to Marxism, indeed, the very fact that these were isolated islands under siege by a capitalist world indicates that they signified something other than socialism, which is, naturally enough, supposed to *follow* capitalism and exist first and foremost in the “advanced” countries. The fact that these “socialist” experiments ultimately succumbed to capitalism is enough to show that, whatever progress they entailed for their respective populations, they were in some sense, in the long term, revolutionary abortions.

2

Marx was right that there is a kind of “logic” to historical development. Notwithstanding the postmodernist and empiricist shibboleths of contemporary historiography, history isn’t all contingency, particularity, individual agency, and alternative paths that were tragically not taken (because of poor leadership or whatever). Rather, institutional contexts determine that some things are possible or probable and others impossible. Revolutionary voluntarism, the elevation of political will above the painfully protracted, largely “unconscious” dialectical processes of resolution of structural contradictions and subsequent appearance of new, unforeseen conditions that are themselves “resolved” through the ordinary actions of millions of people, is a false (and un-Marxist) theory of social change. If the world didn’t go socialist in the twentieth century, it’s because it couldn’t have: structurally, in the heyday of corporate capitalism (monopoly capitalism, state capitalism, imperialism, whatever one calls it), socialism was impossible.

In short, on the broadest of historical scales, the “hidden meaning” of the past—to use a phrase beloved by Marx—is revealed by the present and future, as probabilities with which the past was pregnant become realities.

3

Marx therefore got the timeline of revolution radically wrong. He did not (and could not) foresee the power of nationalism, the welfare state, Keynesian stimulation of demand, the state’s stabilizing management of the crisis-prone economy, and the like. In fact, we might say that, falling victim to the characteristic over-optimism of Enlightenment thinkers, he mistook the birth pangs of industrial capitalism for its death throes. Only in the neoliberal era has the capitalist mode of production even finished its conquest of the world—which the “dialectical” logic of historical materialism suggests is a necessary precondition for socialism—displacing remaining peasantries from the land and privatizing “state-socialist” economies and state-owned resources. Given the distribution of power during and after the 1970s between the working class and the business class, together with the increasing mobility of capital (a function of the advancing productive forces, thus predictable from historical materialism), neoliberal assaults on postwar working-class gains were, in retrospect, entirely predictable.

4

Despite, or because of, its horrifying destructiveness, neoliberalism potentially can play the role of opening up long-term revolutionary possibilities (even as it presents fascist possibilities as well). Its function of exacerbating class polarization, immiserating the working class, eroding social democracy, ripping up the social fabric, degrading the natural environment, destabilizing the global economy, relatively homogenizing conditions between countries, hollowing out the corporatist nation-state and compromising the integrity of the very (anti-revolutionary) idea of “nationality,” facilitating a *global* consciousness through electronic media—a consciousness, in the end, of suffering and oppression—and attenuating the middle class (historically a pretty reliable bastion of conservatism): all this in the aggregate serves to stimulate mass protest on a scale that, eventually, the state will find unmanageable.

Fascist repression, it’s true, is very useful, but fascist regimes can hardly remain in power indefinitely in every country. Even just in the U.S., the governmental structure is too vast and federated, and civil society too thick and resilient, for genuine fascism ever to be fully consolidated everywhere, much less made permanent. Repression alone is not a viable solution for the ruling class.

5

Sooner or later, it will be found necessary to make substantive concessions to the masses (while never abandoning repression). Some writers argue that what these will amount to is a revitalization and expansion of social democracy, such a sustained expansion (under the pressure of popular movements) that eventually society will pass from social democracy straight into socialism. This argument, however, runs contrary to the spirit of Marxism, according to which society does not return to previous social formations after they have departed the stage of history. Fully fledged social democracy was appropriate to a time of industrial unionism and limited mobility of capital; it is hard to imagine that an era of unprecedented crisis and decaying nation-states will see humanity resuscitate, globally, a rather “stable” and nationalistic social form, even expanding it relative to its capacity when unions were incomparably stronger than today. While social democratic policies will surely persist and continue to be legislated, the intensifying dysfunction of the nation-state (a social form that is just as transient as others) will necessitate the granting of different kinds of concessions than centralized and expansive social democratic ones.

6

Here, we have to shift for a moment to considering the Marxist theory of revolution. Then we’ll see the significance of the concessions that states will likely be compelled to grant. There is a glaring flaw in Marx’s conceptualization (expressed, for example, in the famous Preface to *A Contribution to the Critique of Political Economy*) according to which “an era of social revolution” begins when the dominant mode of production starts to fetter the use and development of the productive forces. The flaw is simply that the notion of “fettering” is semi-meaningless. Philosophers such as G. A. Cohen have grappled with this concept of fettering, but we don’t have to delve into the niceties of analytic philosophy in order to understand that the capitalist mode of production has always both fettered and developed the productive forces—fettered them in the context, for instance, of devastating depressions, disincentives to invest in public goods, artificial obstacles to the diffusion of knowledge, and, in general, a socially irrational distribution of resources; even as in other respects it still *develops* the productive forces, as with advances in information technology, biotechnology, renewable energy, and so on. In order to be truly meaningful, therefore, this concept of fettering needs revision.

7

The necessary revision is simple: we have to adopt a *relative* notion of fettering. Rather than an absolute conflict, or a contradiction, between productive forces and production relations, there is a conflict between *two sets of production relations, one of which uses productive forces in a more socially rational and “un-fettering” way than the other*. This revision makes the idea of fettering meaningful, even concretely observable. Capitalism, for example, was, in the final analysis, able to triumph over feudalism because it was infinitely better at developing productive forces, such that its agents could accumulate far greater resources (economic, scientific, technological, intellectual, cultural) than the agents of feudalism. The epoch of social revolution, properly speaking, lasted half a millennium, though it was punctuated by dramatic moments of condensed social and political revolution such as the French Revolution.

If the idea of fettering is to apply to a transition between capitalism and socialism, it can be made sense of only through a similar “relative” understanding, according to which a cooperative and democratic mode of production emerges over a prolonged period of time (hopefully not half a millennium) both interstitially and more visibly in the mainstream. As the old anarchic economy succumbs to crisis and stagnation, the emergent “democratic” economy—which does not yet exist today—does a better job of rationally and equitably distributing resources, thereby attracting ever more people to its practices and ideologies. It accumulates greater resources as the old economy continues to demonstrate its appalling injustice and dysfunction.

8

This theoretical framework permits an answer to the old question that has bedeviled so many radicals: why have all attempts at socialist revolution failed? The answer is that they happened in conditions that guaranteed their eventual failure. There was a radical difference between, for example, October 1917 and the French Revolution: in the latter case, capitalist relations and ideologies had already spread over Western Europe and acquired enormous power and legitimacy. The French revolutionaries were beneficiaries of centuries of capitalist evolution—not, indeed, industrial capitalist, but mercantile, agrarian, financial, and petty-bourgeois. This long economic, social, cultural, and political evolution prepared the ground for the victories of 1789–1793. In 1917, on the other hand, there was no socialist economy whatsoever on which to erect a political superstructure (a superstructure that, in turn, would facilitate the further and more unobstructed development of the socialist economy). Even industrial capitalism was barely implanted in Russia, much less socialism. The meaning of 1917 was merely that a group of opportunistic political adventurers led by two near-geniuses (Lenin and Trotsky) took advantage of a desperate wartime situation and the desperation of the populace—much of which, as a result, supported these “adventurers”—to seize power and almost immediately suppress whatever limited democracy existed. The authoritarian, bureaucratic, and brutal regime that, partly in the context of civil war, resulted—and that ultimately led to Stalinism—was about as far from socialism as one can imagine.

It is one of the ironies of the twentieth century that the Bolsheviks both forgot and illustrate a central Marxian dictum: *never trust the self-interpretations of historical actors*. There is always an objective context and an objective, hidden historical meaning behind the actions of people like Robespierre, Napoleon, or Lenin, a meaning they have no access to because they are caught up in the whirl of events (and, to quote Hegel, the owl of Minerva flies only at dusk, *after* the events). The fact that Lenin and his comrades were convinced they were establishing socialism is of no more than psychological interest. It is unfortunate that many Marxists today continue to credulously believe them.

9

Said differently, the twentieth-century strategy of “Marxist” revolutionaries to seize the state (whether electorally or in an insurrection) and *then* carry out a social revolution—by means of a sweeping, “totalizing” political will—is highly un-Marxist. It is idealistic, voluntaristic, and unrealistic: history moves forward slowly, dialectically, “behind the backs” of historical actors, not straightforwardly or transparently through the all-conquering will of a few leaders or a single political party. The basic problem is that if you

try to reconstruct society entirely from the top down, you have to contend with all the institutional legacies of capitalism. Relations of coercion and domination condition everything you do, and there is no way to break free of them by means of political or bureaucratic will. While the right state policies can be of enormous help in constructing an economically democratic society, in order for it to be genuinely democratic it cannot come into existence *solely through the state*. Marxism itself suggests that the state—largely a function of existing economic relations—cannot be socially creative in such a radical way. Instead, there has to be a ferment of creative energy at the grassroots (as there was during the long transition from feudalism to modern capitalism) that builds and builds over generations, laboriously inventing new kinds of institutions in a process that is both, or alternately, obstructed and facilitated by state policies (depending on whether reactionaries or liberals are in power, or, eventually, leftists).

Nearly all attempts at socialist revolution so far have been directed at a *statist rupture* with the past, and have therefore failed.¹ There is no such thing as a genuine “rupture” in history: if you attempt it, you’ll find that you’re merely reproducing the old authoritarianism, the old hierarchies, the old bureaucratic inefficiencies and injustices, though in new forms.² Rather, the final, culminating stage of the conquest of the state has to take place *after* a long period of economic gestation, so to speak (again, gestation that has been facilitated by incremental changes in state policies, as during the feudalism-to-capitalism transition), a gestation that serves as the material foundation for the final casting off of capitalist residues in the (by then) already-partially-transformed state.

10

This brings us back to the question of how capitalist elites will deal with the popular discontent that is certain to accumulate globally in the coming decades. Since the political economy that produced social democracy is passing from the scene, other sorts of concessions (in addition to repression) will be necessary. In our time of political reaction it is, admittedly, not very easy to imagine what these might be. But we can guess that, as national governments prove increasingly unable to cope with environmental and social crises, they will permit or even encourage the creation of new institutional forms at local, regional, and eventually national levels. Many of these institutions, such as cooperatives of every type (producer, consumer, housing, banking, etc.), will fall under the category of the solidarity economy, which is committed to the kind of mutual aid that has already been rather prominent in the context of the Covid-19 pandemic. Capitalism’s loss of legitimacy will foster the conditions in which people seek more power in their workplaces, in many cases likely taking them over, aided by changes in state policies (such as the active promotion of a cooperative sector to provide employment in a stagnant economy) due in part to the presence of more socialists in government. Other innovations may include a proliferation of public banks, municipal enterprises (again, in part, to provide jobs at a time of raging structural and cyclical unemployment), and even universal basic income.

The subject of what types of “non-reformist reforms”—i.e., reforms that have the potential to serve as stepping-stones to a new economy—governments will be compelled, on pain of complete social collapse, to grant is much too complex to be explored in a brief article. Two points suffice here. First, the usual Marxist critiques of (worker) cooperatives and other ostensibly apolitical, interstitial “anti-capitalist” institutions—such as “mutual aid”—can be answered simply by countering that these are only *one part of*

¹ Other reasons for their failure have been operative as well, notably imperialist interference with the revolutionary process. But the effectiveness of such interference has itself shown the inadequacy of an exclusively “ruptural” strategy—the attempt to create socialism by political fiat in a still-overwhelmingly-capitalist world—because core capitalist nations usually find it easy to squash the political revolution when it hasn’t been preceded by generations of socialist institution-building across the globe, including in the heart of the most advanced countries.

² To repeat, this is the lesson of Marxism itself. We are embedded in the past even when trying to idealistically leap out of it and leave it behind. Insofar as Marx sometimes wrote as if a proletarian dictatorship could virtually “start anew,” enacting whatever policies it wanted and planning a new society as though from a blueprint, he forgot the gist of his own thought.

a very long and multidimensional project that takes place on explicitly political planes too. It is puzzling that so many radicals seem unaware that the transition to a new civilization is an incredibly complex, drawn-out process: for instance, over many generations, emergent institutions like cooperatives network with each other, support each other, accumulate and share resources in an attempt to become ever freer of the competitive, sociopathic logic of the capitalist economy. At the same time, all this grassroots or semi-grassroots activity contributes to building up a counter-hegemony, an anti-capitalist ethos in much of the population. And the resources that are accumulated through cooperative economic activity can be used to help fund political movements whose goal is to further transform the capitalist state and democratize the economy.

Second, the question naturally arises as to why the ruling class will tolerate, or at times even encourage, all this grassroots and statist “experimentation” with non-capitalist institutions. On one level, the answer is just that the history will unfold rather slowly (as history always does—a lesson too often forgotten by revolutionaries), such that at any given time it won’t appear as if some little policy here or there poses an existential threat to capitalism. It will seem that all that is being done is to try to stabilize society and defuse mass discontent by piecemeal reforms (often merely local or regional). Meanwhile, the severity of the worldwide crises—including, inevitably, economic depression, which destroys colossal amounts of wealth and thins the ranks of the obstinate elite—will weaken some of the resistance of the business class to even the more far-reaching policy changes. By the time it becomes clear that capitalism is really on the ropes, it will be too late: too many changes will already have occurred, across the world. Historical time cannot be rewound. The momentum of the global social revolution will, by that point, be unstoppable, not least because only non-capitalist (anti-privatizing, etc.) policies will have any success at addressing ecological and social disaster.

11

The argument that has been sketched here has a couple of implications and a single major presupposition. The presupposition is that civilization will not destroy itself before the historical logic of this long social revolution has had time to unfold. There is no question that the world is in for an extraordinary era of climatic chaos, but—if for a moment we can indulge in optimism—it might transpire that the ecological changes serve to accelerate the necessary reforms by stimulating protest on an absolutely overwhelming scale. Maybe, then, humanity would save itself in the very nick of time. If not, well, we’ll have a grim answer to the old question “Socialism or barbarism?”

One implication of the argument is that there is a kernel of truth in most ideological tendencies on the left, and radicals should therefore temper their squabbling. The old debates between, say, Marxists and anarchists are seen to be narrow, short-sighted, crabbed, doctrinaire, and premised on a false understanding of the timescales in question. If one expects revolution to happen over a couple of decades, then yes, the old sectarian disputes might acquire urgency and make some sense. But if one chooses to be a Marxist rather than a voluntarist, a realist rather than an idealist, one sees that global revolution will take a century or two, and there is temporal room for statist and non-statist strategies of all kinds.

A second implication, less practically important but of interest anyway, is that Marxists going back to the founder himself have misunderstood the prescriptions of historical materialism. There may well be something like a “dictatorship of the proletariat” someday, but, since idealism and voluntarism are false, it will (like the earlier “dictatorship of the bourgeoisie”) happen near the end of the revolutionary epoch, not at the beginning. It is impossible to predict what form the state will take by then, or how the final removal of bourgeois remnants from government will further transform it. What can be known is only that in order to politically oust the ruling class, the working class needs not just numbers but *resources*, which hitherto it has lacked on the necessary scale. With the gradual—but, of course, contested and violent—spread of a semi-socialist economy alongside (and interacting with) the decadent capitalist one, workers will be able to accumulate the requisite resources to effectually compete against the shrinking business class, electing left-wing representatives and progressively changing the character of the capitalist state.

Meanwhile, in the streets, people will be figuratively manning the barricades, decade after decade, across a world tortured by the greed of the wealthy and the suffering of the masses. All their struggles, surely, will not be in vain.

Resisting Fascism: A Review of Shane Burley's "Why We Fight"

The elevation of Donald Trump onto the national political stage in 2016 provoked a heated debate among centrist and left-wing commentators that has yet to be resolved (and likely never will be): do Trump and the Republican Party today represent a recrudescence of fascism, or is this a flawed historical analogy? Writers like Timothy Snyder and Jason Stanley insisted on the parallels between interwar fascism and the contemporary far-right, from demonization of ethnic “Others” to fomenting of violence against democratic institutions (as on January 6, 2021); writers such as Samuel Moyn and Corey Robin disagreed, arguing that Trump proved to be much too weak a figure—and his attacks on the political order were much too weak—to legitimately be called fascist. Scores of articles and books have been published litigating the term “fascism” and its applicability to various ugly phenomena across the American political scene.¹

Wisely, journalist Shane Burley bypasses this debate in his new collection of essays *Why We Fight: Essays on Fascism, Resistance, and Surviving the Apocalypse*. It’s clear there are both similarities and differences between classical fascism, on the one hand, and Trumpism and the modern far-right on the other. (For this reason, one might call the latter neofascism or proto-fascism, as an acknowledgement of the valid points made on both sides of the debate.) Instead, Burley takes it for granted, and illustrates throughout his book, that a vast constellation of groups and individuals on the right today have salient fascist characteristics and would happily tear down democracy if they could. *Why We Fight* consists mostly of articles Burley has published in recent years shedding light on these shadowy groups, this underworld of the Alt-Right and its relatives.

In seventeen chapters, Burley illuminates the methods and varieties of both fascist and anti-fascist organizing. Among the topics he covers are the rise and fall of the Alt-Right, from 2008 to the aftermath of the Charlottesville “Unite the Right” rally in 2017; the nature of the “Alt-Right,” a less extreme version of the far-right that coalesced around figures like Milo Yiannopoulos, Alex Jones, and online “manosphere” leader Mike Cernovich; the toxic cult of masculinity that unites a wide range of far-right groups; the world of fascist publishing in Europe and the U.S., led by companies like Arktos Media and Counter-Currents that are dedicated to “creating the intellectual foundation for a new fascism” (p. 151); attempts by anti-fascists to colonize cultural spaces that have often attracted fascists, such as soccer, gun clubs, mixed martial arts, the paganism and heathenry subculture, and, in music, black metal and neofolk; the deep-rooted and continuing appeal of antisemitism to the far-right; and even the remarkable Kurdish experiment in an anarchist, anti-fascist society at Rojava. Altogether, the book gives a nuanced and compelling picture of the highly fragmented, internally divided, typically amateurish, but very frightening world of the contemporary far-right—from the Proud Boys to militia organizations, from journalist provocateurs like Andy Ngô to the neo-Confederate Council of Conservative Citizens (founded in 1985), from “lone wolf” mass shooters to student groups like Turning Point USA that seek to intimidate and silence left-wing voices at college campuses.

As an “advocacy journalist,” Burley eschews a neutral or academic tone; he combines history, journalism, psychology, an editorial voice, and even memoir to stitch together a tapestry that, in its totality, serves to communicate the urgency of fighting and defeating all these noxious forces. In one of his pieces, for example, he argues that anti-fascist activists (often known collectively as *antifa*), rather than some diffuse “public opinion” or mainstream intellectual commentary, were responsible for the downfall of the

¹ For an overview of the debate, see Udi Greenberg, “What Was the Fascism Debate?,” *Dissent* (Summer, 2021). Links to some sources can be found at Matthew Sitman and Sam Adler-Bell, “[Did It Happen Here?](#),” *Dissent*, January 19, 2021.

Alt-Right in the months after Charlottesville. Through constant interference with public talks by Alt-Right speakers, pressure on university administrations and other venues not to permit such talks, counter-protests, violent physical confrontations, and other aggressive measures, left-wing activists essentially shut down the Alt-Right phase of the white nationalist movement.

“Police barricades,” Burley writes, “last-minute venue cancelations, and public brawls overshadowed the Alt Right’s message, and as members were doxxed and fired from their jobs, it became harder and harder to make their movement attractive to recruits. In the wake of Charlottesville, they were forced off social media, web hosting, podcast platforms, and just about every outreach tool available, leaving them only to the back alleys of the internet” (p. 57). He clearly endorses such tactics, barely even acknowledging concerns about censorship and the right to free speech.

It would have been interesting, however, for him to delve into the ongoing debate over tactics and moral principles. Or, if this would have distracted from the book’s journalistic focus, it is at least incumbent on the reader to think through these issues. On one side are, it appears, the majority of leftists who both deny that fascists have a right to be heard and, tactically, think the best way to defeat them is to prevent them from being heard. On the other side are principled civil libertarians such as Noam Chomsky and Glenn Greenwald who argue that everyone has the right to be heard, neither the state nor private entities like Twitter and Facebook should be allowed to police speech (for then what is to prevent them from policing left-wing speech, as they in fact constantly do?), and even tactically the best way to defeat fascists is to let them air their views so that others can expose their absurdity and immorality. Chomsky, for instance, argues that while fascists should never be invited to speak at college campuses, if they are, the best response is not to shut down the event—which allows the speaker to pose as a great defender of free speech under attack by leftist totalitarians—but to use it as an educational opportunity and organize a counter-event exposing the hideousness of far-right ideas.¹

One might reply, on the other hand, that making life miserable for fascists does seem to help inhibit the growth of a movement. (But, again, is such harassment, including violence, wrong in principle?) As for “deplatforming” the far-right, someone in Burley’s camp might concede that social media companies (for example) should not have the right to police speech and indeed should be publicly owned and operated, while maintaining at the same time that as long as private entities do have this right and are happy to wield it against the left, activists should pressure them to wield it also against racists. If doing so helps conservatives and centrists vilify leftists as authoritarian and opposed to free speech, so be it.

A chapter devoted to these questions of principle and tactics, thorough and fair-minded in its treatment of the conflicting arguments, might have been a valuable addition to Burley’s book, especially given the book’s activist purpose.

One theme that recurs in some of the essays is the useful reminder that fascism doesn’t always wear its heart on its sleeve, and it is important to be able to see through euphemisms or non-fascist appearances to the political reality and poisonous potential underneath. Burley quotes reporter Tess Owen: “Far-right publishing companies like Arktos have sought to give white nationalism a veneer of pseudo-intellectual legitimacy by dressing up old, ugly, racist ideas in euphemisms. For example, their authors don’t talk about whiteness, they talk about ‘European identity.’ This is part of a calculated strategy: move out of the fringes, and into the political mainstream” (p. 164). There are certainly “degrees” of fascism among groups and individuals on the right, but, in the words of Burley, to the extent that there is commitment to “human

¹ The journalist Natasha Lennard, who wrote a foreword to *Why We Fight*, contests Chomsky’s position by making the remarkable claim that arguing against white supremacy is futile; only *force* (of various kinds) can work. “Anyone who has watched [Richard] Spencer and his ilk in public debates,” she writes, “. . . should see how the belief that his violent white supremacy can be reasoned away is flawed. He sticks to his guns about the necessity of a white ‘ethno-state’ . . .” But the point, of course, is not to convince the fanatical racists themselves; the point is to educate and inoculate the public, including young men who might otherwise be susceptible to white supremacy. It is deeply defeatist and cynical to have no faith in the power of rational argument. See Natasha Lennard, “Is Antifa Counterproductive? White Nationalist Richard Spencer Would Beg to Differ,” *The Intercept*, March 17, 2018.

inequality, social traditionalism, racial nationalism, and an authoritarian vision founded in the resurrection of heroic mythologies” (p. 65), there is an affinity for fascism.¹

Even the mere cult of masculinity, widespread among large numbers of disaffected men in an age of social dissolution, can embody very dangerous ideological impulses, as Burley documents in his lengthy final chapter. The whole online “manosphere” of “men’s rights” advocates, incels, pick-up artists, and the like, can be considered a sort of gateway drug to fascism—and it must be said that leftists ignore or ridicule these millions of lost male souls at their peril. When you leave the indoctrinating and organizing of men, as men, to the right-wing, what you get are weird perversions like the neopagan Wolves of Vinland, which Burley has investigated in depth. Founded in 2005 by the bodybuilder Paul Waggener, the Wolves of Vinland is a “male-tribalist organization” that assures men that “the promise of their patriarchal authority is built into the connective tissue of the natural world and that their feeling of anxiety is the proper reaction to the ‘attack on men’ that the modern world has devised” (p. 261). Until being recently discontinued, its online and in-person program Operation Werewolf—“equal parts pagan instruction, workout regimen, and self-help manual” (p. 261)—attracted men from all over the world who craved the “Total Life Reform” it promised. This involved, in part, being indoctrinated into a semi-Nietzschean ideology that glorified violence, physical strength and pain, an idealized masculinity, tribalism, hierarchy, and contempt for the effeminate weakness and decadence of modern society.

What is most frightening about Operation Werewolf, which Burley discusses in great detail while interweaving stories of his own personal experiences with unhealthily masculinist cultures, is that it is just one tiny node in a sprawling global network of similar proto-fascist subcultures. What the left’s answer to this challenge should be is not entirely clear. Burley’s proposed solutions to fascist organizing, scattered throughout the book, are, perhaps inevitably, vague; for instance, to counter groups like the Wolves of Vinland, he suggests we “build up communities that are strong,” “rediscover spiritual traditions...that can connect us to where we are today,” and “help people build a body cult to stay tied to their physicality and health, not to fit the prescriptions of a hierarchical and fat-phobic fitness culture, but to build themselves according to the vision they alone have” (p. 305). What is clear is that the task of defeating cultures of “toxic masculinity,” which often overlap with white supremacy, will require meeting people on their own terms and dispensing with contemporary leftists’ beloved “purity tests” for who they will or won’t interact with.

Why We Fight is, in short, worth a read if one seeks information about cultures of the far-right. This isn’t to say, however, that it is immune to criticism. Burley’s style of writing, while at times eloquent, is often awkward, as well as needlessly prolix, rambling, and repetitive. The frequent typos and grammatically awkward constructions are distracting. More substantively, it would have been nice to see some information on the kinds of people who have been attracted to these fascist organizations, such as their class, occupational, and geographic backgrounds. Statistical studies of Trump’s supporters have shown them to be disproportionately petty-bourgeois and moderately affluent, though frequently without a college degree: small business owners, real estate brokers, managers, and so on—not primarily “the white working class,” despite the mythology. The same is presumably true of the groups Burley discusses, but he presents very little data on the matter.

Likewise, one would have appreciated more information on the funding sources of all these far-right groups, particularly to what extent some of them might be supported by reactionary big business. Doubtless such information is not readily available, though.

In the end, however imperative it is to fight against such organizations as the Wolves of Vinland, or the Proud Boys, the Oath Keepers, the American Identity Movement, the Atomwaffen Division, etc., it is surely not these peons, the flotsam and jetsam of a tempestuous capitalist society, who present the gravest danger to the country and the world. It is the “respectable” people and institutions: the Charles Kochs of

¹ On this understanding, the intellectual celebrity Jordan Peterson, for example, who is enamored of hierarchies (“consider the lobster!”), archaic myths, cultural tradition, strong and heroic masculinity, and the conflict between Order and Chaos, has quite a few points of contact with fascism. See Pankaj Mishra, “Jordan Peterson and Fascist Mysticism,” *New York Review of Books*, March 19, 2018.

the world, the ExxonMobils, the Citigroups and JPMorgan Chases, the Defense Departments and Supreme Courts—the ruling class. These are the agents of our coming immolation in the fires of ecological holocaust and, possibly, nuclear war. Relatively speaking, the likes of Paul Waggener and Andy Ngô are picayune. They're dangerous, but more dangerous are the well-funded think tanks and propaganda outlets like the Heritage Foundation and the Cato Institute—two of the forces behind the immensely damaging Tea Party—or the Manhattan Institute, one of whose “senior fellows” (Christopher Rufo) is almost entirely responsible for the current furor over “critical race theory.”¹ Fox News, One America News, the Daily Caller, the Daily Wire—these are the entities that indoctrinate tens of millions.

How, or whether, the left can dethrone these truly demonic forces before they cause the demise of society is the burning question. As always, the answer can only be found through mass education and organization.

The Radicalism of Working-Class Americans

In the United States there exists today, and has existed since at least the 1950s, a dominant political narrative according to which most Americans, indeed the very history of the country, exemplify a kind of ideological “moderateness.” Democratic Party operatives and sympathizers constantly [preach the virtues](#) of occupying the political center, where most of the population supposedly resides. If the party caves in to its “extremist” left wing, it faces electoral annihilation. This narrative echoes, in a vulgar and opportunistic way, the postwar “liberal consensus” school of thought among social scientists and more generally the political culture, that the U.S. has historically been an exceptional country in its relatively middle-class and Lockean-liberal character, its individualism, its relative absence of dramatic ideological clashes, of class conflict and class consciousness. Louis Hartz’s [The Liberal Tradition in America](#), for example, published in 1955, was a classic expression of this “centrist” interpretation of American history, an interpretation that tended to explain away and criticize what dissent there was—on the left and the right—as consisting of fringe movements of status anxieties, maladjusted psychologies, anti-intellectual impulses, hysterical moralism, and the like.

For the centrist establishments, then, of both the Cold War and today, left-wing (and right-wing) dissidence is simultaneously pathological and, in the broad sweep of American history, aberrational. The U.S. is *essentially* a middle-of-the-road, bourgeois country, which is why radical movements have usually failed and are doomed to failure in the present and future.

Since the 1960s, scholars have subjected this liberal creed in its various facets to devastating criticism, but it continues to hold sway, in some form, even among sophisticated academics who ought to know better. An early critique was given by Michael Paul Rogin in his brilliant [The Intellectuals and McCarthy: The Radical Specter](#) (1967), which systematically exposed the flaws in liberal analyses of “protest politics” (notably their assimilation of McCarthyism to an earlier tradition of agrarian radicalism, as if “irrational” left populism was to blame for McCarthy). Later scholars have shown that U.S. history contains just as much class conflict and class consciousness as the history of Western Europe; Sean Wilentz’s 1984 article [“Against Exceptionalism: Class Consciousness and the American Labor Movement, 1790–1920”](#) is a compelling statement of this point of view.

Recently, my own book [Popular Radicalism and the Unemployed in Chicago during the Great Depression](#) (2022) has criticized liberal analyses of the 1930s, which tend to dismiss the idea that there was much radical potential—socialist yearnings or revolutionary sentiment—in popular collective action of the time. Supposedly even in the 1930s, the quintessential “collectivist” decade, the American masses remained

¹ Benjamin Wallace-Wells, “How a Conservative Activist Invented the Conflict over Critical Race Theory,” *New Yorker*, June 18, 2021. On the origins of the Tea Party, see Jane Mayer, *Dark Money: The Hidden History of the Billionaires Behind the Rise of the Radical Right* (New York: Anchor Books, 2017)—or, more briefly, my blog post [“The rise of right-wing libertarianism since the 1950s.”](#)

broadly subject to the hegemony of bourgeois culture, loyal to the distinctive U.S. political economy, and uninterested in radical social change. After all, they adored Franklin Roosevelt and rushed into the open arms of the Democratic Party in 1936.

Given that the political economy of the U.S. today has ominous parallels with the economy that eventuated in the Great Depression—including extreme income and wealth inequality, limitless aggrandizement of big business, and weakness of organized labor—it might be of interest to challenge such interpretations of American history, borrowing from my book. There is in fact an enormous base of support for truly radical change today, and there certainly was in the 1930s.

Historians influenced by the liberal tradition, such as, for example, the late Alan Brinkley, Jill Lepore, and Jefferson Cowie, tend to adopt a somewhat “idealistic” (anti-materialistic) perspective on society, to some extent abstracting from class conditions and class conflict in favor of an emphasis on culture, ideas, ideologies, and discourses. “The United States is founded on a set of ideas,” Lepore writes in her defiantly [anti-leftist](#) bestseller [These Truths: A History of the United States](#) (2018)—and of course the ideas in question are noble ideas: “a dedication to equality... [and] a dedication to inquiry, fearless and unflinching.” This is the way of the liberal (and many a conservative as well): to ground society in abstract ideas, preferably lofty ones, prioritizing “consciousness” over “social being,” as if Karl Marx hadn’t already shown in [The German Ideology](#) (1846) that the former is largely a sublimation (often obfuscation) of the latter. The idealistic method typically implies an ahistorical essentialism: the U.S. is “essentially” committed to equality and democracy, however rarely it may live up to “its” ideals—or it is essentially individualistic or anti-statist or capitalist or whatever other idea is favored. In abstracting from class conditions, idealism usually has conservative implications, which is doubtless why it has always been preferred by ruling classes and the intellectuals who speak for them.

Jefferson Cowie is more sophisticated and less propagandistic than Lepore, but he too, like many other excellent historians, is not always sufficiently materialistic. For instance, in [The Great Exception: The New Deal and the Limits of American Politics](#) (2016) he insists that Americans remained very “individualistic” even in the depths of the Great Depression, and that traditions of so-called individualism have contributed significantly to vitiating collectivist radicalism in the United States. Like other liberal scholars, Cowie seems to prefer explaining the defeats of the American left in terms of the stubbornness of various popular ideologies and cultures, including divisions among the working class (between race, ethnicity, skill, gender, etc., as if such divisions haven’t existed elsewhere), rather than the more basic and “material” fact that America’s capitalist class has historically been [unusually ruthless](#), class-conscious, repressive, resourceful, and dominant over the state. This fact, indeed, is the real American “exceptionalism,” and it is the primary explanation for the failures of the left in the U.S.

As a case-study of popular consciousness, we might consider the remarkable nationwide support given to two famous left-wing “demagogues” of the 1930s, Huey Long and the “radio priest” Father Charles Coughlin. (Coughlin is sometimes called a fascist, but respected scholars have argued that this label isn’t appropriate for him until after 1937, by which time his popularity was vastly diminished.) Historians commonly interpret the massive popularity of these two figures as, ironically, proof of the relative conservatism of Americans. Cowie, for example, in a vague and idealistic formulation (disregarding class) characteristic of liberal historiography, states that these men and their following were very individualistic: they merely hoped “to restore the republic to the little man, resurrect some version of traditional values, and deliver the individual from the crush of mass society.” His interpretation echoes that of Alan Brinkley’s [Voices of Protest: Huey Long, Father Coughlin, and the Great Depression](#) (1983):

The failure of more radical political movements to take root in the 1930s reflected, in part, the absence of a serious radical tradition in American political culture. The rhetoric of class conflict echoed only weakly among men and women steeped in the dominant themes of their nation’s history; and leaders [such as Communists] relying upon that rhetoric faced grave, perhaps insuperable difficulties in attempting to create political coalitions. The Long and Coughlin movements, by contrast, flourished precisely because they evoked so clearly

one of the oldest and most powerful of American political traditions [namely, “opposition to centralized authority and demands for the wide dispersion of power”].

But what did Long and Coughlin actually say? It is revealing to look at their words. While they both denounced Socialism and Communism, Coughlin thundered that “capitalism is doomed and not worth trying to save.” A journalist wrote in 1935 that he “talk[s] about a living wage, about profits for the farmer, about government-protected labor unions. He insists that human rights be placed above property rights. He emphasizes the ‘wickedness’ of ‘private financialism and production for profit.’” The principles of Coughlin’s National Union for Social Justice, founded in 1934, included the following: a “just and living [i.e., not market-determined] annual wage which will enable [every citizen willing and able to work] to maintain and educate his family according to the standards of American decency”; nationalization of such “public necessities” as banking, credit and currency, power, light, oil and natural gas, and natural resources; private ownership of all other property, but control of it for the public good; abolition of the privately owned Federal Reserve and establishment of a government-owned central bank; “the lifting of crushing taxation from the slender revenues of the laboring class” and substituting for it taxation of the rich; and the guiding value that “the chief concern of government shall be for the poor.”

Huey Long, similarly, made fairly radical proposals, as we can read in his whimsical retrospective account of his *First Days in the White House*, a book completed shortly before he was shot. A reviewer summarized Long’s post-presidential self-description as follows:

He was the man of action who in rapid succession launched a stupendous program of reclamation and conservation, who planned for scientific treatment of criminals, cheaper transportation and popular control of banking. Higher education for all became fact. Tell every parent, he said to his advisers, “I will send your boy and girl to college.” There was much more, but all was overshadowed by legislation for the redistribution of wealth [by means of confiscatory taxation on the wealthy].

These are hardly ideas that shun class conflict. Nor are they obviously “individualistic.” Insofar as Coughlin and Long’s tens of millions of fans, in the working and middle classes, agreed with these political programs, they certainly can be said to have desired *fundamental* reforms in American capitalism, reforms that would have ushered in a much more collectivistic and socialistic society. It requires the impressive intellectual acrobatics of liberal historiography to differentiate these messages from a class-based populism and claim they can be largely reduced to an “opposition to centralized authority” or a “resurrection of traditional values.”

There is more truth to the way Eric Leif Davin frames the matter in his article [“Blue Collar Democracy: Class War and Political Revolution in Western Pennsylvania, 1932–1937”](#) (2000): “Fundamentally, the political mobilization of the working class in the thirties was a class war for political and economic equality.” It is suspicious, after all, that intellectuals are often so determined to deny that the ideal of socialism—workers’ democratic control of their economic life—has much appeal to working Americans. Why wouldn’t it, inasmuch as people obviously want control over their lives and livelihood? Indeed, Brinkley admits as much when he says that Long, Coughlin, and their followers called for “a society in which the individual retained control of his life and livelihood; in which power resided in visible, accessible institutions; in which wealth was equitably (if not necessarily equally) shared.” The obvious reply to this characterization is that it is little but a watered-down definition of socialism!

If American workers don’t always flock to the banner of socialism or communism, the most plausible explanation, *prima facie*, isn’t that they are deeply attached to some traditional ideology or are the benighted victims of bourgeois hegemony but simply that they understand it is hopelessly unrealistic, for now, to try to achieve a democratic economy. As Vivek Chibber has recently argued, it is their *rationality*, not their *ideology*, that generally keeps working-class Americans from throwing themselves into the profoundly difficult (and frequently criminalized) project of building a nationwide class movement that can overthrow the structures of capitalism.

As historians, rather than endlessly investigating “ideology,” we might do better to, say, follow Noam Chomsky’s practice of foregrounding brute repression and censorship. These factors have overwhelming explanatory value. This is illustrated by a forgotten incident that occurred in the spring of 1936: CBS invited Earl Browder, head of the U.S. Communist Party, to speak for fifteen minutes (at 10:45 p.m.) on a national radio broadcast, with the understanding that he would be answered the following night by zealous anti-Communist Congressman Hamilton Fish. Browder seized the opportunity to reach a mass audience and expounded the Marxist analysis of capitalism and prescription for a better society.

Reactions to Browder’s talk were revealing: according to both CBS and the *Daily Worker*, they were almost uniformly positive. CBS immediately received several hundred responses praising Browder’s talk, and the *Daily Worker*, whose New York address Browder had mentioned on the air, received thousands of letters. The following are representative:

Bricelyn, Minnesota: “Your speech came in fine and it was music to the ears of another unemployed for four years. Please send me full and complete data on your movement and send a few extra copies if you will, as I have some very interested friends—plenty of them eager to join up, as is yours truly.”

Evanston, Illinois: “Just listened to your speech tonight and I think it was the truest talk I ever heard on the radio. Mr. Browder, would it not be a good thing if you would have an opportunity to talk to the people of the U.S.A. at least once a week, for 30 to 60 minutes? Let’s hear from you some more, Mr. Browder.”

Springfield, Pennsylvania: “I listened to your most interesting speech recently on the radio. I would be much pleased to receive your articles on Communism. Although I am an American Legion member I believe you are at least sincere in your teachings.”

Harrold, South Dakota: “Thank you for the fine talk over the air tonight. It was good common sense and we were glad you had a chance to talk over the air and glad to hear someone who had nerve enough to speak against capitalism.”

The editors of the *Daily Worker* plaintively asked their readers, “Isn’t it time we overhauled our old horse-and-buggy methods of recruiting? While we are recruiting by ones and twos, aren’t we overlooking hundreds?” One can only imagine how many millions of people in far-flung regions would have flocked to the Communist banner had Browder and William Z. Foster been permitted the national radio audience that Coughlin was.

It is true that [ruling-class propaganda](#), constantly flooding the visual, auditory, and print media, can have a major influence on popular attitudes, manipulating the public into “conservative” political positions. But this doesn’t imply the typical Democratic argument that Americans are naturally moderate or centrist, nor does it mean that because they are somehow “steeped in the dominant themes of their nation’s history” they tend to reject left-wing ideas. Indeed, the very fact that it is necessary to deluge the public with overwhelming amounts of propaganda, and to censor and marginalize views and information associated with the political left, is significant. Why would such a massive and everlasting public relations campaign be necessary if the populace didn’t have subversive or “dangerous” values and beliefs in the first place? It is evidently imperative to *continuously police* people’s behavior and thoughts lest popular resistance overwhelm structures of class and power.

When we consider the findings of polls, we can see why the ruling class devotes such colossal spending to “manufacturing consent.” A few examples may suffice. In 1935, a *Fortune* magazine poll found that 41 percent of the upper-middle class, 49 percent of the lower-middle class, and 60 percent of the poor thought the government should not allow a man to keep investments worth over \$1 million. As late as 1942, 64 percent of people thought it was a good idea to limit annual incomes to \$25,000. That same year, another *Fortune* poll found that almost 30 percent of the nation’s factory workers thought “some form of socialism would be a good thing for the country as a whole,” while 34 percent had open minds about it—which means only 36 percent thought socialism would be “a bad thing.” Given the resources and energy the business class had dedicated to vilifying socialism, these findings are striking.

They may bring to mind more recent findings. Gallup polls have found that [40 percent](#) of Americans (and a majority of Democrats) have a positive view of socialism—which is a remarkable fact, considering that the mass media’s coverage of “socialism” is almost uniformly negative. For a similar reason, the [68 percent approval rating](#) of labor unions is also noteworthy. According to the Pew Research Center, [59 percent of Americans](#) are bothered “a lot” by the feeling that corporations and the wealthy don’t pay their fair share of taxes. [Sixty-four percent of people](#) think that protecting the environment should be a top policy priority. As usual, then, the populace is largely to the left of the two major political parties, even after being continually inundated by anti-left propaganda. In fact, a large number of people come very close to believing in communism: according to a poll in 1987, [45 percent of Americans](#) thought the Marxist slogan “from each according to his ability, to each according to his need” is so morally obvious it is enshrined in the Constitution!

But—to return to the 1930s—what about the fact of Roosevelt’s great popularity? He was hardly a revolutionary figure. Given the enormity of the economic crisis, doesn’t his popularity suggest that most Americans are indeed basically “liberal” at heart, congenitally averse to radical social change?

Well, the fact that he was popular doesn’t mean he wouldn’t have been more popular if he had pursued more transformative change. This is suggested, after all, by the stunning success of Coughlin and Long, who in 1934 and 1935 vehemently denounced Roosevelt and the New Deal for their conservatism. Historian Charles Beard observed a “staggering rapidity” in the “disintegration of President Roosevelt’s prestige” in early 1935, while journalist Martha Gellhorn wrote, “it surprises me how radically attitudes can change within four or five months.” Correspondents wrote to Roosevelt that he had “faded out on the masses of hungry, idle people,” had served only the “very rich” and proven to be “no deferent [sic] from any other President.” “Huey Long is the man we thought you were when we voted for you,” a man wrote from Montana. The so-called Second New Deal, which signified a left turn, shored up Roosevelt’s popular support, but it was not nearly as radical as many millions would have liked.

Communists, too, were more popular at the time than we might think in retrospect, despite their self-sabotage by speaking in an alien jargon and consistently praising the Soviet Union’s tyrannical regime. Millions of people passed through the party and its many auxiliary organizations (Unemployed Councils, the Young Communist League, the John Reed Clubs, the League of Struggle for Negro Rights, etc.)—again, in spite of the savage police repression and media censorship to which Communists were subjected. The party even had great success agitating for its remarkable, socialistic [Workers’ Unemployment Insurance Bill](#) between 1930 and 1936, which would have created a social democracy in some respects more expansive than that which any Western European country enacted after the Second World War. Historians have sadly neglected this bill and the nationwide wave of mass support that developed behind it, which led it to be the first federal unemployment insurance bill in U.S. history to be reported favorably out of a congressional committee (the House Labor Committee, in 1935).

In short, a case can be made that, for the sake of both advancing left-wing political goals and highlighting essential historical truths, historians ought to embrace a consciously materialistic method that emphasizes above all else the ubiquitously ramifying class struggle. Julie Greene [has acutely remarked](#) that even “struggles over environmental justice, human rights, anticolonialism, welfare rights, or women’s reproductive rights” are forms of class struggle. Class is fundamental, as Marx saw, and working people even in the “conservative” U.S. are and have been in many respects very leftist underneath all the ruling-class indoctrination to which we have been subjected. Left intellectuals ought to constantly expose this popular radicalism in public forums and never stop repeating the “reductivist” refrain that the defeat of the left has been a product of ruling-class violence and repression more than anything else. [Reductivism has its virtues.](#)

On stupidity and the excesses of wokeness

One of the first laws of human existence, or at least of existence in class societies (determined by anti-human institutions that mold human behavior), is that the world consists mostly of idiots. Or, more precisely, of people much more prone to idiocy than is desirable. (To say someone is "an idiot" or "unintelligent" or even "irrational" is inadmissibly reifying, since it treats the person as a static entity, an unchanging thing—*irrational, always and forever; just plain stupid, period*. The defensible content of the statement is that the person has *acted* irrationally or stupidly, or *in that moment* has been unintelligent. Even "stupid" or "irrational" people sometimes act intelligently and rationally.) The subject of unintelligence or irrationality—two concepts that, strictly speaking, should be distinguished from each other—doesn't get as much attention as it deserves, given the astonishing prevalence of stupidity and irrationality throughout history. How can it be explained? Why are so many people so dumb, in so many ways? What are the social, institutional, political, psychological, and biological causes? Years ago I jotted down [some thoughts on the matter](#) that I sometimes link to on this blog, but much more can be said.

Politically, for example, the right wing is virtually defined by stupidity, ignorance, bigotry, and, among the higher-ups, sheer lust for power for its own sake (even if it means destroying civilization in the process, tearing apart nature and everything pertaining to social welfare), but the left is lamentably moronic as well. A large proportion of the left's stupidity is, as usual, a result simply of indoctrination, groupthink, and conformism, tendencies that in fact go a long way toward explaining the ubiquity of stupidity/irrationality throughout history. People want to fit in—with whichever group is their preferred one—so they voluntarily and even enthusiastically submit to the ideologies or "discourses" that allow them to fit in, not sufficiently questioning them in the light of reason. The consequence is that you get billions of Christians, Muslims, Jews, etc. even in the modern world that should have left religion behind long ago. Or you get the formerly widespread belief in, say, the divine right of kings. People accept what they've been taught because they see others around them accepting it. Or you get the contemporary left's hyper-woke ideologies that serve, in large part, to marginalize leftists and alienate everyone else. These people have chosen to identify with certain groups, they've read the literature of these groups and imbibed the modes of interaction, and they've accepted it all simply on account of their self-identification (with these groups) and the values that sustain that identification.

I'll give you a trivial example, from my email inbox yesterday. I was amused to see a thread of messages on an academic listserv that were responding to this seemingly innocuous email from, let's say, Jennifer:

Good Morning,

Hope all is well. [Redacted] is in need of a few good men to assist with loading food into the pantry today, Thursday, April 7th from 12noon – 2pm in room 235. Any assistance will be greatly appreciated.

Thank you.

Seems innocent to me. A light-hearted reference to a Tom Cruise movie, etc. But a few minutes later we get, from (say) Lindsay:

Hi Jennifer. Strength does not have a sex or gender. Thank you.

Yes, the woke police were on the job. Thank God someone was there to correct the thoughtcrime! Later we read from a third person (let's say Anna):

Good afternoon All,

I am happy that [redacted] needs assistance in stocking the pantry so that we can provide nourishment for as many students and their families as possible. If anyone is able and willing, please stop by 235 to help.

Thank you Lindsay, for reminding us to be thoughtful in our interactions, both in word and deed. We must all work to un-, re- and learn interpersonal habits. If something is said or done that appears to perpetuate behavior or language we seek to change in efforts to build our inclusive and equitable community, we can be gracious and kind in pointing it out or asking for it to be addressed.

For example, I've been addressing this language in smaller spaces as it occurs: we must all remember not to address large crowds as "ladies and gentlemen" or "you guys", as doing so excludes individuals who do not identify as either. Instead, use inclusive language, such as, "all, everyone, or folks", for example. [...]

I was curious to see how far the wokeness would be taken, so I kept reading, from a fourth person:

**able-bodied volunteers. There, I fixed it for you!*

Later we see another email:

Good afternoon Anna, I really admire how you jump right in to de-escalate a situation!

Yes, the "situation" between Jennifer and Lindsay was...threatening to escalate? Luckily Anna was there to help. Moments later we get a mea culpa from Jennifer:

I sincerely apologize to anyone that took offense to the [redacted] department need for assistance. Thank you Anna for the reminder and it will be taken into consideration if the need should arise again. It was not my intention to exclude or suggest women are not strong and for that I sincerely apologize.

Phew, HR situation averted. But the issue isn't settled yet, because an hour later we see this message from yet another staffer or professor:

Thank you everyone for your thoughtful contributions and your dedication to making [this college] an institution that welcomes everyone - including students, staff and faculty.

We are all learning how to work with each other in thoughtful, compassionate ways. No one is perfect at this (speaking as a lifelong learner here).

In this spirit of sharing and learning, I'd like to add to this important conversation. "Able-bodiedness" can be used as code for "normal" in a way that is potentially harmful, painful, and exclusionary of some people with disabilities.

If the concern is that people have physical strength to volunteer, it probably makes more sense to say that the tasks will require lifting 25 (or however many pounds) rather than disqualifying people with disabilities who may be perfectly able to lift that amount or more.

And, they might even be really fun to work with!

It turns out that the term "able-bodied" is offensive too. Before long, we won't be able to talk anymore. The expression "how are you?" is offensive to people who think it's too nosy and prefer to just say "hello." And so on, and so on (to quote Slavoj Žižek).

By the way, men are, in fact, physically stronger on average than women, so it was perfectly reasonable for Jennifer to ask for male volunteers. Maybe heavy boxes had to be lifted. (I know I just committed a fascist thoughtcrime by saying men are usually stronger than women.)

This email exchange is merely amusing, but it's a microcosm of a veritable epidemic of woke stupidity among the left and liberal-left. I'm not saying everything "woke" is unnecessary or ridiculous; in many contexts, woke interventions are valuable. But the whole discourse just goes so far that it ultimately becomes its own form of "left-wing" "fascism." It would be nice if the highly woke could be relied on to use their common sense about when to intervene and when that would just be petty and alienating, but evidently a lot of them have been indoctrinated out of common sense and are happy to take wokeness to its *reductio ad absurdum*, again and again. Policing every single word people use, making a laughingstock of the left.

It reminds me of part of a *Dissent* interview with Barbara Ehrenreich in 2019:

...Or making any kind of human connection to other people. I'll give you another anecdote—though this is not about DSA. In 2009, there was an event—part of an international series of socialist gatherings—in Detroit. There was a workshop at this conference, and I had invited a group of working-class people from Fort Wayne, Indiana, who I had become close to. About six or seven of them drove from Fort Wayne to Detroit, and they were mostly laid-off foundry workers: stereotypical white men—though, actually, not all of them were white. I was closest with one of them, Tom Lewandowski, who created a workers' organization and was the head of the Central Labor Council in the Fort Wayne area. [At the event], they talked about what they were facing in the recession. And then some woman in the room who was an adjunct professor suddenly says, "I'm tired of listening to white men talk."

I was so aghast. Of course, it was a big setback for my friends from Fort Wayne, who were humiliated. I advised Tom not to get into settings where he would be subjected to that ever again. There has to be a way to say to such people, look, we know you probably aren't doing great as an adjunct, but have some respect for other people's work and their experience, and recognize that they are different from you in some way. I've just had too many encounters like that, which are kind of heartbreaking.

Such is the power of ideological thinking, which typically amounts, in some respects, to *stupid/irrational* thinking. Closed-minded, inflexible, unempathetic, inhumane thinking. The disturbing prevalence of such thinking suggests to me that most people simply lack a sufficiently *rational* (and intelligent) cast of mind, the capacity of intellectual self-defense against the pressures of socialization and indoctrination. It's an unfortunate fact about humanity, which is among the ingredients that have made possible fascism, Nazism, everyday bureaucratic inhumanity, and all manner of stupidities and cruelties. Very few people, actually, are significantly immune to such pressures—I can only think of one, the hyper-rational and hyper-individualistic Chomsky¹—but most are *very, very far* from being immune.

As I've remarked elsewhere on this blog, stupidity/irrationality often amounts to little more than *value-laden thinking*, as opposed to logical, evidence-based, *skeptical* thinking. Lindsay didn't *like* the words "a few good men," with their implication that men are better at lifting things than women (which, on average, they are), so she had to send out a stupid, irrelevant email about how women are strong too. Feminists don't *like* jokes they consider "sexist," so in the middle of comedy shows they stupidly blurt out

¹ If you—like others—think my (frequently reiterated) admiration of Chomsky is excessive, just read his works in linguistics, philosophy, cognitive science, history, and of course politics. Go and read his voluminous output, to see what I'm talking about. There's no one like him.

heckling objections or tweet about how some comedian has made a joke that's, "like, so misogynistic, like it's so not okay!" Get over yourself. Religious people don't *like* the idea that there is no God, so they ignore the hundreds of reasons to be an atheist. A third of the country *likes* Donald Trump, so it stupidly and slavishly waves away all rational objections to that monstrous buffoon. *Values, values, values*—people can't see past their values, refuse to consider anything contrary to their values (or the ideas, objects, people, and ways of being they value). They can't *step outside themselves enough* to consider objections, contrary evidence, chains of reasoning, opposing perspectives that may well be more justifiable than their own. They're *heavily immersed in their own subjectivity*, a subjectivity that doesn't sufficiently incorporate others (for such incorporation is a quality of both intelligence and rationality). Thus you get a world that teems with ludicrous ideas and people, an awe-inspiring freak show of every conceivable form of stupidity, irrationality, and insanity—all because people are trapped in their own petty little subjectivities walled by rigid personal values, windowless monads, prison cells that let in, at most, mere cracks of light.

There's an extreme of *lucid, diaphanous* consciousness and an extreme of *opaque, self-immersed* consciousness. Most of us fall somewhere in the middle, closer to one end or the other. Non-human animals have an ultra-opaque consciousness, barely incorporating other beings at all (barely self-aware, self-critical); people like Chomsky, incorporating an incredible abundance of perspectives and facts, are at the other extreme. A huge proportion of people are, it seems, disturbingly close to the animal end of the spectrum.

Since I've referred to the excesses of wokeness, it makes sense to end this post on an anti-woke note, by briefly defending the terrible left-wing heresy called "*class reductionism*." (Cue the hisses, boos, and outraged shrieks.) What an atrocious heresy, which has had such ignominious exponents as....Karl Marx and Friedrich Engels, for starters. Marxism, after all, is pretty much all about so-called class reductionism—class struggle, class solidarity, the principle of class conflict as being the most important factor in explaining social dynamics. It's a mystery to me how self-styled Marxists can inveigh against [class reductionism](#)—whatever that term means—but, again, stupidity pervades the left.

First of all, "class reductionists" like Adolph Reed Jr. are perfectly aware that issues of race, gender, sexuality, and so on are important and to some degree independent of class. They can't be wholly solved through an exclusively class-based politics. So all the rabid denouncers of class reductionism are, almost entirely, tilting at windmills. It's a classic straw-man fallacy. But there is indeed a disagreement between the camps: genuine Marxists are convinced that class solidarity offers the greatest hope and the largest social base for emancipatory and expansive social change, whereas their woke, postmodernist (identity-politics-obsessed) critics prefer, in effect, a fractured left in which each little group pursues its own agenda—Black people, immigrants, feminists, the LGBTQ community, etc.—perhaps trying to form alliances when they can. Such a politics can certainly produce gains for each group, but meanwhile, the society-wide problems of *working conditions, income distribution, housing, health care, education, unemployment, livable cities, environmental destruction, imperialism, militarism, and nonexistent democracy*—problems that affect huge proportions of people in these groups—remain largely unaddressed. Instead we get, say, campaigns around police brutality that have almost no success at eliminating police brutality—which, after all, is a somewhat minor issue (however horrendous it is) compared to the ones I just listed. All *those* problems have to be addressed through a *class* politics, an alliance of people of all colors in the (immense) working class against a predatory elite. When you build such a movement of overwhelming numbers, you have much more success at addressing *fundamental* issues than a fragmented race-based or gender-based or sexuality-based politics can have.

Marxist intellectuals have written sophisticated academic articles—like this one: ["The Class Path to Racial Liberation"]—in defense of a class-based politics over a race-based one—pointing out, for instance, that race-blind interventions in public policy, such as income redistribution, can substantially reduce racial inequality—but in truth you need only a little bit of intelligence and rationality to see the vast superiority of a strategy that targets class rather than race. "Class" = a much larger social base; solutions to fundamental social ills; potentially an egalitarian society; and plentiful opportunities to combat racial and other prejudices as all sorts of people work together in political and labor organizations. "Race" = divisiveness and fragmentation; frequent *deepening* of racial prejudice among whites who resent all this

focus on the problems of Blacks; political ineffectiveness (as seen by the failures of Black Lives Matter); relative disregard of universal and foundational social ills; and an agenda that, to a large degree, wants little more than for minorities to be treated like heterosexual whites—most of whom capitalism treats horribly. What a grand agenda! Identity politics, especially taken on its own in abstraction from a class strategy, is a retreat from the *revolutionary, universalist* visions of an older left. (And remember, the older left was far from insensitive to the grievances of minorities. The Communist Party in the 1930s really got the civil rights movement started, on the basis largely of class demands on behalf of Blacks. And unions in the AFL-CIO were important funders of the civil rights movement.)

Unfortunately, in order to see these truths, you have to be....somewhat intelligent. Which means—to return to the cynical theme that began this post—only a minority of the intellectual class is able to see them.

Common Sense in the Form of Theory

A review of Vivek Chibber, *The Class Matrix: Social Theory after the Cultural Turn*. Harvard University Press, 2022. 224 pp. \$35.00 (cloth), ISBN 9780674245136.

In the ideological disciplines—the humanities and social sciences—it is rare to come across a theoretical work that doesn't fetishize verbiage and jargonizing for their own sake. From the relatively lucid analytical Marxism of an Erik Olin Wright¹ to the turgid cultural theory of a Stuart Hall, pretentious prolixity is, apparently, seen as an end in itself. In such a context, one of the highest services an intellectual can perform is simply to return to the basics of theoretic common sense, stated clearly and concisely. Society is very complex, but, as Noam Chomsky likes to say, insofar as we understand it at all, our understanding can in principle be expressed rather simply and straightforwardly. Not only is such expression more democratic and accessible, thus permitting a broader diffusion of critical understanding of the world; it also has the merit of showing that, once you shed the paraphernalia of much academic writing, nothing particularly profound is being said. Vivek Chibber's *The Class Matrix* constitutes an exemplary demonstration of this fact, and of these virtues.

Chibber has been critiquing postmodern theory for some time now, ably defending Marxian common sense against generations of carping “culturalist” critics. His *Postcolonial Theory and the Specter of Capital* (2013) brilliantly showed that the Marxian “metanarrative” that has come under sustained attack by poststructuralists and postmodernists retains its value as an explanation of the modern world, and that many of the (often highly obscure) alternative conceptualizations of postcolonial theorists are deeply flawed. More recently, in an article published in 2020 in the journal *Catalyst* (“[Orientalism and Its Afterlives](#)”), Chibber has persuasively criticized Edward Said's classic *Orientalism* for its idealistic interpretation of modern imperialism as emanating in large part from an age-old European Orientalist discourse, rather than from a capitalist political economy that—as materialists argue—merely used such a discourse to rationalize its global expansion. In more popular venues too, notably *Jacobin*, Chibber has argued for the centrality of materialism to the projects of both interpreting and changing the world.

The Class Matrix continues his engagement with these issues, this time in the form of a systematic critique of cultural theory, specifically of its inability to explain the sources of stability and conflict in modern society. Materialism, in contrast—i.e., an emphasis on such concepts as class structures and objective economic interests rather than “discourses,” “cultures,” “identities,” and “meanings” (however important these are in a *secondary* role)—is quite capable of explaining society, and can rather easily be defended against the criticisms of (some) culturalists. The book's admirable lucidity serves several functions: first, Chibber is able to present the arguments of a variety of “culturalisms,” from Gramscians'

¹ See Russell Jacoby's savage review of Wright's *Envisioning Real Utopias* entitled “[Real Men Find Real Utopias](#),” *Dissent*, Winter 2011, for an exposure of the intellectual emptiness of a certain type of “theoretical” sociology.

to the Frankfurt School's to those of the post-1970s cultural turn, very clearly and in a way that illuminates the stakes of the debate; second, his eloquent reconstruction of (aspects of) cultural theory lays the ground for an equally eloquent, and much more thorough, exposition of structural class theory, which is shown to have no difficulty (contrary to the claims of culturalists) in explaining the longevity and stability of capitalism; third, the discarding of all unnecessary verbiage and jargon makes it clear just how intellectually trivial these long-running theoretical debates are in the first place. One can have a perfectly defensible and sophisticated understanding of the modern world on the basis of rational common sense and knowledge of history.

Chibber starts by presenting the culturalist case. Why didn't the West become socialist in the twentieth century, as Marxists predicted? Evidently Marx had gotten something wrong. In fact, it was argued (in the postwar era), he neglected the role of *culture* in forming the consciousness of the working class. Mass culture and the diffusion of dominant ideologies were able to reconcile the working class to capitalism, indeed to generate active popular consent for it. This analysis amounted to a demotion of the classical Marxist emphasis on the conflictual dynamics of the class structure—which supposedly would naturally lead to proletarian class consciousness and thereby revolution—in favor of the cohesive functions of mid-twentieth-century culture. Later culturalists took this argument a step further by rejecting the Marxian theory altogether, arguing that culture is actually *prior* to structure: what people are really presented with are not unmediated structures or objective material interests but “constellations of meaning” (p. 6), social identities, local cultures, contingent processes of socialization that shape how actors understand the many structures they are located in. One cannot (*pace* classical Marxism) predict behavior from people's structural locations and the interests they supposedly define, because people first have to *interpret* structures, a process that is highly contingent and variable. Subjectivity, therefore, is primary, and the objectivity of class structures tends to evaporate.

Chibber's response to this postmodernist argument, in effect, is that while it is perfectly true every structure is steeped in culture and agents' subjectivity, this hardly implies the causal inertness of class location. Capitalist institutions don't impose high interpretive requirements: everyone is capable of understanding “what it means” to be a worker or a capitalist. If you lack ownership of the means of production, you either submit to wage labor or you starve. The economic structures force themselves on you. “[T]he proletarian's *meaning orientation* is [therefore] the effect of his *structural location*” (p. 34). Similarly, the capitalist has to obey market imperatives (structures) in order to survive as a capitalist, so he, too, is compelled to subordinate his normative orientation to objectively existing capitalist institutions. In fact, it is the postmodern culturalists who are in the weaker position: how can they explain “the indubitable fact of capitalism's expansion across the globe and the obvious similarity in its macrodynamics across these regions” without accepting materialist assumptions (p. 45)?

Having dispatched this particular objection to materialism, Chibber moves on to other difficulties. Given the antagonistic relations between worker and capitalist (which Chibber elaborates on in detail), why hasn't collective resistance, and ultimately revolution, been more common? The obvious answer, contrary to cultural theory, is that the asymmetry of power between worker and capitalist is so great that workers find it quite difficult to fight successfully for their collective interests. The insecurity of the worker's position (for example, he can be fired for union activity) makes it easier and safer to pursue *individualized* modes of advancement or resistance. Moreover, the intrinsic problems of collective action—free rider problems, difficulty in securing agreement among large numbers of workers, etc.—militate against class consciousness and collective resistance. Classical Marxists were wrong to assume that the most rational path for workers would always be the “collective” path. In fact, contingent cultural considerations play an important role in the formation (in any given case) of class consciousness—although culture always remains constrained by material factors.

Having successfully and eloquently deployed common sense in his first two chapters, Chibber now turns, in the lengthy third chapter, to an explanation of how capitalism has endured. Here, too, he prefers common sense to the idealistic arguments of many Gramscians and New Left theorists, who pointed to bourgeois “cultural hegemony” and ideological indoctrination as having manufactured consent among the working class. One problem with this theory is its dim view of workers: “Culturalists are in the embarrassing

position of claiming implicitly that while *they* can discern the exploitative—and hence unjust—character of the employment relation, the actors who are, *in fact*, being exploited, who are experiencing its brute facts, are not capable of doing so” (p. 91). There are, admittedly, other possible understandings of the basis of mass consent, more materialistic understandings, but in the end Chibber rejects these as the primary explanation for capitalist stability. Instead, he argues that workers simply *resign* themselves to capitalism—they “accept their location in the class structure because they see no other viable option” (p. 106). What Marx called “the dull compulsion of economic relations” keeps the gears of capitalism grinding on, generation after generation, including in the absence of workers’ “consent” to their subordination.¹ In short, the class structure itself—the enormous power asymmetry between employer and employee—underwrites its own stability, and there is no need to invoke “consent” at all (even if such consent does, perhaps, exist in certain periods).

There remain a couple of other issues Chibber has to address in order for his defense of materialism to be really systematic. First, what about the old charge from E. P. Thompson that “structural theories bury social agency” (p. 122)? Is this necessarily the case, this conflict between structure and agency? No, as long as one acknowledges the role of *reasons* in motivating people’s actions. “The structure is not reproduced because it turns agents into automatons but because it generates good *reasons* for them to play by its rules” (p. 123). A structural process may be rather deterministic in its outcome, but it “is generated by the active intervention of social agency” (p. 126). Given the structures of capitalism, people rationally adapt to them, regulating their behavior in accord with them. Structure thus exerts its causal force precisely through agency.

Of course, agency also exists in tension with structure insofar as agents can flout institutional norms or even rebel against particular structures. This point brings us to another question Chibber considers, namely the relation between structural “determinism” and *contingency*, another favorite concept—along with agency—of the postmodern cultural turn. His argument here is quite rich and nuanced, much too subtle, in fact, to be summarized in a short book review. (It goes without saying that I have merely been outlining his arguments, hardly doing justice to their richness.) One might think that such an austere structuralism as Chibber defends would be unable to account for the contingency of social processes, but through a fairly ingenious analysis he is able to answer this objection, too. Even *prima facie*, however, the objection doesn’t hold much water, because capitalist relations are evidently compatible with an immense variety of social structures, such that between nations and even within a nation there can be great heterogeneity of local cultures. In a world of infinitely many structures and cultures interacting and overlapping, all of them being activated and enlivened by countless individual free wills, there is clearly a place for contingency on both small and large scales. Materialism can therefore accommodate the “argument from contingency”.

The Class Matrix, in short, is a quite thorough and impressive work, not only a compelling defense of materialism but also a fair-minded if highly critical engagement with cultural theory. It isn’t clear how culturalists—especially the anti-Marxist ones—can effectively respond to this broadside, tightly and cogently argued as it is. They might, perhaps, be able to make the case that there is a greater role for culture than Chibber allows (although he does grant the importance of cultural considerations at many points in his arguments), but they certainly can no longer sustain the claim that materialism is deeply flawed.

In fact, that claim could never have been sustained anyway, because, in the end, materialism—the causal primacy of class structures (and the theoretical implications of this doctrine)—is little more than

¹ This argument, indeed much of the book, is anticipated not only, as it were, by common sense (most workers could tell you they don’t *embrace* their position but simply find it inescapable), but also by a brilliant book Chibber doesn’t cite: *The Dominant Ideology Thesis*, by Nicholas Abercrombie et al. (London: George Allen & Unwin, 1980). Incidentally, I myself have grappled with the question of why socialism hasn’t happened yet and have offered a quite different, and perhaps more original, explanation than Chibber. See my paper “Marxism and the Solidarity Economy: Toward a New Theory of Revolution,” *Class, Race and Corporate Power* 9, no. 1 (2021), as well as the shorter articles “Revolution in the Twenty-First Century: A Reconsideration of Marxism,” *New Politics*, May 5, 2020, and “Eleven Theses on Socialist Revolution,” *Socialist Forum* (Summer 2021).

common sense. The average member of the working class, more insightful (realistic) in many ways than most intellectuals, could tell you about the overwhelming importance of economic institutions. If classical Marxism got certain predictions wrong, that wasn't because of any inherent flaws in historical materialism. As Chibber shows, it was because the original theorists misunderstood the implications of their own theory. There was never a good reason to think socialist revolution would “naturally” happen as workers “naturally” achieved greater class consciousness. These predictions were but a projection of the hopes of Marxists, not logical entailments of materialism. In our own day, when the historic achievements of Western labor movements have been or are in the process of being destroyed, it is unclear what the way forward is—except, as ever, for working-class self-organization and critical materialist understanding of society. Toward the latter task, at least, *The Class Matrix* makes a valuable contribution.

Classical music vs. mediocrity

On one side is the mediocrity of all functionaries. All bureaucrats. Let's take a glance, for instance, at the *intellectual* bureaucrats. Here is a randomly selected passage from a typical academic essay (entitled “The state as social relation: Poulantzas on materiality and political strategy”):

...In this [essay], I discuss Poulantzas' work through this lens of the materiality of the capitalist state... I argue that by theorising the state as a social relation—more specifically, as a material condensation of a relationship of forces between classes and class fractions—Poulantzas was able to sidestep the theoretical dilemmas that confounded prior Marxist thinking about the state. Furthermore, Poulantzas' account of political strategy follows from his treatment of the state as a material condensation of political forces. In particular, his conception of the state as a contradictory and uneven terrain that is potentially open to the intervention of the ‘popular classes’ into a given conjuncture continues to provide a foundation for a distinctly Marxist theory of politics.

The author of this passage is no worse a writer than most academics. But my god, what a load of dreck. This is what the “intellectual bureaucracy” looks like, this dull and sterile academese that specializes in saying something without saying anything. Poor Marx is spinning in his grave at the thought of his revolutionary, world-overturning writings being domesticated, via twisted academic byways over the last hundred years, into this desiccated tripe. What is being said in this passage? “A material condensation of political forces.” Okay, yes, the state is a sort of microcosm of conflicts between classes, class fractions, and other groups. Nicos Poulantzas was not the first to say this; nor even was Marx, though he said it in biting and striking ways. It's common sense. But that term “material condensation”—what a vivid metaphor! And it has the word “material” in it, so it's revolutionary! What about the last sentence, the thesis of the whole article? The state is “a contradictory and uneven terrain”: congratulations on finding a pretentious way to say governments are complex. As for the rest of the sentence, yes, Poulantzas and the author are both right that ordinary people can potentially, in certain circumstances, have some influence on governments. What a profound thesis! If this is the “foundation” of the Marxist theory of politics, well then it's a grand and ambitious theory after all, isn't it?

This kind of stuff is why Noam Chomsky says the social sciences are intellectually trivial. Stating truisms in such an aesthetically offensive way serves no other purpose than to help the author fill out his CV and hopefully get tenure someday.

So, on one side is *this* verbiage, which constitutes perhaps 75 percent of academic output. On the other side is...what helps keep me going: Bach, Handel, Scarlatti, Mozart, Beethoven, Schubert, and scattered composers from the century after that. Careerist obedience on the one hand, life-giving humanism on the other. The contrast could not be starker.

Leftists often have an inordinate fondness for such musical genres as punk, metal, hip hop, and the like. Much of this seems to me to be little more than creative sterility and puerility, scarcely worth any attention except as a temporary cathartic escape (or an intriguing sociological symptom to be studied). It's true these genres have some very good songs, but even those are, creatively and artistically speaking, on a lower level than the great music of the past. And that music was as far from "elitist" or "undemocratic" as you can imagine, being little but an elevation and ennobling of *folk* music, to quote the old socialist Oscar Ameringer.¹ People are free to like whatever they want, but leftists should know that nothing is more anti-capitalist than the music of the eighteenth and (most of) the nineteenth centuries. Pop culture, by contrast, is thoroughly integrated into commercial structures, thoroughly money-driven, business-conscious, and commodified.

However therapeutic and fun, sometimes beautiful, popular music can be, classical music *raises you above yourself*—if you really listen to it, study it, and choose good composers to listen to. Such music can have an uncanny power of washing away all the particularities, the grievances and regrets, of your selfhood so that you commune with the universal. You forget the barrenness of our bureaucratized culture, the obedience and the rank *pretense*; you have direct contact with the highest thoughts and feelings, miracles of creativity. These are the ultimate antidotes to the nihilism of life in the United States.

The magic of music is worth pondering. Consider Bach's epic Chaconne for solo violin, about which violinist Joshua Bell has this to say: "not just one of the greatest pieces of music ever written, but one of the greatest achievements of any man in history. It's a spiritually powerful piece, emotionally powerful, structurally perfect." Three hundred years ago, a man returned from a trip to find his wife, who had been healthy, dead from some sudden illness. He grieved, and in his grief he wrote the greatest piece for solo violin in history. He sat down with pen and paper, heard imaginary sounds in his head, imposed a structure on them, crafted them so that they would be a perfectly formed artistic whole, and through the miracle of musical notation transmitted them to paper. Other people then read this notation and used it to reproduce, with their instruments, what the man had conceived in his bitter solitude. His silent inner thoughts were externalized and made concrete so that they could be shared with the world. Generation after generation, century after century, musicians and audiences continued to reproduce and contemplate the thoughts of that old, long-dead man from the eighteenth century who was mourning his wife. Through the media of print and musical performance, the ideas of one person were implanted in the minds of millions of others. And a musical community stretching across centuries, a community of listeners and performers, was created whenever the piece was played. People listened and actually wept, from the sheer mysterious power of sounds arranged in a certain way.

In fact, they themselves, in a sense, *re-created* the music simply by hearing it: their brains processed the sounds, organized them as human brains do, structured them harmonically and melodically such that everyone heard the same harmonies and melodies and marveled at them. What one (unconscious) part of their brain was doing, creating the music by listening to it, another part contemplated in awe.

People even translated Bach's thoughts for different instruments. Ferruccio Busoni wrote a brilliant arrangement for piano, and a hundred years later Hélène Grimaud performed both Bach and Busoni's thoughts at a piano recital one can watch on the internet. Across spans of time, people collaborated in a collective artistic project. Viewers of Grimaud's concert heard the piece and in some cases were themselves inspired to play it on their own piano, having been influenced by Bach-Busoni-Grimaud. And so the chain extended, in a continually expanding display of collective intelligence and creativity. All of which was initiated by one man's imagination as he was shut in a room somewhere three centuries ago.

Grimaud's recital is worth watching on YouTube. In the middle, for instance, after a series of variations on grief, anger, and despair (universalized, not personalized), the music shifts to a softer and

¹ Oscar Ameringer, *If You Don't Weaken* (New York: Henry Holt & Company, 1940), 265, 266. He describes proselytizing for socialism among Oklahoma farmers in the 1890s, at big tent meetings where he and his sons also played pieces by Bach, Mendelssohn, Schubert, and others. "Those simple people took to good music like ducks to water. Their minds were not yet corrupted by the Tin Pan Alley trash that later was a music for profit. Besides, 'classical music' is folk music clarified, interpreted and ennobled by the great masters, and these were folk people."

more consoling register. It is quite moving. It sounds like acceptance, peaceful resignation, expressed in the rich and sonorous voice of some angelic being. And the music builds, as the sufferer is even able to find beauty in his sorrow. It builds and builds, at last reaching even joy and finally ecstasy. Eventually, however, it returns to its earlier register, and at length the piece ends on a note of cosmic darkness.

All this is the very essence of humanity's higher faculties. It is world-spanning, world-creating, world-communicating. We humans *live in each other's minds*. We *create* on the basis of each other's minds, each other's creativity. We interpenetrate, universally, such that a global community can spring from a single person's artistic imagination. What Beethoven wrote two hundred years ago unites billions. His body is long gone, but his mind, in a sense, lives on, in us all, as we live in each other's minds.

So, thank God for music, which can elevate our thoughts in this way and *transport* us out of ourselves. On the basis of music it is almost possible to achieve Nietzsche's goal of *amor fati*, love of fate, love of everything. Sorrow becomes joy. One forgets the mediocre, one sloughs it off effortlessly by being transported to a different realm. That is the highest function of *good* music, as it is the highest function of all art. (But music is the most profound and transporting of the arts, I find.)

Listen to high art when you're sick of modern living. Quite possibly, it will revitalize you.

Organized Labor and the Crisis of Democracy

We live in a time when it's become a boring cliché to say that democracy is under attack. Whether it's an ultra-reactionary Supreme Court, a nationwide Republican assault on voting rights, a MAGA movement that hopes to put an amoral power addict back in the presidency in 2024, a gathering backlash against women's rights and LGBTQ rights, or the very structure of an oligarchical, billionaire-dominated political economy, circumstances in the U.S.—and abroad—are hardly encouraging for people who value democracy and human rights. It seems that things get bleaker every year, so much so that it can be difficult to have any hope at all.

There is, however, at least one glimmer of hope for democracy, and it comes from a source that might initially, to many people, seem rather unrelated: a renascent labor movement.

Given that the primary role of unions is to advocate for the interests of their members on the job, one might wonder how they could play an essential part in protecting and revitalizing the very different institution of political democracy. How can organizations with such a *particular* mission, a seemingly narrow economic one, serve as a buttress for the *universal* interest of democracy itself? Actually, according to polls, two thirds of Americans approve of labor unions, suggesting they understand what a constructive force unions are. If people knew the real history of organized labor, however, the number would probably be close to 90 percent.

So let's take a look at history to gain some insight into why labor organizations are so fundamental to democracy, and why it's so predictable that their decline in the last forty years has led to a political crisis and the rise of neofascism.

The origins of democracy

The very establishment of democracy in the first place—universal suffrage and equal voting “weight” across classes—was in large measure the achievement of unions, labor-based political parties (whether called Socialist, Social Democrat, Labor, or some other name), and mass working-class protest. To quote one scholar, throughout the long struggle across the West to broaden the franchise, from the nineteenth to the twentieth centuries, the labor movement “was the only consistent democratic force in the arena,” playing a “vital role” at nearly all stages in most countries. In Britain, for example, decades of labor organizing and mass demonstrations, from the Chartists of the 1830s to the working-class Reform League of the 1860s and further union agitation up to the 1880s, were a crucial precondition for the enfranchisement

of all men. By the early twentieth century, the new Labor Party also supported the women's suffrage movement.

To take another example, that of Belgium, a comprehensive study observes that “working-class pressure and particularly the use of the political strike were constant features of the process of Belgian democratization from the 1880s on.” As elsewhere, it took decades of struggle to overcome the hostility of the propertied classes—many urban capitalists, agrarian landowners, and the Catholic establishment—but, in alliance with Liberals, the Belgian Labor Party was finally able to establish full male democracy in 1919.

Waves of democratization occurred in the aftermath of the two world wars, and in all or nearly all cases, labor and its representatives were catalysts. Germany's Weimar Republic, which instituted universal suffrage, was a creation of the labor-based Social Democrats. In Sweden, years of strikes, worker demonstrations, and Social Democratic pressure in Parliament culminated in the passage of universal suffrage by 1920. The achievement of full parliamentary democracy after World War II in Italy, France, Austria, Canada, eventually Japan, and other countries was, of course, a result of the world-overturning mobilization of the working class and the Left against fascism, which was defeated primarily by Communists.

What about the United States? “Full” democracy in this supposedly freest of countries didn't exist until the late 1960s, after the passage of the Civil Rights Act and the Voting Rights Act. We're accustomed to thinking of these legislative accomplishments as the fruit of a *religiously* grounded movement organized around Black churches in the South, but in fact, “the long civil rights movement” of the 1930s–1960s critically depended on labor organizations such as the Communist Party (in the 1930s) and industrial unions. Historians have called it “civil rights unionism.” Communists organized Black and white workers to challenge racial discrimination in employment and politics, not least in the savagely white supremacist South, and unions in the CIO, and later (after 1955) the AFL-CIO, continued this sort of work even in the repressive political climate of the Cold War. The AFL-CIO and most of its affiliated unions funded the Civil Rights Movement, actively supported its legal initiatives, and, in the case of the UAW, sent staff members into the Deep South to assist with voter registration drives. Indeed, some of the movement's major leaders, from A. Philip Randolph to E. D. Nixon (who organized the Montgomery bus boycott and chose Martin Luther King Jr. to lead it), came from a union background.

Conversely, it wasn't only *political* democracy that was at stake; the movement aimed to emulate labor movements elsewhere and establish *social* democracy. The 1963 March on Washington, for example, included in its demands decent housing, adequate education, a massive federal works program, a living wage for everyone, and a broadened Fair Labor Standards Act. King himself later became a socialist and helped organize a vast Poor People's Campaign, though he was assassinated before it came to fruition.

Even recent struggles against authoritarian governments have been largely driven by labor organizations and worker protests. From Spain in the late Franco years, Chile under Pinochet, and Argentina under neo-Nazi generals, to the Arab Spring of 2011, workers and unions have not only, through collective action, destabilized despotic regimes but have often led the resistance that overthrew them. This isn't surprising, since the working class is typically the group that suffers most from a lack of democracy.

In short, it is hardly an exaggeration when yet another scholarly study concludes that “the organized working class appeared as a key actor in the development of full democracy almost everywhere.”

Organized labor means solidarity

Evidently, then, unions and other labor organizations aren't as “narrowly economic” as it might seem. They do exist to raise wages and expand benefits for their members, and to enhance job security and increase workers' control over their work, but their functions extend further for two reasons. First, the economic well-being of workers isn't determined only on the job or through collective bargaining; it is a profoundly political issue, intrinsically connected with government policies and the very structures of the political economy. So there are powerful incentives to get involved in politics, whether that takes the form of mass protests, creating political parties, lobbying, or whatever.

Second, unions are, in the end, little else but *their members*. They are themselves, or should be, democracies. What the membership desires, therefore, is (ideally) what the union pursues. The guiding principle of business is to make profit, at all costs; the guiding principle of organized labor is simply to empower people, who can themselves determine what their goals are. So if they decide that their goal is to democratize society—as they very well might and often have—then that’s what they’ll try to do.

For both reasons, most of the time and over a long period, the large-scale thrust of labor organizations is to increase democracy: political and social democracy, and ultimately, perhaps, economic democracy, in which workers oust the boss and run the workplace themselves. The sheer size of the membership and (frequently) the immense resources of organized labor mean that the efforts can have momentous effects.

In the absence of strong unions, on the other hand, “the general prey of the rich on the poor,” as Thomas Jefferson described it, can take truly savage forms and go to lycanthropic extremes. Income and wealth inequality can skyrocket; billionaires can pay trivial tax rates of 3% or 4%, far lower than the rates that most wage-earners pay; agencies like the Occupational Safety and Health Administration that exist to protect workers’ rights can be gutted and hamstrung; vast networks of far-right dark money, political organizations, and media infrastructure can spring up unopposed by comparable networks on the left; reactionaries find it easier to be elected and to appoint fellow reactionaries to the judiciary, which subsequently eviscerates voting rights, opens the floodgates to corporate political spending, makes it more difficult for workers to organize, and overturns *Roe v. Wade*. In general, the decline of unions means relatively untrammelled rule by big business, which itself means oligarchy.

Millions of working people who might have found a home in organized labor, as they did in the mid-twentieth century, become socially unmoored and fall prey to far-right media, lunatic ideologies, racist demagogues, and conservative Christianity. The human need for belonging, for interpreting one’s misfortunes and finding meaning in something larger than oneself, can be fulfilled in either rational or irrational ways. It’s rational for wage-earners to join economic and political organizations that fight for democracy in all its forms; but when such organizations have an anemic social presence, people who have been bombarded by well-funded right-wing propaganda may irrationally join movements that, in effect, seek to strip them of their rights and eliminate democracy itself.

In these circumstances, the priorities of liberals, from abortion rights to anti-racism to environmental legislation, will meet failure after failure because their mass base begins to shrink, to be less readily mobilized, and to feel ever more alienated from the political system. The “professional-managerial class” isn’t enough of a mass base in itself, notwithstanding the apparent belief of two generations of Democratic leaders that it is. We’re seeing the dismal collapse of this illusion play out right now, along with the collapse of the attendant ideology, an identity politics evacuated of class content (which means, more exactly, that it is in fact a class politics, “the politics of the left-wing of neoliberalism,” to quote Adolph Reed). After all, a major reason twentieth-century liberalism ever had any success in the first place, from the 1930s to (in an increasingly attenuated form) the 1990s, was that it had organized labor on its side, and the financial, cultural, and human resources of organized labor. It turns out that when you not only take your popular constituency for granted but collude in its decimation, sooner or later your political fortunes—the fortunes of the Democratic Party and liberalism—decline.

Any liberal who actually cares about saving democracy should be cheering the resurgent labor movement and scrambling to support it in every way possible. In the long run, the only alternative to an authoritarian and neofascist politics is a labor politics. At some point you have to decide which side you’re on.

Even the so-called “cultural” issues dear to liberals have for generations seen active support from labor. In addition to anti-racism and the Civil Rights Movement, labor has often marched beside feminists in the fight for women’s rights, whether pay equality, the Equal Rights Amendment (by the early 1970s, that is), or reproductive rights. Few writers have expressed themselves on these subjects as eloquently as the socialist leader Eugene Debs in 1918: “Freedom, complete freedom, is the goal of woman’s struggle in the modern world... She, the mother of man, shall be the sovereign ruler of the world. She shall have sole custody of her own body; she shall have perfect sex freedom as well as economic, intellectual and moral

freedom, and she alone who suffers the agony of birth shall have control of the creative functions with which she is endowed.”

The natural tendency of organized labor is toward solidarity with all oppressed groups. No other social force is equally equipped to defend everyone and everything under attack today: women, minorities, immigrants, the welfare state, the rule of law, and democracy. No other social force is comparably universal or has a comparable interest in resisting the predations of the oligarchy. No other force offers as much hope for humanity as the cause of labor. For labor *is*, precisely, the cause of humanity.

It is the duty of all believers in freedom and democracy to take up the banner of labor.

A Critique of Social Constructionist Feminism

On various pages of my website and blog I've criticized some of the dogmas of feminism, for instance the social constructionist dogmas about gender (as if [sex hormones](#), for example, have nothing to do with gendered behavior!), the belief that *every form* of unequal power relations between men and women [can someday, hopefully, be overcome](#), and the naïve idea that racism and sexism are equally morally problematic (the truth is that racism is just plain wrong, morally and intellectually, while sexism is part of human nature inasmuch as men and women are, on average, psychologically different and frequently get angry at each other, misunderstand each other, and generalize about each other¹). But I sometimes return to these matters because I think the fashionable demonization of men as such [goes a little too far](#),² and I'm annoyed by the lack of rational, evidence-based thinking and the deeply tribal tendencies among most leftists (no different in this respect from other categories of people, whether conservatives, academics, liberals, the wealthy, or whoever). I think it can be useful to have voices on the left who serve as occasional gadflies. (Not that I have a particle of influence.)

—I suppose I should stop subjecting myself to the feminist men-bashing, and the "[gender is merely constructed and performed!](#)" ideologizing, that's been rampant on social media and in the mass media for years. But I do, once again, want to embellish on points I've made elsewhere that poke holes in the dominant discourse of social constructionism. *Feminism is an essential and overwhelmingly constructive political movement, but, like any movement, it isn't immune to criticism.*

One might ask, "Why even criticize the logical and factual errors feminists make, if on the whole the movement is so constructive?" In part, it simply comes down to whether we care about understanding human behavior. If we don't care about that, then one key reason for making criticisms is gone. But if we do care, then we should be willing to sometimes think un-ideologically. The Judith Butler sort of "anti-essentialist" idealism, totally dismissive of all [scientific research](#) that shows the influence of physiology on gender and sexuality, is very primitive, and yet it's utterly hegemonic among liberals and leftists. Doubtless for political reasons. And while there might, sometimes, be political value in trumpeting the reductive message that humans are nothing but products of sexist socialization, I think we should be willing to explore the possibility that humans are *also* rational, creative, and reasonable, and that men and women, on average, are, in fact, slightly different—not only because of passive subjection to sexist discourses (which does occur, obviously) but also because of the *active* functioning of their brains and bodies.

In answering the above question, one might furthermore say that, if a liberal-left movement starts to alienate large numbers of people who broadly share its values and goals—as woke feminism sometimes does (alienating even such militant feminists as [Camille Paglia](#))—then it's worth looking at *why* this is the case. For instance, is the movement mistaken in some of its social analyses? We shouldn't, out of the

¹ Many expressions of sexism are awful and should be challenged through activism, but sexism as such—categorizing most people as either male or female and being strongly influenced in your thoughts and behavior by that categorization—is universal. For example, taking greater care not to hurt women's feelings than men's is both sexist and very, very common—and also the right thing to do, because women and men are different.

² The linked article has flaws, but it isn't worthless.

pressures of groupthink and cowardice, shrink from critical interrogation of any powerful ideology, including feminism. Constructive criticism might even advance the goals of the left, like by discouraging irrational divisive rhetoric against people who could be political allies.

My final apology for this blog post is that psychology interests me, and I find it unfortunate that, at least in recent decades, there have been so few honest "phenomenological" accounts of the nature and causes of gender relations, accounts that make explicit what is implicit. I don't see why such analyses have to be incompatible with left-wing values—or have to be academically pretentious and perverse in the way (sometimes) of gender studies. Reasoning on matters of social concern should be democratic and accessible.

So here are some foolhardy but hopefully accurate reflections on the sexes, which have the implication that we shouldn't blame men or "the patriarchy," or even "socialization," for *every* type of inequality between men and women. "Nature" plays a [larger role](#) than most feminists allow. Once we accept this fact, moreover, we might devote less time to spouting misandrist, *objectively reactionary* nonsense about the awfulness of men as such and more time to attacking real problems, from authoritarian political control over women's bodies to economic inequality between the sexes.

Some preliminary thoughts on "male dominance"

Consider the notion of "the patriarchy." We hear of this concept all the time. Is there such a thing as the patriarchy? Surely, in a sense, yes. It seems that all "complex" societies and a good many "less complex" ones have been at least partially patriarchal, both in the public and the private spheres. In their book *The Dawn of Everything*, David Graeber and David Wengrow argue that Minoan Crete during the Bronze Age was ruled by women, but even this is debatable, as they admit. The Marxist anthropologist Maurice Godelier argued in an article called "The Origins of Male Domination" (1981) that, while many "primitive" societies have been basically egalitarian, "in the last analysis" it is likely that men have always "occupied the summit of the power hierarchy." Why? One reason isn't hard to fathom: men are usually physically stronger, taller, and larger than women. In all animal species, these traits tend to correlate with (relative) dominance.¹

So yes, it appears that men are, *on average* and with plenty of individual exceptions, in important respects the dominant sex, and one is free to lament this fact if one wants. (Personally, I find it extremely lamentable—lamentable even that there should be such a thing as "dominance" in nature at all.) One can also apply the word "patriarchy" to it if one wants. But it is indicative only of lazy and idealistic thinking to say the tendency of male dominance is *solely* a result of "socialization" or sexist "discourses" or some

¹ Notice, also, that even just among men, physical strength and size tend to correlate with relative dominance, other things being equal. A smaller and weaker man is usually less dominant than a large and strong one—and elicits less sexual interest from women (most of whom show greater preference for strong, tall, (semi-)dominant men). So it's hardly only women who are disadvantaged by the inequalities that are inscribed in nature.

Incidentally, feminist literature has addressed this question of physical strength and size. Let me comment on, for example, Kate Millett's overrated classic *Sexual Politics*, which denigrates biology in favor of culture: "*The heavier musculature of the male is biological in origin...but is also culturally encouraged through breeding, diet and exercise*" (p. 27). True. Culture is important. But the male's "heavier musculature" seems to be "culturally encouraged" in nearly all societies, for reasons of competition between males, hunting for prey, sexual prowess, etc. "*Yet it is hardly an adequate category on which to base political relations within civilization. Male supremacy, like other political creeds*"—but it isn't only a political creed; it's a deeply rooted tendency in personal relations (as we'll see)—"*does not finally reside in physical strength but in the acceptance of a value system which is not biological.*" Again, true: a value system, as such, isn't merely "biological"; it's also cultural. But there is no reason to think biology can't influence value systems. (For instance, the value placed on sex and procreation is clearly biological in origin.) "*Superior physical strength is not a factor in political relations—vide those of race and class.*" Well, for one thing, I'm not making a vulgar reduction of political relations to superior male strength, so this criticism doesn't really apply to me. But, actually, superior physical strength *can be* a factor in political relations. Suppose one race were very physically weak: we would hardly be surprised to find that it was frequently enslaved by others. —Anyway, this gives you the gist of some of Millett's arguments against the importance of "nature." The others are similarly weak.

such. These things are relevant, but, in this case, social constructs and discourses emerge to some extent out of prior conditions of human physiology, anatomy, the biology of sex, and innate psychology. Unless we genetically reengineer the human species so that, for example, women are stronger and larger and men are physically weaker and smaller, we're never doing away with *some degree* of relative male dominance—though that doesn't mean we can't *reduce* the disparity in status between men and women.

(What does dominance mean here? It means the tendency to—often informally—be a leader, to be confident and assertive, respected, listened to, to have a "strong presence" and generally a higher status. Of course, other factors are important, such as intelligence and verbal fluency, and these are not even *relatively* monopolized by the male sex, which is why there have been so many female leaders in history.)

Another consideration related to men's relative strength, but also to their typically greater [visual-spatial skills](#) and facility with (or interest in) the mechanical problems of constructing tools and the built environment, is that men have been overwhelmingly responsible for creating the actual physical infrastructure of civilization. How often do you see women in construction crews? (Even if they can certainly do most of the tasks associated with construction work, it's more "natural," given sexual aptitudes, for men to do such work. Sexist discrimination is hardly irrelevant here, by the way; but even in the absence of such sexism, it is unlikely women ever would have constituted a *majority* of construction workers, carpenters, contractors, artisans, and the like.) One reason—in addition to workplace discrimination—there are fewer female engineers, architects, mathematicians, technologists, and other "[systemizing](#)" types is that women, [partly because of sex hormones](#), are usually more interested in *people-oriented* occupations (education, social work, law, politics, art, dance, theater, music, history). Well, it doesn't require deep insight to see that constructing the material basis of civilization confers a lot of prestige and power.

To the extent that women increase their involvement in such activities of construction, engineering, and manipulation of the physical environment, their status and power will rise.

Here's another factor related to brute physicality: men's achievements in athletics and sports have always surpassed women's, for obvious reasons. Sports are a highly visible, culturally central activity, in relation to which women are treated as either *secondary* (in the case of female athletes) or *spectators*. The implications for female status are obvious.

This permanent fact of *some* male dominance, however, doesn't imply a permanent monopoly of *political and economic* power, for such power is a function of institutional arrangements and can be changed through activism. For many reasons these institutional circumstances are extremely stubborn and difficult to eradicate, but in principle, it may be possible someday in the future, in many (hopefully all!) countries, that men and women will hold equal or virtually equal economic and political power. The type of patriarchy this activism targets should and, perhaps, can indeed be abolished.

On psychological differences between the sexes

It's already an indictment of academic feminism and gender theory that you won't often encounter in such writing the perfectly obvious points I've made here—because these points are perceived as unflattering to women, politically pessimistic (I'm "naturalizing" gender, [like a scientist](#)), and hence unsayable. The humanities and social sciences, after all, are largely ideological, not strictly scientific or intellectually honest. (It's ironic that postmodernists have [critiqued](#) natural science as being ideological, socially constructed, and reflective of power relations, when those criticisms apply [with far more force](#) to postmodernism itself.)

But what I've said so far is only the tip of the iceberg. It's frequently considered rather enlightened or progressive for women to denounce men, in egregious (and "sexist") generalizations, as being, say, misogynistic, insensitive, selfish, narcissistic, and the like, but let's put aside the ideology and look honestly at male and female psychology and romantic relations.

I sometimes find puzzling the nearly universal conspiracy of silence about obvious average differences between the psychologies of men and women. Even without delving into the [scientific research](#) of the past century, some of the differences are apparent. There surely must be *some* implications regarding "male dominance" that most women, for example, cry more easily and often than men—behavior that

people don't see as exuding dominance—and are more excitable and intensely emotional than men. (See Julia Serano's [Whipping Girl](#) for an account of how her emotions became more intense after she transitioned to being a woman. Most stereotypes about the sexes contain a kernel of truth—which is why they're stereotypes to begin with.) A man who was as prone to laughter, tears, excitement, anger, [anxiety](#), and so on as women are (*on average*) would be seen, doubtless, as weak, childish, and very unattractive to the opposite sex. Heterosexual men tend to be more emotionally *detached* than women, more "sober," to quote Kierkegaard from this offensive-sounding and overly generalizing passage in *The Sickness Unto Death*:

Woman has neither the selfishly developed conception of the self nor the intellectuality of man, for all that she is his superior in tenderness and fineness of feeling. [Her] nature is devotion, submission, and it is unwomanly if it is not so... [A] woman who is happy without devotion, that is, without giving herself away (to whatever it may be she gives herself) is unwomanly. A man also devotes himself (gives himself away), and it is a poor sort of a man who does not do it; but his self is not devotion..., nor does he acquire himself by devotion, as in another sense a woman does, he has himself; he gives himself away, but his self still remains behind as a sober consciousness of devotion, whereas woman, with genuine womanliness, plunges her self into that to which she devotes herself...

His mode of expression here is certainly objectionable, but he shows insight into average differences between men and women. One reason people associate women and children, after all, as distinct from men, is that both are more likely to exist in a sort of *emotional immediacy*. They're (usually) more "in the moment," more excitable and receptive—which is one reason men enjoy their presence.¹

Indeed, it's worth asking a question that is rarely asked in a serious way: why have such large proportions of men throughout history been attracted to teenage children? Ancient Greeks with their love of beautiful boys, kings and emperors with their harems of young women, countless "dirty old men" with their child brides, hordes of pedophiles today—what explains it? The answer isn't hard to think of: attraction to children is just a (pathological) extension of attraction to women. Women's tendency to emotional receptivity and excitability isn't *categorically* different from children's; it's only of a less extreme nature. Feminine "giggling," for instance—a rather *receptive* thing, not *assertive*—is sort of on a continuum with childlike giggling. Men find female giggling very attractive, and *some* men find *childlike* giggling attractive.

As unwoke as it may be to say this, implicit in male attraction to women is a kind of condescension, a *protective* urge. Young men, especially, are apt to see women as some sort of semi-angelic being, innocent, naïve, childlike, fragile, needing protection from the cruel world. John Keats gave expression to this feeling in the poem quoted near the bottom of [this page](#), called "Woman! when I behold thee flippant, vain." Men feel similarly about their children: they need protection by the "adult," the one "in charge," the man. (Of course, women want to protect their child too, but, having a different affective cast of mind, they experience this impulse differently than men do.)

—None of this, again, should be controversial. It's just straightforward phenomenological description of human psychology, the kind of thing any intellectual would be happy to write if he or she

¹ The feminist urge to say, in effect, "Sexism!" in response to such thoughts as Kierkegaard's, and thereby to dismiss them, isn't a serious response. Kierkegaard was no idiot, and he had far more psychological insight than the run-of-the-mill feminist. By the way, women's "permission" to be relatively emotional—and, to repeat, this stereotype of "emotionalism" is [based on truth](#), not prejudice—is an example of a kind of *female privilege*: as I just said above, a man who acted exactly like most women do would be judged laughable and pathetic because of his lack of self-control. (*This is just a fact about how he'd be perceived; I'm not making any value-judgment, as if I endorse such a perception or—idiotically—think there's something shameful about female behavior. Lest one kill the messenger, one has to distinguish between reporting facts and 'endorsing' facts.*)

I also might as well note here that there is much truth to the widespread idea that gender is on a spectrum, that the sexes aren't absolutely different, and that everyone has masculine and feminine traits. I'm only saying (or rather reporting the results of scientific research) that most women cluster near one end of this psychological spectrum while most men cluster near the other end.

were sufficiently courageous and interested in truth. But no, we're supposed to think that the age-old *yin/yang duality*—acknowledged in some form by countless cultures—is pure nonsense, a mere social artifact with no basis in human nature! So much for postmodernists' supposed respect for other cultures and their insights.

When someone has the urge—and is expected—to protect, and to be *gentle* (like during sex), to always refrain from exercising his full strength, to be careful what he says so as not to hurt feelings, to "be a shoulder to cry on," and to control himself at all times because of his responsibilities, he is the one who (implicitly or explicitly) has the higher status and the greater power. Adults therefore—and for other reasons—have a higher status than children, and the male sex, unfortunately, has, in general, an at least *slightly* higher status than the female. Women and children are typically permitted to sort of "lose control" in public, to get emotional and even violent (think of women who hit their children or get infuriated at store clerks or some other hapless employee), but if a man acts that way he'll quite possibly be arrested. In this and other respects, society holds men to a higher standard. Likewise, if a young man and woman are drunk together and she seems sexually receptive, some feminists argue that he should act in her best interest and refrain from sexual activity because she might regret it later. She hasn't *really* given her consent. That is, they hold him to a higher standard: he is expected to know what's good for her better than she is. He is supposed to compensate for her "weakness."

Men's higher status—and society's higher standards for them (in *some* respects)—are constantly indicated by trivial, and of course "socially constructed," daily incidents the significance of which most of us, including feminists, hardly even notice. When a wife adopts her husband's last name, that indicates his status. She is adopting him as an important element of her identity. When she holds his arm as they walk together, that's a *tiny* indication of the difference in status between them. When a man is the customary "leader" in a dance with a woman, that expresses his higher status. Women who write things in their online dating profiles like "Make me laugh!" or "Teach me something!" or "Take me to your favorite bar!" are unknowingly expressing their relative passivity—and their *desire* to be relatively passive, their enjoyment of it. (This isn't "oppression," by the way, and there's nothing wrong with it, or with any other female desire.) The universally valued, chivalrous injunction to "save the women and children first!" in the case of an emergency is an expression of the *somewhat* comparable status of women and children. The list goes on without end. Most types of female/male behavior, especially in, say, the first half of life (when, e.g., testosterone concentrations in men are highest), communicate relative passiveness vs. relative activeness—and the fact that this isn't *only* because of "socialization" is shown by the presence of these tendencies across *very different* societies, from, say, pre-Columbian Native American ones to modern China or the U.S.

Sex itself is, typically, characteristic of stereotypical gender relations. To enter a woman and ejaculate inside her is quite a manifestation of male potency. In most sexual positions, from missionary to doggy-style, women are the so-called "submissive" partner. And their verbalizations during sex, more often than not, express passiveness: "Do me!" "How do you want me?" "I love your power!" Even the ecstatic contortions of their bodies signify a kind of relative passiveness, *being-done-to* and losing control. On the whole, the man has taken charge. —Again, these tendencies are not *only* "socially constructed." They emerge organically out of the very nature of sexual intercourse (notwithstanding exceptions, such as sexually submissive men).

It's rarely explicitly acknowledged that women and men experience sex, love, and romance very differently, because (in part) of anatomy, physiology, and psychology. To penetrate someone, and to desire that, is different than to be penetrated and to desire that. The former is intrinsically self-assertive, "virile," semi-dominating; the latter is more akin to submission and to elevation of one's partner. No wonder, then, that men want to have sex with as many women as possible (because it's intrinsically self-affirming) whereas women more often want to pick one partner, get to know him, take the measure of him, and decide if he's actually a person they'd want *inside* them, who could possibly impregnate them. Likewise, men are intoxicated by the female body; they're *driven* to see it naked and touch it everywhere, ravenously grope it and squeeze it and kiss it and taste it—"objectify" it: "License my roving hands, and let them go / Before, behind, between, above, below," [John Donne said](#), speaking for the male sex. And women, of course, frequently enjoy this: they enjoy being touched, fondled, kissed, "manhandled" to some extent, treated

almost as putty in a man's hands. The relations of power or relative dominance in this situation are pretty clear (and are comparable to those in most other "romantic" situations, whether the man is making the woman giggle, giving her flowers, paying for her dinner, buying her jewelry, or fulfilling some other wish of hers).

All of this is almost too obvious to point out,¹ but somehow people are still able to say, "Why do women have a lower status than men? It must be *only* because of male misogyny! It's the patriarchy!" The intellectual naïveté of this—or the willful blindness—is remarkable. The rage at men can even be somewhat galling, because, as I noted, the average heterosexual woman implicitly *wants* and *expects*, in certain contexts, to be of a slightly lower "status" than men, more receptive, protected, and so on. How many women are attracted to men of lower status than they—weaker men, shorter men, insecure men? A man thought to be of a *higher* status (whether in terms of his (perceived) confidence, his finances, his career, his physical strength, his older age, or whatever) is infinitely more attractive.

In fact, behavior that some feminists, such as Andrea Dworkin, have criticized as misogynistic and degrading to women is often *celebrated*—perhaps rightly—by "sex-positive" feminists, who plausibly argue that women should be allowed to explore their sexuality even if it takes "demeaning" forms that Dworkin wouldn't like. Wearing flagrantly self-objectifying clothing, for example, or enjoying and participating in degrading pornography, are sometimes considered "empowering" for women. (Similarly, one recalls the widespread celebration some years ago of Beyoncé's commodification of her sexuality as a bold feminist move.) Apparently the irony passes unnoticed that behavior that *reinforces* women's objectification and subordination should be considered "empowering." But this is yet another instance of the common and perfectly normal female desire—in part a social artifact, and not always consciously acknowledged, but nonetheless a deeply rooted desire—to be relatively "passive" in certain circumstances.

Again, though, to describe all these facts has no implications with regard to essential types of feminist activism. It should be self-evident that the activism focused on domestic violence, rape, sexual harassment, the right to have abortions, and on material issues of childcare, economic security and status, etc., is of a wholly different moral character than the naïve intellectual discourses that pretend there is no natural basis at all for "sexist" gender relations. This is why I'm saying nothing about the fight against political misogyny: it's too obviously legitimate and necessary, and there's nothing interesting to be said about it because it's already universally embraced by leftists and liberals.

But what a disgrace, in the age of 21st-century science, that a semi-"blank slate" model of the mind is still taken seriously by vast numbers of educated people! Behold the influence of postmodern idealism/empiricism—Foucault, Bruno Latour, Judith Butler, and the like, but also the more general, scientifically illiterate *100% social constructionism* of much feminism since the 1960s.²

Not only women suffer

This post has taken on a rather polemical tone, so I should probably repeat the disclaimer I made in a footnote: *I'm not making value-judgments (as if men are "better," whatever that means)*. We're free to deplore any fact about how people naturally behave and think. Personally, I do deplore the "immorality" of nature—the cross-species tendency to valorize "dominance" and devalue, for example, males who are weaker or smaller, or females, or, say, anyone who is physically unattractive. Or, even worse, the vicious

¹ It's also seen as *impolite*—or even misogynistic—to point it out. But, while it's quite proper that in polite company you shouldn't make elementary observations about human behavior that might make someone uncomfortable, if you're actually interested in *understanding*, you can hardly ignore the implications of any of this.

² Social constructionist feminists are in an unenviable position. For the sake of their ideology they're committed to denying that biology or natural human responses play any role *at all* in constructing gender or status relations between men and women—because as soon as you admit they play even a small role, you're naturalizing gender—but this forces them to ignore or try to explain away every piece of scientific evidence and every consideration of elementary rationality that suggests gender is grounded in biology. So they can't help but be dogmatic, irrational, and scientifically perverse.

struggle for survival itself: the carnivorous eating alive of luckless prey, the starving to death of endless numbers of animals, the very creation of an animal—*homo sapiens*—capable of the horrors history is full of. Nature cares nothing about our human values of equality and justice.¹

If you want to play the value-judgment game, it isn't hard to find reasons to say men are the more "shameful" sex. The proliferation of pedophiles, sleazebags, sociopaths, psychopaths, sadists, narcissists, domineering buffoons, amoral power addicts, and every other horrific type of male personality (though not only male) is enough to establish this. A feminist friend of mine once said, "men are *actively* horrible, while women are horrible in their passiveness." The second half of that statement is a little harsh, but there's a lot of truth to the first half. Of course, it too is oversimplified. Men should be shamed to the extent that they act badly, and women should be shamed if they act badly too. Neither sex is "better" than the other, and it's incredibly immature to make such judgments. We're all individuals with our unique strengths and weaknesses.

Having said a little about the partially *natural* foundations of gender stereotypes—and by implication the inadequacy of feminists' blaming men for *every* type of sexual inequality (as though women have no agency and are nothing but victims)—I want to say something about the liberal and left tendency to ignore or dismiss the problems of men in favor of an exclusive focus on the concerns of what they call "the marginalized." (*As if millions of men—even white cisgendered men, believe it or not!—aren't effectively "marginalized" in our crushingly inhuman late-capitalist trainwreck of a civilization!*) It isn't exactly a brilliant political strategy to try to alienate an enormous popular constituency.

It must be said, first, that it certainly is hideous how much suffering men cause women (and each other). Not only institutionally, as with the blatantly misogynistic Supreme Court, but also personally. We shouldn't be surprised that the dominant sex is apt to treat "the second sex" appallingly, not least because the dominant sex (sometimes) treats everyone, including fellow males, appallingly. But that hardly excuses it.² Western society, fortunately, has become well aware of women's suffering due to the achievements of feminism since the 1960s, even if the U.S. is currently experiencing a regression. Unfortunately—on a personal level—male violence and abuse persist, and surely, to some degree, always will. The best we can do is to mitigate them, through education and a more enlightened politics.

With the progress of feminism, however, has, as I said, come a relative decline of interest in the problems of men. Attention to these is now often relegated to the dark corners of the internet—incel forums and the like—and reactionary media figures. The [intellectual buffoon Jordan Peterson](#) quite possibly never would have become a celebrity if liberalism and the left had not ignored the concerns of millions of left-behind young men, a huge sea of lost souls. Who are now, in many cases, ripe for fascism because of their rage and alienation.

Even if their despair couldn't have been solved, it's important at least to be *noticed*. Peterson notices them, and they love him for it.

¹ This isn't to endorse Social Darwinism. Humans are a deeply social and communal species who can, do, and should take care of each other.

² It does, however, make somewhat less impressive the usual charge of "misogyny!" Men treat each other horrifically, just as badly, in a sense, as they treat women. And they often treat women much better, much more respectfully. As I said above, sexism or "double standards" can work to the advantage of women, as when women aren't ridiculed or ostracized for behavior that would get a man relentlessly mocked or even physically assaulted. In this respect, feminists, despite themselves, are very much in favor of a kind of positive sexism or an underlying chivalry—and they're right. It would be unbelievably offensive and gauche, or worse, to treat women just as one treats men. (For example: if a woman acts in a highly obnoxious way, a way that would get a man knocked out if he acted similarly, a man is forbidden from hitting her, because she's a "weak" and "defenseless" woman. It's telling that there *isn't* a similar stricture against hitting a comparably weak or physically frail man, which you'd think there would be if simple "weakness" or "defenselessness" were the issue. Instead, it seems that chivalry and sexism are the only motivations for this (morally right) "don't hit women" rule. This is even more clearly the case given that society is actually more forgiving of parents who hit their children than of men who hit women!—despite the greater disparity in strength between adults and children than between men and women!)

Much of the despair arises from their relations with women. Or their lack of relations with women. What they need are *left-wing* figures to talk to them, to acknowledge them and "recognize" them. Or, better, left-wing institutions and public spaces to discuss together and raise consciousness. There's no substitute for sex or a relationship with a woman—it is this that allows the man to feel like a *man*, to feel affirmed, listened to, cared for and loved—but the construction of public spaces could be precisely a means toward realizing these desires. Social privatization and atomization, driven by neoliberal capitalism, bear much of the blame for the loneliness epidemic that afflicts men and women, but these men, brainwashed by [libertarianism](#) and Ben Shapiro, end up as ideological foot-soldiers for exactly this capitalism that has been their downfall!

I have to admit I have some sympathy for the millions of young men who are sexually starved, anguished, frequently rejected by women after one date for no apparent reason except that she "didn't feel the chemistry." (And what determines chemistry? If he's funny enough, charming enough, good at flirting, or else very good-looking, etc. If he doesn't exude a confident and high-status masculinity, she'll quite possibly brush him aside and look for someone else.) It isn't fun to be lonely, as we all know. I think of that guy who tweeted some weeks ago that he's gone on countless dates, been consistently kind and friendly, and yet been rejected so often that it seems as if all women had a meeting wherein they decided not to date him. So he's just come to accept that he'll never have a girlfriend, and he's trying to adjust to that fact.

I don't really know what I'd say to them, but I wish I could talk to these men who feel *hardly human* because of their rejection by the opposite sex. They feel *ignored*, *invisible*, many of them. To be shunned by such *beautiful* people (it seems) as women is the most awful injury, cutting to the very core of one's manhood.

And so, in misery, a lot of these men become misogynistic. But what is misogyny? It can take structural forms, as when women are systematically excluded from some institution, and it can take subjective forms, as in the hostile attitudes that find expression online. Feminists have stretched the term so that almost anything can be misogynistic—acting chivalrously, looking at a woman's half-exposed breasts, "objectifying" her (as if her highly revealing clothing isn't self-objectifying), making some inadvertent generalization in a conversation—but this is just the usual excess that attends all popular movements. We shouldn't let it mislead us into thinking misogyny is only imagined and not a real problem. There is misogyny even in the womanizing behavior of charismatic, narcissistic, sociopathic men (see: the [Tinder Swindler](#)) who are wildly popular with women and end up breaking their hearts.

Unfortunately, there is no hope to eradicate misogyny. Resentment or even hatred of women will always be present in some men who have been frequently rejected—just as hatred of men will often be present in women who have been rejected. These are natural psychological reactions to acute unhappiness that is thought to be caused by some group of people. You can no more do away with them than you can do away with the human psyche. But it's true that in a less privatized, atomized, and frivolous society, a world without such an incredibly toxic dating culture, the sexes would doubtless have a healthier attitude toward each other.

Meanwhile, for the sake of reducing the threat of fascism, it would be advisable for leftists and liberals to stop ridiculing and demonizing all men and instead start taking them and their problems seriously. Otherwise you're driving them into the arms of the fascists. (Historically, liberalism has always been complicit in fascism—liberals fear socialism, or economic democracy, more than fascism—but it's sad that even leftists now are complicit in the rise of the far-right.¹) After all, it isn't as if most women are saints either. Both sexes participate in and/or benefit from the exploitative, authoritarian relations of capitalism, and both sexes (or most members of both sexes) are harmed by them also. Both sexes act with astonishing cruelty toward other people. As individuals, men are no worse than women.

Many feminists—I see them on social media pretty often—will deny that men have distinctive problems at all, but to wildly dismiss the opposite sex like this is only to substitute a fascism-enabling war between the sexes for the revolutionary war between the classes.

¹ Frankly, they were complicit even in the 1930s, given the suicidal sectarianism of both Communists and Social Democrats.

Rationality vs. ideology

Mainstream intellectual culture revolves around denying or ignoring uncomfortable truths. It is controlled and policed by ideologists who refuse to face—or to publish—obvious facts about a wide array of issues: the disastrous nature of capitalism, the catastrophic role of the U.S. in the world, the total amorality of power centers, the desperate need, for the sake of human survival, to build global anti-capitalist movements. And, far down the list, the irrationality and misandrist tendencies of feminist intellectual discourse.

It's perfectly predictable that most liberals or leftists who come across this blog post will have no response to it except "Misogyny!", but my hope is that some readers will have the cognitive capacity to separate the realm of value from the realm of fact. To look at *homo sapiens* honestly, warts and all, holding their value-judgments at bay.

To spread the message—implicitly or explicitly—that men are nothing but terrible oppressors, that their masculinity is "toxic," that they're alone responsible for all of history's evils and have contributed very little that's positive, that virtue is equivalent to femininity, that only women really suffer and that male perspectives are intrinsically prejudiced and unjust, is to turn people against both feminism and the left. Likewise, to reduce all of gender and sexuality to *socialization*, as if sex hormones don't exist and women and men aren't *naturally* psychologically different in some respects, is to turn people against feminism, because these dogmas are transparently ideological and stupid. It's as if Judith Butler and her acolytes, provincially postmodernist, have never read a [scientific paper](#) or are incapable of reflecting on the status implications of, say, physical size and strength or the tendency to cry easily and crave protection by men. However ridiculous these status implications are, they do exist.

It would be nice if feminism could be more realistic and less fanatically social constructionist/woke, but that won't happen. Mere reason is hopeless against hegemonic institutions and ideologies. It's up to more realistic people, or the more realistic side of the same people, to focus on the things that matter: class organizing, resistance to the dismantling of abortion rights, organizing for maternity leave and free childcare, the defeat of all Republican candidates for office, in general raising the security and status of women. *This* is what's rational and what's needed—not the contempt for men that often passes as feminist.

“Race Reductionism” Threatens to Doom the Left

The reparations debate is getting old. But it shows little sign of abating. [Academic papers](#) continue to parse the idea of reparations for slavery; books continue to be written on the subject, adding to the mountain of material that already exists; celebrated journalists [give speeches](#) to the UN advocating reparations. Democratic candidates in 2020 prominently and sympathetically discussed the issue on the campaign trail. The debate is not going away anytime soon. It is the more unfortunate, then, that much of it is conducted in an unserious way.

The recent “national conversation” about reparations is usually traced to Ta-Nehisi Coates’ 2014 essay in *The Atlantic* “[The Case for Reparations](#),” but this piece only gave a shot in the arm to a conversation that was already quite spirited and publicly visible. Talk of reparations entered the mainstream in the 1990s and early 2000s, having been confined largely to circles of Black nationalism starting in the 1960s. Lawsuits were filed, and dismissed, against the U.S. government and corporations that had profited from slavery; books such as *The Debt: What America Owes to Blacks* (2000), by Randall Robinson, were published to advocate for reparations; magazines and newspapers across the country, from *Harper’s* to the *Los Angeles Times*, presented the case, as did numerous academic papers and conferences. “Reparations” was in the air: Japanese-American internees during World War II had been compensated in 1988; survivors of the Holocaust were being compensated; the Truth and Reconciliation Commission in South Africa recommended reparations for apartheid, and such commissions in Chile, Guatemala, Colombia, Peru, Sierra

Leone, Canada, and many other countries made similar proposals. Year after year, the ideological momentum behind slavery reparations increased, and Coates' essay increased it even further.

The *New York Times*' 1619 Project gave yet another boost to the demand for redress, probably the most significant boost so far. As a systematic effort to interpret U.S. history entirely in terms of the oppression of Blacks, it was tailor-made to advance the reparations narrative. The immense resources of the *Times*, in collaboration with the corporate-endowed Pulitzer Center, went into designing and distributing a curriculum that schools could use to teach the 1619 Project. This massive nationwide campaign soon coincided, fortuitously, with the George Floyd protests in 2020 and the revival of Black Lives Matter. By then, Black identity politics was so deeply embedded in the nation's culture that conservatives discovered they could capitalize on it by inventing a "critical race theory" boogeyman to frighten whites into supporting reactionary politicians and reactionary policies. The discourse of anti-racism and reparations continued to spread even as the right-wing backlash against it grew in intensity and effectiveness.

In the last couple of years, books on reparations have not been lacking. Their titles indicate their content: *From Here to Equality: Reparations for Black Americans in the Twenty-First Century* (2020); *Who Will Pay Reparations on My Soul?* (2021); *Reparations: A Christian Call for Repentance and Repair* (2021); *Reparations Now!* (2021); *Reparations Handbook: A Practical Approach to Reparations for Black Americans* (2021); *Reparations for Slavery* (2021); *Time for Reparations: A Global Perspective* (2021). Liberal America can't get enough of the reparations idea. Fewer books on the subject have been published in 2022, but *Reconsidering Reparations*, by Olúfẹ̀mi Táíwò, is an exception that has gotten some attention. It may be worth briefly reviewing here, because its shortcomings illustrate the shortcomings of the whole reparations discourse, indeed "identity politics" itself.

A debate rages on the left between the practitioners of identity politics and alleged "class reductionists," but the latter seem to be decidedly in the minority. This is unfortunate, because in order to defeat the threat of the far-right—whether it's called white nationalism, Christian nationalism, white supremacy, neofascism, or proto-fascism—we're going to have to build a movement on the basis of class struggle. This doesn't mean denying the legitimacy of the grievances of groups defined by race, ethnicity, gender, or sexuality, but it does mean incorporating them in a broader movement organized around the old Marxian dualism: the working class vs. the capitalist class.

Reconsidering reparations

From a Marxian point of view, the inadequacies of Táíwò's book start in its first paragraph:

Injustice and oppression are global in scale. Why? Because Trans-Atlantic slavery and colonialism built the world we live in, and slavery and colonialism were unjust and oppressive. If we want reparations, we should be thinking more broadly about how to remake the world system.

Apparently the world is unjust not because capitalism is inherently unjust, but because it began, centuries ago, in slavery and colonialism. We're called to remake the world system, but the focus is on how horrible the past was, and, admittedly, how horrible the present is for non-white people because of their past. Capitalism as such isn't mentioned; instead, as in all of the reparations discourse, it is slavery, the slave trade, colonialism, and racism that are emphasized. This fact, of course, is why the liberal establishment is comfortable talking about reparations and even invests enormous resources in propagating the narrative. It understands that it poses no threats to its own power and serves as a useful distraction from class conflict as such.

The purpose of *Reconsidering Reparations* is to argue that "reparation is a construction project," the project of building a new world, a "just distribution." Táíwò approvingly quotes a historian: reparation is "less about the transfer of resources...as it is [sic] about the transformation of *all* social relations...re-envisioning and reconstructing a world-system." He borrows a concept from Adom Getachew that has become fashionable: "worldmaking." Just as the postwar decolonization movements were engaged in

worldmaking, hoping to build a just society on a global scale, so we must continue their project, this time, importantly, taking into account the disasters of climate change that will disproportionately affect countries in the Global South. Reparation, according to Táíwò, is about more than mere income redistribution.

This line of argument is admirably dismissive of liberal technocratic tinkering with palliative policies, but there is an obvious retort to it: socialist, communist, and anarchist revolutionaries since the nineteenth century have always been devoted to this sort of “worldmaking,” and there is nothing original about such a formulation. There has never been a need to justify world revolution in terms of “reparations” for past injustices; rather, the imperative has simply been that because people of all races and genders are horrifically suffering in the present, we need socialism (economic democracy). The revolutionary project has been justified on *class* grounds, not racial grounds. Why the need for a new justification? The answer is clear: reparations is currently a fashionable idea, and for the sake of one’s career and relevance, it makes sense to use fashionable ideas to reframe old ideologies. Doing so may be wholly unnecessary, but at least it gives one’s book the appearance of originality.

It seems noteworthy that nowhere in his book does Táíwò use the word “socialism,” even though his vision for the future is the traditional socialist one: “everyone in the world order should have capabilities that grant effective access to the means of maintaining their biological existence, economic power, and political agency. Our target must be a global community thoroughly structured by non-domination.” Maybe he thought that using the dreaded s-word might not be wise from a careerist point of view, or maybe he thought it would associate his book with an earlier Marxist tradition and thus detract from his attempts at both originality and distinguishing his account from one that prioritizes *class* solidarity. Whatever the reason, the omission is telling.

Much of *Reconsidering Reparations* is dedicated to reviewing the history of what Táíwò calls Global Racial Empire and how it led to the structural disadvantages people of color face today. A historian need have no quarrel with any of this. It is an incontrovertible truth that, for hundreds of years, people of color have been systematically exterminated, enslaved, exploited, massacred, forced off their lands, stripped of their cultures, reduced to peonage, denied the opportunity to own a home, denied a decent education, disproportionately imprisoned, disproportionately consigned to unemployment, and disproportionately subjected to police brutality. A large part of the literature on reparations is concerned to establish these facts, and they certainly do need to be broadcast far and wide. Left critics of the reparations concept do not deny any of the horrifying history or the abysmal present.

What they deny, first of all, is that reparation on a scale large enough to make a difference is practicable. As Coates wrote, “Broach the topic of reparations today and a barrage of questions inevitably follows: Who will be paid? How much will they be paid? Who will pay?” Surely tens of millions of Blacks in the United States are entitled to reparations (not to mention the many descendants of Native Americans and arguably other groups), a number on an altogether different scale than, say, Japanese-American internees or Holocaust survivors. Each of these people, we may grant for the sake of argument, is owed a very large sum of money. Táíwò endorses the idea of unconditional cash transfers to African Americans, perhaps on top of a universal basic income (UBI) for everyone. It isn’t hard to imagine the vast logistical and bureaucratic difficulties of administering such a plan (not the UBI but the reparations). Táíwò’s proposals are extremely abstract, like those of most reparationists, but other writers have suggested that truth commissions could assess the harm cumulatively suffered by African Americans, and on that basis the amount of each payment could somehow be determined. In *Atonement and Forgiveness: A New Model for Black Reparations* (2006), Roy Brooks proposes that a trust fund administer individual payments for the purposes of education and funding businesses, and the total amount of money in the trust would be determined by multiplying the average difference in income of Black and white Americans by the number of Black Americans.

Most writers (including Brooks and Táíwò) reject the idea of merely a one-time cash payout in favor of remedies that “deal with long-term issues in the African-American community,” to quote philosopher Molefi Kete Asante. “Among the potential options,” Asante says, “are educational grants, health care, land or property grants, and a combination of such grants” (cited in Alfred Brophy’s *Reparations: Pro and Con* (2006)). Community development programs are a popular idea in the literature;

for example, Táíwò mentions the African-American Reparations Commission's plan that money be transferred to "cooperative enterprises" and that financing be provided for the "planning and construction of holistic and sustainable 'villages' with affordable housing and comprehensive cultural-educational, health and wellness, employment and economic services."

Whatever the moral merit of these and a myriad of other vague proposals, they face obvious and intractable obstacles. First, as mentioned, is the administrative and political nightmare of determining which individuals or communities will receive reparations, how they will be distributed, and how they will be funded. Second, and even more fundamental, is the question that Adolph Reed posed in 2000 and that has not been answered, because it cannot be answered: "How can we imagine building a political force that would enable us to prevail on this issue?" It is a shockingly obvious problem with the whole reparations discourse, and so intractable that it utterly vitiates the latter. Are we to believe that in an age of resurgent proto-fascism, fueled in part by white fears of something as mild as "critical race theory" and the very idea that racism has played a significant role in American history, a tiny minority of anti-racist activists will be able to build a nationwide movement so overwhelming that it sweeps into power a supermajority of legislators committed to radically restructuring society on the basis of reparations for slavery? Does any serious person find this scenario remotely conceivable?

Táíwò, like nearly all reparationists, scarcely even acknowledges these problems. Why are they so rarely discussed? A cynic would have a ready answer to this question: the politics of reparations is largely *performative*, a way of demonstrating one's political virtue, of surfing the wave of elite liberal preoccupations and perhaps even boldly veering off to the left, thus really proving one's revolutionary bona fides. It doesn't matter if ambitious national—much less global—reparations legislation is inconceivable; the point, if you're an academic, is to have a trendy research project and to play around with various ideas for their own sake. Táíwò, for example, waxes philosophical on conceptual distinctions such as *responsibility vs. liability*, and on the strengths and weaknesses of certain arguments for reparations, including "harm repair" arguments, "relationship repair" arguments, and his own "constructive view" that he considers the most defensible. It's all a waste of time. The most important question is ignored: *how are we to build a massive political movement that will crucially depend on the altruism of white people in a country where whites have been consistently more than 70 percent opposed to the movement's goals?*

Most reparationists don't consider themselves Marxists, but since some do, it is worth pointing out that the movement they advocate doesn't make contact with Marxism. Eugene Debs was a true Marxist when he said, "Solidarity is not a matter of sentiment but a fact, cold and impassive as the granite foundations of a skyscraper. If the basic element, identity of interest, clarity of vision, honesty of intent, and oneness of purpose, or any of these is lacking, all sentimental pleas for solidarity, and all other efforts to achieve it will be barren of results." There is no shared interest or solidarity between white and Black workers when the latter demand from the former (and other whites) financial compensation for centuries of white supremacy. This is instead an idealistic appeal to mass altruism, which, given the motivating force of economic self-interest for most people (of which Marxists are well aware), is unlikely to get very far.

Therefore, it is not only the practicability of material reparations (on a substantial scale) that Marxists deny. It is also the revolutionary or socialist character of the program itself. As Reed, again, has argued, the program is profoundly anti-solidaristic, in that it pits Black workers against white workers. "We've suffered more than you," it says, "and therefore deserve more, even at your expense." It tends to minimize, in fact, the suffering and exploitation of white workers, so much so that even authors who consider themselves anti-capitalist, like Táíwò, are apt to recognize the systemic *class* injustice of capitalism, if at all, only in the mode of an afterthought. This is certainly true of *Reconsidering Reparations*. The book evinces hardly any awareness that capitalism in its origins, its history, and its present has been a horror story not only for people of color but for the exploited and immiserated of all races. Europe's peasantry wasn't exactly coddled during the transition from feudalism to capitalism, which, lest we forget, required kicking them off the land and produced centuries of mass impoverishment in cities and the countryside. Popular uprisings were crushed again and again, vast numbers were massacred, millions were subjected to forced labor of some form, millions experienced the death-in-life of slaving away in mines and early factories.

It should be unnecessary to observe, too, that even today many whites are not having an easy time of it. In the U.S., 43 percent of people on welfare are white. Death rates for whites, especially those without a college degree, have been rising for years, largely because of the “deaths of despair” phenomenon. And most white men (56 percent) lack a college degree (compared to 74 percent of Black men). More whites are killed by police than all other races combined, although the rate at which Blacks are killed is more than twice as high as the rate for whites. Weak unions and stratospheric economic inequality don’t harm only people of color: poor whites are actually more pessimistic, more depressed, and more prone to committing suicide than poor Blacks and Hispanics. Underlying all this is the fundamental fact of capitalism: most people of all races are deprived of control over their work and ownership of productive assets, leaving them with little defense—in the absence of unions—against high rates of exploitation, low wages, autocratic domination by investors and managers, and economic insecurity. Nor are whites unaffected by the housing crisis, the burden of student and consumer debt, environmental crises, or the cultural and psychological pathologies of life in a viciously atomized society.

It isn’t hard to make a case, therefore, that working-class whites deserve “reparations” too. As a Marxist would argue, the wealth they’ve produced for generations has been stolen from them, and they’ve suffered immensely as a result. Why don’t we talk about reparations that the capitalist class owes to the working class? Why is the agenda framed in terms of *whites vs. non-whites*? Again, the answer is clear: this sort of “race reductionism” is, from the perspective of the ruling class that finances it, a fantastically useful diversion from class struggle, which in its implications leads toward the sort of race war that white supremacists advocate. We see, then, that a supposedly left discourse effectively joins hands with the far-right, and even provides it with excellent talking points. (“Those Blacks, lazy parasites, want to take all our hard-earned money! We already give them welfare, now they want even more!”) It helps the racists. This may be an unfair thing to say, but one recalls Marcus Garvey’s flirtation with the Ku Klux Klan. Black nationalism or anything like it—anything that treats the artificial concept of “Black people” or “the Black community” as denoting an entity with a coherent set of interests, as though it isn’t riven by its own class conflicts—is not a genuine left politics.

While it is important to talk about the specific problems faced by people of color, it is even more important, for the sake of solidarity and building a political coalition against both capitalism and proto-fascism, to talk about the *shared interests* of (so to speak) “the 99 percent.” The reparations discourse does the exact opposite of this.

Defeating the right

How can we defeat the far-right and the stagnant center? That is the urgent question. The left has to focus ruthlessly on the question of strategy.

There is a widespread belief among leftists that the only way to defeat racism and thereby achieve working-class solidarity is to constantly talk about how terrible it is to be a person of color, how oppressed such people have been throughout history, and how saturated in racism society is. We have to, as much as possible, draw attention to race rather than submerge it under the fact of shared class interests. In her book *From #BlackLivesMatter to Black Liberation* (2016), for instance, Keeanga-Yamahtta Taylor chastises Bernie Sanders for “essentially argu[ing] that addressing economic inequality is the best way to combat racism.” This is an old argument, she says, from the pre-World War I right wing of the socialist movement, which was discredited when Communist parties around the world were able to recruit millions of non-white people by recognizing the legitimacy of their own distinctive, racially inflected and colonially determined grievances. In the U.S., thousands of Blacks joined the Communist Party because of the party’s attention to the scourge of racism. Moreover, their recruitment to the left did much to energize it and, perhaps, radicalize it. Surely these facts validate a race-centered strategy?

What she fails to see is that the situation today is very different. Today the left has an imperative need to recruit Latinos and whites, who otherwise might join the far-right. There is little danger of Blacks joining a white nationalist movement. If we want to drive economically insecure, socially unmoored, and politically despairing whites into the arms of the right, a great way to do that is by telling them, in effect,

that their own suffering and anxieties are of little moment compared to the suffering of Blacks, and that whites are almost universally racist. Similarly, we should tell men that their masculinity is toxic, that all of them are sexist oppressors and mansplaining chauvinists. As Steve Bannon said in 2017, “the longer [the Democrats] talk about identity politics, I got ’em. I want them to talk about racism every day. If the left is focused on race and identity, and we [Republicans] go with economic nationalism, we can crush the Democrats.” Bannon, whatever else he may be, is a savvy political operator whose opinions on strategy should be taken seriously.

The Communist Party in the 1930s had to overcome an incomparably more virulent racism among white workers and unionists than exists today. But it did so not by *emphasizing* race, and certainly not by calling for whites to pay enormous amounts of money for reparations. That would have gotten it nowhere, just as it has gotten the left nowhere in recent years. Instead, it focused obsessively on the identity of class interests between the races. In essence, it followed the strategy of Bernie Sanders, the Marxist strategy (not that Sanders is a Marxist). It’s true that, in the effort to recruit Blacks, it also took up the cause of their distinct racial oppression, as with the Scottsboro campaign. But it didn’t take this racial advocacy to such a monomaniacal extreme that it would alienate the masses of white workers and obscure the fundamental message about “Black and White” having to “Unite and Fight.”

In truth, whatever leftists who have been steeped in critical race theory or Afro-pessimism might think, racism today isn’t anything like the obstacle to working-class unity it was generations ago. Decades after the historic achievements of the Civil Rights Movement, overt displays of racism are wildly socially unacceptable and are easily shamed through iPhone videos and social media. But even if we accept the very dubious premise that a deeply rooted anti-Black racism is still a major hindrance to building an anti-capitalist political movement, it makes no sense to think we can overcome such racism by expatiating endlessly on the suffering and oppression of Blacks. If people are as racist as we’re supposed to think, they won’t care! These appeals will leave them cold, or rather will *alienate* them from the political organizations that are trumpeting the message. The Communist Party was more intelligent: you overcome racism by bringing people together, and you do that by ceaselessly educating them on their common interests against the ruling class.

This obvious strategy, the Marxist one, doesn’t mean adopting the caricature of “class reductionism” that no sane person actually believes, according to which only class matters or every form of oppression can be solved through an exclusively class-based politics. The absurd, bad-faith nature of the charge of class reductionism is shown by the fact that one of its alleged exemplars, Adolph Reed—whose Marxism (i.e., emphasis on class) is so controversial in DSA that he had to cancel a talk to its New York City chapter in 2020—has written a beautiful, poignant book on his experience growing up in the oppressively racist Jim Crow South. He is hardly blind to the significance of racism—which makes all the more striking his insistence that racism is fairly trivial today compared to what it was sixty years ago.

It still has to be challenged, of course, as do sexism, xenophobia, homophobia, and transphobia. But, in general, “telling people they’re racist, sexist, and xenophobic is going to get you exactly nowhere,” says Alana Conner, a social psychologist at Stanford. “It’s such a threatening message. One of the things we know from social psychology is that when people feel threatened, they can’t change, they can’t listen.” To quote another writer, Margaret Renkl, “somehow you need to find enough common ground for a real conversation about race.” One way to find common ground is to talk about common interests. That can help dissolve people’s defenses against hearing what you have to say. It’s also useful, Renkl notes, to remember that you yourself are hardly innocent either, so you shouldn’t be too condemnatory of basically decent people who, like you, are unaware of their prejudices. “Prejudice is endemic to humanity itself.” There is no such thing as purity, much as the woke mob may disagree.

In short, even if it is only racism and the oppression of Blacks you’re concerned about—for some reason being uninterested in class oppression as such, which, today, is exactly what’s responsible (rather than racism) for most of the deprivation Blacks experience—you should still situate your discussion of race in a broader, consistent emphasis on the capitalist-engendered suffering of all races. This is especially advisable if you actually want to get policies passed, including those relating to “identity politics,” since, as Mark Lilla reminds us, you first have to get people in power who share your values. “You can do nothing

to protect black motorists [pulled over by police] and gay couples walking hand-in-hand down the street if you don't control Congress and, most importantly, if you don't have a voice in state legislatures." You have to get your people elected, and you do that by showing you relate to voters' shared concerns—about the economy, wages, healthcare, housing, unemployment, working conditions, wealthy tax cheats, and the like.

It is also worthy of note and bears repeating that the so-called class reductionists (the Marxists, the ones who prioritize class solidarity) are right that universal programs such as Medicare for All, "Housing for All," free higher education and abolition of student debt, and redistribution of income from the wealthy to the poor would massively reduce racial inequality and achieve many of the goals of race-based reparations. This is argued, for example, in Adaner Usmani and David Zachariah's article "The Class Path to Racial Liberation," but one needs only a little common sense to see its truth. Given that Blacks are, for example, overrepresented in poverty and among those without a college education, it is clear that universal programs will disproportionately benefit them. Since such programs are also, as we have seen, incomparably more politically viable than reparations—unless you think a majority of ostensibly racist whites can be convinced in the near future to give up large amounts of their income to people they hate—it is very puzzling that identitarians are often unmoved by the idea of class-based legislation. In effect, their political practice sabotages the only realistic ways of realizing their goals.

Reed is right, evidently, that "some on the left have a militant objection to thinking analytically." Race-based politics tends to be grounded in *feelings*: outrage that racism still exists and that people of color are disproportionately oppressed. These are understandable feelings, but a politics of self-expression is an unintelligent and nonstrategic politics that risks handing victory to one's enemies.

The need for universalism

In a Dissent interview, Táíwò acknowledges that much of the reparations program will probably never be politically popular. But then he gives the game away: "a lot of the...things that could be part of a reparations drive don't necessarily need to be framed as reparations." Okay, so why did you write a book framing them as reparations? In doing so, you're only contributing to their marginalization. He goes on:

For instance, reducing fossil fuel use polls better than reparations, and it is likely to gain popularity as the climate crisis becomes more and more apparent. If we follow the divest/invest strategies that Black Youth Project and other groups have talked about...that's a win from a reparations standpoint, and you would never need to use the word. You could simply explain what pollution is and why you'd like less of it, and explain the better things that you'd like to do with those resources, like healthcare and housing, and prevention of intimate partner violence and intercommunal violence in non-carceral ways.

So in the end he endorses Sanders-style universalism. Apparently we've been arguing about nothing this whole time.

The failures of Black Lives Matter illustrate the folly of a non-Marxist strategy. The BLM movement did "raise consciousness" for a while, to the point that 52 percent of the public supported it in the summer of 2020. But support has declined since then, and the movement's goals have gone mostly unrealized. The "Defund the Police" demand didn't work out so well, as cities and the U.S. government are spending more money than ever on police departments. It might have been strategically smart to emphasize that whites, too, suffer immensely from police brutality and are killed in very large numbers, but it seems that most identitarians are uninterested in the problems of white people (particularly white cisgendered men). It is unlikely, however, that any amount of campaigning on the narrow issue of police brutality would have resulted in significant change. If you want to defund the police, the way you go about it is not by centering the police but by focusing attention on positive and universal proposals regarding housing, education, employment programs, and the like.

It is true that the “universal” measures in the original version of the Build Back Better bill were, likewise, defeated, despite being wildly popular. But why were they defeated? According to most of the reporting, it was because of two senators: Joe Manchin and Kyrsten Sinema. If the Democratic Party had been more politically competent and managed in 2020 to get a majority of 52 or 53 in the Senate, it is quite possible that these proposals would have passed, making a major difference in the lives of Black people—and whites too, who deserve justice no less than Blacks.

Again, none of this is to dismiss issues of “identity,” including abortion rights, trans rights, and gay rights. They deserve prominent advocacy. But they cannot be allowed to crowd out and marginalize—as they too often do today—fundamental, universal, and solidaristic issues of class. These should provide the continually emphasized ideological framework for every other demand, and, for moral and strategic reasons, should be ceaselessly championed by nearly every organization on the left.

In general, the political terrain of the twenty-first century, everywhere in the world, promises to be dominated by various types of populism. People everywhere are bitterly resentful toward the “elite,” however they define the elite. It is the essential task of the left to channel this populism in the right direction, focusing ire on the *class* elite rather than the supposed cultural or “racial” or “ethnic” elite, the cultural outsiders. That way lies fascism, which is becoming an increasingly threatening global phenomenon. If we want to stop fascism, we have to be Marxists.

Only Class Struggle Can Save the Left

A striking paradox of the history of the left is that it is full of self-defeat. From the bitter divisions between statist and anti-statist socialists in the nineteenth century to the vicious rivalries between Communists and Socialists in the 1930s, followed by many more episodes of destructive sectarianism and flawed strategy up to the present, the left has often had trouble getting its act together. It isn’t clear why this is the case, although doubtless the usual lack of resources in comparison to the right (funded by business) has played a not insignificant role. It is indisputable, however, that the left has periodically suffered from a deficit of analytical and strategic intelligence. Confronted with the rise of fascism in the 1930s, for example, it was obviously suicidal for Communists and Socialists to train their guns on each other. In recent decades, a different type of suicidal impulse has gripped the left, both the activist and the academic left: a fixation on “identity” at the cost of a relative disregard of class struggle. It is high time that the left exorcised its death instinct.

There are, of course, a myriad of social and political hierarchies that deserve to be dismantled, and no consistent leftist would be unmoved by the oppression of women, people of color, homosexuals, transgender people, and other groups that have become associated with identity politics. The question is simply one of emphasis. Is it right to subordinate class organizing and class consciousness to organizing and messaging around gender, sexuality, race, and other such “cultural” identities, as leftists and left-liberals have regularly done since the 1990s? Or, on the contrary, should the message and practice of class solidarity be the basis for all left politics, the continually emphasized framework within which most other organizing and mobilizing takes place? Should, in short, class consciousness become the dominant theme of the left once again, as it was long ago?

In a new book, Cedric Johnson, in effect, answers that question in the affirmative. *The Panthers Can’t Save Us Now: Debating Left Politics and Black Lives Matter* is a provocative and insightful collection of essays and responses by Johnson and several of his critics, who are specifically responding to his award-winning 2017 *Catalyst* essay of the same title. Scholars Jay Arena, Touré Reed, Mia White, and Kim Moody write the (respectively) appreciative and not-so-appreciative replies, Moody in particular providing spirited criticisms. Johnson’s perspective aligns with that of so-called “class reductionists” like Adolph Reed, Jr. and Vivek Chibber (who writes an Introduction) in its critique of the Black Power nostalgia among left academics and activists today. “The premise of black exceptionalism,” Johnson writes, that underlies such

nostalgia “obscures contemporary social realities and actual political alignments, and forestalls honest conversations about the real class interests dominating today’s neoliberal urban landscape.”

Before delving into Johnson’s book, however, it may be worthwhile to contextualize it with a more general critique of the left’s elevation of identity politics at the expense of class. The Marxist project remains an essential one, and, after the long reign of postmodern cultural theory, we could do with more forthright defenses of it.

In defense of common sense

Actually, Chibber has recently written a compelling defense of a type of “structuralist” Marxism in his book *The Class Matrix: Social Theory after the Cultural Turn* (which I’ve summarized [here](#)). Predictably unpopular in left-wing culturalist circles, the book lucidly explains the primacy of class structures relative to cultural discourses and identities. But even Chibber’s succinct theoretical discussion is lengthier than it has to be, given the simplicity of the issues.

Since the 1980s, under the banner of intersectionality, it has become fashionable on the left to insist on the equivalent status of various “simultaneous oppressions,” such as those of class, race, gender, and sexuality. We shouldn’t rank them or argue that one is, in some sense, fundamental; this would amount to a kind of chauvinism, a disrespect for the claim to equal victimhood of other groups, and would thus be very gauche in the decorous environment of postmodern academia. One might find oneself tarred and feathered as a “reductionist,” a most opprobrious label to be avoided at all costs. Instead, class, race, and gender are “imbricated” (a popular word that the sophisticate should use as often as possible), embedded within each other, intersecting, overlapping, dialectically interrelated, etc. Race and class, for example, are so closely related in our system of “racial capitalism”—which, we’re told, is the only kind of capitalism that has ever existed—that it can be difficult even to distinguish them. Racism is *constitutive* of capitalism, part of the intrinsic logic of capital accumulation. (This makes it incredible, by the way, that a man as brilliant as Karl Marx would have devoted so little attention to racism in his lifelong excavation of the logic of capital accumulation.)

This kind of thinking leads to such statements as the following, from Robin D. G. Kelley’s foreword to the third edition of *Black Marxism* by Cedric Robinson:

[C]apitalism does not operate from a purely color-blind market logic but through the ideology of white supremacy. We see it in the history of the policing of Black and Brown communities, land dispossession, displacement, predatory lending, taxation, disfranchisement, and environmental catastrophe; in racial differentials in wages and employment opportunities; in depressed Black home values; in the exclusion of Black people from better schools and public accommodations for which they are taxed; and in the extraction of Black labor and resources to subsidize white wealth accumulation.

The obvious retort to this passage is that countless white people, too, have been victimized by land dispossession, displacement, predatory lending, taxation, disfranchisement, environmental catastrophe, depressed home values, exclusion from better schools, and the extraction of labor and resources to subsidize wealth accumulation (in recent decades among blacks too, not only whites). Accordingly, it can hardly be white supremacy that has driven these processes, even if it has, of course, sometimes exacerbated them for black people. Rather, they have been driven by the capitalist drive for profits at the expense of the large majority of people, no matter what color their skin happens to be.

“White supremacy” is of no relevance to the capitalist exploitation of millions of workers in, say, China, or in a city like Lagos, Nigeria (to use one of Cedric Johnson’s examples in his book). Notwithstanding current academic fashion, there have clearly been capitalisms, at least on local and national scales, that aren’t particularly racialized, in that the masses of the exploited and oppressed are not thought to be of a different race than their oppressors.

The type of thinking represented by Kelley, which takes white supremacy to be no less essential to capitalism than, say, exploitation of workers, is, ultimately, a product of the widespread academic tendency to engage in mere description rather than explanation, a tendency that can lead analysis astray. Descriptively, yes, there exist “simultaneous oppressions” that “intersect” and “overlap” and can only with difficulty be teased apart in people’s subjectivity and everyday experience. Racism, sexism, and “classism” all flow together and interpenetrate in daily experience, such that one cannot really say any is more fundamental than the others. Similarly, the history of capitalism has indeed been bound up, in many contexts, with white supremacy, and it is hardly a great insight to give this obvious fact the name of “racial capitalism,” as the allegedly important Cedric Robinson did. It is even less of an insight, because it’s false, to say that the history implies racism is logically constitutive of capitalism and just as foundational as class.

When Stuart Hall, for instance—who is beloved by many postmodern semi-Marxist academics—famously wrote that “Race is...the modality in which class is ‘lived,’ the medium through which class relations are experienced, the form in which it is appropriated and fought through,” he was saying something very silly, a fact that has escaped his admirers. Class is lived in *many* “modalities,” not only “race”: work practices, conflicts between employer and employee, differing modes of interaction between the classes, forms of leisure that characterize one or another class, levels of education that people reach, occupational horizons, political struggles, in certain contexts racial or gender divisions—and many of these types of experience actually *unite* races that are in the same class, such that it is either meaningless or wrong to say “race is the modality in which class is lived.” Hall and his acolytes have been misled not only by shallow thinking (disguised by the usual pretentious verbiage and jargon) but by their “descriptivist” effort to *fuse together* (race and class) when what explanation requires is analytical *separation*.

Marx was far more sophisticated when he insisted that explanation, or the scientific method, requires *abstraction* from complex appearances (experience). The point of explanation is to *simplify* appearances, to “reduce” phenomena to their essences by formulating simple explanatory principles. As Noam Chomsky points out, this is the method of the natural sciences and ought to be the method of the human sciences. It is a sign of the irrationality of the humanistic disciplines that “reductionism,” or simplification, is considered an intellectual vice, when—if it’s done right—it is in fact the entire purpose of analysis and the meaning of understanding.

(I might note, incidentally, that my own discipline of history, which has bred so many left academics and activists, is especially averse to general explanatory principles, often preferring to “problematize” “metanarratives” like the Marxian, class-centric method and revel in description for its own sake, anecdotal stories for their own sake, “contingency,” “discontinuity,” fragmentary perspectives, and idealistic focus on “discourses.” Many historians seem to be temperamentally attracted to the *particular*, the level of kaleidoscopic appearance, rather than deeper and more general understanding in the mode of a Gabriel Kolko, an Albert Soboul, or a Chomsky. Hence, in part, the celebration of crisscrossing subjective identities and identity politics, a political universe of fragmented and mostly nonrevolutionary identitarian interest groups.)

What was the method of Marx himself? He started from objective relations of material production *abstracted* from the many dimensions in which they are experienced. “[L]ife involves before everything else eating and drinking, a habitation, clothing and many other things. The first historical act is thus the production of the means to satisfy these needs, the production of material life itself.” “The history of all hitherto existing society is the history of class struggles.” “The totality of these relations of production constitutes the economic structure of society, the real foundation, on which arises a legal and political superstructure and to which correspond definite forms of social consciousness. The mode of production of material life conditions the general process of social, political and intellectual life.”

Marx’s “base/superstructure” metaphor has spawned generations of caviling academic sophistry objecting to such “reductionism,” such a “mechanistic” understanding of society, but it is, after all, only a metaphor. And in fact it’s a useful one, precisely *because* it simplifies the chaos of social appearances. One only needs some commonsense reasoning to arrive at Marx’s casually expressed intuition. Let me quote from a recent book of mine where I defend so-called class reductionism:

A culture and politics [including collective conceptions of gender, race, and other identities] is not somehow the product of spontaneous generation; it is brought into being by actors and institutions, which need *resources* in order to bring it into being. The production and distribution of resources, in particular material resources, takes place in the economic sphere. So, the way that resources are allocated according to economic structures—who gets the most, who gets the least, how the structures operate, and so on—will be the key factor in determining, broadly speaking, the nature of a given society with its culture and politics. The interests of the wealthy will tend to dominate, but at all times individuals and groups will be struggling by various means, implicitly or explicitly, to accumulate greater resources and power for themselves. This simple argument grounds historical materialism or “the economic interpretation of history” in the overwhelming importance of control over resources...

Class relations, which broadly determine the production and distribution of resources, therefore provide the basic set of interests and the institutional infrastructure around which is fleshed out the whole array of society’s other objective and subjective relations of power (which in turn, of course, have some reciprocal influence on economic processes). From *a priori* reasoning like this, you reach the conclusion that in order to abolish or radically transform both central and peripheral relations of power, it is necessary to overthrow the dominant mode of production, which conditions everything else more than the latter conditions the former. It is not only issues like wages, working conditions, income and wealth distribution, housing, public health, unemployment, access to well-funded public resources, environmental destruction, the horrors of factory farming, imperialism, militarism, and rampant political corruption that are determined by the class system (far more than by various discourses and subjectivities of race, gender, and sexuality); even, say, the problems of commercial sexual objectification of women, business funding of attacks on women’s rights, political scapegoating of immigrants, and business-funded attacks on the LGBTQ+ population cannot be solved except through sweeping assaults on capitalist structures, which will require massive working-class solidarity across races, genders, and sexualities.

This sort of “class reductionism”—the revolutionary primacy of class solidarity, as opposed to a reactionary racial solidarity (e.g., black vs. white), gender solidarity, ethnic solidarity, or whatever—is mere common sense. It has a commonsensical corollary too: rather than constantly talking about white racism and male sexism—or, for example, the far greater suffering of people of color than whites, who are all ostensibly “privileged” (which many whites living in relative poverty would deny)—activists should foreground talk about shared class interests among wage-earners. Doing otherwise threatens to destroy the solidarity necessary to create a new society or even to elect good public officials. How many whites are you going to attract to your side by monomaniacally denouncing a supposed white supremacy or the alleged ubiquity of white racism? “You’re all terrible, privileged people!” is what is heard. “But we’ll let you be our allies if you can try to educate yourself out of your racism.” That’s a brilliant way to hand victory to the right. I’ve elaborated on this point [elsewhere](#), in connection with the hopeless and counterproductive national campaign for reparations for slavery.

Devotees of the racial capitalism idea, however, argue that because racism and capitalism are inseparable, anti-racism as such is anti-capitalist. It is an attack on the system at its foundation, no less than is the fight for universal social programs like expansive public housing legislation, abolition of student and medical debt, free higher education, and labor law reform. This mistake is emblematic of the political dangers to which faulty analysis can lead. It is true, of course, that capital has exploited and fostered racism, as it has fostered divisions and enmities between genders, ethnicities, groups with different kinds of education or occupational skill, and every other social division that could fragment the working class and shore up the power of business. It is also true that ideologies of race have, historically, been used to justify the plundering, dispossession, enslavement, and extermination of countless millions around the world (including those whose skin looks “white,” like the Irish, Slavs, and Jews). The vaunted Cedric Robinson certainly didn’t discover these facts.

But the fact that one can easily imagine a capitalist world of only one race—though of divisions between nationalities and other groups—whereas it is impossible to imagine a capitalism with only one class already shows class is much more fundamental than race. Academics love to problematize, “interrogate,” and complicate simple truths, since they misunderstand what it means to understand something (believing that *the more complicated, the better*, which is the opposite of rationality), but no amount of postmodernist problematizing can erase the simple truth that “race” or racism is an ideology, an identity, a mishmash of “discourses” and ways of treating people, various types of institutional exclusions and inclusions, whereas class is a set of objectively existing locations in a system of production that determines how resources are allocated. Racism functions, in part, by forcing certain people (but not *only* those “racialized” people) into certain subordinate locations in an independently defined and existing constellation of positions of economic power. If racism were abolished, the given relations of production would still be there, only the various positions in them would be filled by a different distribution of black, white, and brown people. There would be more blacks and browns at the top and more whites at the bottom. This would do nothing to eliminate capitalism, worker exploitation, environmental degradation, colossal military budgets, the threat of nuclear war, epidemic unemployment, inadequate healthcare for millions (but at least there would be more whites and fewer browns and blacks among those millions!), privatization of public resources, the global housing crisis, commodification of the human personality, and every other evil that emerges from capitalism.

Since Marx, ironically, still has a good reputation among many postmodern leftists, I might observe that he evidently, in effect, agreed with all these points, given that he spent his life writing about class and said little about “race” except to argue that workers of all races have to unite and overthrow the bourgeoisie, which is the point I’m making. Apparently—surprise!—he thought what’s crucial is to attend to common class interests. The strategic question that occupied him and should occupy us is how to facilitate working-class unity. It is dubious at best that he would have thought the contemporary left’s obsessive talk of white racism and the plight of people of color with little attention to the frequently equal hardships of whites is the way to do it.

“But racism is exactly what is preventing the working class from uniting and challenging capitalism!” objects the race-addled leftist. Nonsense. Compared to the white supremacy and racism of sixty years ago, the anti-black racism of today—when you can destroy a person’s life by recording an iPhone video of him saying the n-word—is rather trivial, as the much-maligned Adolph Reed Jr. (who grew up in the Jim Crow South) has remarked. More important in fragmenting the working class are such factors as the general atomization of neoliberal life, the privatization of urban, suburban, and rural space, the inherent structural difficulties of building a nationwide labor movement or even unionizing a particular workplace, the ubiquity of business propaganda across the mainstream media, the trivialization of political discourse, and, yes, the left’s highly disproportionate focus on identitarianism. “The longer [the Democrats] talk about identity politics,” Steve Bannon, a Machiavellian strategist, said in 2017, “I got ’em. I want them to talk about racism every day. If the left is focused on race and identity, and we [Republicans] go with economic nationalism, we can crush the Democrats.”

Even if it were true that white racism is a significant obstacle to class solidarity, Bannon’s statement would be no less intelligent. You’re not going to build an anti-capitalist movement with “racists” by telling them how racist they are.

Against race reductionism

Cedric Johnson’s book is, in effect, a case study in the centrality of class (over race) to both understanding and strategy. In his original 2017 article, a follow-up 2019 essay published in *Jacobin*—both appearing in the book—and his response to criticisms by Mia White and Kim Moody, Johnson dismantles the racially reductionist thinking that “insist[s] on the uniqueness of the black predicament and on the need for race-specific remedies” (such as reparations). He quotes an expression of this black exceptionalism by one of the founders of Black Lives Matter, Alicia Garza: “When we say Black Lives Matter, we are talking about the ways in which Black people are deprived of our basic human rights and dignity. It is an

acknowledgement [that] Black poverty and genocide [are] state violence.” This is an apt quotation, for it reveals the chauvinism and political immaturity of this ideology that downplays such facts as that 43% of people on welfare are white, more whites have been killed by police since 2015 than all other races combined, substantial proportions of the incarcerated are Hispanic and white (23% and 30% respectively at the end of 2020), Hispanics had a poverty rate of 17% in 2020 (compared to 19.5% for blacks), and 47% of black adults are in the middle class (compared to 52% of whites).

Johnson’s more sophisticated perspective, which builds on a rich scholarship of neoliberalism, is that the plight of the urban black poor “as a reserve of contingent and unemployed labor is the consequence of neoliberal rollback, technological obsolescence, and informalization, not the revival of Jim Crow racism. The expansion of the carceral state since the seventies has come to replace the welfare state as the chief means of managing social inequality.” He continues:

“The prison expansion and the turn to militaristic hyper-policing are not motivated principally by racism. Whether in Chicago’s North Lawndale neighborhood or the Ozark country of southern Missouri, the process of policing the poor is orchestrated by the same diverse cast of beat cops, case managers, probation officers, district attorneys, public defenders, prison guards and wardens, social reformers, conservative and liberal politicians, weapons manufacturers, lobbyists, nonprofits, and foundations: a kind of social control complex that has been growing by leaps and bounds as poverty, cynicism, and the surplus population increase and the neoliberal era grinds on.”

Johnson’s arguments are far too multifaceted and dense with ideas and history to summarize adequately, but their core is to critique and historicize the “black ethnic politics” that is celebrated today, retrospectively in the form of the Black Power era and contemporaneously in the form of the Movement for Black Lives. Such ethnic politics has been and will continue to be largely a failure for many reasons, for instance that it cannot connect effectively with most white Americans—frequently only alienating them, and in any case relying to a considerable degree on the possibility of their altruistic sympathy for blacks (which is ironic considering the simultaneous insistence on whites’ racist commitment to their own supremacy)—and that it is premised on the naïve, non-Marxist idea that by virtue of their common experience of racism, blacks of all classes, occupations, and ideologies have “deeply shared political interests.” No matter how radical its rhetoric and policy stances may be, black exceptionalism always ends in mere racial liberalism at best, delivering “official recognition and elite representation” (as did Black Power, by the 1970s and ’80s).

To understand the origins of Black Power is to understand its limitations. Accordingly, Johnson discusses the context of Cold War liberalism, the decline of progressive labor activism after the Second Red Scare, the consequent turn by liberals toward more *cultural* explanations of black poverty (as with the famous Moynihan Report of 1965), the increasing physical separation between black and white workers as a result of “white flight,” and the War on Poverty’s programs in urban neighborhoods that cultivated local leadership and “support[ed] Black Power’s genesis and evolution.” The War on Poverty barely addressed the deepening problems of structural unemployment and non-unionized employment, which, rather than “institutional racism,” were (and are) primarily responsible for urban poverty. In this political context of mere liberal anti-racism, Black Power resorted to similarly inadequate and “idealistic” (non-Marxist) calls for socialist revolution, armed struggle, and solidarity with the Third World, calls that were hardly “suited to the affluent, advanced industrial society” of the United States. Much of the Black Power repertoire of rhetoric, self-presentation, and action was more like political theater than a serious politics—although, given the decline of the left, the dominance of anti-communist liberalism, and the resultant inner-city political confusion and despair, one can hardly blame the courageous radicals of that era.

In any event, the legacy of all this, by the 1980s, was that “limited but significant political integration had changed the face of public leadership in most American cities, with some having elected successive black-led governing regimes. In retrospect, the Black Power movement was a transitional stage where black popular discontent diversified the nation’s governing class.”

Johnson's criticisms of the contemporary efforts to resurrect something like this movement are the obvious ones many Marxists would make: for example, that the *Vision for Black Lives* agenda of the Movement for Black Lives "proceeds from the specious view that effective politics should be built on the grounds of ethnic affinity rather than discrete political interests." The *Vision* does express solidarity with "all oppressed people" and lists a raft of extremely progressive, almost revolutionary demands relating to worker rights, divestment from fossil fuels, a radically progressive tax code, universal healthcare, a universal basic income, an end to the privatization of natural resources, and many other issues. But in general, the agenda is framed in the racially essentialist terms of blacks vs. nonblacks, as in the *Preamble's* reference to "those who claim to be our allies." Johnson laments the authors' apparent inability to see that "a politics that builds broad solidarity around commonly felt needs and interests *is* a form of anti-racism, one that we desperately need right now..." Such a politics is what the Communist Party, for instance, built in the United States in the 1930s, as expressed in its slogan "Black and White, Unite and Fight!"

Now, thoughtful responses to Johnson's broadside are possible. One might grant the necessity of organizing the working class as such but argue that blackness is still such a potent source of individual and collective identity that it makes sense to *also* build on a racial foundation. It's true, one might say, that a minority of blacks have interests aligned with the capitalist class, but the point is to reach out to the majority who don't, and who can potentially be mobilized on the basis of their shared race and their common experience of racism. It's still the case in the United States that people are more readily organized through non-class identities, and we might as well appeal to those in the attempt to build a larger class movement—especially given that many of the grievances of these "non-class identities" are in effect class grievances. We should also, of course, appeal to a common class identity, to the extent that that resonates with people. In her essay, Mia White in fact claims that "a truly 'interracial' landscape of working-class solidarity with white people is most deeply possible through and with Black study, with a naked focus on race."

That last claim is pretty counterintuitive, but overall, these replies would seem to have some merit. Johnson doesn't directly answer them, but he does say that the enormous size of the African American population today should render talk of "black self-organization" and "black sentiment" obsolete. "At nearly 46 million, the black population in the United States is greater than the population of Canada [and] three times the size of the population of Greece... Why are so many incapable of thinking about the black population with the same complexity they would afford those populations?" Again, though, his interlocutor could reply, "Black Americans are all victims of racism, unlike Canadians or Greeks! They at least have that in common." In his foreword to *Black Marxism* quoted earlier, Robin Kelley gives an example: "universal health care, a fundamental long-standing demand of the Black freedom movement, will not by itself magically abolish the conditions that produce racialized health inequities, nor will it guarantee equal, bias-free treatment for patients."

But at this point the debate threatens to become uninteresting. "Class-first" types like Johnson and Adolph and Touré Reed can certainly acknowledge that racism remains a problem and won't necessarily be completely solved through the "universalist," class-based measures that Bernie Sanders and socialists advocate; they would insist, however, that enacting such measures would go an immensely long way toward realizing identitarian goals. Whatever residual racism (or sexism) remained could presumably be addressed through progressive educational and other policies designed to eradicate these last vestiges of a more backward era. Pressuring government to this end is of value, but it pales into insignificance compared to the imperative of *class* legislation that will improve the living and working conditions of everyone and address the threat of ecological collapse. Racism in and of itself is, as Johnson shows, of incomparably less importance than the race-blind aspects of neoliberalism in producing dismal outcomes for (some) black people.

Even in the cases of policing and incarceration, supposedly the quintessential examples of racism, class is a more powerful explanatory variable. For one thing, it wasn't merely "racism"—a concept so abstract that, in itself, it can't explain much—that gave rise to the carceral state in the neoliberal period. "Rather, mass incarceration was the creation of various constituencies—black and white; urban, suburban, and rural; liberal and conservative; New Democrats, black nationalists, victims' families, drug rehabilitation clinicians, social workers, and community activists—who supported expanded police protection, more

punitive sentencing laws, increased funding for prisons, and the like.” Even black political elites and local black constituencies have often embraced conservative, pro-policing policies like mandatory minimum sentencing laws. Over and above these discrete interests, the rise of the carceral state has coincided with a *war on the public* of much greater significance than an imagined war on black people alone, who, it’s true, disproportionately belong to the surplus population (especially in cities) that is being controlled, suppressed, incarcerated, and left behind economically. Given their overrepresentation among the poor, it is no wonder they’re overrepresented among the arrested and imprisoned.

Kim Moody objects to the way Johnson deploys the “surplus population” concept, pointing out that according to a study in 2014 of 1,300 inmates, nearly two thirds of the prison population were employed prior to incarceration. “Those who are sentenced to prison are not primarily from the ‘surplus population.’” But Johnson has little trouble refuting this argument, observing not only that a single small study is hardly an authoritative source of data but, more importantly, that employment status at the time of arrest isn’t the key criterion here. The existence of the carceral state serves to discipline and regulate “the poor, homeless, so-called ‘disconnected youth,’ noncitizen workers, and [those engaged in] criminalized forms of work.” These people may be temporarily employed, irregularly employed, sometimes employed full-time, but in their millions they constitute, as Marx said, a reserve army of labor.

Another shibboleth of the contemporary left that Johnson addresses is that the New Deal was wildly racist, and that its racism shows the inherent limitations of universal programs. According to Mia White, “the benefits of universal programs such as the New Deal cannot be misremembered as materially transforming for the better the lives of the most marginalized Black Americans.” Statements like this are doubly problematic: first, the New Deal wasn’t universal, since some of its measures deliberately excluded certain categories of the working class; second, it did benefit millions of the most marginalized blacks through programs like the WPA and the CCC (many of whose work camps, at least outside the South, were racially integrated). Moreover, the New Deal wasn’t quite as racist as people think. Its limitations were more often determined by class factors than racial ones. To take a commonly cited example: it is true that the Social Security Act excluded domestic and farm workers, which would seem to be very racist; the problem is that the large majority of such workers were white. “Some 11.4 million whites were employed as agricultural laborers and domestics, compared to 3.5 million blacks.” Thus, the Social Security exemptions excluded 27 percent of all white workers nationally. These are facts that have been covered up by identitarians and much of the scholarship that inspires them.

The Panthers Can’t Save Us Now is, in short, the sort of book that is all too rare on the left today, an unapologetic attack on the hegemony of identity politics. The case it makes strikes me as almost self-evidently true. In a critical discussion of Asad Haider’s *Mistaken Identity*, Johnson quotes a clear-sighted statement: “As long as racial solidarity among whites is more powerful than class solidarity across races, both capitalism and whiteness will continue to exist.” Fair enough. But then comes Haider’s illogical conclusion: “positivist arguments that class matters more than race reinforce one of the main obstacles to building socialism.” Um, okay. This is what the left has become, this ideology according to which we can achieve class solidarity and break down the (alleged) solidarity among whites only by talking about...race. And how much worse things are for people of color than for whites. Because somehow *that* will get through to (alleged) white racists, *that* will be the thing that builds solidarity with them. *Not* emphasizing the common interests and common suffering of all races, but *distinguishing* the races from each other and arguing that one of them is much more privileged than the others. —This train of thought is so irrational and un-Marxist one doesn’t know what to say.

To understand the reactionary nature of the race-infatuated discourse, one need only consider the fact that much of the ruling class is perfectly happy to subsidize it and promote it. The *New York Times* and other wealthy institutions have invested enormous resources in the 1619 Project, a discourse that foregrounds race and marginalizes class. Corporations and businessmen have given large sums of money to Black Lives Matter. Politicians have draped themselves in kente cloth. Is it at all conceivable that ruling-class institutions would lavish such attention on, say, labor unions, or on any discourse that elevated class at the expense of race? No, because they understand what many leftists apparently don’t: class struggle can drive a stake through the heart of power, while race struggle certainly cannot. On the contrary, racial

narratives are *useful* to the capitalist class, for dividing the working class. Leftists acknowledge this fact in other contexts, but, under the perverting influence of postmodernism and critical race theory, they're blind to its strategic implications in the present.

I doubt Johnson or other “class reductionists” would insist on *never* talking about the plight of people of color or organizing, say, undocumented immigrants to fight for a more humane immigration system; they would only insist on placing such struggles in their proper class context and incorporating them within a much broader class movement. Talk of the common interests of working people should be endlessly repeated and unabashedly prioritized, so that it frames all or nearly all other political battles. And when talking about the disproportionate suffering of people of color, blame should be placed not primarily on the diffuse and idealistic concept of white racism but on the real source of oppression: capitalist class structures that have led to deindustrialization, de-unionization, militarized policing of the multiracial surplus population, privatization of public resources, and theft of over \$50 trillion from the working class in the last forty years. All the white racists out there can be reclaimed and redeemed only in common struggle against the class enemy, struggle that has the potential to educate them out of their racism.

The concept of race is so artificial in the first place—very much *unlike* that of class—that to obsess over it is bizarre. It's a strange kind of fetish, whether it's an obsession of the right or of the left. This, in the end, may be the main point of Johnson's book. If oppressed people identify strongly with a particular race, it is the task of radicals to raise their consciousness so that it encompasses class as well, identification with people of other races. But in order to accomplish this, radicals first have to raise their own consciousness and shed their own race fetishism. A little more Marx and a little less Cedric Robinson would be a good thing.

The Righteous Outrage of Norman Finkelstein

As I was reading Norman Finkelstein's new book, *I'll Burn That Bridge When I Get to It!: Heretical Thoughts on Identity Politics, Cancel Culture, and Academic Freedom*, I thought of Obama's joke at the expense of Rahm Emanuel: “he's one of a kind, and thank god he's one of a kind.” Finkelstein, too, is very much one of a kind. But the analogy with Emanuel fails, because in fact *one* Rahm Emanuel is far too many whereas one Finkelstein is not nearly enough. We need hundreds of him. That is to say, we need hundreds of left intellectuals with the courage and intelligence to think for themselves and never sell out, to refuse to compromise—even to risk alienating fellow leftists by publicly repudiating woke culture and the more vacuous forms of identity politics in favor of an unstinting adherence to class politics. Nor would it hurt to have more writers who are as eloquent and hilarious as him.

It is widely known on the left that Finkelstein is, as it were, a martyr to truth and justice, having been subject to outrageous calumny and denied an academic career because of his relentless advocacy of the Palestinian cause. With *I'll Burn That Bridge*, he shows his willingness to burn bridges not only with the establishment but also with the “left” of today, for which he shows scarcely mitigated contempt. He considers it, or dominant tendencies within it, to have degenerated from soaring moral and intellectual heights with Rosa Luxemburg, W. E. B. DuBois, and Paul Robeson into a censorious, narcissistic, morbidly navel-gazing culture preoccupied with subjectivist trivialities like personal pronouns at the expense of solidaristic struggle for a better world. “Whenever I see *he/him* or *she/her*, I think *fuck/you*.” (“You must be living an awfully precious life,” he goes on, “if, amid the pervasive despair of an economy in free fall, your uppermost concern is clinging to your pronouns.”) If the book is not simply ignored, one can expect that it will elicit a flood of vituperation from leftists and liberals: “racist, misogynistic, transphobic, white supremacist, juvenile, incoherent, petty!” The intelligent reader will not be tempted by such facile judgments but instead will engage with the book's substance, because it has important things to say.

It consists of two parts: in the first, Finkelstein “deconstructs” identity politics and the cancel culture it has given rise to, focusing on five figures whom he eviscerates: Kimberlé Crenshaw, Ta-Nehisi Coates, Robin DiAngelo, Ibram X. Kendi, and Barack Obama. In the second part, he considers a related

subject with which he is intimately familiar: academic freedom. To what extent should a regime of free speech reign on the university campus, and under what circumstances should an academic's "offensive" speech in the public square result in disciplinary action? Is it wrong for universities to grant Holocaust deniers a platform? When teaching, should professors strive for "balance"—presenting with equal force all sides of an issue so that students can make up their own minds—or should they teach only their own perspective? What should we think of campus speech codes? Finkelstein addresses all such questions at length and in a spirit of uncommon seriousness.

One difficulty with the book is that it has a sprawling and meandering character, consisting variously of memoir, brutal polemic, dense argumentation, forensic dissection of texts, scores of long quotations, innumerable long footnotes, and very funny ridicule of everything and everyone from Michelle Obama to Bari Weiss, from the *New York Times* to woke terms like Latinx ("why would an ethnic group want to sound like a porn site?"). At its core, however, beneath the variegated surface, the book is an anguished *cri de coeur* against pervasive cultural, political, and intellectual rot—an unapologetic defense and exegesis of the heavily maligned "Western canon" (John Stuart Mill, Karl Marx, Bertrand Russell, Kant, DuBois, Frederick Douglass, and the like), a sustained lamentation over how far the left has fallen, a furious denunciation of rampant philistinism and pusillanimous groupthink (quoting Mill: "That so few now dare to be eccentric marks the chief danger of the time"), and a proudly unfashionable celebration of such quaint notions as Truth, Reason, and Justice (which Finkelstein capitalizes, in a consciously anti-postmodernist flourish). The book's kaleidoscopic nature and intimidating length might bewilder the reader, so in this review I propose to summarize and comment on several of its main arguments, to facilitate their diffusion.

Before doing so, however, I can't resist quoting a few Finkelsteinian zingers, to preface the following heavy discussion with a bit of levity. On MSNBC's Joy Reid: "living proof that not all yentas are Jewish and not all bovines are cows." On Angela Davis: "Once upon a time she was on the F.B.I.'s Ten Most Wanted List. Now she's on Martha's Vineyard's Five Most Coveted List." On Henry Louis Gates: "a virtuoso at crawling on the ground while typing on his keyboard."¹ On Amy Goodman (whom he doesn't name): "Goddess of Wokeness...a woke machine, churning out insipid clichés as her mental faculty degenerates to mush." On Ibram X. Kendi: "mallet-wielding grifter...preposterous poseur...[whose] 'definitive history of racist ideas in America' reduces to a compendium of prepubescent binary name-calling." On Robin DiAngelo's morbid obsession with diagnosing "racism": "She is the monomaniacal Captain Ahab in pursuit of the White Whale. She is little Jackie Paper out to slay Puff the Racist Dragon. Her palette comprises two colors—white and black... What an unremitting, remorseless, insufferable bore!" On the widespread fascination with transgender people: "the first day of a graduate seminar, students used to describe their intellectual interests. Nowadays, it's de rigueur to declare your sexual orientation. It's only a matter of time before a student announces, 'I'm *she/her* and I'm packing a thick, juicy nine-incher.'"

In an adaptation of Emma Goldman's "If I can't dance, I don't want your Revolution," Finkelstein declares: "If I can't laugh, I don't want your Revolution." Political conservatives, too, have complained about the humorlessness of the woke crowd, but if you're alienating even die-hard leftists, maybe it's time to rethink your messaging.

Identity politics

Debates on the left over identity politics go back decades, and it is easy to be sick of them. Unfortunately, there is no prospect of their ending as long as identity politics and woke culture remain dominant on the left and in the Democratic Party—as they surely do today, at the expense of a class politics. Finkelstein is aware that the identity politics of the left isn't quite the same as the identity politics of the Democrats, but he is right that they overlap, and that such a politics is more conducive to being neutered into empty symbolism (statues, token representation in the corporate class, electing a vapid con artist like Obama) than a Bernie Sanders-style—or more radical—class politics is.

¹ Incredibly, he called Obama a "post-modern Frederick Douglass."

Serious leftists, like Robin D. G. Kelley, have written competent defenses of identity politics, and Finkelstein certainly isn't arguing against the necessity of incorporating anti-racism, anti-sexism, anti-homophobia, and other such "woke" agendas into popular movements. What he objects to are the forms that identity politics often takes, and its tendency to devolve into celebration of an insular tribal identity. The binary, balkanizing drawing of lines between groups and near-contempt for the "oppressing" group—white vs. black, cis vs. trans, straight vs. gay, man vs. woman—is, in its parochialism and vitiating of solidarity against capitalism, not what a real left politics looks like. He quotes at great length some words of Frederick Douglass in 1894 that might well have gotten him "cancelled" today:

We hear, since emancipation, much said by our modern colored leaders in commendation of race pride, race love, race effort, race superiority, race men, and the like... [But] I recognize and adopt no narrow basis for my thoughts, feelings, or modes of action. I would place myself, and I would place you, my young friends, upon grounds vastly higher and broader than any founded upon race or color... We should never forget that the ablest and most eloquent voices ever raised in behalf of the black man's cause, were the voices of white men. Not for the race; not for color, but for man and manhood alone, they labored, fought and died... It is better to be a member of the great human family, than a member of any particular variety of the human family. In regard to men as in regard to things, the whole is more than a part. Away then with the nonsense that a man must be black to be true to the rights of black men. I put my foot upon the effort to draw lines between the white and the black...or to draw race lines anywhere in the domain of liberty.

Moreover, the very idea of being "proud" of what group one happens to belong to—proud of being black or a woman or gay or trans—is puzzling. "[I]t perplexes why one should feel *proud* of one's zoological difference," Finkelstein writes. "[W]hat sense is there in making a 'cult' of that over which one has no choice...? Shouldn't one aspire to transcend the 'inevitable' part—the color of one's skin—so as to be judged by the 'free part'—the content of one's character?" Similarly, the idea of "loving one's people" is odd, first in that it amounts to "loving one's self writ large," which, in its narcissism, hardly seems like a noble thing. It easily becomes chauvinism. Second, one would certainly not love all the individuals who are alleged to constitute "one's people." Many or most of them one would likely personally despise—just as, on the other hand, one would "love" many people belonging to a "different group." Too much identification with some imposed identity such as race is exactly what leads to irrational racial hostility (including against whites), sexist hostility (also against men), and other divisive social forces. Identity politics can be dangerous and destructive, not only on the right but even the left. "In their goodness and badness, there exist only persons, not peoples."

The vacuousness of contemporary identity politics is best exposed by considering its "great minds," the Crenshaws, Coateses, Kendis, and DiAngelos. For a really thorough demolition, Finkelstein would have had to review the record of various feminist and queer theorists too, but it's a big enough task to critique the writers on race. Or, more precisely, that isn't a *difficult* task—it's so easy that Finkelstein is able to devote huge chunks of these chapters to sheer mockery—but it does require patience and a willingness to wade through endless intellectual muck. Take Crenshaw. Unsurprisingly, in her seminal 1989 article on intersectionality "Demarginalizing the Intersection of Race and Sex," "she conspicuously omits class in her dissection of oppression." It disturbs her that white feminists are presumptuous enough to speak for black women, but she "seems less concerned or, for that matter, even conscious that a high-achieving Black woman speaking for Black *working-class* women might also be problematic."

Or take DiAngelo. She has a pathological obsession with racism and an utterly Manichean, paranoid view of the world. If you're white, you're a racist—whether you're John Brown or Jefferson Davis, a fascist or an anti-fascist. Racism is ubiquitous, "immovably entrenched in our psyches and structures" (as Finkelstein paraphrases), "the air we breathe and the water we drink," all-encompassing and constantly reproduced, she says, "automatically"—and therefore, evidently, ineradicable. At best, it can occasionally be "interrupted"—through the "diversity training" at which DiAngelo excels and for which

she charges a hefty fee. Meanwhile, her book *White Fragility* has sold almost a million copies and has had quite an influence on woke culture, helping to instill a collective fixation on—incidentally—the same *idée fixe* of Ta-Nehisi Coates (according to Cornel West): the almighty, unremovable nature of white supremacy. “Whites,” says DiAngelo, “control all major institutions of society and set the policies and practices that others must live by.” Yes, whites are a homogeneous master-class: the billionaires and the working class, they’re all equally guilty, they’re all oppressors. And to blacks she says, as Finkelstein summarizes, “Beware! Don’t trust white people! They’re all racists, racists to the core! Every last one of them! They’re hard-wired for racism; it’s in their DNA.” This is a message perfectly calculated to pit workers against each other. No wonder the business class has so enthusiastically promoted her book!

What about Ibram X. Kendi? Finkelstein seems to take particular pleasure in disemboweling this (as he says) non-scholar and non-activist, for his critique/massacre is a full 110 pages long and features withering juxtapositions with a titan, DuBois. It’s sad that a book review can’t communicate the verve or the slicing humor of this chapter (and others). Kendi’s book *Stamped from the Beginning: The Definitive History of Racist Ideas in America*, for example, whose “only novelty is to shoehorn the epithets *racist* or *antiracist*, *segregationist* or *assimilationist* into every other sentence...[is] less a definitive history than an exhaustive, and exhausting, *taxonomy* that’s as supple as a calcified femur and as subtle as an oversized mallet. It proceeds from the fatuous, almost juvenile, conceit that fastening binary, wooden labels on the actors and ideas incident to Black history will shed light on it.” One problem with Kendi’s and our culture’s promiscuous, indiscriminate use of the label “racist” is that the concept becomes diluted: “to be a racist ceases to be what it ought to be: a scarlet badge of shame... [W]hat information is conveyed by a label that collapses the distinction between Frederick Douglass [whom Kendi considers a racist] and the Grand Wizard of the K.K.K.?” The abolitionists were all racists, as were DuBois, Martin Luther King Jr., Richard Wright, E. Franklin Frasier, etc. etc.—while Kendi singles out for praise Harry Truman, Michelle Obama, Eldridge Cleaver, Pam Grier, Bo Derek, Kanye West, etc. “[T]he rigor of his taxonomy recalls not the Periodic Table but, on the contrary, Pin the Tail on the Donkey.”

As Finkelstein says, Kendi embraces the woke conceit that, over four hundred years, “African-Americans haven’t registered any progress in the struggle against racism. Each seeming stride forward has been attended by a step backward.” If anything, he implies, things have only gotten worse! Such an “analysis” recalls the flagrantly ahistorical, unabashedly gloomy academic school of Afro-pessimism, and, by reifying differences between “whites” and “blacks” and valorizing anti-white resentment among the latter, serves the same function of hindering the class solidarity necessary to achieve real progress in struggles over the distribution of wealth, working conditions, affordable housing, high levels of unemployment, expansion of public resources, abysmal healthcare, environmental destruction, hypertrophying militarism, and the like. (No wonder, again, Kendi has been fêted by the establishment and can charge \$45,000 for his talks.¹ It helps, too, that his only real policy proposal is...affirmative action.)

After Finkelstein’s devastating exposure of Kendi’s countless inconsistencies, hypocrisies, and idiocies—his woke dismissal of the Civil Rights Movement in favor of the macho Black Panthers (who, by comparison, achieved almost nothing); his (in Kendi’s words) “striving to accept and equate and *empower* racial difference” even as he argues that the idea of race is a “mirage” that was invented to rationalize exploitation; his insistence that all racial disparities in society are purely a result of racism; his valorizing of racial differences (e.g., he praises the “irrepressible Blackness” of his friend) at the same time as he says anti-racists see only individuals and not racial behavior (“there is no such thing as Black behavior”); his positing of a deep separation between so-called white culture and black culture; his arguing against the racist “assimilationist” urge to value white culture over black even as he manifestly values white culture over black (lecturing before white audiences, accepting a fellowship at Harvard University, presiding over a research center at Boston University, being proud of publishing in white journals like *The Atlantic*)—nothing remains but the empty husk of a social-climbing charlatan. That such a person can be widely considered to be more or less on the left is a crushing indictment of the state of the left.

¹ He is hardly alone in this sort of thing. Finkelstein reports that, according to local activists in Kerala, India whom he met, Naomi Klein had demanded \$25,000 plus a round-trip first-class airline ticket to give a talk there.

For charlatanry, though, few can beat the next entry on Finkelstein's shit list: Obama. "Barack Obama is the perfected and perfect instrument of identity politics, its summa summarum. He represents the cynical triumph of form over substance, color over character. He is the cool Black dude who is also the reliable—in Professor Cornel West's words—"mascot of Wall Street." Most leftists are hardly enamored of Obama, so I need not summarize the case against him. Nor would I even try, because I couldn't possibly reproduce the distinctive Finkelsteinian humor—and most of this very long chapter consists of (factually grounded) ridicule, directed at nearly everyone in Obama's presidential coterie, a "revolting retinue of bootlickers." Aside from Obama himself, the most satisfying skewering, I found, was of Samantha Power, the "Battleaxe from Hell...downright *evil*...[whose] conscience only bestirs at the suffering of victims of official U.S. enemies." One might argue that in this chapter Finkelstein's profound contempt for the "Elmer Gantry in blackface" at the head of this gaggle of amoral mediocrities gets the best of his prodigious literary gifts, since the ruthless mockery goes on and on and becomes somewhat tiresome, but it can't be gainsaid that it's all well-deserved.

After six chapters and almost 400 pages on the subject, Finkelstein's summary of identity politics is worth quoting:

Identity politics has distracted from and, when need be, outright sabotaged a class-based movement [viz., Bernie Sanders'] that promised profound social change. It counsels Black people not to trust whites, as their racism is so entrenched and so omnipresent as to poison their every thought and action. It conveys to poor whites that they, no less than the white billionaire class, are beneficiaries of racism, so that it would be foolhardy of them to ally with Black people... Then, identity politics puts forth demands that either appear radical but are in fact politically inert—Defund the police, Abolition of prisons—as they have no practical possibility of achievement; or that leave the overall system intact while still enabling a handful, who purport to represent marginalized groups, to access—on a "parity" basis—the exclusive club of the "haves." This, in effect, performance politics has spawned a disgusting den of thieves who brand themselves with radical-sounding hashtags, churn out radical-sounding tweets, and insinuate themselves into positions of prominence, as they rake in corporate donations, cash corporate paychecks, hang out at the watering holes of the rich and famous, and thence can be safely relied upon not to bite the hand that feeds them...

One might object that he's painting with too broad a brush here, that advocacy of the interests of minorities and women can, depending on the context and the cause, indeed be an essential political program, but he wouldn't deny this. He has the highest regard for the Civil Rights Movement, after all—although he would deny that that was identity politics. "The human rights of a victimized group must, of course, be uncompromisingly defended." More problematic than such defense is to make a cult of group differences (group "pride") in the way of the woke, and to place class issues at the bottom of the heap rather than the top, where they belong. "Human dignity is not possible without the ability to pay for a roof over one's head, clothes on one's back, and food on one's table."

Whatever genuinely emancipatory political impulses exist in identity politics have long been, on the whole, coopted and buried under an avalanche of left-liberal virtue-signaling, preening and posing, careerism, and sabotage of a substantive left. Just consider how the woke mob reacted to the Sanders campaign, the most serious challenge to the establishment in more than a generation: they tried to "cancel" Sanders for his being a "privileged white male" with a supposed blind-spot on race. His "economic reductionism," according to Angela Davis, prevented him from "developing a vocabulary that allows him to speak...about the persistence of racism, racist violence, state violence." (Note the pretentious academic language, as if you need a special "vocabulary" to talk about racism and violence—which Sanders, by the way, did.) As Finkelstein says, "When the 'hour of serious danger' to the status quo struck during Bernie Sanders' class-struggle insurgency, the 'true nature' of woke radicalism—not just its opportunism but, even more, its rancid, reactionary core—was exposed as each and all of these erstwhile 'radicals' enlisted under

the banner to stop him.” Woke cancel culture cooperated with the establishment media’s cancel culture to stop the Sanders juggernaut.

Cancel culture and academic freedom

“Cancel culture might be defined as the turning of a person into a non-person.” By that definition, it has been around for a very long time. Arguably, it is as old as civilization. The first and second Red Scares in the U.S. were instances of cancel culture; so is the corporate media’s treatment of virtually everyone on the left; so is the woke treatment of anyone who publicly strays from the party line. Even if such victims of woke defamation campaigns usually find their footing again or don’t always suffer career consequences in the first place, the mob’s impulse to censor and silence remains operative and ever-vigilant. Finkelstein knows cancel culture from the inside, and it is unsurprising that he resolutely opposes it.

His defense of a regime of nearly untrammelled free speech is rooted, first and foremost, in his conviction that this is the surest way to Truth. He quotes DuBois: when free speech is stifled, “the nation...becomes morally emasculated and mentally hog-tied, and cannot evolve that healthy difference of opinion which leads to the discovery of truth under changing conditions.” But John Stuart Mill’s *On Liberty* is the text he primarily grounds his argument in, and he quotes from it liberally in his chapter on the right of even Holocaust deniers to make their case in public forums such as a college campus. “Complete liberty of contradicting and disproving our opinion,” Mill writes, “is the very condition which justifies us in assuming its truth... The beliefs which we have most warrant for, have no safeguard to rest on but a standing invitation to the whole world to prove them unfounded.” As Finkelstein translates, “if you want to rationally hug your certainty, you must first meet the challenge of every naysayer.” Your opponents can even be *useful* for prodding you to rethink weak points in your reasoning or evidentiary basis, exposing little errors in your arguments, giving you something to think about that you had overlooked, in general giving you the opportunity to more rationally ground your beliefs.

The mob’s desire to silence, attack, and destroy comes from feeling threatened, not from being rationally certain and confident. The latter attitudes are more likely to yield calm composure and willingness to give opponents a hearing because you know you’re able to refute them. When a mob tries to prevent someone from talking because it feels threatened by his speech, it’s quite possible, often, that his speech has some truth in it. Suppressing it—unless it’s merely emotive speech like “fuck you!”—possibly allows his opponents to persist in having false or partially false views.

But someone might reply, “What if his speech is socially harmful? Isn’t that a legitimate reason to suppress it?” Well, the definition of “harmful” is, of course, contested, and it evolves over time. Eugenics and forced sterilization were once considered a very enlightened movement, being supported by progressives like Bertrand Russell, Helen Keller, Jane Addams, and Oliver Wendell Holmes. Now eugenics is considered downright evil. Who is to say your definition of “socially harmful” is, in all cases, the right one, or that your application of it is always right? “When it comes to curbing speech,” Finkelstein says, “experience thus confirms the general rule in human affairs: humility is to be preferred over arrogance.”

Moreover, if the “harmful” speech is socially marginal such that hardly anyone believes it, what’s the great danger in letting someone say it now and then? If, on the other hand, it’s not marginal but holds the assent of millions, letting someone express it presents an opportunity to argue against it and thus inoculate people. The strategy of pure suppression is apt to lead many to think there might be something “dangerously truthful” to it—“the establishment doesn’t want us to hear this because it’s threatened by its truth!”—and thus might contribute to its diffusion across the population. People might think they’re being “rebellious” or anti-establishment by believing it, and furthermore that they’re upholding noble values of free speech against authoritarian censoring leftists (as the reactionary right thinks today). I might also note that giving authorities the right to suppress or punish certain kinds of speech, and even encouraging them to do so, will soon lead to their suppressing speech you *like*.

The left has historically been in the vanguard of fights for free speech, from the abolitionists to the IWW (and most other unions, in fact) to the Socialists during World War I to the Civil Rights Movement. Its departure today from these honorable traditions is yet more evidence that it’s become a pseudo-left, a

reactionary left—for the empowering of authorities to regulate speech is ultimately reactionary. It’s ironic that many self-styled anarchists advocate increasing the power of unaccountable bureaucrats to control what is said and what isn’t.

Admittedly, it might have strengthened Finkelstein’s discussion to consider in more depth possible counterarguments. It is, after all, very unfortunate that media operatives like Rush Limbaugh, Alex Jones, and the whole stable of Fox News social arsonists have brainwashed millions of people. It is likely they couldn’t have had such a destructive impact had the FCC’s Fairness Doctrine not been repealed in 1987. Maybe it was right to repeal it, but a case can at least be made that it was wrong. Issues of online content moderation, too, come into play in any debate over censorship, and Finkelstein doesn’t say much about these. The reason, it seems, is that he doesn’t think the internet has raised significantly new questions about free speech, and in any case there is already an extensive literature on web censorship.

Among the many excellent points he makes is one that cuts to the heart of wokeness: the collective obsession with pinning a label—racist or not, sexist or not, transphobic or not—on every thought passing through one’s head and every utterance one makes, and then cancelling all the thoughts that (and all the people who) stray an inch past what’s deemed “acceptable,” is ridiculous and paranoid. It’s also reactionary, because it makes *solidarity* vastly more difficult. One of the more memorable passages in the book is when he imagines, in some alternate universe, a Robin DiAngelo who actually *does* care about fighting oppression of blacks and not only grifting off a culture’s pathologies. Were she to speak before a group of workers, she might say something like this (italics in the original):

*...Although racism is real and you should always be at the ready to fight it whenever it rears its ugly head, you all, Black and white, have a helluva lot more in common. You’re all, Black and white, trapped in dead-end jobs. You all earn poverty wages... [You have to] organize together, as one because you **are** one, to overthrow this wretched, corrupt, god-forsaken system. You can’t eliminate every fleeting, non-p.c. thought passing through your head. The mind is a tricky business... You can’t wait until everyone’s thoughts are simon-pure. You don’t have the time, and they never will be. You cannot police your thoughts, and it’s probably better that way. Were it otherwise, you wouldn’t be human. You’re fallible, you’re imperfect vessels. You weren’t born, and your minds can’t be, immaculate... If you unite to change the system, then your psyches will fall into place. It’s common struggle, common sacrifice, that produces mutual respect, even mutual love. A connection that binds will be forged by you, united in the heat of battle facing a common enemy, each marching beside the other, each lifting the other, each protecting the other. You don’t become better persons by each of you, singly, struggling with your racist demons. You become better persons by all of you, together, struggling against an antihuman system...*

Wokeness is what happens when the destruction of the labor movement proceeds so far, and social atomization becomes so all-consuming, that even the “left” adopts an individualistic, moralistic, psychologistic, censorious, self-righteous, performative approach to making social change.

“The fight against racism must focus...not on the intangible, impalpable, unchangeable, invisible, or unprovable, but, instead, on what’s substantive, meaningful, and corrigible. In the first place, securing economic opportunity and legal equality.” The Sanders program was far more substantively “anti-racist” than the puny liberal programs of most of his woke critics. (As for Sanders’ being constantly hounded to support “reparations” for blacks, I’ve explained elsewhere why that demand is anti-solidaristic, politically impossible, and ultimately a diversion from radical social transformation.)

The last chapter of *I’ll Burn That Bridge* delves into a specific dimension of cancel culture: when is it appropriate for a professor to be disciplined for his public behavior and statements, whether on social media or in some other context? This issue bears, of course, on Finkelstein’s own career, but he is hardly the only academic to have been disciplined in recent decades for alleged “incivility” or taking unpopular political stands. The chapter is tightly argued and has a more disciplined structure than others, consisting

of analyses of four academic freedom cases (Bertrand Russell in 1940, Leo Koch in 1960, Angela Davis in 1969, and Steven Salaita in 2014) and then general reflections that conclude in a discussion of his own case. He endorses the American Association of University Professors' standard that "a faculty member's expression of opinion as a citizen cannot constitute grounds for dismissal unless it clearly demonstrates the faculty member's unfitness to serve [i.e., to teach]"—which was surely *not* the case in the four instances he examines. But he goes much further and questions whether it should even be seen as a professional obligation that one always use civil language in one's scholarship (which Finkelstein didn't when writing about the Holocaust industry and Alan Dershowitz's lies). Given all the invective in Marx's *Capital*, for example, the book would never have been published by a university press today and Marx wouldn't get a position at a top university. "But if the likes of Marx wouldn't qualify for a tenured appointment at a first-rank university, isn't that a *reductio ad absurdum*? Doesn't it conclusively demonstrate the inanity of a standard commanding restrained and temperate language?"

One might connect Finkelstein's lengthy discussion of academic civility with his book's focus on woke politics by pointing to something his targets have in common: a preoccupation with policing language and thought at the expense of more substantive concerns. Academia insists on politeness, decorum, "neutral" language, which often serves to enforce conventions, emasculate dissent, and uphold power structures; wokeness insists on ceaselessly monitoring your own and others' language, in fact making that a priority, allowing people to feel "radical" by doing nothing that remotely challenges real power structures. (No surprise that woke culture has largely emerged from the academy.) To do justice to Truth and Justice, though, requires more than this. In the case of scholarly writing and speaking,

There are moments that might positively require breaking free of the constraints imposed by polite public discourse in order to sound the tocsin that, as we indifferently carry on in a privileged sanctuary of peace and prosperity, innocent people are being butchered by our own state. The uncivil reality, not uncivil words, should be cause for reproach and excoriation, while uncivil words might be called for to bring home the uncivil reality.

It can at least be said for Finkelstein that he practices what he preaches: his book, to put it mildly, does not shrink from uncivil words.

The anti-academic

It should be clear from what has been said here that *I'll Burn That Bridge When I Get to It* is an unusual book. It requires a lot of patience to read, but I think the effort is worth it. It's not a "polished" work, but in an academic and literary environment that sometimes seems to value polish above all else, including moral and intellectual substance, one appreciates something a little more raw. And someone with the courage to *tear down*—in order to build up.

Finkelstein is in the tradition of the great incorruptible truth-tellers. He relates an anecdote from when he was a graduate student at Princeton in 1984: his work exposing a bestselling scholarly hoax on the Israel-Palestine conflict had gotten the favorable attention of the editor of the *New York Review of Books* and his friend (Arthur Hertzberg) at Columbia University, and he sensed that career possibilities were opening up for him. But then, in a meeting with Hertzberg, he was bluntly asked, "Are you in Chomsky's stable?" Despite knowing the probable consequences of giving the wrong answer, he unhesitatingly said he deeply admired Chomsky and was grateful for his support—which, of course, was the wrong answer. He never heard from the men again. Even so, "I was proud of myself," he writes, "not to be tempted, at all, by the lure of fame and fortune, and I was grateful for this test of my fidelity to Truth (and Chomsky), so that I could prove in my own person dead wrong the cynics who imagine, or console themselves, that everyone has a price."

That unshakeable commitment, that willingness not to conform, combined with intellectual power, is chiefly what has set Finkelstein apart from most of his peers. One hopes that his book and his example will inspire young idealists to follow in his path.

How to Rebuild the Left

One might as well state the matter clearly: given the realities of global warming, rampant environmental destruction, escalating imperialistic clashes, and a crisis-prone global economy, there is no hope for the world unless an international left can be resurrected. A left at least as powerful as the one that created social democracy in the wake of World War II. As complex in their origins as the world's ills are, they can be expressed and explained in a single sentence: internationally, there is a political right, a proto-fascist far-right, and a stagnant though tenacious center, but, in effect, no left. That is, there is no real force that represents the interests of the exploited and immiserated majority. No wonder things are so bad. The burning question is: how to build such a left?

How *not* to build it is clear: devote overwhelming attention to issues of race, gender, and sexuality. Indeed, a major reason the left is so weak today is that for decades it—or something that has claimed the mantle of the left, in academia, the media, and politics—has focused disproportionately on such issues, neglecting grievances that unite people across boundaries of race, gender, and sexuality. The ineffectual nature of such a “left” should be obvious from one consideration alone: “universal” issues—which affect workers whatever their identity—of wages, working conditions, income and wealth distribution, scarce housing, unemployment, public health, student and consumer debt, ecological destruction, the shrinking and starving of public goods, murderous imperialism, hypertrophying militarism, and the very survivability of human civilization are scarcely touched by discourses and activism around racial and gender disparities. (“We want to have it as good as white cisgendered men!” Okay, meanwhile you’ll still be dealing with all the crises I just listed.) If you want to build a new world, you don’t go about it by ignoring working-class grievances as such, attending only to matters that affect, say, women, gays, and black people; you target the very structures of capitalism, the class-defined exploitative institutions that have oppressed billions (of white men too, even heterosexual ones!) for centuries.

It has been fashionable among liberals and “leftists” for years to ridicule this so-called “class reductionism,” but thankfully resistance is finally building to reactionary postmodern notions of the priority of racial and gender oppression over class. Norman Finkelstein, for example, who is widely known as the courageous and academically martyred advocate of Palestinian rights, has just published a book called *I’ll Burn That Bridge When I Get to It!: Heretical Thoughts on Identity Politics, Cancel Culture, and Academic Freedom*. I’ve written a lengthy review [here](#); suffice it to say that Finkelstein is fearless, and ruthless, in his exposition of analytical and political common sense. Adolph and Touré Reed are well known for exposing the follies of what they call “race reductionism”—for example, the gloomy and ahistorical academic school of *Afro-pessimism*—and their colleague Cedric Johnson has published a book called *The Panthers Can’t Save Us Now: Debating Left Politics and Black Lives Matter* that eviscerates the current faddish nostalgia for Black Power. (Again, for anyone who would prefer a summary and critique, I [wrote a review](#) of the book that also goes into some depth in defense of Marxism against its postmodern critics.)

Examples could be multiplied, but Musa al-Gharbi has already performed this service in a recent article titled [“Woke-ism Is Winding Down.”](#) If it is true that wokeness has passed its peak and is, or soon will be, on the decline, this is likely not something to be uncritically celebrated. Nevertheless, it may open the space for a more serious left politics that tackles agendas such as rolling back American imperialism and rebuilding social democracy. Or even, perhaps, advancing the distant goal of economic democracy, i.e., workers’ control of the economy. Somehow, this traditional lodestar of the left has been almost totally forgotten and abandoned.

Left academics have honed the art of “problematizing” political common sense, for example by inventing a concept called “racial capitalism” and using it to argue that “white supremacy” is a pillar of capitalism no less foundational than class exploitation itself—as if Shanghai or, say, Lagos, Nigeria, not being ruled by “whites,” aren’t capitalist cities—but people with a modicum of analytical intelligence will see through these woke gambits. The more you talk about how racist all whites are and how much more

oppressed all blacks are, the more you're serving the business class by dividing the working class. Why else would the *New York Times*, quintessential outlet of liberal business, have invested enormous resources into the 1619 Project if not that it understood the profoundly *non-radical* implications of such racialism? Better to talk about *racial* capitalism than simply *capitalism*—*racial* exploitation than *class* exploitation—*reparations* (at the expense of white workers) than *socialism*. The reparations discourse is a brilliant way to destroy working-class solidarity.

With a kernel of political rationality, one can see that it's necessary to reach out to white workers, not alienate them or ignore them. Leftists could learn a thing or two from (of all people) Ralph Waldo Emerson, of whom a woman who frequently heard his lectures said, "Whatever else it might be that I cannot understand, he tells me this one thing, that I am not a God-forsaken sinner. He has made me feel that I am worth something in the sight of God, and not a despised creature." The contemporary "left," from feminists to critical race theorists, essentially tells white men (and the women who identify with them) that they're despised creatures worth nothing in the sight of God. It shouldn't be a surprise when people take this message to heart and turn to a Republican Party that cares not a whit about their well-being but at least *tells* them it does.

It's common sense that empathy, rather than demonization, is necessary for organizing a movement. If, like most liberals and leftists, one doesn't live among the mythologized and despised "white working class," one can at least read about their experiences, thus undermining one's own prejudices and finding common ground on which to educate and organize. Take a book like Arlie Hochschild's *Strangers in Their Own Land: Anger and Mourning on the American Right*, published in 2016. She makes it clear that, however misguided are supporters of Donald Trump's Republican Party, the large majority are not neo-Nazis, virulent racists, or wealthy cynics eager to crush the working class. "Blue-collar" white men across the South, and the communities they represent, are "victims" no less than the victimized groups celebrated by liberals. Neoliberal capitalism has left them behind, as they suffer from (at best) stagnating wages, environmental pollution and destruction, decaying infrastructure, decaying communities, and poor public health outcomes. Meanwhile, they're conscious of their low status: "we're seen as backward and poor." Hochschild's exercise in empathy, as in the following passage, is sadly lacking among most liberals and leftists today:

You [an average white man in the South] are a stranger in your own land. You do not recognize yourself in how others see you. It is a struggle to feel seen and honored...

You turn to your workplace for respect—but wages are flat and jobs insecure. So you look to other sources of honor. You get no extra points for your race. You look to gender, but if you're a man, you get no extra points for that either. If you are straight you are proud to be a married, heterosexual male, but that pride is now seen as a potential sign of homophobia—a source of dishonor. Regional honor? Not that either. You are often disparaged for the place you call home. As for the church, many look down on it, and the proportion of Americans outside any denomination has risen... People like you—white, Christian, working and middle class—suffer this sense of fading honor demographically too, as this very group has declined in numbers.

To begin to wrest power from a depraved Republican and Democratic elite, a corporate sector that cares about literally nothing but profits, it is necessary to appeal to "white America" no less than "black America" (to use race-reductionist metaphors suggested by identity politics). As always, you start by emphasizing what you have in common with people, for instance that you care deeply, as they do, about community, family, economic security, a healthy natural environment, and that you resent no less than they do impersonal government bureaucracies that tax your hard-earned money to wage wars abroad and in fact—here's an opportunity for education—redistribute income *upwards*, to wealthy investors and big business. You don't talk about how racist these people are—after all, everyone is a *little* racist (including against whites), a *little* sexist (against men too: "Men are arrogant, stupid, misogynistic!"), and has numerous prejudices and unappealing traits—but instead you argue that people of all races are being

exploited and victimized, and that ostensibly “lazy” black people work just as hard as whites to get ahead but are just as burdened by taxes and bills and debt. It doesn’t require much imagination to find common ground with struggling whites. Over time, using the “class reductionist” strategy of Bernie Sanders, you educate people and build a movement that promises to transform society much more radically than little identitarian programs of reducing disparities will.

None of this requires that you sacrifice the interests of minorities. It is rather the only way to fully realize those interests, given both the necessity of a broad popular movement and the (in most respects) shared interests of minorities and working-class white men. Through common struggle, not through woke demonization, you’ll succeed in reducing the incidence of racism, sexism, homophobia, and other such vices.

In short, as Finkelstein argues in his eloquent new book, it’s urgent for leftists to shed their race obsessions and gender obsessions and remember the Marxian lesson that class solidarity—albeit incorporating identitarian goals—is the sine qua non of a revolutionary movement. Hardly anything is more important today than organizing to make class struggle the defining issue of, for example, the left wing of the Democratic Party.

Objective economic structures, not subjective identities, are the fundamental evil to be combatted. Until they are, the left will remain, in effect, nonexistent.

The Second Cold War Is More Dangerous than the First

Twenty years ago, Noam Chomsky published a bestselling book called *Hegemony or Survival*. Since then, the stark choice he posed has only become more urgent. Depending on how humanity responds to the challenges of ecological destruction and imperialistic war, in the next decade that terrifying question “Hegemony or survival?” may well be answered.

Modern history shows that the most dangerous periods are when two or more great powers are struggling for hegemony. The eighteenth century in Europe was a time of “multipolarity,” as Britain, France, Prussia, Austria, and Russia were almost continually at war, competing for geopolitical advantage and to divide the continent between them. The conflicts escalated in the era of the French Revolution and Napoleonic Wars, as a mighty France, bursting with revolutionary energy, strove for absolute dominance against, in the end, Britain and Russia.

The 1815 Congress of Vienna led to a century-long balance of power presided over by an industrializing Britain, which soon became the supreme world power. Once industrialization swept the rest of Europe, however, particularly Germany, Britain’s power began to be challenged, not only in the Scramble for Africa but in Europe itself. German elites wanted their country to be the next Britain, and to a great extent it was their desire for hegemony that precipitated both world wars.

Since 1945, the United States has been virtually a global hegemon. As John Ross notes in the recently published *Washington’s New Cold War*, even at the height of its relative economic achievement in the mid-1970s, the Soviet Union’s GDP was only 44 percent of the U.S.’s. The Soviets had vast power in their limited sphere encompassing Eastern Europe and Central Asia, but they were not a capitalistically expansive, dynamically growing imperial power in the mode of the United States—or, more recently, of a resurgent China. China’s GDP is 74 percent of the U.S.’s, and its growth rate is higher (it has grown seven times faster than the American economy since 2007). Measured by purchasing power parities, the U.S. accounts for only 16 percent of the world economy, and China’s economy is 18 percent larger. In short, for the first time since World War II, we are entering an era of real competition between two mammoth economies, a declining hegemon and an aspiring hegemon.

When people talk about “the China threat,” this is, in effect, all they mean. In the long run, China poses a greater threat to U.S. power than the Soviet Union ever did. Mainstream commentators and politicians prate about China’s threat to democratic values and human rights—there always has to be an ideological rationalization for geopolitical strategy—but U.S. foreign and domestic policy since the Second

World War tells us how much its elites care about democracy and human rights. From the Vietnam War to the catastrophic invasion of Iraq, and from U.S. support for thugs like Batista, Diem, Iran's Shah, Suharto, Duvalier, Trujillo, Somoza, Pinochet, Marcos, Rios Montt, Mobutu, Saddam Hussein, Mubarak, Sisi, Modi, Mohammed bin Salman, and Netanyahu to CIA coups and attempted coups against countless governments, it is self-evident that policymakers care little about the moral values they pretend to espouse.

Americans have to ask themselves: is it worth risking nuclear war—and an apocalyptic nuclear winter—for no loftier purpose than to maintain their country's violently enforced grasp of overwhelming global power?

Threats to U.S. Power

The current flashpoint, of course, is the war in Ukraine, which is helping to midwife a “partnership” between China and Russia, both of which are also deepening their ties with Iran. Decades ago, Zbigniew Brzezinski wrote that “a coalition allying Russia with both China and Iran can develop only if the United States is shortsighted enough to antagonize China and Iran simultaneously.” He would presumably not be very happy with U.S. policies that are bringing about exactly this coalition. At the same time, U.S. missteps in the Middle East and its relative disengagement from the region since the Obama presidency are allowing China to improve its position there, as illustrated by the deal it recently brokered between Iran and Saudi Arabia to normalize relations. China's burgeoning economic interests not only in the Middle East but across most of the world, a function of its colossal, globe-spanning Belt and Road Initiative, require the country to play an ever-greater diplomatic role in fraught regions. Saudi Arabia, for its part, has shown it is happy to defy Washington, even joining much of the world in disregarding Western sanctions on Russia.

While Washington's failure to convince most countries to economically and diplomatically isolate Russia highlights the U.S.'s declining “hegemony,” the real threats to American power run deeper than diplomatic embarrassments. In coming years, the very status of the dollar as the world's dominant currency may be threatened. A kind of “de-dollarization” has been happening for some time now, as, for example, the share of dollar reserves held by central banks declined from 71 percent in 1999 to 59 percent in 2021. But in the last few years, and especially since Russia's invasion of Ukraine, the ongoing effort by many countries to undermine the dollar's dominance of the global financial system has intensified.

In part, this is because of the U.S.'s “weaponization” of the dollar: in the recent past, Cuba, Venezuela, Iran, Afghanistan, and Russia have all suffered from financial and trade sanctions that have included even freezing overseas assets and removal from the SWIFT messaging system that underpins the world's financial infrastructure. Other countries, understandably worried about suffering the same fate, share Russia's interest in developing new financial institutions and networks outside of the U.S.-led system. Apart from this motivation, they simply want to reduce their exposure to the effects of U.S. economic and monetary policy, which can devastate economies. And as China rises, it makes sense for it to promote use of the renminbi, or at least non-dollar currencies.

To that end, the BRICS countries, for instance, have been establishing new institutions and market mechanisms to bypass the dollar, and are even exploring the possibility of creating a new reserve currency based on the BRICS basket of currencies. Institutions like the New Development Bank, the Shanghai Cooperation Organization, new payment infrastructures that are alternatives to SWIFT, central bank digital currencies, bilateral trade conducted in currencies other than the dollar, and a renminbi oil futures market to partially de-dollarize the global oil trade all point toward a future currency regime that is at least multilateral, if not bilateral. The economist Nouriel Roubini argues that, “in a world that will be increasingly divided into two geopolitical spheres of influence,” a bilateral currency regime is likely to emerge, perhaps in the next decade.

Given that “the dollar's dominant position in the global financial system [is] the very foundation of [the U.S.'s] global leadership,” as two experts note, Washington can hardly be viewing all these developments with equanimity. Loss of the dollar's status as the world's reserve currency would have severe consequences for the American economy. But this outcome is exactly the end-goal of Washington's bellicose policies toward its perceived rivals! Through economic sanctions and aggressive military

actions—expanding NATO to Russia’s borders and encircling China with U.S. bases, military forces, and militarized partner states like Japan, South Korea, Australia, the Philippines, and even Taiwan—the United States is driving into existence a hostile bloc of great powers and medium-sized powers that are necessarily committed to its defeat. Their policies, then, will become increasingly belligerent, which will serve to justify even more belligerent U.S. policies, in a vicious circle that amounts to an extraordinarily dangerous “hybrid war” and arms race.

History shows that imperial hubris crescendos before a fall. In this case, though, it won’t be only the empire that falls; it will, in all likelihood, be civilization itself.

Addicted to War

The Pentagon has made a record budget request this year of \$842 billion, which it says is necessary to counter China. This claim should inspire skepticism, given that the U.S. has around 750 overseas military bases and China has about eight—one in Djibouti and a few on man-made islands in the South China Sea. China’s military budget, which has been increasing since America’s “Pacific Pivot,” is \$225 billion, not a small sum but still a fraction of the Pentagon’s. It is an interesting thought-experiment, incidentally, to imagine how Washington would react if China had scores of military bases off the U.S. coast and had deputized countries in the Americas to act as its armed sentinel states. Most probably, we wouldn’t be around to talk about it, because a world war would already have wiped us out.

In fact, contemporary China is probably the most pacific great power in world history, as Craig Murray observes. As the U.S. has rampaged all over the Middle East and expanded its direct or indirect military presence to virtually every region of the globe, what wars has China started? What territories has it annexed? What countries has it invaded? The usual response is that sometime in the future it might invade Taiwan—but given the harm such an invasion would likely inflict on the Chinese economy (because of Taiwan’s cutting-edge semiconductor industry, whose physical facilities could well be damaged or destroyed in an invasion), we should be skeptical of this claim too. Even hawkish Chinese generals seem to think war with Taiwan would be “too costly.” In any event, are annual military budgets of almost a trillion dollars necessary to defend Taiwan?

The conclusion is inescapable that the U.S. is simply trying to intimidate an economic rival, a country that, like Putin’s Russia (only more so), challenges its unfettered dominance of the entire world economy. The record of Washington’s foreign policy since 1945 is to seek and enforce compliance in any way it can, whether through carrots or sticks—blandishments and economic or military aid in some cases, coups, invasions, sanctions, paramilitary operations, and militaristic bullying in others. Defiant regimes cannot be tolerated. Accordingly, policymakers want a compliant (or weakened) Russia and a compliant or weakened China. The calculus is evidently that military buildup, whatever crises it leads to and however unpredictable its long-term effects, is the surest means of achieving these ends. It also has the virtue of projecting overwhelming power, which is something powerful states value for its own sake.

Even if the United States doesn’t succeed in provoking military conflicts with China (as it did with Russia), the new Cold War of which Washington is the primary instigator is profoundly damaging to the interests of humanity. As the *Washington Post reports*, this new Cold War “may see the world divided into opposing camps for decades, stymieing cooperation on climate change, choking global action on human rights abuses, paralyzing international institutions and increasing tensions in contested regions.” If only for the sake of cooperating to tackle global warming, nothing is more imperative than for great powers, first among them the U.S., to adopt conciliatory policies.

But that means Americans have to pressure their government to this end. And that, in turn, means building an anti-imperialist left. From Bernie Sanders to Alexandria Ocasio-Cortez (not to mention right-wing legislators), there isn’t a single principled anti-imperialist in Congress. In a time of staggering dangers from war and ecological destruction, this is a shocking and shameful fact.

For now, it seems that humanity is choosing the path of battling for hegemony rather than surviving.

The Left and the Ukraine War

To be a leftist in the United States is a dispiriting experience, but in the last year one of the more dispiriting things has been to see the attitude of many leftists themselves on a subject of crucial importance: the war in Ukraine. The consensus of the Washington establishment remains that the U.S. must support Ukraine against Russian aggression, in the form of providing enormous amounts of military aid. Progressives in Congress largely share this consensus, having voted for military aid and even cravenly retracted their letter to Biden in October that suggested he pursue diplomacy. Outside the halls of power, too, many leftists effectively support Washington's policies. To be sure, they add the qualification that one must also oppose American imperialism—but when they're supporting a U.S. proxy war that is providing pretexts to increase military spending and expand NATO (an instrument of U.S. power), this is an empty qualification. The sad fact is that there is little vocal advocacy in the U.S. today for the only moral position, namely to engage in immediate negotiations to end this horrific war.

Instead, most liberals, conservatives, and even leftists seem to support Antony Blinken's rejection of any ceasefire or negotiations that "would potentially have the effect of freezing in place the conflict, allowing Russia to consolidate the gains that it's made." In other words, negotiations have to be postponed until Russia is in a weaker position than it is now. In fact, the official U.S. war aim is "to see Russia weakened to the degree that it can't do the kinds of things that it has done in invading Ukraine," as Defense Secretary Lloyd Austin says. That means Russia has to be so devastatingly weakened—preferably defeated—that its capacity to wage war is destroyed. This, in turn, means that the war must go on for a very long time, perhaps "to the last Ukrainian," as John Quigley speculates. Zelensky, who seems "heroically" willing to countenance the ongoing destruction of his country, is now even insisting that Russia give up Crimea.

All this is madness, and ought to be seen as such by any clear-eyed opponent of the U.S. empire (which is vastly more global, hegemonic, and dangerous to the world's population than today's Russian "empire"). Before accepting complete defeat, Putin—whom, after all, we're supposed to view as a bloodthirsty monster—would likely wage total war on Ukraine, possibly including use of nuclear weapons. So anyone who defends the U.S. war aim (and Ukraine's current war aims, as stated by Zelensky) is advocating the destruction of Ukraine and, perhaps, nuclear war. Aggression should indeed be opposed, but not at the expense of human survival or the survival of millions of Ukrainians.

However strenuously it has been denied by Western supporters of this war, Russia has legitimate grievances (at least much more legitimate than those that have motivated U.S. wars since the 1960s) that must be addressed in order to end the killing. It isn't a simple matter of evil imperialism vs. a wonderful pacifist democracy. Scores of experts, including even Cold Warriors like George Kennan, have discussed the many provocations from the U.S., NATO, and Ukraine that brought on Putin's invasion, and we needn't rehash the whole history here. What is at stake is, in large part, a clash of rival imperialisms—a global one (the U.S.'s) and a relatively minor regional one (Russia's)—which means there is no morally pure outcome, as there rarely is in politics. A peace settlement will have to be a compromise, which, like most compromises, will doubtless leave all parties somewhat unhappy but at least will end the slaughter. Russia, for example, may well end up retaining Crimea (which it annexed in 1783—until 1954) and certain other small strips of territory it has gained. Leftists and left-liberals who wring their hands about how this would teach the lesson that aggression sometimes pays would do well to reflect on another fact: if, somehow, NATO and Ukraine manage to inflict a terrible defeat on Russia, this will teach America that unfettered military expansion—and incitement of war—is a great way to crush one's enemies, and it will apply the lesson to China.

It's worth noting, too, that it isn't only a confrontation of great powers that is at stake, or the survival of millions of Ukrainians and their country's physical infrastructure, or an atrocious empowerment of the U.S. military industry. The longer this war goes on, the more damage is done to the natural environment, including efforts to combat global warming. In just the first seven months of the war, the fighting released 100 million metric tons of carbon into the atmosphere. Meanwhile, as a report by Chatham House notes,

“across the world, countries are building or reopening coal power stations and investing in oil and gas development.” Soaring energy prices have led to a “gold rush” for new fossil fuel projects. Oil companies are making record profits. Are we supposed to care more about punishing Russia than leaving a livable world to our descendants?

This is to say nothing of the large-scale food insecurity the war has fostered, the cost-of-living crises that are impoverishing millions, and the displacement of refugees. These problems cannot be solved until the war ends. And it can end only with negotiations. One expects neocon vampires like Anne Applebaum, Bill Kristol, and Robert Kagan—not to mention Biden administration officials like Blinken and Victoria Nuland—to experience throes of ecstasy over any war that projects American power, but when even progressives and leftists are vehemently defending U.S. proxy wars and effectively dismissing the idea of negotiations, it is clear that America’s moral and intellectual rot runs very deep indeed.

Liberals and leftists ought to be embarrassed that the most vocal advocacy of the antiwar position today is from the likes of Marjorie Taylor Greene, Tucker Carlson, and right-wing libertarians. It’s time that the left reclaimed its antiwar traditions.

What “Security Threat” Does China Pose?

Everyone who abhors war, detests imperialism, and favors cooperation between nations on global warming, poverty reduction, protection of biodiversity, international disarmament, implementation of international law, and other left-wing priorities ought to be appalled by the escalating tensions between the U.S. and China and actively organizing against them. The new Cold War between “East” (including Russia) and “West” is more dangerous than the first one, not only in having already provoked a proxy war between great powers in Europe itself, and not only in undermining any progress toward goals that are urgent for all of humanity, but also in preparing the conditions for a horrific large-scale war that might well end in nuclear winter. The coming years will, to a substantial degree, determine the future of civilization, which puts a tremendous burden on all decent people to struggle to end the madness.

“Both sides,” of course, bear responsibility for the new Cold War, just as all great powers share most of the responsibility for failing to act decisively on global warming. Given the disproportionate power and imperialistic history of the United States, however, it is this country that bears most of the blame, in both cases. So it is, first and foremost, this country’s policies that we have to change. Even were this not the case, though, the principle that Noam Chomsky has enunciated would apply: it is the dangers presented by *their own* states, not enemy states, that citizens have a duty to organize against. Westerners should, primarily, criticize their own governments, which they can hope to influence. They can’t meaningfully influence China or Russia.

The question arises, then, as to how best to steer America from a course of aggression to one of cooperation and conciliation. That is, how can we build an antiwar movement? A crucial task, evidently, is to delegitimize the direction of policy vis-à-vis China that began under Trump and has continued under Biden, the pursuit of military provocation and economic warfare. This entails a relentless focus on refuting the reasons Washington gives to justify its aggressive posture.

Americans are inundated with the message that China is a “threat,” and that for this reason it must be confronted. They hear it from every major media outlet—CBS, Fox, the New York Times, the Washington Post, etc. This message reflects the attitude of Washington, which obviously views China as a major threat—to American “security,” “national security” (as stated for example in the 2022 National Defense Strategy). Two questions pose themselves: first, is China indeed a threat, and if so, to what, precisely? Second, is confrontation the best means to deal with whatever threat China represents?

National security

The concept of “national security” has been thrown around promiscuously for generations, not only in politics and the popular media but even the international relations scholarship. Rarely is it noticed that the term, unless clarified, is meaningless, or that its meaning varies by context. Was George W. Bush protecting America’s “security” by invading Afghanistan and Iraq, thereby massively increasing terror, and terrorist recruiting, across the Middle East? Is the government protecting Americans’ present and future security by subsidizing the fossil fuel industry, thus accelerating global warming? Prima facie, the most obvious meaning of security is something like Franklin Roosevelt’s Four Freedoms: freedom of expression, freedom of religious belief, freedom from want, and freedom from fear. But this kind of security for the average person—is this a high priority of the U.S. government? Is it what is meant by the mantra that China is a security threat? Is China responsible for the economic insecurity of most Americans, or their housing insecurity, or their fear of mass shootings, or their fear of getting sick because they won’t be able to pay medical bills?

“Security,” therefore, apparently doesn’t mean the security of Americans, at least not of the vast majority. The government could invest \$800 billion in, say, upgrading infrastructures of public health and housing—you know, *actual* security infrastructures—rather than upgrading the military and thereby encouraging a dangerous arms race with China. Realist scholars like John Mearsheimer propose an alternative definition: security in the technical sense means the state’s very survival in an anarchic system of international relations. Potential rivals exist everywhere, so states have to be prepared for military confrontations. Their need to survive, therefore, has a corollary: “great powers [seek] to maximize their relative power,” Mearsheimer writes, “because that is the optimal way to maximize their security. In other words, survival mandates aggressive behavior,” in order that the state can defend itself against a potential aggressive rival. The ultimate goal in this dog-eat-dog security competition is to be a regional hegemon that can trounce any opponent, and then to prevent any other country from becoming a rival hegemon.

This “realist” reasoning might sound plausible, although one can see right away that it tends to rationalize and legitimize militarism (as shown by Mearsheimer’s judgment that the brutal expansionism of Germany, Japan, and the Soviet Union in the 1930s and ’40s was quite rational, for they were only trying to survive!). Can it really be maintained, however, that contemporary China threatens the very survival of the United States? Only through its arsenal of nuclear weapons can China even conceivably threaten the U.S., which means that the most rational American policy is not to provoke a nuclear arms race but to try to phase out all nuclear weapons worldwide. This would certainly increase America’s security. Since the new Cold War only exacerbates the nuclear threat, the U.S. government’s motivation for it, contra Mearsheimer, cannot be to ensure its own survival. So, if “security” concerns are, as is often said, what motivate America’s confrontational policies, we need another definition of that perplexing word.

The work of earlier realists such as Hans Morgenthau, as well as Marxists, provides the answer: in the absence of genuine military threats to a country (like the very fortunate United States since 1812), security is nothing but a euphemism for state power and prestige. The struggle for power as an end in itself is what motivates all ruling elites and governments. Economic, military, geopolitical, ideological, cultural power—even a hegemon will insatiably strive for more power, *total* power, crushing all dissent everywhere to the extent possible. “A political policy,” says Morgenthau, “seeks either to keep power, to increase power, or to demonstrate power.” Whether this is because of human nature, as Morgenthau argues, or the inevitable dynamics of powerful institutions, or the fact that only power-hungry people rise to the top, it is a general principle.

Since Americans rarely look favorably on government as such, opponents of the new Cold War would do well to constantly emphasize that its primary purpose is to defend and assert the hegemonic power (i.e., “national security”) of the U.S. government, together with certain segments of the business community—for example, defense contractors—that are closely interlinked with government. Constant exposure of the belligerence of U.S. policy, as contrasted with China’s relative restraint, would undermine public support for confrontation. When U.S. officials, in characteristic fits of mind-boggling hypocrisy, charge that China is threatening global peace and stability, one might quote Kishore Mahbubani’s article in Harper’s Magazine entitled “What China Threat?”:

Quite remarkably, of the five permanent members of the UN Security Council (China, France, Russia, the United States, and the United Kingdom), China is the only one among them that has not fired a single military shot across its border in thirty years, since a brief naval battle between China and Vietnam in 1988. By contrast, even during the relatively peaceful Obama Administration, the American military dropped twenty-six thousand bombs on seven countries in a single year. Evidently, the Chinese understand well the art of strategic restraint.

China is indeed a threat—to the dominance of a small American elite, centered in finance, government, and tech, over world politics and the world economy. As Deborah Venezia explains in *Washington's New Cold War*, much of the hostility of America's capitalist class (or particular sectors of it) to China results from the difficulty of accessing its domestic market. "U.S. tech giants such as Google, Amazon, and Facebook have virtually no market in China, while companies like Apple and Microsoft face increasing difficulties... [These companies] yearn for a change to the political system in China that would open the door to the country's massive market, and major actors in this sector are actively working to advance Washington's hostile foreign policy." Finance, likewise, is unhappy with China's capital controls, which restrict capital flows into and out of the country. George Soros expressed the frustration of many financiers when he tweeted in January 2022 that "Xi Jinping is the greatest threat that open societies face today."

Aside from grievances due to China's non-neoliberal character, a significant reason for Washington's strategy of aggressive confrontation is simply that expansion of U.S. military capacity is an end in itself, for which pretexts have to be sought. As Morgenthau might say, such a policy demonstrates (and can help keep) power, which is the whole point of being a government. It is also the kind of thing that companies like Lockheed Martin, Raytheon, Boeing, Northrop Grumman, and BAE Systems will benefit from and lobby for. It's hardly a secret that there is a revolving door between the Pentagon and private military contractors: even Secretary of Defense Lloyd Austin was on the board of directors of companies like Raytheon before Biden appointed him. Cold Wars are in the interest of very wealthy corporations and very powerful government bureaucracies, which can use them to justify larger congressional appropriations and expansions of their power.

China will constrain the U.S. empire

Returning to "security" risks—risks to the security of the global dominance ("leadership" is the preferred term) of U.S. elites—it is true that as China's economy grows, its geopolitical power will necessarily grow as well, thus challenging U.S. "leadership." There is some sense, therefore, if not much justice, in Biden's attempts to slow China's economic growth by restricting exports of cutting-edge semiconductor chips and other high-tech equipment. Whether such restrictions are in the interest of American consumers, or of humanity as a whole, is much more debatable. In any event, to partially delegitimize the trade wars that the U.S. is escalating, and which may well become quite harmful to Americans, it suffices for dissenters to note at every opportunity that these wars' entire purpose is to hurt China's economy so it will have more trouble challenging the global dominance of America's tech industry and the U.S. government. Most Americans are smart enough to know that their interests and those of the government don't usually coincide.

Indeed, that's the crucial question to keep asking in public forums: *why should we hate and fear China so much?* It makes a lot more sense to hate and fear our own government, together with the corporate sector with which it is fused. China caused none of the vast human suffering, the desolation of hundreds of millions of lives over two generations, that has brought American society to its knees; it merely benefited from the decisions by corporate executives to relocate factories abroad, where it was easier to exploit labor at a higher rate. The fight of working Americans is not with China.

But what about China's theft of intellectual property? What about its military threat to Taiwan? What about that terrifying *balloon* that floated into U.S. airspace? Surely all this justifies a new Cold War

that could last a generation or more! Well, in fact, as every reasonable person knows, the right way to deal with whatever genuine threats China might pose is to pursue diplomacy, preferably through one of the multilateral institutions that exist for precisely such cases as these, including the United Nations and the World Trade Organization. When the U.S. rejects the obvious path of diplomacy in favor of military escalation and overblown rhetoric, it is clear that it's merely seizing on real or imagined provocations as pretexts for pursuing some other goal it prefers not to publicize. This was clear when the Bush administration flailed around for excuses to invade Iraq—from weapons of mass destruction to ousting Saddam Hussein to building a wondrous new democracy—and it's clear now, as the Biden administration orchestrates the wholly unnecessary military and economic containment of China.

In fairness, it is perfectly natural for a hegemonic government, used to getting its way and running rampant over most of the world, to try to prevent the emergence of a peer competitor. As Marco Rubio said plaintively in a moment of refreshing candor some weeks ago, “Brazil cut a trade deal with China. They're now going to do trade in their own currencies, get right around the dollar. They're creating a secondary economy in the world, totally independent of the United States. We won't have to talk about sanctions in five years, because there will be so many countries transacting in currencies other than the dollar that we won't have the ability to sanction them.” From a superpower's point of view, these are major crimes, the worst crimes possible. To constrain the ability to bully and browbeat that the U.S. has enjoyed since the late 1940s is totally unforgivable.

But the American people should question whether such a threat to their government's power is also a threat to them. Maybe a forced reining in of the U.S. empire could be *good* for Americans. Whatever constrains the power of the elite is likely to expand the power of the majority. Those who favor peace, in any case, should welcome the emergence of a new superpower that can challenge the policies of the most warmongering country on earth, such as by brokering peace agreements the United States refuses to. However authoritarian China is internally, its role in the world might end up being relatively constructive.

This is especially the case given that, in its search for support among other countries and peoples, it can't appeal to any democratic ideology it supposedly represents, as the U.S. at least rhetorically can. To win moral authority, China has to actually *deliver* rather than merely *preach*.

In the end, then, China's rise poses a straightforward security threat: it threatens the security of the old order, the Washington-directed, neoliberal, war-as-a-first-resort order. It threatens to bring about a more multilateral world, with less impunity for America's crimes and more recourses to which victims can turn. People everywhere—except the West's power centers—should cheer this fact.

Love of Freedom Defines the Political Left, Not the Right

Political discourse in the United States consists largely of lies and confusions. One of the greatest of lies and confusions, which I hope to help dispel in this article, is the common delimitation of the very concepts “left” and “right”: it is claimed that to be on the right is to value freedom above all—this is what “small government” is supposed to mean, for example—while to be on the left is to value equality, if necessary an equality enforced tyrannically by an enormous, Soviet-style government. Nothing could be farther from the truth than this conventional wisdom. The opposite is closer to the truth: to be on the right means, in effect, to advocate an enforced equality of nearly universal servitude and anti-democracy, while to be on the left means to value the greatest freedom for the greatest number. Since left and right are still the most salient political categories (notwithstanding the fantasies of some commentators that they're obsolete concepts), it is of utmost importance to be clear about their meanings.

Underlying this debate about definitions and political commitments is an important strategic point: the left has to reclaim the language of freedom from the faux-libertarian right. We shouldn't let conservatives get away with pretending they're the ones who value free speech, for example. The only reason freedom of expression is (to some degree) protected today is because of centuries of left-wing activism.

A couple of approaches to this subject are possible. One might expound the history of left and right, from the seventeenth century to the present, using it to illustrate the underlying values of the “radical” and the “conservative” traditions (with a congeries of milquetoast “centrists” always somewhere in between). Alternatively, one might analyze contemporary ideologies and policy positions, showing what their implications for freedom and human flourishing are. Both of these approaches would yield the same result: the left’s is a philosophy of emancipation and not mere insipid “equality”—unless it’s an equality of emancipation (freedom); the right’s is a philosophy of, to quote Corey Robin, defending hierarchy, or more specifically, of “having power, seeing it threatened, and trying to win it back.” The right’s is an authoritarian, not a libertarian, philosophy. There have, admittedly, been people and governments who have called themselves leftist—or socialist, democratic, communist—who have been profoundly authoritarian, but they have always been attacked by more principled leftists, often anarchists or left-Marxists like Rosa Luxemburg, for their betrayal of libertarian values and having been corrupted by a love of power.

It was during the Cold War that the present political confusions became embedded in American culture. Before the 1940s, defenders of laissez-faire capitalism, from Social Darwinists like William Graham Sumner to anti-New Dealers like Herbert Hoover, had indeed insisted they were the true upholders of freedom, but labor organizers and socialists from Samuel Gompers to Eugene Debs had compellingly countered these claims. Franklin Roosevelt was revered for identifying freedom with economic security: “I am not for a return to that definition of liberty,” he said in one of his fireside chats, “under which for many years a free people were being gradually regimented into the service of the privileged few. I prefer and I am sure you prefer that broader definition of liberty under which we are moving forward to greater freedom, to greater security for the average man...” This inclusion of security in the definition of freedom was common sense to most Americans: you weren’t free if you had to work long hours in poor conditions for low wages, subject to the capricious tyranny of an employer because it was absolutely forbidden to form a union, i.e., to cooperate with your coworkers for mutual uplift. Most people in the 1930s took it for granted that the “freedom” of conservatives was the freedom of the ruling class to dominate, exploit, and immiserate the majority.

By the late 1940s and 1950s, during and after the Second Red Scare, big business had successfully counterattacked and “sold free enterprise” to Americans as the epitome of freedom itself. This was an easier sell than it would have been had the Soviet Union not been there to tarnish the idea of socialism (or communism), which used to mean nothing but an extension of democracy into the economic sphere: ordinary people freely controlling their own work, in the form of worker cooperatives and democratic government coordination of large industry. Americans were now persuaded to believe something ridiculous: whatever a government calls itself, it is in fact that thing. If, like the USSR, it calls itself socialist, communist, or left-wing, we have to take its word for it, because governments are always honest and trustworthy. (But then why didn’t we take the Soviets’ word for it when they called themselves a democracy, and thus conclude that the USSR had invalidated democracy just as it had supposedly invalidated socialism or communism? Could it be that we were simply victims of the West’s propaganda to defame an old anti-capitalist tradition?)

The history of the left was now forgotten, as, perversely, to be on the left ostensibly meant to be a totalitarian, a “collectivist,” who was willing to sacrifice freedom for the gray equality of a universal government bureaucracy. It was forgotten that the revolutionary left had always been at the forefront of the struggle for freedom. The words of the Declaration of Independence—“We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are Life, Liberty, and the pursuit of Happiness” (note the alteration of John Locke’s original “life, liberty, and property”)—written in the context of mass struggle against illegitimate power, belonged to the tradition of the left. The abolitionist movement to emancipate the slaves was denounced for its radicalism by conservatives and centrists of the day. In the early twentieth century, the Industrial Workers of the World courageously tested the limits of American democracy in their famous free speech fights. In the 1930s, the Communist Party helped organize the early stages of a long civil rights movement against lynching, the Jim Crow regime, and economic exploitation of blacks in the South. The New Left of the 1960s expanded the realm of freedom further in its battles, anticipated in the Port Huron Statement,

against the stultifyingly conformist, bureaucratic, right-wing Cold War establishment. And the counterculture, which conservatives so hated that it helped birth the New Right, had freedom as its watchword: free love, free access to drugs, free celebration of life and music and community.

In the meantime, conservatism was marshaling its forces for an all-out fifty-year assault against the emancipatory legacy of the New Deal and the New Left. Characteristically, it disguised its real intentions in the language of liberty: its economic philosophy it called libertarianism, although what it meant in practice was nothing but the tyranny of big business unconstrained by unions, government regulation, or the welfare state. This dystopian “free market” vision of the Mont Pelerin Society, significantly, was attractive to Southern white supremacists, who voted for Barry Goldwater, an early right-wing “libertarian,” in 1964 despite his being a Republican. Why this affinity between white supremacists and business supremacists? (One sees it today too, as white supremacists have notoriously supported Donald Trump, a business supremacist.) Because both groups worship power and hierarchy. In desiring a weakened—in some respects—federal government, what both types of conservatives really want is unfettered power over a subordinate group, whether non-whites or workers. With a smaller, weakened government, they can more easily wield this power unhindered by irksome federal laws and regulations that protect workers, minorities, public resources, and the natural environment.

In other words, however appealing the “small government” slogan might seem, or however grounded in classical liberalism, it is motivated today by values *opposite* to those of classical liberals like Wilhelm von Humboldt and Immanuel Kant. Humboldt argued that a human being “is born to inquire and create, and when a man or a child chooses to inquire or create out of his own free choice then he becomes in his own terms an artist rather than a tool of production or a well-trained parrot.” For Kant, “there is only one innate right: freedom (independence from being constrained by another’s choice), insofar as it can coexist with the freedom of every other in accordance with a universal law.” In a time before the colossal modern corporation, before the vast complexity of industrial capitalist society, it made perfect sense to arrive from these premises at the conclusion that the state ought to be very small.

But circumstances change. How far the libertarian, anarchistic sensibility of Humboldt and Kant is from modern conservatism is clear from, say, the famous Powell Memorandum of 1971, which plotted the counterattack of the New Right against the New Left. To restore the ideological and cultural hegemony of big business over American society, Lewis Powell advocated, for example, a “Big Brother”-style monitoring of all media and educational institutions—not by the state, it’s true, but by the Chamber of Commerce. “The national television networks should be monitored in the same way that textbooks should be kept under constant surveillance. This applies not merely to so-called educational programs...but to the daily ‘news analysis’ which so often includes the most insidious type of criticism of the enterprise system [i.e., capitalism]. ...[T]he result is the gradual erosion of confidence in ‘business’ and free enterprise.” It is necessary, then, to control what the public is allowed to see, hear, and read, so that confidence in capitalism is not eroded.

This waging of political war on behalf of the rich and powerful, so as to eliminate dissent against the system that has given them their power, is antithetical to classical liberalism. It has nothing in common with the desire for universal freedom.

Consistent leftists certainly have no love of “big government”: just read the writings of anarchists in the last 180 years, from Bakunin through Alexander Berkman to David Graeber. (*These* are the real successors to classical liberalism.) Even Marxists are well aware that the state tends to crush individual freedom, which is why they look forward to a withering away of the state. They understand, however, that a social democratic government that guarantees people the right to healthcare, free education, expansive public resources, and a decent standard of living is at least preferable to a Milton Friedmanite laissez-faire capitalism that leaves people no recourse against total domination by super-concentrations of economic power (and the government they control).

The distinction is sometimes made between negative freedom and positive freedom: “negatively, liberty is the absence of restraint; positively, it is the power to act and to enjoy,” to quote the liberal priest John Ryan (in his 1912 book *A Living Wage*). And it is claimed that conservatives value negative freedom while leftists value positive freedom. This, too, is false. For one thing, social conservatives are very

comfortable restraining the liberty of others. Whatever one may think of abortion, same-sex marriage, and other social issues, it is evident that to legislate against them is to restrict the freedoms of women, gays, and other targeted groups. But economic conservatism, too, amounts to limiting people's freedom, including their negative freedom. If strong labor laws, for instance, do not exist or are not enforced, employers can easily prevent workers from unionizing, which is an obvious infringement of their freedom. More generally, having to obey all the orders of a boss lest you be fired and left to the tender mercies of unemployment and (in many cases) a brutal job market is a clear "restraint" on your liberty. The philosophy of conservatism, therefore, is a philosophy of authoritarianism, precisely the opposite of what its exponents usually say.

In fairness, conservatives are often more honest when talking to each other. They can be quite open about their hatred of democracy (i.e., the *freedom* of everyone to participate in politics). In his presidential address in 1978 to the Mont Pelerin Society, for example, economist George Stigler suggested that victory in their privatization crusade might be achieved by "the restriction of the franchise to property owners, educated classes, employed persons or some such group." As Nancy MacLean documents in *Democracy in Chains*, Stigler's colleague James Buchanan, along with Murray Rothbard, Friedrich Hayek, and other "libertarian" authoritarians (who infamously supported Chile's dictator Pinochet), were likewise very hostile to democracy, as conservatives have typically been. (It's hardly a surprise that the Republican Party is currently trying to make it harder for certain groups of people, such as college students, to vote.) But this is perfectly natural if their ideology, as I'm arguing, is in its essence opposed to the freedom of everyone except the economic and political elite.

None of this is to say that all leftists are consistent, however. Woke cancel culture, which has been criticized by both leftists and conservatives, tends to restrict people's freedom of expression, by implanting the fear in them that if they say something slightly outside the bounds of what is considered acceptable at that moment, they'll suffer grievous consequences. If cancel culture could go as far as many of its practitioners would like it to go, very little dissent on matters of social significance would exist or be tolerated. A timidity and frigidity of thought would descend like a pall under a regime of soft totalitarianism. Cancel culture is hardly a new thing in history—conservatives and centrists have always practiced it to silence dissent, whether by excluding leftists from the dominant media, destroying their careers, imprisoning them, or killing them—but it is unseemly for leftists to participate in it.

In the end, the values of the left are those of the Enlightenment (in reaction against which conservatism was originally founded). "Enlightenment is man's emergence from his self-imposed immaturity," said Kant. "Have courage to use your own understanding!"—that is the motto of the Enlightenment." Voltaire's loathing of censorship, Rousseau's love of freedom, Kant's emphasis on the critical use of reason, Adam Smith's moral philosophy of sympathy, Spinoza's faith in democracy, Humboldt's exaltation of individual creativity, Benjamin Rush's philosophy of universal education, Condorcet's belief in progress—these are the pillars of the left, the emancipatory tradition in politics. The "equality" that is valued is the equality of human rights, the equality of freedom, which presupposes a relative equality of economic security. Against the conservative love of unaccountable power and imposed inequality, the left believes in the universality of human dignity.

Postliberals Against the Common Good

"The Republican Party is the most dangerous organization in human history," says Noam Chomsky. It seems like a ridiculous statement. "Has there ever been an organization in human history that is dedicated, with such commitment, to the destruction of organized human life on Earth? Not that I'm aware of." He has a point. Even the Nazis didn't want to destroy civilization itself; they wanted to kill millions of people and dominate civilization, not bring it to an end. The Republican Party is much more ambitious, and more nihilistic: it is the capitalist id, or rather the capitalist death instinct, adopted as the organizing principle of a vast political force. *Profit over people at all costs, including acceleration of global warming—not to mention demolition of organized labor, the welfare state, the regulatory state, progressive taxation, public*

resources like education and transportation, and the whole legacy of the New Deal. For Republicans even more than Democrats, enslavement to the business oligarchy is the highest good.

This being the case, one might be perplexed that “postliberals” and other conservatives who pride themselves on their concern for “the common good” do not devote all their energy to defeating Republicans and organizing a popular movement for social democracy. In fact, they tend to do the opposite: they praise and endorse Republicans (especially pseudo-populists like Donald Trump, Josh Hawley, and J. D. Vance) while denouncing the “progressives” or “democratic socialists” who are struggling to build movements that will defend the common good and repair the social fabric rent by hyper-capitalism. On issue after issue, from protection of the environment to the resurrection of labor unions to the dismantling of psychopathic mass incarceration, it is organizers on the left, not the right, who are actually trying to *conserve* society. In this sense, it is leftists who are the true conservatives.

The political attitudes of most postliberals are approximately those manifested in Patrick Deneen’s new book *Regime Change: Toward a Postliberal Future*. It’s a very flawed book, as I explain in a forthcoming review. Here, I want only to note the incoherence of its political stance, which is that of right-wing postliberalism in general (as opposed to left-wing postliberalism, such as Adrian Pabst’s). As in his earlier book *Why Liberalism Failed*, Deneen deplores the atomization of modern society and the decline of community, stability, family, and traditional norms of social obligation. But he blames this social crisis on “liberalism,” a constellation of ideologies (some of which, historically, are mutually contradictory), rather than the material social relations of capitalism, as Marxists have done since the *Communist Manifesto* of 1848. In Marx’s famous words, “The bourgeoisie, wherever it has got the upper hand, has put an end to all feudal, patriarchal, idyllic relations... All that is solid melts into air, all that is holy is profaned...” Since capitalist class structures are the real basis for a way of life—an atomized, profit-obsessed, consumerist, hedonistic way of life—postliberals have gotten the very name of their philosophy wrong. It should be called postcapitalism, assuming the goal really is to create a cohesive, communal society.

What a postcapitalist world would look like is hard to imagine, but it would at least do away with the antagonistic and exploitative production relations that are ultimately responsible for the atomization postliberals lament. Ordinary people would control their work, in the form of worker cooperatives and democratic government coordination of large industry (possibly still in a market-oriented economy). The 1912 platform of Eugene Debs’ Socialist Party isn’t a bad place to start. If the notion of some degree of “government planning” seems unrealistic or tyrannical, we should remember that even today, the U.S. government engages in economic planning on a colossal scale, for instance through its subsidies to high-tech industry, its trade and tariff policies, its military procurement programs, and its regulation of all sectors of the economy. During World War II, in fact, government planning was remarkably successful, leading to full employment and setting the stage for the prosperous 1950s and 1960s. We don’t live in a true market economy.

Instead of taking their “communitarian” values to their logical, anti-capitalist conclusion, however, most postliberals remain on the level of culture, identity politics, and other half-measures. Deneen, like his co-thinkers Gladden Pappin, Chad Pecknold, Adrian Vermeule, Yoram Hazony, and others, advocates restrictions on immigration in the hope that this will somehow shore up the national community and protect wages. (He disregards the fact that the presence of undocumented immigrants and refugees stimulates the economy and creates jobs.) He argues that we have to renew the “Christian roots of our civilization” by making politics “a place for prayer” and reinfusing religion into public and private activities. Broadly, “an ennobling of our elite,” such that it is selflessly concerned with the well-being of “the people” and “work[s] to improve the[ir] lives, prospects, and fate,” will revitalize society and community. He fails to explain how such an ennobling of the ruling class can ever occur in the context of advanced capitalism, characterized by the global hegemony of unfettered greed.

In fact, Deneen even deprecates social democracy and its “progressive liberalism,” claiming without evidence that redistribution of wealth to workers has “led to extensive damage to the broader economic order.” He seems unaware that postwar social democracy, created through overwhelming pressure by unions, socialists, and communists, was the closest modern society has ever come to protecting families, communities, and social stability.

It isn't hard to criticize the idealism, political naïveté (as if class conflict isn't endemic to capitalism!), and historical ignorance of postliberalism. But the basic incoherence of the ideology is that its attacks on liberalism and the left, and its defense of conservatism, only serve to empower the forces most dedicated to sabotaging the very values postliberals claim to uphold, values like “national resilience,” “common purposes,” and the “social covenant.” Republicans and business reactionaries love to keep the political focus on things like the decline of religion, the ostensible immigrant invasion, and the excesses of liberal identity politics, so that they can go on smashing the working class, appropriating most of the world's wealth, privatizing and atomizing society, and destroying the prospects for human survival. Postliberals are in danger of being useful idiots for the most insatiable sociopaths on the planet.

Will it be denied that the Republican Party is as bad as all this? Consider the evidence. Donald Trump is supposedly a populist, someone trying to turn Republicans into the party of the working class. It turns out that his administration, like all Republican administrations since Reagan's, was utterly slavish to the most misanthropic sectors of business. His NLRB waged an “unprecedented” attack on workers' rights. He weakened or eliminated over 125 policies that protected the country's air, water, and land. His budgets savagely slashed benefits for low-income Americans, continuing a longstanding Republican practice. All this is the exact opposite of protecting the “common good” that postliberals say they value so much.

What about the great “populist” senators Hawley and Vance? They give, at best, tokenistic and rhetorical support to the working class: neither has even cosponsored the Protecting the Right to Organize Act, and Hawley, according to the AFL-CIO, has almost always voted against the interests of workers. Vance, a venture capitalist, finds it much more congenial to spew racist “great replacement” nonsense—an identity politics of the right—and blame those with a low income for their own failures than to actually do anything to help the latter. If this is the record of Republicans who present themselves as pro-worker, it isn't hard to imagine how bad establishment Republicans are.

Perhaps the greatest crime of the Republican Party is that it is almost rock-solidly opposed to even the mildest proposals to address global warming, which threatens not only working people but all life on earth. The sweltering summer the world has just experienced will likely be seen as a gloriously mild one thirty years from now, when wildfires are raging everywhere, ocean levels are much higher, and whole continents are descending into chaos. The Republican plan to address the coming cataclysms is...to make them worse. Project 2025, a conservative blueprint for the next Republican president, calls for “shredding regulations to curb greenhouse gas pollution from cars, oil and gas wells and power plants, dismantling almost every clean energy program in the federal government and boosting the production of fossil fuels.” The inadequate Inflation Reduction Act, which provides \$370 billion for investment in clean energy, would be repealed. Allied nations would be encouraged to use more fossil fuels, and the National Security Council would be forbidden to consider climate change worthy of discussion.

Nihilism on this scale, an explicit embrace of something close to species-suicide by a major political party, is unheard-of in history. It is collective criminal lunacy, worse than Nazism, as Chomsky rightly notes. And yet how many postliberals, how many conservative proponents of the traditional values of family, community, and morality, are strongly speaking out against it, against this brazen threat to all families, communities, and morality itself? Their priority, rather, is to denounce “critical race theory” and keep out immigrants, as if that will heal the country.

Postliberals claim to favor policies that support marriage and family, singling out for praise Hungary's initiatives to offer paid leave for parents and financial incentives for three or more children. They also support government spending on large infrastructure projects. So why didn't they aggressively lobby Congress to pass Biden's original Build Back Better bill in 2021? This bill, which couldn't pass because of Republican opposition, would have been an immense boon to working families through its investments in childcare and preschool, paid family and medical leave, community college, child tax credits, physical infrastructure, affordable housing, health care, and environmental protection. It was the most ambitious measure in generations to repair the social compact and encourage family formation. Not a single Republican supported it.

It is hard to imagine that any party has ever been more committed to destroying families than the Republican, yet the self-proclaimed defenders of family values aim their ire at Democrats. However bad

Democrats are, they are the party responsible for the New Deal, for Lyndon Johnson's Great Society, for the almost-passed Build Back Better bill, for Biden's NLRB that is as supportive of unions as Trump's was hostile towards them. We should recognize, then, a perhaps unpalatable truth: since Republicans will never do a single thing opposed to the interests of the billionaire class, the only hope for the United States is to keep them out of power at the same time as popular movements are pushing Democrats to the left. Had the Democratic Party won a few more seats in the Senate in 2020, transformative laws on voting rights, union organizing, family welfare, and environmental protection that were passed in the House might have been enacted. It was a tragic missed opportunity, but, with the defeat of Republicans and the election of leftists, such opportunities can appear again.

Postliberals can contribute positively to politics, but only if they follow the recent example of one of their own: Sohrab Ahmari, who has written an impressive book on corporate America's plunder of the working class, entitled *Tyranny, Inc: How Private Power Crushed American Liberty—And What to Do About It*. Ahmari still seems to have some illusory hope regarding the likes of Hawley, Vance, and Marco Rubio, who wouldn't be in the Republican Party if they really wanted to help people. (Token populist moves shore up their voting base.) But at least Ahmari has apparently realized that the battle against liberal identity politics is less important than the battle for a left-wing economic agenda—and in fact that the right-wing crusade against wokeness sabotages the struggle for workers' rights and a livable future, since it empowers Republicans.

One hopes that more postliberals will, similarly, come to their senses.

Nikole Hannah-Jones, Frederick Douglass, and the Left

Twitter conversations with public intellectuals are rarely worthy of note, but a recent exchange I had with Nikole Hannah-Jones, famed mastermind of the *New York Times*' 1619 Project, was symptomatic of widespread tendencies in left-liberal culture and brought up important issues.

Hannah-Jones is a spokeswoman for wokeness, the cultural phenomenon that, as I've written elsewhere, is brilliantly undermining the left and providing grist for the mill of the right-wing outrage machine. Historically, a crucial method of undermining the left is to divide the working class according to race and ethnicity, fostering resentments and enmity between groups of people who share economic and political interests. Accordingly, in a characteristic statement, Hannah-Jones tweeted that "it is Black people who are the greatest agents of democracy the United States has ever seen. No one see[s] this country with more clarity than Black Americans. It is why while so many other[s] falter, we always muster the courage to do what must be done." Divide people by race, elevating some and lowering others, with the effect of undercutting interracial solidarity: that's the way of the conservative and the liberal, not the leftist.

Regarding Hannah-Jones's tweet, we may pass over the grandiloquent language, as if "Black Americans" (as a group) have never "faltered" and have "always" mustered the courage "to do what must be done." Only one thing is worth noting here: this is explicitly the language of myth-making, of glossing over messy reality in order to create a cult of black people. Other groups are inferior, less courageous and clear-sighted. The discursive terrain we're on—since we're in the realm of identity politics—is thus a mythopoetic exaltation of "a" people who have a particular skin color.

Setting aside the rhetoric, her substantive claim is, in effect, that black activism is the main reason the U.S. achieved something slightly akin to democracy. Is this true? Upon consulting historical scholarship, we find that it is not. Consider Alexander Keyssar's definitive survey of American democracy, *The Right to Vote: The Contested History of Democracy in the United States* (2000). Electoral democracy was, in fact, expanding even before the abolition of slavery, and later it expanded to include women (a movement that was led by whites), and then finally, with the Civil Rights Movement, it expanded to include blacks in the South. This was a nearly two-hundred-year struggle, certain phases of which hardly involved black people at all.

As a good historian and a non-ideologue, Keyssar emphasizes the salience of class, not race. “It is class—and its link to immigration—that shapes the periodization of the story,” he argues. “The history of the right to vote [is]...a protracted yet dynamic conflict between class tensions and the exigencies of war.” In the Jacksonian era, property requirements for white men’s right to vote were dismantled, as masses of propertyless whites mobilized to expand the suffrage. After the Civil War, agitation among freed slaves and the determination of white Republicans gave black men the right to vote, but by the end of the century they had lost it in the South. This was not, however, merely a result of racism, as woke orthodoxy would have it. For one thing, many poor whites were disfranchised as well, in order to protect the power of the propertied. More importantly, “[r]idding the electorate of blacks was a means of rendering most of the agricultural laborers of the rural South politically powerless...[which would allow] landowners and businessmen [to] wield unchallenged control of the state.” Class power was what mattered most.

Contrary to common belief, the disfranchisement of Southern blacks was not the only example of democratic backsliding between the late nineteenth and early twentieth centuries. These tumultuous decades saw the explosive growth of an immigrant industrial working class that terrified the country’s economic and political leaders, who now turned against universal manhood suffrage. It was necessary to “diminish the power of the worst classes,” one eminent writer argued in 1883. Across the country, efforts to do so thrived. As Keyssar summarizes, they included “the introduction of literacy tests, lengthening residency periods, abolishing provisions that permitted noncitizen aliens to vote, restricting municipal elections to property owners or taxpayers, and the creation of complex, cumbersome registration procedures.” Hundreds of thousands of “paupers” were excluded from the franchise. Naturalization laws were made more restrictive, reducing the proportion of immigrants who could vote. Felons and ex-felons were disfranchised. The list of inventive means to purify the electorate and thus protect the existing distribution of economic (and hence political) power was very long.

In short, black Southerners were hardly the only victims of disfranchisement; and when many of these laws were overturned in the 1960s and 1970s, it was because of activism not only by black people but also labor unions (crucial supporters of the Civil Rights Movement) and a vast liberal legal and political infrastructure that even swept up Nixon’s Republican Party in the reforming zeal. (For example, the Nixon administration shortened state residency requirements for voting, enfranchising millions.)

It might seem I’m making too big a deal out of a couple of flippant tweets, but it’s the tendency of thought they represent that is at issue. American political culture suffers from a collective fixation on skin color and ethnicity: both on the left and the right, identity politics dominates. On one side are authorities like Hannah-Jones, Ibram X. Kendi, and (the more sophisticated) Robin D. G. Kelley, who obsess over a supposedly ubiquitous racism (or “white supremacy”) and romanticize the posturing and preening militancy of Black Power; on the other side are people like Donald Trump, Ron DeSantis, Christopher Rufo, and their billionaire backers, who preach their own identity politics in order to keep the focus off class, which would threaten to genuinely remake society. Identitarian leftists are playing the right’s game when they set white against black, as if there aren’t enormous, class-determined antagonisms of interest within both white and black populations.

The crudity of race reductionism can be stunning. Hannah-Jones is evidently of the opinion that every white person (including, say, an underpaid adjunct professor) is “a member of the ruling class.” She, on the other hand, a multimillionaire with deep ties to the establishment, is a revolutionary and one of the oppressed because she’s black. Not all advocates of identity politics adhere to such a preposterous racialism, but to the extent that one foregrounds factors other than class position (which is the most direct determinant of income, life chances, and economic and political power), one’s politics is in danger of sliding toward some such faux-radical reductionism. The effect, again, is to divide white workers, “privileged” members of the “ruling class” (no matter if they’re unemployed or barely scraping by), from black workers, who are the truly oppressed and deserve reparations paid for by taxes on whites.

When you point this out to identitarians, specifically that the racialism of their politics—if it isn’t significantly tempered by emphasis on common interests and common grievances—has the effect of vitiating working-class solidarity, they’re apt to say something like, “If racism is already entrenched, how is acknowledging that what divides?” There are two errors here: first, sixty years after the transformative

victories of the Civil Rights Movement, racism is vastly less “entrenched” than it once was; second, the most effective way to overcome some people’s residual racism is to educate them on the common interests shared by economically suffering people of different races, not to constantly attack them for being privileged racists. This will only alienate them, deepen their racism, and push them into the arms of the far-right. The Communist Party of the 1930s was much more intelligent when it adopted the slogan “Black and White, Unite and Fight!” In common struggle, whites and blacks overcame their mutual antipathies and built industrial unions that greatly benefited working people of all colors.

In any case, in a time when you can virtually ruin a person’s life by taking a video of them saying something racist and posting it on the internet, it’s clear that racism is hardly as virulent or hegemonic as left-liberals like to pretend. It exists, but it’s relatively marginal compared to the forms of class power that are decimating working people of all ethnicities (worldwide). Not only blacks are affected by precarious employment, low wages, the housing crisis, student debt, global warming, psychopathically militaristic foreign policies, decades of disinvestment in public infrastructure, rising levels of homelessness, and countless other crises. Shouting about racism or white supremacy won’t solve any of these problems.

Unsurprisingly, it fails to impress liberal identitarians that some of their most cherished icons have had contempt for forms of race politics that are fashionable today. White racial pride, for instance, is taken to be downright evil, but black pride—as exemplified by Hannah-Jones’ original tweet quoted above—is considered admirably rebellious or even revolutionary. It is scarcely acknowledged that, say, Frederick Douglass, a uniquely towering figure, fervently opposed even black racial pride. Whether or not one agrees with him, Douglass’s arguments should be grappled with:

For my part I see no superiority or inferiority in race or color. Neither the one nor the other is a proper source of pride or complacency. Our race and our color are not of our choosing. We have no volition in the case one way or another... When a colored man is charged with a want of race pride, he may well ask, What race? For a large percentage of the colored race are related in some degree to more than one race. But the whole assumption of race pride is ridiculous. Let us have done with complexional superiorities or inferiorities, complexional pride or shame... Our policy should be to unite with the great mass of the American people in all their activities... We cannot afford to draw the color line in politics, trade, education, manners, religion, fashion, or civilization...

This is from a speech in 1889 entitled “The Nation’s Problem.” A few years later, in 1894, Douglass sounded the same themes:

We hear, since emancipation, much said by our modern colored leaders in commendation of race pride, race love, race effort, race superiority, race men, and the like... In all this talk of race, the motive may be good, but the method is bad. It is an effort to cast out Satan by Beelzebub. The evils which are now crushing the negro to earth have their root and sap, their force and mainspring, in this narrow spirit of race and color, and the negro has no more right to excuse and foster it than have men of any other race. I recognize and adopt no narrow basis for my thoughts, feelings, or modes of action. I would place myself, and I would place you, my young friends, upon grounds vastly higher and broader than any founded upon race or color. Neither law, learning, nor religion, is addressed to any man’s color or race. Science, education, the Word of God, and all the virtues known among men, are recommended to us, not as races, but as men. We are not recommended to love or hate any particular variety of the human family more than any other...

The *separatism*, the racial self-love, of Nikole Hannah-Jones’s philosophy, and of influential strains of identity politics (on the left and the right), is diametrically opposed to the philosophy of Frederick Douglass, which is grounded in the much more capacious humanism of the Enlightenment. To be proud of being black

is as senseless as to be proud of being white, or of being a man or a woman, or heterosexual or homosexual. Chauvinism is not a virtue.

For many reasons, then—historical, politically strategic, and moral—identity politics is bankrupt, at least if it isn't explicitly grounded in the imperative of class solidarity.

The left will not be a real left until the likes of Hannah-Jones, who make a virtue of their historical and moral ignorance, are widely seen not as challenging power-structures but as indirectly defending them. Economic exploitation and insecurity, the roots of oppression, afflict people of all races; and all races have played, and will play, an integral role in the struggle to democratize society. The perennial conflict between rich and poor, whatever their skin color, is the fulcrum of injustice.

Postliberalism: A Dangerous “New” Conservatism

In Wilhelm von Humboldt's book *The Limits of State Action* (1792), one of the most thoughtful expressions of classical liberalism, these passages appear:

The true end of Man...is the highest and most harmonious development of his powers to a complete and consistent whole. Freedom is the first and indispensable condition which the possibility of such a development presupposes... Whatever does not spring from a man's free choice, or is only the result of instruction and guidance, does not enter into his very being but still remains alien to his true nature; he does not perform it with truly human energies but merely with mechanical exactness...

[T]he principle of the true art of social intercourse consists in a ceaseless endeavor to grasp the innermost individuality of another, to avail oneself of it, and, with the deepest respect for it as the individuality of another, to act upon it... The very variety arising from the union of numbers of individuals is the highest good which social life can confer, and this variety is undoubtedly lost in proportion to the degree of State interference. Under such a system, we have not so much the individual members of a nation living united in the bonds of a civil compact, but isolated subjects living in relation to the State...

The entire book is an elaboration of these ideas. In them, we do not see a vulgar individualism, a reduction of humans to mere nodes in the cash-nexus who buy and sell to one another and need protection from each other, the kind of anti-humanism for which traditionalists and Marxists have criticized classical liberalism. We see, instead, an appreciation of the richness of every individuality; an emphasis on the human need for community, respect, friendship, and love; an anarchist critique of coercive institutions, in particular the state; a proto-Marxist theory of the alienation of labor; socialistic intimations that people have the right to control their own labor; in short, a liberal humanism of the sort that leftists of various persuasions would embellish in the following two centuries.

If one were to believe the “postliberals” who have burst onto the ideological scene in recent years, liberalism doesn't have the moral or intellectual resources for such a mature humanism. It seems they haven't read Humboldt.

Postliberalism has emerged in the UK and U.S. during the last ten years as a reaction against the manifest failures of what its thinkers call liberalism. The economic, social, political, and environmental crises that afflict the world they attribute to a systemic lack of regard for the “common good,” which, in turn, they attribute to a liberalism that has been horribly successful in its reduction of humans to atoms—“increasingly separate, autonomous, nonrelational selves replete with rights and defined by our liberty, but insecure, powerless, afraid, and alone.” So writes Patrick Deneen, professor of political science at the University of Notre Dame, in his 2018 book *Why Liberalism Failed*. Other vocal postliberals include Adrian Vermeule, Sohrab Ahmari, Yoram Hazony, Adrian Pabst, Chad Pecknold, Gladden Pappin, and some other writers associated with such magazines as *American Affairs*, *UnHerd*, and *Compact*. For all their

differences, these writers share a rejection of any one-sided fixation on liberty, whether it be that of right-wing libertarianism—the “free market” doctrine to which the Republican Party is at least rhetorically committed—or left-wing social liberalism, the liberalism of identity politics. They seek to resuscitate ideas of social obligation, duty, community, and tradition, for example in the forms of family, church, and nation. The modern understanding of liberty is unhealthy and immorally *licentious*; better is the ancient and Christian conception that true freedom consists in self-control, self-discipline (under the constraints of tradition and religion), rather than slavish submission to base and hedonistic appetites.

Postliberals, therefore, criticize the modern gospel of “progress” and its ideological cognates, alleged solvents of social bonds, such as “Enlightenment rationalism,” or the application of critical reason to all forms of order and authority for the sake of dismantling whatever isn’t emancipatory, liberal, or conducive to economic growth. Their perspective is reminiscent of that of the social theorist and historian Christopher Lasch, whose 1991 book *The True and Only Heaven: Progress and Its Critics* was an extended critique of the ideology of progress and a history of its dissenters in the United States. Preferring an honest recognition of ineluctable *limits*—not least ecological limits—over modern liberalism’s faith in endless economic growth, endless moral progress, and liberation from the benighted parochialism of the past, Lasch turned to the culture of the lower middle class as a more human and realistic alternative. Without denying the historical vices of this culture (“envy, resentment, and servility”), he was nevertheless impressed by “the moral conservatism of the petty bourgeoisie, its egalitarianism, its respect for workmanship, its understanding of the value of loyalty,” in general its *rootedness*, so different from the deracinated *future-fixation*—detachment from the past—of contemporary liberal elites. Postliberals share these concerns and values.

What postliberalism amounts to, then, is a rejection of dominant tendencies of modernity. Some writers are more willing than others to acknowledge the positive achievements of liberalism—for instance, in *The Politics of Virtue* (2016), John Milbank and Adrian Pabst grant that liberalism “has afforded some protection against the worst transgressions upon the liberty of some by the liberty of others”—but, on the whole, postliberals are attracted to a kind of Burkean conservatism. “Right-wing on culture, left-wing on the economy” is how they are usually characterized. Through this formula, they think, it may be possible to bring back social cohesion, “the wisdom of tradition,” and respect for “the common good.”

Two books published this year by leading lights of postliberalism, Patrick Deneen and Sohrab Ahmari, provide an opportunity to critically evaluate this “new” school of thought (perhaps not so new). On the one hand, Deneen’s *Regime Change: Toward a Postliberal Future* illustrates the weaknesses of the ideology; on the other hand, Ahmari’s *Tyranny, Inc.: How Private Power Crushed American Liberty—and What to Do About It* illustrates its potential strengths. Ultimately, however, despite its mutability, postliberalism is misguided and dangerous in its idealism, its theoretical confusions, its political naïveté, and many of its political commitments. It too easily slides into proto-fascism. What is valid in it can be and has been expressed more sophisticatedly by the Marxist left.

Since it has the ear of some right-wing populists, such as J. D. Vance and Josh Hawley, and it seems to be growing in influence, this ideology should be taken seriously. Leftists may be able to find common ground with its advocates on certain issues, but in general, they should strongly resist this latest brand of conservatism.

The Idealism of Postliberalism

One of the major analytical flaws of postliberalism is, in fact, one of the weaknesses of all conservatism: its idealism, in the anti-Marxian sense. In all his romantic talk of reverence for ancestral traditions, Edmund Burke abstracted from the actual daily functioning of these traditions, from their foundations in appalling violence, in constant violations of the dignity and freedom of the lower classes, in the irrationality of a nation’s being subject to the will of some arbitrary monarch who happened to be born to a previous monarch. A very different conservative, Milton Friedman, similarly abstracted from the daily realities of capitalism—the indignities of working for a boss, the suppression of the right to unionize, the violence in which the rule of capital is grounded—in his simplistic paeans to “freedom.” (His famous book

Capitalism and Freedom (1962) consists of abstract idealizations like this one, chosen at random: “The kind of economic organization that promotes economic freedom directly, namely, competitive capitalism, also promotes political freedom because it separates economic power from political power and in this way enables the one to offset the other.” As if, in the real world, economic power doesn’t tend to confer political power!) Fascism was even worse: it idealized will, nation, race, the state, the Leader, and war, abstracting from the grubby realities of all these things.

Being a type of conservatism, postliberalism does the same. Its very name is idealistic and simplistic. “Liberalism” can’t be the fundamental problem we face today for the simple reason that there isn’t only one liberalism, there are many. Among the classical liberals, there were British, French, American, and German figures, as diverse as John Locke, Wilhelm von Humboldt, Kant, Thomas Paine, William Godwin, John Stuart Mill, and Tocqueville. There were socialists, anarchists, and capitalists. There were deists, Protestants, Catholics, and atheists. There were democrats, republicans, and monarchists. And in the twentieth century, liberalism evolved in even more complex ways, towards social democracy and its protection not only of “negative liberty” but also “positive liberty,” as in the freedom of people to have a living wage, a home, an education, and affordable healthcare. Even the anarchist communism of Peter Kropotkin can be said, in some respects, to belong to the liberal tradition. In short, the core intuition of liberalism—“a general enlargement and freedom and rational direction of human life,” as Lionel Trilling described it—can be fleshed out institutionally in innumerable ways, including in socialism (which isn’t Sovietism), i.e., people’s democratic control of their work. (In fact, one can argue that Marxism is but a continuation and conceptual deepening of the best traditions of liberalism.)

Patrick Deneen’s two recent books—*Why Liberalism Failed* and *Regime Change*—exemplify the idealism of conservatism. Again and again, imposing a false unity on the liberal tradition, he blames liberalism for things that are more realistically attributed to capitalism. When he refers to “[recent] decades of liberal dismantling of cultural norms and political habits essential to self-governance,” what he means is capitalist dismantling. Liberalism is but an ideological attitude, a constellation of philosophies; capitalism—how people work, how they acquire property, how they exchange goods, how class relations are structured, how culture is produced and politics is organized—is the real basis for a way of life.

When Deneen, in *Why Liberalism Failed*, writes that “[liberalism] has remade the world in its image, especially through the realms of politics, economics, education, science, and technology, all aimed at achieving supreme and complete freedom through the liberation of the individual from particular places, relationships, memberships, and even identities,” one recalls the words of an infinitely more profound thinker:

The bourgeoisie, wherever it has got the upper hand, has put an end to all feudal, patriarchal, idyllic relations... It has drowned the most heavenly ecstasies of religious fervor, of chivalrous enthusiasm, of philistine sentimentalism, in the icy water of egotistical calculation... All fixed, fast-frozen relations, with their train of ancient and venerable prejudices and opinions, are swept away, all new-formed ones become antiquated before they can ossify. All that is solid melts into air, all that is holy is profaned...

No mere ideological “tendency” (to quote Trilling again) could achieve all this. It is the class structures of capitalism that have remade the world.

Regime Change is shot through with idealism. The basic structure of the book is reasonable enough: in the first two chapters, Deneen diagnoses the faults of liberalism, including not only its ostensible ripping apart and atomizing of the social fabric but also its elevation of hypocritical liberal elites (“the managerial class,” the real power elite) who don’t care about “the people” but use identity politics to pretend they do, shredding the last vestiges of traditional norms in the process. In the next three chapters, he presents the postliberal vision. He calls this “common-good conservatism,” associating it with Burke, Benjamin Disraeli, and G. K. Chesterton, but more generally with “the classical and Christian tradition of the West—a common-good political order that seeks to harmonize the various contentious elements of any human society.” This conservatism aligns itself with the “common sense” of ordinary people, who “seek stability,

predictability, and order within the context of a system that is broadly fair.” The solution to contemporary social ills is to implement the political philosophy of Aristotle and Thomas Aquinas, a “mixed constitution” (democratic and aristocratic) in which an elite much more noble than that of today will “work to improve the lives, prospects, and fate of the people,” as the people, in turn, demand excellence from the elite and themselves are influenced by the virtues of the new aristocracy.

In the final two chapters, Deneen fills out his Aristotelian vision, which he calls “aristopopulism,” while also gesturing towards an answer as to *how* this glorious new society will be realized. His answer isn’t particularly satisfying: “an ennobling of our elite” will come about “through the force of a threat from the *popolo* [people],” that is, “through the efforts of an energized, forceful, and demanding populace.” This is pretty much all he says on the matter. Likewise, his sketches of the better world to come consist of empty bromides and exhortations. Rather than meritocracy, we need a society that integrates the “working-class ethos of social solidarity, family, community, church, and nation” with the “virtues of those blessed by privilege.” To combat racism, we shouldn’t embrace affirmative action or other divisive approaches but should resurrect Martin Luther King Jr.’s vision of a “deeper ‘integration.’” Tepidly criticizing the ardent nationalism of people like Yoram Hazony (author of *The Virtue of Nationalism*), *National Review* editor Rich Lowry, and other “national conservatives,” Deneen proposes instead “*a new form of integration of local, national, and international*” (italics in the original). What that concretely means he leaves unsaid. His practical program for reinfusing religion into social life is similarly perfunctory, containing little more than such vague entreaties as “a simple first step would be to publicly promote and protect a life of prayer.” Politics should be “a place for prayer, since politics is how we together seek to realize the good that is common.”

One of the greatest swindles of postliberalism is its nostalgia for an idealized past. According to Deneen, the Enlightenment project of individual liberation required the overthrow of “older social forms that had taught and reinforced the cultivation of virtue.” Traditional institutions “protect the stability and order that most benefits ordinary people,” and in fact are deeply democratic “because they are the creation of countless generations of forebears” and “largely develop from the ‘bottom up.’” As it happens, feudalism wasn’t a particularly democratic institution that cultivated virtue. Nor was absolute monarchy. Nor was the Catholic Church, which, until the spirit of liberalism finally began to permeate it, was a rapacious tyranny that burned heretics, policed thought, crusaded against the advance of knowledge, and made common cause with autocrats everywhere. (Also, of course, it now has the distinction of systemically aiding and abetting child abuse.) However inspiring the figure and philosophy of Jesus may be, history has shown that religious institutions, like all administrative hierarchies, are prone to abusing their power unless suffused with the liberal spirit of respect for individual rights.

This worship of religion is a classic instance of mistaken idealism. Postliberals are enamored of Christianity, attributing much of what is good in our civilization to its religious inheritance and much of what is bad to its abandonment of religion. Most of the time, they ignore questions about whether, after all, it is *true* that something called “God” exists or that Jesus is His son and was resurrected after dying for our sins, or any of the other dogmas of Christianity (or Judaism)—and rightly so, for in order to evaluate the plausibility of any proposition, it’s necessary to use the Enlightenment’s “rationalistic” method they dislike. With regard to socially relevant questions, they appear to have a pragmatist conception of truth: if a belief is useful, we might as well believe it. But is religion in fact useful? Its violent, tortured, bigoted history suggests otherwise. Nor is it at all clear that humans need religion in order to enjoy a healthy communal and family life or to heed the moral duties that bind us all together.

Often, religion has functioned to *undermine* the well-being of communities and families. It isn’t a secret that conservative politicians use appeals to religion to convince people to vote against their economic interests. An infamous example is that of Governor Sam Brownback of Kansas, a religiose Christian who passed radical tax cuts in 2012 that, as the Brookings Institution summarizes, “led to sluggish growth, lower-than-expected revenues, and brutal cuts to government programs” like schools, housing, infrastructure, and police and fire protection. Similarly, for over a hundred years, businesses in the American South have used conservative Christianity to ward off the threat of unionism, helping to keep the region in a state of relative poverty. In *Struggle for the Soul of the Postwar South* (2015), historians

Elizabeth and Ken Fones-Wolf describe how corporate executives in the postwar era relocated their factories to this region, where “chambers of commerce advertised the benefits [of] locating in a ‘distinctly religious city’ where the ‘labor is of native Anglo-Saxon stock—loyal and efficient.’” The CIO’s Operation Dixie was unable to overcome the resistance that evangelical Protestantism (among other forces) put up to unions.

On the whole, then, postliberals have a rather uncritical attitude towards tradition and religion, as conservatives usually do. They’re nostalgic for a lost social cohesion, the lost unity of “Western culture.” As Adrian Pabst writes in *Liberal World Order and Its Critics* (2019), identity politics (combined with “corporate crony capitalism”) is “changing the fundamental character of Western civilisation from being a cultural community bound together by common values that define shared interests to a ‘business community’ based on sectional interests that promote divisive values.” But when, exactly, was “Western civilization” such a unitary entity? The history of Europe is the history of constant clashes, constant wars, constant struggles between different value systems and interests and cultures, long centuries of violence and bloody suppression of innumerable popular uprisings. Divisiveness *is* history. And idealism is false history.

Buried under all the confusions and shallowness of postliberalism, however, there is a truth: throughout its five-hundred-year history, riven by war, privatization and the destruction of the commons, mass immiseration, and the crushing of democracy, capitalism has profoundly disrupted communities and uprooted identities. This is precisely why, or one reason why, leftists and “the people” have fought against it. Genuine leftists are well aware of the human need for roots, for order and stability and community. The great anarchist mystic Simone Weil even wrote a book entitled *The Need for Roots: Prelude to a Declaration of Duties towards Mankind*. “To be rooted is perhaps the most important and least recognized need of the human soul... Money destroys human roots wherever it is able to penetrate, by turning desire for gain into the sole motive.” There is no reason such a recognition should be incompatible with the best traditions of liberalism, for instance Humboldtian liberalism. That is, there is no reason a philosophy of individual rights and individual dignity should preclude a recognition of mutual obligations and the essentially *social* nature of humanity, including even a valorization of *honorable* traditions and shared norms that constrain unfettered liberty. This isn’t the place to delve into the philosophies of communism, socialism, and anarchism—the writings of Kropotkin, William Morris, Anton Pannekoek, Rudolf Rocker, Murray Bookchin, etc.—but the societies they envision are hardly licentious or degenerate or atomized. (Or remotely similar to the Soviet Union’s state capitalism, with which socialism and communism are absurdly associated.) They are eminently ordered, communal, and democratic, *because* they are grounded in a liberal humanist sensibility.

Indeed, one might even say that the real reason the world is in such an awful state is the opposite of that given by postliberals: there is *too little* freedom, not *too much*. There is too much authoritarianism, not enough liberalism or democracy. In particular, the authoritarian structures known as corporations have overwhelming power—including over governments—which they certainly do not use in the interests of humanity, community, or social harmony. Noam Chomsky is surely right that classical liberalism, or libertarianism, in its profoundest forms is not only *not* fulfilled in capitalism but actually incompatible with it, inasmuch as capitalism tends to violate both the negative and positive liberties (“freedom from” and “freedom to”) of ordinary people. A vast literature of the left, of journalism, and of historical scholarship exposes the tyrannical nature of capitalist institutions; for example, in 2017, the philosopher Elizabeth Anderson published a well-received book called *Private Government: How Employers Rule Our Lives (and Why We Don’t Talk about It)*. (A corporation is “a government that assigns almost everyone a superior whom they must obey... [T]here is no rule of law... Superiors are unaccountable to those they order around. They are neither elected nor removable by their inferiors,” etc.) The most recent addition to this literature may be a surprise, though: Ahmari’s new book.

Tyranny, Inc. could not be more different from *Regime Change*. It appears, in fact, that Ahmari is undergoing a semi-conversion to the left, or to aspects of the left. It is striking, after all, that a postliberal should have written a book the very subtitle and substance of which valorizes “American liberty.” Whereas Deneen wallows in a lazy idealism that traffics in windy abstractions like virtue, excellence, and tradition,

Ahmari investigates the material conditions workers have faced under the neoliberal onslaught, together with the corrupt political economy that has brought about these abysmal conditions. Where Deneen believes that an enlightened Aristotelian aristocracy will magically come into being and work to uplift the people, Ahmari comprehends the essential fact of class struggle and advocates the resurrection of strong unions and social democracy. He even uses Marxist language: “cultural norms, practices, and beliefs...rest on a material substrate that includes law, politics, and economics.” In short, while Deneen and his co-thinkers blame a unitary ideology of their imagination called liberalism, Ahmari, at least in this book, blames capitalism.

One can't help wondering if the postliberal gang is a little unhappy with Ahmari's semi-apostasy. Consider his criticisms of conservatives in his concluding chapter:

[C]onservative defenders of the [social] system are often the first to lament its cultural ramifications: ...a decline in civic and religious engagement, particularly among the poor and working classes; low rates of marriage and family formation; and so on.

...[What results] is a downright ludicrous politics centered on preaching timeless virtues while denying what political theory going back to the Greeks has taught, and what every good parent or teacher knows: that cultivating virtue requires tangible, structural supports. A child will struggle to master honesty if his parents routinely model dishonesty; a body politic will likewise spurn the virtues if subjected to merciless economic exploitation.

It's true that more populist conservatives these days are prepared to defend right-wing cultural values against “woke capital.” But few if any dare question the coercive power of capital itself. Dig into the policy platforms of tub-thumping GOP populists, and you will likely find effusions of unreserved praise for capitalism.

Here, he is coming close to the realization that right-wing populism is completely phony, that it has always functioned to distract from the class conflicts that are fundamentally responsible for popular suffering, so that a large portion of the public instead rages against LGBTQ people, liberals, Muslims, immigrants, Jews, Communists, China, and anyone else *not* big business. To be sure, postliberals don't effusively praise capitalism, as other populist conservatives do. But if they really valued “the common good” about which they prattle, they would, like leftists and the new-and-improved Ahmari, direct their ire at the chief agents of the collapse of community, family, morality, and the natural environment, namely the capitalist class. Otherwise they're in danger of being useful idiots for this class that is interested only in further shredding the social compact.

Tyranny, Inc. is dense with journalistic investigations of a litany of types of “coercion” corporations inflict today on employees and the public, informed by a competent telling of the history behind it all (relying on scholars like Karl Polanyi, John Kenneth Galbraith, and David Harvey). Among other topics, Ahmari illuminates the many ways in which the sacred doctrine of “liberty of contract” between employer and employee conceals chasmic disparities in power that can ruin people's lives. He illustrates the capture of the judiciary by the corporate sector. He exposes the predations of private equity, including its use of private emergency services (firefighting firms, ambulance companies) to fleece unsuspecting innocents of tens of thousands of dollars. He discusses the ongoing evisceration by Big Tech and Big Finance of the U.S.'s newspaper industry, which has seen almost a third of its newspapers shutter since 2005 (while many of the remainder are gutted by their new Wall Street owners). And so on. The most viable solution to all these tragedies, he argues, is to revive Galbraithian countervailing power. “Once more, it's up to the American worker to drag our politicians and corporate leaders into a new consensus.”

Insofar as Ahmari remains a postliberal, his book shows the mutability of this ideology. Its proponents can choose any particular agenda to devote their energies to, whether reconstituting unions and social democracy, advocating a Catholic theocracy (like Adrian Vermeule), fighting against the rights of non-heteronormative people, seeking a much more restrictive immigration regime, denouncing so-called “liberal” interventionist foreign policy, or prohibiting the teaching of the history of racism in the U.S.'s

public schools. Rhetorically at least, all of this can be defended in terms of shoring up the disintegrating social order and protecting “communal solidarity.” In a sense, this mutability can be considered a strength, for it allows postliberalism to appeal to people of very different values and interests. But it is the strength of fascism, an ideology that likewise prided itself on being postliberal. Fascism was no less resourceful in appealing to different groups of people, including peasants, landowners, industrialists, the petty bourgeois, racists, traditionalists, even a small minority of workers, who were told their interests would be represented in the great community of the nation bound together by common traditions. In practice, of course, fascism, as a species of conservatism, ended up representing above all the interests of the ruling class, while crushing unions and working-class political parties.

The Proto-Fascism of Postliberalism

Tyranny, Inc. shows that leftists can find common cause with postliberals on some issues. To the extent that someone of the right really does care about the common good, or rather the good of the vast majority (to which the good of the ruling class tends to be inimical, since its power rests on the exploitation of others), a socialist might well be willing to work together with him. Such an alliance, necessarily limited and conditional, is often ridiculed as “red-brownism” by leftists, but it does happen in politics that people of different ideologies cooperate on a political campaign or policy that will conduce to the greater good. A politics that rests on maintaining one’s purity is unlikely to get very far.

Nevertheless, it is undeniable that postliberalism is very dangerous, potentially fascist. Insofar as it is *anti*-liberal—which left-leaning postliberals, such as Adrian Pabst, are not—this isn’t a difficult case to make. “Within the West, Hungary has set the standard for a reasonable approach,” Gladden Pappin believes. Vermeule deploras the expansiveness of liberal rights: “Yesterday the frontier was divorce, contraception, and abortion; then it became same-sex marriage; today it is transgenderism; tomorrow it may be polygamy, consensual adult incest, or who knows what.” In *Conservatism: A Rediscovery* (2022), Yoram Hazony argues that “cultivation of the national religion is an indispensable purpose of government.” He goes so far as to affirm, quoting Irving Kristol, that “*there is no inherent right to self-government if it means that such government is vicious, mean, squalid, and debased.*” But who is to make such a judgment? Why is your definition of what is right and good necessarily better than someone else’s? Are you infallible? What gives a reactionary religious nationalist like Hazony the right to impose his vision of the good life on an entire society?

Apart from the noxious political commitments of most postliberals, there is an even deeper problem: in conditions in the United States today, to ground one’s politics in attacking liberalism is to undermine *postliberals’ own professed values* of “national resilience,” “common purposes,” and the “social covenant” (to quote Adrian Pabst’s *Postliberal Politics*). This is because the chief beneficiaries are the forces most aggressively sabotaging these values, the Republican Party and reactionaries in the business community.

To put it bluntly, postliberals’ embrace of politicians like J. D. Vance, Josh Hawley, even (in some cases) Donald Trump, and their hope for an authentically populist, working-class Republican Party, is incredibly naïve. Nor is it new. At least since (in fact, before) Richard Nixon’s Southern Strategy, Republican politicians have been clothing themselves in populist garb, stoking culture wars and denouncing liberal elites in order to cleave the “working-class” vote from Democrats. As Nixon’s vice president, Spiro Agnew traveled the country attacking “permissivists,” “elitists,” “radical liberals,” “thieves, traitors, and perverts.” Reagan liked to invoke the “postliberal” themes of family and community: “When they [Democrats] talk about family, they mean Big Brother in Washington. When we talk about family, we mean ‘honor thy father and mother.’” These themes, of course, have been a mainstay of Republican rhetoric for generations. “I am here to say to America,” Bob Dole pontificated, “do not abandon the great traditions that stretch to the dawn of our history. Do not topple the pillars of those beliefs—God, family, honor, duty, country—that have brought us through time and time again.” George W. Bush preached the virtues of compassionate conservatism, which proved to be just as oxymoronic as common-good conservatism will

doubtless be. Today, the enemies du jour are critical race theory, transgenderism, and wokeness, but the underlying strategy is always the same.

And what does that strategy eventuate in? Tax cuts for the rich, gutting of regulations to protect the environment, and a war on workers and the poor. Trump's NLRB waged an "unprecedented" attack on workers' rights. His administration weakened or eliminated over 125 policies that protected the country's air, water, and land. His budgets savagely slashed benefits for low-income Americans, continuing a longstanding Republican practice. The great "populist" senators Hawley and Vance give, at best, tokenistic and rhetorical support to the working class: neither has even cosponsored the Protecting the Right to Organize Act, and Hawley, according to the AFL-CIO, has almost always voted against the interests of workers. Vance, a venture capitalist, finds it much more congenial to spout racist "great replacement" nonsense and blame those with a low income for their own failures than to actually do anything to help the latter. Meanwhile, the Republican Party remains rock-solidly opposed to even the mildest proposals to address global warming, which threatens not only working people but all life on earth. If this sabotage of life itself is what the postliberal common good looks like, one might even *prefer* the classical fascists.

Analytically, a key error that helps make possible postliberal political naïveté (assuming the likes of Patrick Deneen and Yoram Hazony are acting in good faith) is to associate together, in one overarching nefarious tradition, classical liberals, modern economic conservatives, New Deal liberals, contemporary centrist liberals, woke identitarians, and "liberal" imperialists from Harry Truman and Lyndon Johnson to Hillary Clinton and Joe Biden. In a sense, even Marxism is included in this tradition, inasmuch as it shares the orientation towards *progress* of all these groups, their detachment from and denial of the virtues of tradition. (As if the left doesn't want to *preserve healthy traditions* and *abandon unhealthy ones*.) This is a hopelessly confused classification, wholly superficial because of its idealistic focus on the supposed shared commitment to vague concepts of progress and freedom. In order to understand political history, you have to consider the material interests that these different groups and ideologies serve.

For example, economic conservatives like Milton Friedman or Paul Ryan are liberal or libertarian in name only. Their talk of free markets is a fig leaf for outright authoritarianism in the form of slavish support for corporate tyrannies (as Ahmari describes), which would have horrified classical liberals like Adam Smith. Most conservatives don't care about a mythical free market anyway, as shown by their enthusiasm for exorbitant government spending on the defense industry and for munificent tax breaks and subsidies for corporations. Capitalism could not survive without these sorts of government interventions, nor can markets operate without some firms soon exerting "illiberal" market power; so it is idle for postliberals to talk about a nonexistent economic liberalism.

New Deal liberals were and are totally different from self-styled economic liberals, serving a *popular* constituency—so it's odd that Deneen attacks them, too. After all, they often acted—as progressives still act—in approximately the same way as his ideal aristocracy would, "work[ing] to improve the lives, prospects, and fate of the people." If one cares about the common good, why denounce social democracy, which more than any other capitalist formation protected families and communities? But because the progressive state was irreligious, non-traditional, and supposedly inspired by elite fear and loathing of the people (?), it was and is bad. (Deneen also opines that redistribution of wealth to workers has "led to extensive damage to the broader economic order," citing no evidence.) His preferred reforms include increasing the size of the House of Representatives to 6,000 members; requiring that every American serve one year in the military; "substantially reducing" university education and investing in more vocational education; breaking up monopolistic companies; investing more public funds in infrastructure and manufacturing; penalizing companies that employ undocumented immigrants; banning pornography and passing laws that promote "public morality"; and enacting policies that reward marriage and family formation, such as Hungary has instituted under Orbán. Predictably, he says nothing about labor unions, except, as a parenthesis, that strengthening them is "a worthy undertaking."

Leftists would be more sympathetic to postliberals' contempt for the conventional centrist liberalism of the Democratic Party today, albeit not necessarily for the same reasons. Indeed, many are similarly disdainful of the performative, business-friendly identity politics that has become a dominant ethos in the "professional-managerial class" that postliberals despise. But to call this "class" the real power

elite, the real oppressors—as Deneen and others do—is both laughable and proto-fascist. This thesis is a core premise of right-wing postliberalism, for, if you can find a villain that isn't the capitalist class, you don't have to locate yourself uncomfortably close to the left. The PMC will do the job nicely, since it's a diffuse category of people, many of whom have an elite status, that pervades and partially runs society's hegemonic institutions. Its members tend to be culturally different from the masses of Americans without a college degree, so it's easy to stir up resentment against them, which can be used to elect reactionaries who will do the bidding of the *real* ruling class (while blaming woke liberal professionals for the suffering that results).

Deneen's treatment of the "managerial elite" is influenced by a favorite text of postliberals, Michael Lind's *The New Class War: Saving Democracy from the Managerial Elite* (2020), which itself is influenced by James Burnham's famous book *The Managerial Revolution* (1941). Burnham posited that ownership and control were separated in modern corporations, and that, as a result, a new managerial class was replacing capitalists as the ruling class. This was a flawed analysis: for one thing, despite the transformations of the economy that had indeed occurred in preceding decades, corporations were still subject to the logic of capital, which required that they squeeze profits out of the exploited labor of workers. Capitalism was not ending. But whatever plausibility the thesis may have once had was long gone by the time of the 1980s' shareholder revolution, which Deneen and Lind seem not to have heard of. The stubborn fact is that some people still make their money from ownership and investments, while others make money by selling their labor-power. These two groups tend to have antagonistic interests, an antagonism rooted not in the vague cultural differences between the "meritocracy" and "the people" that Deneen describes—such as (he says) the former's mobility, its "disconnection from a shared cultural inheritance," and its identity politics—but rather in objective structures of how money is made and how power is distributed in the workplace and the economy.

It is true that most professionals occupy an ambiguous place between capitalists and the larger working class. Barbara and John Ehrenreich theorized this ambiguity in their landmark 1977 essay "The Professional-Managerial Class," and Marxists since then have devoted a great deal of effort to making sense of this huge group of people, some of whom have more interests in common with the traditional working class and others with corporate executives and owners. Since its emergence in the early twentieth century to help manage "the reproduction of capitalist culture and capitalist class relations," the PMC has, most of the time, not shown much solidarity with the blue-collar working class. In fact, in their 2013 essay "Death of a Yuppie Dream," the Ehrenreichs argue it "has played a major role in the oppression and disempowerment of the old working class." Professionals (usually more or less politically centrist, or "liberal" in today's jargon) are easy to dislike, since they often exhibit the vices of high-status groups everywhere: they're prone to being smug, elitist, hypocritical, conformist despite their pretensions to independent thought, complicit in the neoliberal evisceration of society, etc. Leftists are, perhaps, almost as fond of ridiculing them as conservatives; see Catherine Liu's *Virtue Hoarders: The Case against the Professional Managerial Class* (2021) and Amber A'Lee Frost's "The Characterless Opportunism of the Managerial Class" for examples.

Nevertheless, if you want a more communal, just, and sustainable social order, you have to think about strategy. No class exemplifies virtue. The question is whether your agenda will be to dismantle corporate power, the real engine behind the atomization that postliberals decry, or to attack the relative peons of the PMC, who (as the Ehrenreichs note) are beginning to succumb to the disintegrating economic and political forces that have decimated the old working class. The second path is the road of fascism, the search for a scapegoat that only ends up empowering the most vicious elements of the ruling class. The first path, according to which professionals in precarious economic circumstances ought to be *appealed* to instead of vilified, is the road to genuine social change.

In other words, postliberals have to make a decision: do they want to concentrate on combating social liberalism—banning pornography, criminalizing gender-affirming health care for those who suffer from dysphoria, erecting draconian barriers to immigration, banning "liberal" books and school curricula that address America's real history—thereby empowering faux-populist Republicans who will cut social programs, attack unions, increase military spending, accelerate environmental destruction, give

corporations and the wealthy even more power than they have, and devastate families and communities? Or do they want to concentrate on tackling the latter crises and forego a war on social liberalism? They can't have it both ways, because only the left will ever honestly confront the material catastrophes that are savaging working-class communities. The left itself would do well to start prioritizing *class solidarity* rather than only identity politics (as some leftists have argued), but at least it is trying to do far more for the working class than the right is (since the right, after all, exists to serve business). Even Biden's Build Back Better bill, which couldn't pass because of Republican opposition, would have enormously benefited working families through its investments in childcare and preschool, paid family and medical leave, community college, child tax credits, physical infrastructure, affordable housing, health care, and environmental protection.

Thus, because of its alleged interest in the public good but its conservative (Republican) orientation, postliberalism is ultimately incoherent. It is not a new ideology, being in many ways a return of paleoconservatism, of the anti-modernism of Jerry Falwell and Pat Buchanan, even of the—admittedly more extreme—alt-right of several years ago, which shared a lot of the reactionary cultural grievances of postliberals. Deneen & Company try to make their ideas more respectable by invoking Aristotle, Aquinas, Tocqueville, Pope Leo XIII, and other exalted names, but this is a transparent exercise in idealistic mystification. The proto-fascism is right below the surface.

There is a particle of hope, however. If more postliberals choose the left-wing path of *Tyranny, Inc.* than the far-right path of *Regime Change*, they might manage to make a positive contribution to American politics. But this will require shedding their illusions about the likes of J. D. Vance, Marco Rubio, and Josh Hawley, and instead following the example of, say, Bernie Sanders. That's where a humane, working-class politics is to be found.

The Origins of Patriarchy

One of the many reasons that any Left that emerges from academia—as does much of today's "Left," with its disproportionate emphasis on issues of gender, race, and sexuality—is doomed to ineffectiveness is that academics tend to cultivate a stubborn refusal to think. Truth and justice are of less concern to them than careers, academic politics, and adherence to institutional norms. The result is that they can sometimes be blind to the most obvious facts of the world, preferring to "complicate" even the essential, albeit simple, insights that are much more far-reaching than the "problematizations" that are preferred. Turbid and pretentious thinking blocks the way to both truth and a rational politics.

Some aspects of contemporary feminism are a case in point. No reasonable person could deny that women, like men, have a right to economic and social well-being (with all the "radical" implications of that fact), but reasonable people can certainly object to some of the confusions and dishonest fixations of left-liberal feminism. These revolve around the concept of "patriarchy," that nefarious thing that has existed for thousands of years across most of the world. So what is patriarchy?

In the most general sense, it just means male domination. It has many dimensions, from intimate relationships to the possession of power in political and economic institutions. Wherever it exists, there is said to be misogyny and oppression of women; thus, it is always rooted in "men behaving badly." If men would simply respect women, and if patriarchal indoctrination were eradicated, male domination would wither away and the sexes would finally be treated as equal.

According to these notions, which have become feminist dogmas, male domination is as unjust and oppressive as, say, capitalist domination and exploitation of workers, or imperialist domination and exploitation of foreign countries. Men are the main problem, and they have to be educated, lectured, browbeaten, and ridiculed (as they often are in liberal and left spaces) into a deep awareness of their undeserved privilege, so that they'll be persuaded to give up their privilege for the greater good. This massive project of dismantling patriarchy will doubtless alienate much of the public, both men and women,

pushing them away from the left and into the arms of the far-right, but that, supposedly, is the price of progress.

One of the latest sallies in this long-running feminist crusade is a book published this year entitled *The Patriarchs: The Origins of Inequality*, by science journalist Angela Saini. It's a sprawling survey of the alleged origins of patriarchy, of myriad examples of it around the world, of its academic theorizations, and of resistance to it. While the book isn't without merit, its chief interest is in its manifesting the intellectual shallowness and self-deception with which feminism itself is plagued. It presents an opportunity, therefore, to dispel some common confusions that have had baleful political consequences. Maybe if we can give more plausible answers to questions around "patriarchy," this will discourage frivolous pseudo-political research and activism in favor of attention to more urgent issues such as the revival of the labor movement, the resurrection of social democracy, and mitigation of global warming.

As a social constructionist feminist, Saini premises her entire account on the obligatory, but false, denial that there is anything natural about male domination. She quotes primatologist Frans de Waal: "I think when people say that patriarchy is sort of natural for the human species, . . . that male dominance and male violence are natural, I think they are totally exaggerating." Here we have a characteristic instance of sloppy thinking. Male *physical* dominance is of course entirely natural: on average, men are stronger, larger, and taller than women. So, this dimension of "patriarchy" is indeed dictated by nature.

Moreover, given that the anthropological consensus is that a strict *matriarchy* has never existed whereas social systems manifesting some degree of patriarchy have been overwhelmingly common in history (if not universal), in what sense is male dominance not "natural"? There is evidently *something* about human nature that causes patriarchy to keep reappearing again and again, countless times, in societies many of which have had no contact with each other, from at least the Neolithic era to the present. The Marxist anthropologist Maurice Godelier went so far as to argue that even in the most egalitarian societies, "in the last analysis" it is likely that men have "occupied the summit of the power hierarchy"—doubtless because, in the last analysis, questions of power are grounded in questions of physical force. In principle, if men wanted to, they could always band together and forcibly have their way with the women. Brute facts of physiology therefore mean that women and children are in some respects subject to male power, and that it is men's good will that keeps their potential violent self-assertiveness in check.

Feminists have sometimes denied the salience of male physical strength, size, and aggressiveness, but their arguments have been unconvincing. Consider one example: in her overrated classic *Sexual Politics*, Kate Millett remarked that "male supremacy . . . does not finally reside in physical strength but in the acceptance of a value system which is not biological." But value systems can certainly be grounded in biology, so this statement isn't quite true. (For instance, the value placed on sex and procreation is clearly biological in origin, as is the value placed on strength.) Similarly, Millett averred that "superior physical strength is not a factor in political relations—*vide* those of race and class." This seems true enough, until one reflects that if some race of people were discovered who happened to be physically weak, we would hardly be surprised to find that they were, e.g., frequently enslaved by others. That is to say, contrary to social constructionist orthodoxy, "nature" (as opposed to nurture) is very relevant to social relations.

The postmodern feminist insistence that "culture" is everything and "nature" is nothing does not withstand a moment's scrutiny. It is still regularly denied, for example, that sex hormones have anything to do with gendered behavior, but this is a ludicrous anti-scientific idealism (culturalism) that has been refuted countless times. Even apart from male physicality, there are natural tendencies toward masculine dominance. The ubiquitous identification of masculinity with such qualities as relative autonomy, detachment, strength, self-control, and self-possession, all of which are valorized as manifesting a kind of dominance, does not come out of thin air. It results from the average behaviors and psychologies of the sexes, not from some malevolent conspiracy of misogynists to oppress women and spread groundless stereotypes.

One doesn't need acute observational skill to notice that, cross-culturally, women tend to laugh and cry much more often than men, to have more intense emotions, and to be more excitable than the somewhat "detached" male. To take a flippant example: the female tendency to scream and run at the sight of a mouse or a cockroach or some other critter, and to appeal to a nearby man to deal with it, doesn't exactly exude

dominance or self-control.¹ Neither do tendencies to cry or “giggle” far more easily than the opposite sex. The experiences of a trans woman like Julia Serano are of interest here: in *Whipping Girl*, Serano writes about how her emotions became more intense after her hormone therapy, as did her senses of touch and smell, and her sexual sensitivity and pleasure. Susceptibility to emotions—things that *happen to* you, that you can’t really control—and sensitivity to physiological sensations are, again, antithetical to the valorized concept of self-control.

Given all these biological facts, and the fact that it’s natural for the sexes to define themselves in relation to each other, it is perfectly rational for women, on average, to embrace their comparative advantage in attributes such as “nurturing,” feminine physical beauty, attractive anti-masculine behavior like “giggling,” and empathetic receptiveness. It happens that these traits don’t lend themselves to asserting dominance. But they’re attractive to men, just as masculine confidence, strength, height, financial prosperity, and charisma are attractive to women. It isn’t “misogyny” that draws the sexes to each other in this way, with contrasts being drawn such that the relative dominance of one sex is valued by both. It is just the natural dialectic of sexual attraction.

Indeed, in light of women’s valorization of relative male dominance in romantic and sexual contexts, it can rankle that feminists denounce this same dominance as being terrible and misogynistic. On one hand, women will not rarely want a man to protect them, which is to say have a slightly higher status than them (for one’s protection of a “weaker” person indicates one’s higher status). In the realm of dating, they will often say they want a man who can “make them laugh,” a desire and phrase that indicates a self-conception of relative passivity. Or they’ll want a man to take them to dinner or a movie, to buy them flowers or jewelry, or more generally to provide for them, all desires that place women in a position of passivity in relation to the man.

On the other hand, the very notion of male dominance is supposed to be morally odious. It’s no wonder that a lot of young men today are confused about what’s expected of them. But if you take seriously the implications of feminist dogma, you should consider female desire itself morally odious! A large proportion of women, for instance, enjoy rough sex, which is to say overt male dominance. Sex in general is a pretty “patriarchal” affair: one party is being penetrated, acted on (acted in), ejaculated into, ecstatically subjected to the perceived muscular strength of the other. Sex is rather important to human life, so one suspects that its mechanics of male assertiveness and female receptiveness might condition general patterns of human psychology.

Being a doctrinaire social constructionist, Saini mentions none of this. In fact, she never really answers the question of how male domination began or why it is so universal, perhaps because doing so would necessitate acknowledgment of these unsayable facts. Instead, in an attempt to sum up her discussion, she says, “States institutionalized human categorization and gendered laws; slavery influenced patrilineal marriage; empires exported gendered oppression to nearly every corner of the globe; capitalism exacerbated gender disparities; and religions and traditions are still being manipulated to give psychological force to the notion of male domination.” All this is doubtless true, and one can agree that many forms of patriarchy can and ought to be dismantled. But it is wrong to deny obvious facts just because they conflict with feminist ideologies.

If no aspect of male dominance is grounded in biology, does that mean male dominance in sports and athletics has nothing to do with biology? Men are primarily responsible for building the material infrastructure of civilization (which elevates their status): is this unrelated to their greater physical strength, or their typically greater visual-spatial abilities and interest in mechanical problems?

Men’s sexual arousal is stimulated in large part through the visual sense. Since the sexes want to attract one another, it is, therefore, rational for women to beautify and objectify themselves, even if this

¹ That sentence might sound like mockery, but it isn’t. It’s a true statement of how people, both men and women, perceive certain kinds of “feminine” behavior in relation to “masculine” behavior. These simple, daily behavioral tendencies, which in the case of this example are hardly a product solely of “socialization” or “culture,” influence how people think of women and men in relation to each other (e.g., less-dominant vs. more-dominant, on average). It is puzzling that most gender theorists and feminists are blind to the significance of these behaviors.

also causes them sometimes to be treated more as objects than subjects. The infamous “male gaze” that can, indeed, be dehumanizing isn’t merely a social artifact but is partly an expression of male biology. To demonize the male sex for its “objectification of women,” as if that’s always misogynistic, is thus to demonize how the male brain works.

Relative male dominance is so deeply embedded in society and the human mind that it can never be wholly extirpated. It is everywhere. Every chivalrous gesture expresses masculine authority. When couples marry, the woman often wants to adopt her husband’s last name. In ballroom dancing, men are the customary “leaders,” which is apparently a form of patriarchy (because it’s male domination). Men are expected to refrain from hurting women’s feelings, in fact to treat them, in some measure, with greater respect and kindness than they treat other men—evidently because women are perceived as more emotionally fragile than men. Implicit in a man’s romantic attraction to a woman is a kind of condescension, a *protective* urge, not radically different from his urge to protect his children.

None of this means men are “superior.” On average, women are superior in some ways, men in others. (And there are always exceptions.) Value-judgments are not the point, and only an immature or damaged person would care about them. The point is to understand, not make cheap judgments.

One wishes, in short, that feminists would show a little more understanding of women and men. The habit of demonizing the latter, the treatment of them as little more than oppressors, is intellectually, morally, and politically unjustifiable. Some kinds of “patriarchy” are both natural and good, and are appreciated by women (even if not all will admit that to themselves). Some kinds of sexism, such as protecting women and being kinder to them than men, are good and are widely valued. It may be unfair that masculinity tends to be respected more than femininity, but this is hardly the only instance of unfairness in life. It’s also unfair that, *ceteris paribus*, tall men are valued over short and strong over weak, and that physically attractive people are preferred to the unattractive, and the charismatic to the uncharismatic. Nature itself is unfair: the emotional and cognitive structures of the human brain did not evolve to primarily heed the moral quality of “fairness.”

Not all feminism, however, is trivial or deluded or consists of barely concealed misandry. Materialist feminism, in particular, is essential: all women should have the right to free childcare, extended maternity leave, pay for household work, strong unions, generous wages, high-quality education, and a rewarding job. It should be widely accepted for women to have positions of dominance in political, economic, and cultural institutions. Even foreign policy ought to be considered a feminist issue: militaristic policy is hardly in the interests of women and children abroad and domestically. (It is telling, then, that feminists rarely have much to say about it and do even less to organize against it.) Addressing all these injustices, in fact, would be the most effective way of raising the “cultural” status of women with which academic feminists are so concerned.

If the feminist movement were to prioritize issues of economic security, it could become a major asset to the left. It could help draw people away from a Republican Party that ridiculously claims to speak for the working class; it would help revive a labor movement that is crucial to elevating women’s conditions. But in order to rise to this level, it first has to shed its academic influences and theoretical pretensions. It has to treat its culturalist preoccupations with theorizing gender, sexuality, and some monolithic thing called patriarchy as being second-order concerns. Whether in the coming years feminists will be able to shift their priorities remains to be seen, but few political projects can be more urgent.¹

And here’s something I wrote back in 2014, which I included in my third book:

¹ [After posting that article on academic websites I got an email from some woman that made my day: “I randomly came across your article ‘The Origins of Patriarchy’ last night and as an outspoken feminist... oh my god! I was fuming. If you’re that articulate in the classroom and if you were to give a lecture about that topic, some of your female students would have the biggest crush on you haha.” I love infuriating idiots! But she’s probably right that some students would have a crush on me, which in itself is pretty telling (as regards female psychology).]

Thoughts on Stupidity

One of the books I'd like to write someday is a comprehensive investigation of stupidity. I want to demonstrate its ubiquity, from politics to philosophy and so forth, and then try to explain it in various ways, using biology, psychology, and commonsense reasoning. It's just astonishing how *bad* people are at certain kinds of thinking (such as empathy and abstract reasoning), and I want to understand this. In part it's a result of contemporary social structures, but in part there must be biological and psychological causes.

I'm not talking about things that require real talent, such as quantum physics or hyper-abstract philosophical reasoning or even being good at reading maps. I'm talking about common sense. Very few celebrated philosophers have philosophical common sense (for example, they ask idiotic questions like "Can computers think?" or "Can machines understand language?,"¹ etc.); feminists and postmodernists have ridiculous radical-empiricist ideas about biology's irrelevance to gender norms or the mind's being a nearly blank slate; intellectuals tend to have naïve conceptions of how politics works, and they often have little institutional self-understanding; Leninists think it's possible for "the working class" to simply take over the national government, while many anarchists are convinced that if we can just abolish the government, things will be great. And then there's the political right wing, and ordinary people everywhere (including in the educated elite). Wherever I turn, I'm suffocated by this miasma of stupidity.

The first task is to distinguish between the types of stupidity. As I said, I don't find a simple lack of talent to be particularly interesting. Everyone lacks some talents. I myself am a moron at activities that require visual-spatial intelligence or kinesthetic intelligence, and I'm pretty bad at mathematics. Such facts are in large part a function of one's genetic endowment, and so there is really nothing that needs explaining. A lack of social intelligence, which has much to do with a subtle deficiency in empathy, is a little more interesting: I've always been intrigued by people who talk about themselves endlessly, unaware of how boring they are. Or people who act awkwardly without knowing it. (Introverts, on the other hand, are often aware of their occasional awkwardness but can't do much about it. Sometimes they just don't know what to say, or they're *too* aware of themselves as viewed by others, and so end up being uncomfortably quiet.) But this isn't so mysterious: aside from its being obviously, in part, a reflection of straightforward genetic factors, social unintelligence is somewhat explainable by the fact that people are more interested in themselves than others. Necessarily so. With some, this manifests itself partly in a lack of sensitivity to other people's reactions. They enjoy talking so much more than listening that it can seem as though all you have to do is shove a person in front of them and, like a pigeon responding to a stimulus, they'll launch into an extended monologue.

Incidentally, a lack of "sensitivity" (physical, emotional, and cognitive) is of course one trait—even a defining trait—of broadly unintelligent people. Arthur Schopenhauer understood this when he said, in his curmudgeonly way,

The truly stoical indifference of ordinary persons to noise is amazing; no noise disturbs them in their thinking, reading, writing, or any other work, whereas the superior mind is rendered quite incapable by it. But that very thing which makes them so insensitive to noise of every kind also makes them insensitive to the beautiful in the plastic arts, and to profound thought and fine expression in the rhetorical arts, in short, to everything that does not touch their personal interest... Actually, I have for a long time been of the opinion that the quantity of noise anyone can comfortably endure is in inverse proportion to his mental powers, and may therefore be regarded as a rough estimate of them. Therefore, when I hear dogs barking unchecked for hours in the courtyard of a house, I know what to think of the mental powers of the inhabitant. The man who habitually slams doors instead of shutting

¹ In recent decades an incredible amount of "research" in philosophy, the cognitive sciences, and artificial intelligence has been devoted to answering questions like these. As Noam Chomsky says, it all consists of "confused attempt[s] to answer a question that has no meaning." Noam Chomsky, *Powers and Prospects* (London: Pluto Press, 1996), 40.

them with the hand, or allows this to be done in his house, is not merely ill-mannered, but also coarse and narrow-minded. That “*sensible*” in English also means “intelligent,” “judicious,” accordingly rests on an accurate and fine observation.¹

Schopenhauer exaggerates here, but it does seem that, for whatever reason, the different kinds of sensitivity tend (though not always) to exist together in a particular person. Someone highly sensitive to physical stimuli will also likely be sensitive—or will have the mental potential to be sensitive—to artistic and/or intellectual stimuli, and to people’s reactions to him, and to the thoughts and emotions behind people’s facial expressions (a capacity that amounts to a kind of empathy). From what I gather, neuroscience isn’t advanced enough yet to explain why this may be so—if indeed it is so.

While the psychologist Howard Gardner has famously described eight or nine different kinds of intelligence, including musical, linguistic, interpersonal, intra-personal, and so on, people usually have in mind something more general when thinking “He’s smart!” or “He’s a little slow.” This broad impression that one gets of someone’s intelligence evidently involves various modalities, including his empathy or interpersonal intelligence, his intra-personal intelligence or awareness of his own feelings, thoughts, and motives, and his linguistic intelligence or ability to verbalize thoughts, memories, feelings, etc. Together, these seem to be the main determinants of our opinion of another’s general intelligence. Of course in specific contexts other things come into play; for instance, as I said a moment ago, someone might well conclude that I personally am not very smart if he observed my absentmindedness or my forgetfulness.

But the general mental “slowness” of many people, such as the elderly or some working-class people you see in public buses, is mildly interesting. It must have to do with the brain’s slower processing of information, or a less efficient neural circuitry than in “intelligent” brains. What role does one’s social environment play in this? Surely poor education during youth may contribute to mental slowness, or a low IQ, later in life. Physical health is certainly important: research shows that malnutrition severely hinders cognitive development in children.² Insofar as people in the lower classes lack the money to eat as healthfully and buy as good an education as those in the upper class, they’re at a clear disadvantage. Nor are they helped by the frequent necessity of parents to work two or more jobs—intellectually stultifying jobs—or by the unhealthy and un-nurturing home environment that may result from this fact and other stresses of low-income life.³ Moreover, with a low income one likely has less easy access to books, high culture, varied social experiences, and other intellectual stimulation than the middle-class or well-off, which may cause innate potential to atrophy. Living in dilapidated, crime-ridden neighborhoods, or in culturally barren trailer parks or low-income suburbs, may foster certain types of intelligence but rarely the kinds valorized by mainstream society. –I’ll return to the “working class” in a moment, for, despite all these disadvantages, in some respects its members show more intelligence than their supposed betters.

What I’m most intrigued—and disturbed—by is not low IQ but rather three very common deficiencies: a lack of empathy, a lack of self-insight, and a deficiency in the capacity to reason or “think abstractly.” These deficiencies seem to be spread fairly evenly throughout the U.S. population and aren’t obviously distributed by class—with the partial exception of the empathy deficit, which appears to be more common among the wealthy than the middle class or the poor.⁴ This particular finding is an example of

¹ From *The World as Will and Representation*, Vol. II.

² See, e.g., Hasanain Faisal Ghazi and Syed Aljunid, “Eating for Intelligence: Breakfast and IQ among Iraqi Children,” United Nations University, <http://unu.edu/publications/articles/eating-for-intelligence-iraqi-children.html> (accessed April 1, 2014).

³ Such stresses in themselves appear to affect intelligence, according to research. See Amina Khan, “Poverty can sap brainpower, research shows,” *Los Angeles Times*, August 30, 2013. As for the home environment, research confirms the obvious: “the family in general, and the mother in particular, need to provide a *varied* amount of stimulation, to allow exploration, play and varieties of perceptual experience... In rearing the child, the ‘climate’ seems important—democratic but demanding, a home which encourages resourcefulness and independence. These probably lead to clearer and richer concepts, not to mention a belief in one’s ‘self.’ This all strengthens the ability to ‘cope.’” David W. Pyle, *Intelligence: An Introduction* (Boston: Routledge & Keegan Paul, 1979), 58.

science confirming common sense. People are influenced by their social environment, which, to a great extent, amounts to their class position, since one's economic resources largely determine where one lives, whom one interacts with, what kinds of institutions one identifies with, etc. Or, from a different perspective, in order to rise in the ranks and become "wealthy" one is often compelled to act in a generally selfish and greedy way. However you look at it, therefore, the wealthy face many pressures to develop unsympathetic character traits like arrogance, greed, and a lack of empathy. The human tendency to rationalize everything one does and justify one's social existence further tempts the rich into adopting Social Darwinistic ideologies, such that they may have contempt rather than compassion for the poor.

Conversely, it is well-known that the poor are far more generous than their "betters." They give relatively more to charity than the rich do, and studies have shown that they're "more attuned to the needs of others and more committed generally to the values of egalitarianism."¹ No surprise there: knowing hardship firsthand, the poor have more compassion for the suffering. And they may well live in a more communal environment than the rich, which itself fosters mutual understanding and concern—especially since this ethic of mutualism helps the poor survive. If empathy can be called a kind of intelligence—an emotional understanding of others, an ability to imagine oneself in their shoes and see the world through their eyes—then it would seem that in this respect the poor are more "intelligent" than the socially esteemed.

On a broad scale, the dearth of empathy and the pervasiveness of stupidity throughout history have often dumbfounded progressives and radicals. The socialist Einstein famously remarked, "Two things are infinite: the universe and human stupidity. And I'm not sure about the universe." (Another fun quotation of his is, "The difference between stupidity and genius is that genius has its limits.") One can be sure that he was, at least in part, thinking of Nazism, the very epitome of a lack of empathy. And its lack of empathy made possible—indeed, was a component in—its unbelievable stupidity. Its racist thinking exemplified one classic psychological source of the empathy deficit, namely humans' categorization of particular others as *other*—and an inferior or hateful other at that. This affective labeling evidently interferes with cognitive functioning, such that one may become insensitive to rational considerations. No amount of science or philosophy could have convinced most fervent Nazis that their hatred of "the Jew" (or the Slav, the Communist, the Gypsy, the homosexual) was idiotic; their hate was a brutal and stupid primitive "structure of feeling" in their minds that caused them to act in brutal and stupid, primitive ways. Emotional impulses directed *against* people or types of people, as opposed to impulses of openness and compassion, seem to be dangerously susceptible to a disregard of facts and logic if they contradict the content of the impulse.

In short, it is surely the case that much of the stupidity, or inability to reason objectively, that Einstein lamented is directly related to an absence of empathy and openness, and a knee-jerk psychological defensiveness. Comments on the internet, for instance, frequently provide evidence for this. These reflections of mine from a few years ago give an example:

Chomsky recently wrote an article describing how the rights enshrined in the Magna Carta have been shredded in the last five hundred years. Naturally, in the "Comments" section under the article online are observations to the effect that Chomsky, that horrible Commie, wants to take us back to the year 1215. Etc. An eight-year-old would understand Chomsky's point(s), but apparently these people can't. They've been indoctrinated into a pre-eight-year-old level of intelligence and rationality. They can't interpret statements from "Commies" except through a fog of "Fuck you." Virulent hostility toward people who challenge them so colors their mind that they *can't understand what is being said*. It becomes impossible to consider arguments on their merits; all that really registers (implicitly) in these people's minds is that "This horrible guy is saying 'Fuck you!' to me—his very existence is a 'Fuck you!'—so I have to defend myself [i.e., my opinions and sense of self] by attacking him." It's a fascinating phenomenon, which gives clues as to how Nazism and concentration camps are possible. Hatred of the Other, whether Commie or Jew or whatever, *consumes the mind*, so that any capacity for lucid reasoning is lost and

¹ Paul Piff, quoted in Ken Eisold, "Why Are the Poor More Generous?," *Psychology Today*, August 23, 2010.

the other's humanity is barely recognized. The kind of mind susceptible to this descent into semi-madness must be deeply paranoid, anxiously sensitive, insecure, prone to feeling as if it is beset by all kinds of demons that have to be destroyed. Commies, socialists, Muslims, terrorists, gays, big government, immigrants...the whole world is against me! All these evil forces have to be destroyed! Thus: far-right conservatives.

There's a continuum, of course; not everyone who hates Chomsky has a thoroughgoing fascist, authoritarian, paranoid mindset. But most have traveled some distance down that road. (Actually, everyone to some extent shares these traits—subtly categorizing certain people and disliking them as instances of that category, etc.)

Affective and cognitive capacities are thus inextricably tied together, to the point that behavior called “cognitive,” such as abstract reasoning about politics, history, and societal functioning, incorporates and is grounded in affective attitudes—acts of valuing, of caring, of implicitly sympathizing with other points of view. The more broad-minded and inclusive one can be in these affective stances, the more objective, rational, and “intelligent” one will tend to be. (Even Nietzsche, the supposed arch-perspectivist, in the *Genealogy of Morals* recognized the possibility and necessity of such objectivity: “There is *only* a perspective seeing, *only* a perspective ‘knowing’; [but] the *more* affects we allow to speak about one thing, the *more* eyes, different eyes, we can use to observe one thing, the more complete will our ‘concept’ of this thing, our ‘objectivity,’ be.”) The problem is that our society of atomized relations and bitter anonymity, in producing people who are not only isolated from opposing viewpoints but also lonely, unrecognized, hostile, and defensive, discourages inclusive affective stances. Shallow, stupid, dogmatic thinking, often in the form of cruel and anti-human ideologies, is the result.

There are also more straightforward causes of the stupidity epidemic. Powerful people and institutions don't want the masses to empower themselves on the basis of solidarity and knowledge, so they use their considerable command over resources to fragment people and keep them ignorant. The ideal is that they act and think as irrationally as possible, for instance by voting against their own economic interests, refusing to unionize, and blaming their woes on people who are even worse off than they (such as blacks or undocumented immigrants). It isn't necessary to dwell on the ways that big business accomplishes its goals of social control; suffice it to say that when business has a virtual monopoly over government and the media, the kinds of information, entertainment, commentary, ideologies, and educational policies on offer will not conduce to rationality and social understanding.¹ Instead, submissive respect for authority, slavish-mindedness (not questioning what authorities tell you), conformism, thinking-by-emotional-impulse, jingoistic identification with the “home team” (in sports, politics, and other spheres), impatience with sustained analysis as opposed to sound-bites, and lack of interest in substantive issues will be strongly encouraged and valorized—especially in an age of hyper-consumerism and a smashed labor movement. A pronounced intellectual laziness and lack of curiosity about others' beliefs will be widespread, not least because of the self-fixated personality-type manufactured by late-capitalist social structures and consumerist values. And, to repeat, the human tendency to filter out information that contradicts what one believes or wants to believe is accentuated in a society that makes it very easy to surround oneself only with like-minded people and news sources.

It must be said, too, that what someone may unthinkingly interpret as “stupidity” or irrationality is in many cases only *ignorance*. To an academic like me, who has easy access to data, critical studies of society, and left-wing viewpoints, people will seem unintelligent when they engage in the kinds of simplistic discourse that proliferate on the internet and in the media. Doubtless media figures often *are*

¹ See, e.g., Alex Carey, *Taking the Risk Out of Democracy: Corporate Propaganda versus Freedom and Liberty* (Urbana: University of Illinois Press, 1997); Elizabeth Fones-Wolf, *Selling Free Enterprise: The Business Assault on Labor and Liberalism, 1945–60* (Chicago: University of Illinois Press, 1994); Neil Postman, *Amusing Ourselves to Death: Public Discourse in the Age of Show Business* (New York: Penguin Books, 1985); Samuel Bowles and Herbert Gintis, *Schooling in Capitalist America* (Chicago: Haymarket Books, 2011/1979); and Christopher Lasch, *The Culture of Narcissism* (New York: W. W. Norton & Company, 1979).

unintelligent and dogmatic; but the ordinary people one talks to are frequently merely ignorant of certain facts and opposing viewpoints, because the corporate media do not propagate them. It is lazy and elitist to interpret such ignorance as unintelligence or an indication of it.

All this helps explain the disturbing phenomenon of mass irrational and anti-factual thinking, but I'm still not quite satisfied. Despite understanding these factors, I remain surprised and bewildered each time I encounter a new instance of stupidity. For example, it mystifies me that millions of people can think the 9/11 attack in New York was planned by George W. Bush and/or his associates. Even after hearing compelling arguments against the conspiracy theory, they cling to it. They're unmoved by the argument that even to *attempt* such an improbable and certain-to-be-leaked plot would require literal insanity; or that if the goal was to have an excuse to invade Iraq, it would have made much more sense to blame the attack on Iraqis rather than Saudis (especially since Saudi Arabia is an important ally of the U.S.); or that, in fact, there *was* no leak, which is an impossibility if the plot existed (because its complexity is such that many, many people would have had to be involved, and someone certainly would have leaked the story). Like so many other believers of odd theories, these people are *committed* to an idea and will let nothing stand in the way of their commitment. *What is it like* to have a mind like that? I want to understand how it's possible, but on some level I simply can't. All I can do is state truisms about these people being unable to reason dispassionately on a particular set of issues, or thinking in terms of faith rather than disinterested logic. But, in fact, that seems to apply to *most people*—ultimately to everyone, in certain ways, but some more so than others. Most people, for reasons having to do with both their genes and their social upbringing (nature and nurture), evidently don't have a rigorously self-critical, logical, "broad-minded rationality"-governed cast of mind. The Chomskys are rare, the Sarah Palins common.

But you don't have to go to the extremes of Sarah Palin to find examples of a relative lack of interest in logical and evidence-based reasoning, or the kinds of "insensitivity" I mentioned in the context of the Schopenhauer quotation above. They're very common—throughout history.¹ I have to conclude that nature has designed humans, on the whole, to be creatures less of impartial reason and intellection than of emotion, sexuality, play, self-expression, sensitivity to personal interest, and brute *habit*. This appears to be a trans-historical fact, and thus, probably, is a biologically determined one. In particular, the priority of habit over reason and open-mindedness is striking. We get used to thinking and behaving in certain ways, and it becomes difficult to accept any change. In this sense, humans, like all other species, tend to be conservative, basing their existence on various forms of *repetition*. There is comfort and stability in routine, repetition, habit, the use of already-formed schemata to interpret experiences; and the brain itself evidently prefers to use old neural pathways instead of forging new ones, except when it must. Thus we're averse to changing our minds on an issue or adopting a new affective/cognitive stance—especially if the opinions we already hold have become integrated into our sense of self. In some cases, to change our mind might even necessitate changes in behavior or lifestyle, a very uncomfortable thing. In short, we *value* our beliefs; and to adopt new values, so to speak, isn't easy. Moreover, in this context it means admitting we were wrong about something or were thinking about it in a superficial way, an admission that can be painful, especially if one has a fragile sense of self (as many or most do, regardless of the brave show they put on).

Such considerations help explain why it is frequently so hard to change someone's mind on an issue. In fact, people's beliefs often have the character of lazily held *prejudices*, whether or not we call them prejudices in the narrow sense. Rarely have they been arrived at through processes of disinterested reasoning; more often they're products of socialization, indoctrination, peer-group pressure, and gradual exposure to new views that slowly come to seem less exotic and more familiar, hence "acceptable." For instance, according to Gallup polls, in 2009 only 40 percent of Americans thought that same-sex couples should have the same marriage rights as heterosexual couples; by 2014, that number had risen to 55 percent. The reason is probably just that more people got *used* to the idea—it seemed less strange and radical—as

¹ To give a personal example: all through my years of schooling I was constantly frustrated by the academic dullness of my classmates. Their lack of interest in, and understanding of, everything from mathematics to history to classical music baffled me. Like most people, they were (understandably) more interested in socializing with peers, partying, etc.

media coverage expanded and more states legalized gay marriage. Most of those who changed their mind, I suspect, were persuaded not by specific arguments—they didn't have an "Aha!" moment—but rather by a process of *acclimation*. The majority of people simply don't *care* about arguments very much, or even about ideas, in the sense of wanting to rationally evaluate ideas on their merits and so "disinterestedly" accept or reject them. They have other interests, typically revolving around sociality and self-expression. Their lack of interest is probably both a cause and an effect of a lack of intellectual ability/acute/sensitivity, in part genetically and in part socially determined.

While I haven't seen any research on this, I suspect that what's usually involved in adopting a new perspective on a subject is a mostly *unconscious* process of acclimation and assimilation. One's *inclinations* or *predispositions* change, as it were. For people who are more intelligent and rational than others—that is, who are able to consider ideas relatively disinterestedly, divorced from any emotional valences they may have—the process of "changing one's mind" is correspondingly under more conscious control, such that they have more free will. But even for these people, once they have decided on a certain viewpoint, they are definitely inclined—"inertially," so to speak—to persist in it. Their minds are *less* brutally and unconsciously inertial than others', but no one is immune to these unconscious and inertial influences. We all have an implicit "web of beliefs" in our mind, an affective and cognitive framework of ideology-fragments, background assumptions about people and the world, intellectual and emotional residues of previous experiences, commitments to particular values and social groups. Insofar as this framework is semi-coherent, changing certain beliefs might necessitate changing many others. Besides, the whole "framework" itself, which in its totality is essentially the very cast of one's mind, tends to be quite rigid (the more so as one gets older). The question is: to what extent is the mental framework with which one interprets the world factually grounded, rationally justifiable, and open to new influences? Given both the authoritarian nature of modern society and most people's evident lack of intellectual interest and acuity, it's hardly surprising that the usual answer is "not very."

Recent research has led to conclusions that are especially unflattering to political conservatives. Supporting the findings of that classic work of social psychology *The Authoritarian Personality* (1950), scientists are discovering that "*liberals and conservatives disagree about politics in part because they are different people at the level of personality, psychology, and even traits like physiology and genetics.*"¹ As several scholars write, "There is by now evidence from a variety of laboratories around the world using a variety of methodological techniques leading to the virtually inescapable conclusion that the cognitive-motivational styles of leftists and rightists are quite different. This research consistently finds that conservatism is positively associated with heightened epistemic concerns for order, structure, closure, certainty, consistency, simplicity, and familiarity, as well as existential concerns such as perceptions of danger, sensitivity to threat, and death anxiety."² Liberals tend to be more open to new experiences and more empathetic, while conservatives care more about purity, authority, conformity, and in-group/out-group status. They are more sensitive to negative stimuli, such as disgust and danger, than liberals.³ Inasmuch as empathy, open-mindedness, curiosity, and tolerance of uncertainty can reasonably be thought to correlate with high intelligence and rationality, it would seem, then, that liberals and leftists are on average more intelligent than conservatives. Indeed, research has consistently shown that the socially conservative tend to be less intelligent than the socially liberal.⁴ Conservatives also seem more prone than liberals to believing *more strongly* in mistaken beliefs after being shown evidence that these beliefs are

¹ Chris Mooney, "Scientists Are Beginning to Figure Out Why Conservatives Are...Conservative," *Mother Jones*, July 15, 2014. Italics in original.

² Quoted in *ibid.* The inclusion of "consistency" in this list is odd, since it is easy to demonstrate that rightwing and fascist ideologies are more or less incoherent.

⁴ See Ronald Bailey, "Are Conservatives Dumber Than Liberals?," Reason.com, June 13, 2014; Satoshi Kanazawa, "Why Liberals Are More Intelligent Than Conservatives," *Psychology Today*, March 21, 2010; Rebecca Searles, "Intelligence Study Links Low I.Q. To Prejudice, Racism, Conservatism," *Huffington Post*, February 1, 2012; John Cloud, "Study: Are Liberals Smarter Than Conservatives?," *Time*, February 26, 2010.

wrong.¹ On the other hand, subjects were more likely to be open-minded if they were first asked to do an activity that made them feel good about themselves—a result that suggests the importance of a healthy, confident sense of self to rational and open-minded thinking. This supports the reasonable idea, referred to above, that dogmatic, irrational, and unempathetic thinking is at least sometimes caused by a deficiency in the sense of self. Thus, to repeat, it's likely that a society with less anti-social structures and values than our own would produce a more rational and intelligent—and informed—population.

Despite all this research critical of conservatives, liberals and leftists are perfectly capable of being dogmatic and irrational themselves. I've already given the example of 9/11 Truthers. Liberal supporters of Obama are another group of people with whom it is frequently futile to argue. They have such an "affective attachment" to Obama that confronting them with evidence and compelling arguments that, e.g., he has too often supported big business over people, presided over an incredibly dangerous expansion of the national security state, been content to *increase* the threat and presence of terror in the world through his global drone-killing campaign, done precious little to address global warming, etc., often only elicits silly rationalizations and *ad hominem* attacks. In these cases it's hard to avoid the conclusion that the liberal's affective commitments are making him insensitive to another, more rational perspective (more rational in that, given the liberal's basic values of freedom, democracy, and social welfare, a consideration of facts makes it more consistent to criticize Obama than to support him).

Of course, no one is totally immune to stupidity and irrationality, because the human mind is not a rational machine. What's disturbing is the frequency of these things, not their existence. Consider intellectuals again. Upon perusing philosophical scholarship, for instance, an intelligent and rational layman is likely to be struck by the sheer perverseness of many of the ideas he comes across. The theories of extended mind, of eliminative materialism, of modal realism, of anti-realism in accounts of what 'truth' is (accounts that reject the correspondence theory of truth), as well as the (incoherent) postmodern denial that there is such a thing as "objective truth," and the common dismissal of the utterly obvious Chomskian idea that the human brain is *programmed* to learn, or 'grow,' language, and countless other bizarre positions, show how difficult *sensible* abstract thinking can be for intellectuals. Earlier in this book I mentioned the peculiar phenomenon of scholars in political science, history, economics, sociology, and other such disciplines denying the existence of class or class struggle, or that the agendas of government and the media are overwhelmingly the agendas of the rich, or that, in general, historical materialism is far more realistic and analytically powerful than idealism. And I needn't repeat the arguments I've brought against certain feminist ideologies beloved by liberal academics.

To the question "How is all this woolly thinking possible?," the answers are fairly obvious and have already been suggested. Their premise is that many or most people are somewhat easily indoctrinated and aren't very acute thinkers, who can turn a critical eye on everything and "intuitively," imaginatively analyze it in the light of objectivity. Certainly very few people have Chomsky's razor-sharp logical vision, which somehow can quickly grasp the essence of a matter and parse it clearly. In the extreme form it takes with him, this is ultra-rationality: a minimal determination by (semi-)emotional states of mind, social and ideological conventions, *ad hominem* attitudes, mere *habit*, and a maximal ability to "step outside oneself" and see things in their proper relations to each other by taking—insofar as is humanly possible—a God's-eye point of view, or something like it.² This Chomskian hyper-rationality is a very specific *talent*, which people have to varying degrees. Among most intellectuals, evidently, it isn't closely approximated.

¹ Marty Kaplan, "The Most Depressing Discovery About the Brain, Ever," *AlterNet*, September 16, 2013. For example, "people who thought WMDs were found in Iraq believed that misinformation even more strongly when they were shown a news story correcting it."

² This is the meaning, for instance, of Chomsky's precept that we should apply to ourselves the rational and moral standards we apply to others—something that is rarely done—and try to view ourselves as others might view us. As for not being manipulated by emotions: it's of course true that any passionate leftist can get quite emotional about politics. The point, however, is that the emotions (to the extent possible) have to come *after* the reasoning, so to speak. The latter should ground the former, not vice versa.

Thus, these people have fairly pliable natures: they are taught and socialized to think and act in certain ways, and they willingly do so, assuming that these are the best ways and not devoting much time to critically examining their beliefs and ways of doing things. Or, if they do devote time to that, they must lack a particular *ability*. This seems like the best explanation of why some people, who have been subjected to basically the same influences as others, nonetheless manage to think in more sensible and rational ways.¹ Most philosophers, for example, think mainly on the level of *words*, not “the things themselves” (to quote Edmund Husserl). They discuss concepts and terms like perdurantism and endurantism, dualism and monism, functionalism and emergentism, playing with arguments and modifying them to make them more consistent...never trying to get *beneath* the superficial level of words and think in a deeper, more *intuitive* way.² Hence they end up with wildly implausible positions like denial of the private character of consciousness, or they argue endlessly over false and shallow alternatives without trying to “dissolve” the puzzles by showing how they arise out of mistaken ways of thinking.

In fact, the fixation on *words* rather than *substance* is a very common cause and manifestation of stupidity and irrationality. In the broader society it means not only shallow thinking, as with academics, but also such an extreme emotional attachment or aversion to certain words that clear thinking becomes impossible. All it takes is that one invoke terms like free market, conservative, liberal, socialism, communism, welfare, terrorist, big government, Democrat, Republican, Obama—or, among feminists, misogyny, sexism, victim-blaming, “mansplain”—and, as often as not, lucid thinking is thrown out the window. People accept or reject something on the basis of a mere label that serves as a disguised value-judgment, i.e., ‘Bad!’ or ‘Good!’ Emotional content effaces cognitive content. The human mind’s susceptibility to this phenomenon of emotional labeling has been incredibly useful to power-structures’ use of propaganda in the last hundred years, as a way to manipulate people into thinking irrationally.

I won’t give examples of *conservative* label-fixation, since they’re too obvious. (Some given thing or idea is automatically wrong and horrible because of its association with communism or homosexuals or atheists or black people, etc.) Slightly more interesting are those leftists who fall victim to the same pathology. For instance, after Richard Dawkins argued once that some forms of rape and pedophilia are worse than others, feminists and others among the political-correctness police flooded the liberal media with outrage at what a horrible person Dawkins must be in order to have said that. It didn’t matter that even a rational eight-year-old could have seen he was right: it’s obviously worse to, say, anally rape a child than to briefly touch his genitals and do nothing else (which is the example Dawkins gave); it’s worse to violently force oneself upon a screaming, protesting woman than to have sex with her when both partners are drunk and the woman two days later decides she was “raped.” But the words ‘rape’ and ‘child abuse’ are so charged that some people become *unable to make distinctions* when they hear them. They reverse the meaning of Dawkins’ statement, so to speak: while his real meaning was that some kinds of behavior are more horrific than others, they interpret him as saying that some forms of child abuse and rape are okay or not so bad. And then they protest, “No, child abuse is never okay!” and feel good about themselves for taking such a courageous moral stance. In reality, they’re sub-rational morons, at least in that moment of being unable to understand a moral truism.

Anyway, these pathologies fortunately are not universal among the populace, being, probably, more common among the elite than the relatively poor. Since it is the more educated and privileged sectors of the population that are most inundated by propaganda and indoctrination, it should be no surprise that some of the most rational and clear-headed thinking exists among the “lower classes.” The white lower class is a partial exception, to the extent that it identifies with the middle class and has contempt for those lower in

¹ Another factor may be that some people, through accident or mental independence or curiosity, at an early age are exposed to different and more rational ideas than the mainstream, and are to that extent inoculated against indoctrination.

² Saul Kripke is one of the few philosophers who appreciates the importance of intuition, as is clear from his books *Naming and Necessity* (1972) and *Wittgenstein on Rules and Private Language* (1982). Others include Descartes, Kant, Hegel, Nietzsche, Frege, and the twentieth-century phenomenologists, whose method was intuitive and introspective.

status. But, in the U.S., low-income blacks and Hispanics, as groups, probably have a more defensible picture of society than most other socio-economic groups do. For example, a recent poll found that blacks are—justifiably—increasingly pessimistic that progress is being made toward racial equality, an attitude that contrasts with that of the mainstream.¹ A study in 2013 found that higher percentages of minorities say global warming is happening and want the president to take action to address the issue.² In general, it's widely recognized that low-income minorities, and to an extent low-income whites, tend to have more progressive political views than the mainstream—and progressive views (with few exceptions) are demonstrably more rational, evidence-based, and empathy-based than conservative views.

I still haven't said much about the third kind of unintelligence I mentioned above: people's lack of self-insight and their (or rather our) remarkable capacity for self-deception. To a degree this phenomenon can be explained by factors I've already invoked, such as low introspective ability, emotional or empathic insensitivity, and susceptibility to indoctrination. But in fact the question of self-deception is such a vast and difficult subject, which has inspired so much literature in philosophy and psychology, that it can hardly be touched upon here. Contrary to what Sartre argued, the mind is profoundly opaque to itself; in many respects we are constantly deceiving ourselves (without knowing it), telling ourselves stories to bolster our self-regard, passing lightly over incidents that might contradict our self-interpretations, refusing to probe deeply into matters that make us uncomfortable because we fear what they might reveal about us, and willingly accepting people's facile approval of us as confirmation of our value. We attribute noble motives to ourselves when a moment of intelligent self-reflection would show that money or power or sex is the deeper motive. We call others cowardly or greedy or selfish without "stepping outside ourselves" to acknowledge that our own behavior is so as well. We tell ourselves we feel a certain way about someone when our real feelings (as shown by how we treat him or her) are quite different. In general, we run on autopilot most of the time, living on the glib and facile level of sociability, not *thinking* about things but just *behaving*, persisting in habits, refusing to subject ourselves to the ruthless rule of reason. It's an understandable and tempting way to live, but not a productive or healthy one.

Also, I sort of like these thoughts I put in my third book:

The Value of the Humanities

The old question of the humanities' relation to humanity continues to bedevil, bewilder, and bemuse. Intellectuals like Stanley Fish perform mental acrobatics to justify their life-pursuits.³ Do art and the humanities tend to ennoble? Does immersion in them make moral, elevated, broad-minded, and empathetic? Does it give one a greater appreciation of "life's meaning," or greater understanding of other minds and cultures, or greater capacities for public-spirited and informed citizenship? Does it give one the mental habits and resources with which to live well and resist modern dehumanization? What, in the end, is the humanities' value at all?

Or are the naysayers right that this sphere of study and creation is not only economically unproductive but also elitist, solipsistic, socially disengaging, and in general useless, even harmful? Given the age in which we live, it seems that a clear and forceful statement of the value of the humanities—if indeed we decide they have value—is in order.

¹ Carol Morello, "African Americans are more pessimistic about racial progress, poll finds," *Washington Post*, August 22, 2013. www.eesi.org.

² Margarite Suozzo-Gole, "Fact Sheet: Polling the American Public on Climate Change," Environmental and Energy Study Institute, April 2013, at www.eesi.org.

³ See Fish's articles "Will the Humanities Save Us?" and "The Uses of the Humanities, Part Two," *New York Times*, January 6 and 13, 2008.

That creating and studying humanistic works need not make humane is shown by the caliber of so many people who create and study these works. “Humanistic” intellectuals are perfectly capable not only of being cultural decadents, contemptible narcissists, and personally immoral obscenities (pedophiles, sadists, abusers of women, whatever you want), but also of being enthusiastic fascists, Nazis, and semi-Eichmannian bureaucrats. The scholarship of Zeev Sternhell, for example, shows how the ideological seeds of fascism germinated in the fecund soil of alienated turn-of-the-century European intellectual culture.¹ George Steiner’s thoughts are worth quoting at length:

The simple yet appalling fact is that we have very little solid evidence that literary studies do very much to enrich or stabilize moral perception, that they *humanize*. We have little proof that a tradition of literary studies in fact makes a man more humane. What is worse—a certain body of evidence points the other way. When barbarism came to twentieth-century Europe, the arts faculties offered very little moral resistance, and this is not a trivial or local accident. In a disturbing number of cases the literary imagination gave servile or ecstatic welcome to political bestiality. That bestiality was at times enforced and refined by individuals educated in the culture of traditional humanism. Knowledge of Goethe, a delight in the poetry of Rilke, seemed no bar to personal and institutionalized sadism... It is at least conceivable [not only that the humanities don’t humanize, but that] the focusing of consciousness on a written text, which is the substance of our training and pursuit, diminishes the sharpness and readiness of our actual moral response. Because we are trained to give psychological and moral credence to the imaginary, to the character in a play or a novel, to the condition of spirit we gather from a poem, we may find it more difficult to identify with the real world... Thus there may be a covert, betraying link between the cultivation of aesthetic response and the potential of personal inhumanity.²

One can’t help thinking of Hannibal Lecter reveling in Bach’s Goldberg Variations as he kills and cannibalizes his victims.

It is significant, however, that such juxtapositions seem strikingly incongruous. Great artistic and philosophical works have an intrinsically elevated character, in the sense of embodying and speaking to our higher capacities: reason, spirituality, existential wonder, empathy (thus the genre of tragedy, for example), creativity guided by standards of beauty and human resonance, and the quest for understanding. Whatever the “usefulness” of art and the humanities, their being a manifestation and confirmation of such high values and capacities already justifies them. Humans are perpetually drawn to them, from the cave-paintings of Cro-Magnon man to the poetry of postmodern man. They are the creative facets of the human spirit at play, self-constrained only by rules of logic, proportion, harmony, expressive power, and fidelity to experience. It is a magnificent fact that art and the humanities hold a magnetic attraction for people in all times and of all ages: we’re fascinated by them, whether the six-year-old fantasy-conducting a Beethoven symphony or the sixty-year-old writing a commentary on the philosophy of Spinoza. And if the creation and appreciation of such works is, so to speak, justified in itself, so is the study and analysis of them. For that is a humanistic, creative act as well, an expressing of our higher powers, a contribution to the thoughtful assimilating of experience, an oblique contribution to the object of analysis itself (to its meaning for others). This whole humanistic and artistic sphere of life—together with the academic study of it—does not need a justification outside itself; it is justified as long as it moves us, grips us, captures our imagination and is not creatively barren or a parody of itself, as it can be in the hands of mediocrities.

The reason it seems as though art and the humanities *should* have a morally uplifting effect is that they intrinsically affirm humanity. Their pursuit of beauty and truth is a pursuit of what is good and noble,

¹ Zeev Sternhell, *The Birth of Fascist Ideology: From Cultural Rebellion to Political Revolution* (Princeton: Princeton University Press, 1995).

² George Steiner, *Language and Silence: Essays on Language, Literature, and the Inhuman* (New Haven: Yale University Press, 1998 (1967)), 60, 61.

what inspires and serves as an ornament to life, what raises one's vision from crass self-advantage to a more disinterested and universal plane of experience. We are drawn out of ourselves and called to join a community of minds. Indeed, one of the foundations of art is empathy, implicit identification with the feelings and thoughts of others; it is largely this that moves us, whether in a piece of music or a poem or a painting. Thus there is a kind of inherent moral quality to art, or at least good art—even to negative works like, say, Samuel Beckett's *Waiting for Godot*. But a huge proportion of art and philosophy—surely the best of it—is more positive, moral, and “humanistic” in spirit than absurdist or nihilistic, and in such cases the connection between morality and the humanities is especially clear. It strikes us as particularly obscene that admirers of Goethe should have become Nazis.

On the other hand, art also exists in tension with humanity, as the passage quoted from George Steiner shows. While the aesthetic may have moral overtones, it is perfectly possible to sacrifice morality in the creation and appreciation of art. In themselves, the ethical and the aesthetic are two very different things. Kierkegaard, for example, illustrates this with his famous story of Johannes the Seducer, whose aesthetic approach to life disregards morality. A lived philosophy of aestheticism, in fact, can be pure decadence, pure moral and psychological rot; see Thomas Mann's story “Death in Venice,” or consider an aesthete like Oscar Wilde (whose life, however, was not without some tragic dignity—unlike that of his lover Lord Alfred Douglas, and most other such refined hedonists). The production of art even has an ironic similarity to capitalist production: humans and nature are objectified and subordinated to a “higher” principle, whether beauty and profundity in art or profit and capital accumulation in capitalism. Some film directors are notorious for treating actors cruelly in the attempt to produce a more compelling work of art, and performance artists sometimes integrate violence into their routines. Doubtless such art is rarely good, consisting of mere provocation; but it is the *reductio ad absurdum* of the aesthetic stance, inasmuch as the ethical-for-its-own-sake is obliterated.

From this perspective, there is nothing inconsistent about artists and most types of humanistic intellectuals (except maybe ethicists) being morally objectionable in some way. Art and the humanities constitute a separate sphere of life, a separate set of values, from ethical treatment of others, even if particular works—the large majority—do embody and proceed from an ethical vision that is properly moral. Indeed, the humanities don't *give values* at all; they *reflect* values, as science does, and can be used in the service of any agenda. They don't in themselves give meaning to life or make us appreciate life's value; they don't necessarily make their partaker wise or compassionate or broad-minded. They have no *necessary* utilitarian justification. All depends on *how* one “takes them up.” The most that can be said is that using art and the humanities in a morally and intellectually elevated way, to improve oneself and the world, is more consistent with their spirit than *not* being improved by them would be. They are most fully realized when one remakes oneself in the light of the values they embody, namely human connection, exaltation of the imagination, and insatiable hunger for truth. One honors and personifies art and philosophy by treating *oneself* as a work of art and philosophy.

Thus, if you approach art and the humanities with the right attitude, they *can* be all the things stated in the first paragraph above, and that does give them a myriad of utilitarian justifications. A good system of education would approach these works from a humanistic standpoint, not only as valuable in themselves (aesthetically, philosophically, etc.) but as important components of the good life—as means for us to make *ourselves* more valuable. Their study, and the study of good scholarly analyses of them, should make us more thoughtful and empathetic, more informed about the world and better able to act intelligently on that information, more adept at “critical thinking” about people and society, more open to alternative viewpoints, more well-rounded and able to appreciate the “more complexly valuable” experiences we have access to,¹ and, yes, more moral and concerned for others. Reading good literature and literary criticism is not only a pleasure in itself but can foster deeper understanding of ourselves and others; reading moral philosophers and their commentators can and should make us more thoughtful about how we act and interpret our actions; listening to and studying great music can invigorate, can sharpen the appetite for life

¹ Barton Swaim, “Book Review: ‘The Value of the Humanities’ by Helen Small,” *Wall Street Journal*, February 14, 2014.

and cultivate acute sensibilities; studying history can teach innumerable lessons about our own society, where it's headed, and how best to change it. None of this is automatic; it requires good teachers, an educational system that prioritizes humane learning, and an open and interested attitude on the part of students.

Incidentally, these reflections on what the humanities *can* be also provide some criteria for great art, philosophy, historical writing, and critical commentary. The distinction can be conceptualized as between decadence and vitality. The literary criticism of Georg Lukács elaborates on this in detail,¹ but to an extent it is intuitive. What is healthy, and what isn't? What stimulates to action and exalted achievement, and what enervates or alienates or seems comically pretentious? (Much of "avant-garde" art falls under the latter category.) What induces a feeling of brotherhood with humanity, and what fills with contempt or existential nausea? What *integrates*, is ambitious and comprehensive, and what fragments, is overly specialized or parochial? What contributes to realistic understanding, rationally and clearly placing things in proper relations to each other, and what mystifies or obfuscates? Despite what formalists and postmodernists and *l'art pour l'art* advocates might think, considerations of morality and "healthiness" and truth—considerations of *content*—cannot be irrelevant to judging the value of a work of art (although of course art should never be subordinated to ideology or moralism).² While it's true that art and the humanities in a sense constitute their own separate sphere of experience with its own standards, on a deeper level they are integrated into life, society, and personality, and cannot or should not be divorced from their context. The Goethean and Marxian attention to the *whole* is the noblest, truest, healthiest, and most moral—most humanistic—approach to living, to art, and to analysis.

Whether any of this justifies the enormous academic apparatus of the humanities is an open question, which I'm inclined to answer in the negative. Most scholarship and criticism is forgettable, and most teaching is of middling value to the student, who is not well served by the anti-humanistic, pro-status quo priorities of the educational establishment. Nevertheless, when done well, humanistic teaching can open the student's mind to new and more adequate ways of viewing the world, and it can even contribute to such things as democracy, civic engagement, and other populist values our society pretends to uphold. In particular, if their spirit is properly imbibed, the humanities can instill a healthy and moral disgust with capitalism, consumerism, arbitrary authority, irrational thinking, war, and all things inhumane. At their heart, art and the humanities are essentially moral, the very jewel of human creativity and moral awareness.

Actually, since I've included two long-ish sections from my third book, I might as well put some other passages here that I like. I'm not a fan of much of the book, but I think these sections (the book's first sections, plus some other scattered ones) aren't too bad. I'll start with the introduction.

Introduction

This is an odd book, both timely and untimely. From an objective standpoint it is timely, addressing the urgent issues of our age. It takes as its starting point the coming demise of a civilization, at the hands of global warming, economic stagnation and crisis, and possible nuclear war—all ultimately products of corporate capitalism in its neoliberal phase. It consists largely of reflections on how we got here, how to interpret our society and ourselves, and what ideals are worth extracting from the wreckage of the past. It eschews academic conventions in favor of getting directly to the point and not mincing words.

But that is also why it's untimely. Its defiance of institutional norms and political correctness, in addition to its unusual, Nietzsche-esque form, makes it very different from the kinds of books that attract

¹ See, e.g., his *Realism in Our Time: Literature and the Class Struggle* (New York: Harper & Row, 1964).

² Even the postmodernist decadent Susan Sontag recognized the value of this Marxian-humanistic perspective late in her life, when she to some extent repudiated the formalist sins of her youth. See my *Notes of an Underground Humanist*, 432, 433.

traditional publishers and markets. To its cost, it exists *between* academic and popular markets, drawing from scholarship but presenting ideas in an un-academic way. Indeed, the whole of Part Two consists of summaries of and commentaries on left-wing scholarship that has impressed me. Few writers dedicate themselves to collecting and summarizing scholarship, to make it more accessible to the public and bring it all together; Noam Chomsky is one. But since good, materialistic (Marxist or semi-Marxist) scholarship is so useful in explaining our world, I've decided to compile here some of the notes I've taken in recent years on the work of such academics as Robert Brenner, David Harvey, Harry Braverman, David Graeber, and Walden Bello. People who don't find academic writings accessible should nevertheless know of this scholarship and at least read summaries of it, so they have a better understanding of society.

Part One is even more unconventional, jumping from subject to subject in a series of brief reflections. Superficially these "sections" might appear to be random and unrelated to each other, but I have organized them carefully so that thematic threads tie them together. They're taken from a huge collection of notes I've accumulated in the last fifteen years, on philosophy, history, psychology, music, etc. Overall, the unifying perspective is the young Marx's: "For a ruthless criticism of everything existing!" including capitalism, the U.S. government, Western intellectual culture, academia, postmodernism, certain strains of feminism, even the concepts of "genius" and "greatness" that people use to exalt a few individuals and denigrate everyone else. I want to defend the integrity of reason and the individual from attacks by the bane of our age, institutional thinking and behavior. Collectivism is humanity's enemy; unfortunately it's almost ubiquitous in the modern world. But its most dangerous manifestation is corporate capitalism, which is why the book's main polemic is against capitalism.

This book is essentially an extension of my first, *Notes of an Underground Humanist* (2013), and can be read in conjunction with it. Subjects I discuss only briefly here are dealt with in more depth there, and vice versa. My second book, *Worker Cooperatives and Revolution: History and Possibilities in the United States* (2014), is probably the most original and important of the three, containing a major revision of Marxism and clarification of its true relation to anarchism, a discussion of the past and present of the "solidarity economy" (focusing on cooperatives), and a case-study of the successful New Era Windows cooperative in Chicago. Readers interested in a constructive critique of Marxism should turn to that book, which also contains informed speculation about where society may be headed in the next fifty years, as the present *ancien régime* disintegrates.

I have to confess to a rather pessimistic point of view on that score. I think we're all in for some horrific suffering and titanic upheavals. I just hope we make it through the conflagration and into a more peaceful world on the other side.

Part 1

*

Valedictory.— Our civilization is approaching the end. We're peering over the precipice, and chaos boils below. The time has come to sum it all up, to take account of where we are and what we've done, and to pass judgment. We, the generations now living, have been lucky or unlucky enough to be present as history nears its climax; we have an abundance of human experience to survey and draw conclusions from, conclusions to pass on to posterity as it surveys the even more breathtaking ruins we'll leave behind. We want to go out with some dignity, with positive lessons to impart to our descendants so that they know not all of us were idiots. We've lived long enough to learn life's truths; we've suffered enough to be wise. Let's cast our glance from the future to the past and grasp the threads of human thought while there is still some link between what was and what is, some memory of what is rapidly fading. Perhaps some future explorer will discover our buried treasure, our Dead Sea Scrolls, and read about lost worlds, and be carried away by tales of folly and adventure. In the meantime, a few glimmers of honesty and perspective may light up our world and reveal it to itself...

*

Advice for writers.— In general, it's a good idea for writers to imagine how their work would be seen by posterity. Would their descendants view it as parochial, time-bound, and faddish, or would they still find intrinsic and timeless merit in it? Would it hold up in a different cultural context? If not, the writer should rethink his work so as to give it more universal relevance, thereby heightening its artistic and intellectual value. It's true that one cannot, even in imagination, entirely rise above one's culture and view its artifacts from the outside; nevertheless, insofar as we're *humans* and not mere cultural byproducts, the exercise is partly within the bounds of possibility. Indeed, people are constantly judging their societies and particular social practices from a human, semi-"objective" standpoint; such are moral judgments, properly so-called, grounded in the timeless and universal morality of the Golden Rule, i.e., respect and compassion for others. Aesthetic and intellectual judgments, too, are not mere epiphenomena of a particular culture but are natural, though socially influenced, expressions of innate structures in the human cognitive and affective faculties. The writer's, in fact the artist's and philosopher's and scientist's, task ought to be to transcend the limitations of time and place and appeal to the highest standards of the innately human. Ideally his work would be "immortal."

*

Enlightenment.— Said Samuel Johnson, on art: "Nothing can please many, and please long, but just [i.e., true] representations of general nature. Particular manners can be known to few, and therefore few only can judge how nearly they are copied. The irregular combinations of fanciful invention may delight a-while, by that novelty of which the common satiety of life sends us all in quest; but the pleasures of sudden wonder are soon exhausted, and the mind can only repose on the stability of truth." This statement is a sufficient indictment of most postmodernist art, and most things culturally postmodern. It's time we turned away from relativism, solipsism, social atomism, fragmentary perspectives, ironical self-consciousness, instant gratifications, pop art, pop philosophies, and commodified creativity. Honesty and truth are overdue.

*

On the use and abuse of "perspective" for life.— There are delights and dangers in adopting a broad perspective on oneself and one's society. Looking at the "big picture" can either electrify or paralyze one's will. The latter possibility is obvious, given, for example, the big-picturesque horrors of global warming and capitalist global pollution. Oceanic garbage patches the size of continents, slums the size of cities, cities disintegrating into slums, and a planetary future incinerated in the vortex of capitalism are not things that quicken the will to live. Internecine violence running riot from Mexico to the Middle East, from central Africa to Russia, as governments outdo each other in the art of cultivating murderous resentments, does not inspire confidence in one's ability to make meaningful change. Despair on a cosmic scale, encompassing life from low species already extinguished to high species threatened with extinction, suffocates "optimism of the will," "pessimism of the intellect" alone remaining.

The added burden of such modern afflictions has done nothing to ease the ancient burdens philosophers and poets have bewailed since the Upanishads. Earth is a pale blue dot in the infinite expanse of desolate space. What matter our little earthly tribulations or triumphs? Someday we'll all be gone, Earth itself will be gone, and it will be as though nothing ever was. No art, no music, none of the sound and fury of a Faustian but forgotten history. "All is vanity!" The flower of youth wilts, as poets have lamented for millennia, withering into a decayed old age and finally death. Pleasures are evanescent; time consumes all, like Saturn devouring his children. The transience of everything makes life seem meaningless—as does, in another way, the immensity of Earth (however microscopic it is on the cosmic scale), the prodigious mass of humanity compared to which the individual is too puny to mention. People come and go like flies. —The plaintive cry of Ecclesiastes still resonates two thousand years later.

On the other hand, the "big picture" need not be utterly demoralizing. To contemplate the grandeur of the universe can be a nearly religious experience, Kantian in its sublimity. "Two things fill the mind with

ever-increasing wonder and awe,” Kant said, “the more often and the more intensely we reflect on them: the starry heavens above me and the moral law within me.” One feels vanishingly insignificant but gloriously exalted at the same time, uplifted to dazzling infinity as one glories in the ability to *reflect* on this black unbounded cosmos. The relative immensity of Earth, likewise, and one’s being a mere momentary individual among billions, fills with wonder and awe, even love for all fellow creatures stranded inexplicably on this floating island in space. Time itself overawes. Translucent as a pellucid mountain river, the life-engendering flow of time carries us along to experience the beauty of *change*. The broad human perspective illuminates hope and the reality of change.

To glance over the modern world is to know the temptation of despair, but it is to know *possibility* as well. Fatalism is a factually incorrect philosophy. Horrors happen daily, but from a broad perspective one sees also constant kindnesses and life-saving interventions. A billion moments of moral beauty every day; ten billion meaningful connections between this life and that life. Even lost in anguish, even surrounded by modern ugliness, one can see beams of hope piercing the gloom. To know the true urgency of humanity’s situation, however, *should* entail not wretched immobility but galvanized movement, passionate activism. When people join together, they *can* make meaningful change.

*

The Goethean possibilities of history.— A major advantage of living at this time, so late in history, is that the past is a kaleidoscope of cultural achievements, or rather a cornucopian buffet whose fruits one can sample—a kiwi here, a mango there—a few papayas—and then choose which are one’s favorite delicacies—which are healthiest, which savory and sweet—and invent one’s own diet tailored to one’s needs. History can be appropriated by each person as he chooses, selectively used in the service of his self-creation. The individual can be more complete than ever in the past! Only, to bring the magnificent array of possibilities down to earth and so give *all* people the means to sample history’s treats requires a reevaluation of society’s values and transformation of its structures. It’s time we spread the banquet not in the gilded halls of the elite but in the humble homes of the people.

*

Götterdämmerung.— Albert Camus: “We [moderns] read more than we meditate. We have no philosophies but merely commentaries. This is what Étienne Gilson says, considering that the age of philosophers concerned with philosophy was followed by the age of professors of philosophy concerned with philosophers. Such an attitude shows both modesty and impotence. And a thinker who began his book with these words: ‘Let us take things from the beginning,’ would evoke smiles. It has come to the point where a book of philosophy appearing today without basing itself on any authority, quotation or commentary would not be taken seriously.” The reality that he describes is nothing else than institution-think. Expertly calibrated, self-replicating capitalist-friendly institutions dominate culture, and such institutions cannot get to the heart of the matter or exalt the sort of world-engendering creativity that highly ennobles. What they can do is manufacture minute monographs, reduce to the common denominator, and make ever less relevant to human concerns. I recall what I wrote once in college:

Looked at the Tufts University philosophy department website; I might apply there. Part of its mission statement is “to provide students with the skills necessary for Ph.D. research, as well as to foster the independence of mind required for genuinely creative philosophical work.” It depressed me to read that, as if a draft of nihilism had wafted by: life felt picayune suddenly, mechanical, scholarly—training people to think!—and denying philosophy even as they preach it! Well-oiled parts of the machine, functioning smoothly, cooperating with contemporary ways of doing things. What philosopher has ever cooperated? Philosophy is rebellion, war with authority in every form; it is a *way of life*, not ‘tidy thinking’ or scholarship or a specialty. Spartacus was a philosopher; Daniel Dennett is not.

The verbose perverseness that passes for philosophy now signifies a perversion of the human spirit, a discursifying of it, a domesticating institutionalizing of it, perversely appropriate to a society that has “repressively desublimated” all that is profound and creative in life. The late-capitalist categorical imperative of culture is to trivialize at all costs and for all profits, to privatize, atomize, marketize, professionalize, impersonalize, and stupidize, all in order to replicate and accumulate, to replicate and accumulate institutions and a New Man, *homo bureaucraticus*. Or, ultimately, *homo economicus*. Certainly philosophy, of all things, cannot flourish in such an environment, nor can anything else that demands to be free and unconstrained by institutional limits. The existentialist cry of the mid-twentieth century—followed by the barbaric yawp of the Sixties’ youth movements, preceded by the anti-capitalist vibrancy of labor movements in their heyday and earlier Romantic culture for the modernity-ambivalent elite and saturnalian revelry for the untamed multitude—has died, or faded from cultural prominence, but its echo cannot die until humankind itself does. The cycle continues, and we’re about to see another of its revolutions...

*

Modernity vs. humanity.— Herbert Gutman’s “Work, Culture, and Society in Industrializing America, 1815–1919” (1973) reminds us of what a rich world we lost with the standardization and atomization of society. Such diversity and humanness, artisanal craftsmanship and pride, free-wheeling festivals of life outside the factory. Actually, already in the mid-nineteenth century the dehumanization was apparent, according to Mike Walsh in the 1840s: “A ‘gloomy, churlish, money-worshipping spirit’ had ‘swept nearly all the poetry out of the poor man’s sphere,’ said the editor-politician. ‘Ballad-singing, street dancing, tumbling, public games, all are either prohibited or discountenanced, so that Fourth of July and election sports alone remain.’” Local and national power-structures pressing the masses into dull rectangular shapes. The nascent nation-state suppressing local variety, spontaneity being dangerous to centralized power.

*

Homo ludens vs. homo institutorum.— The psychoanalyst D. W. Winnicott said it simply—one of those simple but profound truths worth remembering: “*It is creative apperception more than anything that makes the individual feel that life is worth living.*” Creativity is not uniquely human, but humans are uniquely creative. We have a need to create, and to love, and to inquire—to express ourselves and see ourselves reflected in the world. We have the urge to *play*, an urge innate in our biological nature. “Creative impulses are the stuff of playing. And on the basis of playing is built the whole of man’s experiential existence.” The child plays with his toys and his playmates, exploring his new world in the realm of fantasy, like the poet and the artist. The musician *plays* music, as the athlete plays a sport. In theater, one watches a *play*. The scientist and the philosopher play with ideas, perhaps in great seriousness but with those elements of fun, creativity, “tension,” and voluntary submission to implicit rules that Johan Huizinga invokes in *Homo Ludens* (1938) to define play. Social life is essentially playful, very clearly so as regards flirting and dating, in which the tension of play takes the form of *sexual* tension. And when things get more intimate the partners engage in sexual *foreplay*—and intercourse itself can be delightfully playful. The ubiquity of games in human societies, from simple hide-and-seek to chess and complex card games, in addition to the thrill of friendly *competition* in indefinitely many forms (athletic, intellectual, artistic, etc.), shows how the agonistic spirit suffuses the human mind. The spirit of play, in short, is the spirit of freedom, “superfluous,” joyful self-expression, and immersive engagement with the world.

At the other end of the spectrum are *modern institutions*. Humans, it turns out, are capable not only of play but also of dull and dead seriousness. We have the capacity to *obey authority*, and to imbibe its individuality-denying, repressively collectivistic norms. We join institutions or are subject to them, to the impersonal rules that dictate how we are to act and think, and without even noticing it we participate in the near-extirpation of our individuality (at least in the institutional context). The self-effacing, amoral, mechanical mentality of the typical bureaucrat is the obvious example, which, as Hannah Arendt observed

in *Eichmann in Jerusalem* (1963), can lead straight into complicity in monstrous crimes. But more benign manifestations exist. Theodor Adorno already remarked in the 1940s that “even the so-called intellectual professions are being deprived, through their growing resemblance to business, of all joy. Atomization is advancing not only between men, but within each individual, between the spheres of his life.”[1] In leisure time one might still “play” and be creative, though mass-produced culture was sapping even leisurely pursuits of their authentically creative and spontaneous element; but in the context of the “job,” the rote conformism of *seriousness* had crowded out freedom and self-expression. Ultimately corporate capitalism itself, with its hideous architecture of concrete hierarchies to control society and amass profit, was and is responsible for such pernicious tendencies—for the bureaucratic collectivism that requires but a nudge to become fascist totalitarianism, and for the detaching of hapless functionaries from the consequences of their actions so that professionals and bureaucrats and intellectuals can all become little Eichmanns engineering distant horrors, and for the kitschifying of culture that brings totalitarianism into the sphere of play, and for the routinizing and vulgarizing of creativity that empties life of its meaning. The two principles are at opposite poles: *creative play*, and *capitalist-institutional atomization*.

It is the tragedy of modern man that “two souls, alas, dwell within my breast.” We seek self-affirming self-expression—authentic engagement with others—even as we let ourselves be regimented by authority. The path to reclaim play, i.e., our very humanity, is the path to reclaim democracy, human dignity, and social justice: tear down the walls that divide us from ourselves and others. Bring back the “ballad-singing, street dancing, tumbling, [and] public games,” and scandalize the bosses with your flouting of their rules. Resurrect the *public*.

*

On the Holocaust.— Even seventy years later, having learned nothing, Western intellectuals still love to proclaim with the ponderous air of authority that the Holocaust was “thoroughly at odds with the great traditions of Western civilization,” as Richard Rubenstein paraphrases in his book *The Cunning of History: The Holocaust and the American Future* (1975). It was contrary to all our glorious Western values of freedom, truth, beauty, rationality, and other pretty words that intellectuals pretend to admire. Let’s leave aside the fact that “the West” has never had a monopoly on such values: they’re not *Western* values but *human* values, which people from prehistory onwards have implicitly subscribed to and acted on. More pertinent is the fact that for centuries the West has been more committed to quite different values, such as insatiable greed, plunder and enslavement of foreign peoples, genocide of native populations, vicious exploitation of wage-laborers, murderous hatred of the “Other,” ever-increasing policing of society (in both “soft” and “hard” forms), and atomizing bureaucratic collectivism that dehumanizes everything it touches. None of this has been because Westerners are uniquely evil or have a different human nature from other peoples; it has been because a new kind of society arose, structured around the institutional imperative to accumulate capital at whatever cost to the natural and human worlds. At the same time as horrific tendencies of racism and nationalism gradually developed under the influence of an ‘*inter-nationally*’ organized imperialistic capitalism, trends of depersonalization, regimentation, authoritarian control and monitoring of populations, and manufacturing authority-friendly popular attitudes through propaganda grew more pronounced. The relatively “personalistic” slavery of the antebellum American South gave way to the impersonal industrial slavery of the South in the 1890s and later.¹ The violent and tumultuous conquest of society by profit-driven market relations, not *humanizing* but *atomizing* and *instrumentalizing*, spread reifying habits of thought that reduced humans to numbers, calculations, agglomerations, categories, ideologies, foreign objects to be used and discarded. Ever-larger concentrations of capital and industry made possible and necessary ever-larger bureaucracies, with their diabolical Weberian “formal rationality” and “efficiency”—exquisite subordination of every human impulse to the order from on high, the administrative rule, the technique for the smooth functioning of power. Corporate capital and national

¹ See Douglas Blackmon, *Slavery by Another Name: The Re-enslavement of Black Americans from the Civil War to World War II* (New York: Anchor Books, 2009).

governments matured together, intertwining in their policy formation and administrative machinery, the interests of one often becoming the interests of the other, each requiring for the sake of its power that social dissent be regulated or eradicated and domestic capital continue accumulating. In an over-competitive capitalist world, the obsession of big business with big profits led to nationalistic protectionism, tariff wars, conquest of colonial markets, the “scramble for Africa,” an international arms race that exalted “blood and iron” as supreme values, and ideologies of national and racial grandeur to justify all this imperialism. A brutalization of the human spirit proceeded apace, particularly as savage colonial wars and amoral colonial administration trained bureaucrats in the efficient use of pure violence to attain the ends of power.¹ World War I brought imperialist brutality home to Europe, intensifying it exponentially in the process. Afterwards, millions of shattered, defeated, resentful, homeless men roamed the continent, seething with rage against this society that had forgotten them, directing their rage at scapegoats readymade by the ruling class’s ongoing demonization of them: Socialists, Communists, Jews, foreign peoples, effete intellectuals—anything and anyone whose targeting would distract from class structures. Again capitalism plunged into crisis: the Great Depression happened, which raised fears among ruling classes that organized labor or even Communists would attain political power. To prevent this, in a political environment of gridlock and dysfunction, conservatives and big business turned in desperation to the fascist movements that had spread in the 1920s, which they thought they could control. They installed Hitler, and elsewhere in Europe fascist parties made significant headway.² Under Hitler, finally, all the nefarious tendencies of Western civilization that had been building for decades and centuries were unleashed in a *danse macabre* that culminated in the most unfathomable enormity in history, the Holocaust. The racism, the institutional and ideological “categorizing” of people, the enslavement and genocide of the Other, the efficient doing-away-with superfluous people (the Jews were made stateless so that no government had to protect them), the impersonal cost-benefit mode of thinking, and the totalitarian aspects of bureaucracy, states, corporations, capitalism itself, were all perfected—the principle of submission to authority was deified. It should be noted that Nazism and the Holocaust were singularly compatible with corporate capitalism: big business all over the West cooperated with and funded the Nazis (at least until that became politically inexpedient in Allied countries during World War II), who performed a useful service in destroying the German labor movement; and Jewish slave labor was gratefully used by politically connected companies. Nor is there any inherent reason why business should object to genocide, which, in fact, can be profitable for firms lucky enough to get the contracts.³ Clear elective affinities exist between the anti-humanism of capitalism—everything subordinated to the mania for profit, workers ideally being pushed down to a starvation diet for the sake of profits (or, even better, being eliminated entirely through mechanization and automation)—and the anti-humanism of Nazism, which subordinates everything to the mania for power. The superfluity of *humanity* to capitalism was made literally manifest in the superfluity of individuality, personality, and millions of physical beings to state-capitalist totalitarianism—such that the death-factories can perhaps be considered an apt symbol of modernity itself. —In short, far from being a betrayal of Western values, the Holocaust was the *apotheosis* of some of the most deep-seated, albeit implicit, Western values and social structures. Even if it hadn’t happened, the catastrophe it signified would have anyway, namely the elimination of human connections in mass society and in the dominant institutions of modern civilization.

¹ See Hannah Arendt, *The Origins of Totalitarianism* (New York: The World Publishing Company, 1958). Nikolai Bukharin, *Imperialism and World Economy* (International Publishers Co., 1929) is a good analysis of the sources and nature of imperialism.

² See, e.g., Robert O. Paxton, *The Anatomy of Fascism* (New York: Vintage Books, 2005); Stanley Payne, *A History of Fascism, 1914–1945* (Madison: University of Wisconsin Press, 1995); and Daniel Guérin, *Fascism and Big Business* (New York: Pioneer Publishers, 1939).

³ As Rubenstein argues, “both genocide and slave labor proved to be highly profitable enterprises... The business of mass murder was both a highly complex and successful corporate venture,” as it has always been during the imperialistic age from the 1870s to the recent Iraq war. After all, “the same attitude of impersonal rationality is required to run successfully a large corporation, a death camp slave factory and an extermination center. All three are part of the same world.” *The Cunning of History* (New York: Harper & Row, 1975), 60, 62. The thoroughly capitalist nature of the Nazi regime is made clear in Ernest Mandel’s *The Meaning of the Second World War* (London: Verso, 1986).

This plague of multifarious inhumanity has by no means been overcome since World War II; it has only assumed different forms in an age in which explicit racism and virulent nationalism have—at least until recently—gone out of style.

*

To see the Holocaust in a grain of sand.— While the industrialized murder of six million people is in a category all its own, one can observe in daily life many of the tendencies that make it possible. The thinking that sees the machinery of death as solely a thing of the past, an incomprehensible anomaly that we have decisively overcome in our more enlightened age, is deeply embedded in us but, as the “enormous condescension of posterity” always is, deeply wrong. One needn’t invoke the obvious monstrosities to show how a semi-Holocaustic spirit, a spirit of distanced disregard for all human and natural considerations (including the very survival of the species), still suffuses our society. One needn’t, for instance, point to the U.S.’s bureaucratically administered near-annihilation of Vietnam for the sake of preventing a national liberation movement from starting a “domino effect.” One needn’t mention the U.S.’s provision of arms to Indonesia between the 1970s and 1990s with which to slaughter hundreds of thousands of East Timorese, nor the Reagan administration’s torture of Central America to “shock and awe” the population into acceptance of reactionary governments and domination by U.S. business. One needn’t invoke the Clinton administration’s murder of maybe half a million Iraqi children by means of economic sanctions, nor the second Bush administration’s destruction of Iraq to get control of the country’s oil and benefit politically connected companies like Halliburton, nor, in general, any of the *thousands* of heinous Western political crimes documented in books by Noam Chomsky, Alexander Cockburn, Edward Said, Naomi Klein, Jeremy Scahill, left-wing historians like Gabriel Kolko and Walter LaFeber, and too many other critical voices to list. It’s not even necessary to mention the most recent abominations of drone warfare—murder by video-game—or killing of particular people (including American citizens) by executive fiat, or indefinite detention without trial, or construction of a surveillance state that dwarfs anything even dreamed of by Hitler or Stalin. All this is in direct continuity with traditions that eventuated in the Holocaust, but to discuss these obscenities is superfluous. It makes it too easy for me to make my case.

No, I see the machinery of death—can’t help seeing it—in the very *words* spoken by low-level bureaucrats, in gestures of contempt by police officers (quite apart from rampant police brutality), in someone’s command to “Get away, this is private property!,” in a corporation’s laying off a thousand workers for the sake of the bottom line, in pop culture’s erasure of individuality, in academia’s enforcement of “politically neutral” scholarly norms, and in the very *anonymous* structure of capitalist mass society. When an airport security guard callously rifles through someone’s luggage or behaves in an intentionally brutish way—indeed, when an airport employee simply commands you, in the *I-will-not-be-contradicted* tone of authority, to step back behind the line because it’s not your turn yet—the kernel of moral horror and human degeneration is evident. When an employee says, “I’m sorry, it’s the rules; I didn’t make them, I just follow them,” he has already placed one foot on the path to Nazism. All it takes now is the right circumstances and a succession of nudges for him to become a gas-chamber attendant or an SS officer. For he has forsaken rationality, independence, freedom, sympathy for others, and absolved himself of responsibility and the need to have a conscience. Because of its rarity, few things impress me more than when someone “doing his job” momentarily disregards the rules and makes an exception for you out of his sympathy. “The fee is twenty dollars,” he says, “but forget it, I’ll waive that.” A glimmer of humanity! “Maybe there’s hope for the species after all,” I then think. But I’m quickly disabused of that delusion when I reflect on the absence of rationality and compassion in social relations themselves, a fact that pressures us all to act in socially irrational and impersonally cruel ways.

Even the most seemingly innocent and ubiquitous actions can have the seed of anti-personal amorality—lack of identification with others, or groupthink and mindless conformism, contempt for people who are “different” or don’t follow the common norms—that bears fruit in Nazism and genocide. He who ignores a homeless person on the street has the stain of moral corruption in him, however he rationalizes his behavior. (So much the worse for humanity that we all do that, from time to time.) He who automatically

recoils from a working-class black or Hispanic or white man approaching him in the subway with a friendly air, just to talk, must be profoundly alienated from his fellow human beings, a stranger to them, unconcerned with the majority of them, in fact slightly disgusted by those who show a little independence vis-à-vis conventional styles of dress and behavior. Their fates, their lives and hardships, leave him cold; he simply doesn't care. This is usually true, indeed, even with respect to strangers who belong to one's own social stratum: since they're strangers, what happens to them is not a matter of concern.

"*Men are accomplices to that which leaves them indifferent,*" George Steiner said.¹ Are you indifferent to the suffering of another person, whether in the neighboring house or on the other side of the world? Then, in a sense, you're an accomplice to it. You let it happen—or you may even indirectly participate in it, say by paying taxes to a militaristic government. After World War II people reproached themselves and were reproached for their silence as the Holocaust was happening, their *having done nothing to make it stop*. Well, why is that question not asked now? The world is in as much agony as ever, and most people are as silent as ever. Nothing has changed. Even now, as in the 1940s, people are being systematically murdered, tortured, enslaved, made superfluous by the hundreds of millions (being herded into gargantuan slums where they merely subsist animal-like, or, in the U.S., being imprisoned *en masse* for having black skin and not having a vital economic role in society). The point isn't only that "all that is necessary for the triumph of evil is that good men do nothing"; it is that modern, impersonal evil largely *consists of* people doing seemingly nothing—following rules, showing indifference, ignoring the plea for help. That way lies barbarism.

Of course there are other manifestations of the barbarity. It isn't only because of individual stupidity that millions of Americans deny global warming, detest homosexuals, revile "liberals," and nurse secret race-hatred. It isn't only, or even mainly, an individual's genes that make possible the phenomenon of the latently fascist "authoritarian personality."² There are far more diabolical social forces at work. Such stupid and prejudiced attitudes, which by their nature cannot be based on dispassionate reasoning about facts or impartial openness to experiences, to new people and new ideas—such attitudes well up out of the impersonal, defensive, diffusely resentful, beset-from-all-sides mode of experience that has disfigured so many millions of minds since mass society made the individual superfluous. Without self-validation, one becomes a moral and intellectual homunculus. To some extent we moderns are all *les étrangers*, but evidently some feel more so than others—often from their greater material grievances—and embrace in their alienation emotional notions of belongingness versus otherness, Us versus Them. Contempt and hatred for the outsider, comforting submission to the authority of the insider. The question is, who will get to these alienated masses first, the left or the right? As it turns out, the right has far more resources than the left, since the right is precisely big business, and so the winners in the race are usually the forces that blame all woes on everything except the one thing that matters, class. And so instead of a more productive semi-submission to left-wing authority—(for, after all, there *is* an authoritarianism of the "left," an undemocratic institutional and personality structure, deplorably common among leftist political parties and fringe groups)—what you get is a counterproductive submission to fascist authority. And thus a pullulating of radically illogical thinking, which, combined with mass anonymity and impersonality, gets you—the Holocaust. Or, more recently, *enthusiastic marching into global environmental destruction*, the goose-stepping elite leading its goose-stepping followers straight off the cliff.

The market mode of behavior is therefore, humanistically speaking, the twin of the authoritarian, or rather totalitarian, mode of behavior. Corporations, of course, are totalitarian entities (hierarchies that rent employees, suppress dissent, enforce a common ideology, etc.), and capitalism is just fragmented totalitarianism, profit-making machines competing against each other and trying to destroy each other. An

² Theodor Adorno et al., *The Authoritarian Personality* (New York: Harper & Row, 1950). The spread of contemporary semi-fascist movements and parties has revived interest in this concept, and recent work largely validates Adorno and his colleagues' conclusions. See, for example, William F. Stone, Gerda Lederer, and Richard Christie, eds., *Strength and Weakness: The Authoritarian Personality Today* (New York: Springer-Verlag, 1993).

unfortunate externality of which is the destruction of life and nature. So, in addition to plowing full steam ahead to end millions of species and hundreds of millions of human lives, companies have now accomplished the grotesquerie of profiting *by means of* this very apocalypse. Capitalism can make money from its own self-immolation! For example, companies are buying water rights and farmland because “drought and food shortages can mean big profit”; the greater frequency of natural disasters means insurers can raise rates; and melting ice in the Arctic exposes oil reserves for BP and Shell to exploit.¹ Just as a brave new world of *species*-holocaust lies ahead, so new frontiers of profit thus tantalize our intrepid corporate world-conquerors. *Vive* capitalism and its commodification of all!

—The point, however, is that the potential for humanity’s self-extinction by means of Weberian formal rationality—methodical calculation, quantitative reasoning, mechanical adoption of the proper means to an end—is implicit not only in the operation of any bureaucracy but also in the simplest market transaction. For each side seeks personal profit of some sort in disregard of “externalities” and non-market values. Someone with an idealist turn of mind could even interpret the modern world, in Hegelian fashion, as a progressive, dialectical unfolding of all the human and anti-human dimensions latent in the logic of the market transaction, revealed as the all-devouring market economy has colonized the world. All the modern reduction of people and nature to commodities, and the mass movements of workers’ resistance, and the extermination of whole peoples, and the despairing cultural reactions against market-driven alienation, and the subordination of society and politics to the power of money—a left-wing Hegel would say it’s all there, in potentiality, in the mere act of selling a product to a customer for a profit. —Cosmic evil can be present in a grain of sand.

*

Collectivism.— Collectivism comes in both noble and evil forms. In the former, the principle of the individual is paramount; in the latter, the principle of the mass. The one means the rule of mutual self-actualization, self-respect, sympathy for others, democracy, human diversity—“an association in which the free development of each is the condition for the free development of all,” to quote Karl Marx. It is, in short, authentic community and sociality, healthy equality, a state of society in which, to quote Hegel, individuals recognize the self in the other and the other in the self, humans as human, rational beings as rational—freedom and dignity personified, one’s desire for the other’s recognition calling forth one’s own powers and potentialities. Perhaps never fully realized on a large scale, this anarchist ideal of free and dignified (though not conflictless) community can at least be approximated—as it is, for example, in many grassroots-democratic activist groups, not to mention families, friendships, and relationships between lovers—and *must* so be in order for the social animal called *homo sapiens* to really belong to himself and be at home in the world.²

On the other hand is the all-too-common kind of large-scale collectivism, the reducing-to-the-common-denominator kind. This is often present to some degree—along with the “good” kind of collectivism, existing in tension with it—even when a small group of people, be they friends or acquaintances or strangers, interact socially. One is pressured, almost imperceptibly, to conform to the ideas and norms that emerge from the group’s behavior, the senses of humor, the opinions that command the

¹ Julia Greenberg, “6 Industries That Will Profit From Global Warming,” *Wired*, February 27, 2014; Matthew Campbell and Chris V. Nicholson, “Investors Seek Ways to Profit From Global Warming,” *Business Week*, March 7, 2013.

² See Alexander Berkman’s thoughts on equality in *ABC of Anarchism* (London: Freedom Press, 1977/1929), 25: “‘But will not life under anarchy, in economic and social equality, mean general levelling?’ you ask. No, my dear friend, quite the contrary. Because equality does not mean an equal amount but equal *opportunity*... Do not make the mistake of identifying equality in liberty with the forced equality of the convict camp. True anarchist equality implies freedom, not quantity... Individual needs and tastes differ, as appetites differ. It is equal opportunity to satisfy them that constitutes true equality. Far from levelling, such equality opens the door for the greatest possible variety of activity and development. For human character is diverse, and only the repression of this free diversity results in levelling, in uniformity and sameness.”

most assent, the reactions to particular charismatic or uncharismatic people in the group. Even on this innocuous level of everyday sociality, the group spontaneously develops something like a collective consciousness that molds and guides one's own consciousness along the path of uniformity. All participants must recreate in the common space that has been cleared, drawing from the common touchstones, the tropes, social techniques, group interests—sports, television, movies, popular music. Defying the accepted norms, however slightly, gets one ostracized—frequently by being ignored, an effective method.

Collectivistic coercion takes more pernicious forms, however, in institutions and institutionally determined mass thinking and action. Here is where the real crimes against all that is good in life take place. Examples have already been given; let us only quote a few thoughts from the anarchist Alexander Berkman, who fathomed the depths of modernity's extreme collectivism:

Our lives and habits, our behavior and manners, even our thoughts and feelings are pressed into a uniform mould and fashioned into sameness. The spirit of authority, law, written and unwritten, tradition and custom force us into a common groove and make a man a will-less automaton without independence or individuality... The authority of the past and present dictates not only our behavior but dominates our very minds and souls, and is continually at work to stifle every symptom of nonconformity, of independent attitude and unorthodox opinion. The whole weight of social condemnation comes down upon the head of the man or woman who dares defy conventional codes... In science and art, in literature, poetry, and in painting this spirit compels adaptation and adjustment, resulting in imitation of the established and approved, in uniformity and sameness, in stereotyped expression.¹

While tendencies of repressive collectivism exist in all social life, outside institutional contexts they are not truly *repressive*, per se. It is only with stultifying institutional authority, market relations, policing and soldiering, and the professionalizing of the mind that one gets...the mass holocaust of individuality. Personally, having spent much time in academia, I am most familiar with intellectuals' collectivism, and so will focus on it here.

I must confess to an emotional *disgust* with the “stereotyped expression,” the cowardly uniformity of the intellectual world in all its crannies, from the mainstream media to the cobwebbed corners of academe. It's hard for me to be objective about something with which I am so intimately familiar. It's gotten to the point that the very idea of being published in a scholarly journal or by a traditional publisher makes me uncomfortable, because it associates me with the Machine. To submit to being “polished” like a pretty pebble in the tumbler of bureaucratic culture seems to me a violation. The benefit to it, of course, is that it's the only way to be taken seriously—although if you dissent too much from favored dogmas, even having the imprimatur of a respected institution or publisher won't be enough to earn you the good will of most intellectuals.

The basic point is simple and obvious: institutions select for obedience and conformity, such that if you act independently you will almost certainly be kicked out or ostracized. If you're slavish, you will meet with greater success. The essence of any large institution is thus collectivism, submersion in the mass and subordination to impersonal rules. Contemporary conservatives who decry “socialist collectivism” (amusingly accusing Obama and other such center-right politicians of it) are unaware that the institutions and behavior they adore, namely corporations, market-determined behavior, and acknowledgement of other people only as instantiating the types “employee,” “manager,” “executive,” etc., are the most collectivistic of all. In the truest sense of individualism, it's impossible to imagine a more anti-individualistic structure than the market or its corporate apotheosis, in which people's individuality is (ideally) erased. Because of this erasure, though, these institutions do exemplify a *pervverted* individualism, in the same way that bureaucracy and totalitarianism do: all that exist are *atoms*, windowless monads of suppressed humanity.

Being farther from the operations of power, academia is less pathologically fragmented and collectivistic than the market economy or the corporate world. The difference is fairly marginal, though,

¹ *Ibid.*, 26.

given that every facet of academic culture embodies fragmentation and collectivism. Scholarship is intensely specialized, people spending entire careers studying subtopics of a subtopic; the fetish of “expertise” reinforces the notion that all that matters is familiarity with a specialized and conventional scholarly literature; careerist imperatives overwhelm any interest in truth, realistic understanding, or genuine originality (at least in the humanities and social sciences). Economics, for example, is a particularly egregious case, because its main functions are to mystify and to provide ideological idealizations of capitalist behavior. Already in the 1980s, economists were complaining that

Economics has... become so broad and so complicated that, within the fields, one group of specialists barely speaks the same language as the Ph.D.s across the hall. And so much of what is published seems more to proselytize for an ideology than to make sense of the chaotic world... It's no wonder that a single economic development can be interpreted as a godsend or a disaster, depending on the interpreter's frame of reference.¹

Even in more serious disciplines than economics, though, the worship of ideology—i.e., collectivism—over intellectual integrity is so obvious that only the blindly indoctrinated could fail to see it. In history departments, for instance, the “fashionable theory of economic nondeterminism” of politics and society about which Gabriel Kolko complained in the 1960s, and which has reigned since at least the 1950s, now takes postmodern forms of obsession with gender, sexuality, and “discourse.” As a result, the incredibly important work of Kolko and likeminded New Left historians, like that of other materialist scholars such as the political scientist Thomas Ferguson, is almost *never mentioned* among academics. Indeed, it is unmentionable, because of its subversive implications and its implicit critique of postmodernist idealism. A radical like Kolko is not “one of us,” he is not mainstream enough, and so is to be ignored. The fact that his work explains the sources of American foreign and domestic policy is irrelevant; what matters is that other academics don't mention him, so it would be impolitic to do so oneself.

We tend to forget that intellectual artifacts are not simply produced by individuals pursuing their own idiosyncratic interests; they are, in most cases, expressions of institutional priorities and configurations. They are *collective* products, testaments to institutional agendas, power-relations, and the kinds of work that can make it through academic, media, and publishing filters—which of course tend to filter out anything that is challenging to their own power and interests. In forgetting this institutional context and background, we forget that there are overwhelming pressures for only innocuous and conventional work to be rewarded, and for critical voices to be marginalized. The vast majority of people in an elite institution will be successfully indoctrinated with its ethos and agendas, so that the interests of the institution become their own personal interests. As a result, they react with extreme emotional hostility to anyone who doesn't follow the rules with utmost fidelity—thereby revealing the essential meanness and smugness of collectivism. All may be pleasant and polite on the surface, as long as norms are followed, but scratch this veneer and an abyss of petty hate and contempt opens up. Whether you're a scholar booted from academia for criticizing Israel or a graduate student who incurs the wrath of professors for not submitting to hyper-specialization, the “herd of independent minds” will brook no dissent.

The rule of collectivism also produces a ubiquitous *stupidity*. I'll have more to say later about the subject of stupidity in America; for now, I'll confine myself to the observation that narrow institutional points of view are almost never sensible, self-critical, or grounded in reason and realism. They are dogmatic and stupid, based on myths about the importance and value of the institution in question (and therefore the people who identify with it). So, to the extent that someone identifies with an institution—as most professionals do—he will exhibit traits of dogmatism, stupidity, and self-overestimation. For example, journalists are trained to think that their profession, in its present reality, is both “objective” or “neutral” between opposing points of view and inherently adversarial towards power, two ideas that are obviously

¹ Quoted in Kenneth Gergen, *The Saturated Self* (New York: Basic Books, 1991), 83. The shallowness of contemporary economics is shown by the fact that virtually no American economist predicted the 2008 financial crisis and economic collapse.

false (and mutually inconsistent); politicians are generally convinced of the nobility of their motives and their relative innocence regarding social problems or state crimes; most academics believe the self-glorifying myth that ideas and philosophies, rather than institutional dynamics, are what move the world. And nearly all professionals are basically ignorant of the functions they really serve in the political economy, their complicity in the evils of the world, and the by-no-means-flattering reasons they have been able to rise in their professions (namely because of their obedience, lack of intellectual curiosity, and willingness not to challenge norms). They often even deny such truisms as that society has a ruling class and that the wealthy have wildly disproportionate control over politics, the media, and mainstream ideologies. In other words, naïve self-deceptions are ubiquitous among the institutional automatons who constitute the “elite.”

In addition to an underlying meanness, smugness, and stupidity, intellectual collectivism breeds a remarkable pretentiousness. Whether it’s a philosopher poring over a sentence by Nietzsche, a literary or film critic writing a turgid essay on some little facet of a poem or a movie, a poet laboring for hours and days to come up with the most dense and paradoxical imagery possible, or a postmodernist disguising a trivial idea in jargonistic, pleonastic prose, intellectuals excel in pretense. Academic conferences can be unbearably pretentious, full of people taking themselves seriously to a comical degree—priding themselves on their vocabulary, their articulateness, their specialized knowledge—subject to the delusion, apparently, that what they’re talking about has some sort of significance (which it rarely does).¹ The endless “calls for papers!” to submit to yet another conference remind one of how insular and therefore feckless the intellectual world is. But because academia takes itself very seriously, it encourages self-serious behavior in the people who submit to it. “Pretentiousness,” in fact, often just means “institutionally sanctioned behavior.” Since institutions are artificial and anti-human, the behavior appropriate to them strikes us as artificial, even ludicrous (or, sometimes, downright evil, as in the case of the corporate sector).

Incidentally, it isn’t only academics. Far from it. One turns on the television, flips to CNN, and sees Serious People discussing issues of high moment, such as whether Edward Snowden is a traitor or a hero, or what to think of the president’s latest rhetorical performance. “Panels” provide “expert” “commentary” on “both sides” of an issue. It is all intensely serious and important, and one is overawed by the intellectual fireworks on display.

The ubiquity of such pretentiousness in elite culture serves an important function: it signifies that *authority is being taken seriously*. That’s generally what elite pretentiousness is, just a taking-seriously of authority, a refusal to acknowledge how absurd and risible are the performative dimensions of authority. The rules about what can be said and what can’t be said, and how to say what can be said, protect the supposed legitimacy of authority, which is to say authoritarian collectivism (for that’s what authority means: a collective submission to power). If you’re forbidden from “questioning the motives” of your fellow politicians, or from asking a scholar “*Who cares?*” about the (usually uninteresting) thesis of some little article he has published, or, in general, from saying “Come on, let’s be *real* and admit what we all know but are pretending to deny!,” then institutions can function smoothly and authority can operate without a hitch. That’s the categorical imperative that explains much of what is ludicrous and awful about the world.

For all these reasons, I take a different perspective from most people regarding who it is I respect and who I don’t. I’m inclined to respect someone who’s lower on the totem-pole, because he still may have an independent mind (and also is typically not such an asshole as his superiors are); the successful and admired, on the other hand, I usually consider rather contemptible. *Ceteris paribus*, someone who’s a “top scholar” has already lost most of my respect (unless he or she proves me wrong). Few things are sadder than an institutionalized mind.

Certainly there are overwhelming pressures to submit; but one should at least try not to *mentally* submit too. A little nonconformism is a good thing.

¹ The one question that doesn’t exist in their otherwise amply stocked arsenal of interrogatives is the most important one: “*Why does this matter?*”

*

Social Luddism, a necessity.— No one has ever said it better than Mario Savio in 1964, in the context of the Berkeley Free Speech Movement. Just as we have a duty to remember and reflect on every great horror of history, so, in a different sense, do we have a duty to remember and reflect on words like these, spoken in a moment of high disgust with the bourgeois world: “*There’s a time when the operation of the machine becomes so odious, makes you so sick at heart, that you can’t take part, you can’t even passively take part. And you’ve got to put your bodies upon the gears and upon the wheels, upon the levers, upon all the apparatus, and you’ve got to make it stop! And you’ve got to indicate to the people who run it, to the people who own it, that unless you’re free, the machine will be prevented from working at all!*” This is the immortal message of anarchism—man’s primordial and instinctual cry for freedom. And it is the passion that has birthed a better world from time immemorial, and will continue to do so until the human species is extinguished. *Authority vs. freedom and rationality: that is the underlying “dialectic” of history.*

*

I dance, therefore I am.— A piece that’s good for restoring the love of living after you’ve been corrupted by contact with authority is Beethoven’s King Stephen Overture. It’s joy in fun and fun in joy. Enjoy! :-)

*

The secular divine.— My God: Beethoven’s Choral Fantasy. I discovered that piece earlier this year [2010]. I thought it was a little strange at first, unstructured and meandering, but...you know, it’s quintessential Beethoven, the affirmation of everything in spite of everything, the redemption of the universe. I often get tears in my eyes when watching great music performed by...*people*, people who have devoted their lives to art and you can see it when they’re singing, the hours and years of practice and passion as they belt out their notes, their devotion to music. That beautiful soprano with the blond hair coiffed perfectly and the makeup and earrings on—the most beautiful thing about her is that she’s a woman, just a normal person who wants to look pretty like all women and has a family and sees her friends every day and has to do maintenance on her house every year—and yet here she is standing between an orchestra and a chorus, belting out Beethoven, *singing*—humans can *sing!* (how superfluous!)—singing about how “graceful, charming and sweet is the sound of life’s harmonies!” The three men and the three women singing about God’s grace being bestowed on humanity when love and strength are united, and peace and joy advancing in perfect concord, and then the chorus trumpeting that we must “accept the gifts of high art!,” and the orchestra and piano and the conductor swinging his arms wildly singing along with the chorus (you can only see his lips moving but you know he’s shouting as loud as the singers)—can you picture these men and women sitting and standing beside each other in front of a rapt audience, not fighting or arguing or talking of money or politics or responsibilities but *singing about art*? It’s a miracle, the greatest miracle of life.

A community, timeless and universal because they’re performing music scribbled two hundred years ago by a deaf man who lived alone in his cluttered and filthy apartment—scratched-in ideas transported from one man’s head to a concert hall where worshipers pay homage to the thing most worth paying homage to, art. It’ll all be over soon (two hours), but its very transience enhances its beauty.

*

The clean air of the Baroque.— Notwithstanding the uniquely life-affirming character of Beethoven’s music, Bach has pieces that are more invigorating than anything except, perhaps, standing atop some Himalayan peak a breath away from the heavens. (The difference is that the air of Bach, unlike that of the Himalayas, has a superabundance of oxygen.) —To momentarily escape from the polluted atmosphere of modern culture into the “luminiferous ether” of the Baroque and Classical periods, which transmits light

straight into one's *money-stained* soul—Bach's translucent Partita No. 5 for keyboard, Handel's limpid Water Music, Vivaldi's sun-drenched Four Seasons—restores youth and life. It's actually possible to *breathe* in this air of freedom from commodification!

*

Antitheses.— For the last couple of hours I watched videos on YouTube of William Buckley, Norman Mailer, Martin Amis, Christopher Hitchens and such characters. It was almost an unreal experience. These people and evidently their circles were/are not ordinary, in the worst possible way. I was watching degenerates, narcissists, poseurs, boors, and bores. No doubt brilliant in their own diseased way. But I couldn't help thinking I was in the electronic presence of personified decadence. Hitchens of course was the embodiment of sleaze, his whole being *icky, greasy, slimy*. Those are the adjectives that come immediately to mind when I look at him. The perfect emblem of this group of people, this whole literary cocktail-party subculture, would be a picture of Hitchens' face in the midst of an attempted smile. A grotesque, false image. Pop culture meets pretentious intellectualism meets Roman orgies.

—The essence is simple: with those people, as with most pop culture, I can feel myself being lowered—to the particular (and the vulgar). With Chomsky, as with good classical music, I can feel myself being elevated—to the universal. It's pollution vs. cleanliness. Shiny pollution vs. radiant cleanliness.

*

From the Greeks to the Enlightenment.— The best way to think about the human task of living is that it should be, as Nietzsche said, a continual journey of self-overcoming. The project should be that embodied in the great religions' concepts of salvation or nirvana: *to overcome particularity*, to wash out the blemishes of self-fixated particularity. That is, to fuse the particular, i.e. oneself, with the universal, by remaking oneself in its light. We are born spotted, tainted with the "sin" of self-immersion, base impulses, and ignorance; our task is to become (relatively) spotless, elevated above ordinary determinations so that in freedom we master ourselves. The imperative, in short—the *categorical* imperative—is to be *clean*, and, on the whole, whatever doesn't make you feel clean should usually be rejected as ignoble and corrupting. We all have capacities for high and low things, for things that a universal humanity would appreciate and things it would despise. Our calling is to cultivate the former capacities and let the others atrophy. —On one side is stupidity, ignorance, slavishness, unreasoned emotion, unconcern for others, greed, smugness, hedonism, and brute bodily pleasures, all things that entrap within the *determined self*, the unfree and "unclean" self ruled by animal impulses. On the other side is intelligence, knowledge, courage, reason, compassion, generosity, a deep humility, and "spiritual pleasures," things that liberate from the self's primal immediacy and so make free and dignified. Insofar as these latter qualities are grounded in internalization of "the other's" perspective—broadening of experience and the desire to impress the other—which is a uniquely human capacity that makes possible our very self-consciousness, they are, in a sense, the *fulfillment of human potential*, of the universality implicit in self-consciousness. The former qualities, by contrast, are merely human manifestations of the lowest animal conditions and instincts. Stupidity, for example, is utterly immersed in itself; intelligence incorporates others.

While it may sound odd, therefore, the idea of cleanliness—moral, intellectual, emotional, aesthetic, etc.—is a useful "regulative principle" for human thought and action (to speak in Kantian language). It is evocative; it is imprecise but elevating, and recalls that other ennobling idea, the concept of universality. It shouldn't be confused with *purity*, which is extreme, potentially fanatical and anti-humanistic; cleanliness is more moderate—merely moral, beautiful, rational, humane, elevated above petty resentment and neurotic fixations. One can also use the idea of cleanliness as a test to determine what is "decadent": if some cultural artifact doesn't seem *healthy*, a sign and product of good health, vigor, or lofty universality, one might well call it decadent—that is, a symptom of sickness, neurasthenic self-consciousness, polluted and anti-human life, pathological social atomization, or psychological and cultural exhaustion. Most twentieth-century avant-garde art is decidedly decadent (which doesn't mean it's

worthless). Even late-nineteenth-century composers, such as Brahms and Wagner, can be very decadent, unlike Mozart and Haydn. The social context of the former was, so to speak, dirty and sick (hypochondriacal, navel-gazing)—as you can sometimes hear in its music—that of the latter relatively clean and vital, naïvely confident.

The ideals of cleanliness and universality overlap with, but are superior to, Nietzsche's ideals of strength, enthusiasm, "overflowing vitality," instinct, *virtù* in the Renaissance sense. There is some intuitive plausibility to Nietzsche's judging the worth of things by determining where to place them on the spectrum from shriveled weakness to brimming-over strength. This standard of value is reminiscent of past "aesthetic moralities" that center not on the antithesis *right/wrong* or *good/evil* but on *noble/base*: Aristotle's ethic of virtue is an example, as is, perhaps, Goethe's (unoriginal) conception of the "genius" whose demonic vitality is such that he isn't bound by ordinary standards of right and wrong.¹ One problem with such an emphasis on "strength," of course, is that it subordinates the claims of altruism to those of egoism. The weak but good man is considered lower than the strong but amoral man. Another problem is the vagueness of words like "strong" and "weak": their meanings are elusive, tending to evaporate the more closely you examine them. Moreover, insofar as the terms are meaningful at all, someone can be psychologically strong and weak in different respects—indeed, *everyone* is both strong and weak (whatever that means). A third problem, perhaps most damning, is that the Nietzschean—or Calliclean—value-system is the parochial ethic of the master class, which has the requisite leisure and privilege to care about individualistic values of "*virtù*" and whatnot. To people preoccupied with the tasks of survival, all this master-moralizing seems *juvenile*, parasitic, self-indulgent, a mere luxury. It's unreal. What makes more sense is to try to be morally and intellectually clean—compassionate, cooperative, communally oriented, not self-fixated but attuned to the health of the collective, which is also the health of the self. One attains a kind of universality—and "strength"—simply by working together with others, molding and being molded by them, internalizing their perspectives, thus achieving intelligence, knowledge, courage, reason, and the other noble values that thinkers from Plato to Nietzsche have upheld (in different ways and for different reasons). The egoistic ideal of strength or "health" is therefore best achieved precisely through altruism, which can also be a symptom of it.²

*

In defense of Socrates.—Nietzsche ridiculed the Socratic equation "*reason = virtue = happiness*," calling it "weird" and decadent, but in fact one can consider Nietzsche's ridicule itself to be weird and decadent. It is of a piece with his inability to see the value of the altruistic Christian morality, the psychological profundity of which should be obvious. Happiness is based on high self-esteem, which requires that you see your implicit self-love confirmed in the world, reflected in people's behavior towards you, validated by yourself and others. Ordinarily, acting virtuously will get you not only self-respect but also the respect and affection of others—which will itself increase your self-respect, and so your happiness. In those cases in which doing the right thing gets you ostracized or punished, you will still at least have the happiness of knowing your own value, and your superiority to the contemptible herd. Conversely, it is well known that dissolute living or obsessive chasing after fame and money does not equal stable happiness, because it does not entail a secure sense of self. So, inasmuch as it is reasonable to do what makes you happy, it is reasonable to do what is right and virtuous. Moreover, the pleasures of reason—science, philosophy, inquiry and creativity—can be definitely happiness-inducing, even if at times an obsessive engagement with philosophy or science can be tormenting. Doubtless there is *some* truth to the cliché that ignorance is bliss; for example, ignorantly believing in God—the idea of which reason rejects—can make people happy, and

¹ Goethe's example is Napoleon. In Dostoyevsky's *Crime and Punishment*, Raskolnikov is initially seduced by this ethic, until through suffering he rises to the higher Christian morality. It's worth noting, by the way, that the Nietzschean and Goethean standards of value were already recognized, and rejected, by Plato, whose character Callicles espoused them in *The Gorgias*.

² See Max Scheler's discussion of St. Francis in *Ressentiment* (1912).

understanding the “meaninglessness” of human existence isn’t necessarily a happy experience. It can drive to despair. In fact, however, it is never just *a thought* (like the thought of God’s nonexistence) that makes someone unhappy; it is a thought conceived in certain circumstances, for example conditions of social alienation or loneliness or lack of interest in life. It isn’t *reason* or *knowledge* that makes unhappy, as so many poets and others have thought; it is *a particular set of experiences*, which cause you to latch onto some given thought and obsess over it, imagining that it is the source of your unhappiness. In a healthy social environment, it’s perfectly possible not to be disturbed by some truth that a person in a different social context might find disturbing. —In any case, it’s a risky strategy to pin your happiness on a lie, like the lie that God exists, because doubt is apt to seep in and upset your carefully arranged house of illusions.

In short, the Socratic equation is not only morally uplifting but psychologically valid, all things considered. One can object to it on the grounds that it optimistically oversimplifies, given that virtuous people are not necessarily happy—and vice versa—and “rational” people are not necessarily virtuous or happy, etc.¹ But on the level of ideal-types—and/or in a sanely organized society—there does seem to be an elective affinity between the three concepts of reason, morality, and happiness. Enlightenment thinkers thought so. And the Enlightenment was not a “decadent” movement; it was too naïve, confident, optimistic, and vigorous for that. What *is* decadent, perhaps, is a late-nineteenth-century rejection of something as universal and “*clean*” as the Socratic and Enlightenment association of reason, morality, and happiness—for such a (Nietzschean) rejection proceeds from a faux sophistication, a disgust with optimism, a fondness for perverse formulations, a late-romantic or *fin-de-siècle* fascination with the irrational and the repressed. —One should strive to be rational and moral, and relative happiness may well ensue.

*

Thoughts on morality.— The “moral sphere” has extended in recent centuries, so that now such things as slavery, colonialism, racial segregation, and discriminatory treatment of women are considered wrong. But we still have a ways to go. There are the obvious left-wing concerns: horrific treatment of animals and the environment, brutalization of homeless people, demonization of immigrants, tolerance of degrading wage-labor, etc. But aside from these issues are ones that almost nobody talks about, which can be summed up in the observation that people are frequently *not nice* to each other. Being unkind ought to be considered *immoral*, not just unpleasant. Unkindness is ubiquitous, and in a sense it’s inhuman. Indeed, any act that demonstrates an absence of empathy should be thought of as immoral. For what is morality if not respect and consideration for others?

Broadly speaking, then—but also strictly speaking—it’s immoral, say, to ignore someone (*ceteris paribus*), whether a homeless person on the street or someone who’s talking to you at a party or a friend who sends you an email. That is, doing so has negative implications regarding your worth as a human being. If you want to be a good person, you should always act on the basis of empathy and respect. That isn’t always possible, of course, which just means it’s impossible to be an absolutely good person, or to always abide by moral imperatives.

In fact, imperatives can conflict. Respecting human life is a duty, but one may also have a duty to kill a mass murderer if that’s the only way to prevent him from killing again. Or one may, in some extreme scenario, have a duty to lie to someone, even though lying is immoral because it shows a lack of respect and so forth. Moral values can also conflict with non-moral values—and it isn’t always right to follow the moral value in this case. For instance, it may hurt a person’s feelings to criticize an irrational belief he holds, but one’s commitment to truth and reason may justify so criticizing his belief. (It’s debatable whether commitment to truth is “moral” *per se*, but insofar as it doesn’t impinge on one’s treatment of others, a case can be made that it’s a non-moral value.) All this goes to show that no one, except maybe a very young child, is “innocent,” everyone is tainted, indeed in most moments we’re acting contrary to morality in some

¹ One can also object that, contrary to Kant’s philosophy, morality cannot be grounded in pure reason alone, and so in this sense morality ≠ reason. I think that this Humean and Nietzschean objection is correct, but to defend it would require a technical discussion inappropriate here.

way or other (e.g., by not roaming the streets looking for suffering people to help). Still, the broader one thinks of the moral sphere as being, and the more one acts on that belief, the more one can pride oneself on being a “basically good” person.

*

Reason = virtue = dignity.— One of the glories of being human is that we’re the only creature that can intentionally *rise above* impulses that nature has implanted in us. What a miracle! Our self-consciousness and intelligence make it possible to reflect on some deep aspect of ourselves and say, “No, I reject that,” and act contrary to it. For example, it seems to be a natural impulse, or at least a natural *tendency*, for us to treat unattractive or uncharismatic or obese or short people differently from their opposites, to show them less appreciation or affection (other things being equal). This seems to be true in every society, and so must be grounded in nature, in natural responses to the world. Nature, in fact, has given us a myriad of immoral, “illiberal” impulses. But it has also given us the ability to internalize others’ viewpoints, thus giving us empathy and allowing us to invent the concept of morality. And so we can say, “No, it’s wrong to treat people differently on the basis of qualities that are *not part of the moral sphere*, such as height or skin color or attractiveness,” and adjust our behavior accordingly, to some extent defying nature. Indeed, such moral defiance of nature is a major manifestation of humans’ unique *freedom*; and so, as classical thinkers have said or implied (Plato, the Stoics, Kant, Hegel, Goethe), we are in a sense acting more freely—less “instinctively”—when we choose to act morally and rationally rather than hedonistically or in other ways determined by primitive impulses. Not only is moral behavior *right*; it’s *dignified*.

[Here I put that short essay on “the value of the humanities.”]

*

Literature in the service of compassion.— I recommend Gogol’s story “Diary of a Madman.” Comedy and tragedy are united seamlessly: the more comical it becomes, the more tragic. It’s reminiscent of *Don Quixote*, except more moving. A civil servant who has been ground into the dirt for decades, treated as a nobody, his sole purpose in life to sharpen His Excellency’s quills and copy out documents—becomes infatuated with His Excellency’s daughter. He starts having conversations with her dog, to find out more about her. The more debased he is, the more his humanity rebels: he has been so degraded that he comes to believe he is King Ferdinand VIII of Spain, waiting for the deputation that will take him to his new kingdom. Instead it takes him to an insane asylum (which he thinks is Spain)—after he has finally, in his own eyes, regained his dignity by behaving like a king with the clerks at his office. His delusion has even given him the courage to declare his love to the girl. (Courage required delusion, because of the delusive trappings of society.) But in the asylum they manage to strip him even of his life-saving insanity: he cries out that he is a miserable wretch, that he longs for his mother in his old peasant hut. “Give me a troika with horses swift as the whirlwind! Climb up, driver, and let the bells ring! Soar away, horses, and carry me from this world!” But after this piteous speech, the last sentence of the story is the comical non sequitur, “And did you know that the Dhey of Algiers has a wart right under his nose?” The man is obsessed with little things like that, little flaws in appearance, little gradations in rank, because that’s what his society is obsessed with. And that’s the tragedy of it. He has been made incapable of seeing his humanity, even as he screams inwardly that he is a man!

You see, appearance is everything. Social status determines all. It takes a change in his self-perceived status for the man to finally put an end (in his own eyes) to his dehumanization. That’s the only way people know how to, in this world. There is no such thing as humanizing yourself, because the only way to do so is to play the game of social rank, which is a dehumanizing game. You can’t break out of the framework; the charade has become the cast of your mind. So even if you’re a king, you’re still dehumanized.

And obviously the dog is symbolic.

What a masterful story! Totally free of sentimentality—totally lighthearted—but infinitely tragic. It forces the reader to rely on his imagination, to imagine the real situation behind the character who writes such silly journal entries. At forty-two years of age he goes insane. Think of all the pain behind that! We're forced to *imagine* the pain, though, which makes it more effective. —Through such means, literature can sharpen our moral sense.

*

The fraudulence of status.— In order to determine someone's intellectual or artistic integrity and acuity, a simple test is available. It has to be supplemented with others, but it's useful. If in any context you can tell that someone is responding to a set of ideas or a work differently from how he otherwise would have on the basis of *who produced it*, you know he lacks integrity as an intellectual or an artist. If it's clear that he dismisses a work or an idea because it wasn't produced by a person with the proper credentials, the proper status or fame or institutional qualifications—or, conversely, if he positively values a work because it *was* produced by such a person—you can write him off as shallow or a fake. I'm talking particularly about people who, as judged by society, are supposed to be the "experts" in some given field, in other words academics, artists, critics—the arbiters of taste and "truth." If they show any snobbery or credentials-worship or groupthink, you know immediately that, to that extent, they're charlatans and frauds.

By this standard, unfortunately, the enormous majority of intellectuals and artists are, to some degree, frauds. As I said above, they value institutional conventions more than genuine merit. An art critic will extravagantly praise some silly painting with a respected name attached to it and ignore a nearly identical painting by an unknown. So then you know: "Buffoon." An academic philosopher won't care about original ideas he reads in a student's paper but will be terrifically impressed by unoriginal or simplistic ideas he reads in a book by Foucault or some lesser-known colleague. "Buffoon." Since institutions function by virtue of groupthink and snobbery, it's no surprise that virtually everyone (at least among the higher-ups) in a given institution is a groupthinker and a snob.

One sees it constantly. It's the very *air one breathes* in any elite institution. To give a random and perhaps subtle example: years ago I attended a literary conference for a few days and took these notes:

There are public readings every night, usually by the famous writers here. Ravi Shankar, Alexander Chee, Josip Novakovich, Katha Pollitt (annoying liberal feminist). But last night and tonight, readings by students. Much less well-attended, of course, than the celebrities' readings. But they're more enjoyable, more affecting. All these diverse people, many of them shy and worn down by life, all talented, all sharing their private lives with strangers. Brought together by a love of something the culture doesn't love; the only common denominator a love of writing. People not famous, writing on faith. Predictably none of the famous people attends these readings, only a few students. But they're so much more powerful than those other readings! Far more intimate, certainly more transporting because no ego is involved and no books outside waiting to be bought, only mysterious pasts like that woman whose every piece is about her son Simon who died young and those women who read quietly with head bowed low, their writing wonderful. What has brought them here? What pasts? Most of them won't be successful authors because few people have the right luck and connections, but they continue writing anyway on faith.

At the celebrity readings the audience is duly appreciative, basking in the presence of fame, applauding the sometimes idiotic selections on display. (For example, Katha Pollitt read a piece that related her experiences with a small group of Marxist activists; most of it was devoted to glib jokes at their expense, which duly elicited laughter from the audience.) The whole charade, with all the glamor and self-congratulation and two-minute-long introductions of each writer, repulsed me. Such artificiality! Any of the poems and stories written by the students could have been read and would have received the same applause; people would have been clamoring to buy the book, would have wanted autographs—although, actually, those reactions

might have been relatively justified, since some of the students' work was better than the celebrities'. Only in the later, sparsely attended student readings could one escape the snobbery and credentials-worship.

Evidently there is something about "high status" that brings out human mediocrity. —For one thing, the *spectacle* of it all, of the cultural world, is supremely *vulgar*. No one is more vulgar than an intellectual trying to get noticed. Just think of the Slavoj Žižeks dancing for the cameras, clamoring for attention, costuming themselves (sometimes literally) in whatever garb will provoke a response from the culture industry. Fashionable decadents, clownish self-promoters, actors on the stage of a (now) dying civilization. Such as when a Žižek makes it his mission to offend the delicate sensibilities of his liberal intellectual friends—declaring, for instance, that "the problem with Hitler was that he wasn't violent enough." "What?!" the culture industry duly gasps, playing along by pretending to be aghast. "Well," he gives his prepared response, "Hitler's violence didn't fundamentally challenge the system, and in this sense Gandhi was more violent than Hitler." Ah, good point, great contribution, way to contribute to rational discourse—let's play on the meaning of "violence" and twist it around to provoke our liberal friends and capture the headlines of a bored intellectual world, since the only thing that matters is getting noticed. These people, these insular attention-whores of the elite—and, more generally, all the millions of pseudo-intellectual upper-crusters and middle-crusters who in their parasitic boredom take them seriously, just as they take seriously (or play the game of taking seriously) all and only those who have the stamp of some elite institution's approval on their forehead—as though the whole charade of status, recognition, riches, resumé-padding, curricula vitae, *means* anything!—should be seen not really as autonomous and dignified human beings but more as *institutional byproducts*, waste products of the culture-factories. Such a huge industry with such huge profits is bound, after all, to produce a titanic volume of pollution.

What all this phony status-worship amounts to, in short, is *anti-democracy*. We don't live in a democratic world, which is just to say we don't live in a human world, a world based on individuality, morality, clear communication, and rationality. We live, as I've said, in an institutionally structured world—what's worse, a world structured by *capitalist* institutions. Integrity and merit will rarely be rewarded in such a world, and democracy will barely exist.

In a sense, though, these reflections should be a comfort to the millions of people who unjustly suffer from a lack of recognition, whether they're talented artists or dedicated activists. Their lack of recognition, far from proving their lack of worth, can be thought of as an indication of it, since what civilization values is pretense and fraud. And highly "successful" people should ask themselves what their success suggests about them, and whether they too, like so many others, are living an inauthentic existence.¹

*

With regard to the elite, another test for intellectual integrity is readily available: simply ask the person in question what he thinks of Noam Chomsky. If he expresses contempt or scorn, you know what to think of him. Assuming he isn't ignorant of Chomsky's work, he has either internalized conventional norms and ideologies, and thus has become blind to facts and moral truisms, or he is a fundamentally dishonest person. (Or both.) Alan Dershowitz is the obvious example.²

The reason I make these seemingly harsh and closed-minded judgments is that nearly all Chomsky's political, social, and ethical commentary follows from elementary values and truths and is backed up by overwhelming evidence. Most of what he says is, indeed, mere common sense, expressed eloquently. Only a mind that has been subtly or egregiously warped could fail to see the essential social and moral truth in his opinions, or would fail to be impressed by his reasoning and his superhuman factual knowledge. It's no surprise, then, that most "ordinary people" wherever he goes seem to adore him, and that authorities and the elite loathe him. For the latter have achieved their station by internalizing warped

¹ On the notion of authenticity, see Lionel Trilling, *Sincerity and Authenticity* (Cambridge: Harvard University Press, 1971).

² See Howard Friel, *Chomsky and Dershowitz: On Endless War and the End of Civil Liberties* (Olive Branch Press, 2014).

norms, while the former, who have not had to be so deeply indoctrinated (because they're more distant from the workings of power), still have common sense and understand moral principles, such as that you should apply to yourself the standards you apply to others. Or that participatory democracy is a positive value. Or that it's good to alleviate others' suffering. These three principles alone, in conjunction with an array of facts, are enough to establish Chomsky's positions.

Intellectuals love to insist that "things are complicated," in part because it's by complicating simple things that they get a paycheck—but also because it absolves them of the responsibility to take a stand against the powerful institutions they serve—and then they dismiss Chomsky because of his supposedly simple-minded statements. But moral truths are, in fact, not terribly complicated. In any case, it is clear what to think of people who flippantly denounce someone but rarely or never give specific examples to justify the denunciation. (Or, when they do give examples, they actually redound to Chomsky's credit, as in the case of his consistently defending the right to free speech of people who hold obnoxious views. How *deformed* must a mind be not to understand that defending the right of a Holocaust-denier like Robert Faurisson to air his views isn't the same thing as defending the views themselves??¹ The very notion of *principle* is foreign to the average intellectual—a fact that Chomsky himself documents abundantly.)

*

The upside-down world.— Given the nature of modern society, failure is a point in one's favor. —Our world is like a stagnant pond: the scum floats to the top.²

*

Anti-intellectual intellectuals.— If intellectual curiosity means the desire to learn new things, encounter new ideas, explore and explain the world, then "intellectuals" have no more of it than other people do. Possibly less. They limit themselves to one field and do their job and earn their paycheck, as a reward for serving the masters by enforcing conventional wisdom and political correctness. In fact, it's much more common to find subtlety and openness of thought, as well as sheer common sense, among the working class, which has been far less indoctrinated and regimented than the middle and upper classes. The British journalist William Cobbett said it in 1820: "Give me leave to say that...these [lower] classes are, to my certain knowledge, at this time, more enlightened than the other classes of the community... They see further into the future than the Parliament and the Ministers. —There is this advantage attending the pursuit of their knowledge: they have no particular interest to answer; and, therefore, their judgement is unclouded by prejudice and selfishness. Besides which, their communication with each other is perfectly free. The thoughts of one man produce other thoughts in another man. Notions are canvassed without the restraint imposed upon suspicion, by false pride, or false delicacy. And hence the truth is speedily arrived at." Talk to someone from the working class about politics and, unless he's a white man who has been corrupted by Limbaughite fascism, you'll see he understands elementary Marxian truths—that the rich run the country, politicians are virtually bought by the corporate sector, American "democracy" is a sham, the whole game is rigged against the majority of the population—that most academics can't even comprehend, much less believe. The more education, the less rational.³

¹ "The Faurisson affair" of the late 1970s is worth reading about if you want an example of cleanliness fighting an uphill battle against pollution.

² As the historian Albert Prago said, in an amoral society, the amoral man is best qualified to succeed.

³ To give a minor example: upon my arguing once that big business has near-total control over U.S. policy, a highly respected liberal historian said there was an obvious problem with this opinion, namely: if the rich are so clearly in charge, why doesn't everyone know this fact and rebel against it? To which I replied that most people (not academics) do know it—just look at public-opinion polls—but that it isn't exactly easy to rise up collectively and overthrow a society's central institutions. His blindness to these profoundly obvious truths is symptomatic, and very different from non-academics' relative clear-headedness. See Nicholas Abercrombie et al., *The Dominant Ideology Thesis* (London: George Allen & Unwin, 1984).

*

Popular sanity.— No reasonable person would deny that pop culture is a vulgar, artificial, debased and debasing thing. Does this mean that “the people”—who tend to enjoy pop culture—are vulgar and debased? Not necessarily. For one thing, we should distinguish between popular culture and pop culture, “the corporate-sponsored mass culture that is so often mistaken for [the former],” to quote T. J. Jackson Lears. Genuine popular culture is the kind of thing there was among the farmers in the 1890s’ Populist movement, among New England’s Italian anarchists in the early twentieth century, and among working-class communities of the nineteenth century.¹ Neighborhood theaters, festivals, picnics, churches, benefit societies, cooperatives, democratic labor unions, Communist-associated ethnic workers’ clubs in the 1930s—every conceivable form of mutuality. Popular culture is bottom-up, not top-down, and so *brings together*. Mass culture, by contrast, is founded on the co-optation and mutilation of a few popular impulses into means of making profit, tools of business. Whatever is good and authentic in the original becomes bad and commercial in the copy. In music: classical, jazz, blues, bluegrass, folk, rap—all can be puerilized, vulgarized, atomized, lucrified. Same with literature, theater, the plastic arts, religion, dance, and sex. It can all cease to be a means of authentic expression, a sublime sublimation of individuality, as it becomes impersonal—impersonally replicated on the assembly-line of capitalist culture.

It’s the same, incidentally, with social movements. Truly popular movements are anti-authoritarian, even anarchistic, emancipatory; the Ku Klux Klans, the fascism, the McCarthyism, the social conservatism are not populist but pseudo-populist, business-engendered and -supported.² Strains of authentic popular discontent are manipulated, attenuated, and directed to new repressive ends as the elite sees in them an opportunity.

People value art, self-expression, and emancipation. In a society that doesn’t reward those things—or actively suppresses them—many people will embrace their ubiquitous substitutes and even cling to them desperately to escape, if momentarily, a life of hassled boredom. When one is surrounded by fun and “sexy” distractions, sees everyone else indulging in them, and is relentlessly pressured to do the same oneself, it requires a willful and rebellious nature to turn away from them and into the past or an alternative present. One may, therefore, end up with low cultural tastes—or, politically, sympathize with a pseudo-populist “movement” like the Tea Party—but the deep-seated human affinity for high art and high values can never be wholly eradicated. Even a world formed and defined by anti-human social structures cannot destroy the instinct for beauty and high creativity, which is wont to show itself in small and unexpected ways.

We’re reminded of all this by the socialist Oscar Ameringer’s autobiography, *If You Don’t Weaken* (1940). In it he describes proselytizing for socialism in the 1890s, in isolated communities in Oklahoma, where he got a good reception. The “white trash” took a liking to him and his message.

“White trash!” [he writes]. There is good stuff in those people. If many of them now are below par it is not their nature that made them so, but the greed and stupidity of their so-called betters...

Dinner over, and dishes washed, the two o’clock meeting started under the big tent with singing and instrumental music. Singing was led by our choir, recruited on the ground. The instrumental music was supplied by myself and three sons, and we played only the best, so far as the best can be played by a brass quartet augmented by piano. Before our instrumental concert, I usually gave a short lecture on classical music, which I defined as Bill Nye had defined Wagner’s music: “it is a helluva lot better than it sounds.” I also explained how to acquire the appreciation of good music by simply listening to it with all

¹ See, e.g., Paul Avrich, *Sacco and Vanzetti: The Anarchist Background* (Princeton: Princeton University Press, 1991), and Lawrence Goodwyn, *The Populist Moment: A Short History of the Agrarian Revolt in America* (New York: Oxford University Press, 1978).

your mind and heart. Believe it or not, we played arrangements of Beethoven, Mozart, and Schubert quartets, chorals of Bach, songs of Mendelssohn...and of course gems from Stephen Foster, America's own sweet singer. They loved it. Those simple people took to good music like ducks to water. Their minds were not yet corrupted by the Tin Pan Alley trash that later was a music for profit. Besides, "classical music" is folk music clarified, interpreted and ennobled by the great masters, and these were folk people.¹

What we need are social structures that bring out the best in us, not the basest.

*

Lessons from history.— The elite has the money, but the workers have the dignity. The elite consumes; the workers produce. Future ages always forget the past elite or view its decadence with horrified contempt; the lower classes go on to found new societies and are vindicated. The masters die off, Hegel said, being collectively a parasitic excrescence, while the slaves birth new worlds. Think of the old American South: the slaves went on to form cultures of Christian love and soulful living—the "Negro spiritual," gospel, ragtime, blues, jazz, arts of sublimated emancipation—while the slave-masters' culture, based on idle leisure and violent exploitation of a productive people, withered away. Think of the French *ancien régime*: the aristocracy was good only for patronizing its artistic servants (Mozart and others), while the *sans-culottes* made revolutions that began the modern era. Think of ancient Rome: the grand empire collapsed under the weight of its own rot, as the despised barbarians triumphed and a more democratic Europe rose. Thus will our modern global empire collapse, our modern aristocracy succumb to its own decadence, and our *sans-culottes* lead the way to a new world.

*

Revolutionary betrayal.— Here's a (somewhat oversimplified) one-sentence summary of the origins, trajectory, and outcome of the American Revolution: it "ended in reaction as the Founding Fathers used race, nation, and citizenship to discipline, divide, and exclude the very sailors and slaves who had initiated and propelled the revolutionary movement."² In general, *mutatis mutandis*, that's how revolutions go. *Class struggle* is the original and essential meaning for most of the population, but the leadership that takes over uses ideology to justify setting up a new hierarchy, a new authoritarian structure. One elite takes the place of another—and so the vicious cycle of history continues. In the case of the American experience, the Progressive historian Carl Becker pithily observed that the Revolution wasn't only about home rule but also about who would rule at home. For example, during the revolutionary turmoil of the 1770s farmers and urban tradesmen in several colonies forced the ruling elite to pass radically democratic laws and constitutions meant to protect debtors and the economic independence of all "commoners." The Pennsylvania constitution of 1776 actually abolished property restrictions on voting, created a unicameral legislature with members elected for one year, created a judiciary appointed by the legislature for seven-year terms but removable at any time, and eliminated the post of a governor who could veto laws, installing in his place a twelve-member Supreme Executive Council that would administer the government. The Thermidorian reaction to all this "irresponsible" democratizing occurred in the 1780s, when bondholders and other anti-debtor, anti-farmer groups forced governments to roll back many of the rights previously won by the people, in the name of "fiscal responsibility." Our now-revered federal Constitution, far from being "revolutionary," was but the culmination of Thermidor. Throughout these years "ordinary farmers agitated for a more accountable, localist, and responsive government because they accurately perceived the

The ironic anti-capitalism of the Founding Fathers.— In the footnotes to chapter 6 of Chomsky’s *Understanding Power* are these illuminating remarks: “[Thomas] Jefferson did not support capitalism; he supported independent production... The fundamental Jeffersonian proposition is that ‘widespread poverty and concentrated wealth cannot exist side by side in a democracy.’ This proposition is dismissed by liberals making peace with the rich and coming to terms with inequality, but Jefferson perceived the basic contradictions between democracy and capitalism... In 1817 he complained that the banks’ mania ‘is raising up a monied aristocracy in our country which has already set the government at defiance...’ A year earlier he said he hoped the United States would reject the British example and ‘crush in its birth the aristocracy of our monied corporations which dare already to challenge our government to a trial of strength and bid defiance to the laws of our country...’” “Men divide naturally into two parties, ‘aristocrats and democrats,’ [Jefferson] wrote. On one side stood ‘those who fear and distrust the people, and wish to draw all powers from them into the hands of the higher classes’; on the other stood ‘those who identify with the people, have confidence in them, cherish and consider them as the honest & safe, altho’ not the most wise depository of the public interests...’” Among all the Founders Jefferson had the most positive view of democracy, but later in their lives even John Adams and James Madison were disgusted by the growth of American capitalism. After all, they had been trained in the Ciceronian school of civic virtue, republican ideals of engaged citizenship, liberty and independent-mindedness, public-spiritedness—all the very opposite of capitalism, this tornado of privatization that has been laying waste to the world since the fifteenth century. The tragedy of our Founding elitists, including even Jefferson, was that they were mere tools of historical forces they didn’t understand: in thrall to the conservative, antiquity-derived ideology of republicanism, which incorporated the naïve Enlightenment notion that in the sphere of politics men of property (unlike the propertyless) could act in disinterested and virtuous ways, they were blind—until it was too late—to the fractionating and mammonizing tendencies of commercialism and early industrialism. The republican empowerment of the opulent and crushing of the poor had the opposite effects Madison and Adams wanted it to: it helped clear the ground for the most rapacious tyranny in history, the tyranny of capital. *This* is the Founders’ true legacy.

*

The dialectic of business’s attacks on the public sphere.— In my Master’s thesis, *Worker Cooperatives and Revolution* (2010), I argued that in the coming decades, the state and the ruling class, in order to partly contain popular discontent and so prop up their power, will probably have to evolve in ways that will undermine their position in the long run. I ought to have noted that neoliberalism itself—the state’s configuration in the past thirty-five years—has shown similar dynamics. It has been the means by which the ruling class has maintained and even augmented its power after the popular uprisings of the 1960s and 1970s, but ultimately it will prove—or is proving—to have made the long-term position of the ruling class untenable. It has so undermined social stability that I suspect power-structures all over the world are panicking now. In the last twenty years there has been a militarizing of police forces and an expansion of the “national security” state in order to control the population, and these trends are intensifying. But they won’t prove adequate to the challenge. As the global economy falls apart and privatization continues to

¹ Seth Cotlar, review of *Taming Democracy: “The People,” the Founders, and the Troubled Ending of the American Revolution*, by Terry Bouton, and *Unruly Americans and the Origins of the Constitution*, by Woody Holton, *Journal of Southern History*, vol. 76, no. 4 (November, 2010): 971–973.

rend the social fabric, the ruling class will, I think, have to start tolerating and even supporting the kinds of decentralized “solidarity economy”-esque initiatives Gar Alperovitz discusses in *What Then Must We Do?* (2013), because they’ll be thought to help stabilize society and will seem less subversive towards power than mass political movements (which will exist too). Gradually, with the conditional help of sectors of the ruling class that don’t understand the historical significance of their actions, a new society will thereby be constructed in the interstices of the dying one. Thus, the rich and their state will advance to another stage of the dialectic, another stage of their self-undermining, in which they participate more actively—out of necessity—in destroying the conditions of their rule. The “necessity” of this stage, if it occurs, will have organically emerged from the previous neoliberal phase, which itself grew out of the unsustainability of the earlier, more “populist” phase (the heyday of the welfare and regulatory state between the 1940s and 1970s), and so on back to the beginning. Marx was right that history has a logic.

*

Capitalist parricide.— The nation-state and capitalism were born as twins from the fertile, ancient womb of greed and power-hunger. They grew up together, were playmates from an early age—going on treasure hunts, playing Cowboys and Indians, in their later years preferring Monopoly—learned from each other, helped each other achieve their dreams, relied on each other in difficult times. Their youths and early adulthood were full of storms and stresses, brutal competition with bullies in their neighborhood—feudalism, aristocracy, absolute monarchy, foreign empires—in addition to more distant but redoubtable enemies like community, untamed nature, and the stubborn human urge for freedom, but in the end, working together, they were able to triumph over all adversaries. And yet just at the pinnacle of their glory, cracks in their relationship emerged: the nation-state, the (slightly) more responsible partner, resented capitalism’s reckless and profligate ways and thus demanded adherence to codes of behavior that capitalism found onerous. So the latter, having always been the more ambitious and restless one, plotted to free itself from all constraints, whatever the cost. At last the opportunity arose: with the help of new technology it broke free of nation-statist, welfare-statist restrictions and roamed the world unencumbered by social contracts or conscience. Power-mad, it reveled in orgies of violence and destruction that reduced every country they touched to semi-chaos. With blind disloyalty, having been corrupted to the point of insanity by power, it finally even turned against its brother and plotted to *kill* the nation-state. Perhaps the state’s continued remonstrances against the totalitarianism of profit-making, feeble and infrequent though they were, annoyed it. Whatever its motives, capitalism resolved to sabotage the laws, conventions, contracts, treaties, borders, and civil society organizations that were the conditions of its brother’s life: former compromises between the siblings were scrapped, and capitalism appropriated more and more of the world to its own private sphere of arbitrary power. The resultant social disorganization, popular protest, and ruination of nature amounted to a slow-acting poison wending its way through the nation’s metabolism, making it ever sicker and more desperate to suppress every rebellious symptom of the illness. At the same time the state, ironically, behaved especially abjectly toward its conniving and too-powerful brother/partner, trying to stay in capitalism’s good graces—and too weak now, anyway, to act independently. All its efforts, however, were for naught: its sibling had outgrown it and showed no mercy. The nation-state succumbed to its afflictions and approached death. –But a surprise lay in wait for capitalism. Far from now being the supreme, unchallenged power on earth, it found, as it stared in epiphanic panic at its collapsing brother, that in killing the nation-state it had also killed itself! A reckoning worthy of Edgar Allan Poe’s horror! The dying state could no longer protect capitalism from its enemies or its own demonic will to self-destruction, and so it, too, advanced swiftly to its mortality. Thus the brothers, still dripping with blood from all their conquests, were swallowed up in the death-heap of history, to which they had themselves contributed so mightily. Death reclaimed its own.¹

*

Lessons from a critical sociologist.— In the last chapter of *Social Origins of Dictatorship and Democracy* (1966), Barrington Moore explains the value of Marxian analytical methods, as contrasted with methods that emphasize *cultural* factors, ideologies, subjective values, etc. Here are excerpts: [see the excerpts from years ago in my journal].

He's right. An egregious and well-known example is the myth, or the Big Lie (see *Mein Kampf*), propagated by pseudo-scholars like Samuel Huntington, Bernard Lewis, Christopher Hitchens, and Sam Harris that we're in the midst of a potentially apocalyptic "clash of civilizations" between the Christian (or, in some versions, secular) "West" and the Muslim "East" or "Middle East." This *cultural* fault-line is conceived as the primary geopolitical fact of the present. It's Us versus Them. The Huntingtonian hypothesis has been amply refuted since its introduction in the early 1990s;¹ it is widely known by now, or should be, that "they" don't "hate us for our freedom" (or our Christianity or secularism or whatever) but for our savage imperialistic policies that are ripping their societies apart. Nevertheless, bipolar, culturalist, Huntington-type thinking persists, largely because of its usefulness to the powerful. (It distracts from intra-societal conflict, particularly from class and other institutional structures, and generates popular support for militaristic policies.)

Indeed, this sort of culturalism is not far from racialism, which is not far from racism. As the story goes, people in a particular region of the world—in this case, North Africa and the Middle East—acquired a long time ago, in some primeval past, something called "a culture," which has stayed with them nearly unchanged for centuries and millennia just because cultures are the sorts of things that are very hard to change. The longer they exist, the harder it is to change them. By virtue of mere inertia, as Moore says, traditions are supposed to pass from generation to generation passively, like the ebb and flow of time itself. There is little room for human agency in this story: one grows up in a cultural atmosphere, soaks it up like a sponge, and passes it on to one's descendants. So now, in the twenty-first century, an Arab or Middle Easterner necessarily has this tremendous cultural burden simply because he comes from North Africa or the Middle East. He cannot be other than he is; it is virtually in his blood. —Edward Said dealt with all this long ago in his classic *Orientalism* (1978), but, since ideological servants of power-structures continue to exist, "Orientalist" thinking does as well.

Culturalism, or idealism, comes in less obnoxious forms too. In fact, in these forms it's almost ubiquitous. Hackneyed concepts like "American individualism" or "the competitive spirit" or "Americans' traditional conservatism" are used to explain everything from the proliferation of guns and violence in the U.S. to the weakness of labor unions. With that simple rhetorical trick, the whole history of the labor movement, of business and state violence, of corporate propaganda and public-relations campaigns, of myriad social possibilities that were foreclosed by repression, is erased.² What culturalism/idealism really amounts to is *anti-historical thinking*. No wonder conservatives and the powerful love it: for knowledge of history is dangerous to authority, and has to be suppressed.

Even scholars who think of themselves as consummate historians are often inadvertently suppressing history by putting forward idealistic interpretations. For example, to explain political policies

¹ See, for example, Edward Said, "The Clash of Ignorance," *The Nation*, Oct. 4, 2001; Sandra Buckley, "Remaking the World Order: Reflections on Huntington's *Clash of Civilizations*," *Theory & Event* 2, No. 4 (1998); Carl Gershman, "The Clash within Civilizations," *Journal of Democracy* 8, No. 4 (October 1997). In fact, polls have demonstrated that the vast majority of Muslims have nearly identical values to Western liberals. See my paper "'Eastern Muslims' and 'Western Liberals': Ne'er the Twain Shall Meet?," at www.academic.edu.

² See David Montgomery, *The Fall of the House of Labor: The Workplace, the State, and American Labor Activism, 1865-1925* (New York: Cambridge University Press, 1987); Patricia Cayo Sexton, *The War on Labor and the Left: Understanding America's Unique Conservatism* (Boulder, CO: Westview Press, Inc., 1991); Alex Carey, *Taking the Risk Out of Democracy: Corporate Propaganda versus Freedom and Liberty* (Urbana: University of Illinois, 1996); and Elizabeth Fones-Wolf, *Selling Free Enterprise: The Business Assault on Labor and Liberalism, 1945-60* (Urbana: University of Illinois Press, 1994).

in terms of the ideologies that politicians use to justify them is to suppress the *real* history, the institutional history, in favor of a fairy-tale that glorifies the powerful. To take a random but typical instance: in *The Global Cold War* (2005), Odd Arne Westad argues that “the United States and the Soviet Union were driven to intervene in the Third World by the ideologies inherent in their politics.”¹ He pays little attention to economic dynamics and institutional interests, relying instead on policymakers’ rhetoric and self-understanding. Thus, in addition to legitimizing powerful actors and the political status quo, his method falsifies the history, or rather “superficializes” it.²

But it may be unfair for me to pick on Westad: his approach is and always has been the default approach of 90 percent of intellectuals. What people who actually care about truth should do is heed Moore’s materialist admonitions.

[...]

*

The science.— It’s embarrassing (to humanity) that it’s still necessary to give evidence that men and women are innately different, but I’ll quote a couple scientists whose books the reader may not have read. In *The Blank Slate* (2002), Steven Pinker summarizes what should be common sense: “Variation in the level of testosterone in different men, and in the same man in different seasons or at different times of day, correlates with libido, self-confidence, and the drive for dominance... When women preparing for a sex-change operation are given androgens, they improve on tests of mental rotation and get worse on tests of verbal fluency. The journalist Andrew Sullivan, whose medical condition had lowered his testosterone levels, describes the effects of injecting it: ‘The rush of a T shot is not unlike the rush of going on a first date or speaking before an audience. I feel braced. After one injection, I almost got in a public brawl for the first time in my life. There is always a lust peak—every time it takes me unaware.’”

“Many of the sex differences [in behavior] are found widely in other primates, indeed, throughout the mammalian class...” An obvious but very suggestive fact.

“The brains of men differ visibly from the brains of women in several ways. Men have larger brains with more neurons (even correcting for body size), though women have a higher percentage of gray matter. (Since men and women are equally intelligent overall, the significance of these differences is unknown.) The interstitial nuclei in the anterior hypothalamus, and a nucleus of the stria terminalis, also in the hypothalamus, are larger in men; they have been implicated in sexual behavior and aggression...”³

Pinker also gives compelling evidence that “two key predictions of the social construction theory—that boys treated as girls will grow up with girls’ minds, and that differences between boys and girls can be traced to differences in how their parents treated them—have gone down in flames.” One can expect that many feminists will dismiss Pinker as an ideologist and so forth, but the range of scientific literature he draws on is impressive.

Simon Baron-Cohen’s *The Essential Difference: Male and Female Brains and the Truth about Autism* (2003) is more systematic, providing overwhelming evidence that male and female brains are innately different, in interesting ways. His main thesis is that male brains are better at systemizing (which he defines), while female brains are better at empathizing. The “maleness” and “femaleness” of brains varies between individuals, but clear tendencies apply to each sex. The behavioral and biological evidence Baron-Cohen adduces validates most stereotypes about the sexes, such as male dominance, aggression, and interest in certain types of abstract intellection, versus female nurturance, attention to people’s feelings, and interest in people-centered things over “systemizing.” He mentions the usual compelling data relating to hormones, for example that boys born to women who have been prescribed a synthetic female hormone

² See my *Notes of an Underground Humanist*, 251, 252.

³ Steven Pinker, *The Blank Slate: The Modern Denial of Human Nature* (New York: Penguin Books, 2002), 346–348.

(diethylstilbestrol) are likely to show more female-typical behaviors. Or that male-to-female transsexuals show a reduction in “direct” forms of aggression (physical assaults) and an increase in indirect or “relational” aggression—which suggests that “testosterone affects the form that aggression takes.”¹ He also gives evidence to support the obvious idea that genes—and there are genetic differences between males and females—partly determine systemizing and empathizing abilities.

Anyway, isn't it just *reasonable* to think that both biology and socialization would contribute to the nature of gender roles? *A priori*, this is what a reasonable person, unblinded by ideology, would think. No surprise, then, that science tends to confirm it.

*

Institutional blinders.— What makes things like academic “gender feminism” possible—or the postmodern dismissal of science, or scientists’ dismissal of philosophy, or analytic philosophers’ dismissal of all things Continental, or historians’ dismissal of sociology, or economists’ dismissal of history—is the parochialism of modern intellectual life, which grows out of the institutional fragmentation of society. Most of the time, whatever isn't institutionally sanctioned isn't pursued, because most people are conformists content to adopt the limits of their institution as approximately the limits of their mind. So academics narrow themselves to their chosen department of knowledge and rarely venture out into the big, scary world of other kinds of thought. “The way *I* do it is right,” everyone thinks, “and besides, it's necessary to specialize in something. So I devote my intellectual labors to my specialty.” Also, understandably, all people (not just academics) interest themselves only in what they find most congenial to their tastes and beliefs. The problem is that their tastes and beliefs are encouraged to be limited and one-sided given the limits and one-sidedness of institutions, including the one that has molded them most.

[...]

*

Self-refuting postmodernism.— The concept of “socialization” cuts both ways. If feminists want to argue that people are socialized into so-called patriarchal norms, I can argue that they, and other postmodernists, have been socialized and indoctrinated into rejecting science (insofar as it contradicts favored dogmas), deploring “phallogocentrism” or “phallogocentrism,” and exalting Foucault or other postmodern “thinkers.” That is, I can take their ideas to their logical conclusions: if our beliefs and scientific theories are mere products of power-systems, then postmodern beliefs, too, have no intrinsic rational validity but are only expressions of a certain kind of society. This reductivism of course conflicts with the implicit claims to *truth* that postmodernists make when they put forward their ideas. In other words, if their ideas are right, as they think, then they can't be right, because there is no such thing as rightness or truth or autonomous reason. Everything is supposed to be a mere expression or reflection of a particular state of affairs, and nothing is even remotely “autonomous”—a dogma, incidentally, that denies humans dignity, creativity, freedom, and reason. This kind of (pseudo-)philosophical postmodernism amounts to a profound nihilism. Its extreme philosophical empiricism—much more extreme than, say, David Hume's—is revealingly similar to B. F. Skinner's radical behaviorism, which, likewise, effectively denied humans dignity and creativity by interpreting them in terms of mere conditioning, reinforcement, and stimulus-and-response. So, whether it's behaviorism, or an empiricism that denies individuals contribute anything to their own development, or a postmodernism that says “Language speaks us” (i.e., we're mere products of particular discourses or languages or power-systems or whatever), the Enlightenment values of autonomous reason and freedom have no place.

Nevertheless, there is some value to philosophical postmodernism: socialization does, after all, exist (though that has been understood for a very long time). Gender feminists, for example, *have* been

¹ Simon Baron-Cohen, *The Essential Difference* (New York: Basic Books, 2003), 99.

socialized into their bizarre beliefs; they're not as autonomous or rational as they implicitly, and self-contradictorily, think.

*

Postmodern irony.— Given the rigor of the scientific method, the conclusions of modern natural science are much less “socially constructed” than are the ideas of postmodernists who critique science as being socially constructed. Maybe these people should look in the mirror from time to time.

[...]

*

Thoughts on common feminist arguments.— To object to a belief on the grounds that it's a cliché is not a compelling argument. Something can be a cliché and yet be true. Such is the case, for example, with the belief that big business has immense influence over politics. Nor is it a convincing argument to object to a belief on the grounds that it's offensive. Wall Street tycoons might take offense at the idea that they thrive off the systematic exploitation of millions of workers, but that doesn't make it any less true.

On the other hand, the argument that a belief is *morally* offensive cannot be so easily dismissed. But here the question immediately arises: how can *truth* be *morally offensive*? As David Hume argued, the realm of “is” and the realm of “ought” are radically distinct, such that a fact cannot be morally wrong or objectionable. It just *is*. And to believe what *is* is surely, likewise, not morally wrong.

And yet there are difficulties here. It seems morally offensive to believe, say, that white people are on average less intelligent than blacks, or men are less intelligent than women. But, *prima facie*, neither belief appears *necessarily* false. For all we know, nature might have designed things that way. So, if those are possible truths, how is it that they can seem morally objectionable?

Here it's necessary to clarify a few things. First, the concept of “intelligence” is scientifically useless, meaningless. Scientifically it can be fleshed out in an indefinite number of ways. So, the offending statements in the previous paragraph, being effectively meaningless, can in fact *not* be true. Consider, then, some variation on them. Suppose someone believes that men are on average less adept at empathic understanding of others than most women are, because of biological structures in the brain. (And suppose this belief can be “precisified” so as to have scientific content and be testable.) Is that belief morally objectionable? No, it isn't. Insofar as it has cognitive content and isn't merely an underhanded way of denigrating one sex or the other, it is nothing but a neutral hypothesis to be accepted or rejected.

In fact, it's only insofar as the element of *valuing*—or *devaluing*—is present that it can be morally wrong to believe something. The intuition that it's wrong to think whites are less intelligent than blacks is explained by our sense that the real *point* of that belief is that *whites are inferior*. The “value-judgment” aspect of the statement is what's offensive. If the concept of intelligence had scientific meaning and could be separated from its emotional overtones, it wouldn't be morally wrong to believe the statement, as long as one didn't invest it with emotional content or use it to justify the belief that whites are inferior. Morality, to repeat, has to do with the act of valuing or devaluing, not with simple statements of fact (or non-fact).

This is also what explains the intuition that even to *care* about certain questions is morally wrong. To care about the differences between the brains of black people and white people seems wrong because we suspect that the only reason anyone would care is if he or she were a racist, and so wanted to demonstrate that one race is inferior to the other. However, such an awful motive isn't necessarily what would lead someone to be interested in differences between the *sexes*, because sexual differences are much more substantial and biologically meaningful than racial differences. There are legitimate scientific reasons to investigate differences between men and women. Again, as long as one doesn't invest hypotheses or conclusions with emotional content, i.e., use them to justify denigrating some category of people, the act of believing them is morally innocuous.

Thus, it *can* be innocuous to believe that women, for example, tend, on average, to be more

emotional than men, or more changeable in their moods, or more excitable, or whatever. It is by no means necessarily the case that someone who has these beliefs—and most people do, at least implicitly—thinks thereby that women are “inferior” to men or is only interested in the ideas to justify misogyny. For these statements may, after all, be true, given how little science understands about the human species! (And no reasonable person would deny that evidence exists to support these clichés, and others.) On the other hand, inasmuch as publicly advertising such views, or giving evidence for them and seeking out biological explanations, may give aid and comfort to misogynists and social conservatives, one has to think long and hard before concluding that the possible scientific gains in understanding outweigh the possible moral costs.

It’s unfortunate that humanity is so constituted as to be able to pervert and corrupt truths, or possible truths, into supposed justifications of immoral and even meaningless value-judgments. Because some people act this way, many feminists lash out at *anyone* who makes speculations about biology or psychology that can be perceived by misogynists and feminists as unflattering to women. Thus you get the totalitarian climate of political correctness, in which even making a mild, correct observation about male and female behavior in our society is enough to get you slandered as a “misogynist.” Indeed, the very act of generalizing at all—even with qualifications—is typically seen as beyond the pale, given the aversion postmodernism has to general truths (preferring fragmentary understanding, particularity, obsessive acknowledgement of human diversity, etc.). “That’s a generalization!” the postmodernist screams in outrage, unaware that generalizations can be true or approximations of the truth. Even stereotypes frequently contain a kernel of truth—one reason for their being stereotypes to begin with.

[...]

*

Subversive common sense.— Nietzsche’s self-appointed task of “revaluating values” isn’t difficult. It requires only a slightly independent mind to see the silliness of conventional wisdom. For example, to be “successful” typically means to conform well, not to have moral and intellectual integrity or to be a broad-minded and compassionate human being. Quite the contrary! Thus, financial and career success, in themselves, are contemptible (for many reasons, actually).

Or, being a man who “gets” a lot of women tends to have negative implications regarding your moral and intellectual worth. The Tucker Maxes of the world are beloved by young women, while the merely good or overly intellectual men are not. There is nothing admirable about being charismatic or seducing females by projecting “masculine dominance.”

Or, to act morally, while always a good thing, is usually psychologically indistinguishable from acting so as to be thought well of by others. Even if you *want* to do something considered immoral or unkind, you take the easy way out and fit in with the crowd.

Or, most leftists conform almost as much as everyone else, only in a different milieu. To question Leninism in the International Socialist Organization will get you ostracized or expelled; to point out obvious truths about human biology and psychology to feminists will get you demonized as a misogynist; to offer slight qualifications to anarchism in some anarchist group will get you hated as an authoritarian; and hipsters are embarrassing. Ideologically defined groups are no credit to humanity.

Or, an “intellectual” can, to a first approximation, be defined as an educated person who loves to hear himself or herself talk. Other criteria can be given: one should have no commitment to truth for its own sake, one should take others seriously as long as they have a few letters after their name, one should care far more about career goals than mentoring students, etc.

Or, being a soldier, that oh-so-noble vocation, requires a unique skillset: being uniquely willing to submit to orders without question, being willing to kill others only because you’ve been told to, and being naïve enough to believe that there’s something called “my country” for which you should fight, because you’ve been told to.

Or, children are more interesting and independent than adults, who have matured into a propriety-worshipping, authority-respecting, penny-pinching old age.

Or, believing in God makes you *less* moral than atheists, because it supposedly means you act morally mainly for God's sake (not humans'—or only indirectly), and it's a way of disrespecting the suffering of billions of people (God is just), and, most likely, it means you're prejudiced in various ways.

Or, the U.S. government is second only to the Nazis in the number of people it has killed or helped kill. (Actually, in two hundred years, from the Indians to the Iraqis and beyond, we've surely taken first place.)

Or, the glorious "free market" means that starving people without money can't eat, and public education or public transportation or social welfare programs don't exist, and future generations don't have a say in what kind of world we leave them (because they lack money), and nothing can interfere with the reduction of people and nature and life itself to *commodities*.

Or, the U.S. Communist Party, for all its faults, basically began the Civil Rights Movement in the 1930s, organizing whites and blacks to fight for their collective economic, political, and civil rights. Social welfare in the U.S. was born in response to Communist agitation and stimulation of mass protest in the early 1930s. In the 1940s and '50s authorities crushed the new laborite institutions that had nurtured racial equality and solidarity, so the later Civil Rights Movement had to be organized mainly around churches rather than unions.

—See? It's not hard.

[...]

*

Against Nietzsche.— Nietzsche was indisputably brilliant, but his way of writing doesn't lend itself to the disinterested pursuit of truth. His impassioned, sarcastic, lightning-quick style is more like literature than proper philosophy or science. Indeed, if his ideas are distilled into their essence, divested of their decorative eloquence, they become no more than *interesting perspectives*—and there become fewer of them. (His writing is somehow dense and diffuse at the same time.) As for the content of his philosophy, I'll only make the obvious point that, like so many brilliant psychologists, he greatly overestimates the importance of psychology and underestimates the importance of institutional structures. He reduces everything to body and psyche, to an individual's physical health, mental character, emotional vitality, and the influence of such asocial elements as climate and weather. It doesn't occur to him that not everything is *affect*; it is possible, e.g., for thinkers simply to follow trains of thought that seem plausible to them, their affective or bodily needs having nothing to do with the matter. Reason *can be* relatively autonomous, and it's a treacherous task to read something into a person's psychology from the fact that he holds certain beliefs.¹ Nor does it occur to Nietzsche that people are so enmeshed in social structures that it is more often these, not individual psychologies, that determine beliefs, even much behavior. —Marxism is the way to go, though Nietzsche is a worthy adversary.

*

Against Freud.— To think that people desire *pleasure* more than *recognition* (validation) is ridiculous. Virtually every facet of society points to the priority of recognition over mere pleasure. Culture may be partly a sublimation of libidinal drives, but it is even more a manifestation of the human need for the other's esteem.

[...]

*

¹ It can be done, but not in the promiscuous way Nietzsche does it.

The writer.— For whom do I write? Not really for myself, since I want an audience. But not really for other people either, since I don't have in mind anyone in particular when I'm writing, and knowing that my works are read doesn't give me much pleasure. Besides, I don't have a high enough opinion of most people for their approval to mean a lot. What I'm writing for, then, is something abstract, not concrete. I have in mind, obscurely, an "abstract" audience. Most immediately, the abstraction in question has to be the abstract Other in my consciousness, the "other" in the "self-other" structure that defines human consciousness. My mind is permeated by otherness—I'm aware of myself as an other to myself—and it's this that drives me to create. Getting recognition from concrete people is slightly satisfying because it entails some small recognition from the Other in my mind, and so from myself. Ultimately, then, it's *myself*—but in a mediated way—to whom I want to prove my worth, or the supposed "objective justifiability" of my self-respect.

But since the Other that accompanies me (and makes possible human self-consciousness) is abstract, it really can only correspond to another abstract entity. Thus I'm led to imagine things like God or humanity or posterity, universal things "out there" whose recognition or appreciation of me would truly confirm my value. Recognition from them would be as "objectively real" as it can get, and so would basically satisfy me. I create for these things, and I pretend that they exist and aren't just figments of my imagination. Since they *don't* exist, I'll never be satisfied, never certain of my objective worth (the notion of which, in any case, is meaningless). Still, I have to keep striving, impressing myself on the world, imagining that I'm writing for posterity and all humanity, imagining that I'll be immortal...

*

The enduring truth of Hegelian mysticism.— The paradox of the self, or human consciousness, is that it's a concrete abstractness, or an abstract concreteness. It's incoherent: it's a fusion of the universal and the particular, abstract otherness and concrete individuality, and it is never at one with itself. It seeks to coincide with itself, to bring the otherness and individuality together so that its self-otherness is abolished and its individuality, its self-love, is fused with objective reality—thereby confirmed and made *real* (no longer only "imaginary")—but it is doomed to fail. (This is where Hegel went wrong. He was optimistic, but there is in fact no transcending of the self-distancing inherent in self-consciousness.)

So much for my third book (or selections from it). Now here's the introduction of my dissertation. I totally rewrote it for the book, so I'll put the original version here in order not to lose it. It's flawed, but I think it has merits.

Introduction

Mark Twain showed characteristic wisdom when he remarked, supposedly, that while history does not repeat itself, it rhymes. The most recent evidence for this thesis concerns the state of the world economy, the "fundamentals" of which are *not* "strong" (John McCain's erstwhile optimism notwithstanding). In many respects, the Great Recession of 2008–9 rhymed with the Great Depression of the 1930s, as political and academic commentators have pointed out.¹ Even more ominously, contemporary economic trends continue to rhyme with the trends that preceded and precipitated the Great Depression. All indications are that the world is headed for another such cataclysm, although of course it will not follow the contours of the last one. This grim prognosis is the reason I thought it would be worthwhile and timely to reconsider the experiences of the long-term unemployed in the United States—more specifically, in Chicago—in the Great Depression; for the ranks of our own unemployed are about to swell dramatically.

¹ E.g., Peter Temin, "The Great Recession and the Great Depression," National Bureau of Economic Research Working Paper No. 15645, January 2010, at <http://www.nber.org/papers/w15645>.

In the first chapter I parenthetically draw parallels between the political economy of the late 1920s and that of the present, but I'll make a few more remarks here. The central point is the old Keynesian one, which originally was the old socialist and Marxian one (until Keynes appropriated it and made it respectably bourgeois and mainstream): economic growth at a compound rate cannot continue indefinitely when aggregate demand is weak. David Harvey said it well in 2010, in the thick of the Great Recession: "A synoptic view of the current crisis would say: while the epicentre lies in the technologies and organisational forms of the credit system and the state-finance nexus, the underlying problem is excessive capitalist empowerment vis-à-vis labour and consequent wage repression, leading to problems of effective demand papered over by a credit-fuelled consumerism of excess in one part of the world [the West, especially the U.S.] and a too-rapid expansion of production in new product lines in another [e.g., much of Asia]."¹ The problem of excessive capitalist empowerment and consequent wage repression remains, and is essentially the problem of the late 1920s, when American Communists, among others, were predicting an economic collapse on the basis of old "underconsumptionist" and "overproductionist" arguments.

Wherever one looks, one finds parallels between the past and the present. The explosion of consumer credit in the late 1920s (mentioned in the following chapter) has been dwarfed by the explosion of credit since the 1980s—an explosion necessary because of the broad-based stagnation and decline of American workers' income over the same period. But expansion of credit with no corresponding expansion of income cannot continue indefinitely, as the economic collapses of 1929 and 2008 showed. Since the Great Recession ended, income inequality in the U.S. has continued to rise, as it did in the 1920s: for example, between 2009 and 2012, the top 1 percent captured 95 percent of total income growth. As before the Depression, unproductive speculation on the stock market, sustained by financial bubbles, has in the last 40 years become an increasingly favored form of investment by the titans of capitalism, even as deindustrialization has left millions of Americans without stable work and is contributing to the erosion of the middle class. Organized labor has suffered enormous defeats since the 1970s, as it did in the 1920s, to the point that union density in the private sector is now what it was in 1930 (a little less than 7 percent). And so on and on one can list the parallels—the pathologies.²

In short, there is every reason to believe that we're entering an era of prolonged economic stagnation punctuated by crisis, an era structurally analogous (in some ways) to the Great Depression. The obvious question, then, is—What can we learn from the past about how the future will unfold, and about how we can make the future unfold in a *positive* way? This being an academic work of history, I will not discuss these questions much in the body of the work. I have already done so, in any case, in another book, *Worker Cooperatives and Revolution: History and Possibilities in the United States* (2014), where I also show how a few revisions to the doctrines of orthodox Marxism can and should inform, in interesting and productive ways, the strategies of left-wing activists in the 21st century. Nevertheless, I hope that this dissertation at least indirectly illuminates our current historical moment, with regard both to its dominant features and to the possibilities that lie dormant within it.

Much has been written about the history of the unemployed in the United States—although perhaps not as much as one would think, given the importance of the topic. One of the most notable studies is Alexander Keyssar's *Out of Work: The First Century of Unemployment in Massachusetts* (1986), a pioneering social history of the nineteenth and early twentieth centuries that includes discussion of politics, organized labor, "spontaneous" collective action by the jobless, and ways that people coped with losing their livelihood. While only a few pages are devoted to the 1930s, the implicit recognition throughout the

book of the agency and dignity of people who suffered the ignominy of unemployment is something I have tried to emulate in this study, even to emphasize.

One reason Keyssar does not discuss the Great Depression at length is that so much had already been written about it. Well-known books by Arthur Schlesinger, Jr., William Leuchtenburg, Lester Chandler, Irving Bernstein, Robert McElvaine, and many others had flooded light on the plight of the unemployed in those years, while far less was known about the century preceding the 1930s. On the other hand, much of the earlier scholarship had been rather dismissive of the jobless, treating them as basically passive, apathetic, and apolitical.¹ It showed little interest in “ordinary people” on their own terms, in reconstructing their lives and struggles and thoughts, instead making sweeping, and sometimes unflattering, generalizations about them. Of course, since this scholarship was usually national in scope and focused on the most important political and institutional currents of the Depression, it could hardly be expected to do justice to the variegated tapestry of people’s experiences. Local studies would be better adapted for that.

One such work is Joan M. Crouse’s *The Homeless Transient in the Great Depression: New York State, 1929–1941*, published in the same year as Keyssar’s book. This is an exemplary study of one category of the homeless unemployed, which reconstructs not only the dynamics of the state’s relief administration—and the effects of its partial dismantling in late 1935—but also the experiences and attitudes of both transients and the public as it related to them. The influence of the “new” (by now old) social history is evident in Crouse’s sympathetic treatment of that despised category the non-resident unemployed, in all their diversity and frustrated dignity. Indeed, by the 1980s and ’90s one is hard-pressed to find historical scholarship that does not valorize the experiences of “ordinary people” to the same degree that they were devalued in an earlier time.

The work of James Lorence, for example, takes seriously the organizing of the unemployed that went on throughout the 1930s, instead of dismissing its significance as some earlier histories had. However, Lorence focuses not on the rank and file of the movements but on the most prominent activists and institutions that led the organizing. Thus, in *Organizing the Unemployed: Community and Union Activists in the Industrial Heartland* (1996), he gives “an exhaustive analysis of the Michigan unemployed movement in all its phases and expressions” from the early Depression to the Second World War, but an analysis primarily of institutional activities and interrelations—between local and state governments, left-wing political parties, unemployed organizations, and industrial unions such as the UAW (which by 1937 was heavily involved in organizing the jobless).² Social history is largely absent. Likewise, in *The Unemployed People’s Movement: Leftists, Liberals, and Labor in Georgia, 1929–1941* (2009), Lorence is concerned mainly with the activities of leaders and institutions, although he does devote considerable space to discussion of race relations and the tribulations of African-Americans. He also more explicitly argues than in his book on Michigan that “the presumably inarticulate gained a voice” and effectively pressured authorities. “[T]he Depression crisis,” he states, “taught the unemployed to combine to speak with one voice; and the result was an increase in governmental responsiveness under pressure from below.”³ This is quite a different emphasis from that of earlier “top-down” scholarship.

For instance, one might contrast it with two articles written decades earlier, one by Daniel J. Leab and the other by John Garraty. The first, published in 1967 and titled “‘United We Eat’: The Creation and Organization of the Unemployed Councils in 1930,” has valuable information on how the Communist Party organized the jobless, how Unemployed Councils were structured, and what Communists thought of their successes and failures in rousing the public, but it takes a somewhat condescending perspective toward the jobless, treating them as little more than a semi-apatetic mass that had to be organized from the outside. Garraty’s article, published in 1976 and titled “Unemployment during the Great Depression,” has a different and broader focus but shares the “condescending” attitude of Leab’s. In brief, Garraty relies on novelists of the day, reporters, autobiographical accounts, and sociological studies to argue (in part) that the vast

¹ I give examples at the beginning of chapter three.

majority of the unemployed in Europe and the U.S. were demoralized, politically passive, hopeless, and ashamed of their unemployment. After a paragraph in which he acknowledges that many protests did occur, he concludes that they were “sporadic, unfocused, and to a considerable extent merely rhetorical.”¹ Such an interpretation, while doubtless partly true, can certainly be contested as an oversimplification; and I do so contest it in chapter six.

An exception among pre-1980s scholarship is that of Roy Rosenzweig, who in the 1970s wrote a series of articles on Depression-era activism among the Communists, Socialists, and Musteites. The content of his three essays is clear from their titles: “Radicals and the Jobless: The Musteites and the Unemployed Leagues, 1932-1936,” “Organizing the Unemployed: The Early Years of the Great Depression, 1929-1933,” and “‘Socialism in Our Time’: The Socialist Party and the Unemployed, 1929-1936.” Like Leab, he is more concerned with the organizers and the institutions they helped form than with rank and file members; however, he paints a nuanced and sympathetic picture of the latter that attributes more agency to them than most previous historians had. He flatly rejects William Leuchtenburg’s judgment (in *Franklin D. Roosevelt and the New Deal*) that “most of the unemployed meekly accepted their lot,” insisting on the contrary that “the jobless employed a number of spontaneous survival strategies such as informal and formal cooperative movements, family and neighborhood networks of assistance, individual and group looting of supermarkets, coal bootlegging, determined searches for work, and innovative stretching of income.”² His articles substantiate this point in relation to political and semi-political activities, by showing that in many cases it was the ordinary members of the Unemployed Councils, Workers’ Committees, and Unemployed Leagues who pressed for more radical action and even had to be restrained by the ideological leftists. In Chicago, the Workers’ Committee quickly came under the control of the grassroots unemployed, who founded dozens of locals with thousands of members all over the city; and the same was true, though perhaps to a lesser extent, of the Unemployed Councils.

On the whole, then, it is not hard to find historical scholarship that discusses the unemployed in the Depression. Two works on Chicago must also be mentioned: Randi Storch’s *Red Chicago: American Communism at its Grassroots, 1928–1935* (2009), which has some material on Communist organizing around relief policies, eviction fights, and police brutality, and Lizabeth Cohen’s *Making a New Deal: Industrial Workers in Chicago, 1919–1939* (1990), which has a chapter on how local institutions such as benefit societies, building and loan associations, churches, and welfare-capitalist employers ultimately failed to protect the unemployed from the ravages of economic collapse, causing them to turn to the federal government and the New Deal. However, it should be evident by now that virtually none of the historiography takes a direct and sustained look, over the entirety of the Depression decade, at the social history of the long-term unemployed, which is what interests me. Certainly it does not do so with regard to Chicago, as a local study. This strikes me as a rather gaping gap in the literature, a gap that ought to be closed. Whether I have successfully done so in this dissertation is for the reader to judge.

One might ask, however, why this “gap” in the historiography is something to be closed in the first place. What is there to be learned by a history of the experiences, the survival strategies, and the various modes of resistance of “the unemployed” in Chicago in the Depression? On one level, the answer is the same one that can be given as regards any piece of historical writing: it fills in details, adds to our fund of knowledge, makes interpretive connections that have not necessarily been made before. Not all scholarly perspectives or agendas are very interesting, but they do, at least, present information that can be used by other writers.

But of course one wants more than that bare minimum. And one wants more than merely the fact that the U.S. currently has such a bleak economic future that analyses of the 1930s will soon be of particular interest again. What one wants are arguments that challenge conventional patterns of thought (or scholarship) and portray history in a new light. So the question here is, what are the conventional patterns of thought that I want to challenge?

¹ John Garraty, “Unemployment during the Great Depression,” *Labor History*, vol. 17, no. 2 (Spring 1976): 152.

² Roy Rosenzweig, “Organizing the Unemployed: The Early Years of the Great Depression, 1929–1933,” *Radical America* 10 (July–August 1976): 38.

Social history since the 1970s has done much to counteract posterity's "enormous condescension" towards the forgotten masses by reconstructing their lives, their agency, to some extent restoring the dignity that the dominant society denied them in life and later in death. Numberless works have followed in the democratic and humanistic spirit of E. P. Thompson's *The Making of the English Working Class* (1963), showing how people found ways to resist, even to construct their own relatively autonomous subcultures. This vast scholarly project, however, has arguably not gone far enough, in at least two respects. First, as I've said, there has still not been enough attention to the huge and socially significant category of the long-term unemployed in all periods of U.S. history. Instead, there are works on other subjects that, at most, overlap with unemployment; or there are works that address unemployment in one chapter and then move on to some other topic. But unemployment has been such a central part of the history of capitalism—being one of the most widely shared, and most debilitating, of experiences—and is so integral to an understanding of the system's functioning, that it deserves a whole literature of its own, not just in public policy but in social history too.

Perhaps more importantly, historians have not really plumbed the depths of people's opposition to the dominant society. A virtual library of historiography has been written on the subject of explicit political and economic resistance, especially in the form of labor unions and social movements, but more can still be said about subtler types of resistance and nonconformism. In particular, the anti-capitalist and anti-authoritarian dimensions of people's behavior and thoughts can be further explored. If capitalism means private ownership of the means of production, private control (by the owners or their representatives) over the workplace, production for the single purpose of accumulating profits that are privately appropriated by the owners, and such tendencies as ever-increasing privatization of society (an outgrowth of capital owners' extension of their control and ownership to ever more social domains), the mediation of more and more human interactions through market processes, and commodification of increasingly many things, including human labor-power, nature, ideas, and public goods like education and health care—all of which tendencies have become increasingly pronounced in recent centuries, except when held in check by popular movements or other countervailing forces¹—then it can be shown that the vast majority of people have, in various ways and often even unknowingly, opposed it. Much of labor history, of course, has this implication, though it is not always made clear. Thus, I think historians should do more to show the extent to which people are ambivalent, even hostile, towards dominant institutions, practices, ideologies, and values. This anti-Gramscian emphasis is one of the guiding themes of my dissertation.

On the most basic level, for instance, everyone acts in a rather "communistic" way, as the anthropologist David Graeber points out.² Even corporate executives, not to mention people less integrated into market structures, ordinarily act according to what Graeber calls "baseline communism." For, if communism means "from each according to his abilities, to each according to his needs" (as Marx defined it), then it simply means sharing, helping, and cooperating—giving to others in need what you're able to give them, even if it is only advice, assistance at some task, sympathy or emotional support, or some money to tide them over. Friends, coworkers, relatives, lovers, even total strangers constantly act in this way. In this sense, in fact, "*communism is the foundation of all human sociability*"; it can be considered "the raw material of sociality, a recognition of our ultimate interdependence that is the ultimate substance of social peace," as Graeber says. Society is held together by this dense anti-capitalist fabric, into which the more superficial patterns of commercialism, the profit motive, and greed are woven. One might even reverse the typical judgment of apologists for capitalism: not only is capitalism not a straightforward expression of human nature (supposedly because we're all naturally greedy, as a Milton Friedman or a Friedrich Hayek might say); it is more like a perversion of human nature, which is evidently drawn to such things as compassion, love, community, respect for others, and free self-expression unimpeded by authoritarian rules in the economic or political sphere. Capitalism is parasitic on "everyday communism," which is but a

manifestation of human needs and desires. In short, insofar as there is a “hegemony” of capitalist culture and ideology at all, simple reflections such as these—even apart from historical analysis—already show that it must be quite superficial compared to the underlying substratum of human sociality, which expresses itself in frequently anti-capitalist and anti-authoritarian ways in every moment of the day.

Everyday communism, however, has historically been especially pronounced among the lower classes—the peasantry, industrial workers, struggling immigrants, the petty-bourgeoisie—who have relied on it for survival in hard times and even in normal times, and who, moreover, have not been as deeply integrated into commercial structures and ideologies as the elite has. Social history has done much to illuminate the “communism” (without calling it that) of the American working class during its many formative decades, through description of the thick networks of voluntary associations that workers, especially immigrants, created among themselves, and of the “mutualist” ethic to which they subscribed in the context of their battles with employers, and of the vitally *public* character of their shared culture up to at least the 1940s.¹ All this was very much anti-capitalist and anti- the dominant ideologies of the day, whether individualism, the “open shop” idea, Social Darwinism, or imperialistic nationalism. The long-term unemployed have tended to be ignored in this historiography, so in the third chapter I try to show in what respects they, too, acted in communistic ways. For unemployment did not produce only atomization, as is commonly supposed; it also gave rise to the opposite, community. And that is what is most interesting to study.

The Gramscian notion of hegemony—which James C. Scott defines as the idea that “class rule is effected not so much by sanctions and coercion as by the consent and passive compliance of subordinate classes”²—has been criticized repeatedly and should, I think—if watered down from this strong formulation—be relegated to the status of little more than an important qualification to the truths of a “vulgar Marxism” that assigns overwhelming explanatory power to brute economic and political coercion, and to *interest*—primarily class-determined—rather than *values* or *consciousness* (which tend to reflect economic position). Before defending this statement, however, and elaborating on its relation to my dissertation, I want to make a suggestion that pertains to “bottom-up” social history as a whole, to its very *raison d’être*. To my knowledge, the radical political scientist Thomas Ferguson’s challenge, in 1995, to social historians has never met with a response:

Perhaps in reaction to the last generation of “consensus historians,” many recent studies of American history make a determined effort to discuss the often very painful daily-life experiences of ordinary people. This research has produced many significant works that amount to a powerful indictment of conventional pluralist theories of American politics. But while I am totally in sympathy with efforts to “assert the dignity of work,” “reveal the thoughts and actions of the rank and file,” or show ordinary people as “active, articulate participants in a historical process,” and similar aims, I am very skeptical about this literature’s frequent unwillingness and inability to come finally to a point. That ordinary people are historical subjects is a vital truth; that they are the primary shapers of the American past seems to me either a triviality or a highly dubious theory about the control of both political and economic investment in American history.³

³ Thomas Ferguson, *Golden Rule: The Investment Theory of Party Competition and the Logic of Money-Driven*

In other words, why do we do social history in the first place? What are the general truths we are trying to establish? Admittedly, there need not be such truths at all. The project of unearthing the lives and thoughts of people whom history has tried to bury in oblivion—the “voiceless toilers” from time immemorial, upon whom have been built great civilizations that “despised them and [have done] all [they] could to forget them,” to quote G. E. M. de Ste. Croix¹—is an intrinsically noble endeavor, a kind of moral crusade to be waged for its own sake. It would be nice, though, if there were also certain truths we were trying to illustrate in our reconstructions and analyses.

It seems to me that there is one such truth above all, which is implicit in much historiography but ought to be made explicit: the Gramscian idea of hegemony, as defined a moment ago, is wrong. Any emphasis on consent, consensus, culture, ideology, shared values, “discourses,” or some such concept as being what secures the obedience of the lower classes and so explains the perpetuation of a given society is at best highly misleading. If labor history, blood-sodden, conflict-saturated, shows anything at all, it shows that. This, I think, is the best answer to Ferguson’s question about the overarching purpose or implication(s) of this type of social history. The point is not that ordinary people are the primary shapers of the past, for, as Ferguson says, this is either a truism or completely wrong (since surely the economic and political elite, which possesses incomparably the most resources, has more direct power than “ordinary people” over the paths that history takes). But the anti-Gramscian point is both substantive and true, as I’ll argue presently. It has the merit, moreover—if explicitly emphasized by historians—of elevating bottom-up social history to an even higher moral level, for it implies that people are not mere receptacles for propaganda, slavish beings with easily inscribable *tabula rasas* for minds, but rather have to be *coerced* into a subordinate status because of their essentially independent and freedom-loving nature. Thus, to the degree that historians reject the tendency of thought known as Gramscianism and embrace a more traditional Marxian view that highlights struggle, the use of force, violence, the conflict between rich and poor, and the soft compulsion of institutional structures, they can pride themselves on their knowledge of serving both morality—or, better, “humanism,” a belief in the inherent dignity of all people—and truth. If, that is, they accept the following arguments.

First, I must point out that even though it is not necessarily common in recent historiography to bandy about such notions as cultural hegemony or consent or the masses’ ideological submission to their masters—and so this whole fuss I’m making about the Gramscian tendency of thought might seem pointless or dated—in fact the methods of some postmodern scholarship tend to imply an idealism much more extreme than that of Gramsci (who was, after all, a Marxist). While this is not the place for a sustained critique of postmodernism,² it is relevant to observe that the postmodern fixation on discourses, language, “vocabularies,” culture, “society’s imaginary,” and subjective identities, as opposed to objective class structures, institutional relations, class struggle, control over the means of producing wealth and of physical coercion, has implications that are more Gramscian than Gramscianism itself. For, to the extent that one emphasizes phenomena of ideology and consciousness as explicating the nature of social dynamics, one implies that people’s subordination to the powerful is a product either of (1) their conscious choice, (2) their being too incompetent to rise through their own individual efforts into the ranks of the elite, or (3) their being brainwashed by culture and dominant ideologies. To the degree that one denies the primacy of economic structures in determining social relations, preferring the idealistic mode of explanation, one is forced to invoke such unattractive options in order to explain inequalities of power. This fact is ironic, since one of the guiding ideals of postmodern historians is their recognition of the agency and dignity of ordinary people (by, for example, relating, without judgment, how people see themselves and interpret their

Political Systems (Chicago: University of Chicago Press, 1995), 96.

actions).¹ Being unaware of the logical implications of their idealistic perspective, they are unaware that the interpretation that attributes most rationality and dignity to people is a Marxism that treats idealist considerations as little more than an important afterthought.

Postmodernism, however, is but the most recent manifestation of the idealism that has always afflicted mainstream intellectual culture, even back to the Enlightenment—or rather back to antiquity, when Plato viewed the world as consisting of shadows of ideal Forms, Hindus and Buddhists interpreted it in spiritual terms and as being somehow illusory, and Stoics were telling “the slave in the mines that if he would only think aright he would be happy.”² Such idealism is no surprise, since people (intellectuals) whose institutional function is to produce words and ideas are naturally going to think that words and ideas are of exceptional importance, and that bodily needs and processes of material production are vulgar and uninteresting. Moreover, from a Marxian perspective it makes perfect sense that mainstream intellectuals would propagate ideologies that distract from class struggle and class structure, because the dominant interests in society—viz., wealthy individuals and institutions, which are dominant because they have the most control over the most resources—are not going to support, and indeed will try to suppress, interpretations that draw attention to their wealth and power by showing how it operates, how it has been acquired, and how it is inversely related to the power of ordinary people. In other words, a materialist analysis that foregrounds class conflict and the exploitation of subordinate classes threatens the given distribution of power, so it will incur the wrath of the powerful and will tend to be “filtered out” of intellectual institutions.³ “Politically neutral” or idealist scholarship, unchallenging to the wealthy, will therefore predominate. One recalls that before the reign of postmodernism there was the reign of the liberal consensus school of historians such as Louis Hartz, Arthur Schlesinger Jr., Oscar Handlin, and Daniel Boorstin, a school that makes one think of a bourgeois version of Gramscianism in its emphasis on the socially cohering force of a relative consensus of values among all classes.⁴ Thus, “the fashionable theory of economic nondeterminism” of politics and society about which Gabriel Kolko complained in the 1960s has in fact been fashionable since at least the 1940s, and will probably continue to be so until class-based social movements again reach the level they attained in the 1930s.⁵

In defense of the Marxism that guides this dissertation, a few general statements may be offered. The explanatory primacy of class over other variables can be established on simple *a priori* grounds, quite apart from empirical sociological or historical analysis. One has only to reflect that access to resources—money, capital, technology—is of unique importance to life, being key to survival, to a high quality of life, to political power, to social and cultural influence; and access to (or control over) resources is determined

¹ See, e.g., Lisa McGirr, *Suburban Warriors: The Origins of the New American Right* (Princeton: Princeton University Press, 2001), and Bethany Moreton, *To Serve God and Wal-Mart: The Making of Christian Free Enterprise* (Cambridge: Harvard University Press, 2009). Needless to say, good “postmodern” scholarship, like Moreton’s, tempers its focus on subjectivity and ideology with attention to economic context and the overwhelming power of big business. I am commenting only on *tendencies* that I see as problematic.

² W. W. Tarn, *Hellenistic Civilisation* (London: Edward Arnold & Co., 1927), 298.

³ There are many examples of intellectuals whose careers have been damaged or destroyed because of their radical scholarship. In one egregious case, Thomas Ferguson was denied tenure at MIT explicitly because of his materialist writings. See Peter Mitchell and John Schoeffel, eds., *Understanding Power: The Indispensable Chomsky* (New York: The New Press, 2002), 243.

⁴ The radical historian Jesse Lemisch devastatingly criticized this school in his 1969 paper “Present-Mindedness Revisited: Anti-Radicalism as a Goal of American Historical Writing Since World War II,” published in 1975 (as *On Active Service in War and Peace: Politics and Ideology in the American Historical Profession*) by an obscure independent press because it was too left-wing to make it into establishment journals.

⁵ The quotation is from Gabriel Kolko, *The Roots of American Foreign Policy* (Boston: Beacon Press, 1969), 81. A recent example of such economic nondeterminism is Odd Arne Westad’s highly regarded book *The Global Cold War: Third World Interventions and the Making of Our Times* (New York: Cambridge University Press, 2005), which argues, implausibly, that “the United States and the Soviet Union were driven to intervene in the Third World by the *ideologies* inherent in their politics” (my italics), rather than by economic and strategic considerations of power. Kolko’s and Walter LaFeber’s works are excellent correctives to the liberal idealism of a Westad.

ultimately by class position, one's position in the social relations of production. The owner of the means of production, i.e. the capitalist, has control over more resources than the person who owns only his labor-power, which means he is better able to influence the political process (for example by bribing politicians) and to propagate ideas and values that legitimate his dominant position and justify the subordination of others. These two broad groups of owners and workers—an analytic classification that, of course, simplifies and abstracts from the complexities of the real world in order to create a model that can facilitate understanding—have opposing interests, most obviously in the inverse relation between wages and profits. This antagonism of interests is the “class struggle,” a struggle that need not always be explicit or conscious but is constantly present on an implicit level, indeed is constitutive of the relationship between capitalist and worker. The class struggle—that is, the structure and functioning of economic institutions—can be called the foundation of society, the dynamic around which society tends to revolve, because, again, it is through class that institutions and actors acquire the means to influence social life. Marx was therefore right to contrast—albeit in metaphorical and misleading language—the economic “base” with the political, cultural, and ideological “superstructure.”¹

It may be of interest to note, incidentally, that Marx was far from the first writer to prioritize class struggle. Aristotle's *Politics* already has a definitely materialistic bias, treating it as a truism that “class” (to use an anachronism) is of foundational significance to society. More recently, James Madison was, in essence, a proto-“historical materialist,” as is clear from his famous *Federalist No. 10*:

[T]he most common and durable source of factions [he writes] has been the various and unequal distribution of property. Those who hold and those who are without property have ever formed distinct interests in society. Those who are creditors, and those who are debtors, fall under a like discrimination. A landed interest, a manufacturing interest, a mercantile interest, a moneyed interest, with many lesser interests, grow up of necessity in civilized nations, and divide them into different classes actuated by different sentiments and views.

Charles Beard went so far as to say that *The Federalist* “is in fact the finest study in the economic interpretation of politics which exists in any language; and whoever would understand the Constitution as an economic document need hardly go beyond it.”² The quotation from Madison indicates that, strictly speaking, the idea of class conflict denotes more than just the conflict between worker and capitalist (or master and slave, etc.); it extends to conflicts between economic subdivisions of the dominant class(es). In the dissertation, however, I disregard this extension of the concept, since it is of little relevance to my subject.

An enormous amount of scholarship shows the explanatory power of the Marxian framework that uses class, or class struggle, to understand the world.³ Even ideologies of race, nation, and gender are largely

¹ The base/superstructure controversy has spawned an entire literature, but the previous sentence in the text is really all that's needed to end the controversy and establish the meaning and validity of the Marxian metaphor. *Of course* the economy is the “base” and everything else the “superstructure.” After all, culture and politics and ideologies are not somehow the product of spontaneous generation; they are brought into being by particular actors and institutions. And in order to bring into being the forms and content of a culture and politics, one needs resources. The production and distribution of resources, in particular material resources, takes place in the economic sphere. So, the way that resources are allocated according to economic structures—who gets the most, who gets the least, etc.—will be the key factor in determining, broadly speaking, the forms and content of a given culture and politics. The interests of the wealthy will tend to be disproportionately represented. —In the entire literature (not all of which I've read), I don't recall ever encountering this simple and decisive, commonsensical argument.

a product of class—of slavery and its aftermath in the U.S., of European imperialism, of attempts by the Victorian upper class to control working-class women’s lives and sexuality.¹ In the case of religious fundamentalism in the U.S., for example, historians have shown that since early in the twentieth century, and especially since the 1970s, conservative sectors of the business community have subsidized right-wing evangelical Christianity in order to beat back unionism and liberalism, which have been tarred and feathered as communist, socialist, godless, etc.² More generally, for centuries the ruling class (which is to say the aggregate of those who occupy the dominant positions in a society’s dominant mode of production, and so have shared interests) has propagated divisive ideas of race, ethnicity, religion, nationality, and gender in order, partly, to fragment the working class and so control it more easily and effectively. It is true, again, that such arguments—that all Marxist or “economistic” arguments—simplify, abstracting from complicating factors; and mainstream scholars typically consider this fact to be a weakness of Marxism, a sign of unsophistication. The pejorative label “reductivism” is flung at any argument that explains a set of phenomena in economic terms, especially in terms of class struggle. Somehow, it is considered an intellectual *vice*, and not a *virtue*, to *simplify* for the sake of *understanding*. After all, the world is a complex place, and in order to understand it one has to simplify it a bit, explain it in terms of general principles. As in the natural sciences, a single principle can never explain *everything*; but, if it is the right one, it can explain a great deal.

Since this is an important point for my dissertation, which gives pride of place to class struggle, it deserves a more extensive defense than the preceding three sentences. I will yield here to Noam Chomsky, whose eloquence is unsurpassed. The following is an excerpt from an interview:

Question: But you're often accused of being too black-and-white in your analysis, of dividing the world into evil élites and subjugated or mystified masses. Does your approach ever get in the way of basic accuracy?

Answer: I do approach these questions a bit differently than historical scholarship generally does. But that's because humanistic scholarship tends to be irrational. I approach these questions pretty much as I would approach my scientific work. In that work—in any kind of rational inquiry—what you try to do is identify major factors, understand them, and see what you can explain in terms of them. Then you always find a periphery of unexplained phenomena, and you introduce minor factors and try to account for those phenomena. What you're always searching for is the guiding principles: the major effects, the dominant structures. In order to do that, you set aside a lot of tenth-order effects. Now, that's not the method of humanistic scholarship, which tends in a different direction. Humanistic scholarship—I'm caricaturing a bit for simplicity—says every fact is precious; you put it alongside every other fact. That's a sure way to guarantee you'll never understand anything. If you tried to do that in the sciences, you wouldn't even reach the level of Babylonian astronomy.

I don't think the [social] field of inquiry is fundamentally different in this respect. Take what we were talking about before: institutional facts. Those are major factors. There are also minor factors, like individual differences, microbureaucratic interactions, or what the President's wife told him at breakfast. These are all tenth-order effects. I don't pay much

attention to them, because I think they all operate within a fairly narrow range which is predictable by the major factors. I think you can isolate those major factors. You can document them quite well; you can illustrate them in historical practice; you can verify them. If you read the documentary record critically, you can find them very prominently displayed, and you can find that other things follow from them. There's also a range of nuances and minor effects, and I think these two categories should be very sharply separated.

When you proceed in this fashion, it might give someone who's not used to such an approach the sense of black-and-white, of drawing lines too clearly. It purposely does that. That's what is involved when you try to identify major, dominant effects and put them in their proper place.¹

Karl Kautsky said something similar when he wrote, in *Foundations of Christianity*, “[T]he task of science is not simply a presentation of that which *is*, giving a faithful photograph of reality, so that any normally constituted observer will form the same image. The task of science consists in observing the general, essential element in the mass of impressions and phenomena received, and thus providing a clue by means of which we can find our bearings in the labyrinth of reality.”²

Likewise, Jean Jaurès wrote in his classic history of the French Revolution, “In every order of questions, in every order of facts we must attempt to draw out the most general idea. We must seek the largest and simplest concept under which we can group the greatest number of orders and objects, and we will thus little by little extend our net over the world... In all times and places, under the infinite and overwhelming diversity of particular facts, science through a daring operation perceives and draws out a few decisive and profound characteristics. And it is this clear and relatively simple idea that it tests and develops through observation, calculations, and by the ceaseless comparisons of the extension of the act and the extensions of the idea.”³ This is the method of the true scientist, both the natural and the social scientist.

The postmodern academic agenda of “problematizing” “narratives”—especially “meta-narratives” like the Marxian approach to history—has had many salutary consequences for our understanding of the world. Simplifications often *are* superficial. But not always: sometimes they are much deeper than the “complications” that scholarship revels in, which distract from essential general insights into how power works, and how class is the basis for the institutional infrastructure that regulates social behavior. Just as it is of little interest to problematize for the sake of problematizing—as is done all too frequently—so the mainstream scholarly aversion to general truths, to generalities as such, is wrong.

The class-focused perspective in fact allows us to understand how the approach to history that heeds only the *particular* and not the *general*—the *exception* at the expense of the *rule*—could have become dominant in the first place. It has to do with how postmodernism itself—i.e., an emphasis on the particular, the fragmented, the single exception, and the subjective, the imagistic, the discursive, the self-interpretations of actors (as if self-interpretations are always correct and not usually deceived)—could have become the reigning paradigm in the humanities. The key, to repeat, is that this approach to writing history does not challenge the dominant interests in society, the main power-structures, the “ruling class” in traditional Marxian language, so it will be allowed and encouraged to proliferate. The explanation of postmodern particularism—“every fact is precious; you put it alongside every other fact”—really is similar to the explanation of its idealism. Again, regarding the idealism: the reason someone like Foucault could become an inspiration for mainstream scholarship is that his works attend to everything except class:

discourse, knowledge, consciousness, the body, the state.¹ Such anti-Marxism, being politically safe, is always good for having a stable and successful career, especially in a time (post-1970s) when organized labor is on the decline, such that there is no powerful political constituency to subsidize and promote materialist scholarship. Foucault was appropriate to a time when big business was decimating labor, the rise of feminism was turning cultural attention to the body and sexuality, conservative ideological attacks on the overweening power of “big government” made it appropriate for intellectuals to study the history of the state’s attempts to control “discourses,” etc. To many intellectuals, class struggle seemed to have disappeared. Of course, this perception was only a symptom of the *intensification*—and *triumph*—of class struggle on the capitalist side and its substantial defeat on the labor side.²

In a similar way, the historiographical agenda to problematize Marxian common sense by treating class as merely a “social construct,” a subjective identity not different in kind from gender or race or sexuality, as if objective institutional structures do not exist—and so arguing that Marxian explanations are “unsophisticated” because of all the little factors they ignore—is essentially just a way of enforcing mainstream ideologies and thus serving the masters, the corporate sector and wealthy university donors, most of whom certainly do not want general truths about class, wealth, and power to be propagated. Scholars may not be aware of these facts or have such motivations in mind when ignoring class or criticizing its analytic prioritization, but this is the effect that doing so has, and this is the main institutional function of postmodern intellectual agendas.

As a result, I depart from academic orthodoxy in this dissertation, preferring to illustrate general truths about the conflict between (relatively) rich and (relatively) poor that roughly determines social dynamics. I am interested in the particular less for its own sake than for its broader implications. The foregrounding of class at times gives the book a polemical tone, as in some passages on the service that Chicago’s police force regularly rendered the business community, but it is a logical fallacy to think that a slightly polemical tone indicates that a work has abandoned the “disinterested” pursuit of truth in favor of advancing a political agenda. For one thing, “tone” can always be separated from the actual arguments that are made: e.g., in the case of Chomsky’s writings, the morally outraged tone does not entail that the facts he unearths and the arguments he makes are false. Secondly, it simply happens to be the case that certain truths about how the world works are not morally acceptable, so that by describing them, even in neutral language, one cannot avoid giving the impression of partisanship. There is no reason, after all, to think that the revelation of historical truth must necessarily shine a positive light on the rich and powerful. The contrary would be more likely to be the case. Therefore, it is far from being a counterargument to left-wing writing such as Chomsky’s or Howard Zinn’s or Gabriel Kolko’s that it seems partisan or polemical, for this is what one would expect of a true description of a world in which power is concentrated in the hands of a small elite that, quite rationally, pursues its own interests. Indeed, from this perspective, the *lack* of a partisan tone in most mainstream scholarship suggests (though does not entail) it has not penetrated to essential truths about how society works.³

¹ To see how explanatorily impoverished, even confused, such a scholarly focus is compared with the focus on class, contrast Foucault’s famous *Discipline and Punish* with the Marxist classic *Punishment and Social Structure* (1939), by Georg Rusche and Otto Kirchheimer. While the latter *explains*, the former merely *describes* (badly and obscurely).

In short, I think it is time for historians to, in some respects, problematize the ceaseless problematizing and return to basics. Which means returning to a non-Gramscian Marxism, or at least a Marxism that relegates considerations of culture and hegemony to a decidedly subordinate place. Many arguments can be given in favor of this type of Marxism, and many have been given, especially in a book published in 1980 called *The Dominant Ideology Thesis*, by Nicholas Abercrombie, Stephen Hill, and Bryan Turner. This book is essential reading for a just evaluation of the Gramscian concept of hegemony, and I cannot hope to reproduce even a fraction of its arguments here. One should also read the last chapter of James C. Scott's classic *Weapons of the Weak* (1985), which builds on the analysis given in the earlier book. In the following I will sketch only a few general arguments, after which I will discuss the 1930s in relation to a paper that presents a perspective different from my own: Melvyn Dubofsky's well-known and provocative "Not so 'Turbulent Years': A New Look at the 1930s," published as a chapter in a book edited by Charles Stephenson and Robert Asher called *Life and Labor: Dimensions of American Working-Class History* (1986). Last, I'll provide a brief summary of each chapter in the dissertation.

The first point to be made is that the foundation of social order is, in fact, violence and the threat of violence. Perry Anderson makes the point by imagining what would happen if the threat vanished. While a kind of consent may ordinarily prevail in our society, it is "constituted by a silent, absent force...: the monopoly of legitimate violence by the State. Deprived of this, the system of cultural control would be instantly fragile, since the limits of possible actions against it would disappear."¹ One can imagine how differently people would behave if there were no police force or military or security guards or prisons. Surely the poor and even many in the middle class would quickly overrun the property of the rich—neighborhoods, banks, mansions—and take what they could, or distribute it among themselves. This fact already suggests that most people's ordinary "consent" to the system of rule that exists is basically *prudential* and not ideological, not an indication that they think prevailing hierarchies are legitimate. Later I quote unemployed men in the Depression who had no moral compunctions whatever about stealing, refraining from doing so only because of the possible consequences to their families and themselves.

The threat of state-sanctioned violence is so ubiquitous that we hardly ever notice it or stop to think about it. It hovers over even the hallowed groves of academe, seemingly so peaceful and idyllic. David Graeber muses on the fact that "graduate students [are] able to spend days in the stacks of university libraries poring over Foucault-inspired theoretical tracts about the declining importance of coercion as a factor in modern life without ever reflecting on the fact that, had they insisted on their right to enter the stacks without showing a properly stamped and validated ID, armed men would have been summoned to physically remove them, using whatever force might be required."² In any given context, if one doesn't behave in the proper way then one can expect violent repercussions. Violence is the ultimate arbiter—as generations of workers and activists have learned to their cost, and as the history of capitalism shows all too clearly. In a late capitalist society—hyper-bureaucratized, hyper-regimented, hyper-regulated³—it does not take long for young people to internalize this fact and, as they age, to adjust their behavior accordingly.

However, while the (unconscious) adjustment of behavior to conform with dominant social structures is in part determined by the ever-present threat and reality of violence, it is also determined simply by the "dull compulsion of economic relations," to quote Marx. And not only economic relations: *all* institutional relations. If one wants to participate in society, one cannot escape them. Speaking of capitalism, Max Weber observed that the economy "is an immense cosmos into which the individual is born, and which presents itself to him...as an unalterable order of things in which he must live. It forces the individual, in so far as he is involved in the system of market relationships, to conform to capitalistic rules of action."⁴ To survive, one has to get a job, cooperate with bureaucracies, buy the commodities on

⁴ Max Weber, *The Protestant Ethic and the Spirit of Capitalism* (London: Routledge, 1997 [1930]), 54.

offer, obey the dictates of certain authorities, in general conform. But this does not imply *endorsement* of the structures and values to which one must conform.

The three preceding paragraphs are sufficient to answer the old, “grand” sociological question of how societies manage to function when they are so riven by conflicts between groups and between individuals. For this purpose, it is not necessary to invoke ideologies or culture or hegemony or “false consciousness” at all. One has only to recognize that (1) the means of violence are overwhelmingly in the hands of the wealthy and those who (directly or indirectly) serve them, whose interest is in maintaining the given distribution of power, and (2) the dominant social structures have a “compulsory” dynamic of their own, even apart from the physical violence that is always on hand to back them up. Even if every member of the subordinate groups perfectly understood how he was exploited and dominated and saw through every mystifying element of the dominant culture, we can see how he would still be inclined to “fit in” in order to survive. Unless his oppression was unbearable, it would make perfect rational sense for him not to risk everything by overtly challenging the institutions that enforced his subordination. To an outside observer it might look as if he were a victim of false consciousness or viewed the system of inequality as legitimate and just—or, alternatively, were discontented but deplorably “passive” or “apathetic” or “apolitical”—when in fact he was merely a rational person with insight into the functioning of power and the probable consequences of flouting its authority.

Of course, most—or all—people in history, including most intellectuals and most members of the ruling class, have not had a scientifically lucid understanding of the world or a perfectly consistent and rational system of values and beliefs (if that is even possible). We are all brought up in a cultural and political environment opaque with myths, deceptions, rationalizations, legitimizing rituals, every technique of obfuscation imaginable. No one is impervious to such influences; we all, surely, have elements of incoherence and false or deluded consciousness in our (mostly unconscious) individual ideological framework. So it is necessary to consider the Gramscian question of consciousness, particularly in relation to subordinate classes.

Before continuing, however, it may be noted that there are senses in which this question is not very interesting. For one thing, people’s reports of their beliefs tend to be quite superficial, which makes it hard to draw conclusions from them about the “consciousness” of the masses. What someone says he believes—and even what he privately *thinks* he believes—is clearly context-dependent, stimulus-dependent, mood-dependent. In one moment, perhaps after hearing a conservative politician speak, he may think that “big government” is society’s main problem; in another moment, perhaps after hearing a progressive politician speak, he may think that government should regulate the economy much more aggressively, and that the country needs a single-payer national health insurance system. In one moment he may think that the government should nationalize “too-big-to-fail” banks, or even that all businesses should be owned and run by the people who work in them and not by investors or their representatives; in another moment he may think that such ideas are absurd and unrealistic. It is notorious that polling results depend on how questions are phrased.¹ In many cases, what people think they believe may be contradicted by their actions and by other statements of theirs. For example, millions of Americans might say that the free market should be the overwhelmingly dominant mode of social regulation even as they complain about the increasing costs of public education, the cost and inadequacy of private health insurance, the limited availability of public transportation, the limited number of public parks in their city, and so forth. In such cases it might be tempting to say they have a “divided consciousness,” but it is evident that what they really would like is a more extensive and better-funded public infrastructure, not a dismantling of public resources in favor of the market. It is only because the “free market” has acquired positive connotations in mainstream culture and politics that people might say they support the expansion of its range, not understanding what such support logically entails.

In general, people are far from having acute insight into what they believe and value; and both their “real” (often *implicit*, not explicit) and reported beliefs and values are far from being consistent with each

¹ Carl Bialik, “When Wording Skews Results in Polls,” *Wall Street Journal*, September 25, 2010.

other or over time.¹ Human consciousness is not exactly an exemplar of lucidity and (self-)honesty, as Marx, Nietzsche, and Freud understood (which is why they were less interested in consciousness as such than in uncovering its hidden grounds and determinants, the *hidden meaning* of conscious states). Self-deception is extraordinarily common, frequently taking the form of merely superficial or nominal adherence to a system of beliefs just because it is a socially accepted thing to believe in. When polls say that 71 percent of Americans in 2014 identified as Christian, what does that mean?² How does one interpret that finding? How many of these people consciously regulated their lives according to a Christian ideology, and how many used the label “Christian” without its having a perceptible effect on their behavior or values? How many would in fact reject most Christian doctrines, or ideas that have come to be associated with Christianity? One can ask comparable questions about people who consider themselves patriotic, or who say they believe in the “free-enterprise system,” or who identify as conservative (or liberal), etc. These sorts of questions, which challenge the meaningfulness of people’s reports of their values and beliefs, can pose problems for a Gramscian or idealistic type of analysis.

It is not even clear that most people have much in the way of determinate beliefs at all.³ And certainly it is doubtful that beliefs, to the extent that they exist, tend in and of themselves to be important regulators of behavior. The world consists, by and large, of pragmatists who do not ordinarily exhibit sustained interest in ideologies or abstract ideas, who may think about such things from time to time but then continue to participate in society in a pragmatic and realistic way, treating it (society) as more or less *given* even if they find many of its features absurd or repellent. We all must, to a large degree, accommodate ourselves to the world and live in it on *its* terms; that is part of what it means to become a mature adult. But such accommodation is a very weak form of “consent” indeed; for it is a consent into which we are *forced*, on pain of ostracism, physical starvation, and legal punishment. In a world of such extreme institutional obstacles to effecting change, it is sensible and natural for people to devote their energy to tasks of survival and recreation (through available, or “hegemonic,” channels like movie-watching, television, and spectator sports) rather than active political dissent or the crafting of considered opinions on issues of moment—even if, to repeat, at bottom they might believe society to be horribly unjust and in need of radical change.

Nevertheless, despite the nebulousness, contradictoriness, and *half-formed* character—and the pragmatic and basically “reactive” character—of an individual’s and a group’s political and cultural consciousness, it can hardly be denied that popular attitudes do, in some sense, exist and have consequences. It is the business class’s understanding of this that explains its intense efforts since the early twentieth century to shape the public mind, to indoctrinate people with conservative ideologies.⁴ One of the arguments I make in this dissertation, then, is that the long-term unemployed in the Depression, contrary to what scholarship has often assumed, were not generally apolitical, that in fact they tended to have a definite left-wing politics. Sometimes this politics was expressed in protest marches, sometimes in “eviction riots,” sometimes in fervent support for Franklin Roosevelt, but most often simply in “the tenacity of self-preservation,” to quote James C. Scott’s characterization of Malaysian peasants in the 1970s. As with these exploited peasants, so with the unemployed in Chicago forty years earlier we can see “in ridicule, in truculence, in irony, in petty acts of noncompliance... in resistant mutuality, in the disbelief in elite homilies, in the steady, grinding efforts to hold one’s own against overwhelming odds” a radical-left politics,⁵ a kind of class struggle and implicit consciousness of class interests against the rich, albeit one handicapped by the distinctively American absence of a major labor party in the national political arena. In certain contexts, even self-preservation can be a political act.

When the poor aided the poor, and when the unemployed joined their more fortunate employed fellows on the picket line, and even when people grumbled about the absurdity of a social order that would deprive healthy men of the opportunity to make a living, an intrinsically subversive anti-capitalist mentality was manifesting itself. The mechanisms of “hegemony” had in part broken down: the legitimacy of the social structures that determined the U.S.’s political economy was being denied, and people were “taking matters into their own hands” by one means or another. This was far from unprecedented, of course. In fact, Immanuel Wallerstein was probably right that “it is doubtful if very many governments in human history have been considered ‘legitimate’ by the majority of those exploited, oppressed, and maltreated by their governments... Governments tend to be endured, not appreciated or admired or loved or even supported.”¹ Nonetheless, the 1930s did signify an eruption of counter-hegemonic thinking and behavior (including among the—rarely examined—unemployed), as the class struggle burst into the open.

Historians have sometimes downplayed the radicalism or revolutionary consciousness of the masses during the 1930s, preferring to emphasize the basic stability of the political economy, the conservative character of the New Deal, the relatively small numbers of people who became members of the Communist party, and the channeling of popular discontent into the Democratic Party. For example, in their 1977 article “Unemployment, Class Consciousness, and Radical Politics: What Didn’t Happen in the Thirties,” Sidney Verba and Kay Lehman Schlozman argue that few American workers at the time were politically radical or “fully” class-conscious, in the sense of identifying with a class and believing that the interests of that class were opposed to the interests of others. Despite the Depression, they were in most cases optimistic about the long-term future and still favored the “American dream” of advancing through hard work and risk-taking.² Such interpretations are lent support by the writings of liberals in the 1930s who were disappointed, even bewildered, by what they saw as the passivity of most of the unemployed. Sherwood Anderson represented these views when he argued in 1936 that “There is in the average American a profound humbleness. People seem to blame themselves.”³

In his aforementioned paper, Melvyn Dubofsky presents a sophisticated version of this “pessimistic” perspective. While acknowledging that the 1930s was in many respects a uniquely turbulent decade, he reminds us that workers to some extent remained divided by nationality, race, and religion, and that the majority almost never acted in a notably “militant” way. He quotes from Robert and Helen Lynd’s 1937 study of Muncie, Indiana: workers’ ambitions were “largely those of the business class: both are caught up in the tradition of a rising standard of living and lured by the enticements of salesmanship.” They “worshipped” the automobile as the symbol of the American dream, and preferred going for a drive to attending a union meeting. “Fear, resentment, insecurity, and disillusionment,” the Lynds wrote, “has been to Middletown’s [i.e., Muncie’s] workers largely an *individual* experience for each worker, and not a thing generalized by him into a ‘class’ experience.” Thus do the Lynds and Dubofsky embrace the Gramscian point of view that foregrounds cultural hegemony, especially in relation to “Middle America.” Dubofsky admits that the situation is somewhat different in more urban environments such as New Haven, where, according to a study by E. Wight Bakke in 1940, workers did not share the drives of the business class and did have a collective sense of their own class. “‘Hell, brother,’ a machinist told Bakke, ‘you don’t have to look to know there’s a workin’ class. We may not say so—but look at what we do. Work. Look at where we live. Nothing there but workers. Look at how we get along. Just like every other damned worker. Hell’s bells, of course there’s a workin’ class, and it’s gettin’ more so every day.’” Nevertheless, in New Haven, too, there was an absence of collective militancy, in large part because of workers’ realism about what was

¹ Quoted in Abercrombie et al., *The Dominant Ideology Thesis*, 156.

² One is tempted to remark, however, that, if defined this way, the “American dream” was surely attractive not only to Americans but to people all over the Western world, and perhaps throughout much of history in many different societies. The concept of “success through hard work” is hardly an American invention. Nor should commitment to the “American dream” be assumed to preclude commitment to left-wing ideas and causes. See Sidney Verba and Kay Lehman Schlozman, “Unemployment, Class Consciousness, and Radical Politics: What Didn’t Happen in the Thirties,” *Journal of Politics*, vol. 39, no. 2 (May 1977): 291–323.

³ Quoted in Anthony Badger, *The New Deal: The Depression Years, 1933–40* (New York: Hill and Wang, 1989), 38.

possible. “They regularly had had to adjust their goals to actual possibilities,” Dubofsky says, “which almost always fell far below their aspirations. As one worker after another informed Bakke, life involved putting up with it, grinning and bearing it, and using common sense to survive.”¹

This conclusion, it seems to me, gets to the crux of the matter. It certainly is possible to overestimate the class consciousness and militancy of America’s working class in the Depression. And it is surely the case that the lower classes, now and a century ago, tend to be integrated into the “dominant culture” in many respects, just as they are *not* integrated in many other respects. The question is to what extent we should emphasize their (and our) indoctrination with the ideas and values of the ruling class, and to what extent we should emphasize, in contrast, their (and our) independence, their rationality and understanding, their opposition to the hierarchies of power, their realism and pragmatism. I have argued that the Gramscian perspective, as an explanation of why capitalist society continues to function and why people do not continually rebel against its many injustices and indignities, must be subordinated to an explanation that simply invokes the threat of violence and the dull compulsion of institutional structures. *Prudence* and *realism*, that is, are better explanations of people’s broad “conformism”—in the 1930s and today—than mass delusion and indoctrination (“false consciousness,” “hegemony,” or whatever term one likes). In this study, therefore, I choose to highlight people’s rationality and realism, as well as their courage and opposition to dominant practices and values, rather than the ways in which they may have submitted to mainstream culture and accepted its commercial and individualistic values. This strikes me, moreover, as a more *interesting* interpretation than the Gramscian one put forward by Dubofsky and the Lynds in relation to Muncie, Indiana.

In the sixth chapter of the book, for example, where I consider the collective action of the unemployed, I address one of the major ways in which historians have downplayed the radicalism and class consciousness of Americans in this period. It has sometimes been remarked in the historiography that most of the unemployed were far less responsive to abstract Communist slogans about socialist revolution or ending imperialist wars than efforts to win concrete gains in such forms as increased relief appropriations and better conditions in homeless shelters. Most of the time, it was not the nuances of Communist ideology that attracted people but (1) Communist actions in defense of the poor and (2) programmatic goals like national unemployment insurance and a shorter workweek. One might say, then, that people had the equivalent of a “trade-union consciousness” (concerned with “bread-and-butter” issues), not a “revolutionary consciousness.” And this conclusion may be largely correct, provided one recognize that no working class anywhere in the world has ever been different in this regard. As James C. Scott says, “the rank-and-file actors in most, if not all, revolutionary situations are in fact fighting for rather mundane, if vital, objectives that could in principle—but often not in practice—be accommodated within the prevailing social order.”² Better wages, better treatment, more control over production, perhaps a house of one’s own with some land—these are the sorts of demands that most often animate people, whether in the United States in the 1930s or Germany or Russia twenty years earlier. Barrington Moore has shown that factory workers in Russia just before the October revolution had as “pragmatic” a consciousness as any patriotic American might have had at the time, wanting, among other things, an eight-hour day, a minimum wage, severance pay in case of dismissal, and better toilet facilities. “The whole thrust of these demands,” Moore sums up, “was to improve working conditions, not to change them. . . . Once again we see that the workers’ idea of a good society. . . is the present order with its most disagreeable features softened or eliminated.”³

So, first of all, we should give up the remnants of American exceptionalism that seem present in Dubofsky’s paper, and in the “pessimistic” way of thinking about American workers that it represents. The main way in which America has been exceptional is simply in the brutality and aggressiveness of its

¹ Melvyn Dubofsky, “Not so ‘Turbulent Years’: A New Look at the 1930s,” in *Life and Labor: Dimensions of American Working-Class History*, eds. Charles Stephenson and Robert Asher (Albany: State University of New York Press, 1986), 205–223.

capitalist class as compared to that of other countries.¹ With such an incomparably formidable adversary, it is hardly surprising that organized labor and the Left in the U.S. have frequently fared worse than their counterparts in France, Italy, England, and elsewhere. (Incidentally, like most social historians, Dubofsky plays down this crucial aspect of American society in his attempt to explain the failures of the Left in the 1930s, instead invoking “trade-union opportunism, corporate co-optation...New Deal liberalism,” and “the inability of most workers and their leaders to conceive of an alternative to the values of marketplace capitalism.”)²

But secondly, whatever left-wing intellectuals have thought about the ideological unsophistication or lack of class consciousness of the masses, the fact is that the skeptical attitude most Americans displayed toward Communism and “revolution” in the 1930s was in many ways more sensible, rational, and healthy than the ideological fanaticism—or, in more positive language, “theoretical consistency”—of committed Communists themselves.³ Was the skepticism in part a product of “bourgeois cultural hegemony” and hence “conservatism”? One can make that argument if one wants. But given conditions in Stalinist Russia, and given the prospects for a Communist revolution in the United States, and given the utopian nature of the ideology being proselytized and the frequently intolerant and offensive behavior of the proselytizers, the most natural conclusion is simply that the majority of unemployed and poor Americans were too *clear-headed* to throw themselves into a nationwide Communist movement (or the attempt to build one). They were hard-headed realists—ironically more so, in certain respects, than the Marxist dreamers who prided themselves on their realism. “Ordinary people” tended to stay close to the material foundation like good Marxists were supposed to, issues of survival, material comfort, achieving concrete gains, eroding the power of the rich (for instance by supporting FDR, as they saw it) without necessarily seeking to overthrow the entire social order, a goal they understood to be hopeless and deluded. Nor, again, was this true only of the *American* working class. The reason that the ideal of workers everywhere has usually been “the present order with its most disagreeable features softened or eliminated,” and not the overthrow of this order and creation of a new one, is that most people have a healthy common sense and a suspicion of utopian nostrums. *Not* that they are too indoctrinated by mainstream culture to think clearly.

This is not to say, however, that people are without ideology, nor that in their own ways they cannot be quite extreme left-wing radicals. The political program of an astonishingly broad swath of the American populace in the 1930s would, if enacted, have constituted in effect a revolution without a revolution. Upton Sinclair’s End Poverty in California campaign, Huey Long’s Share Our Wealth program, Charles Coughlin’s overwhelmingly left-wing radio broadcasts in 1934 and 1935 (“Capitalism is doomed and not worth trying to save”), and the immensely popular Lundeen Bill, introduced in Congress in 1934 and 1935 in opposition to the more conservative Social Security Act, all amounted to full-on class war against the rich.⁴ But also in more subtle ways—as I show throughout this study—the unemployed in Chicago had a rather mature understanding of class conflict, if typically an understanding that incorporated attitudes of political cynicism and resignation to the largely individualized (or at least family-centered) nature of survival in urban America. Such attitudes were thoroughly rational and realistic; nevertheless, I particularly try to highlight the ways in which people overcame their isolation and built community even on the basis of “atomizing” unemployment.

¹ See Patricia Cayo Sexton, *The War on Labor and the Left: Understanding America’s Unique Conservatism* (Boulder, CO: Westview Press, Inc., 1991).

² Dubofsky, “Not So ‘Turbulent Years,’” 223.

³ As it happens, even the most doctrinaire Marxists among them were not theoretically consistent, and did not really understand Marxism or have the type of class consciousness that “sophistication” requires. I establish this in chapters four and six of *Worker Cooperatives and Revolution*. The fact that even Leninists, who have always prided themselves on their theoretical sophistication, have an essentially incoherent ideology shows what a chimera is the notion of “correct” consciousness as opposed to the consciousness corrupted by bourgeois hegemony and incoherence. There can be no litmus tests in these matters.

⁴ McElvaine, *The Great Depression*, 238–240.

In a longer study I might have included a chapter that generalizes beyond the Great Depression to argue that the large majority of people have a primarily left-wing, in some ways even anarchist and Marxist, ideological framework (though of course one full of inconsistencies and lacunae). This is not a difficult argument to make. For instance, one can use polls to show that the American public has social democratic values. Even in the 1980s, when conservatism was ascendant in politics and elite culture, the public remained broadly left-wing. On environmental regulation, a major poll in 1983 found that 58 percent of people supported the radical proposition that “protecting the environment is so important that requirements and standards cannot be too high, and continuing environmental improvements must be made regardless of cost.” Another 1983 poll found that 74 percent supported a jobs program for the unemployed even if it meant increasing the size of the federal deficit. In 1986, 66 percent of the public thought that “government should spend money now on efforts similar to those of the Great Society programs to help the poor people.” Large majorities supported keeping regulations on industrial safety, offshore oil drilling, auto emission and safety standards, and the teenage minimum wage. In 1979, 79 percent of the public thought there was too much power concentrated in the hands of a few large companies for the good of the nation. More recently, a Pew Research Center poll in 2015 found that, while only 27 percent of Americans are bothered “a lot” by the amount they pay in taxes, 61 percent are bothered a lot by the feeling that the wealthy do not pay their fair share. Eighty-four percent thought money has too much influence in political campaigns. In early 2015, 75 percent of Americans supported raising the federal minimum wage to \$12.50 by 2020 (and 63 percent wanted it raised to \$15). A year later, 58 percent supported replacing the Affordable Care Act with a federally funded healthcare program providing insurance for all Americans, and 59 percent of likely 2016 voters supported the radical idea of expanding Social Security to Americans of all ages “so that everyone has a guaranteed minimum income.” By and large, it seems that most people are far more leftist than the business, political, and intellectual elite.¹

Instead of exploring these matters, however, I confine myself to elaborating on Robert McElvaine’s argument that the 1930s saw a shift leftward in the values and practices of the American people, a shift towards community, cooperation, and generosity. I also accept Elizabeth Cohen’s argument that the Depression caused workers and the unemployed to turn from welfare capitalists, local charities, and ethnic associations to unions and the federal government as guarantors of economic security. Where I go further than she is to argue (in chapter six) that this shift in attitude is another indication that, despite their demoralizing experiences, the unemployed tended to be far from apathetic and apolitical, that in fact it was common for them to have a more sensible and realistic politics than many of the Communists who tried to organize them. They knew that the world is not a just place, that it was hopeless to try to create a workers’ government or to construct a classless utopia. In their own way they were fighting against a bourgeois ideological hegemony by insisting, through protest marches and letters to politicians (among other means), that the government must radically intervene in the economy to curb the excesses of capitalism. Ordinary people decisively rejected the old ideology of “limited government” and paved the way for the New Deal. (As we’ll see, most wanted a much more radical version of the New Deal.)

I should note, though it is probably already evident, that in this dissertation I somewhat reconceptualize the idea of class struggle, broadening it in several ways. Above I equated the term to “the structure and functioning of economic institutions,” by which I meant the objective antagonism of interests

between capitalist and worker. This “objectivist” understanding of the concept, while implicit in Marx’s writings, amounts to an appropriation of Ste. Croix’s use of it in his magnificent 1981 study of the ancient Greek world quoted earlier. Ste. Croix points out that class struggle need not involve collective action or activity on a political plane, and it need not even be accompanied by “class consciousness” or an *awareness* of “struggle” at all.¹ But furthermore, on the basis of this understanding I extend the notion even further and treat the efforts of the poor and the unemployed to survive in a hostile world as themselves a manifestation of class struggle, and as being implicitly political. For—to be somewhat glib—they certainly involved struggles against authorities and their (class-based) prioritization of “fiscal austerity” (to use an anachronistic term), and they grew out of class. Working-class efforts to survive, and to resist, were and are essential products of exploitative class dynamics. They also frequently involved collective solidarity, the solidarity of the poor with the poor. In contexts of severe deprivation, the mere fact of surviving can be a type of resistance to dominant social structures, a way of asserting oneself against realities of class and power that are, in effect, organized to crush one under the boot of the ruling class or even, in some cases, to erase one’s existence. For most people, fighting daily for the survival of their family and collectively fighting employers or relief authorities or pro-business political policies are not sharply separated activities, the latter belonging to “class struggle” and the former not. Such distinctions are artificial and arbitrary, mere intellectual contrivances. The whole existence of the poor tends to incorporate a kind of generalized and diffuse class struggle and class consciousness—perhaps not a theoretically sophisticated consciousness, but a realistic one.

I’ll elaborate on these arguments in later chapters, when I discuss the “class consciousness” of particular (types of) actors. It may be noted here, however, that such ideas recall James C. Scott’s arguments in (among other writings) his 1989 paper “Everyday Forms of Resistance,” where under the broad category of the paper’s title he lists acts such as “foot-dragging, dissimulations, false compliance, feigned ignorance, desertion, pilfering, smuggling, poaching, arson, slander, sabotage, surreptitious assault and murder, [and] anonymous threats.” “These techniques,” he observes, “for the most part quite prosaic, are the ordinary means of class struggle.”² Against the charge that he makes the concept of class resistance overly inclusive, Scott marshals a number of arguments, for instance that when such activities are sufficiently generalized to become a *pattern* of resistance, their relevance to class conflict is clear. (As we’ll see, activities like pilfering, dissimulation to relief authorities, false compliance with unreasonable conditions for receiving relief, and anonymous threats against state legislatures, not to mention collective protests, were indeed generalized patterns of resistance among the Depression’s unemployed.) We might paraphrase Scott’s definition as follows: lower-class resistance is any act by a member of a given class that is intended either to mitigate or to deny claims made on that class by superordinate classes or to advance its own claims (e.g., to work, land, charity, or respect) vis-à-vis these superordinate classes. Even when workers shirk on the job or when the poor try by any means to obtain resources for themselves, class resistance to dominant institutions and inegalitarian value-systems is occurring.

The dissertation is organized as follows. In chapter one I provide a brief overview of the Great Depression and its effects on Chicago, and then, at the end, summarize again some of the main arguments I’ll make in later chapters. The second chapter is different from the others in saying nothing about the *agency* of the unemployed, consisting instead of a litany of the woes they had to endure. While not much is said explicitly about the machinations of Chicago’s political and business elite, most of what is discussed serves as an implicit critique of the class priorities of this elite that was happy to sacrifice the well-being of hundreds of thousands on the altar of “lower costs.” The reader may notice parallels between the political agenda of “economy” during the Depression and the agenda of “austerity” in our own day.

In the third chapter I explore some of the dimensions of people’s activeness, specifically the ways in which they coped physically and emotionally with the tragedies that had befallen them. Having been virtually outcast from many of society’s dominant institutions, the unemployed had to reconstruct their lives even in the midst of their collapse. In most cases this would not have been possible if the poor had not

¹ Ste. Croix, *The Class Struggle in the Ancient Greek World*, 44, 57.

² James C. Scott, “Everyday Forms of Resistance,” *Copenhagen Papers*, no. 4 (1989): 33–62.

been munificent in giving aid to one another—a feature of Depression life that has still not been exhaustively analyzed. Indeed, David Graeber is surely right that the disciplines of anthropology and history could do more than they have to illuminate the myriad dimensions of “everyday communism” that have always formed the bedrock of society. Ideological blinders have prevented us from studying, even from seeing, the deep-rooted modes of cooperation and generosity that not only make society possible but, as I have argued, frequently amount to powerful forms of class solidarity. In addition, I examine the many ways in which the impoverished unemployed constructed their own modes of recreation, from sports to gambling to dancing. General studies of life in the Depression, such as David E. Kyvig’s *Daily Life in the United States, 1920–1940* (2004), James R. McGovern’s *And a Time for Hope: Americans in the Great Depression* (2000), and Robert McElvaine’s *The Great Depression: America, 1929–1941* (1984), broadly describe the forms of recreation and popular culture that Americans indulged in during these years, but they do not focus on people without work, nor on a particular location (Chicago, in this case). A local study permits greater depth.

The fourth chapter is devoted to “the unattached,” who often had to live in flophouses or public shelters because they could not afford their own rooms. Not until late 1935 did the relief administration provide outdoor relief, or home relief, for most of the unattached, and even then thousands still used the free shelters that remained open or the cheap flophouses in the Hobohemian district. I describe in detail the miserable conditions in which “shelter men” lived, the conditions that amounted to a form of class war calculated to humiliate and degrade the poor. (Whether policymakers and administrators had intentions of class war in mind is beside the point; the institutions they served functioned so as to beat down the poor, as this study bears out.) Shelter clients tended to be well aware of class structures and of the conflict between rich and poor that determined U.S. politics. They even organized to press for changes in shelter administration. Thus, I focus on what shelter men thought of their situation, and on how they coped with being the objects of a cruel and inhumane policy.

In the following chapter I discuss three types of institutions that had an impact on the unemployed: governments, unions, and churches. With regard to the first, I illustrate what a low priority the well-being of the poor was to the Chicago and Illinois governments by recounting the dreary story of relief financing from 1930 to 1941, which is to say the story of how the elites of the business and political worlds singularly failed to provide for the millions of Illinoisans thrown out of work. As a wealthy state that periodically even had budget surpluses, Illinois certainly could have afforded to be more munificent than it was in the funds it diverted to relief. That it *wasn't* testifies to the degree to which class conflict determines politics. Unions and churches, on the other hand, frequently showed striking compassion for, and solidarity with, the unemployed, although their inadequate resources prevented them from being as effective as they might have been. The main reason I include a section on unions is simply that very little scholarship addresses the question of how unions in Chicago engaged with both their out-of-work members and the broader unemployed population. Indeed, little scholarship addresses the question as it relates to any place in the country, not only Chicago, although James Lorence’s aforementioned works on Michigan and Georgia are notable exceptions.

Originally I had intended to include a chapter on outdoor relief, to complement the chapter on indoor relief. I wanted to investigate what it was like to be on relief: what the procedures were, how they changed over the years, what humiliations had to be suffered, what the different types of work relief entailed and what people’s attitudes toward them were, what the grievances were of people working on CWA and WPA projects, how individuals (as opposed to groups) resisted the injustices they continually experienced, etc. I came to realize, however, that such a chapter could be a book in itself. Nor, probably, would the payoff be worth the effort of writing it, because so much other scholarship already discusses these issues (though admittedly not as a local study of Chicago). Standard general histories of the Depression and the New Deal provide answers to the questions I had in mind, and it was unlikely that a monograph on Chicago would significantly challenge their interpretations. In any case, I was less interested in relief for its own sake than in clients’ responses to it, particularly their resistance, and I already planned to devote the last chapter to a consideration of the collective action of the unemployed. So in the end I decided it made little sense to write an enormous chapter on home relief, and substituted for it the one I have just described,

which consists, in effect, of a contrast between the relative inhumanity of the dominant political economy and the relative humanity of the subordinate political economy of unions and churches. Historians have not sufficiently emphasized the degree to which niggardly relief was a political choice rather than an economic necessity.

In the sixth chapter I follow this account of the politics of relief with a discussion of the politics and activism of the unemployed. Again, much has been said about this subject in writings by Roy Rosenzweig, Daniel J. Leab, James Lorence, Randi Storch, and Franklin Folsom, the latter in a popular book called *Impatient Armies of the Poor: The Story of Collective Action of the Unemployed, 1808–1942* (published in 1991). But there is no systematic discussion of the social history in Chicago, and barely a mention of the second half of the 1930s. My main concern, to repeat, is to highlight the realism and the militancy of ordinary people, to undermine the myth of their dominance by mainstream indoctrination. Especially when material comforts fall away and people sense that they are being treated unfairly, radicalization can happen very quickly. The “self-blame” of the unemployed was not such an utterly dominant reaction as many historians have thought. And even when there was self-blame, anger at an unjust society was not infrequently present as well. Such anger helped motivate the radicalism that emerged on local and national scales, a radicalism of both “form”—including widespread occupying of private property, sit-ins at relief stations and legislative chambers, constant demonstrations and hunger marches, collective thefts—and “content,” i.e., the policy goals that, in fact, were in essence revolutionary. In our own time of social crisis, high unemployment (see page 60), and slowly building mass struggles, it is useful to recall how class-conscious and rebellious people were the last time society was at such a fever pitch of polarization.

Throughout the dissertation I try to make distinctions—to the extent that the sources allow—between subcategories of the unemployed, such as ethnicities and income levels. The most obvious distinctions are between African-Americans and whites, especially native whites, because the hardships of blacks were on a more acute plane than those of whites. Not surprisingly, then, blacks were more frequently militant and class-conscious—and of course race-conscious—than whites. Nevertheless, unemployment united as well as divided, in part through efforts of the Communist party to bridge racial divisions.

In short, with this dissertation I’m trying both to fill a few gaps in the historiography and to put forward an interpretation of the unemployed in the 1930s that rescues them from posterity’s condescension. To adopt Marx’s famous dictum, they were not only “made” by their circumstances, by their misfortunes; they also made their own history, and made themselves as they made history. Through personal and collective struggle they refused to let the political economy cast them aside as so many “redundant” pieces of human scrap metal. Their legacy, in fact, is the legacy of class struggle against overwhelming odds.

Meanwhile, in recent years I’ve taken some notes on books and articles I was reading. I might as well put a few of those jottings here, in case one or two potential readers would be interested.

On humans’ language faculty

You may have heard of the “talking gorilla” [Koko](#). I remember as a child reading about this fascinating creature that had been trained to use sign language to communicate desires, thoughts, feelings, and the like. This was utterly amazing to me, because the idea of non-human apes possessing even the rudiments of human language seemed outlandish. Apes seem to be on such a vastly more primitive cognitive level than humans that I found it miraculous and thrilling that Koko could apparently express somewhat sophisticated ideas. The truth, of course, was that she couldn’t.

Laura Ann-Petitto’s contribution to the first edition of *The Cambridge Companion to Chomsky*, titled “How the brain begets language,” is interesting and instructive in this Koko-context. (The book can be downloaded at [Z-Library](#).) So much so that I want to quote long passages for the benefit of any other amateurs like me who might be interested in these matters. One of the intriguing things about Petitto’s

chapter is the same thing that has always baffled me about people's responses to Chomsky: somehow, ideas that strike me as perfectly reasonable, if not embarrassingly truistic, are considered controversial or obviously wrong by hordes of academics and many others. (I have to admit that this has given me a rather uncharitable view of the intelligence of the average intellectual.) E.g.:

I first met Noam Chomsky through a project that attempted to get the baby chimp Nim Chimpsky to "talk." At nineteen, with the certainty of youth, I knew that I would soon be "talking to the animals." Nim was the focus of our Columbia University research team's Grand Experiment: could we teach human language to other animals through environmental input alone with direct instruction and reinforcement principles? Or would there prove to be aspects of human language that resisted instruction, suggesting that language is a cognitive capacity that is uniquely human and likely under biological control? Nim was affectionately named "Chimpsky" because we were testing some of Chomsky's nativist [rationalist] views. To do so, we used natural sign language. Chimps cannot literally speak and cannot learn spoken language. But chimps have hands, arms, and faces and thus can, in principle, learn the silent language of Deaf people.

By the early 1970s, a surprising number of researchers had turned to learning about human language through the study of non-human apes. Noam Chomsky had stated the challenge: important parts of the grammar of human language are innate and specific to human beings alone. Key among these parts is the specific way that humans arrange words in a sentence (syntax), the ways that humans change the meanings of words by adding and taking away small meaningful parts to word stems (morphology), and the ways that a small set of meaningless sounds are arranged to produce all the words in an entire language (phonology). The human baby, Chomsky argued, is not born a "blank slate" with only the capacity to learn from direct instruction the sentences that its mother reinforces in the child's environment, as had been one of the prevailing tenets of a famous psychologist of the time, B. F. Skinner... Innately equipped with tacit knowledge of the finite set of possible language units and the rules for combining them, the baby listens to the patterns present in the specific language sample to which she is being exposed, and "chooses" from her innate set of possible grammars the grammar she is hearing...

My departure from Project Nim Chimpsky in the mid 1970s to attend graduate school in theoretical linguistics at the University of California, San Diego, was bittersweet. It had become clear that while Nim had some impressive communicative and cognitive abilities, there was a fundamental divide between his knowledge and use of language and ours. No one can "talk to the animals" by sign or otherwise. Nim's data, along with our close analyses of data from all other chimp language projects, unequivocally demonstrated that Chomsky was correct: aspects of human language are innate and unique, requiring a human biological endowment.

And people were surprised by this? Wow. Poor Chomsky has had to argue with irrationalists his whole life.

It turns out that non-human primates are (of course) almost completely incapable of *abstraction*. For them, as for every other animal except humans, it seems that only what is immediately present—in sensory experience, memory, desire, or whatever—exists. For example, apes cannot construct patterned sequences of three or more signs. "After producing a 'matrix' two words, they then—choosing from only the top five or so most frequently used words that they can produce (all primary food or contact words, such as *eat* or *tickle*)—randomly construct a grocery list. There is no rhyme or reason to the list, only a word salad lacking internal organization." Petitto continues:

Alas, the whole story is even worse than irregularities in chimpanzees' syntax, morphology, and phonology: the very *meanings* of their words were "off." For one thing, chimps cannot, without great difficulty, *acquire* the word *fruit*. While apes seem to have

some capacity to associate words with concrete things and events in the world they inhabit, unlike humans, they seem to have little capacity to acquire and readily apply words with an *abstract* sense. Thus, while chimps can associate a small set of labels with concrete objects in the world (*apple* for apples, *orange* for oranges), they have enormous difficulty acquiring a word like *fruit*, which is a classification of both apples and oranges. There is no tangible item in the world that is literally fruit, only instances or examples of this abstract kind-concept that seems to exist only in human heads.

For another thing, chimps do not *use* words in the way we do at all. When we humans use the common noun *apple* in reference to that small round and juicy object in the world that we eat, we do not use it to index (pick out) only one object in the world (say, a specific red apple on a table), nor do we use it to refer to all things, locations, and actions globally associated with apples. Instead we use the label to “stand for” or *symbolize* the set of related objects in the world that are true of this particular kind-concept in our heads. Crucially, we also know the range or scope over which word kind-concepts may apply: for example, the label *apple* symbolizes a set of related *objects* and therefore this label is used only in reference to objects, not actions... Chimps, unlike humans, use such labels in a way that seems to rely heavily on some global notion of *association*. A chimp will use the same label *apple* to refer to the action of eating apples, the location where apples are kept, events and locations of objects other than apples that happened to be stored with an apple (the knife used to cut it), and so on and so forth—all simultaneously, and without apparent recognition of the relevant differences or the advantages of being able to distinguish among them. Even the first words of the young human baby are used in a kind-concept constrained way (a way that indicates that the child’s usage adheres to “natural kind” boundaries—kinds of events, kinds of actions, kinds of objects, etc.). But the usage of chimps, even after years of training and communication with humans, never displays this sensitivity to differences among natural kinds. Surprisingly, then, chimps do not really have “names for things” at all. They have only a hodge-podge of loose associations with no Chomsky-type internal constraints or categories and rules that govern them. In effect, they do not ever acquire the *human* word *apple*.

Surprising?! Frankly, what surprises me is that apes can be taught to *sign* “words” at all. I find that pretty impressive. Though maybe I shouldn’t, since apes obviously communicate with each other in some primitive way that involves gestures.

Aside from information about chimps’ non-acquisition of language, Petitto’s paper presents interesting data on comparisons between monolingual deaf children and monolingual hearing children, as well as bilingual hearing children in “typical” (spoken) contexts, bilingual hearing children who were taught two *signed* languages and nothing spoken (because their parents were deaf), and bilingual hearing children who acquired both a signed and a spoken language. One finding was that deaf babies’ development of (signed) language proceeds at exactly the same pace and follows exactly the same stages as hearing children’s development of language. (A point for Chomsky, which is to say for the *biological—preprogrammed*—perspective, no matter the modality of communication.) As for “bilingual hearing children exposed to both a *signed* and a *spoken* language from birth (e.g., one parent signs and the other parent speaks), [they] demonstrate no preference whatsoever for speech, even though they can hear.” In the experiment conducted, they produced their first word in French and their first word in sign language at the same time.

What’s also notable is that babies who were exposed to, say, French and English at the same time “achieved their linguistic milestones on the same timetable as *monolinguals*, revealing no language delay or confusion.” Isn’t that incredible? It’s hard enough—in fact, *magical*—for babies to *construct in their head an entire language* on the basis of the fragmentary, scattered linguistic data they’re exposed to from their parents. (This is the “poverty of the stimulus” miracle.) But for them to construct *two* languages on the basis of these confusing and conflicting data is impossible to comprehend. Imagine being an infant who

hears a hodgepodge of sounds from adults, some of the sounds being organized according to the rules of English and others according to those of German: and you (your brain) *instinctively* can recognize that these differences exist, these sounds are organized in different ways, and you build up in your brain (unconsciously) a set of structures of two different languages *at the same time, without getting irremediably confused*. That feat is absolutely astonishing. Science has no conception of how it's accomplished.

But one thing it indicates, at least, is that Chomsky is right that the infant's brain *hungers* for linguistic data, it's desperately eager to construct linguistic structures spontaneously on the basis of the verbal sounds (or hand gestures) it encounters. There is obviously a *language faculty* in the human brain, a specialized mental organ that effortlessly and unconsciously uses sensory (auditory and/or visual) data to construct the unimaginably complex rules of a particular language. Humans are *genetically endowed* with this aptitude, this predisposition; we don't just use our "general intelligence" and rules of association or induction or whatnot to develop a language, contrary to what empiricists think. This fact is so obvious even from this single piece of evidence—the *ease* with which infants learn *even two or more languages at the same time!* (when *adults* find it *infinitely more difficult*)—that even I, who have a pretty dim view of intellectuals, find it shocking they can reject Chomsky's "biologism" ([Universal Grammar](#), etc.) and maintain an allegiance to empiricism.

I know I'm just a dilettante and have no professional status in linguistics or related disciplines. But these aren't technical issues that you need extensive training in order to understand. They're very general, having to do with simple rules of logic and induction (or "abduction"): it's like [inference to the best explanation](#). Despite what professionals might say—not Chomsky, who is consistently democratic, but other professionals—you and I have a right to have an opinion about straightforward topics like this, insofar as we're capable of reading and reasoning. (Not all people are truly capable of reasoning, but I assume *you* are.) The technical linguistics—no, I can't possibly understand that. But the reasoning about rationalism vs. empiricism—yes, since I am, and you are, able to understand chains of reasoning and evaluate evidence bearing on these chains of reasoning, we're qualified to hold opinions about general "philosophical" matters. (Of course, the more we read and the more we reflect, the more qualified we are.)

And it seems to me that however hard it might be sometimes to *confirm* rationalist (nativist) hypotheses, or even to flesh them out in such a way that they're immune to all objections from empiricists, they have an enormous amount of plausibility *prima facie*. Not least because it's uncontroversial that *other* animals are genetically preprogrammed to act in specific ways barely influenced by environmental stimulation. (E.g., baby squirrels [engage in](#) squirrely behavior (digging) even if they've been deprived of input from other squirrels and are confined in solitude to an isolated room.) Presumably empiricists wouldn't deny that humans are animals, right? We're part of the animal kingdom. So you'd think that what's true of all other animals would be true of us, no? Why should *we* not be preprogrammed if *other* animals are? We're not angels!¹

Anyway, let's leave this empiricist nonsense aside. Returning to *interesting* things... You're aware of the infant "babbling" phenomenon, right? *Ba-ba-ba-ba*, etc. What does that babbling mean? For many researchers, babbling is "the initial manifestation of human language acquisition, or, at least, of language production." This seems plausible. More specifically, though, some researchers think that babbling is "determined by the development of the anatomy of the *vocal tract* and the neuroanatomical and neurophysiological mechanisms subserving the *motor control of speech production*." But no, *that* hypothesis is wrong, because *deaf* babies babble too! They *manually*, *not vocally*, babble! This scientific discovery of *hand* babbling "confirmed a claim central to Chomsky's theory: that early language acquisition is governed by tacit knowledge of the abstract patterning of language that is biologically endowed in the species, and that this governance is so powerful that it will 'out' itself by mapping onto the tongue if given

¹ As I've noted elsewhere on this website, the indubitable fact of psychological/behavioral preprogramming has uncomfortable implications with regard to the postmodern dogma that gender (gendered thinking and behavior) is nothing but a social construction: viz., that the dogma is flat-out false. Postmodern empiricism and idealism (elevation of "discourses" and "culture" above class structures and sheer brute *material facts*, including biological facts) are just flaky irrationalism.

the tongue, or the hands if given the hands—all the while preserving linguistic structures across the two modalities.” In other words: empiricism loses again.

The idea of hand babbling is fascinating. If babbling is indeed an early manifestation of the language faculty, then, of course, you’d expect to see it manifested somehow in deaf babies too (who have the language faculty), not only hearing babies. But what does it mean to say that hand gestures can *babble*? Well, Petitto discovered that there is actually syllabic organization (analogous to *ba-ba-ba*) in deaf babies’ silent hand babbling. “In signed languages, the sign-syllable consists of the *rhythmic closing and opening*...alternations of the hands/arms. This sign-syllabic organization has been analyzed as being structurally homologous with the closing and opening of the mouth aperture in the production of consonant–vowel (closed–open) mouth alternations in spoken language.” So babies can express *ba-ba-ba* or *da-da-da* or *ma-ma-ma* with their hands, not only their mouths.

...If babies are born [as Chomsky argues] with *tacit knowledge* of the core patterns that are universal to all languages, even signed languages, then the [Chomskyan] hypothesis predicts that differences in the form of language input should yield differences in the hand activity of [deaf babies]. In biological terms, *tacit knowledge* was construed [in our experiment] as the baby’s sensitivity to specific patterns at the heart of human language—in particular, the rhythmic patterns that bind *syllables*, the elementary units of language, into baby *babbles*, and then into *words and sentences*.

Babies are, it appears, highly sensitive to these linguistic patterns, even if they’re deaf and exposed only to signed language. But why else would they be so sensitive if not that they were *predetermined* to be so sensitive?

Anyway, the broader point is that deaf children experience the same linguistic milestones at the same rate as hearing children, and the Chomskyan hypothesis that internal linguistic structures will find some way to manifest themselves in external expression, even if the usual verbal/auditory mode is impaired, is supported. The language faculty is a core *genetically determined and elaborated* property of humans. As should have been obvious all along.

None of this is to deny, however, the great conceptual and scientific difficulties associated with this faculty. Such as how and why it appeared in the first place (a question we’ll probably never have a good answer to, as Richard Lewontin [argued](#)), or what the universal linguistic rules are, or how the baby’s brain processes sounds to construct a language on the basis of these rules. The human brain is mostly a mystery and will, I suspect, remain so.

Notes on the evolutionary history of life

Reading *A New History of Life: The Radical New Discoveries about the Origins and Evolution of Life on Earth* (2016), by Peter Ward and Joe Kirschvink. A great book, so dense with information I have to take notes in order not to forget everything.

For almost a billion years the early Earth, largely molten, was bombarded by meteorites and comets, as well as ultraviolet radiation. An environment not exactly hospitable to life. It seems that the oldest fossil is from 3.4 billion years ago, of bacteria that needed the element sulfur to live and died if exposed to oxygen. (Related bacteria exist today.) The world was much hotter than today, with air composed of the (to us) toxic gases methane, carbon dioxide, ammonia, and hydrogen sulfide.

There have been many hypotheses for where and how life began. One possibility is that scalding deep-sea vents provided its environment. “The vents emit chemicals that are appropriate for the evolution of life, such as hydrogen sulfide, methane, and ammonia amid lots of hot water. The vent chemistry would be largely decoupled from the atmosphere, and thus the evolution of life could have taken place independent of the atmosphere. This removed the problem that the Earth’s atmosphere at the time was not chemically

correct to form life. But the so-called vent origin had its own problems. How could RNA, that highly unstable molecule, have formed in the vents, with their high temperatures and pressures?”

Another possibility is that RNA (which can form DNA) may have originated in desert conditions. “RNA is a very fragile molecule, large and complicated, and thus very easily destroyed. Water attacks and breaks up the nucleic acid polymers (strings of smaller molecules) that make up RNA.” So maybe a dry environment would be more promising. The problem is that Earth’s surface at this time was pretty much entirely ocean. But what about Mars? Mars never had planet-covering oceans, but it did have large bodies of water, which are necessary in order to form the borate minerals that are needed to stabilize RNA. It also had other advantages over Earth. So maybe life came here on meteorites from Mars.

Experiments have shown that meteorites can come here from Mars without being heat-sterilized, meaning life could have survived the journey. A large impact on Mars could easily have hurled life-bearing meteorites onto Earth. This is the scenario the authors favor.

Anyway, here’s how the chapter on the beginning of life ends:

The two major components necessary for life are a cell that can reproduce itself and some sort of molecule that can carry information, as well as performing chemical catalysis (changing conditions so that a chemical reaction that would not otherwise occur does take place because of the action of the catalyst being present)... Cells and RNA [may have] evolved as a single unit—double-walled cells of fat with small RNA nucleotides within them grew by obtaining more fat and more nucleotides, which could have passed through gaps in the fat of the cell wall, whereas the larger linked nucleotides of the interior would be too large to pass out of the walls. The material available on the early Earth necessary to make the protocells were chemicals that would have combined to form fatty (lipid) molecules, which themselves would readily link together to form sheets and then spheres.

...The earliest life might have been composed of cells with very porous cell walls, allowing the swapping of whole genomes, a process known as horizontal gene transfer. But there came a time when the cell systems went from ephemeral to permanent. This is the point that biologist Carl Woese called the “Darwinian threshold.” It is the point where species, in something approaching the modern sense, can be recognized, and when natural selection—evolution in other words—takes over. Natural selection favored more functionally complex, integrated cells than simpler precursors, and they flourished at the expense of the simpler modular varieties.

Modern Earth life was born when the radical changing of genes stopped. Some who study the evolution of the first life, such as Carl Woese, believe that arriving at this grade of organization is the most important event in all of evolutionary history. Yet those first cells were surely not alone, for there were probably ecosystems packed with all manners of complex chemical assemblages that had at least some life aspects. We can think of a giant zoo of the living, the near living, and the evolving toward living. What would that zoo contain? Lots of nucleic acid creatures of many kinds, things no longer existing and having no name because of this. We can imagine complicated chemical amalgamations that have been roughly defined as RNA-protein organisms, RNA-DNA organisms, DNA-RNA-protein creatures, RNA viruses, DNA viruses, lipid protocells, protein protocells. And all these huge menageries of the living and near living would have existed in one thriving, messy, competing ecosystem—the time of life’s greatest diversity on Earth, perhaps 3.9 to 4.0 GA (billion years ago), but with our new view being that it was later rather than sooner. Natural selection whittled what might have been a thousand really different kinds of life down to one.

So, sometime in the middle of the Archean period (which lasted from 4.2 billion to 2.5 billion years ago) various life forms appeared, somehow. Much of early life used methane for food, but eventually

cyanobacteria evolved, which were the first oxygenic photosynthesizing organisms. “Some of their descendants were enslaved by other organisms, and now serve us all as the green light-gathering organelles in plants and other algae. Every plant on Earth now has tiny ‘capsules’ that evolved from those first cyanobacteria, but are now ‘endosymbiosis’ slaves doing the bidding of the multicellular plant.” Over hundreds of millions of years, these oxygen-producing cyanobacteria radically changed the composition of the atmosphere. This is the Great Oxygenation Event.

“[T]he evolution of the cyanobacteria was the most profound biological event on this planet (even more so than the evolution of the eukaryotic cell, and then multicellular life).”

One major consequence of all this production of oxygen and consumption of carbon dioxide was the first Snowball Earth event, which may have lasted 100 million years or so. This would have been around 2.3 billion years ago. The majority of life died out, but cyanobacteria survived, probably in local hot springs. Only after volcanic activity had released enough greenhouse gases could this frozen period come to an end. When it did, the cyanobacteria multiplied in numbers “almost incomprehensible” because the oceans, having been submerged under ice for so long, had loaded up on nutrients from hydrothermal vents. So there were further massive increases in the amount of oxygen in Earth’s atmosphere, until it was “supersaturated” in oxygen (because there weren’t yet organisms capable of breathing it, as animals do). Finally oxygen-breathing eukaryotes appeared around 2 billion years ago, restoring some balance to the atmosphere. They used mitochondria, which had originally been independent bacteria, as sources of energy—which relied on oxygen.

It took a very long time, though, for common multicellular life to evolve. Why? For a billion years or more there wasn’t enough oxygen to support animal life (even though, it seems, many millions of years earlier there had been more than enough, when there weren’t any oxygen-breathing organisms around at all). The reason is that there was an overabundance of sulfur-using bacteria, which relied on a type of photosynthesis that doesn’t split water apart or produce oxygen. They populated most of the ocean, and after dying, their rotting bodies would have used up many of the oxygen molecules being emitted by other bacteria. After hundreds of millions of years these sulfur-consuming bacteria largely (though not entirely) died out for various complicated reasons, making possible levels of oxygen that could support animal life.

But there were already primitive multicellular organisms around, going back to 2 billion or more years ago. *Grypania*, for example, were bacteria that seem to have lived as “colonies” of cells, held together and bound by membranes. Multicellular plants evolved over a billion years ago, “species probably looking very much like the green and red algae found on any seashore.” But it isn’t until about 600 MA (million years ago) that fossils of true animals appear in abundance.

A summary:

Here is a view of a shallow sea bottom, some 1 billion years ago: Kelp-like plants and green algae wave in the currents, as do shimmering mats of rainbow-hued microbial life, multicolored sheaths of the softest chiffon covering all of the sunlit portions of the bottom. Stromatolites peak out from the bottom sheaths, large to small domes and hummocks punching upward out of the microbial sheaths. The water is thick with life, single celled to multicellular. There is nary an animal anywhere on the planet...

In the oceans a revolution was brewing a billion years ago, while on land there may already have been a vast biomass of life: the ever-resourceful microbes, invading first ponds and swamps, but ultimately covering wetlands, bogs, and anywhere that was exposed to sun, had a least a modicum of water, and might get windblown dust with enough phosphates and nitrates to allow these tiny, single-celled plantlike microbes to grow their land-covering tarps of green snot. Life, colonizing the land in exuberance...

But then a second Snowball Earth episode occurred, from 717 to 635 million years ago, once again extinguishing most life. This second episode may have been caused primarily by the movement and tectonic activity of continents. The supercontinent Rodinia began to split apart, which substituted an abundance of maritime climates for formerly arid ones. This created the potential for increased chemical weathering of

silicate rock minerals, which causes a reduction of carbon dioxide levels in the atmosphere. And thus a reduction of temperature.

In addition, the new (single-celled) plant species spreading over the land about 750 MA may have sucked up so much carbon dioxide that the Earth significantly cooled.

Whatever the cause, the huge masses of snow and ice that resulted shut out most sunlight and led to the loss of nutrients like iron, phosphates, and nitrates. But over millions of years, volcanoes and hot springs produced small warm bodies of open water, in which organisms could thrive. “Evolution works best on small, isolated populations. Thousands of these small marine and even freshwater refuges would have been evolutionary incubators, using the principle of ‘genetic bottlenecks’ (where tiny populations, when isolated, can quickly evolve because of their small number of genes). In this way, protozoa, those small single-celled eukaryotes, may have evolved into many different kinds of metazoans—animals. With the release of the snowball conditions, caused by the eventual buildup of greenhouse gases from all of those active volcanoes, there would have been rapid melting of the ice, as well as a rapid release of these thousands of new evolutionary experiments.”

So Snowball Earth ironically fostered conditions necessary for the future rapid evolution of complex organisms. This is even more likely because it’s known that many organisms respond to environmental stress by wholesale reorganization of their genomes. And Snowball Earth was certainly stressful.

The Ediacaran period, the last period before the start of the Paleozoic Era, began 635 million years ago and saw the beginning of truly complex and large multicellular life. Perhaps even animal life. Tiny wormlike creatures with *bilateral symmetry* appeared around 600 MA, and they apparently evolved into many of the larger Ediacarans, which colonized the world. These were soft-bodied, sexually reproducing, virtually immobile creatures that lasted until 540 million years ago, when they were wiped out by the animals, including predators, of the Cambrian explosion. Some of them were like fronds, some like worms, some like soft discs, etc. They don’t seem to have any obvious evolutionary descendants.

Summing up:

In the time between about 635 and 550 million years ago, a whole new category of organisms had evolved, ones with internal water-filled spaces that could act as an internal or hydrostatic skeleton, as well as creatures with muscles, nerves, specialized sensory cells, germ cells, connective tissue cells, and the ability to secrete precipitated skeletal hard parts. Animals or not, the Ediacarans were the first on Earth to evolve skeletons, albeit nonmineralized. Skeletons allow for the attachment of muscles, and muscles allow locomotion. Locomotion then creates other needs that continue to drive the evolution of ever more complexity. Once moving, an animal needs sensory information to find food and mates, as well as to avoid predators. Sensory information needs a brain to process it. All of these developments were intertwined, and were triumphs of the eukaryotic metazoan revolution, which is really what happened near the end of the Proterozoic.

Then, of course, was the Cambrian explosion, when all the current animal phyla appeared. It was apparently a result, at least in part, of oxygen levels finally growing high enough by 550 or 540 million years ago. The iconic fossils of this time are the trilobites, arthropods with three body sections, fairly complex eyes, limbs, and large size. Even two or three feet long. But trilobites weren’t the first animals: they appeared around 520 million years ago, well after the first tiny fossilized exoskeletons from about 545 MA. There were also brachiopods, echinoderms, mollusks, sponges, and cnidarians (the latter two may have been present among the Ediacarans), but the arthropods were the most successful and numerous animals of the Cambrian.

The authors have a fascinating discussion of what I’ve always found to be a central problem with Darwinism, namely that it can’t really explain the origin of *novelty*. “The radical breakthroughs—be it the appearance of wings, legs for land, segmentation in arthropods, or even large size, the hallmark of the Cambrian explosion—could not stand up to stories about many and sudden [random] mutations all working

in concert to somehow radically change an organism.” Exactly. But apparently this problem has been solved in recent years, which, if true, strikes me as a theoretical development of the first importance. Commenting on Sean Carroll’s 2005 book *Endless Forms Most Beautiful*, they list four “secrets to innovation.” First is to “work with what is already present.” It isn’t always necessary to build new equipment; it’s easier to work with what’s already given. The second and third are multifunctionality and redundancy.

Multifunctionality first is using an already present morphology or physiology to take over some second function in addition to that for which it was first evolved. Redundancy, on the other hand, is when some structure is composed of several parts that complete some function. If one of these can be then co-opted for some new kind of job, while the remaining parts are still able to function as before, there is in place a clear path for innovation that is far easier to use than the total de novo formation of some entirely novel morphology from scratch. Cephalopod swimming and respiration are like this. Cephalopods routinely pump huge quantities of water over their gills, and like many invertebrates used separated “tubes” or designated channels for water coming in and water being expelled, to ensure that oxygen-rich water is not rebreathed. But with minor morphological “tinkering” with this excurrent tube, a powerful new means of locomotion came about. Breathing and moving could now take place using the same amount of energy by utilizing the same volume of water for respiration and movement.

The fourth “secret” is modularity. Animals built of segments, including to an extent vertebrates, are composed of modules. Limbs branching off arthropod segments have been modified into feeding, mating, locomotion, and other functions, while vertebrates’ digits have been used to walk on land, to swim, and to fly.

But more interesting than these four “secrets to innovation” is the research on the genetic “switches” that tell various parts of the body when and where to grow. The old view was that if new animals come into existence, it must mean there are new genes. Surely a sponge or a jellyfish must have fewer genes than the more complex arthropods! Wouldn’t the common ancestor of all arthropod groups have had to add new genes to those that were present in the sponges and jellyfish? No: all that was necessary was to use the already existing genes in different ways. In fact, “ten different Hox genes were all that were necessary to utterly change and diversify the arthropods.” Incredibly, the thousands or millions of different kinds of arthropod morphologies all evolved using the same toolkit of ten genes. Frankly, I don’t fully understand this part. But I’ll quote some passages anyway:

One of the great discoveries [of the recent ‘evolutionary development’ field] is that the exact sequence of different body regions on an arthropod from its head to midregion to abdomen are lined up first on chromosomes in the same geographic pattern, and then on the developing embryo itself...

...The old idea that some gene or genes of an arthropod coded for the construction of a leg is false. The Hox genes make proteins. These proteins then become the means of starting and stopping the growth of particular regions of a developing embryo. Some of these proteins are concerned with making specific kinds of appendages. If those Hox gene proteins are somehow moved to different geographic regions on the developing embryo, the product that is produced will move as well. In this way a leg that was formerly in one part of the body might suddenly be found in a totally new place—if, however, the Hox gene protein was somehow moved to the corresponding place on the embryo long before the leg was formed. Innovation came from shifting the geographic places or “zones” on an embryo that a specific Hox gene protein could be found in.

So...but how do these shifts happen? How does the organism, or the set of Hox genes, ‘know’ when it’s time for some innovation, time to change things around? Presumably there’s some sort of interaction with

the environment, some environmental trigger for novelty. But the authors don't go into this subject in any depth.

Anyway, their suggestions are tantalizing, and I'll have to do more reading on this topic. Epigenetics is surely relevant to all this.

The Cambrian ended 485 million years ago with a mass extinction (but a "minor" one that killed less than 50 percent of species). Oxygen levels had increased, and now, during the Ordovician, there was a new explosion of diversity. Coral reefs appeared, benefiting from the higher oxygen levels, and have remained one of the most significant and diverse of all ecosystems. Life spread to environments that had been poorly populated, such as freshwater lakes and both deep and shallow regions of the sea. It may be that the late Cambrian extinctions actually made possible all this new vitality: "[They] acted like gasoline on the open fire of diversification, perhaps, in that those forms that were less adaptive died out, opening the way for new innovation and new species in the same manner that ridding a garden of weeds leads to a rapid proliferation of new growth from the nonweeded." Many of the primitive and inefficient evolutionary designs from earlier were replaced, as competition killed off the less fit.

The biggest winners in the Ordovician were animals that lived in colonies, such as corals, bryozoans, and sponges. This was a new adaptation that hadn't really been present during the Cambrian. The Ordovician period ended 444 million years ago with the first of the "big five" mass extinctions, probably caused by a "little ice age" and falling sea levels that destroyed habitats.

In this period and through the Silurian, Devonian, and Carboniferous, plants and animals invaded the land. Lichens, fungi, and sheets of green microbes were on the land even a billion years ago, but it wasn't until about 475 million years ago that aquatic green algae began the evolutionary changes that would allow them to get nutrients and reproduce on land. And it wasn't until 50 million years later that the fossil record shows clear remains of plants with roots and stems—but no leaves yet. It took yet another 40 million years (around 385 MA) for plants with true leaves to appear. But then change was more rapid: by 360 MA, trees were up to 25 feet tall and forests almost completely covered the world.

This plant invasion utterly changed the nature of the land and the atmosphere. All the sand dunes and dust storms started to disappear as roots held the grit and dust of the land in place. Thicker soil formed as plants died and rotted, and "the ragged, rocky landscape that had always been Earth began to soften." By the late Devonian, atmospheric oxygen levels had shot up to 30 or 35 percent (compared to 21 percent today). And these oxygen levels allowed limbed, lungless fish to climb out of the sea and survive the hundreds of thousands of years it took to evolve an efficient, air-breathing lung.

In order for the green algal group, the Charophyceae, to come onto land it had to protect itself from desiccation. This may have been done by coating itself in the same sort of cuticle that covers its reproductive zygotes. But the cuticle cut off easy access to carbon dioxide (which, in water, had been simply absorbed across the cell wall), so it had to evolve many small holes called stomata that allowed the entry of carbon dioxide. Modern plants still have these. Meanwhile, stems evolved so that plants could grow upright and access more light in an environment where there was competition between many low-growing plants.

But why did it take tens of millions of years for leaves to appear? It seems that plants evolved the genetic toolkit to assemble leaves but then had to wait a long time to actually use them, because carbon dioxide levels were too high. The problem is that high CO₂ levels mean a very warm planet. The stomata that let CO₂ in also let water out, a process that cools the plant. In a hot climate, a lot of cooling is needed, which means a lot of stomata. But there was so much CO₂ that *few* stomata were needed to absorb sufficient carbon dioxide. A large leaf with few stomata would cause the plant to overheat to the point of death, so, in short, leaves couldn't appear until the planet was cooler. This began to happen as deeper roots evolved for stability and access to nutrients and water: deeper roots increased the chemical weathering of silicate rocks, which drew CO₂ out of the atmosphere and cooled the climate. So the land became full of plant life that animals could eat, as the atmosphere was full of oxygen for them to breathe. It was time for the next big step.

Arthropods were well-adapted to be the first on land, since their exoskeletons could protect them from desiccation. But they still had to evolve proper respiratory structures. The pioneers certainly had less efficient such structures than later species, but air can diffuse across the body wall of very small land

animals, so this was a help. What the first land spiders and scorpions evolved was a book lung, so called because of its resemblance to the pages of a book. (“A series of flat plates within the body have blood flowing between the leaves. Air enters the book lungs through a series of openings in the carapace.”) It seems that proto-scorpions with water gills came onto land 430 million years ago (perhaps scavenging on dead animals that had washed up onto beaches), followed by millipedes and insects 10 and 20 million years later. Flying insects existed 330 million years ago, by which time oxygen levels had reached modern-day levels and were climbing to record heights.

The vertebrate transition to land is a complicated story. The famous *Tiktaalik*, which was a fish with a flattened head and sturdy interior bones and limb-like fins with which it could prop itself up in shallow water, may have been an ancestor of the amphibians that lived their whole adult lives on land. It existed about 375 million years ago. (The Devonian, from 416 to 359 MA, has been called the Age of Fish.) More generally, the rhipidistians, lobe-finned fish some of which still exist (such as the living fossils called coelacanths), appear to have been the ancestors of the first amphibians. Still-living lungfish shed light on the transition from gill to lung.

It’s possible that the first amphibians evolved about 400 million years ago, although the first tetrapod bone fossils (as opposed to tracks) are 360 million years old. *Ichthyostega*, from around this time, was a genus that was a kind of proto-amphibian, which like several other similar genera existed soon after the devastating late Devonian mass extinction (caused by a drop in atmospheric oxygen that created widespread anoxia in the seas). It didn’t lead to an evolutionary radiation of amphibians, however; within a few million years, it and the other pioneering tetrapods for some reason disappeared. It wasn’t until 340 or 330 million years ago that amphibians were widespread. *Pederpes*, from about 350 MA, may have been the first true amphibian, since it had the legs necessary for land life.

In short, “The evidence at hand suggests that the evolution of the amphibian grade of organization, essentially a fish that came on land, may have taken place twice, or even three times, the first being some 400 million years ago as evidenced by the *Valentia* footprints as well as the *Tiktaalik* fossil discovery, and the second some 360 million years ago, and the last some 350 million years ago.”

Moving on...the next really interesting ‘phase’ of life is the time when giants reigned, during the Carboniferous and the first half of the Permian periods. Between 320 and 260 MA, atmospheric oxygen reached the highest levels in Earth’s history, making possible huge arthropods (and amphibians). Dragonflies with 30-inch wingspans, spiders with 18-inch legs, six- or seven-foot-long millipedes and scorpions. But why was there so much oxygen? “When a great deal of organic matter is buried, oxygen levels go up.” In fact, 90 percent of the Earth’s coal deposits are found in rocks of the time period mentioned a moment ago. The Carboniferous was the time of forest burial “on a spectacular scale” (as trees were spreading to new areas)—as well as the burial of plankton, which produced huge amounts of both oxygen and carbon at the bottom of oceans. Another piece of the puzzle is that

...[b]ack in the Carboniferous, many or perhaps all of the bacteria that decompose wood were not yet present, with the key to this the seeming inability of microbes to break down the main structural component of wood, the material lignin. Trees would fall and not decompose back then. Eventually sediment would cover the undecomposed trees, and ‘reduced’ carbon was buried in the process. With all of these trees (and the plankton in the seas) producing oxygen through photosynthesis, and very little of this new oxygen being used to decompose the rapidly growing and falling forests, oxygen levels began to rise.

Eventually you got massive arthropods as a result.

It was also in this time that reptiles evolved, which, unlike amphibians, laid amniotic eggs. (They didn’t have to lay eggs in water.) This was around 310 MA or earlier. Fairly soon thereafter, “three great stocks of reptiles had diverged from one another to become independent groups: one [synapsids] that gave rise to mammals, a second [anapsids] to turtles, and a third [diapsids] to the other reptilian groups [such as dinosaurs, lizards, snakes, etc.]—and to the birds.”

Regarding mammals, the authors suggest, somewhat whimsically, that there were three “ages” of mammals. First was during the Permian, the heyday of therapsids: technically these weren’t mammals, but they were close, as you can see from pictures on Google. For instance, their legs weren’t so splayed out to the side as in modern lizards but were under the trunk of the body, making possible a more upright position. Also, the therapsids were probably warm-blooded. They included the cynodonts, which gave rise to modern mammals. Second was the time between the late Triassic and the end of the Cretaceous, when small mammals lived in the shadow of the dinosaurs, usually creeping around at night, in burrows or in trees. Third was the real “age of mammals,” after the mass extinction that decimated the dinosaurs. –So mammals have been quite resilient. At least until *homo sapiens* emerged, a species that may well kill off most mammals in the next century or two.

And then, 252 million years ago, occurred the greatest of all mass extinctions, the Permian extinction. About 90 percent of species were snuffed out. The extinction itself, or at least the most deadly phase of it, may have lasted no more than 60,000 years. Trilobites were killed off, though they had been declining for a long time.

What caused the cataclysm? First, colossal volcanic eruptions in Siberia likely ejected large amounts of CO₂ into the atmosphere, causing global warming, as acid aerosols blocked out sunlight and caused acid rain. The Wikipedia article on the event notes that massive coal beds may also have ignited, which could have released more than 3 trillion tons of carbon. To make things even worse, all this emission of carbon could have led to severe anoxia in the oceans, which would have permitted sulfate-reducing bacteria to thrive. Huge amounts of hydrogen sulfide would have poisoned the water and bubbled up into the atmosphere. Bad enough in itself, this would have weakened or destroyed the ozone layer, exposing much of the life that remained to fatal levels of UV radiation. And so on. It was a pretty hellish time.

The first few million years of the Triassic weren’t much better. Temperatures in the ocean were an incredible 110°F, and on the land they were around 140°. Not much could survive these temperatures. “The entire zone of the tropics would have been devoid of animals, and complex life would have hung on only at high latitudes.” But it was a paradise for sulfur-loving, oxygen-hating microbes.

Later in the Triassic, mammals and (especially) dinosaurs started to become more prominent—though it wasn’t until the Jurassic that the Age of Dinosaurs arrived. But even before this, an amazingly diverse assemblage of life appeared:

In some ways it was not unlike the Cambrian explosion—a slew of newly invented body plans filling up an empty world, just as the first animals rapidly evolved into the cornucopia of body plans that filled the seas after the extinction of the first animals, the Ediacarans. And like the great Cambrian explosion, many of the body plans of novelty turned out to be but short-term experiments, to be pushed into extinction by the competition and/or predation of better-designed organisms. There is no time period other than the Cambrian and Triassic in which such a diversity of new forms appeared.

The main reason is just that the world was so empty that virtually any new design would work, at least for a while. But the authors also suggest that times of low oxygen, like the Triassic, foster a diversity of new body plans. “Body plans were being evolutionarily modified by intense selective pressures, and dominant among these was the need to access sufficient oxygen to feed, breed, and compete in a low-oxygen world.”

In the sea, “new stocks of bivalve mollusks took the place of the many extinct brachiopods, while a great diversification of ammonoids and nautiloids refilled the oceans with active predators. Fully a quarter of all the ammonites that ever lived have been found in Triassic rocks, a time interval that is only 10 percent of their total time existence on Earth... A new kind of coral, the scleractinians, began to build reefs, and many land reptiles returned to the sea.” On land, therapsids diversified and competed with archosaurs and many kinds of reptiles. Dinosaurs emerged about 235 million years ago, but remained rather rare and small for over 30 million years.

In an atmosphere with little oxygen, certain adaptations evolved. To breathe as efficiently as possible, the ancestors of dinosaurs and birds adopted bipedalism. “By removing the quadruped stance, they were freed of the constraints of motion and lung function.” Ancestors of mammals, on the other hand, evolved a secondary palate, which allows simultaneous eating and breathing. (The nasal cavity is separated from the oral cavity.) They also grew a new powerful set of muscles called the diaphragm, which allowed a more forceful system of inhaling and exhaling.

Meanwhile, many reptiles solved the problem of living in a hot, low-oxygenated world by returning to the cooler sea. (A high temperature entails a high metabolic rate—a high rate of using energy—which means the animal needs more oxygen to fuel the metabolic processes. Since there were low oxygen levels in the Triassic, one solution was to move to the relatively cool oceans.) Ichthyosaurs, placodonts (like large seals), eventually plesiosaurs, etc.

But then 200 million years ago there was another mass extinction, and the Triassic came to an end. Another volcanic event, probably, led to skyrocketing CO₂ levels and a lethal greenhouse effect. Every group except the saurischian dinosaurs either died out or got smaller over this period, which had the lowest oxygen levels of the last 500 million years. Why did the saurischians do better than the others, even expanding their numbers? The authors argue it’s because they were “unique in possessing a highly septate lung (one with many tiny flaps to increase surface area) that was more efficient than the lungs of any other lineage... [I]n the very low oxygen world that occurred both before and after the Triassic-Jurassic mass extinction, this respiratory system conveyed great competitive advantages.” The Age of Dinosaurs began.

It didn’t start out very auspiciously, though:

...At the beginning [of the Jurassic], it was a shattered world: a world again coming out of mass extinction; a world without coral reefs; a world where the dinosaurs were still few in number, species, and size; a world of such low oxygen that insects could barely fly, but to no matter, as no vertebrate flier could have caught them anyway.

By the end of the Jurassic the largest land animals of all time were common: dinosaurs were lords of all creation; tiny primitive birds and tinier primitive mammals hid in the lowest-rent districts in town. At the beginning the seas were so bare that stromatolites had made a comeback, and the larger fish and predators were few indeed.

By its end there was a veritable cornucopia of the most spectacular marine denizens to have ever populated the sea: long-necked reptilian plesiosaurs, dolphin-like ichthyosaurs, and splendid primitive fish—similar to the modern-day gar and sturgeon (both with strange body armor)—schooled among vast coral reefs and an ocean filled to exuberance with all manner of ammonites and their more squid-like relatives, the belemnites...

With regard to dinosaurs, the authors don’t focus on well-known facts like that birds evolved from them (or, in fact, *are* them—dinosaurs still exist!) or that because of their dominance mammals “retreated in size and numbers to become a minor aspect of the land fauna.” They’re trying to write a *new* history of life, after all. So, in keeping with their overall argument that levels of carbon dioxide and oxygen have been some of the most important variables for life on this planet, they suggest that both dinosaur numbers and size increased as oxygen levels rose through the Jurassic and Cretaceous periods.

...By the end of the Cretaceous (in the Campanian age, 84 to 72 million years ago) there are hundreds of times more dinosaurs than during the Triassic to late Jurassic. So what was the cause of this great increase? The relationship suggests that oxygen levels played a role in dictating dinosaur diversity. Through the late Triassic and first half of Jurassic, dinosaur numbers were both stable and low, as was atmospheric oxygen when compared to today’s values. Gradually, oxygen rose in the Jurassic, hitting 15 to 20 percent in the latter part of the period. It is only then that the numbers of dinosaurs really began to increase. Oxygen levels steadily climbed through the Cretaceous, and so too did dinosaur numbers, with a

great rise in dinosaur numbers found in the late Cretaceous, the true dinosaur heyday. The dramatic rise in oxygen at the end of the Jurassic was also the time that the sizes of dinosaurs increased, culminating in the largest-known dinosaurs appearing from the late Jurassic through the Cretaceous.

Other factors must have played a role too, such as the appearance of angiosperms (flowering plants) in the mid-Cretaceous, which created more plants and sparked an insect diversification. More resources became available in all ecosystems.

Another interesting observation is that dinosaurs, or at least many of them, had the same highly efficient air-sac system of breathing that birds do, and the same hollows in their bones in which the air sacs rested. (Birds are far more effective at extracting oxygen from air than mammals, and dinosaurs must have been too.) They were also warm-blooded, like birds: they could generate heat in their bodies without external heat sources.

The chapter on the Mesozoic oceans I don't find particularly gripping, so let's skip to the chapter on the extinction of the dinosaurs. This event, of course, was caused by an asteroid impact. It led to a several-month period of darkness from all the material thrown into the atmosphere, which was long enough to kill much of the plant life on Earth, including plankton. "With the death of the plants, disaster and starvation rippled upward through the food chains." In addition, for a number of years solar energy transmission to Earth was reduced through absorption by aerosols, which produced a decade of near-freezing temperatures in a world that had been largely tropical. More than half of the species died out.

But now the mammals and birds had their chance to shine. The earliest-known mammals were tiny, shrew-sized things called morganucodontids, living about 210 million years ago in the late Triassic. "Much of mammalian success came from anatomical change, including the separation of the jaw and the ear bones, which allowed the skulls of later mammals to expand sideways and backward, a prerequisite for bigger brains. But the most important of all innovations was the revolution of mammalian teeth. The upper and lower molars of morganucodontid jawbones interlocked, letting them slice their food into pieces." The two major groups of mammals today, marsupials and placentals, diverged 175 million years ago.

So all kinds of new and larger mammals were appearing after the K-T asteroid impact...until once again, 9 million years later, there was a mass extinction. A greenhouse event, such as we're experiencing today, known as the Paleocene-Eocene Thermal Maximum (PETM). It isn't clear what caused it, though it surely involved raised methane levels, but the actual event lasted 10,000 or 20,000 years and raised global temperatures by 5° to 8° Celsius. According to Wikipedia, this warm period lasted about 200,000 years. Among plants, the gymnosperms (conifers, etc.) disappeared...but then after it was all over they reappeared. Old insect species eventually came back to life too, after seemingly going extinct for a while. But the mammals that died out didn't return; instead, the PETM marked "the start of our modern-day mammalian fauna." For instance, many marsupials and carnivorous ungulates (hoofed mammals) went extinct, while, afterwards, more modern herbivorous ungulates and carnivores preying on them appeared.

Gradually the world cooled:

From the Eocene to the start of the 23.5–5.3-million-year-ago Miocene epoch, the world slowly began to cool. At first, during the Eocene, this was almost imperceptible, and in fact there was a global tropical forest with crocodiles living inside the present-day Arctic Circle. But in the Oligocene this cooling accelerated, creating a different kind of major climate, and changing what had been a near uniform global climate to one with extreme seasonality. At the same time, giant continental ice sheets began to form on Antarctica, and probably Greenland as well. These swelling ice sheets caused a rapid and dramatic fall in sea level. At higher latitudes, forests gradually gave way in many places to grassland meadows and savannas...

This brings us, finally, to modern ecosystems. The primates, naturally, are the animals that interest us. They date well back into the Cretaceous, some of the earliest belonging to the lemur branch. The

Purgatorius genus, luckily for us, survived the K-T extinction; by 45 million years ago, more advanced anthropoids (which today include monkeys, apes, and humans) existed in Asia. Ten million years later, smarter, larger, and more aggressive monkeys existed, such as *Catopithecus*, which “has a skull the size of a small monkey’s, a relatively flat face, and is the first primate to sport the same arrangement of teeth humans have—two incisors, one canine, two premolars, and three molars.”

The hominids arrived five or six million years ago with the appearance of the famous Lucy and her kind, *Australopithecus afarensis*. The most important descendant of the early pre-Pleistocene hominids is the first member of our genus, *Homo habilis*, about 2.5 million years old. “This creature gave rise to *Homo erectus* about 1.5 million years ago, and *H. erectus* either gave rise to our species, *Homo sapiens*, directly about 200,000 years ago, or through an evolutionary intermediate known as *Homo heidelbergensis*. Our species has been further subdivided into a number of separate varieties. Some workers consider the Neanderthals to be a variety, while others interpret it as separate species, *Homo neanderthalensis*.”

The first fairly modern *Homo sapiens* lived 200,000 years ago in Ethiopia. Soon this group migrated out of Africa and spread around the world, the different habitats leading to slightly different morphologies and physiologies among members of the same species.

Over the past 2.5 million years, because of orbital changes Earth has undergone, ice ages have repeatedly occurred, the more recent interglacial periods on average lasting about 11,000 years. They haven’t been anything like Snowball Earth, but they’ve been cold enough. “As late as fourteen thousand years ago, the continental glaciers covering most of Canada and large portions of what is now the United States were still slowly melting under gradually rising temperatures.” After the end of the last ice age, human populations began to increase markedly. By 10,000 years ago, humans had colonized all of the continents except Antarctica.

Meanwhile, in fact for the last 50,000 years, other changes were happening: the larger mammalian species were disappearing. For example, in the Late Pleistocene epoch of 15,000 to 12,000 years ago, a significant proportion of large mammals in North America went extinct. “At least thirty-five genera (and thus at least this number of species) became extinct. Six of these lived on elsewhere (such as the horse, which died out in North and South America but lived on in the Old World). The vast majority, however, died out. In fact, most belonged to a wide spectrum of taxonomic groups, being distributed across twenty-one families and seven orders.” For thousands of years we’ve been in the midst of a tenth mass extinction. Which, of course, is accelerating now.

One reason for these extinctions may be that climatic changes have caused nutritious plants in North America and elsewhere, such as willow, aspen, and birch trees, to shrink in numbers and give way to the less nutritious spruce and alder groves. Another reason is probably that humans hunted species to extinction.

In South America, 15,000 to 10,000 years ago 46 genera went extinct. In Australia, earlier and over a longer period of time, 45 species of marsupials died out. Large reptiles also vanished, including a giant snake, a giant monitor lizard, a giant tortoise, etc. “The larger creatures that did survive were those capable of speed or those that had nocturnal habits.” Africa was the continent least affected. “The loss of large mammalian genera in North America was 73 percent; in South America, 79 percent; in Australia, 86 percent; but in Africa, only 14 percent died out during the last hundred thousand years.”

What does the future hold? The very long-term future isn’t in doubt: life on Earth is doomed. The sun’s energy output has been increasing for billions of years and will continue to do so. The sun won’t become a red giant until about 7.5 billion years from now, but life will be long gone by then, maybe by half a billion years from now. The sun will just be too bright and energetic for organisms to survive here; in fact, oceans will evaporate (though after life disappears), and conditions will approach those on Venus.

Another problem is that CO₂ levels have been slowly but inexorably decreasing for at least a billion years. “The lowering levels are because of both life and plate tectonics: as more and more CO₂ is used to make the skeletons of organisms, especially in the oceans, CO₂ is consumed. If these skeletons stay in the oceans, the skeletally confined CO₂ (now in calcium carbonate) will recycle. But plate tectonics makes the continents ever larger, and an increasing amount of limestone, which is the grave of atmospheric CO₂, becomes locked to the continents as sedimentary deposits.” The decrease of carbon dioxide won’t lead to a

colder planet, because the increase of the sun's intensity will utterly dwarf the cooling effects of diminishing CO₂. (Needless to say, carbon dioxide emissions from human activity will not stop the long-term trend of disappearing atmospheric CO₂.)

A low-CO₂ atmosphere will kill off photosynthetic organisms (which will, in turn, reduce oxygen levels). For a long time, plants will be able to adapt; there will even still be types of plants when carbon dioxide concentrations have dropped to as low as 10 ppm. "Eventually, however, even these last holdouts will die out." Phytoplankton will be devastated too, thus devastating all marine life. After all plants and animals have gone extinct, those hardy creatures the bacteria will still be around. Cyanobacteria, for instance. Meanwhile, the Earth will look more like it did early in its history: soils will blow away, leaving behind bare rock surfaces. The mechanical weathering of rock will build up an enormous volume of blowing sand, and the surface of the planet will become a giant series of dune fields.

It's a rather bleak future. It'll be as if life never existed. Everything that's happened—gone. No wonder people want to believe in God.

Anyway, there you have it. A summary of life's evolution. What humanity's future holds is anyone's guess, though personally I'm not very optimistic. Turning from this book to the political headlines of today is like turning one's gaze from the night's canopy of stars to a small mass of writhing maggots. The little things of the present are just so *little* compared to the grand sweep of life's history.

But we must press on, and try to influence the future using what we've learned from the past.

Closed borders and democratic theory

You may have noticed that the question of immigration is on people's minds lately (as it has been, almost without interruption, since the mid-nineteenth century;—ugh, the repetitiveness and predictability of history). The whole "border crisis" is absurd: the only crisis is a humanitarian crisis, and it could be solved simply by abolishing ICE, diverting more resources to processing immigrants ("legal" and "undocumented"), reforming the punitive nature of border control, and changing American foreign policies so as to support the democratization and development of countries from which migrants are fleeing (largely as a result of past American foreign policies). None of this will happen, since we live in a dystopia controlled by reactionaries, proto-fascists, and big business. But it's always worth remembering that, in principle, the solutions to any given social problem are (in nearly all cases) pretty clear. The reason they can't be enacted is that the powerful, despite what they might say, aren't interested in solutions. They're interested in the path of least resistance, and in maintaining their own power.

I thought I'd post something about border policies, not because I have anything new to say on the subject but because I recently came across an interesting article by a political theorist named Arash Abizadeh, "[Democratic Theory and Border Coercion: No Right to Unilaterally Control Your Own Borders](#)" (2008). Full disclosure: Abizadeh was a professor of mine at Wesleyan University. Few of us students thought much of him as a professor, but after reading his paper I have to admit he's at least capable of compelling argumentation—for the morally right conclusion, moreover. I decided to translate his arguments into non-academese for any interested reader, since I think they're of more than merely academic interest.

My own opinion, for what it's worth, is that the politically fraught question of immigration should be a non-issue. It's a nice tool for proto-fascists to rile up masses of ignorant people and get them to vote for politicians who are interested only in increasing repression and empowering the wealthy, but that's all it is. What should happen, ideally, is that borders become ever more porous, in the long run heading toward a regime of open borders (to the extent possible), since freedom of movement should be a fundamental human right and immigration is [far from harmful](#) to a domestic economy or society. If there were more global freedom of movement, moreover, it's possible that states would begin to implement more humane and progressive social policies, since otherwise they might lose some of their population to countries that did have such policies. Instead of the neoliberal race to the bottom, there might be something like a race to the top.

Wage levels would tend to equalize everywhere, which would be good for low-wage countries and bad for high-wage countries—but, at the same time, it would likely be easier to organize a global labor movement, which would be good for the non-rich everywhere. In the very long run, the nation-state system itself should be dismantled to the degree possible, since nation-states are violent, authoritarian, illegitimate entities.

Anyway, let's get to Abizadeh's article...

Usually we think of a country as having the right to unilaterally control its own border policy, subject only to democratic input from its citizens, not from foreigners. What foreigners want doesn't matter because they're not members of the state. Many commentators reject unilaterally closed borders, or restrictive and punitive border policies, on the grounds of liberalism, which is committed to universal human rights, individualism, freedom of movement, and so on. (Some, such as Frederick Whelan, even argue that "liberalism in its fully realized form would require the reduction if not the abolition of the sovereign powers of states...especially those connected with borders and the citizen-alien distinction"—a position Chomsky and many other anarchists advocate, since liberalism after all is just supposed to mean a regime of individual freedom, which is what anarchism means.) Abizadeh, however, chooses to argue against unilateral border policies on the basis of *democratic* grounds, not liberal grounds. This is what makes his paper novel and interesting, since, *prima facie*, it would seem that considerations of democracy are in tension with those of liberalism: democracy supposedly "requires a bounded polity whose members exercise self-determination, including control of their own boundaries." Liberalism is universal, democracy is particular and bounded. So how can you use democratic theory to argue *against* unilaterally closed borders?

It's simple: argue that "the demos [the community, the people] of democratic theory is in principle *unbounded*, and the regime of boundary control must consequently be justified to foreigners as well as to citizens." This is Abizadeh's conclusion. Whether a state recognizes or denies (to foreigners) the legal right to freedom of movement, to the degree that it is democratic it can only arrive at its policy as "the result of democratic processes giving participatory standing to foreigners asserting such a right [to freedom of movement]." What these democratic processes would look like is an open question, but they would involve international or supra-state organizations of some form or other.

Of course, one is free to reject Abizadeh's arguments, but (if his arguments succeed) to that extent one is an authoritarian, not a democrat.

The core of the argument is very simple. According to democratic theory, a state's coercive powers (involving coercive acts and coercive threats) have to be democratically justified to all those over whom they are exercised, which is to say the members of the demos must have the opportunity to participate in political decision-making on a free and equal basis. But a country's regime of border control subjects both members *and nonmembers* (non-citizens) to state coercion. "Therefore, the justification for a particular regime of border control is owed not just to those whom the boundary marks as members, but to nonmembers as well."

The obvious objection to this argument is that, even if foreigners are subject to coercion, justification is owed only to citizens, since foreigners have no political standing in the state. It seems to me that this objection reveals an unattractive and illiberal comfort with treating any non-citizen in an authoritarian or even brutal way (remember, that's how the Nazis could "legally" exterminate Jews: they had deprived them of citizenship), but be that as it may, Abizadeh points to a more serious logical flaw: the objection's presupposition, that the demos is inherently bounded, is incoherent.

It's an argument that Whelan makes: how can a state *democratically* determine its own civic (and territorial) boundaries, the boundaries of the demos? Who are the people who will vote on this question of membership? You'd have to somehow determine the membership of the group that is entitled to vote on the question in the first place—but how do you decide this second-order membership question? It would itself need to be voted on. Ultimately you get an infinite regress. As Whelan says, "the boundary problem is one matter of collective decision that cannot be decided democratically... We would need to make a prior decision regarding who are entitled to participate in arriving at a solution... [Democracy] cannot be brought

to bear on the logically prior matter of the constitution of the group itself, the existence of which it presupposes.”

As Abizadeh comments, the problem is that “democratic theory *requires* a democratic principle of legitimation for borders, because borders are one of the most important ways that political power is coercively exercised over human beings. Decisions about who is granted and who is denied membership, and who controls such decisions, are among the most important instances of the exercise of political power”—especially given the incredibly brutal nature of modern border controls (involving police dogs, electric wires, incarceration, deportation, torture, shooting on sight, etc.). By the very act of constituting the state’s civic and territorial borders, you’re disenfranchising large numbers of people—“outsiders”—over whom power is exercised. But this violates democratic theory.

(And if you look at history, you’ll find that no state, including no “democratic” state, has ever been founded democratically. Civic and territorial borders are always created by means of violence, and are policed very violently.)

If you abandon the “bounded demos” thesis, however, the incoherence disappears:

An alternative reading of democratic legitimacy comes into view: the view that political power is legitimate only insofar as its exercise is mutually justified by and to those subject to it, in a manner consistent with their freedom and equality... The democratic principle of legitimacy requires replacing coercive relations with relations of discursive argumentation, and legitimating the remaining instances of coercion by subjecting them to participatory discursive practices of mutual justification on terms consistent with the freedom and equality of all. On this view, democratic theory *does* provide an answer to the boundary question: the reach of its principle of legitimation extends as far as practices of mutual justification can go, which is to say that the demos is in principle unbounded.

Therefore, a regime of border control can be legitimate only if there are international democratic institutions in which both citizens and foreigners can participate to determine what the border policies will be. (Actually, it seems to me that Abizadeh’s arguments call into question the very existence of borders except insofar as “foreigners” and “citizens” can vote on who will be entitled to be a citizen and where the territorial border will be drawn. But he doesn’t draw this conclusion, for some reason.)

I’d note here that in the absence of such international institutions (in which foreigners can help determine what will be a given country’s border policies, to which they are coercively subjected), the most democratic option would be to adopt a maximally permissive and open border policy, since this reduces the element of coercion. People who oppose this conclusion, or Abizadeh’s arguments, are not “good democrats” standing up for their own country’s right to self-determination (right to determine its own policies); they are authoritarians comfortable with coercing masses of people who have had no role whatsoever in determining the policies to which they’re subjected.

The remainder of the article is concerned with answering objections based on the “self-determination argument for unilateral border control” (the argument I just mentioned, that a country has a right to determine its own policies). Abizadeh’s strategy is to argue that the self-determination argument is incompatible with the most plausible liberal and democratic arguments for the very existence of borders (separate countries) in the first place. So if you accept any of those arguments, you’re logically compelled to *reject* the self-determination argument.

For example, liberals are, rightly, afraid of “concentrated political power and its potential to breed tyranny.” One way they have tried to thwart this potential is by dividing and dispersing power (as in the “checks and balances” American system of government). Well, the worst tyranny of all would be a global tyranny. So, many liberals see “a plurality of political units [countries] as a crucial bulwark against tyranny,” in that it makes a global tyranny impossible. Okay, so far so good. But how do unilaterally closed borders help counteract the threat of a global tyranny? If tyranny is bad and individuals should have the right to escape it, there should be relatively *open* borders that hold out the promise of safe haven for refugees fleeing a tyranny. Thus, if you accept this particular liberal argument for the existence of separate countries, you’re bound to reject the argument for closed borders.

Anyway, I think you get the point. The main value of the article is in providing some theoretical points to make against (unilateral) closed-border advocates. These people are not democrats.

But, frankly, that should have been obvious all along. ICE is hardly a “democratic” agency. I also doubt that any academic article, or the arguments it makes, can sway the minds of more than a micro-fraction of conservatives, since very few of these people are susceptible to reason or questions of principle (much less compassion). Nevertheless, more highly evolved people can find food for thought in the occasional scholarly article.

Notes on a radical interpretation of the Cold War

I’ve been reading Gabriel and Joyce Kolko’s classic *The Limits of Power: The World and United States Foreign Policy, 1945–54* (1972). Being a brilliant materialist analysis that’s utterly indispensable to an understanding of the postwar world, the book is out of print and hard to find anywhere. It’s a massive tome, but I thought I’d quote here just a few necessary correctives to the bromides and platitudes of mainstream liberal scholarship. (Almost by definition, liberal historians are worse at their craft—more superficial and ideological—than radical historians, because the latter get to the *root* of the matter, as is suggested by the etymology of the very word ‘radical.’) The overall purpose of the book is to delineate how the U.S. tried to reconstruct the postwar world in ways favorable to capitalism and the country’s own hegemonic, imperialistic power.

Quoting the authors (p. 6):

We have not written a book about the “Cold War,” an egregious term that burdens one’s comprehension of the postwar era with oversimplifications and evokes the wrong questions. At best, that unfortunate phrase describes United States–Soviet diplomacy in the narrowest context, as if that relationship subsumes most that is crucial in the history of our times. It gives us no framework within which to understand the fact that the postwar experience, the formal cold peace between Russian and the United States notwithstanding, has been one of conflict, war, repression, and ever-mounting violence. That process has occurred despite literal peace between Russia and the West essentially because the larger, more significant context for understanding postwar history is the entire globe and the revolution, the counterrevolution, and the great, often violent, interaction between the United States, its European allies, and the vast social and economic transformation in the Third World that is the defining fact of our world [in the early 1970s]. It is only in this context that Soviet-American relations should be placed, and it is here that the limits of the notion of the Cold War become most apparent. For that static concept conditions us not to probe further the real character of the forces of intervention and expansion—and therefore violence—in our times. It minimizes the nature and causes of mankind’s fate today, leading us to believe that conflict and violence are accidental rather than inevitable consequences of the objectives of American foreign policy and the imperatives it has imposed on movements of social transformation throughout the world.

To approach the history of the postwar world as if Soviet–American rivalry encompasses its major theme—a notion implicit in the term ‘Cold War’—is to leave most of the crucial dimensions of our epoch off to the side of any picture in a bewildering, disconnected profusion. Such a specialized focus leads to myopia, for the bulk of the crucial events of our time are interrelated, and one cannot truly understand anything without comprehending a great deal more than United States–Soviet diplomacy. This global context, and the goals motivating the conduct of American foreign policy, are the main subject of our book...

It’s a little sad that even today, students are taught the history of the late 1940s to the late 1980s through the lens of the “Cold War.” It’s certainly a convenient way to teach, since the rhetoric and ideology of “Communism vs. anti-Communism” was so common in these decades, to some degree providing a framework for politics and culture in most of the world. “The Russians are coming!” was a ubiquitous war-

cry for conservative and liberal (not left) policymakers and intellectuals, used to justify a whole array of values and goals they held. And it did deeply influence society and culture, beating people into line, disciplining the labor movement and marginalizing dissenters. The Manichean worldview did incalculable damage to progressive hopes around the world, and was of incalculable benefit to reactionaries and neofascists. But rhetoric and ideology are, in the end, superficial and misleading. American goals and policies would have been substantially the same had there been no Soviet Union. The latter provided a very useful pretext to pursue policies that were in the interest of American capitalism, more particularly of the ruling class. After the Cold War, new rationalizations were immediately thought of to justify the same astronomical levels of defense spending and the same interventions around the world: the war on drugs, the war on terrorism, the clash of civilizations, spreading freedom and democracy, etc. It's always the same old bag of ideological tricks, amounting to the same old refrain "Us vs. Them!" During the "Cold War," the Them were the "Communists" (whatever that word is supposed to mean). But you can insert into the Them space whatever plausible enemy you want, whenever you want.

Whatever the official rhetoric, the fact is that it was the U.S. that was the massively expansionist power, not the Soviet Union or China. It was capitalism that was, and is, expansionist. Since capitalism, or imperialism, amounts to a whirlwind of repression, it provoked resistance everywhere. And it was convenient to call this resistance "Communism!" (Cue the hysterical shrieks.) "It's the Russians! They're behind it!" But the real conflict wasn't between the Soviets and the U.S. The Soviet Union was a rather minor power compared to America, fearsome only within its narrow zone of Eastern Europe and Central Asia. The real conflict was between capitalist imperialism and the worldwide resistance it engendered. And that remains the real conflict to this day, as it was long before the Cold War.

For the conventional, superficial liberal interpretation, on the other hand, you can consult Odd Arne Westad's celebrated book *The Global Cold War: Third World Interventions and the Making of Our Times* (2005). It's a tour de force of historical misinterpretation, shallow idealism that has the heroic naïveté to take at face-value the rhetoric of every mediocre politician.

The Kolkos' analysis of the famous Marshall Plan is a beautiful refutation of the liberal mythology, providing one case-study in a book that's full of them. As they say, "Since 1947 the public, as well as subsequent scholars, has regarded the Marshall Plan as an expression of the unprecedented generosity of a powerful nation rebuilding its potential economic competitors from the ruins of war and spreading the bounty of American production to the ravaged people of Europe. Even otherwise critical historians have discussed the program in terms of enlightened self-interest and as an effort to forestall Communist penetration by raising the living standards of the masses in Europe and to reestablish normal trading patterns through which the entire world would realize prosperity and peace." The usual liberal pablum.

The book's chapters on the Marshall Plan are far too lengthy and rich to be discussed or quoted in much depth here. But I have to give you a taste of them. The concern of U.S. policymakers was that European capitalism be reconstructed in a way that would benefit American interests. For one thing, without a major aid program, it was feared that American exports would plummet. But so, perhaps, would imports. As Averell Harriman told the Senate in 1947, for instance, "the decline of Europe would require far-reaching readjustments of agricultural and industrial production in this country and in other areas. It might well affect our ability to obtain needed imports and, particularly, essential raw materials..." From internal memos, papers, and policy statements, it seems that policymakers weren't particularly worried about the spread of Communism in Europe; they only invoked that theme in public statements and addresses to Congress in order to get a reluctant public and Congress behind a large program of aid. ("We have to stop Communism! It's a crisis over there! We don't have much time left!") Nor did the Truman administration care about raising the living standards of the European masses. In fact, its political and economic agenda was almost consistently to *lower* living standards, or at least prevent their rise.

"America's intention to shape Western Europe's economic policies was the critical fact of the [Marshall Plan] from the beginning." (The plan began to be implemented in mid-1948.) "Washington did not propose merely to fill Europe's shopping list, and the initial thrust of United States policy was in manipulating European fiscal affairs." But this manipulation was flawed from the start: the Economic Cooperation Administration, the American agency that administered the Marshall Plan, had contradictory

goals. On the one hand it desired the industrial reconstruction and renewed prosperity of Europe, while on the other hand it wanted monetary conservatism and balanced budgets. The ECA continually pressured European governments to enact deflationary economic policies—which were incompatible with a return to full prosperity and full employment. So, in part because of this, the Marshall Plan ended up partially failing.

To a very real extent, the ECA went beyond the needs of the American economy for stable markets, and pressed orthodox [conservative] policies on governments... The first result was to strengthen those conservative political forces in Europe that desired a similar program. The ECA, in its general financial policy, introduced strict banker's criteria of balanced budgets, stable currencies, high profits to entice investment, and low wages to discourage consumption. Public pronouncements aside, the American administrators believed that it was essential to keep internal mass living standards at a low level in order to have a surplus for export and to limit imports so as not to upset further the balance of payments. The European governments were now required to restrict their expenditure in social welfare and subsidies in order to balance the budget, and the American advisers always maintained that "excess egalitarianism" in taxation policy suppressed incentive... In Italy, Germany, France, and the Benelux, profits over the first year rose far out of proportion to any other index of reconstruction, and the contours of the old order gradually reemerged in their solid, traditional form...

In West Germany, for example, in mid-1948 there was a currency reform that limited the amount of money in circulation, hurting low-income groups and benefiting many businesses. Profits skyrocketed while real wages fell sharply and unemployment nearly doubled by December 1948. Tax reform and tightened credit further hurt workers and enriched the wealthy. Ultimately, "the economic outcome was not the reconstruction of German industrial power, but rather the full restoration of the propertied class" (p. 435). Meanwhile, Americans put former Nazis in control of German heavy industry (especially in the Ruhr) and made sure industries wouldn't be nationalized, as some had been in Britain.

"The governments of Belgium and Italy introduced economic policies similar to those in Germany, with much the same results. The Italian government successfully reduced its balance of payments and budget deficits and renewed confidence in the value of the lira. The economy continued its deflationary trend..." In France, throughout 1947 and '48 workers' standard of living declined: the average wage barely covered essential food. Large strikes and revolts were crushed. "It was ultimately cheaper to crush a strike, split the unions, and repress the workers than to pay the price of a higher standard of living which the French government and the ECA saw as an unacceptable inflationary thrust that would shatter their plans for a balanced budget, trade surplus, high profit, and 'reconstruction' conforming to their capitalist model."

By the way, readers familiar with neoliberalism will notice that the economic agenda of the ECA was pretty much the same as that of the IMF (with its structural adjustment programs that have done so much to decimate the Third World since the 1970s): downsizing welfare states, undermining unions, privatizing public property, tightening credit, encouraging exports, etc. Coincidence? I think not.

As for the materials that Europeans bought from U.S. suppliers through the Marshall Plan, in many cases they were simply compelled to buy whatever American policymakers and industries forced on them. (And this was after the initial European request for \$29 billion had been slashed to \$13 billion over a four-year period. So much for American generosity.) "During the first year the ECA cut certain food requests sharply and made their allocations on the basis of United States agricultural surpluses." To limit future competition, Europe got only half the number of tractors it wanted. And less than half the number of freight cars (at least in the first 15 months). Congress insisted that at least 50 percent of aid had to be shipped in American boats. American firms sold grossly overpriced oil to Europe. In fact, much of the Marshall Plan amounted to a needed subsidy to the U.S. oil and agriculture sectors.

It's worth noting, incidentally, that in a sense the Marshall Plan was just another example of the U.S. government subsidizing the exports of U.S. firms. Starting from after World War I, tens of billions of dollars had already, by the time of the Marshall Plan, been loaned and granted to Western Europe, nearly all of which had then returned to buy American goods. So it's misleading to call these sorts of aid programs

“generous.” They’re generous to American businesses, and they’re essential—and remain essential—to keeping the American economy humming. (So much for “free markets.” These are government subsidies. Capitalism crucially relies on absolutely massive government subsidies of a thousand different types.)

Summing up one aspect of their discussion, the authors write, “for the working class of Europe the ERP [European Recovery Program] experience of capitalist reconstruction was an unequivocal calamity. This class was required to increase its effort in the production process, to abstain from asserting demands, and to reap a falling standard of living and unemployment. An appreciation of this fact as a crucial dimension of the ERP is essential to understanding the real meaning of the Marshall Plan.”

In 1949 and 1950, unemployment in West Germany continued to rise, to the point that tens of thousands of skilled workers, scientists, and artists fled to the Soviet zone in 1949. Conservative policies continued to have the same depressive effects in Belgium, Italy, and France, even as Europe still suffered from a dollar shortage (which had been a key reason for the Marshall Plan, to reconstruct markets in Europe for American exports).

It didn’t help that the U.S. was entering a severe recession in the last couple of years of the 1940s, which aggravated Europe’s economic problems. The recession “mainly reflected the recurrence of the crisis of overproduction and maldistribution of income” in capitalist economies. The American market for European exports (which were needed to overcome Europe’s dollar shortage) dried up, and businesses pressured the U.S. government to enact even higher tariffs than already existed. In a context of recession and acute pressure by powerful business lobbies, Congress was more and more reluctant to send funds to Europe. So in the end the Truman administration was compelled to once again invoke “national security” in an effort to save the Marshall Plan and, eventually, go beyond it.

The administration’s many bruised encounters [with Congress] had shown that the only palatable rationale for Congress to continue to send funds abroad was a rearmament and an anti-Communist program... Indeed, the historian will search in vain to discover why the United States decided to press for North Atlantic Treaty Organization (NATO) and arms aid to Europe in mid-1949 unless he looks at these economic problems in conjunction with the congressional mood. The Soviet military dangers were far less critical than during the previous year. The Russians lifted the blockade on Berlin in May and had embarked on one of their most extensive peace campaigns. There was, in short, no overt military or security crisis in the spring and summer 1949 when the administration presented the NATO bill to Congress and asked for \$1 billion in military aid to Europe. But there was a serious crisis in the domestic economy. Such an approach, from the inception, made the United States military policy on the questions of NATO and European rearmament intimately linked to the policy of European recovery.

Actually, in 1949 not even Congress was naïve enough to take seriously the idea that “the Russians are coming!” Instead, the State Department emphasized to Congress and the public the need to assist Europe with its “internal military security.” “Internal order was a dominant concern because most of Western Europe’s conservative economic policies precluded welfare measures or a rise in the standard of living.” Popular resistance to capitalism was a constant threat, and European governments, it was claimed, needed larger armed forces to deal with the threat.

But the “defense” stimulus that Congress approved wasn’t enough. The American and Europe economies needed a further boost if they were to get out of their crisis, a crisis that seemed solvable only by a powerful external stimulus to capitalism (some such stimulus as World War II had been, though not necessarily on that colossal scale). Luckily, the Korean War came at just the right time and saved both Europe and the U.S., boosting defense spending enormously and thus raising aggregate demand.

As Kolko says (p. 476), the late 1940s “highlighted the dangers of peace to world capitalism, and the failure of strictly economic means, within the framework of capitalist alternatives, to keep the vast productive capacity of the United States and Western Europe from sinking into the mire of stagnation, if not depression. The artificial stimulus of rearmament needed as its rationale a crisis somewhere in the world

if Washington was to resolve its new dilemma, one that was the result of the Marshall Plan's failure to achieve its original goals through purely economic means."

On this subject, Noam Chomsky remarks in his brilliant *Understanding Power* (p. 39), "military spending was considered the only thing that could [rebuild the world market], it was seen as the engine that could drive economic growth after the wartime boom ended, and prevent the U.S. from slipping back into a depression. And it worked: military spending was a big stimulus to the U.S. economy, and it led to the rebuilding of Japanese industry, and the rebuilding of European industry—and in fact, it has continued to be our mode of industrial management right up to the present." That's pretty much why the famous NSC 68 (National Security Council Memorandum 68, in 1950)—the major Cold War document—called for a vast increase in military spending.

This is why, to quote Kolko, "Russia's real threat was scarcely military, but [rather] its ability to communicate its desire for peace and thereby take the momentum out of Washington's policies." As usual with politics, appearance was practically the opposite of reality.

Kolko's analysis of why NATO was formed (in 1949) is of interest. It wasn't to deal with the Soviets: the U.S. was quite willing and able on its own to fight the Soviets if they invaded Europe, and in any case it was at that point inconceivable that they would invade. They were far too weak, for one thing. "NATO's formation was much more the outcome of Europe's desire to prevent a resurgent Germany from yet again disturbing the peace [for Germany was initially excluded from NATO], to which the United States added its desire to strengthen Western Europe's ability to cope with internal revolt as well as to sustain a psychological mood of anti-Soviet tension that the administration thought functional." Anyway, for many ruling classes around the world—but especially the American—the more military spending, the better. NATO was "functional" for this purpose.¹

A minor civil war, or a border war, between the two Koreas had already been going on before 1950. Both North and South repeatedly announced their intention to invade each other, and it was a highly unstable situation. The dictatorship of Syngman Rhee was incredibly brutal, corrupt, and economically incompetent, and provoked large-scale resistance in the South (just as Diem's dictatorship in South Vietnam did later). Rhee was determined to reunite Korea. So the North struck first, in the summer of 1950. A few weeks later, the Indian ambassador to China floated a compromise plan according to which (among other provisions) the Security Council would mediate the dispute, but the U.S. rejected it (after China and Russia had accepted it). Doubtless Washington thought it was premature—they didn't want to let a good crisis go to waste.

General Douglas MacArthur, of course, was totally reckless, hoping to use the crisis to liberate Asia from Communism, even at the risk of a world war. He had to fulfill his destiny, you see. (Napoleon's vanity and grandiosity were, arguably, no match for MacArthur's.) But Washington was reckless too, embracing his vision of reuniting Korea rather than just ejecting the North. By September 1950,

Truman had authorized a major increase in United States troops in Europe, and urged NATO members to follow suit. Administration members over these same weeks sustained demands for continued high levels of military spending...and pressed to consolidate the immense strengthening of American global military and economic power that had begun the prior June [when North Korea invaded the South]. A quick end to the war in Korea at the 38th parallel, which the administration could reasonably anticipate by virtue of the massive offensive then being planned, might immobilize all its economic and military efforts... Truman and Acheson saw Korea as a handle

¹ Later (p. 662), Kolko summarizes: "NATO and the Western European alliance...was, first of all, an integrative economic mechanism that offered practical solutions for the United States' immediate needs and future hopes, and then [in addition] operated on an ideological and political plane. Its military value [e.g., as providing bases] was still essential to the autonomous American and sea forces. It coped with the threat of internal upheaval, which in itself required incorporating more reactionary allies [such as Franco's Spain] who had still to confront local resistance, and it provided a framework for an integrated West Germany's future role in Europe."

with which to control world affairs essentially outside Asia [in Europe], while MacArthur still hoped to use the crisis to deepen America's commitment to fulfill its destiny in Asia...

Washington knew China was prepared to enter the war after the U.S. troops crossed the 38th parallel, but it went ahead with its plan anyway. What's a little world war, after all? But the fact is that Washington's position was ambiguous, or at least not as totally determined as MacArthur's. Truman and his advisors didn't want peace, but they didn't want a larger war with China. The stronger force, MacArthur, thus carried the day for a while, which got the Chinese involved (and appalled European allies, who seem to have considered the general a near-lunatic). Sometime in November or December MacArthur proposed dropping thirty to fifty atomic bombs in Manchuria, while Truman meanwhile said at a press conference that "there has always been active consideration of [the bomb's] use," thereby provoking something of a diplomatic crisis. By early 1951 the Chinese had pushed MacArthur back past the 38th parallel, and then began a stalemate that lasted over two years.

The story is pretty well-known. Truman soon fired MacArthur for his outrageous public statements; the U.S. pushed the battle lines a bit north of the 38th parallel again; armistice talks began in 1951, with the Communists wanting a return to the parallel and the Americans wanting a cease-fire along the existing battle lines; the Americans inflicted massive destruction on North Korea with their air and naval power (in fact, all of Korea, but especially the North, was virtually destroyed); talks got bogged down in details about the repatriation of prisoners of war (the American position violated the 1949 Geneva Convention); in 1953, America even committed the genocidal, Nazi-esque war crime of bombing irrigation dams that provided the water supply for the North's rice production.

In the meantime, rearmament and increased U.S. demand actually weren't unequivocally good for Europe. They did pull Europe out of its recession, but enormous U.S. demand for strategic raw materials caused some European states to face raw material shortages (prices for these materials had shot up) and an aggravated dollar deficit. Britain, for example, suffered from inflationary pressures and growing unemployment (because factories, unable to afford newly expensive raw materials, were closing). Also, Britain's shift toward rearmament—"as a predictable source of dollars and a stable demand that might keep the economy on an even keel"—caused it to lose export markets. "The industries that the English most relied on for export were those that were diverted to arms." This had a permanent, damaging effect on its future trade.

But West Germany and Japan—not having to rearm—benefited, moving into England's markets. Their economies, oriented towards export, grew rapidly, even though, at least in Germany, unemployment remained high and the income distribution worsened. Business continued to benefit far more than workers. But I recall that Robert Brenner, in his magisterial *The Economics of Global Turbulence*, attributed Germany's and Japan's long-term economic growth to this very fact (at least in part): high profits and low wages permitted heightened investment, given the large size of export markets (which themselves had much to do with U.S. military spending). Kolko likes to criticize the Marshall Plan and the conservative European policies it partially engendered—which continued with the shift to rearmament in the early 1950s—for failing to raise the masses' standard of living, but from Brenner's point of view this fact was rather constructive. It tended to ensure high profits and thus long-term economic growth (notwithstanding recessions in the short term).

Kolko himself acknowledges this (p. 640):

Measured against its initial goals, the Marshall Plan was both a success and a failure. Probably its most important accomplishment was its aid to the firm consolidation of the conservative class in its control of Western Europe, guaranteeing the continuation of a capitalism Washington hoped would become even more receptive to American capitalism...

Washington had successfully guided Western Europe's economic policies to enhance profits and investments and prodded the region's governments to pursue orthodox economic policies. The United States also attained its ends in the absolutely vital function of subsidizing its exports and securing significant concessions in Europe and its colonies for American industries, many of which would have

suffered critically without the ERP [the Marshall Plan]. No less important was Washington's reintegration of West Germany under conservative leadership into Western Europe...

On the other hand, he says, Washington was unable "to impose its almost mystical ideal system of free, nondiscriminatory, multilateral trade upon the world." In addition, to repeat, conservative policies led to unemployment, inflation, and recessions, with the mass suffering that entailed. "Finally, having achieved the conservative goal of a strong currency and balanced budget, Western European economies began to stagnate and head straight toward depression, only to be revived temporarily by the Korean War and arms production before again confronting renewed crises."

These notes are getting lengthy, but I have to quote Kolko's conclusion to one of his final chapters. First, I should just say: given Washington frenzied rhetoric about the rampant militarism of the Soviet Union, the evil plans it had for the whole world, there aren't sufficient words to characterize the irony of the real world. For the Soviets were in fact desperate for peace and continually returned to that theme in different contexts. In the early 1950s, to prevent West Germany's eventual inclusion in NATO, they even proposed on several occasions that Germany be reunited under free elections, etc.—proposals the U.S. rejected, since they weren't in American interests. So, while the Soviets were periodically pleading for peace and supporting the world peace movement, it was the U.S. that was heightening and hastening the arms race, for its own economic and geopolitical purposes.

Truman, in his last message to Congress in January 1953, reflected the premises of his postwar foreign policy and summed up its myths, leaving to Eisenhower some crucial advice on his basic course. Paranoid images of Communist chieftains building a vast war potential in their campaign, drugging masses of deluded followers throughout the world to insurrection, sabotage, and aggression, of cynical Communist identification with the forces of nationalism and economic change throughout the world merely "...to enslave more millions of human souls"—all this Truman conjured for future politicians to confront. There could be no respite, no peace; and in his final words the departing President reflected the essence of America's postwar policy and the rationalization under which its more enduring objectives had long since been buried. "Were we to grow discouraged now, were we to weaken and slack off, the whole structure we have built, these eight years, would come apart and fall away. Never then, no matter by what stringent means, could our free world regain the ground, the sheer momentum, lost by such a move." The crisis of mankind, the tension and pain by which history had been tormented for so long, could not cease.

And yet, as Kolko writes later, "after 1950, with the increasing equalization of the military balance [between the U.S. and the U.S.S.R.], and with the eventual success of the Soviet peace offensive in convincing a few Western leaders that diplomacy has a place, after all, in the scheme of things, the alliance based on fear and terror was challenged at its very core. For practical purposes, the continuing, gradual erosion of Washington's tenuous mastery over its bloc was to become a defining trend of postwar history."

Anyway, I've skipped over a lot of profound analysis, but I'll end the summarizing here. The book is practically a work of genius, and therefore totally ignored by the intellectual community. But I recommend you seek it out and read it if you want to understand the last 75 years of American history, and world history.

Origins of the European state system

Reading Charles Tilly's classic [*Coercion, Capital, and European States, AD 990–1992*](#) (1992). Taking notes on it for myself, but also for any interested readers. It's an influential account of how and why Western and ultimately global civilization took the political form it had achieved by the late twentieth century.

The book is structured in part around the dualism or dialectic between cities and states, or, more exactly, “capital” and “coercion.” (But also, more memorably, the importance of *war* as a factor in state formation.) As Tilly says,

Over the eight or ten millennia since the couple first appeared, cities and states have oscillated between love and hate. Armed conquerors have often razed cities and slaughtered their inhabitants, only to raise new capitals in their place. City people have bolstered their independence and railed against royal interference in urban affairs, only to seek their king’s protection against bandits, pirates, and rival groups of merchants. Over the long run and at a distance, cities and states have proved indispensable to each other.

Why did national states and national armies eventually win out in Europe over other forms of state organization, such as regional empires, city-states, and federations of cities? “Surely part of the answer lies in the dialectic of cities and states that developed within a few hundred years after 990... Behind the changing geography of cities and states operated the dynamics of capital (whose preferred sphere was cities) and of coercion (which crystallized especially in states). Inquiries into the interplay between cities and states rapidly become investigations of capital and coercion.”

“...Only late and slowly did the national state become the predominant form. Hence the critical double question: *What accounts for the great variation over time and space in the kinds of states that have prevailed in Europe since AD 990, and why did European states eventually converge on different variants of the national state?* Why were the directions of change so similar and the paths so different? This book aims to clarify that problem, if not to resolve it entirely.”

After summarizing the perspectives of other theorists, Tilly gives a useful general statement of his argument:

This book takes up the problem where Barrington Moore, Stein Rokkan, and Lewis Mumford left it: at the point of recognizing decisive variations in the paths of change followed by states in different parts of Europe during successive epochs, with the realization that the class coalitions prevailing in a region at a given point in time strongly limited the possibilities of action open to any ruler or would-be ruler, and with the specific hypothesis that regions of early urban dominance, with their active capitalists, produced very different kinds of states from regions in which great landlords and their estates dominated the landscape. It goes beyond Moore, Rokkan, and Mumford most emphatically in two ways: first by placing the organization of coercion and preparation for war squarely in the middle of the analysis, arguing in its rasher moments that state structure appeared chiefly as a by-product of rulers’ efforts to acquire the means of war; and second by insisting that relations among states, especially through war and preparation for war, strongly affected the entire process of state formation. Thus in this book I derive alternative histories of state formation from continuously-varying combinations of concentrated capital, concentrated coercion, preparation for war, and position within the international system.

There follows a more detailed and lengthy statement, which I might as well quote here too:

Men who controlled concentrated means of coercion (armies, navies, police forces, weapons, and their equivalent) ordinarily tried to use them to extend the range of population and resources over which they wielded power. When they encountered no one

with comparable control of coercion, they conquered; when they met rivals, they made war.

Some conquerors managed to exert stable control over the populations in substantial territories, and to gain routine access to part of the goods and services produced in the territory; they became rulers.

Every form of rule faced significant limits to its range of effectiveness within a particular kind of environment. Efforts to exceed that range produced defeats or fragmentation of control, with the result that most rulers settled for a combination of conquest, protection against powerful rivals, and coexistence with cooperative neighbors.

The most powerful rulers in any particular region set the terms of war for all; smaller rulers faced a choice between accommodating themselves to the demands of powerful neighbors and putting exceptional efforts into preparations for war.

War and preparation for war involved rulers in extracting the means of war from others who held the essential resources—men, arms, supplies, or money to buy them—and who were reluctant to surrender them without strong pressure or compensation.

Within limits set by the demands and rewards of other states, extraction and struggle over the means of war created the central organizational structures of states.

The organization of major social classes within a state's territory, and their relations to the state, significantly affected the strategies rulers employed to extract resources, the resistance they met, the struggle that resulted, the sorts of durable organization that extraction and struggle laid down, and therefore the efficiency of resource extraction.

The organization of major social classes and their relations to the state varied significantly from Europe's coercion-intensive regions (areas of few cities and agricultural predominance, where direct coercion played a major part in production) to its capital-intensive regions (areas of many cities and commercial predominance, where markets, exchange, and market-oriented production prevailed). The demands major classes made on the state, and their influence over the state, varied correspondingly.

The relative success of different extractive strategies, and the strategies rulers actually applied, therefore varied significantly from coercion-intensive to capital-intensive regions. As a consequence, the organizational forms of states followed distinctly different trajectories in these different parts of Europe.

Which sort of state prevailed in a given era and part of Europe varied greatly. Only late in the millennium did national states exercise clear superiority over city-states, empires, and other common European forms of state.

Nevertheless, the increasing scale of war and the knitting together of the European state system through commercial, military, and diplomatic interaction eventually gave the war-making advantage to those states that could field standing armies; states having access to a combination of large rural populations, capitalists, and relatively commercialized economies won out. They set the terms of war, and their form of state became the predominant one in Europe. Eventually European states converged on that form: the national state.

In [another publication](#) Tilly makes the point that states are little more than protection rackets, like the Mafia. Rulers or would-be rulers come in and say, “Submit to my rule, give me tribute (or taxes or periodic forced labor or something), and I’ll protect you from bandits and other people or armies like me. If you don’t submit, I’ll punish you or kill you.” Historically, the central activity of states has been war or preparation for war. Which, in a sense, includes “war” against their own population. Even today, the coercive apparatus of the state is overwhelming, however much states have acquired other functions like administering social welfare programs and public goods such as education.

Another “theoretical” statement:

The story concerns capital and coercion. It recounts the ways that wielders of coercion, who played the major part in the creation of national states, drew for their own purposes on manipulators of capital, whose activities generated cities... Although states strongly reflect the organization of coercion, they actually show the effects of capital as well; as the rest of this book will demonstrate, various combinations of capital and coercion produced very different kinds of states. Again, cities respond especially to changes in capital, but the organization of coercion affects their character as well; Lewis Mumford’s “baroque city” lived on capital like its cousins, but showed a clearer imprint of princely power—in palaces, parade grounds, and barracks—than they did. Over time, furthermore, the place of capital in the form of states grew ever larger, while the influence of coercion (in the guise of policing and state intervention) expanded as well.

Capital defines the realm of exploitation (relations of production and exchange produce surpluses that capitalists capture), while coercion defines the realm of domination. “The processes that accumulate and concentrate capital also produce cities,” where trade, warehousing, banking, and in some respects production go on. Coercion has to do with armed force, incarceration, expropriation, and so on. “Europe created two major overlapping groups of specialists in coercion: soldiers and great landlords; where they merged and received ratification from states in the form of titles and privileges they crystallized into nobilities, who in turn supplied the principal European rulers for many centuries.” Coercion and capital can certainly merge, but, on the whole, they’re sufficiently distinct that they can be analyzed separately.

“Efforts to subordinate neighbors and fight off more distant rivals create state structures in the form not only of armies but also of civilian staffs that gather the means to sustain armies and that organize the ruler’s day-to-day control over the rest of the civilian population.” Of course, as a state builds up its extractive and administrative infrastructure, different groups acquire power and interests of their own, and they may limit the character and intensity of warfare the state can carry on. Over time, rulers have to bargain with their subjects to get the resources they need for war-making and control of the subject population, and the latter can thus acquire greater rights and powers. This process grew more pronounced especially *after* the long centuries of “indirect rule,” in which states (empires, city-states with sway over large hinterlands, etc.) generally had to rely on cooperation from and bargaining with local authorities who paid tribute to the “state.” It wasn’t until the era of the French Revolution that most European states really began to institute *direct* rule from top to bottom, a type of rule that necessitated much greater financing and larger administrative apparatuses.

“The transition to direct rule gave rulers access to citizens and the resources they controlled through household taxation, mass conscription, censuses, police systems, and many other invasions of small-scale social life. But it did so at the cost of widespread resistance, extensive bargaining, and the creation of rights and perquisites for citizens [such as the beginnings of representative democracy]. Both the penetration and the bargaining laid down new state structures, inflating the government’s budgets, personnel, and organizational diagrams. The omnivorous state of our own time took shape.”

The book is dense with empirical detail that isn't easy to summarize, but now and then there are points of general interest. Here's an interesting paragraph, for example, even more interesting if you know how important the French *intendants* were to the rise of absolutism and a relatively centralized state structure:

No one designed the principal components of national states—treasuries, courts, central administrations, and so on. They usually formed as more or less inadvertent by-products of efforts to carry out more immediate tasks, especially the creation and support of armed force. When the French crown, greatly expanding its involvement in European wars during the 1630s, stretched its credit to the point of bankruptcy, the local authorities and officeholders on whom the king's ministers ordinarily relied for the collection of revenues ceased cooperating. At that point chief minister Richelieu, in desperation, began sending out his own agents to coerce or bypass local authorities. Those emissaries were the royal *intendants*, who became the mainstays of state authority in French regions under Colbert and Louis XIV. Only in faulty retrospect do we imagine the *intendants* as deliberately designed instruments of Absolutism.

Most far-reaching innovations like this emerged as ad hoc means to achieve immediate goals. Meanwhile, through all these processes of extracting resources from populations, a society's class structure significantly affected the state's organization, "and variations in class structure from one part of Europe to another produced systematic geographic differences in the character of states. Not only the ruling classes, but all classes whose resources and activities affected preparation for war, left their imprint on European states."

Different paths to state formation

Tilly argues that there were, broadly speaking, three major paths to state formation: coercion-intensive, capital-intensive, and capitalized coercion. The differences resulted from rulers having to adapt to very different environments and class structures. Here's another long quotation from the first chapter:

In the *coercion-intensive* mode, rulers squeezed the means of war from their own populations and others they conquered, building massive structures of extraction in the process. Brandenburg and Russia—especially in their phases as tribute-taking empires—illustrate the coercion-intensive mode. At the very extreme of the mode, however, armed landlords wielded so much power that no one of them could establish durable control over the rest; for several centuries, the Polish and Hungarian nobilities actually elected their own kings, and struck them down when they strove too hard for supreme power.

In the *capital-intensive* mode, rulers relied on compacts with capitalists—whose interests they served with care—to rent or purchase military force, and thereby warred without building vast permanent state structures. City-states, city-empires, urban federations, and other forms of fragmented sovereignty commonly fall into this path of change. Genoa, Dubrovnik, the Dutch Republic, and, for a time, Catalonia, exemplify the capital-intensive mode. As the history of the Dutch Republic illustrates, at the extreme this mode produced federations of largely autonomous city-states, and constant negotiation among them over state policy.

In the intermediate *capitalized coercion* mode, rulers did some of each, but spent more of their effort than did their capital-intensive neighbors on incorporating capitalists and sources of capital directly into the structures of their states. Holders of capital and coercion interacted on terms of relative equality. France and England eventually followed the

capitalized coercion mode, which produced full-fledged national states earlier than the coercion-intensive and capital-intensive modes did.

Driven by the pressures of international competition (especially by war and preparation for war) all three paths eventually converged on concentrations of capital and of coercion out of all proportion to those that prevailed in AD 990. From the seventeenth century onward the capitalized coercion form proved more effective in war, and therefore provided a compelling model for states that had originated in other combinations of coercion and capital. From the nineteenth century to the recent past, furthermore, all European states involved themselves much more heavily than before in building social infrastructure, in providing services, in regulating economic activity, in controlling population movements, and in assuring citizens' welfare; all these activities began as byproducts of rulers' efforts to acquire revenues and compliance from their subject populations, but took on lives and rationales of their own...

I'm starting to think my "summary" of the book will consist almost entirely of lengthy excerpts. I doubt these will be of much interest to anyone.

Over Europe as a whole, alterations in state control of capital and of coercion between AD 900 and the present have followed two parallel arcs. At first, during the age of *patrimonialism*, European monarchs generally extracted what capital they needed as tribute or rent from lands and populations that lay under their immediate control—often within stringent contractual limits on the amounts they could demand. In the time of *brokerage* (especially between 1400 and 1700 or so), they relied heavily on formally independent capitalists for loans, for management of revenue-producing enterprises, and for collection of taxes. By the eighteenth century, however, the time of *nationalization* had come; many sovereigns were incorporating the fiscal apparatus directly into the state structure, and drastically curtailing the involvement of independent contractors. The last century or so, the age of *specialization*, has brought a sharper separation of fiscal from military organization and an increasing involvement of states in the oversight of fixed capital.

On the side of coercion, a similar evolution took place. During the period of patrimonialism, monarchs drew armed force from retainers, vassals, and militias who owed them personal service—but again within significant contractual limits. In the age of brokerage (again especially between 1400 and 1700) they turned increasingly to mercenary forces supplied to them by contractors who retained considerable freedom of action. Next, during nationalization, sovereigns absorbed armies and navies directly into the state's administrative structure, eventually turning away from foreign mercenaries and hiring or conscripting the bulk of their troops from their own citizenries. Since the mid-nineteenth century, in a phase of specialization, European states have consolidated the system of citizen militias backed by large civilian bureaucracies, and split off police forces specialized in the use of coercion outside of war.

By the nineteenth century, most European states had internalized both armed forces and fiscal mechanisms; they thus reduced the governmental roles of tax farmers, military contractors, and other independent middlemen. Their rulers then continued to bargain with capitalists and other classes for credit, revenues, manpower, and the necessities of war. Bargaining, in its turn, created numerous new claims on the state: pensions, payments to the poor, public education, city planning, and much more. In the process, states changed from magnified war machines into multiple-purpose organizations. Their efforts to control

coercion and capital continued, but in the company of a wide variety of regulatory, compensatory, distributive, and protective activities.

I'm not summarizing all the empirical details of the book, since I think the book's main interest is in its general theses. At the end of the second chapter Tilly states several of these, in fact partially answering the big question he started with (italicized near the beginning of this blog post). He's been describing the great variations over the millennium in states' access to capital, their proximity to important cities, etc. So then he says, "There are three answers [to the question about the great variation of European states over the last millennium and their eventual convergence on the national state]: the relative availability of concentrated capital and concentrated means of coercion in different regions and periods significantly affected the organizational consequences of making war; until recently only those states survived that held their own in war with other states; and finally, over the long run the changing character of war gave the military advantage to states that could draw large, durable military forces from their own populations, which were increasingly national states." So, much of it comes down to the imperatives of war, and the socioeconomic environments in which states had to make war. Needless to say, this analysis is rather simplified.

He also gives broad answers to some smaller questions. For example:

Why, despite obvious interests to the contrary, did rulers frequently accept the establishment of institutions representing the major classes within their jurisdictions? In fact, rulers attempted to avoid the establishment of institutions representing groups outside their own class, and sometimes succeeded for considerable periods. In the long term, however, those institutions were the price and outcome of bargaining with different members of the subject population for the wherewithal of state activity, especially the means of war. Kings of England did not *want* a Parliament to form and assume ever-greater power; they conceded to barons [like with the Magna Carta of 1215], and then to clergy, gentry, and bourgeois, in the course of persuading them to raise the money for warfare.

Incidentally, this trend continued into the twentieth century. As [the research of Göran Therborn](#), for instance, has shown, the culminating, universal expansions of the franchise in most Western countries were achieved in the twentieth century in the context of the First and Second World Wars. Admittedly, it wasn't only because of nations' need to finance the wars; it was also because of the sheer scale of mass mobilization, and the unleashing of popular democratic energies (especially during and after World War II).

A couple more questions and answers:

Why did city-states, city-empires, federations, and religious organizations lose their importance as prevailing kinds of state in Europe? Two things happened. First, commercialization and capital accumulation in the larger states reduced the advantage enjoyed by small mercantile states [like in Italy], which had previously been able to borrow extensively, tax efficiently, and rely on their own seapower to hold off large landbound states. Second, war eventually changed in a direction that made their small scale and fragmented sovereignty a clear disadvantage, and they lost to large states. Florentine and Milanese republics crumbled under the weight of the fifteenth and sixteenth century's military requirements...

Why did war shift from conquest for tribute and struggle among armed tribute-takers to sustained battles among massed armies and navies? For essentially the same reasons: with the organizational and technical innovations in warfare of the fifteenth and sixteenth centuries, states with access to large numbers of men and volumes of capital gained a clear

advantage, and either drove back the tribute-takers or forced them into patterns of extraction that built a more durable state structure. During the fifteenth and sixteenth centuries, the Russian state made the transition as Ivan III and Ivan IV used awards of land to tie bureaucrats and soldiers to long-term service of the state. During the eighteenth century, the ability of populous states such as Great Britain and France to draw mass armies from their own citizens gave them the means to overpower small states.

How war made states, and vice versa

In the third chapter he gets into more detail about the subject of war and state formation. Since the seventeenth century, European states began to disarm their populations, including rival powerholders like great landowners. Disarmament took place in many small steps, such as seizures of weapons at the end of rebellions, prohibitions of duels, introduction of licensing for private arms, and so on. “In England, the Tudors suppressed private armies, reduced the princely power of great lords along the Scottish border, contained aristocratic violence, and eliminated the fortress-castles that once announced the power and autonomy of the great English magnates. Louis XIII, the seventeenth-century monarch who with the aid of Richelieu and Mazarin rebuilt the armed force of the French state, probably tore down more fortresses than he constructed. But he built at the frontiers, and destroyed in the interior. In subduing magnates and cities that resisted his rule, he commonly demolished their fortifications, reduced their rights to bear arms, and thereby decreased the odds of any serious future rebellion.”

In urban areas, the installation of routine policing played a part in civilian disarmament, while in regions dominated by powerful landlords it was necessary to dismantle private armies and eliminate walled and moated castles. Rulers’ simultaneous creation of armed force generated durable state structures not only by making armies significant organizations within the state but also by bringing forth treasuries, supply services, mechanisms for conscriptions, tax bureaus, etc. In the late seventeenth century, for instance, England’s governments built royal shipyards into the country’s largest concentrated industry. (One of the innumerable examples in recent centuries of governments, not “the free market,” being responsible for industrial development.)

Over the last millennium, war has been the dominant activity of European states. Even state finances reflect that fact. “From the late seventeenth century onward, budgets, debts, and taxes arose to the rhythm of war.” In France, borrowing for eighteenth-century wars overwhelmed the state, ruined its credit, and led to the calling of the Estates-General in 1789 that began the French Revolution. Britain, too, acquired huge state debts, which signified the expansion of bureaucratic state capacity largely under the impetus of war. (Of course, this tendency continued into the twentieth century, as the two world wars, for example—especially the second—stimulated gigantic growth of governments. In the U.S., the New Deal had already enormously expanded state capacity, but the war increased the federal budget tenfold and was fantastic for economic growth. War is great business! And it has been so for well over five hundred years, since the long era of mercenary forces crisscrossing Europe.¹)

In fact, major war efforts usually produced a *permanent* expansion of the state apparatus. “When Holland and Spain reached a truce in their draining war over Dutch claims to independence in 1609, many observers on both sides expected relief from the extraordinary taxation that had beset them during the previous decade.

¹ On mercenaries: “The peculiarity of the system became clear early on, when in 1515 ‘two Swiss armies, one in the service of the French king and one in the service of an Italian baron, met on opposing sides in a battle at Marignano in northern Italy and almost completely annihilated each other.’ The event helped persuade the Swiss to avoid wars of their own, but it did not keep them from shipping mercenaries to other people’s battles.” The dominance of mercenary armies didn’t completely end until the wars of the French Revolution and the Napoleonic Empire, which were fought by ordinary French citizens.

As it turned out, debt service, building of fortifications, and other state activities easily absorbed the revenues freed by military demobilization. Taxes did not decline significantly in either country.”

The struggle for maritime empire also helped shape different kinds of states, though not as much as land warfare.

The connection between state and empire ran in both directions: the character of the European state governed the form of its expansion outside of Europe, and the nature of the empire significantly affected the metropole’s operation. Capital-intensive states such as Venice and the Dutch Republic reached out chiefly by the ruthless pursuit of trading monopolies, but invested little effort in military conquest and colonization. Coercion-intensive states such as the Norse and the Spanish devoted more of their energy to settlement, enslavement of the indigenous (or imported) labor force, and exaction of tribute. The in-between states, such as Britain and France, entered the imperial game relatively late, and excelled at it by combining the capitalist and coercive strategies.

The capitalist strategy added relatively little bulk to the central state, especially when conducted through essentially private organizations such as the Dutch East India Company. These commercial megaliths, however, became political forces to be contended with in their own right; thus privatization pushed the state toward bargaining with its subject population, or at least with the dominant commercial class. The strategy of conquest and settlement, which inevitably called forth durable armies and navies, added to the central state bureaucracy, not to mention the world-wide web of officialdom it called into being. Where it brought in riches—especially in the form of bullion, as in Spain—conquest created an alternative to domestic taxation, and thereby shielded rulers from some of the bargaining that established citizens’ rights and set limits on state prerogatives elsewhere. [So that’s one reason Spain, for example, remained relatively politically backward in the following centuries.]

It seems to me that Tilly’s distinction between capital and coercion bears on the old debates about the nature of “Oriental despotism,” states like Russia, China, ancient Egypt, and the like. As he says, “We might imagine a continuum from an imperial Russia in which a cumbersome state apparatus grew up to wrest military men and resources from a huge but uncommercialized economy to a Dutch Republic which relied heavily on navies, ran its military forces on temporary grants from its city-dominated provinces, easily drew taxes from customs and excise, and never created a substantial central bureaucracy.” Many of these “Oriental” states throughout history were coercion-intensive because of their largely uncommercialized economies, and they needed cumbersome political structures to extract taxes and other resources from a peasant social base that didn’t have a widespread money economy.

Bargaining and direct rule

As stated earlier, all the (very brutal) processes of state formation over many centuries¹ necessitated that rulers engage continually in various forms of “bargaining” with their subjects, which over time gave the

¹ “From the short-run perspectives of ordinary people, what we in blithe retrospect call ‘state formation’ included the setting of ruthless tax farmers against poor peasants and artisans, the forced sale for taxes of animals that would have paid for dowries, the imprisoning of local leaders as hostages to the local community’s payment of overdue taxes, the hanging of others who dared to protest, the loosing of brutal soldiers on a hapless civilian population, the conscription of young men who were their parents’ main hope for comfort in old age, the forced purchase of tainted salt, the elevation of already arrogant local property holders into officers of the state, and the imposition of religious conformity in the name of public order and morality.”

latter durable rights but also imposed obligations on them. “The core of what we now call ‘citizenship,’ indeed, consists of multiple bargains hammered out by rulers and ruled in the course of their struggles over the means of state action, especially the making of war.” Through these processes of “struggle, negotiation, and sustained interaction with the holders of essential resources,” states came to reflect the class structures of their subject populations.

“Bargaining” could itself be brutal, as when rulers sent in troops to crush a tax rebellion or a capture a reluctant taxpayer, but it also took more peaceful forms: “pleading with parliaments, buying off city officials with tax exemptions, confirming guild privileges in return for loans or fees, regularizing the assessment and collection of taxes against the guarantee of their more willing payment, and so on.” Means were set up by which citizens could seek redress, such as through petition and representation in local assemblies. Later, in the last couple of centuries, workers, bourgeois, and others took advantage of these means to press for more expanded rights such as direct representation. Eventually states responded to the population’s demands by creating programs like social insurance, public education, veterans’ pensions, and housing, which cumulatively changed the character of government so that it became even more bureaucratic and civilian.

It’s probably superfluous to note, by the way, that “bargaining” goes on up to the present and never stops. The state always has to try to keep its citizenry—its main enemy, to quote Chomsky—sufficiently pacified so that they won’t rebel *en masse*. Both repression and more constructive kinds of bargaining are essential to this. In recent decades, the state has fused especially closely with the most exploitative and predatory sectors of the ruling class, so the constructive forms of bargaining have tended to wither. Which explains rising mass discontent, and in fact the slow-moving collapse of society itself.

Anyway, for most of the last millennium, microstates like city-states and petty principalities ruled in a relatively direct way, but larger states didn’t. They had to deal with powerful intermediaries (clergy, landlords, urban oligarchies, independent warriors) who had a lot of autonomy and could hinder state demands that weren’t in their own interest. This reliance on indirect rule began to change in the seventeenth and eighteenth centuries, as “the nationalization of military power” (shifting from the hiring of mercenaries to the recruitment of soldiers from their own populations) occurred, to deal with the increasing scale of war and for other reasons. Having to work through intermediaries had never been ideal: it set serious limits on the quantity of resources rulers could extract from the economy. By the eighteenth century, “as war demanded greater resources, emphatically including manpower, and as the threat of conquest by the largest states grew more serious, ever more rulers bypassed, suppressed, or co-opted old intermediaries and reached directly into communities and households to seize the wherewithal of war. Thus national standing armies, national states, and direct rule caused each other.”

The French Revolution and Napoleonic Empire greatly accelerated the shift to direct rule, both because other states emulated the French model of centralized government and because France imposed that model wherever it conquered. Tilly’s discussion of the Revolution is very good, if necessarily simplified, and worth quoting at obnoxious length (among other reasons because it gives the lie to revisionist historians who have resisted the traditional Marxist description of the event as a “bourgeois revolution”):

The lawyers, officials, and other bourgeois who seized the state apparatus in 1789-90 rapidly displaced the old intermediaries: landlords, seigneurial officials, venal officeholders, clergy, and sometimes municipal oligarchies as well. “[I]t was not a rural class of English-style gentlemen,” declares Lynn Hunt, “who gained political prominence on either the national or the regional level, but rather thousands of city professionals who seized the opportunity to develop political careers.” At a local level, the so-called Municipal Revolution widely transferred power to enemies of the old rulers; patriot coalitions based in militias, clubs, and revolutionary committees and linked to Parisian

activists ousted the old municipalities. Even where the old powerholders managed to survive the Revolution's early turmoil, relations between each locality and the national capital altered abruptly. Village "republics" of the Alps, for example, found their ancient liberties—including ostensibly free consent to taxes—crumbling as outsiders clamped them into the new administrative machine. Then Parisian revolutionaries faced the problem of governing without intermediaries; they experimented with the committees and militias that had appeared in the mobilization of 1789, but found them hard to control from the center. More or less simultaneously they recast the French map into a nested system of departments, districts, cantons, and communes, while sending out *représentants en mission* to forward revolutionary reorganization. They installed direct rule.

...By and large, the Federalist movement, with its protests against Jacobin centralism and its demands for regional autonomy, took root in cities whose commercial positions greatly outpaced their rank [in the new administrative system]. In dealing with these alternative obstacles to direct rule, Parisian revolutionaries improvised three parallel, and sometimes conflicting, systems of rule: the committees and militias; a geographically-defined hierarchy of elected officials and representatives; and roving commissioners from the central government. To collect information and gain support, all three relied extensively on the existing personal networks of lawyers, professionals, and merchants.

As the system began to work, revolutionary leaders strove to routinize their control and contain independent action by local enthusiasts, who often resisted. Using both co-optation and repression, they gradually squeezed out the committees and militias. Mobilization for war put great pressure on the system, incited new resistance, and increased the national leaders' incentives for a tight system of control. Starting in 1792, the central administration (which until then had continued in a form greatly resembling that of the Old Regime) underwent its own revolution: the staff expanded enormously, and a genuine hierarchical bureaucracy took shape. In the process, revolutionaries installed one of the first systems of direct rule ever to take shape in a large state.

That shift entailed changes in systems of taxation, justice, public works, and much more. Consider policing. Outside of the Paris region, France's Old Regime state had almost no specialized police of its own... The revolutionaries changed things. With respect to ordinary people, they moved from reactive to proactive policing and information-gathering: instead of simply waiting until a rebellion or collective violation of the law occurred, and then retaliating ferociously but selectively, they began to station agents whose job was to anticipate and prevent threatening popular collective action. During the Revolution's early years, Old Regime police forces generally dissolved as popular committees, national guards, and revolutionary tribunals took over their day-to-day activities. But with the Directory [1795-99] the state concentrated surveillance and apprehension in a single centralized organization...

Resistance and counter-revolutionary action followed directly from the process by which the new state established direct rule. Remember how much change the revolutionaries introduced in a very short time. They eliminated all previous territorial jurisdictions, consolidated many old parishes into larger communes, abolished the tithe and feudal dues, dissolved corporations and their privileges, constructed a top-to-bottom administrative and electoral system, imposed expanded and standardized taxes through that system, seized the properties of emigrant nobles and of the church, disbanded monastic orders, subjected clergy to the state and imposed upon them an oath to defend the new state church, conscripted young men at an unprecedented rate, and displaced both nobles and priests

from the automatic exercise of local leadership. All this occurred between 1789 and 1793... What is more, the new state hierarchy consisted largely of lawyers, physicians, notaries, merchants, and other bourgeois...

[Counterrevolutionary resistance in the west of France] grew directly from the efforts of revolutionary officials to install a particular kind of direct rule in the region: a rule that practically eliminated nobles and priests from their positions as partly autonomous intermediaries, that brought the state's demands for taxes, manpower, and deference to the level of individual communities, neighborhoods, and households, that gave the region's bourgeois political power they had never before wielded. In seeking to extend the state's rule to every locality, and to dislodge all enemies of that rule, French revolutionaries started a process that did not cease for twenty-five years. In some ways, it has not yet ceased today...¹

As he sums up, “the revolutionary transition from indirect to direct rule embodied a bourgeois revolution and engendered a series of anti-bourgeois counter-revolutions.” But the changes, even across Europe, couldn't be wholly reversed. And they led to further changes, such as the rise of nationalism. “Direct rule and mass national politics grew up together, and reinforced each other mightily.” Over the course of the nineteenth century, states imposed national languages—for ease of communication and administration—created national education systems, controlled movement across frontiers, and generally tried to homogenize conditions within their borders. Which led to rebellious nationalisms among minorities.

Thus, in the “dialectical” logic Marxists love to invoke, as states built up their capacity, they found they had to deal with new, unanticipated burdens. For instance, new organizations to make war or draw the requisites of war from subjects—including customs services, treasuries, and regional administrations—developed their own interests. With regard to Brandenburg-Prussia, which became famously bureaucratic by the eighteenth century (leading to the infamously bureaucratic structures of Germany later on), Tilly quotes another historian: “the bureaucracy acquired an *esprit de corps* and developed into a force formidable enough to recast the system of government in its own image. It restrained the autocratic authority of the monarch. It ceased to be responsible to the dynastic interest. It captured control of the central administration and of public policy.” This is just one example of a much broader trend.

Another ironic result of direct rule and the expansion of government capacity was the *civilianization* of government. The state had always been an essentially military institution, but in the process of creating structures to support an expanded military force, more and more resources were devoted to non-military purposes like a larger civilian bureaucracy and growing the civilian economy (which in the later nineteenth century far outstripped military expansion, thus further reducing the social and political dominance of the military). By the late twentieth century, in nearly all Western countries very small proportions of the population were under arms, small proportions of state budgets were devoted to the military, and small percentages of national income were spent on soldiers and weapons.

Lineages of the national state, and thoughts on the Third World

¹ For a very brief summary of the contours of the French Revolution, see Vivek Chibber, [Postcolonial Theory and the Specter of Capital](#), chapter 3. He notes that the large majority of representatives of the Third Estate in 1789 weren't bourgeois in the sense of being actual capitalists (merchants, etc.), and they weren't even particularly revolutionary. In the beginning, they only wanted to create a constitutional monarchy and eliminate the privileges of the nobility. It required continual interventions by the more radical populace, in the succeeding years, to force the leaders to become truly revolutionary. Nevertheless, in its outcomes and many of its guiding values, I'd say the epochal event certainly qualifies as a “bourgeois revolution.”

In the fifth chapter, Tilly goes into greater detail about the three paths to state formation mentioned above. He starts with the coercion-intensive one, focusing on Russia and Eastern Europe. It's a pretty impressive capsule history he provides, from AD 1000 to the nineteenth century, but here's the main point:

In broadly similar ways, Russian, Polish, Hungarian, Serbian, and Brandenburger states formed on the basis of strong alliances between war-making princes and armed landlords, large concessions of governmental power to nobles and gentry, joint exploitation of the peasantry, and restricted scope for merchant capital. Repeatedly, leaders of conquering forces who lacked capital offered their followers booty and land, only to face the problem of containing the great warrior-landlords they thereby created...

Although the relative weight of crown and nobility (and therefore the extent to which warfare created durable state structure) varied significantly from state to state, all these states stood out from their European neighbors by heavy reliance on brute coercion. When, in the sixteenth century, large volumes of eastern European grain began to flow westward, the existing structure of control permitted great landlords to profit directly from those shipments; they used state power to contain merchants and coerce peasant producers, building a new serfdom in the process [even as the old serfdom in the west was ending]. In that balance of power, even extensive commercialization did not build cities, an independent capitalist class, or a state more greatly resembling those of urban Europe.

So, because there were so few cities and such little concentrated capital, it was, typically, necessary to create enormous coercive apparatuses to squeeze and control the peasantry (and also to fight and control the nobility). The main difference is that in some of these states, like Russia, one armed landlord early on established supremacy over his rivals, while in others, like Poland, the multitude of armed landlords were able to prevent any one of their own from achieving such supremacy. (Which led to a weaker Polish state and its dismemberment in the eighteenth and nineteenth centuries.)

Let's skip the history of capital-intensive states like Venice and go straight to the capitalized-coercive Britain. I'll revert to quoting, once again. Not everyone knows much about the Magna Carta—which, among other things (such as [protecting peasants' right to the commons](#)), helped set a precedent for a degree of political representation—so here's something about that:

In the process of making war and intervening in dynastic rivalries, the barons on whom English kings relied for their wars acquired enough power to fight the king as well as each other, exacting chartered concessions—most dramatically in Magna Carta—from the monarch. The Great Charter of 1215 committed the king to cease squeezing feudal obligations for the wherewithal to conduct wars, to stop hiring mercenaries when barons would not fight, and to impose the major taxes only with the consent of the great council, representative of the magnates. The council started to wield durable power, reinforced especially by its place in the approval of new taxation. Later kings confirmed the charter repeatedly. Nevertheless, the continuing efforts of English monarchs to create armed force produced a durable central structure: royal treasury, courts, and domain.

The Hundred Years' War (1337–1453), a result of English kings' efforts to hold onto their French possessions, required such exorbitant finances that Parliament was able to consolidate its position. Even for more than a century afterwards, wars with France and Scotland involved Parliament in royal fundraising and established its right to consent to taxation. The House of Commons, meanwhile, “came increasingly to represent a tight alliance of merchants and cash-cropping landowners” who, aided by legally sanctioned enclosures of open fields and common lands, grew heavily involved in the marketing of grain and wool.

The Stuart kings of the seventeenth century made the mistake of disrespecting the prerogatives of this rising capitalist class (the merchants and landowners represented in the House of Commons) in their struggles for money to fund yet more wars. The agrarian and mercantile bourgeoisie didn't look fondly on kings' attempts to tax without Parliament, or, more generally, to construct an absolutist state in which the bourgeoisie was very definitely politically subordinate. Charles I, especially, let power go to his head, and as a result he lost it (his head). In the 1630s his credit with financiers failed, "and his demands for loans and taxes only sharpened conflict with Parliament and its financiers. By 1640 he was seizing the gold and silver left in the Tower of London for safekeeping, and bargaining with the goldsmiths and merchants who owned it for a loan secured by customs revenues. Charles' attempt to raise and control an army to put down rebellion in Ireland and resistance in Scotland did him in."¹

After the Glorious Revolution of 1688 and the renewal of British military involvement on the continent, "Britain started to form a substantial standing army, an effective central bureaucracy took shape, and the tax-granting House of Commons gained power vis-à-vis the king and his ministers." Basically, a bourgeois revolution had occurred over a long period, from the mid-sixteenth century (when enclosures began, Henry VIII suppressed the Catholic Church and seized its revenues while expropriating monasteries, and England commercialized at the same time as much of its peasantry was proletarianized) to the late seventeenth century. Absolutism had been defeated, a capitalist—though not yet industrial capitalist—economy had spread, and various types of capitalist class had secured political power. In the next two centuries, political centralization and direct rule deepened, incrementally, as capitalism advanced and matured.

Moving ahead to the seventh and last chapter, Tilly wonders why Third World governments tend to be quite different from those of the West, and not in good ways. In particular, why is the place of the military so different, so overwhelming? "On the whole, [militaries in the Third World] intervene in domestic political life far more directly and frequently, and with more obviously damaging consequences for rights of citizens. Why should that be?" It's certainly an important question. There are many answers to it, of course, but Tilly focuses on those his earlier analysis bears on. Here's a useful review of that analysis:

Think back to the central paradox of European state formation: that *the pursuit of war and military capacity, after having created national states as a sort of byproduct, led to a civilianization of government and domestic politics*. That happened, I have argued, for five main reasons: because the effort to build and sustain military forces led agents of states to build bulky extractive apparatuses staffed by civilians, and those extractive apparatuses came to contain and constrain the military forces; because agents of states bargained with civilian groups that controlled the resources required for effective war-making, and in bargaining gave the civilian groups enforceable claims on the state that further constrained the military; because the expansion of state capacity in wartime gave those states that had not suffered great losses in war expanded capacity at the ends of wars, and agents of those states took advantage of the situation by taking on new activities, or continuing activities they had started as emergency measures; because participants in the war effort, including military personnel, acquired claims on the state that they deferred during the war in response to repression or mutual consent but which they reactivated at demobilization; and finally because wartime borrowing led to great increases in national debts, which in turn generated service bureaucracies and encouraged greater state intervention in national economies.

Given this analysis, one possibility is obvious: since Third World states have largely acquired and built up their militaries from abroad, through military aid from great powers, it hasn't been necessary to undergo a

¹ Again, for a short summary of the main issues involved in the English Civil War, see *Postcolonial Theory and the Specter of Capital*, chapter 3.

long process of “bargaining” with the civilian population. There hasn’t had to be “the same internal forging of mutual constraints between rulers and ruled,” as Tilly says in the article linked to earlier. Nor have several other of the above conditions applied.

When you have the U.S and other powers giving extreme support to military organizations in the Third World or the Global South, it isn’t surprising that such organizations become dominant over civilian competitors. Or that they use their dominance to seize power repeatedly, whenever the civilian government is failing or doing something they don’t like. And the government will, indeed, often fail or become dysfunctional in an international context of subordination to the interests of the West (as in the frequent inability to have an independent tariff policy to protect domestic industry, or the necessity to apply for loans from an IMF that attaches such onerous conditions to the loans that society partially breaks down and the population rebels). Since there isn’t much need to protect borders anymore or, usually, engage in external wars, armies develop great power *internally* that they may use to influence domestic politics.

In any case, one thing does come out very clearly from the book: states are in the business of coercing, and are formed in profoundly morally illegitimate ways. Primarily through war: war against internal and external enemies. In this respect, Tillyism is quite friendly to anarchism and the left. The real question, especially in our dangerous era today, is how to get states *away* from the business of making war. Presumably the only way to do that is through mass popular movements to pressure leaders and to elect leftists to political office.

Against liberal “pluralism”

In the time of Trumpism, Michael Paul Rogin’s great book [*The Intellectuals and McCarthy: The Radical Specter*](#) (1967) shouldn’t be as neglected as it is. It’s quite relevant. I recall reading Jesse Lemisch’s brilliant little pamphlet [*On Active Service in War and Peace: Politics and Ideology in the American Historical Profession*](#) (1969) and [taking notes on it](#) where I quoted Lemisch’s appreciative discussion of Rogin’s work. I should have read Rogin then.

So here are some notes on a wonderful old book.

Its target is the postwar, Cold War school of liberal thought called “pluralism,” expounded by such intellectual luminaries as Richard Hofstadter, Louis Hartz, Seymour Martin Lipset, Daniel Bell, Talcott Parsons, Daniel Boorstin, etc. It’s still with us, at least implicitly, throughout the political mainstream. And Rogin’s criticisms still very much hold up.

But let’s start at the beginning, where Rogin poses the problem that the book sets out to answer: how to understand McCarthyism, which had traumatized the intellectual class.

When McCarthy first became prominent, most liberals interpreted the danger he posed in fairly straightforward terms. To them McCarthy was simply the most successful a number of conservative Republicans capitalizing on the Communist threat to attack the New Deal at home and the Fair Deal abroad. “McCarthyism” was a synonym for smear attacks on liberals, its roots were in traditional right-wing politics, and its principal targets were innocent individuals and liberal political goals...

But to many writers such traditional analysis failed to account for McCarthy’s strength. In their eyes, McCarthy was getting support not from established groups with which traditional conservatism had been associated but rather from the dispossessed and discontented... Moreover, McCarthy appealed to the mass of people over the heads of their elected leaders. And the established eastern elite, unsympathetic to the Wisconsin senator, was one of his important targets.

All this suggested that popular democracy constituted a real threat to the making of responsible political decisions. McCarthy appeared not in the guise of a conservative smearing innocent liberals but in the guise of a democrat assaulting the political fabric.

Meanwhile, just as faith in democracy suffered during the McCarthy years, so did sympathy for radicalism. To many intellectuals, McCarthy seemed like “the bearer of the historical radical mission,” challenging established institutions like earlier leftists had. People started talking about the “radical Right”; and radicals or extremists as such, whether on the left or the right, were seen as dangerous anti-democrats. This view, you may notice, still predominates in the mainstream.

“In this new view, McCarthyism was a movement of the radical Right that grew out of movements of the radical Left.” This idea reminds me a little of Zeev Sternhell’s analysis of European fascism, which [he argues](#) grew out of earlier ideological currents among Marxists and syndicalists. It seems that centrist intellectuals like to blame the left for the right, and associate the two. (What a surprise.) “Left-wing protest movements, democratic in their appeal to the popular masses, radical in the discontent they mobilized, had borne fruit in McCarthyism. To some, McCarthy was directly descended from an agrarian radical tradition [Populism, etc.]...”

This might seem like an absurd thesis, but it is true, after all, that McCarthy and earlier agrarian radicalism had a similar geographical base of support. Outside the South (which opposed McCarthy just because he was a Republican and the South was Democratic in the 1950s), protest movements from the 1880s to the 1930s were strongest in the West and the western Midwest. Later, political leaders in these states vociferously supported McCarthy. In fact, the same state that had produced the great radical Progressive Robert La Follette—Wisconsin—also produced McCarthy! So the evidence seems compelling.

Nevertheless, Rogin rejects the thesis. When you look more closely, McCarthyism had only a traditional conservative heritage and no “agrarian radical” character at all. You can’t blame it on the masses or excessive democracy or the heritage of the left. You can blame it on the elites, and on the dangers of *too little* democracy.

Summing up the view he rejects, Rogin says,

Those connecting it with the earlier [left-wing] movements see McCarthyism, first, as a democratic revolt of dispossessed groups against the educated, eastern elite. Like McCarthyism, agrarian radicalism is also said to have substituted moralistic, irrational appeals for a rational politics. For many writers, these movements embody a nativist mystique which, glorifying the ordinary folk, threatens the civilized restraints of a complex society.

You’ll notice, again, that contemporary mainstream denunciations of “populism”—as if the fascist and leftist versions of populism are essentially the same—are the descendants of these earlier revisionist interpretations of McCarthyism and agrarian radicalism. We’re still living, to some extent, in the framework of a (decaying) “centrist” politics hammered out during the Cold War.

*

Rogin follows this introduction with a very thoughtful and interesting chapter on the ideology, or the political theory, of “pluralism” that produced these interpretations of left and right radicalism. He summarizes it as follows:

Modern pluralism, I will argue, is not simply a defense of shared power or a sympathy for diverse values but also a theory of history in which industrialization is the major actor. *[Notice the ahistorical substitution of an abstract “industrialization” for concrete conflict between classes and subclasses. See also [modernization theory](#).]* Industrialization destroys traditional stability, but the success of industrialization enables group politics to dominate

a society. Mass politics is defined by its orientation to the institutions and norms of industrial society. Group politics does not eliminate political moralism [*which pluralists don't like, preferring issues-based pragmatism*] but rather directs it to its proper concern—social cohesion in a constitutional, industrial society. Group politics is the conflict not among groups but among group leaders, socialized into the dominant values and associations of industrial society. Pluralism does not extend its tolerance for diversity to mass movements and anti-industrial attitudes felt to threaten the conditions of diversity.

From this brief description, you can already recognize the ideological heritage of most of the political gerontocracy that runs the U.S. today. Especially in the Democratic Party (the Republican is actively discarding mainstream traditions, despite behind-the-scenes efforts of so-called “moderates” like Mitt Romney and Lisa Murkowski to keep it still residually semi-sane), Cold War pluralism, proceduralism, pragmatism, centrist liberalism, elitism is the ideology that governs the leadership. When Biden a few months ago said, nauseatingly, that the country “needs a Republican Party that’s principled and strong,” that was pluralism speaking. The liberal hatred of Sanders and Ocasio-Cortez is the reaction of pluralist elitism to critiques of elitism. In order for real progress to happen, we need this pluralist centrism to decline, as it’s finally doing today. (Of course, that opens the way for neofascism, but the left simply has to fight this challenge off.)

Rogin’s discussion of pluralism is extremely rich; I wish I could reproduce even a fraction of its richness here. The pluralists were/are, in essence, semi-conservatives concerned above all with social cohesion and stability in an industrial society. They share *avowed* conservatives’ fear of the irrational masses and mass society itself—since it can supposedly lead to disorder, mass movements, totalitarianism, and the like—but they think the masses can be disciplined and controlled by belonging to a network of formal and informal groups in a bureaucratized society. They share Durkheim’s worry that an epidemic of anomie and alienation, and thereby dangerous mass movements, can arise in a modern individualistic society in which old traditions and communities have been lost, but they respond that the solution to mass society is the *pluralist society* in which “groups provide individuals with specific channels for realizing their demands, focusing their members on the practical desires that can be realized in ordinary democratic politics... Moreover, when an individual belongs to many groups he cannot act in an extreme fashion in support of one group without threatening his commitment to another. He thus becomes committed in general to the society and is unable to threaten that commitment through the support of a particular extremism.”

It’s a nice little theory, especially as it’s fleshed out in distinctions like that between rational *class* politics (not *ideological* but involving clashes of narrow economic interests between groups) and irrational *status* politics, based on vague status anxieties that bring forth things like the Ku Klux Klan in the 1920s, later McCarthyism, earlier Progressivism, and Populism. But pluralism isn’t hard to criticize. For instance, an argument Rogin could have made is that the modern, “stable” society its theorists love was made possible precisely by ideological mass movements like abolitionism, which indirectly abolished slavery, and the unemployed workers’ movement of the 1930s, which led to the welfare state. The civil rights movement, too, which had a “mass” character, was necessary to expand democracy and the liberal constitutional order that is the pluralists’ be-all and end-all. It seems these writers aren’t the most perceptive historians (despite including in their ranks famous historians like Hofstadter).

Their views of agrarian radicals can also be criticized right off the bat. For example, in line with their fetish of “industrial society,” pluralists interpret both earlier radicals and McCarthy as having directed irrational moralistic appeals “against the development of an instrumental, bureaucratized industrial order.” Whatever the truth about McCarthy, [recent scholarship](#) by Charles Postel, for example, has demolished this view of Populists: they were actually quite forward-thinking, industrial, modern, and highly rational in their analyses of social ills and prescriptions for a more just and democratic social order. This is also one of Rogin’s main arguments.

Certain other pluralist arguments might seem more plausible. Like the argument that McCarthyism and Populism/Progressivism had a petit-bourgeois base in common, receiving support from the small, independent, old middle class (which, out of its status anxiety, supposedly feared concentrated industry).

In the pluralist view, certain specific similarities between McCarthyism and agrarian radicalism are due to the rural, small middle-class basis they shared in common. The movements were anti-British, anti-Wall Street, anti-international bankers, anti-eastern aristocracy. They were pro-German. They stood for the moral absolutes associated with agrarian virtue, such as personal integrity and religion. They were against bigness, favoring equal opportunity and the small producer. Calling upon the traditions of a rural, individualistic America, McCarthyism and agrarian radicalism threatened in the name of the popular will to destroy the pluralist society in which they lived.

Most of this is a caricature of reality, as Rogin will show.

The relevance to the present, again, is that pluralist analyses of small-p “populism” still dominate mainstream perceptions, insanely associating the far left with the far right as equally dangerous, undemocratic, and irrational.

*

As an aside, here’s an intriguing comparison of the pluralist, or centrist-liberal, thinking with that of America’s “Founding Fathers” the Federalists (James Madison, Alexander Hamilton, and their followers, who were opposed to the more democratic Jeffersonians):

[The Federalists’] political outlook resembles that of the pluralists. Here [with the Federalists] is the same fear of an uprising of the masses, the same suspicion of democracy. Federalists and pluralists alike place a considerable reliance on responsible leadership. Both groups of thinkers are pessimistic about human nature and optimistic about the power of institutions to check and control human beings. Both are preoccupied with the importance of balance. Both rely heavily on a pluralism of interests and institutions. Both express powerful nationalistic sentiments while asserting the primacy and legitimacy of (mainly economic) individual self-interest. Both insist that political institutions must [inevitably] be rooted in social conflict, yet desire those institutions to stand apart from and mediate social conflict.

Birds of a feather. Neither Federalists nor pluralists were the true *conservatives* of their day (Edmund Burke and other monarchists/feudalists were the real conservatives at the end of the eighteenth century), but they share the more general conservatism of belonging to the establishment and wanting to suppress the people.

Anyway, Rogin has no trouble dismantling some of the absurdities of pluralist theory. Like the typical attacks on left-wing radicalism and right-wing McCarthyism for their supposed moralism, populism, intolerance, extreme and apocalyptic rhetoric, conspiratorial and utopian thinking, etc. He has only to point out that good, respectable, mainstream conservatism has been just as susceptible to all these tendencies. (Just read newspapers in the late nineteenth and early twentieth centuries to be amazed by the wild hysterical overreactions to labor unions, strikes, and agrarian organizing.) Which, from pluralist theory, you wouldn’t think would be the case. So much the worse for pluralist theory.

Let’s move on to something more interesting. How does the base of support for Populism/Progressivism compare with the base for McCarthyism? Is it largely the same, as the pluralists argue? Rogin conducts a few case-studies, namely of Wisconsin and the Dakotas. With regard to Wisconsin, for example, after a long and expert analysis of voting patterns, Rogin concludes as follows:

Progressivism in Wisconsin mobilized poor Scandinavian farmers against the richer areas of the state... McCarthy, on the other hand, rose to power with the votes of the richer German inhabitants of the farms and small cities in southern and eastern Wisconsin—anti-Progressive except when they were victims of McCarthy-type tactics during World War I

[when Germans were demonized all over the country]. McCarthy's unique strength was not as important as this [traditional] Republican Party strength. In any case, it reflected less a continuity with the Progressive past and more the particular issues, preoccupations, and individual attachments of politics in the Korean War decade...

For instance, Czechs and Poles tended to support McCarthy, not because of any "status anxiety" or whatnot but probably because of the Communism issue. Czechoslovakia had recently been the victim of a Communist coup d'état and Poland was under the thumb of the Soviet Union. So Communism was on the minds of Czechs and Poles.

Summing up his extremely detailed discussions of three Midwestern states, Rogin says that after the social base of agrarian radicalism had declined by the 1940s-50s, there was no longer a significant force to challenge conservative Republicanism.¹ "McCarthyism rose to power in the Middle West in the context of conservative dominance. While he had marginal agrarian radical support, the overwhelming majority of those who sent McCarthy-supporters to the Senate was part of the regular Republican constituency." Unlike radicalism, McCarthyism was not a "mass" phenomenon, nor did it realign the bases of the two major parties in any way.

*

Rogin dedicates a couple of chapters to demolishing pluralist attacks on Populism and Progressivism—not a difficult task, but he's a virtuoso at it. (E.g., Progressives weren't just backward-looking rural nostalgists, Populists were actually no more anti-Semitic than the rest of their society, etc.)

He raises the important, and still very timely, question of why rural America has been prone to conservatism. Again, a crucial factor has been the decline of farmers' radicalism since the 1940s, which isn't only a result of prosperity and the relatively small numbers of farmers but also the fact that farming was increasingly mechanized and commercialized, even dominated by agribusiness. But why had non-farm rural areas, such as small towns, always been prone to conservatism, going back to the nineteenth century? Well, simply because local elites *always* tend to be conservative, so they can maintain their power. They don't want the outside world horning in on the little sets of power relations they've constructed in their town or small city, and they have always viciously opposed unions, agrarian radicalism, and, since the 1930s-40s, the New Deal state. (See, for example, Elizabeth Tandy Shermer's [Sunbelt Capitalism: Phoenix and the Transformation of American Politics](#) (2013). Phoenix gave us Barry Goldwater, so you can guess how conservative it was.) In the South, of course, the conservatism even goes back to slavery and Reconstruction, and racism has been of inestimable benefit to local power-structures. So the conservatism of "Trump country" has very deep roots, even if political realities in the last fifty years, such as Democrats' abandonment of the working class, have intensified the problem.

(But don't forget that—despite what the media says—it isn't so much the "white working class" that is Trump's base as the [petty bourgeoisie and middle class](#): small business owners, managers, supervisors, real estate and insurance agents, in general [moderately affluent](#) people who, in many cases, lack a college degree. These are always the popular base of fascism or neofascism.)

McCarthy's base of support overlapped to a large degree with Trump's. First, it's worth noting that the contemporary split in the Republican Party—between, roughly speaking, the lunatic base and the corporate-bureaucrat elite, or (oversimplifying) small business and big business—already existed in embryo

¹ The most important reason for the decline of agrarian radicalism was probably that there were vastly fewer farm families in 1950 than in 1890. Also, World War II had brought prosperity to most farmers, nullifying their former grievances. "Economically radical movements had generally pitted farmers against their conservative, small-town rural neighbors. As the relative proportions of farmers in the Middle West declined drastically, the conservative, nonfarm vote increased in importance. Hence, conservative strength in South Dakota and other former agrarian radical territory indicated in large part the disappearance of the agrarian radical social base." Very different from what the pluralists would have you think!

in the 1940s. As the big corporations on the east coast became even more established and bureaucratized by the 1940s, more integrated into a colossal New Deal state, they became less militantly conservative than they had been before the Great Depression. They became the “liberal Republicans” of the postwar era, the Rockefellers and so on. On the other hand, the more provincial and smaller centers of business in the western Midwest and South/west remained ultra-conservative: isolationist, fearful of cosmopolitan values and ways of life, suspicious of big cities and big bureaucracies, religious, and fiercely opposed to unions and the New Deal state. These were the conservatives who most supported McCarthy, given his attacks on Communists, liberals, cosmopolitan intellectuals, government bureaucrats, the United Nations, etc. Such rhetoric, or such an ideology, wasn’t new in American conservatism; just think of the Ku Klux Klan of the 1920s. McCarthy only used it in a more extreme, successful, and mainstream way. Later politicians from Goldwater (well, sort of) to George Wallace, Nixon to Reagan, George W. Bush to Trump—amid hordes of lesser figures—would follow a similar “anti-elitist,” demagogic playbook. Actually, this has been a crucial component of the so-called “New Right” of the post-1950s.

Trump is certainly nothing new. He’s just an unusually vulgar and successful player of the proto-fascist game. Similar in a lot of ways, actually, to the pioneering McCarthy. (For example, McCarthy was a complete nihilist and sadist who cared only about his own power and prestige, was dismissive of civil liberties and democratic rights, had contempt for established political norms, and liked to think of himself as a “tough guy” who “thinks with his gut.”)

According to polls, McCarthy did get a sizable amount of support from the populace. It fluctuated a lot, from 15 percent in 1951 to 50 percent in early 1954 (after which it declined permanently). Not surprisingly, Republicans were much more likely than Democrats to view him favorably. Professionals and executives were least likely to support him, while small businessmen and unskilled laborers were more likely to. (There are some similarities here with Trump.) But it seems that most of his support, especially among the working class (to the extent that it supported him), was simply a function of his being identified with anti-Communism at a time of huge propaganda campaigns against Communism, in the context of the Korean War.

Thus, contrary to what the pluralists argued, the meaning of McCarthyism wasn’t some “revolt of the masses” against established institutions and responsible political leadership.¹ After all, Eisenhower, the most “respectable” figure imaginable, remained widely popular in these years. Rather, it was elites, not the masses, who were to blame for McCarthyism. “Conservative Republican activists [such as many businessmen] provided McCarthy with the core of his enthusiastic support,” but the actions and inactions of political elites helped to augment his power:

Some, like moderate Republicans in their battle with the Democrats, congressmen in their battle with the executive, newspapers in their search for news, thought they could use him. Others, like Southern Democrats, saw no need to treat McCarthy differently than they treated other senators. Still others, moderate Republicans in their desire for party unity [such as Eisenhower, who didn’t denounce McCarthy but actually *enabled* him], [or] liberal Democrats in their desire for reelection, were afraid of him.

As with Trump—who was, and still is, made possible by Democratic elitism, corruption, and incompetence²—the whole establishment was complicit in McCarthyism. The rot extended down to provincial newspapers across much of the country that supported him; even establishment newspapers that opposed him, like the *New York Times*, gave him abundant publicity. “To understand the role of the press

¹ Here, there *is* somewhat of a difference with Trump. Americans by now share a broad disgust with established institutions, and some of them—generally belonging to the middle layers—incline toward fascist solutions. I’d venture to say, though, that the majority incline toward the left, favoring, e.g., universal healthcare, higher wages, and greater public investment in infrastructure.

² If Democrats want to avoid Republican gains in 2022 and a possible Trump victory in 2024, they have to enact an ambitious legislative program. The reason they won’t is that they’re elitist, corrupt, and incompetent.

in the McCarthy period one must realize that a figure who gains notoriety sells more papers, and that to ignore such a figure is to risk losing sales to competing publishers.” Yep. There’s nothing new under the sun.

*

The book’s final chapter consists of an unremitting evisceration of pluralism. Rogin demolishes the whole sociological/political metaphysic that still animates the Democratic Party. If Biden and the rest of the gerontocracy were capable of self-critical thought, I would think someone should recommend that they read this chapter. Pluralism, or liberalism, is so intellectually bankrupt that it isn’t very interesting to argue against anymore, so I won’t reproduce the arguments he makes. But here’s a paragraph that gets to the heart of the matter regarding mass movements (which liberals always fear):

Behind the pluralist misinterpretation of McCarthyism and fear of agrarian radicalism [or any other radicalism] lies a legitimate suspicion of mass movements. But this fear, fed by the triumph of totalitarianism in Russia, Italy, and Germany, obscures the differences among mass movements. To find radical roots for McCarthy’s support is to underestimate the middle-class diversity of the American populace. For the pluralists, McCarthyism and agrarian radicalism were united by their *petit bourgeois* character. But in America the *petit bourgeois* class is both enormous and diverse. Different political movements can call on support from different segments of that class; their support can be *petit bourgeois* without being significantly related. It is a mistake to identify mass movements with authoritarianism and pressure groups with democracy. Rather there are authoritarian and democratic mass movements, just as there are authoritarian and democratic pressure groups. [For example, labor is democratic; business is authoritarian.] The Populist mass movement operated within the established constitutional framework of the republic; it was not a threat to democracy.

The petite bourgeoisie can go either way, left or right. As can the “middle class” in general, or, rather, different strata of the middle class. An immigrant small business owner in New York City might very well join a left-wing movement; a white small business owner in the Midwest will probably be conservative or proto-fascist.

Let’s hope and pray that mass movements of the *democratic* kind spring up in the coming years, to demolish the complacent technocratic liberalism that was so beloved by the pluralists.

The secret history of automation

Here are some notes on an unjustly neglected book by the great Marxist David F. Noble (social historian of technology) called [*Progress Without People: New Technology, Unemployment, and the Message of Resistance*](#). It was published in 1995, but it was ahead of its time, since its warnings resonate even more profoundly today:

The information highway is barely under construction, the virtual workplace still largely experimental, but their consequences are readily predictable in the light of recent history. In the wake of five decades of information revolution, people are now working longer hours, under worsening conditions, with greater anxiety and stress, less skills, less security, less power, less benefits, and less pay. Information technology has clearly been developed and used during these years to deskill, discipline, and displace human labour in a global speed-up of unprecedented proportions. Those still working are the lucky ones. For the

technology has been designed and deployed as well to tighten the corporate stranglehold on the world's resources, with obvious and intended results: increasing dislocation and marginalization of a large proportion of the world's population—within as well as without the industrial countries; growing structural (that is, permanent) unemployment and the attendant emergence of a nomadic army of temporary and part-time workers (the human complement of flexible production); a swelling of the ranks of the perpetually impoverished; and a dramatic widening of the gap between rich and poor to nineteenth-century dimensions.

All these tendencies have reached crisis levels by now, and even mainstream economists are warning that in the coming years automation will eliminate millions of jobs. —On the other hand, automation could make possible an unprecedented life of leisure for everyone—for instance, a four-day or three-day workweek—if we could only shift the priorities of government.

One of the uses of the book is as a reminder that it is the government, not the private sector, that's responsible for the most important technological and scientific innovations. The only reason the capitalist economy works at all is that government (i.e., the public, the working and middle classes) shoulders most of the burden and the cost of innovation. The public sector and what you could call the “public-private sector” (involving public-private partnerships, most notably in high technology and science) is the most dynamic part of the economy. E.g.:

What mechanization was to the first industrial revolution, automation was to the second. The roots of the second industrial revolution lay in the state-sponsored technological developments of World War II. Military technologies—control systems for automatic gunfire, computers for ballistics and A-bomb calculations, microelectronics for proximity fuses, radar, computers, aircraft and missile guidance systems, and a host of sensing and measuring devices—gave rise to not only programmable machinery but also “intelligent” or self-correcting machinery. In the postwar years, the promotion of such technologies was fuelled by Cold War concerns about “national security,” the enthusiasm of technical people, management's quest for a solution to its growing labour problems, and by a general cultural offensive to restore confidence in scientific salvation and technological deliverance following the twin traumas of depression and global war. Often with state initiative and subsidy, industrial application of these new technologies (as well as an intensification of older forms of fixed automation and mechanization) began to take hold, in steel, auto, petroleum refining, chemical processing (and uranium enrichment), and aircraft, machinery, and electrical equipment manufacture, among others (pp. 24–25).

The economy was growing healthily in the postwar era, so the slow and gradual introduction of automation didn't lead to crises of unemployment or massive worker resistance. It started to by the late 1960s, though. “The increasing displacement, deskilling, and disciplining of workers in industry proceeded apace, largely unnoticed except by the workers themselves until, by the end of the 1960s, the situation exploded in an upsurge of pent-up rank-and-file militancy.” All across the Western world, the ruling class had to put down an epidemic of rank-and-file resistance, often violently, in the 1970s. Layoffs, the degradation of work, and speed-ups resulted in countless wildcat strikes and relatively new forms of working-class direct action such as “shop-floor organization, counter-planning strategies against management, rank-and-file caucuses against union leadership, and systematic sabotage.” North America and Western Europe were riven by industrial conflict.

One of the responses to all this discontent was to partially co-opt it. “The managers of some companies experimented with new methods—so-called job enrichment, job enlargement, and quality of worklife schemes—designed to absorb discontent and redirect energies along more productive paths. Sweden was a centre for such experimentation and became a model throughout the industrialized world.” In the end, most of workers' victories from these schemes of “participation” and “job-enrichment” were

very limited and short-lived. “In the wake of these limited gains, the rebellious [rank-and-file] energies that had brought them about dissipated and all but disappeared. In their place arose committees, rules, agreements, and other formal devices for dealing with the new challenges at the workplace, including the challenge of new technology.” The technology issue was formalized, bureaucratized, regulated in the form, e.g., of new contract language between unions and employers pertaining to the introduction of new technology. “Whatever these gains, however, they were achieved at the expense of removing the technology issue from the shop floor and thus from the realm of direct action available to the workers themselves. ‘With increasing formalization,’ [one sociologist] observed, ‘the spread of sabotage could once again be held in check by pressure from trade union organizations opposed to it.’”

As has often happened, then, union leadership cooperated with business to suppress and defuse rank-and-file discontent. Resistance lasted into the 1980s, as workers in Europe and North America engaged in sabotage of new technology that threatened to put them out of a job, deskill their work, and give ever greater powers of surveillance to management, but ultimately the rolling tide of automation—organized and implemented so as to benefit *management*, not workers—proved unstoppable. So here we are today, on the precipice.

*

Noble is an expert on the social history of technology, and he continually insists on the fact that automation has been designed in such a way as to benefit management, not workers. It isn’t some “automatic,” “natural,” or apolitical process by which the best and most efficient technological designs are chosen by engineers, adopted by businessmen, and then tested (for productivity, efficiency, profitability) in the crucible of the marketplace. Technical development “is not some abstractly rational enterprise with an internal logic all its own, but rather a human effort that reflects at every turn the relations of power in society.”

Engineers simply want to do what’s good for society, “yet, consistently, again and again, they turn out [technical] solutions that are good for the people in power (management) but often disastrous for the rest of us (workers). Can this be explained?” Yes, it can! “For one thing, few technical people have any contact whatsoever with workers; in their education and their professional careers, they typically communicate only with management. Not surprisingly, they tend to view the world pretty much as management does, whether they know it or not. They are taught and usually believe that this is simply the most objective way of looking at things, but it is, in reality, the view from the top, the perspective of those with power.”

Noble gives a couple of examples. Here’s one:

For seven years I investigated the history of automated machine tools. Much of the pioneering design and development work of these tools took place at MIT, and I spent many months pouring over the vast collection of documents from the ten-year project. I discovered that the engineers involved in creating this self-professed revolution in metal-working manufacturing had been in constant contact with industrial managers and military officers, who had sponsored and monitored the project. Yet I found not a single piece of paper indicating that there had been contact with any of the many thousands of men and women who work as machinists in the metal-working industry—those most knowledgeable about metal-cutting and...those most directly affected by the technical changes under development... The engineering effort was essentially a management effort, and the resulting technology reflected this limited perspective—the worldview of those in power (p. 74).

In our society, an authoritarian pattern predominates in all institutions and workplaces. “So when an engineer begins to design a top-down technical system, he reasonably assumes from the outset that the social power of management will be available to make his system functional. Such authoritarian systems

are also simpler to design than more democratic ones, since they entail fewer independent variables, and this also makes them more appealing to designers. Finally, authoritarian systems satisfy the engineer's own will to control and offer the engineer a powerful place in the scheme of things. Thus, for all these reasons, new technical systems are conceived from the outset as authoritarian ones, perfectly suited for today's world."

Behind the history of industrial automation, Noble found not merely technical and economic considerations but rather three overriding impulses: "1) a management obsession with control; 2) a military emphasis upon command and performance; and 3) enthusiasms and compulsions that blindly fostered the drive for automaticity."

So, first of all, managers "consistently solicit and welcome technologies that promise to enhance their power and minimize challenge to it, by enabling them to discipline, deskill (in order to reduce worker power as well as pay) and displace potentially recalcitrant workers. Perhaps more than any other single factor, this explains the historical trend toward capital-intensive production methods and ever more automatic machinery, which have typically been designed with such purposes in mind." These purposes, and technologies designed in accord with them, are hardly new: they go back to the early days of the first industrial revolution. But let's focus on more recent times:

In the late 1940s control engineers at MIT (who had just completed a rolling mill control system designed to enable Bethlehem Steel management to eliminate "pacing" by workers) turned their "fertile genius" to the metal-working industry. The ultimate result of their efforts, "numerical control" (NC), reflected management's [priorities] and set the pattern for all subsequent development of what are now known as computer-aided manufacturing systems. As the very name suggests, control was and remains its essence, not just management control of machines but, through them, of machinists as well.

Noble quotes industry insiders on the nature of numerical control. For example: "With numerical control, there was a shift of control to management. The control over the machine was placed in the hands of management." "I remember the fears that haunted industrial management in the 1950s. There was the fear of losing management control over a corporate operation that was becoming ever more complex and unmanageable. Numerical control is restoring control of shop operations to management." "Numerical control has been defined in many ways. But perhaps the most significant definition is that [it] is a means for bringing decision-making in many manufacturing operations closer to management. Since decision-making at the machine tool has been removed from the operator and is now in the form of pulses on the control media, [NC] gives maximum control of the machine to management." Automation, in the ways it has been carried out, is therefore just another stage in the long history of "scientific management" (sometimes called Taylorism, though that makes it too narrow) that Harry Braverman [wrote about](#) in the 1970s.

In the history of automated machine tools, alternative designs, more democratic and worker-friendly than numerical control, were proposed, but they never got much funding from military or (later) industrial backers. "Thus, NC became the dominant and, ultimately, the only technology for automating metal-working."

The perfect compatibility of the military mentality with the business mentality is interesting, and telling. Sorry for the long quotation, but it's informative:

The military [has always played a central role](#) in the technological development of U.S. industry, from mining and metallurgy to shipping and navigation, from interchangeable parts manufacture to scientific management. As the army and navy have been the major movers in the past, the air force has led the way in our time... If we just consider today's so-called high technology—electronics, computers, aerospace, cybernetics (automatic control), lasers—all are essentially military creations. When some of these war-generated

technologies were brought together to automate the metal-working industry, the military was once again the driving force.

From the start in the late 1940s down to the present day, the air force has been and remains the major sponsor of industrial automation. With regard to numerical control, the air force underwrote the first several decades of research and development of both hardware and software, determined what the technology would ultimately look like by setting design specifications and criteria to meet military objectives, created an artificial market for the automated equipment by making itself the main customer and thereby generating demand, subsidized both machine-tool builders and industrial (primarily aerospace) users in the construction, purchase, and installation of the new equipment, and even paid them to learn how to run it.

Numerical control was just the beginning of air force involvement in the automation drive. The air force numerical-control project had global significance; on a recent visit to a locomotive factory in Prague, I was surprised to find the air force NC programming system in use even there. And before long, this single project had evolved into the more expansive Integrated Computer Aided Manufacturing Program. More recently, ICAM became the still more ambitious and diversified MANTECH (manufacturing technologies) programs, designed to promote the computer automated approach to manufacturing not only in industry but also in universities...

The effects of this military involvement reflect the peculiar characteristics of the military world. First and most obvious is the military emphasis upon command, the quintessence of the authoritarian approach to organization. This means, essentially, that subordinates must do as they are told, with no ifs, ands, or buts; the intent is to eliminate wherever possible any human intervention between the command (by the superior) and the execution (by the subordinate). It is easy to understand the military emphasis upon automation, given its potential for eliminating such intermediate steps... In the military outlook, an army of men behaving like machines is readily replaced by an army of machines. This command orientation neatly complements and powerfully reinforces the managerial obsession with control. If the business suit and the uniform are interchangeable in our day, so too are the minds that go with them.

As for the idea that the ostensibly “no-nonsense economic rationality of profit-seeking businessmen” is primarily what guides their adoption of new technologies, it’s largely false. Noble presents fascinating evidence that businessmen aren’t motivated mainly by the prospect of cost savings or higher profits in their adoption of automation. Rather, there are various cultural, social, and psychological pressures to get the newest cool thing, to follow the herd mentality and do what others are doing, to obey the supposedly objective momentum of technological progress even without calculating whether some new machine is profitable or might actually *increase* costs. It seems that rigorous studies of the cost effectiveness of new equipment—does it increase productivity or not?—are rarely conducted. Actually, “by means of creative accounting and sophisticated use of the tax laws, machines can mysteriously make money for their owners even if they don’t work or are never used.”

So the dominant ideology of the “inevitable laws of technological progress” and the hyper-rationality of businessmen’s economic genius is nonsense. New equipment is frequently unnecessary or costlier than what was used before.

What about the vaunted discipline of the market? Doesn’t this ensure that firms whose acquisitions of new equipment aren’t profitable will succumb to the competition? No. For one thing, the state, which is perfectly willing to spend extravagantly and wastefully, is largely responsible for the advance of automation. “Not only has it subsidized extravagant developments that the market could not or refused to bear, but it also absorbed excessive costs and thereby kept afloat those competitors who would otherwise have sunk.” When your primary customer is the government, you don’t have to worry about market discipline.

Moreover, defense-related industries “are *expanding* along with the military automation programs, as more and more businesses rush to this state-supported sanctuary to escape the unpredictable vicissitudes of the market. At the same time, the military automation programs are today being matched by those of civilian agencies such as the Department of Commerce, the National Science Foundation, and others. All have now become the publicly funded pushers of automation madness, charting a course and promoting a pace that no self-adjusting market, had it existed, would ever have tolerated.”

Economists tend to focus on “market logic” and ignore the influence of the state, so they write as if it’s the market that is impelling the “inexorable,” “automatic” adoption of automation. But, again, this is either false or highly oversimplified.

*

Noble dedicates chapter five to an effective critique of market worship, together with the “quasi-religious faith in the automatic beneficence of technological progress” that tends to go along with it. He summarizes the quasi-religious philosophy as follows:

It goes like this—people with money are offered incentives (the chance to make more money) to urge them to invest in a new, improved plant and equipment (so-called innovation). This innovation automatically yields increased productivity and, hence, lower costs and prices, which results in greater competitiveness. Finally, this enhanced competitiveness necessarily brings about what Adam Smith, the great eighteenth-century philosopher of capitalism, called the “wealth of nations”: economic growth, jobs, cheap and plentiful commodities, in short, prosperity.

At every point, this religious faith is questionable.

For example: “To begin with, the assumption that rich people will invest in new means of production if given sufficient lucrative incentives presupposes that they would not do so voluntarily without such inducements. As such, it is itself a tacit recognition of the inadequacy of the market as a stimulus to development.” What if it isn’t lucrative to invest in new means of production, new factories or businesses or whatnot? Then capitalists won’t invest in them. In recent decades, real estate and financial speculation have become more lucrative than productive investment. This is one reason for the deterioration of infrastructure, the decline of manufacturing, and the slow collapse of society. So much for the automatic beneficence of the market.

What about the link between innovation and productivity? “When investment does in fact generate innovation [as it usually *doesn't*], does such innovation necessarily yield greater productivity? The assumption here is that the return of profits to the investor will be matched by more and cheaper goods for society.” He remarks that this assumption is “the cornerstone of apologies for capitalism, its central tenet of legitimation.” But it has become highly dubious. Even the business press admits that there’s a lot of investment in labor-saving technology designed to increase profits without necessarily adding to productive output.

In any case, with all the capital investment in recent decades and supposed advances in productivity, have you noticed any declines in prices? Hardly. If there have been gains from productivity, it seems that neither workers nor consumers have captured them. (You can check business headlines from recent years to confirm this.) So there goes another justification of capitalism.

Well, I’ll end the summarizing here, even though I haven’t discussed at all a very interesting chapter on the millennium-old (Christian) origins of the Western (and now global) “religion of technology” that has become hegemonic since the first industrial revolution. It’s a rich book, despite its brevity, and worth reading, in its totality amounting to a brilliant critique of this technology-worship (as if technology itself, regardless of social or political context, holds out salvation). Elsewhere, Noble wrote a [cutting critique](#) of the automation and commodification of higher education. It seems that his life’s mission, or one of them, was to deepen our understanding of the human meaning of technology and to critique and contextualize our

blind reverence for it. As an antediluvian traditionalist, I can only wish more writers would adopt the same calling.

America's use of the atomic bomb on Japan

Years ago I posted [some thoughts](#) on America's use of the atomic bomb at the end of World War II. I happen to be reading parts of Gabriel Kolko's classic *The Politics of War*, and his investigations of the issue have gotten me interested in it again. Not least because I sometimes discuss it in university classes, so I should have a firmer knowledge of the history than I do. After reading some academic articles, I've realized that (some of) my earlier conclusions, based on Gar Alperovitz's book, were inadequate. I still think it was a terrible crime that illustrated the amorality of most political leaders, but my earlier judgments were a little simplistic.

Since most people are unaware of the scholarship and there's a colossal amount of ignorance out there about this controversial topic, here are a few comments...

Let's look at what Kolko says. He's arguably one of the greatest American historians of the twentieth century, so he's worth taking seriously. Unlike some of the revisionists (critical of Truman) who argue that the Japanese government was desperate for peace and on the verge of surrender by July 1945, he's aware of the profound divisions in that government between militarists who wanted to continue the war and liberals who wanted to end it as soon as possible (not unconditionally but with an assurance that the Emperor could remain on the throne). The Americans knew of these disagreements among Japanese officials, that a peace faction was contending against the intransigence of the army. In late May 1945, Joseph Grew, a high official in the State Department, "won the President's support for a proposal to offer the Japanese surrender terms permitting them to retain the Emperor if they chose, which in fact was the American position since the year before." But Truman, the Joint Chiefs of Staff, and Secretary of War Henry Stimson wouldn't yet authorize a public offer to the Japanese, since they thought (for some reason) the situation wasn't ripe for a public change in policy. It wasn't until the [Potsdam Declaration](#) on July 26 that an "offer" (or ultimatum) was made. Meanwhile, Truman decided not to warn Japan of the possibility of an atomic attack.

At Potsdam, the Americans were very eager to get from Stalin (to quote Truman) a "reaffirmation of Russia's entry into the war against Japan, a matter which our military chiefs were most anxious to clinch." The prospect of an American invasion of Japan was dreadful—although, as more recent scholarship has established, estimates given by Truman and others after the war that an invasion would have caused hundreds of thousands of American casualties or even fatalities were hardly discussed at all among officials at the time, nearly all of whom (including Truman, it seems) thought such figures "entirely too high." [Around 25,000 fatalities](#) was the usual estimate. Even General Curtis LeMay said in October 1945 that the atomic attacks had saved "thousands of lives"—and he had every reason to inflate the numbers for public consumption, so it's significant that he didn't. (See J. Samuel Walker's [2005 review of the scholarly literature](#) for a discussion of casualty estimates.)

Anyway, during the Potsdam Conference the Americans heard news of the first successful test of the atomic bomb. Winston Churchill's reaction was characteristic of the man:

Churchill was the first to realize the bomb had political and military significance... Field Marshal Alan Brooke thought the Prime Minister's infantile enthusiasm bordered on the dangerous: "He was already seeing himself capable of eliminating all the Russian centres of industry... He had at once painted a wonderful picture of himself as the sole possessor of these bombs and capable of dumping them where he wished." He tried to communicate the fantasy to his associates, but they resisted it, and he [unsuccessfully] urged Truman to dispense with the aid of the Russians in the war.

On July 24, Truman, Churchill, and the Combined Chiefs of Staff had a meeting wherein "they agreed that the military situation still necessitated an invasion of Japan, requiring perhaps a million or more men. They did not expect the bomb to alter that fact." So there goes the conventional retrospective defense of American decision-making that it was *either* invasion *or* the atomic bomb, and the Americans dropped the bomb to make an invasion unnecessary. Truman himself used this justification in later years, but he was simply lying or had a faulty memory. As the judicious and unpartisan Samuel Walker writes in his 2005 article, "In the summer of 1945, the president and his chief advisers never weighed a decision between the bomb and an invasion as an either/or proposition. This was a postwar construct that followed the dichotomy drawn by Stimson, Truman, and other policymakers in their [later] explanations for using the bomb. During the last weeks of the war, they were keenly aware of alternatives to an invasion other than the bomb."

So actually, despite the meeting on July 24, American leaders were not at all certain that an invasion would be necessary (although they continued to plan for it). This is clear from Truman's diary entries, for example, and the statements of high-ranking army officials. They evidently hoped, for instance, that the staggering blow of Russia's entry into the war would help persuade the Japanese to surrender. On the other hand, General George Marshall, at least, thought that if it came to an invasion, six to nine atomic bombs should be used to support the American forces.

On July 24 "Truman sent instructions to the Air Force to drop the first bomb as soon as it was ready, and weather permitted, 'after about August 3rd,' and to deliver the rest on four target cities 'as soon as made ready.'" Kolko's judgment is that "the bomb was built to be dropped [and] no one ever had the slightest doubt America would use it." As General Leslie Groves later said, "As far as I was concerned, [Truman's] decision [to use the bomb] was one of noninterference—basically, a decision not to upset the existing plans."

The original draft of the Potsdam Declaration had a clause saying the Emperor could be retained, but Secretary of State Byrnes excised it because it might appear to be a retreat from unconditional surrender. The Joint Chiefs of Staff supported the revision, against Stimson and Grew, who thought retaining the clause might help strengthen the Emperor and liberals against the hard-line army. Of course, we can't know how the Japanese would have reacted to the Declaration if the clause had been retained. From later scholarship—contrary to the arguments of anti-Truman revisionists—it's highly unlikely they would have surrendered right away. But it might have, sooner or later, given the upper hand to the liberals in Japan's government who had already been reaching out, albeit awkwardly and tentatively, to "neutral" parties like the Russians to try to broker peace. Especially since the devastating naval blockade of Japan, the continuing destruction of the country's agricultural, industrial, and transportation resources, the diminishing morale among soldiers and civilians, etc. were exerting intense pressure on the government to end the war.

After the Declaration, Foreign Minister Togo, without real support from his divided government, continued to press the Russians to explore means of ending the war without unconditional surrender—overtures the Americans were aware of (because of code-breaking) but that they did nothing about, rightly or wrongly. So the war continued, and a few days later Hiroshima was bombed. Kolko sums up the whole affair by saying, "Mechanism [i.e., bureaucratic inertia] prevailed. No one seriously explored any of the options—neither Japanese surrender, nor delay, nor withholding the bomb." He continues:

Any realistic assessment of the objective conditions of the Japanese during those weeks might have convinced a reasonable group of men that significant alternatives to prolonged war existed, but the Japanese leaders themselves were incapable of confronting their defeat and acting accordingly. For precisely the same reasons of mechanism and conservatism, which the Japanese in their own desperate way shared, the Americans decided to use the bomb as a known and now predictable factor of war, an economical means of destroying vast numbers of men, women, and children, soldiers and civilians. Well before August 1945 they had reduced this to a routine.

The United States could have won the war without the Russians and without the atomic bomb.

The last statement is an unknowable counterfactual, but it is at least plausible, and echoes the conclusion of the U.S. Strategic Bombing Survey of 1946. What is certain is that there was no moral agonizing over the decision to use the bomb, hardly even a doubt or a second thought. Stimson, for a while, didn't even want to issue any peace offer like the Potsdam Declaration until *after* the bombs had been dropped. Why should there be moral qualms when America had for months been firebombing dozens of Japanese cities and killing hundreds of thousands of civilians? They knew the bomb would be less destructive than all that.

It's true that the Americans wanted to end the war as soon as possible, and they obviously thought dropping atomic bombs might contribute to that. (On this point, most scholarship, including Kolko's, has concluded that Alperovitz is wrong to think the bomb was used *primarily* as a diplomatic weapon against the Soviets, to intimidate them.¹) Even if few people thought an invasion of Japan would cost hundreds of thousands of casualties, and there was actually some doubt that an invasion would be necessary at all, the longer the war went on, the more Americans would die. (And, axiomatically, saving even a few thousand American lives was worth killing hundreds of thousands of Japanese.) But then: why not try harder, publicly or through "back channels," to make peace with Japan? Of course, the Japanese leadership was even more culpable for not surrendering months earlier and saving countless lives.

But in World War II, no one cared much about saving lives.

The first bomb was dropped on August 6. The historian Sadao Asada has a [good article](#) on Japan's decision-making in the following days. The military initially denied it was an atomic bomb, but Togo called an emergency cabinet meeting on August 7 at which he argued that, lest the U.S. keep dropping such bombs, Japan should accept the Potsdam terms with the condition that the emperor system remain in place. But the army wouldn't agree—it was adamant for a decisive battle on the homeland against an American invasion—so the meeting broke up. On the 8th Togo met with Emperor Hirohito to argue for surrender, and Hirohito, who was very disturbed by the Hiroshima bombing, wholly agreed. It was arranged that the Supreme War Council would meet the next day. Early on the 9th, just before the meeting, the Soviet Union declared war, which was another terrible shock, albeit not as unexpected as the atom bomb. But the army, concerned with "honor" and the like, was still resistant to surrender. In the middle of the meeting came yet a third staggering blow: the bombing of Nagasaki, which a local commander had ordered, having been authorized by Washington to do so. The U.S. hadn't even bothered to assess the impact of the first bomb or of the Soviets' declaration of war, and Asada (among many other scholars) concludes the Nagasaki bomb was unnecessary. Meanwhile, the army still refused to surrender! Another meeting later that day resulted in the same stalemate. Shortly before midnight a conference with Hirohito was convened at which the usual debates between the army and the peace faction were reenacted, with no breakthrough. So then, "in an act unprecedented in modern Japanese history, the prime minister stepped up to the emperor, bowed deeply, and submitted the matter for an imperial decision." Hirohito ordered surrender, and later on the 10th the conditional surrender was relayed to Washington through the Swiss and Swedish governments. (It was a considerable surprise to Washington, which had expected the war to last weeks or months longer.²)

In later statements, high-level Japanese officials said the "psychological shock" of the Hiroshima bomb had aided their efforts to end the war—as had the Soviet declaration of war. It is hard to say which was more important, but Asada thinks the bomb was. For one thing, he argues it allowed the army fanatics to save face: they could say they were defeated by *superior science* rather than "spiritual weakness" or strategic errors. As Japan's chief cabinet secretary recalled later, "The atomic bomb was a golden

¹ As Kolko says, by 1942 the Russians knew of the Manhattan Project and were trying to build their own bomb. "At no time did the Americans believe they could surprise the Russians with a weapon that would cause them to cower, and at every stage in their diplomacy the Russians acted with full knowledge that the United States was likely to be the first to have an atomic bomb." This isn't to say, however, that possession of the bomb was of *no* diplomatic importance, especially in the following years. See [this other article](#) by J. Samuel Walker.

² In fact, at first Truman [rejected the surrender](#) because it wasn't unconditional! Instead, the White House replied with an intentionally ambiguous statement that emboldened Japanese militarists once more, which required that Hirohito intervene on the side of peace again on the 14th. Meanwhile, despite the surrender, Truman had authorized the continuation of bombing raids on cities, though not the use of a third atomic bomb.

opportunity given by Heaven for Japan to end the war. There were those who said that the Japanese armed forces were not defeated. It was in science that Japan was defeated, so the military will not bring shame on themselves by surrendering." The bomb was a "clever pretext" for ending the war.

But surely it ultimately came down to Hirohito's decision, and he, while vacillating, had been inclined to end the war for months. Had he been a stronger person, he probably could have compelled the army to surrender weeks or months earlier.

As I indicated, the Strategic Bombing Survey of 1946 concluded that "in all probability" Japan would have surrendered before November 1, the day scheduled for an American invasion, "even if the atomic bombs had not been dropped, even if Russia had not entered the war, and even if no invasion had been planned or contemplated," but [some scholars](#) have argued this conclusion was based on too little evidence. Who knows? When it comes to counterfactuals, all you can do is speculate. It does seem very likely, though, that at least *with* the Russian entry into war (and without the bombs), Japan would have surrendered before November.

What is clear is that the whole tragic and absurd episode of the last weeks of the war was, to quote Kolko, "testimony to the irrationality and profound immorality of all leaders and the triumph of unwavering mechanism in the war between Japan and the Allies." The scholarly literature on use of the bomb is full of incredibly detailed investigations of why it was dropped, what weight was given to various considerations, why available alternatives weren't seriously pursued, and so on, but surely there is something a little misguided about this whole endeavor. Political leaders, in brief, are not so *thoughtful*, not so concerned with morality or absolute consistency or the most efficient possible means of attaining carefully defined ends. They exist in an environment of overwhelming power and pressures to expand power, bureaucratic momentum, intra-bureaucratic turf wars, technological fetishism, intoxication with military technology because of its glorious *power* and use as a tool of intimidating others. Whatever political leaders say, their environment is *power for the sake of power*. "We have this great new weapon, we might as well use it!" It reminds me of Madeleine Albright's [objections](#) to Colin Powell's refusal to use the military in Bosnia in 1993: "What's the point of having this superb military that you're always talking about if we can't use it?!" Power is to be projected for its own sake. That's the only ethic of power. Leslie Groves, for example, who was mostly in charge of determining when and where to use the bomb, "was anxious to justify the effort and the expenditures of the Manhattan Project, and he avoided outlining alternatives to Truman that could change existing plans and frustrate his objectives. Thus the bomb fell more because of bureaucratic imperatives than because of carefully considered questions of national interest." (From [the other article](#) by Walker I linked to in a footnote.) And scholars who have written, in particular, about Truman's alleged pinpricks of conscience in later years are wasting their time. *Who cares* about Truman's conscience? He was a morally and intellectually puny man (racist, self-deceiving, authoritarian, obedient to capitalist class power, self-serving, morally unimaginative, intellectually incurious), a nonentity like most public officials.

The bomb was used for many reasons: it might help defeat the Japanese; it might help end the war before the Soviets had conquered much territory in East Asia; it might help save American lives; *and crucially*: it projected American power to both allies and enemies; enormous resources had been poured into its construction; powerful officials had always taken for granted that the bomb would be used; hardly anyone expressed any opposition to it; political leaders are moral cowards; etc. Were the attacks on Hiroshima and Nagasaki horrific crimes? Of course. You need only a little moral common sense to see that. (Just read about the bombs' actual effects on the victims, if you can stomach such reading.) The Americans and, obviously, the Japanese could both have exerted more effort than they did at ending the war months earlier. Or, if they had cared about Japanese lives at all, the Americans could at least have bombed an exclusively military target or warned people to leave the area before the attack, as General Marshall futilely advocated. Even the sociopathic Curtis LeMay, in charge of the strategic bombing of Japan, admitted that he and the other American (and foreign) leaders were war criminals or would have been punished as such had they lost the war.

Nationalist habits of thought cause irrationality and moral imbecility, leading many people to think the atomic bombings (and the firebombing of Tokyo and other cities, also in Europe) were necessary and justified. They weren't.

January, 2024

Henry Plotkin's article "The Central Problem of Cognitive Science: The Rationalist–Empiricist Divide" (2008) is useful. Notes that the classical empiricists (Locke, Hume, etc.) didn't deny innate psychological processes and structures, such as a capacity for forming associations based on particular features of our perceptions; they only denied innate representational knowledge of the world. This is what empiricists continue to deny, and what rationalists, like Konrad Lorenz, Jerry Fodor, and Chomsky, affirm. Lorenz made an important contribution in 1965 when he noted that learning—an individual's learning about the world as he develops from infancy—is almost always adaptive in outcome. 'Adaptive' in the evolutionary sense. Thus, learning as an adaptation (to the environment) must itself be innate, an outcome of Darwinian evolution. That is, humans (and other animals) have innate constraints on learning, on what will be learned and how it will be learned. "It is important to note," Plotkin writes, "that Lorenz was not claiming merely that the mechanisms underlying learning are innate. He was asserting that some representational knowledge is innate, because that is what points the learning mechanisms at the specific features of the world that must be learned." "...[T]he idea of evolved constraints on learning was original to him, and was a seminal contribution to cognitive science."

Empiricists (including in the twentieth century) had assumed that

learning was a general process, the same process, caused by the same cognitive mechanisms in all learners, human and non-human, and that within each species, knowledge is gained by way of some single learning mechanism. Even Piagetians, working outside of the intellectually crippling confines of behaviorism, adopted a general process view. This is why Lorenz's 1965 insight was so revolutionary, and why constraints in animal learning received so much attention. It provided sound justification for the view that learning need not, indeed was unlikely to be, a general process; and that its specificity and difference in different species is the product of evolution.

The "new rationalism" was, of course, stimulated in large part by Chomsky's "poverty of the stimulus" argument, namely that "the output of some computational process, for example perception, contains more information than the proximal stimulus, the input, and hence that the increase in the information of the output must be coming from features of the computational mechanism itself." As Fodor wrote, such an argument shows that "sensory information alone underdetermines perceptual integrations" (i.e., perceptions). As I've often said, this seems obvious. In the case of language, for instance, the toddler hears nothing but a continuous stream of sounds; it doesn't *hear* syntax or words or sentences. It has to *impose* a structure on the sounds: they don't come with a syntactic structure right on the surface. Only if the child's brain were equipped with a special faculty for somehow detecting hidden grammatical structures—and also semantic units and complex phonological rules!—in unbroken streams of sound could it possibly figure out what's going on. Moreover, the grammar is so insanely complex that it, um, isn't easy to believe that toddlers are consciously deciphering it, figuring it out, and then creating a language on that basis. If a genius like Chomsky has spent his life deciphering syntax, I'm skeptical that two-year-olds can manage it. Their construction of a language has to be *unconscious*, determined by innate principles and processes that *automatically* linguistically parse the verbal sounds that are heard.

From the point of view of most academics, committed to irrationality, the problem with this Chomskyan hypothesis seems to be that it's too rational.

Meanwhile, Fodor's thesis of the modularity of mind became central to cognitive science. Plotkin implies that one needn't have an innatist interpretation of modularity, but the idea of mental modules does strike me as peculiarly compatible with the rationalist, innatist view.

Anyway, a large body of evidence has accumulated that infants only a few months old display knowledge relating to causality, intuitive physics, numerical competence, and so on. Theoretically, in their short life they could have learned all this, but it seems doubtful, given their restricted sensory systems, uncoordinated movements, inability to reason, and constant sleeping. The knowledge is innate. These ‘knowledges’ “are modern-day psychology’s Kantian *a priori*s; the realization of Lorenz’s learning constraints that direct the infant’s attention to specific and constant features of the world.”

Aside from these considerations of cognition and language, there is *affective* evidence. Why would infants automatically direct their attention to others’ eyes and to direction of gaze? Why would they *point* in order to direct others’ attention, if not because of an innate proto-understanding that other people have minds? In fact, I’d even add that the infantile sucking and grasping reflexes manifest a kind of representational knowledge of the world (encoded in genes), viz. that nipples exist and provide sustenance and that there are graspable objects in the world.

Plotkin sympathetically presents the arguments of recent empiricists who are aware of things like innate attentional biases but still deny innate representational knowledge. He then makes a good counterpoint:

It remains the case that there is a contradiction, a deeply serious contradiction, between a denial of representational nativism on the one hand, and an acceptance of innate attentional biases or innate differential weightings within networks on the other. It is this: How can some feature of a cognitive system which biases attention, or differentially weights input, be considered as anything other than a form of representation of some aspect of the world? If human infants are predisposed to attend to faces rather than to elbows, and if that predisposition takes the form of attending differentially to a particular configuration of horizontal lines which occur regularly within the neonates’ highly limited visual space, then that configuration is a specific aspect, a *representation*, albeit a highly reduced and fragmentary representation, of something in the world of infants, viz. the faces of its caretakers.

Frankly, I’m convinced that empiricism is *massively wrong*. That is, the mind is absolutely saturated with and determined by innate “knowledge,” innate cognitive and emotional and aesthetic structures, principles, rules, constraints, ideas, instincts, expectations, intuitions, operations. Over millions of years of organisms’ interactions with the environment, this inconceivably rich innate endowment—knowledge and means of getting around in the world—has accumulated. Plato really was right, in a sense: the foundation of an individual’s knowledge comes from previous lives. Millions of previous generations.

It’s awe-inspiring to think of the unbroken chain of life stretching back billions of years, in which I am yet one more link, link #5,000,000,000,000. On one end is a bacterium, or rather a strand of RNA; on the other end is Chris Wright. (Well, now Aidan Yusipov.)

Stephen Laurence and Eric Margolis’s long, comprehensive paper “The Poverty of the Stimulus Argument” (2001) decimates the empiricist criticisms and shows that the argument is overwhelmingly, inescapably plausible. Aside from the authors’ massive evidence for the total impossibility of a relatively blank empiricist mind’s acquisition of language—there are just too many hurdles, too many ways to get one’s guesses about the right grammar wrong—secondary considerations are compelling. For instance, why is it that virtually all children acquire language at the same rate and through the same stages? To quote Karen Stromswold’s study, “The order in which these 15 children acquired complex constructions—questions, negative constructions, passives, datives, exceptional case marking constructions, embedded sentences, preposition-stranding constructions, causative constructions, small clause constructions, verb-particle constructions, and relative clause constructions—was extremely regular.” Given an empiricist framework, why would these patterns appear? People approach problems differently, after all.

Ugh, empiricists:

Empiricists sometimes write as if empiricism is the default position, the one that should be adopted in the study of language, all things being equal. The assumption is that a domain-specific mechanism of acquisition is plainly implausible. This is an odd position to maintain, however, especially in light of the approach that is widely taken with regard to the distinctive abilities in other species. These days there is little hostility to the idea that there are special mechanisms devoted to the acquisition of bee dance, bird song, nest building, web design, or mate selection (to name just a few). Quite the contrary; the best work in comparative psychology is widely recognized to overstep the restrictions that empiricism would impose. It's hard to believe that things should look differently just because the focus switches to *Homo sapiens*.

Early philosophical criticisms from the likes of Nelson Goodman and Hilary Putnam were silly. Goodman even said only his respect for nativism's (innatism's) advocates enabled him to take it at all seriously, and that it was "an intrinsically repugnant and incomprehensible theory." What a dumbass. Being steeped in a culture of empiricism and behaviorism had so thoroughly corrupted Goodman's mind that he couldn't even *understand* an opposing viewpoint! Putnam objected to the "vagueness" of nativism, whatever that means. Laurence and Margolis have no trouble dispatching the various early criticisms, and they don't find it too difficult to refute later criticisms either.

Henry Plotkin's *Evolutionary Thought in Psychology: A Brief History* (2004) is pretty good. I've sometimes wondered how behaviorism was able to dominate for so long, given its intellectual poverty, but if one knows a bit of history it isn't that mysterious. For one thing, its emergence in the early twentieth century dovetailed with the Progressive state's—and the business community's—interest in controlling the population through propaganda and other means. (See the Creel Committee, for example, and the corporate advertising campaigns of the 1920s.) Modern states are, in part, in the business of "behavior modification," and behaviorism can be a theoretical, or methodological, underpinning for that. Just as certain ideas of psychoanalysis can, which accounts for early propagandists' interest in that field.

Aside from this political and economic utility, which Plotkin doesn't mention, he observes that American society is famously "practical" and anti-theoretical—and behaviorism was especially popular in the U.S. It was far more interested in *prediction* and *results* than in *explanation*, and thus fit with "the American character."

But there were more respectable reasons for the rise and dominance of behaviorism. One of them, of course, is the Watsonian suspicion of introspective reports and internal mental states in general. This suspicion is somewhat understandable in light of the profusion of pseudo-scientific speculation at that time about instincts (thousands of possible instincts were proposed!), the nature of consciousness and the human mind, etc. The behaviorist impulse to purge all the nonsense, everything that wasn't strictly scientific, and pare psychology down to its essentials was healthy, even if it went way too far. Here's Plotkin on instinct theory and behaviorism:

The behaviorists would have none of what was outrageously bad science, if it was science at all. The bases of instincts were not publicly observable. The entire notion of instinct ran counter to the empiricism of behaviorism which, as an idea whose time had come, simply steamrolled one of the sillier and more shameful episodes in psychology's history. The inevitable collapse of instinct theory added to the impetus of behaviorism... The central tenets of [behaviorist] psychology were that psychology as science is based on what happens in muscles and other peripheral organs, and on how a few basic reflexes are elaborated by experience, either by conditioning or a history of reinforcement contingencies, to result in observable behavior.

Rationalism was largely purged from psychology, as was evolutionary theory. But even this wasn't wholly regressive, since at least it counteracted the influence of eugenics, which was grounded in Darwinian

notions (or rather vulgarizations of them). Emphasis on environmental factors as opposed to “nature” and heritability at least challenged the racism of eugenics.

This in fact is one reason Franz Boas founded cultural anthropology, which rejected all “biologism” and embraced social constructionism. For Boas, “culture is extragenetic, works identically in all social groups, results in differences in different social groups because of difference in history, and as a force in humans is far, far greater than that of biology.” Boas was appalled by the popular racism of his day, so he went to the other extreme of total empiricism. This permitted an attitude more enlightened even than that of Bertrand Russell, who favored eugenics.

After some decades of “clearing the air” of all this noxiousness, biology, innatism, and evolutionary theory were able to reenter psychology, in the 1950s and 1960s. On one hand there was the Cognitive Revolution, stimulated partly by computer science; on the other hand there emerged sociobiology. (To be fair, in Europe the Gestalt school had arisen in the meantime, but that had nothing to do with evolutionary theory.)

The negative achievement of behaviorism reminds me of the negative achievement of postmodernism, which ridiculed and tried to “deconstruct” all the grand theorizations of Marxism-Leninism, Stalinism, Maoism, structuralism, Althusser, and other dense left-wing theoretical debates, instead embracing a kind of empiricism, a theoretically nugatory analysis of discursive appearances, fragmented cultures, hybrid identities, simulacra and pop cultures. Like behaviorism, in its anti-theoretical and “particularistic” stances (notwithstanding the “theory” pretensions of many postmodernists), it went too far. Historical materialism, for instance, is essential, not some grand narrative that has to be discarded.

I had never encountered the concepts of the Baldwin effect or of C. H. Waddington’s genetic assimilation, which seem like interesting additions to evolutionary theory but aren’t easy to fully grasp. If I have time, maybe I’ll read another book on epigenetics.

The evidence of constrained learning in non-human animals is interesting, not least because it tends to refute empiricism. For example, it turns out that rats find it easier to associate taste and smell stimuli with the stimulus of nausea than with electrical shock. Likewise, Plotkin mentions “the acquisition of song in song-birds which is powerfully constrained towards the learning of species-specific song; humming-birds able to acquire certain strategies that fit well with their natural foraging behavior; and sex-differences in spatial learning ability in different species of vole which matches their reproductive strategies.” Language learning in humans is surely another example, an even more compelling one (because of the complexity of language, which “general learning processes” can’t possibly accommodate).

By the way, insofar as all this is determined by evolution, “evolutionary psychology” is obviously, in principle, a valid discipline. Notwithstanding the criticisms leftists have made of it (many of which are justified).

*

My not having written anything about Israel’s genocide of Palestinians doesn’t mean I haven’t been thinking about it constantly. The videos on Twitter have been almost unbearable to watch. I had no respect for Biden previously, but I didn’t fully understand what a monster he is, a sociopath happy to enable and contribute to a literal genocide. And it’s been striking to see legions of liberals and conservatives reveal themselves as old-fashioned racists happy to countenance genocide. No wonder the Holocaust was able to happen! Once again, the establishment media is happily complicit in the most barbarous crimes imaginable: the BBC, for example, refused to air South Africa’s devastating case against Israel before the International Court of Justice but aired Israel’s rebuttal. Norman Finkelstein—whom, by the way, I’ve had some entertaining long conversations with when I went down to his apartment in Brooklyn—calls Israel the SS: the Satanic State. And Joe Biden is now and forevermore to be known as Genocide Joe.

Reading Rashid Khalidi’s excellent *The Hundred Years’ War on Palestine: A History of Settler Colonial Conquest and Resistance, 1917–2017* has given me a deeper historical understanding. Though I already knew the basic history and its very simple moral dimensions. Israel evidently thinks it’s *finally* on the verge of achieving the long-sought goal of Zionism, to purge all of Palestine of its indigenous

inhabitants. Slaughter and expel the Gazans so as to turn that strip of land into a tourist mecca, and continue settling the West Bank and killing its inhabitants until they're confined entirely to desert wastelands. Because of the unfathomably evil U.S. empire, it might get its wish. But the entire world now loathes it, so the near-achievement of its dreams has come at quite a cost.

One very worrisome wild card is Israel's possession of nuclear weapons. When a state is run by psychopathic genocidal maniacs who feel like a tiger backed into a corner, and when they have access to "weapons of mass destruction" (unlike Saddam Hussein), the future of the species is at risk.

To be fair, the species probably has no future anyway. And maybe it doesn't deserve to.

Trump will likely win the 2024 election because people think Biden sucks and he's too egomaniacal to step aside. And it's downhill from there. Two generations of abjectly mediocre political leadership have left the U.S. a basketcase of a country at the mercy of jackals and vultures.

*

As has been the case for the last 25 years, my life continues to feel meaningless unless I'm writing something. Too bad nothing seems worth writing about and in any case I feel my talents waning! But I can still comment on articles and books, at least. In fact, I can console myself with the thought that these short commentaries are of some value, since the one talent I still have is that I'm consistently rational and, unlike nearly everyone, almost always right.

I know contemporary philosophy is of interest to very few people, doubtless including you, the reader, but I find it worth occasionally critiquing anyway. And maybe there's value in quoting it sometimes and thereby immortalizing it in my journal, as an expression of a certain type of society that future readers can laugh at. For example, consider the respected Joseph Rouse's 1991 paper "The Dynamics of Power and Knowledge in Science." It's fashionably Foucauldian, postmodernist, and pragmatist, and therefore forgettable. But interesting as a symptom. We have the predictable denial that knowledge and power are "analytically distinct domains" and the predictable affirmation that knowledge/power is "temporally, socially, and spatially dispersed," such that knowledge is about more than beliefs or propositions and power is about more than causally influencing the acts of others. I'm surprised the paper doesn't have the (by now) beloved word "imbricated." It turns out that the things that mediate power (and its resistance) include not only the social world, as we're accustomed to thinking, but also "tools, processes, practices, and things worked with and upon." Um, yes, I'd have to agree with that. Rouse's book *Knowledge and Power: Toward a Political Philosophy of Science* (1987) apparently "initiated [the] rethinking [of the distinction between the natural and the social] by extending 'power' beyond narrowly 'social' interactions to include transformations of the configuration of practices and things within which actions are intelligible." So, in other words, Rouse has taught us that the concept of power can involve acting on nature and physical things, not only people. Wow! That wouldn't have occurred to me!

But the insights keep coming. Scientific knowledge, too, can be modeled on "this reinterpretation of power as dynamic and heterogeneous. Knowledge is then not something possessed and exchanged, but a process mediated by heterogeneous and contested alignments." What a stroke of genius! "For example, 'genes' emerge as objects of possible discourse through accumulations of capabilities and insights in specific contexts..." In general, "strategic alignments [i.e., "gradual transformations, reproductions, and extensions of localized knowledges"] are constitutive of knowledge. Thus, a statement, skill, or model does not count as knowledge in isolation or instantaneously. Rather, their epistemic standing depends upon relations to many other practices and capabilities, and especially upon how these relations are reproduced, transformed, and extended." It then gets *really* deep:

Knowledge therefore has a more complex temporality than do operant or abiding warranted beliefs. To take something as knowledge is to project it as a resource for ongoing activity, whether in further research or in various "applications." Knowledge in this sense *circulates*, and its points of articulation, or even collection and assessment, are caught up

in its circulation... Scientific work continually reorganizes what is known as a resource for further investigation.

The intellectual pyrotechnics are dazzling.

Knowledge isn't a distinct *object* domain. Instead, to understand it dynamically "in all its local proliferation and heterogeneity invokes considerations 'properly' belonging to other domains were the world present in such discrete bundles." Power and knowledge, you see, overlap in many ways! They can't be strictly separated from each other. By the way, Rouse isn't just talking about "background knowledge." "Instead," he says, "I take the 'field' within which scientific claims acquire significance and justification to include more than a web of belief: skills and techniques, instruments and material systems...resource availability...institutional structures, relevance to other social practices or political concerns, and much more." Thus, "epistemic and sociopolitical alignments intertwine."

There's no need to go on. Even apart from the unoriginality of all this and the silliness of pretending that any of it is intellectually substantive is the deeper sterility of the project, the quintessentially "philosophical" project of trying to clarify meanings of particular concepts. What is power, what is knowledge? They are *actually* such and such, they have all these hidden dimensions and overlap in so many ways! Fine, whatever. Concepts like these, like *most* concepts, are rather vague and can be fleshed out and extended as you like. By analyzing them you're really only analyzing how we use certain words or, if you're trying to extend their meanings, how we should use them or what's implicit in our usage of them. It's mostly a linguistic exercise—and a sociologically descriptive one, in this case (stating truisms about scientific practice and how it involves 'extra-epistemic' processes)—not an interesting philosophical one. "Knowledge," especially scientific production of knowledge, implicates a whole lot of phenomena, that's true. But why is that interesting? It doesn't imply, for instance, that science isn't getting closer and closer to understanding the essence of a mind-independent world, or that knowledge is somehow all relative or merely expressive of power relations, or that there is no objective truth about the world.

Let's look at a representative work from a more famous writer: Bruno Latour. Here's a paper entitled "On actor-network theory: A few clarifications" (1996). Oh the profundities that await us:

[Actor-network theory, or ANT] was devised as a reaction to the often too global concepts like those of institutions, organizations, states and nations, adding to them a more realistic and smaller set of associations. Although ANT shares this distrust for such vague all-encompassing sociological terms, it also aims at describing the very nature of societies. But to do so it does not limit itself to human individual actors, but extends the word actor—or actant—to *non-human, non-individual* entities...

...As a first approximation, ANT claims that modern societies cannot be described without recognizing them as having a fibrous, thread-like, wiry, stringy, ropy, capillary character that is never captured by the notions of levels, layers, territories, spheres, categories, structures, systems. It aims at explaining the *effects* accounted for by those traditional words without having to buy the ontology, topology and politics that go with them. ANT has been developed by students of science and technology, and its claim is that it is utterly impossible to understand what holds society together without reinjecting in its fabric the facts manufactured by natural and social sciences and the artefacts designed by engineers. As a second approximation, ANT is thus the claim that the only way to achieve this reinjection of things into our understanding of social fabrics is through a network-like ontology and social theory.

...This is the most counterintuitive aspect of ANT. Literally there is nothing but networks, there is nothing in between them, or, to use a metaphor from the history of physics, there is no aether in which networks should be immersed...

[There are advantages of thinking in terms of networks. For example, we can avoid old binary oppositions in social theory like far/close, inside/outside, and small-scale/large-scale. On the latter:] the notion of network allows us to dissolve the micro-macro

distinction that has plagued social theory from its inception. The whole metaphor of scales going from the individual to the nation state, through family, extended kin, groups, institutions etc. is replaced by a metaphor of connections. A network is never *bigger* than another one, it is simply *longer* or *more intensely* connected. The small-scale/large-scale model has three features which have proven devastating for social theory: it is tied to an order relation that goes from top to bottom or from bottom to top—as if society really had a top and a bottom; it implies that an element “b” being macro-scale is of a different nature and should thus be studied differently from an element “a” which is micro-scale; it is utterly unable to follow how an element goes from being individual to collective and back... [Etc., etc., for many more pages.]

There are people who take this garbage seriously!

Somehow it's taken as a substantive question whether we should think of society in terms of *networks* or in terms of *structures* and *institutions*. Imbeciles, these are metaphors. You can choose whatever metaphors you like; the real intellectual work isn't done by the metaphor but by your specific explanations of events. Sure, society consists of networks, if you like. And yes, we can also say these networks incorporate physical objects and other non-human things. You can have whatever “social ontology” you like: society consists of people or networks or structures or institutions or relations or whatever. Debates about social ontology are empty! Empty and comical. Ontological questions are meaningful when they pertain to the physical world, but regarding the social world it's just a matter of which way of talking about it you prefer. The intellectual substance enters when you start discussing, for example, rival economic theories/explanations, or the causes of particular historical events, or the reasons for mass immiseration, and so on. Postmodern “theory,” which tries so hard to be profound, ends up as less than superficial.

Even when Marx wrote “Society does not consist of individuals but expresses the sum of interrelations, the relations within which these individuals stand,” it wasn't a particularly substantive statement. It was mostly just an indication that he was going to approach society “as a whole” instead of focusing on atomized and de-historicized individuals. On the other hand, if you want to include in “social ontology” the broad question of historical causation, of materialism vs. idealism, well then the debates get more substantive—albeit dumb, because it doesn't take genius to see that control over material resources is a matter of greater social consequence than what ideas people happen to believe (or *say* they believe, perhaps deceiving themselves about their real attitudes).

Ugh, forget about the commentating on mediocrities. Let's turn to something more rewarding. I think I, for some reason, hadn't previously read H. A. Prichard's classic paper “Does Moral Philosophy Rest on a Mistake?” (1912). Prichard's writing gets straight to the point, and I love his breezy ambitiousness. Here's the first paragraph:

Probably to most students of Moral Philosophy there comes a time when they feel a vague sense of dissatisfaction with the whole subject. And the sense of dissatisfaction tends to grow rather than to diminish. It is not so much that the positions, and still more the arguments, of particular thinkers seem unconvincing, though this is true. It is rather that the aim of the subject becomes increasingly obscure. “What,” it is asked, “are we really going to learn by Moral Philosophy?” “What are books on Moral Philosophy really trying to show, and when their aim is clear, why are they so unconvincing and artificial?” And again: “Why is it so difficult to substitute anything better?” Personally, I have been led by growing dissatisfaction of this kind to wonder whether the reason may not be that the subject, at any rate as usually understood, consists in the attempt to answer an improper question. And in this article, I shall venture to contend that the existence of the whole subject, as usually understood, rests on a mistake, and on a mistake parallel to that on which rests, as I think, the subject usually called the Theory of Knowledge.

You have my attention, sir!

As he takes it, moral philosophy exists to answer the question “*Why be moral?* Why can’t I just do what I want?” And there’s a parallel here with the theory of knowledge. “Just as we try to find a proof, based on the general consideration of action and of human life, that we ought to act in the ways usually called moral, so we, like Descartes, propose by a process of reflexion on our thinking to find a test of knowledge, i.e. a principle by applying which we can show that a certain condition of mind was really knowledge, a condition which *ex hypothesi* existed independently of the process of reflexion.”

As you may know from my old reflections on the subject, I think we never have knowledge in the strictest possible sense. That would entail absolute certainty, the absolute absence of doubt: but there can always be doubt inasmuch as we can always conceive the possibility that we’re massively deceived in some inexplicable way. It’s always possible to question your beliefs, even the ones that seem indubitable, like my belief that there is a patch of white in my field of vision right now. Even if the possibility scarcely makes sense at all, it *might* be that I’m somehow, in some transcendent and true metaphysical world, bizarrely deceived.

But setting aside this weird possibility and these weird philosophical doubts, I’d have to agree with a number of philosophers that I do indeed have *knowledge* of what is immediately present to me (my sensory experiences). Anything beyond that is more tenuous as knowledge, although the probability of some belief’s truth might still be very high (taking into consideration all relevant factors).

On the old Platonic question of why we should be moral, I agree with Hume and my past self—*contra* philosophers like Philippa Foot (and Plato, Kant, and many others)—that, if acting immorally advances your own interests and it doesn’t sting your conscience, it’s perfectly rational to act immorally. If you don’t care whether people would judge you as lacking integrity or being a bad person, then fine, go do immoral things. For, ultimately, that really is the most compelling reason to act well: you want to think of yourself as a good person, and you want others to think of you that way (and you don’t like the thought that *if they knew* about your bad actions, they’d likely consider you a bad person). But some of us don’t care much, and there isn’t a lot you can say to change their minds. If they think they’ll get away with the bad behavior and it’ll be good for them and that’s all they care about, no sustained philosophical argument can “prove” to them they should act differently (e.g., that they’re being irrational if they don’t).

Of course, there are other reasons too. If you care about people, you should act morally. Likewise if you want to make the world a better place, or if you want to model behavior for your children, and so on. Also—getting back to reasons that pertain to your own self-interest—it’s more *dignified* to act well than to act badly, so that should matter to you if you care about having dignity. To have self-control, to present yourself (even to yourself) in the best possible light, is to be dignified. But there is no “categorical imperative” to be moral, only “hypothetical imperatives.”

Maybe you think judgments of personal badness or goodness are meaningless, mere expressions of the judge’s attitude and not somehow “objectively true.” And so why should you care what others happen to think about you or what they would think if they knew the immoral things you’d done? Why should you care about morality itself, since it’s just a collection of values people happen to have? You have different values, so screw them! We’re all free to have whatever values we want, and to make rather arbitrary judgments about others’ badness for not adhering to *our* values. Others think you’re bad for being willing to lie all the time, but you think they’re bad for being so brainwashed as to believe that always telling the truth is important and good. Or for not acknowledging that *they* often lie too, or whatever. Well sure, your skeptical, not to say nihilistic, beliefs about the nature of morality and values may even be true. (I think they are, in fact.) But it’ll still be the case that society has a generally agreed-upon morality according to which people will judge you as “bad” or “immoral” for doing certain things, and you’ll have to live with their judgments, their ostracism of you, or your knowledge that if they knew about your acts, nearly everyone would consider you despicable. Sometimes, of course, society’s moral judgments are themselves immoral, and the lone dissenter is the moral and courageous one. But in that case he at least has the comfort of truly believing himself to be in the right—based on fundamental moral precepts that *others* acknowledge too (only misapplying them or disregarding them, as you think, in this instance)! But the situation is different if you’re just someone who wants to act on his own inclinations, selfishly, casually rejecting moral

rules when they're inconvenient, and then comforting yourself with the thought that value systems are, at bottom, pretty arbitrary—"we humans happen to value kindness, mutual respect, and compassion, but we could have been constituted differently, so who really cares! Our moral judgments are merely manifestations of how our minds, through evolution, happen to have been constituted!" For this person, it will be difficult to be fully at peace with himself, fully confident of his worth—because, after all, as a human, it's probable that even he can't totally avoid the perception that there is something good and valid about conventional morality. So on some level even he will have the suspicion that he's not a "good person." And that will bother him, perhaps even, unconsciously, make him very unhappy. So then we come back to the point that, for these reasons, it's rational for him to be moral.

But again, if he's a sociopath or a psychopath and genuinely doesn't care, there is no other compelling argument we can give. And philosophers should stop looking for one.

An intuitionist like Prichard might reply to the questions "Why should I tell the truth? Why should I repay my debts? Why should I treat people as they'd like to be treated?" by saying "It's just self-evident that these are the right ways to act! You know, intuitively, that they're right. You can't escape that intuition, much as you try. So your question is misguided. You should act in these ways because they're self-evidently right." Upon reflection, his interlocutor might have to admit he does share those intuitions. But he could retort, "Saying they're right, or even pointing out that they strike *me* as obviously right, isn't a very compelling argument. I don't want to be bound by intuitions I happen to have for whatever reason. My question is exactly *what justifies* those intuitions, and why I should abide by them. And here you're silent." A non-intuitionist can point to all sorts of other considerations, such as that a common morality holds society together and therefore should be followed, but if a determined skeptic truly doesn't care about any of your reasons, it won't be irrational for him to act immorally. He isn't doing anything "contrary to reason" or "contrary to his nature" or whatnot.

Anyway, on a somewhat different topic, I want to note, again, that some of the puzzles philosophers get themselves into are a result of taking words too seriously or too literally or applying them in contexts that go beyond their original meaning. For instance, philosophers will sometimes inquire, and expound at great length, about the nature of "obligation" (or "normativity," etc). What does it mean for something to be an obligation? Why is it an obligation? Why is *not lying* an obligation? It makes more obvious sense to say that repaying a debt or keeping a promise is an obligation, because you've already committed yourself to it. Since you bound your future self to act a certain way, and you told someone you would, you're "obliged" to act that way. But, in the absence of a prior commitment like this, why am I obliged not to lie, not to kill, not to steal? What is the "meaning" of the obligation here? To whom is it an obligation? To humanity in the abstract, to myself, to all particular people? And why should I have obligations to these people, especially if they have no personal connection to me or haven't done anything for me that deserves my gratitude and reciprocation?

Well, in fact, I'd say the strict notion of obligation isn't appropriate to a lot of moral contexts. No wonder we find it mysterious, then! Centuries ago, we used to think of telling the truth and whatnot as *virtues*, not necessarily "obligatory duties." The Greeks talked of virtues, as did medieval moralists (as Stanley Cunningham notes in "Does 'Does Moral Philosophy Rest Upon a Mistake?' Make an Even Greater Mistake?" (1970)). Virtues are *good* but not as binding as obligations. You *should* tell the truth—because that shows respect for others, it's how you would want to be treated, it justifies people thinking of you as a good person—but it isn't precisely an obligation you mysteriously have to everyone. Nor do you have an "obligation" not to kill. Why would you have an obligation not to kill someone who had done you wrong? It's *good* not to kill him, and you could even use the word 'right'—the *right* thing is not to kill him, because killing is wrong, for whatever reasons you want to give (our common humanity, life is precious, you're inflicting pain on his loved ones, the Golden Rule, etc.). But you don't have a literal *duty* to him not to kill him. A duty to yourself, maybe? Are you betraying or contradicting yourself in some way by killing or stealing or lying, as some philosophers, notably Kant, have claimed? This argumentative gambit reeks of artificiality, of desperation to justify continued use of words like obligation and duty. It's best just to admit that we talk about moral situations in various ways, using different words with slightly different meanings and connotations, but that the salient meaning of them all is merely *don't do that, it's bad, i.e. people*

disapprove of it (or do that, it's good, people highly value it). Attempts to precisify it all, to make fine conceptual distinctions, to flesh out or invent “deeper” meanings of words that are casually used in different contexts, are misguided. Moral language exists to enable people to get along with each other. That’s the extent of its meaning. Don’t look for anything deeper than that. If you do, if you take too literally the subtle differences in conceptual valences of different words (like between right and good) and probe them too obsessively, you’re just being tricked by accidents of language and etymology.

“What is the Good? What does it mean for something to be right vs. good? How do duties differ from virtues? What does it mean to say someone is a virtuous person? How can I have duties to distant people I don’t know? Why should I act morally?” Ugh, stop with all this! The “naturalistic” analysis is [almost] always best. Just follow the Golden Rule, that’s the point of it all. Act in ways that are plausibly implied by the Golden Rule. But if you can feel good about yourself even without acting morally, fine, go ahead. There’s no profound, non-obvious argument to convince you to be moral.

–The dirty little secret of philosophy is that most of the “perennial questions” are, ultimately, pretty easily answered. (The ones that aren’t, on the other hand, are most often pretty obviously unanswerable, or at least permanently shrouded in mystery and paradox.) And some of them, like “Why should I be moral?”, are kind of juvenile. Searching for a knock-down argument where there isn’t one. Life is full of ambiguity and difficult decisions. Becoming an adult means tolerating that ambiguity and ceasing to look for certainty.

[See the thoughts in the entry from April, below.]

*

I recently learned that one of the ways in which I’m unusual is that I have aphantasia. I mean, I always knew I can’t really visualize things—although I may have been a little better at it when I was young—but I didn’t know until recently that it’s a “condition,” and it’s rare. The idea of being able to call images to mind at will seems incredible to me; I always see nothing but black when I close my eyes. I thought everyone did! I suspect my condition is bound up with my other odd, and sometimes inconvenient, traits, like my terrible memory. And maybe other cognitive abilities and disabilities.

February

Almost everything seems frivolous when radical evil rules the world and is on the verge of destroying an immense proportion of life on Earth. Not to mention exterminating a people in full view of everyone, every government and every national population everywhere. One person—Genocide Joe—could end it, but he insists on its continuing month after month, even if it will cost him his reelection. Not even self-interest can stop him from providing the means for the genocide, so committed is he to the exterminationist settler colonial project. Not even the prospect of outright neofascists taking over his government can stop him from passionately supporting genocidal neofascists in Israel. Almost everything seems frivolous except preventing Evil like this from seizing power, or casting it out once it’s seized power.

But the 2024 choice is between Genocide Joe and Nihilist Trump. It’s enough to plunge the most steely stoic into despair.

Trump will win, fascists will take over, and civilization’s days will be numbered. This century, either nuclear war or ecological destruction (largely but not entirely from global warming) will likely bring organized society to a close. The Holocene will definitively end and the ensuing thousands of years will be a time of chaos. Humanity might be driven extinct. It would be sad, but at least it would give the planet a chance to recover from the damage this disastrous species had done to it. All the glorious achievements of the culture creators, the Newtons and Beethovens, and the moral heroes, the millions of good people struggling to elevate humanity, will have proven no match for the profound evil of the Bidens and Trumps, the businessmen and politicians.

In the end, it seems that human DNA was simply too prolific of moral mediocrity for the species to flourish for very long. The Chomskys were much too rare, the mediocrities much too common. Higher

intelligence was an interesting experiment, but, because of the suffering it entails, it probably shouldn't be attempted again. With the demise of the hominid line, it quite possibly won't be.

*

Aidan is a delightful little guy, although he's definitely in his terrible twos. He's quite a cutie, with his dimples and his adorable voice and his pronunciations of words (and made-up words). Helicopter is habucabu; race car is wiki car (or rather 'cah'); water is wadoo; airplanes and helicopters are kabak, for some reason (he's called them kabak for many months); nutter butter cookies are butterfly; star is giggle-star (from "Twinkle, twinkle, little star"). He *loves* cars and wheels, bulldozers and excavators, motorcycles and firetrucks. (A point against feminists, empiricists, and social constructionists, since he spontaneously loved these things as soon as he had such toys at only a few months old.) He has a shy personality, like his parents; hopefully as he gets older his cuteness will compensate for that. I'd say I'm a good father, being infinitely patient and caring and enthusiastic with him. He seems to like music, though it's too early to tell if that will amount to anything.

*

"Without it no music: cognition, biology and evolution of musicality" (2015) by Henkjan Honing et al. A comment on the empiricism of much scholarship:

Until relatively recently, most scholars were wary of the notion that music could have a biological basis: "There is no reason to believe there is a universally shared, innate basis for music perception. Although the possible survival value of music has often been speculated about, music has not been around long enough to have shaped perceptual mechanisms over thousands of generations. Clearly, music is a cultural artifact, and knowledge about it must be acquired..." This position is typical of scholarly thought in musicology over the last 50 years, with music viewed as a cultural product with no evolutionary history and no biological constraints on its manifestation.

Fortunately, the times they are a-changing, and the field of biomusicology is more sophisticated than this earlier position.

It's very possible, after all, that music has been around for hundreds of thousands of years and therefore has been able to "shape perceptual mechanisms." Or, rather, music itself hasn't shaped perceptual and cognitive changes but has been shaped by them. But it's a mystery why and how these changes have happened, these changes that manifestly *have* established a biological basis for musical perception. For humans do "share a predisposition for music, especially when the focus is perception rather than production. To recognize a melody and move to (or perceive) the beat of music are trivial skills for most humans and, at the same time, fundamental to our musicality. Even infants and young children are sensitive to a number of musical features that are common across cultures."

I still find it hard to comprehend the existence of universally shared traits across a species. How on earth can emergent traits spread across a large population? One would think the behavior would have to emerge as a genetic modification in one individual, and then it would spread among his or her descendants. But how is it even mathematically possible for a trait that begins in this way to colonize an entire group of thousands or millions of individuals in the following generations? If the trait is obviously or overwhelmingly adaptive, maybe I can understand it; but traits like music perception or numeracy are hardly adaptive. So why would they spread to everyone? They could be "spandrels," of course, byproducts of other adaptations. But music perception and production are pretty damned complex sets of skills, so it remains a puzzle that they evolved at all.

Probably earlier hominids had primitive music perception, like they enjoyed stamping their feet or hitting a hollow log in a repetitive rhythm. They likely even vocalized while doing so, shouting in different

pitches. Actually, auditory perception of *tones*, sounds that contain integer harmonics, must go back millions of years. As W. Tecumseh Fitch says in his article “On the Biology and Evolution of Music” (2006), “the natural sounds that have harmonic structure are essentially limited to vocalizations created by animals—the main sounds of biological interest for most species. Even the basic proclivity of the auditory system to seek tonality—its ‘desperate search for pitch’—may thus represent an ancient adaptation to the characteristics of the voice, whose evolution began with the first terrestrial vertebrates (or before).”

So the earliest rudiments of what later flowered as human musical perception go back a very long time. Perceptual adaptation to the relatively tonal nature of the *voice* must have advanced, becoming more refined and discriminating, as hominid vocal ranges and refinements grew and cognitive structures evolved. Eventually this co-evolution of sensorimotor, perceptual, and cognitive abilities made possible human receptivity to full tonality, the system of pitches and harmonics and so on that’s grounded in the physics of sound. Tonality was sort of implicit in the nature of the human voice, and so from attunement to the voice came, gradually, with greater sophistication of cognition, attunement to musical tonality. Or so it seems to me. All this must have been bound up with the emergence of numeracy (which was only implicit for a long time, until people started counting and creating number systems)—for recognition of rhythm and a beat, the repetitive pulse of equal intervals, strikes me as bound up with recognition of equal numerical divisions.¹ And numeracy is quite possibly—as Chomsky has suggested—an offshoot of the language faculty, an abstraction from it, since both language and numbers are recursive systems that yield discrete infinity. So then music, too, if it presupposes the capacity for open-ended counting, would be in part an offshoot of the language capacity. Not because both music and language can be forms of communication but because of the cognitive structures implicit in both faculties.²

As for why humans *enjoy* music, there are doubtless many reasons. There’s the social character of musical production and audition, the enjoyment of shared experiences, shared creativity, and shared self-expression, together with the possibility of joyous movement (dancing) to the musical beat. Music is a kind of *play*, a creative and interactive exploration of sound engaged in for its own sake, because creative expression is intrinsically satisfying. There’s also what Leibniz said: “Music is the pleasure the human mind experiences from counting without being aware it is counting.” The enjoyment of sounds organized tonally must come, at least in part, from the mind’s intrinsic enjoyment of certain physical proportions, ratios, and of the computational processing of these dynamic sequences of sound. All this unconscious brain activity is evidently “pleasurable” in itself. Meanwhile, the intellectual effort that we can devote to the production, study, and appreciation of music is another source of pleasure, for intellectual “play” is fun. But musical enjoyment of course has to do with appreciation of “beauty,” and what *that* is, or how to understand it, is yet another mystery. So is the question of why and how music is so closely related to the emotions.

In addition, people enjoy the sheer experience of a repetitive beat, and of creating another beat or rhythm or musical forms on top of it. There’s something hypnotic about a beat. I don’t know why—I guess because it’s predictable, it’s regular, stable, highly ordered, inertial, full of momentum, also ‘symmetrical.’ The human mind finds comfort and enjoyment in repetitive rhythms, like the rhythm of the infant suckling a breast. You’re “carried along” by rhythm.

¹ [On rereading this, I’m reminded of Kant’s idea that arithmetic corresponds to the inner sense of *time*, while geometry corresponds to the outer sense of *space*. And of course musical beats are intrinsically bound up with time, being divisions of it. So maybe the distinctively human perception of time, more advanced than that of other animals, is, in part, another outgrowth of the language faculty, at least if human cognition of number is. An interesting hypothesis! But sadly I see no way to test it. You might say it’s easily falsified by the fact that people who can’t talk surely perceive time as the rest of us do, but, as Chomsky says, the core of language isn’t its externalization but some recursive capacity very deeply buried in the human mind.]

² In fact, like language, music would seem to be an instance of finite means (particularly the notes in the chromatic and diatonic scales) being used to produce an unlimited output, in this case of melodies, phrases, musical expressions, whatever. Would this count as “discrete infinity,” like language and numbers? And could Chomsky’s notion of Merge be applied at all usefully to music, in that units can combine to form new units, which themselves can combine into larger units? I’m thinking here of phrases and melodies. —Actually, upon further reading, I see that Ray Jackendoff and Fred Lerdahl came up with a “generative theory of tonal music” decades ago. It’s certainly a suggestive theory.

Here's an interesting fact, which recalls what Plotkin said in his article I quoted: "How does the young bird, surrounded by songs of many different species, know which sounds to imitate? The answer... is that young birds have an innate template for their species specific song: a proclivity to attend to and imitate certain types of song and not others. Deprived of sounds fitting this template, the bird will imitate whatever else is in the environment. But given songs of its own species the bird will unerringly imitate those, and for most species only those." Mind-boggling that nature has figured out how to do all this, all this "constrained learning" and everything else.

Anyway, I'm inclined to agree with Ray Jackendoff, in his article "Parallels and Nonparallels between Language and Music" (2009), that we should be "cautio[us] in drawing strong connections between language and music, both in the contemporary human brain and in their evolutionary roots." They're surely two very different faculties, albeit with some intriguing similarities. As he says, "language and music differ substantially in their rhythmic structure, in their use of pitch, in their 'meaning' (propositional versus affective), and in the form and function of their hierarchical structures." The vast architecture of tonality, fleshed out in monumental creations of Western classical music, is implicit in the music faculty and has little or nothing to do with language, which doesn't even need sound but can be expressed in sign. Language is conceptual; music isn't. But I might be right that music perception developed, as an odd byproduct, from perceptual and cognitive attention to the (relatively tonal) voice, as sensorimotor, perceptual, and cognitive systems grew more sophisticated over many thousands of years. And if music presupposes human cognition of number, which in turn is (perhaps) an offshoot of the language faculty, then in this respect, too, music would derive from the cognitive ramifications of language. Even though in their essences, music and language are quite different.

*

For a long time it's seemed obvious to me that female faces on average look younger than male faces. It's hard to explain why, but they look softer, less "strong," less severe, more "open," like a child's. If this is really a natural tendency, it would help explain why men are frequently attracted to teenagers or even younger children, namely because their faces are somewhat feminine in their youthfulness. (And their bodies are feminine in their smallness.) Female facial youthfulness also makes sense given the youthfulness of female minds and personalities, their relative excitability, love of giggling, receptiveness, emotionalism (not a sexist prejudice but a truth), etc. The face tends to express what's inside. I, for example, have a youthful face, and I've always felt I have a rather youthful mind.

Scientific research supports these ideas. Like Daniel Fitoussi's paper "How facial aging affects perceived gender" (2021):

Generally, the results suggest that female faces are perceived as more masculine as they become older; and young faces (age 20 and 30) are judged as older as they become more masculine. Why do aging and gender interact? The answer is rooted in the perceptual structure of the faces themselves. Perception of facial gender and age rely on shape and texture cues... Facial aging is conveyed by morphological cues such as a) an increase in the size of the jaw, b) thinning of the lips, and c) an increase in the distance between the eyebrow and the eyes. Textural cues for aging particularly affect the skin: a) skin tone becomes darker, b) it has more wrinkles, c) its luminance contrast decreases, and d) its pigmentation becomes yellower. Many of these shape and texture cues also signal masculine features. Men have bigger jaws, their lips are thinner, and their eyebrows are closer to their eyes than females; moreover, they tend to have darker skin with lower contrast. The upshot is that many of the features that serve as cues for old age are also signs of masculinity...

From an evolutionary standpoint, the current findings make sense. Fertility in young females may be signaled by cues for femininity and cues for age. The correlation between the two types of cues leads to informational redundancy that increases the chances

that information about fertility is transmitted efficiently and correctly to potential mates. This idea can also explain the success of cosmetics and its higher prevalence among women. Sexual attractiveness and anti-aging are two main goals of the cosmetics industry, and the current study can explain why. Signals of femininity are positively correlated with attractiveness, and as we have shown here are also negatively correlated with age. This finding can explain the biological incentive for using cosmetics to highlight sexually dimorphic attributes of femininity, but also to conceal cues for old age. Both serve as signals of fertility and are expressed on the same facial cues. For example, Russell (2009) demonstrated the existence of a sex difference in facial contrast that affects the perception of gender. Females have greater luminance contrast between the eyes, lips and the surrounding skin than men. Russell (2009) showed that cosmetics consistently increase facial contrast and thus are functioning to exaggerate feminine features and consequently their attractiveness. Notably, skin contrast also differs between young and old faces and serves as a cue for age. Lower levels of contrast signal old age...

Whoops, it appears that, once again, dogmatically social constructionist feminists are very wrong.

It's striking how different heterosexual male and female minds are—and how blind people must be not to perceive this fact. The kind of mind that craves being-penetrated by a big erect penis, being rubbed and caressed by a strong muscular person, and that smiles and laughs and cries incredibly easily is very different from the kind of mind that craves penetrating a vagina, rubbing and caressing a soft fleshy body, and that offers smiles and laughs and tears rather sparingly. The differences between the sexes are endless.

I might as well also say, again, that the constant whining of feminists is both pathetic and irritating. “Men have treated us so badly throughout history!” Yes, welcome to the world. Women have treated one another very badly too—just as men have treated men very badly, and women often treat men badly. People suck. But your rage at men for, in effect, being stronger and more assertive than you, and therefore able to dominate you (which, in some contexts, you enjoy, though you won't admit it), reflects a pronounced naïveté and is one-sided. There's more sense in Camille Paglia's perspective: “Women should regard men with a mix of gratitude and rational fear.” Men have not only dominated women; they've also, as Paglia notes, through all history given their lives and their labor for women and children. Moreover, women can, mostly, thank men for the comforts and satisfactions of modern civilization: sanitation, medicine, technology, science, mathematics, industry, physical infrastructure, and most of the best art, music, philosophy, and literature. Hegel and Gabriel Garcia Marquez (in *One Hundred Years of Solitude*) were right that it's primarily men who make history. “If civilization had been left in female hands,” Paglia says, “we'd still be living in grass huts.” Women are relatively content to just live, to have a home and family and friends; men are more often driven to *achieve*, to make a mark on the world. Men are restless, women, on average, are soft and sated (as long as they have the things they want). All this is, to some extent, encoded in the human genome—as it must be, since it appears to have been true in all places at all times.

I've always found it ironic that, by incessantly whining and complaining, blaming others, and being highly emotional, most feminists only validate stereotypes about women. An alternative would be to grow up and accept some responsibility.

*

For the heck of it, I read Chomsky's 1969 article “Some Empirical Assumptions in Modern Philosophy of Language.” I won't pretend to have understood every paragraph, but it's a brilliant demolition of Quine and Wittgenstein. Those two thinkers (like most others) are really quite primitive and irrational compared to Chomsky. I've pointed out problems with Wittgenstein in other discussions, like when commenting on Scott Soames' book many years ago, but, aside from his seemingly willful obscurity—specialists constantly disagree about how to interpret even his most famous “arguments,” like the private language argument (maybe, after all, his perverse thought-fragments don't justify all the attention devoted to them?)—his chief inadequacy is just that he was intellectually formed in an environment of empiricism

and behaviorism and couldn't break out of that framework. Unlike Chomsky, he lacked the genius and intellectual self-confidence to do so. A lot of the puzzles he grapples with, and the confusions and superficialities and irrelevancies he gets himself into, are a function of the empiricist background assumptions he brings even to his critiques of empiricist doctrines (and that he often carries to even greater behaviorist extremes). The possibility of rationalism, or innatism or cognitivism or thoroughgoing "mentalism," scarcely occurs to him, or when it does he peremptorily dismisses it. It's more congenial to him to (periodically) descend to outright absurdities, like when he says thinking might be the "activity performed by the hand, when we think by writing," to quote an example Chomsky gives. Maybe he didn't really mean that, but for such a thought even to occur to someone he must have been pathologically steeped in behaviorism. *The Blue and Brown Books*, from what I remember, are full of perversities like that, often in the context of the philosophy of mathematics.

Again—and irrelevantly—this aversion to the idea of an inner mental reality reminds me of aspects of postmodernism, all the social constructionist dogmas of the likes of Judith Butler and other "gender theorists." Why in God's name is Western intellectual culture so enamored of empiricism?

I admit it's tempting to believe what Wittgenstein says in one of his "rare categorical assertions" (to quote Chomsky), which has to do with the presumed absurdity of, in Wittgenstein's words, "investigating, analyzing, the meaning of a word." He says "a word hasn't got a meaning given to it, as it were, by a power independent of us, so that there could be a kind of scientific investigation into what the word really means. A word has the meaning someone has given to it." We give words meanings by explaining them. If we can't give an explanation, then the word doesn't "have a strict meaning."

But this just isn't right. As Chomsky says, it's sheer dogmatism to reject the possibility that humans are born "with a rich system of constraints on the possible grammatical rules, possible concepts and their interrelations and relations to sensory evidence, the characteristics of physical objects and the ways in which they interact, the structure of space and time, [etc.]." He goes on: "For such an organism, we would surely want to say that the meanings of words are given to it in part by a power independent of any conscious choice; and a scientific investigation of the conditions that determine how an elaborate semantic and syntactic system was constructed on the basis of evidence would certainly be quite in order." In fact, humans might be so richly endowed that, "with no element of voluntary choice and no ability to give a conscious account (explanations) of the structure of [their] system of concepts or system of beliefs," they unconsciously acquire all the knowledge of an incredibly complex language. Why must every language user be able to consciously explain the meaning of every word he uses? That's just a weird behavioristic demand with no rational justification. In fact, given the evidence of sixty years of empirical research, there's no doubt whatever that our concepts are structured in ways we're not consciously aware of. That is, we're not aware of all the dimensions of their meanings. Chomsky likes to give the examples of everyday concepts such as river and house.

It's true, admittedly, that most concepts are fuzzy around their edges, and that there might appear to be only "family resemblances" between all their uses. But does that really mean the concept in question in fact has no determinate meaning? This can't be true, surely. Even the classic Wittgensteinian concept "game" has the semantic content of, say, not serious, play-ish, (semi-)frivolous, and the like. So that when one applies the concept to some activity, one is applying these properties to the activity. Maybe the totality of activities we call "games," from boardgames to (metaphorically) life itself, in themselves have no relevant property in common; still, when we apply the concept, we're applying its meaning, or at least certain aspects of its meaning, to each of them.

In any event, the point—and the point of Chomsky's essay—is that the puzzles and paradoxes presented by Quine and Wittgenstein tend to evaporate once you embrace the "rationalism" of sophisticated cognitive psychology.

I might add that the notion of language-games isn't particularly useful. Also, of course, Wittgenstein's idea that almost all philosophical questions arise from confusions due to inappropriate uses of ordinary language is very wrong, even if *sometimes* this is half-true. Nor do I find it earth-shattering to say linguistic meaning is use. Surely it should have been, and was, obvious before him that the meanings of linguistic expressions are, um, pretty closely bound up with how the expressions (words, phrases,

sentences) are used. But the uses, the actual particular usages, of expressions are not *literally* their meanings; rather, meanings are (despite Hilary Putnam) in the head. The *rules* of how, e.g., a word is used are its meaning, and those rules are somehow represented in the brain—as they must be inasmuch as we’re able to use words correctly. Likewise, *what I mean* when I say something is a mental phenomenon, a fact of consciousness, of my intentions. So both the semantics and the pragmatics of language use are *in the head*, not (only) “external.”

A large proportion of what Wittgenstein wrote was either wrong, obvious, or confused.

I like Richard Schlagel’s short 1974 paper “Contra Wittgenstein.” It’s so refreshing when a philosopher is actually rational! “While it is true that language plays an important role in philosophical considerations, it is not true that the inadvertent influence of grammatical forms due to the misuse of ordinary language has been a *primary* cause of philosophical problems.” Duh!

*

The way I soothe my conscience for not writing more academic articles is that there isn’t only one road to truth. One doesn’t have to write academically in order to get at reality. Most academic writing, in fact, even in good papers or books, is merely a function of unnecessary professional norms. I’m happy to *use* academic writing for understanding, but I don’t feel the need to indulge in all its throat-clearing and mutual masturbation and verbiage-fetishizing.

Besides, writing in general, but especially academic writing, seems so damned ineffectual. Hard work is admirable, but how does one justify hard work that hardly anyone reads or is affected by?

*

There aren’t words in the English language that could do justice to the unspeakable evil of Joe Biden, Antony Blinken, Jake Sullivan, and others (not to mention Netanyahu and other Israeli officials, but that goes without saying). Imagine providing the arms to kill tens of thousands of innocent civilians in the most horrible ways, injure hundreds of thousands more, starve many thousands to death, and expel over 2 million people from their homeland. If you can do that and, in addition, continue to defend the aggressor politically and diplomatically, constantly telling the most obvious and outrageous lies to the media, you’ve lost your humanity. All the more so if at the moment when catastrophic hunger threatens, you cut off aid to the United Nations Relief and Works Agency for Palestine Refugees, as Biden did. The genocide of Gazans is probably the most horrific event of the 21st century, so far—a century that has already seen plenty of horrific events, such as the U.S.’s near-destruction of Iraq, Afghanistan, and Libya. But the leadership of the West, with Biden in front, in effect wants it to continue. (They pretend they don’t, but their actions expose this pretense for the fraud it is.)

Needless to say, as war criminals and enablers of crimes against humanity, every last one of them deserves to be hanged. I suspend my opposition to the death penalty when it concerns those who have committed genocide. They don’t belong among the living anymore. Their humanity has already died, their conscience is nonexistent, so we might as well confirm the reality by killing their bodies, which is really all that remains of them. They’re zombies animated only by the power relations in which they’re embedded.

The scale of the suffering they’ve caused beggars the imagination.

Millions and millions of others—liberals and conservatives—passionately support what Israel is doing, so their humanity, too, has essentially died, as the people who supported the Nazis’ extermination of Jews had mostly lost their humanity. But these psychotic cheerleaders of genocide at least aren’t directly responsible for it, so they have the legal and moral right to continue living. Their punishment should be that others shun them for the rest of their miserable lives.

But the sad truth is that anti-Arab racism saturates the West, and tens of millions are comfortable with it and complicit in it. More broadly, billions of people the world over are quite racist. And of course “classist.” Which is to say, they’ve lost touch with a part of their humanity. Gratuitous, morally senseless

callousness and cruelty have taken over an aspect of their personalities. They see people not as people but as instantiations of morally meaningless categories.

It's unfortunate that you can't tell someone's moral worth just by looking at him. It would be better if people glowed, so that a Chomsky would be blinding to look at and a Biden or Trump would be pitch-black. But ultimately individuals are, naturally, highly ambiguous and contradictory, so such moral "measurements" are obviously not possible. And morality is a human construct anyway, however grounded it is in our nature.

In any event, the current blood-frenzy in Gaza and its rhetorical echoes around the world are yet more proof of the moral squalor of the human species.

As for Israel, there is no depth to which it won't sink. Its horrific offensive in Rafah began today, February 11th, to coincide with the Super Bowl, so that American audiences will be distracted. What other government besides Israel would be capable of such psychopathic cynicism? (Maybe the U.S. would.)

By coincidence, I happen to be rereading James Green's *Death in the Haymarket* for a class I'm teaching on labor history. It's a good book, which makes you quiver with rage at the injustice of capitalist society. It also memorably depicts the fundamental evil and mediocrity of the respectable classes. After the four innocent anarchists were hanged on November 11, 1887, "one reporter described a palpable feeling of relief among downtown people, because the execution had occurred without a single hand being raised in violent protest." So their class privilege, thank God, would continue unmolested. This is what people care about, being safe and secure in their wealth and privilege. Social justice and the suffering of the majority are of no concern to them.

It'll be interesting to observe, in the coming months and years as the full reality of the genocide is unearthed, political and media personalities backtrack on their earlier vampiric thirst for blood. Fortunately the internet does not forget. They'll be hounded without end. On the other hand, there will be no real justice for them, as their careers and lives will go on pretty much as before.

*

[Deleted updates on several romantic relationships/flings.]

"Tell us more about Aidan." He gets cuter and cuter. At around 25-26 months he's started pretend playing (at least in a more impressive form than before). Such playing seems like quite a cognitive achievement! The last time I was there he said "Aidan dibling bulldoziz" several times while holding a bulldozer toy onto which he had put a little Lego man. Earlier that day I had sat him atop a large lawnmower in a park nearby (he adores lawnmowers), where he turned the steering wheel and I remarked that he was driving the lawnmower, which he repeated. So that night, evidently, he was pretending that he was the Lego man driving the bulldozer. He also said, while pushing a car away from the bulldozer, "Bye buldo, bye..." He was adopting the mental perspective of the car driving away. It's hard to know how to interpret pretend playing, and I didn't get much illumination from reading a couple academic articles on it. But it's interesting that children's cognition is, in a sense, more advanced in play than ordinarily, since in play they're able to partially shed their ordinary egocentricity and adopt the perspectives of others.

Actually, the very ability to know that drawings of something in a book represent the real thing in the world is impressive. At a shockingly early age, like maybe 1 or less, children seem to instinctively know that the drawing of a duck represents the same thing as the real duck they see in the lake. Even if the two look quite different! And when they play with a toy car they say "beep beep," as if the car is a real one on the road. The human brain is programmed to understand at a very early age the idea that "*this* represents *that*."

*

Reading a textbook called *Color Atlas of Genetics* (2007), by Eberhard Passarge. I don't think I had known that genomes "contain parts that can move from one location to another, called *mobile genetic elements* or *transposons*. This lends the genome flexibility to adapt to changing environmental conditions

during the course of evolution.” Interesting! And there’s also, as you may know, horizontal gene transfer, gene duplication, *de novo* gene birth, gene fusion, genetic drift, exon shuffling, etc., all of which play a role in evolution. We’ve come a long way from the days of “evolution occurs just through random mutation.” In fact, it turns out that the most important parts of the genome are much less susceptible to mutation than less important parts.

That book isn’t a great introduction, so I turned to *Genetics for Dummies* (2024), a very good overview. High school/college biology is coming back to me, having been buried for 25 years somewhere in my brain. The details of mitosis, meiosis, and genetics as a whole are, in a sense, indescribably beautiful, especially given that there isn’t a divine intelligence behind them—as you’d think there should be, in light of their incredible complexity. Somehow all these exquisitely organized processes just...evolved, in an unplanned way. And somehow they all happen constantly in an unplanned way, “automatically,” based only on laws of physics and chemistry.

From hydrogen and helium atoms, in the beginning, you get, 13 billion years later, cellular mitosis, meiosis, the laws of inheritance, DNA transcription and translation—and every other miraculous thing in the body.

What’s also miraculous is that scientists have figured all this out. I don’t understand how they’ve been able to penetrate so deeply into the workings of a dizzying array of molecules, and of even tinier components of molecules. How would one go about deciphering it all? It doesn’t even seem possible. Astonishing collective genius was required.

It’s stunning to reflect that for every one of us, *one molecule* gives the blueprint. As we sit in subways and buses and walk around cities, what we are are gigantic moving and talking manifestations of *one molecule*. One molecule at the center of every cell of our body, except for red blood cells. Each of us is a slightly different, but overwhelmingly similar, molecule. —Well, strictly speaking, we’re 46 molecules, since human DNA is divided into 23 pairs of chromosomes, 23 pieces of DNA from our mother and 23 from our father. I am nothing but the elaboration in flesh and blood of 46 molecules. Think of how much information is coded in these molecules! The brain, the heart, the liver and kidneys, the stomach and intestines, the skeleton and immune system and muscles and lungs and reproductive system and everything else—all encoded in *46 fucking molecules!* (Actually, in a sense it’s even less than that, since a lot of the alleles in each pair of chromosomes are a duplicate of what’s on the other chromosome.)

The social sciences are so intellectually impoverished and unchallenging compared to the natural sciences. (Admittedly, economics is challenging—which may be one reason that most economists are terrible at it, adhering to shallow neoclassical ideology.)

*

Sweet mellow mood on an overcast Friday, listening to Sviatoslav Richter’s interpretation of Schubert’s piano sonata D. 784. The darkness and fierce anger of the first movement interspersed with brief passages of heavenly consolation, some angelic voice piercing the gloom.

*

Airman Aaron Bushnell immolating himself outside the Israeli embassy in Washington, D.C., shouting “Free Palestine!” as the flames engulfed him and he collapsed. Pure heroism, breathtaking courage. Choosing to die as a saint, in an act so shocking that even the depraved corporate media is compelled to cover it. CNN, incredibly, actually read the statement he gave before killing himself: “I will no longer be complicit in genocide. I’m about to engage in an extreme act of protest. But compared to what people have been experiencing in Palestine at the hands of their colonizers, it’s not extreme at all. This is what our ruling class has decided will be normal.” Bushnell’s self-immolation provoked CNN to say the g-word, even the c-word (colonizers) and the r-word (ruling class), so he was right: something like his act was necessary in order for a little bit of truth to momentarily break through the deluge of non-stop propaganda.

Bushnell was someone unlike the rest of us: he couldn't go about his day, day after day, as his government is committing the most transparent genocide in history. He took simple morality so seriously that he decided he couldn't live in a world as immoral as ours. Unbelievable nobility of soul, this willingness to face up to the reality of what's happening every day as everyone else goes shopping, goes drinking, goes on dates, and covers their eyes. His act wasn't "extreme"; it was perfectly appropriate and morally called for, even though the heroism it took was almost beyond what is human.

In an era of ubiquitous moral frivolity, an era of soundbites and social media, a 25-year-old refused to let his humanity die. And so he killed himself.

As he did so, by the way, a police officer pointed a gun at him and ordered him repeatedly to "get on the ground!" (He soon did, as he died.) Even in the presence of such a heroic act, society couldn't have the good taste to suspend its farcical nature for one second. A fascist functionary had to aim his gun at the flame-engulfed man, adding an element of absurdist comedy to the scene. But it was somehow appropriate, the contrast between Bushnell and the fascist. This fascist mentality, this fascist reality, is exactly what Bushnell was protesting. It surrounds us, it is everywhere. The police officer personified precisely the moral monstrosity—total callousness—Bushnell was denouncing.

I hope his martyrdom catalyzes something.

March

The massacre on October 7th was entirely understandable (even if criminal), just as Nat Turner's massacres were understandable, but it was surely a mistake. It gave Israel the perfect pretext to finish its ongoing genocide of Palestinians. A miserable life in the open-air prison of Gaza is hardly a happy fate, but the rampant slaughter of tens of thousands, and death by starvation of more, seems worse. I also find it catastrophic that the indirect consequences of Hamas's action will probably help give Trump the presidency. But it's interesting, at least, that the West is finally losing every last shred of legitimacy. The contrast between the attitude of the ruling class and the attitude of most of the population has been remarkable.

This genocide has shattered the myth that political and economic leaders are, basically, decent people caught in a mesh of complex and inhuman institutions. They're not decent: they're shocking cowards, personifications of cruelty and power-hunger, cliquey elitists who value their bubble of privilege above all else. To quote Marx, they are exterminators whom "history has already nailed to that eternal pillory from which all the prayers of their priests will not avail to redeem them."

There is no future for such a civilization as ours.

It's obvious, but it's worth noting again: few of history's many ironies are as pungent as the irony that Zionism is a genocidal project that has turned Jews into Nazis. The Nazis wanted *Lebensraum*, and Israelis want *Lebensraum*. The Nazis had a Hunger Plan, and now Israel has a Hunger Plan. Already in the 1940s Zionism was Nazi-esque, given the many massacres of Palestinians that took place—and the whole crusade of driving Palestinians from their homes. But the Nazism has been on proud and celebrated (in Israel) display for the last five months. Israeli tanks are crushing scores of live Palestinians (pictures on social media of bodies squashed like a smashed bag of tomatoes); Israeli soldiers are firing on people trying to get food from aid convoys; pictures are emerging of children and old men starved to death, looking like victims of Auschwitz. Mass graves of Arabs recall the mass graves of Jews. The IDF, "the most moral army in the world," consists of beasts in human form. How many Klaus Barbies are there in the IDF and Israeli security forces, and how many horrors worthy of Klaus Barbie are happening right now in Israeli prisons?

Zionism is a product of the same kind of culture that birthed Nazism, the imperialistic culture of racial, ethnic, and religious prejudices, of "manifest destiny," of European colonialism. Today, it is an atavism, an anachronism. It doesn't, or shouldn't, really belong to the twenty-first century. It's the last instance of genocidal settler colonialism—rationalized by the Bible, no less! What could be more anachronistic? But if Zionism ends up precipitating or helping to precipitate a nuclear war that brings an

end to civilization, this wouldn't be without some poetic justice. The last expression of the Western genocidal impulse heralding human speciesticide—that would be somehow appropriate.

(In any event, if Zionism doesn't get the job done, capitalism will. Capitalism is worse than genocidal: it's speciesticidal.)

*

Been reading randomly lately. Like novels for the first time in ages, such as *The Spy Who Came in from the Cold*, *Out of This Furnace* (classic labor history), *Ragtime*, *Quitting Time* (another classic, though largely forgotten), *Player Piano* (Vonnegut), *Dead Souls* (beautifully written but kind of boring), *Fontamara* (Ignazio Silone's anti-fascist classic), *The Dispossessed* (Le Guin), *The Strange Case of Dr. Jekyll and Mr. Hyde* (saw it on a bookshelf), and *Southern Rebel in Reverse*—actually a memoir. Also *The Man Who Mistook His Wife for a Hat*, since Oliver Sacks is great. He's the R. D. Laing of neurology, seeking to humanize patients rather than reduce them to a collection of symptoms.

His book is a reminder that every millisecond of life is a miracle. It's strange that I don't continually reflect on what a godlike achievement it is to, say, see an object. Trillions of photons zip around and collide with atoms and other things...and a few of them enter the tiny holes in our eyes...and are captured by retinal photoreceptors that convert them to electrical signals...and the brain works these signals up into the colored images we see. Somehow, from a cacophony of photons hitting the retina from all angles, the brain forms a stable, three-dimensional image. It can infer that some objects are farther away than others; in fact, it can create the very illusion that there *are* solid objects all around us, objects that aren't composed primarily of empty space (as they really are) but are dense and continuous. None of this is remotely capable of being truly, intuitively understood.

Billions of photons hit the page of a book—that is, the billions of molecules that constitute a page—and bounce into your eyes (somehow not being knocked off course by all the other molecules in the air)...and a tiny fraction of a second later you see a page with words on it. The brain imposes on all these photons-transformed-into-electrical-signals the schemata of language, of letters, so that you see letters and not random marks. And it filters these letters through the schemata of linguistic syntax and meaning, so that you see words and sentences rather than mere strings of letters. At the same time, you experience perceptions from other sensory modalities. And all these perceptions are integrated into one consciousness, one sense of self, and are stored in memory as “my” perceptions. The illusion of a “you” who owns these memories is created every second, to accompany all perceptions. And all these unimaginable neural processes occur because of trillions of molecules in your head interacting automatically, in milliseconds, according to nothing but the laws of physics and chemistry. But from these automatic physical processes, the sense of personal free will, intentionality, a thinking self, emerges...to then *reflect on* the mystery of this whole chain of causation. —And Daniel Dennett thinks that in principle the human mind can understand everything. (It's closer to the truth to say it can't genuinely understand anything.)

Sacks' book also reminds me of the proximity of “sickness” to “health,” a proximity so close that the conditions essentially interpenetrate. I'm reminded of my own relatively healthy sickness. I'm primordially set apart from the world—my absent-mindedness, self-consciousness, shyness, forgetfulness (especially of people's names), inability to find someone to love, lack of interest in most people and increasing lack of interest in anything, emotional deadness. I'm somewhat enclosed within myself, and always have been. But I haven't always had the sort of semi-anhedonia I've had for many years now.

I care less and less about intellectual creation and more about merely making money, so I can have a fairly comfortable middle age and old age. I want to be able to make major financial contributions to Aidan's life. But I can't think of any job I want. Getting pretty sick of teaching, actually.

I sometimes feel so weary and disengaged that I'm almost ready for retirement, if not death.

*

Reading an interesting (though very basic) book called *Why Icebergs Float: Exploring Science in Everyday Life*, by Andrew Morris (2016). Maybe if more academics read science and imbibed its rigorous spirit, they'd be less prone to writing pretentious silliness about the likes of Foucault, Lacan, and Deleuze.

...Now a book called *The Epigenetics Revolution: How Modern Biology is Rewriting Our Understanding of Genetics, Disease, and Inheritance* (2012), by Nessa Carey.

*

Aidan's language skills are advancing pretty rapidly. He constantly repeats things people say, though often without understanding what he's saying. And today in a video Amina recorded he said, out of the blue, "Put the phone back right here." Amazing that two-year-olds can learn idioms so easily, and can unthinkingly say words in the correct order. It's also mysterious how they learn to distinguish between questions and statements. How does Aidan already know that sentences starting with "Did" or "Where," etc., are questions? The brain must be primed, at a certain age, to be on the lookout for interrogatives, doubtless by being hyper-attuned to intonation, inflection, pitch, and the like. But frequently, for example, we don't raise our voice at the end of questions. So how does the child figure out what "Where?" means, or other words like that? I suppose the brain just has to make guesses, and it gradually eliminates various possibilities the more times it hears the word in different contexts. Finally it hits on the right guess, the meaning that makes sense in all the contexts it hears the word.

The child figures out "Daddy" means a particular person, and then when someone says "Where is Daddy?" on repeated occasions, perhaps while looking around, the child thinks of Daddy and wonders where Daddy is. So this speculative looking around for something becomes associated with "Where?"

But "where" is a simple example. I'll have to look at more academic papers to see what ideas are floating around about these questions. Of course "theory of mind," "shared intentionality," and so on are crucial. Spontaneously understanding others' states of mind is essential to learning many words, which is surely (one reason) why autistic children have trouble with language. Normal children must be exquisitely sensitive to people's intentions and feelings, thus facilitating enormously the acquisition of a lexicon.

On a trip to the grocery store, Aidan saw cereal on someone's cart and said, "Dadda's food." I usually call it cereal when around him, not food. So it seems he understands levels of meaning, as it were: it's both cereal and something more general, food. Interesting that two-year-olds know an object can exist in overlapping categories, that two or more words, with increasingly abstract meanings, can apply to it.

It's unbelievable that a miracle source of energy, efficient and nearly pollution-free, exists, namely nuclear energy, but *environmentalists* have been largely responsible for curtailing its use (for instance by increasing its regulatory costs), thereby increasing the use of polluting and carbon-intensive fossil fuels. If they had instead, since the 1970s, *aggressively advocated* for it everywhere in the world, maybe it would have been possible to stay under the 1.5°C limit for global warming! But now civilization is probably doomed—partly because of environmentalists! I hate the ironies of history.

It's appalling to contemplate the level of suffering we're all going to experience, but especially people in the Global South, most of whom are least responsible for the crises. Another irony it's painful to contemplate.

...There's something strangely moving about the contradiction between the vastness of human suffering throughout history and the innocence of Aidan. A new life, completely ignorant of all the horror. For him, none of it has happened: he's a bundle of joyful curiosity about the world. How beautiful that every time a person is born, it's all new again. A fresh start, a blank slate. Infinite possibilities, and in the meantime a flood of new discoveries every day, new animals and plants and people and objects to see, discoveries that have been made tens of billions of times but are fresh and riveting for Aidan. Always the instinctual life-affirmation, life's primordial affirmation of itself.

On one side, the disgraceful oppression and injustice meted out to the peasants of Fontamara, hoary as civilization but even more grinding under the Fascists; on the other side, the bright eyes and pristine laugh of a two-year-old. The leaden weight of the past vs. the lightness of freedom and early childhood.

How sad that, in the end, years from now, the past and the horror will likely prove the dominant principle.

*

I've lived my whole life in ignorance of botany, so I'm reading Brian Capon's *Botany for Gardeners* (2005). My gardening skills are far below mediocrity, but luckily you don't have to be a gardener to appreciate this book.

Random bits of interesting trivia: How is it that sun-loving plants can bend and grow toward the source of light? Answer: when the stem is illuminated from directly above, "cells [in the stem] undergo equal rates of elongation, resulting in vertical growth. But when lit from one side, stems change direction because cells on the shaded side grow faster than those toward the light." Their faster growth, of course, causes the stem to bend towards the more slowly growing side (the illuminated side). Fascinating! But why do shaded cells grow faster? Because of the hormone *auxin*. "When light strikes one side of a stem, auxin accumulates in the shaded side, causing the cells there to grow at the fastest rate."

Similarly, suppose you tip over a potted plant so that the plant is horizontal now. You'll soon find that the stem returns to its vertical growth. How? Because "under the influence of gravity, auxin collects in the lower side of the stem where it stimulates the cells to grow more rapidly than those across the top." So the stem bends upwards.

What about the opening and closing of flowers? This, too, is controlled by hormones. When a flower opens, "cell expansion occurs in the petal's upper surface; when the flower closes, cells in the lower petal surface increase in size." The same principle applies in the case of Venus fly traps: their closing is just an exceptionally rapid growth response (on the part of cells on the outside). Pretty amazing!

The aging process in fruits and leaves is, naturally, directed by hormones, particularly ethylene:

When fruits ripen, various biochemical events take place. Color changes result from the breakdown of green chlorophyll and an increase in yellow, orange, and red pigments. Tannins, which protect immature fruits against predators, give way to sugars—making some fruits attractive to seed-dispersing animals. And, primarily as a result of ethylene's influence, drastic changes occur in cell structure, including the breakdown of membranes and the softening of cell walls. The outcome of such processes is seen in the rapid deterioration of a fruit as it becomes overripe, ready to release its seeds. Unprotected by tannins, well-stocked with carbohydrates, and the cuticle layer degraded, the ripe fruit also becomes a perfect medium on which fungi can grow. Their presence eventually leads to the fruit's decomposition.

...Leaf senescence [in autumn], prior to abscission [separation from the stem], includes the breakdown of chlorophyll and weakening of cell walls at the base of the petiole, in a narrow band of cells called the *abscission zone*. In spring and summer, auxin produced in the leaf keeps the abscission zone intact. But low night temperatures and short days in autumn cue the leaves to reduce auxin production and increase the liberation of ethylene. The latter stimulates an enzymatic breakdown of cellulose walls and pectin in the middle lamellae—the glue holding cells together. The restriction of ethylene's destructive effects only to cells in the abscission zone illustrates the precise control plants exercise over their hormone systems.

Let's turn to the question of how the plant uptakes water. It starts with osmosis into the root. "During osmosis, water molecules attempt to equalize their concentration on both sides of cell membranes when they move into or out of living protoplasm [i.e., the interior of the cell]." In brief, here's how it works:

In most soils, small quantities of salts are dissolved in large volumes of water. Conversely, the protoplasm of epidermal cells [in roots] contains lesser amounts of water in which salts,

sugars, and other substances are concentrated. Thus, when water moves (diffuses) from the soil, where it is most abundant, it seeks to dilute the cells' solutions.

When water enters the cell it's stored in the large central vacuole, which expands and presses the cytoplasm against the rigid cell wall. Eventually the cell becomes *turgid*, or fully inflated. "Cell turgor gives firmness to water-filled tissues. The difference between crisp and wilted lettuce leaves illustrates the nature of turgid and nonturgid (flaccid) cells." I hadn't known that wilted plants are literally just...their cells aren't fat with water.

So how does the water get up to the stem and leaves? Basically, the root's turgid epidermal cells discharge water into spaces between other cells, cortex cells, where the water works its way into the hollow tubular cells of the *xylem* at the root's center. Articles online have technical details, but the upshot is that water is pushed up the xylem with a slight pressure. At the same time, the evaporation of water from the surfaces of cells in the leaves generates a "pulling" force that can lift water hundreds of feet up a tree.

Okay, let's move on to the main attraction: *photosynthesis*. It's absurd I've never known exactly what photosynthesis involves. After all, it's "the single most important process on Earth," since "the large-scale storage of abundant sunlight in the form of compact, energy-rich food molecules is the unique function of Earth's flora." In fact, "autotrophic [i.e., making their own food] plants hold the key to life on Earth; they alone are the intermediaries between the sun and all other creatures. And it is their leaves' microscopic chloroplasts that have the awesome responsibility of making the system work." So let's investigate photosynthesis, the process that makes it possible for you and me to live.

(It's worth noting that photosynthesis provides, directly and indirectly, not only our food and oxygen but even most of the world's energy, almost 90 percent of it, through fossilized photosynthetic fuels. It's also, apparently, the *sole source* of the organic carbon that all carbon-based life forms use to build themselves.)

Combining the book and a lot of articles, I've arrived at this understanding: photosynthesis takes place in the organelles called chloroplasts, which contain *chlorophyll* molecules (two different kinds: chlorophyll *a* and *b*). They also have *carotene*, which reflects orange/red/yellow light (unlike chlorophyll, which reflects the green wavelength), and *xanthophyll*, which reflects yellow. By the way, "when leaves turn yellow [in autumn], they simply lose chlorophyll that had previously masked the appearance of the orange and yellow carotene and xanthophylls." Interesting! The point of photosynthesis is that the wavelengths of light *absorbed* by these molecules are transferred into the synthesis of food, in other words carbohydrates (sugar and starch), fats, and proteins.

It might be obvious, but it's interesting to reflect that what a leaf is, in essence, is just a "solar collector crammed full of photosynthetic cells." Actually, that's too simple: leaves also contain thousands of pores on their surface (mostly their bottom surface) called *stomata*, through which carbon dioxide enters and oxygen is released. Anyway, leaves exist to produce the plant's food, from light, water, and carbon dioxide.

The way it works is...insanely complex. As usual. But I'll try to make it comprehensible. First, chlorophyll *b*, carotene, and xanthophylls absorb and channel photons to chlorophyll *a*, whose electrons are thereby boosted to a higher energy potential. In their energized state, chlorophyll's electrons are diverted into an "electron transport chain" that ends in the formation of the molecules NADPH and ATP. Meanwhile, chlorophylls get back the electrons they've lost by the splitting of water molecules (so that these molecules donate electrons to the chlorophyll), which breaks down water into its components hydrogen and oxygen. In its new gaseous form O₂, oxygen then flees the hectic scene into the atmosphere.

In the second stage of photosynthesis, carbon dioxide links to sugar molecules called ribulose biphosphate, producing new molecules that then, with the help of ATP and NADPH, are rearranged to form, ultimately, glucose and other sugars, including more molecules of ribulose biphosphate (thus allowing this stage of photosynthesis to keep repeating again and again as long as ATP and NADPH are available). So we've finally arrived at carbohydrates that the plant can use for energy! Specifically, glucose, fructose, sucrose, starch, and cellulose. Yay! These sugars can also be used to form lipids and amino acids

(i.e. proteins). Starch (made of glucose) is the principal food stored in plant cells, while cellulose (also made of glucose) is incorporated into the structure of cell walls.

Okay, enough about photosynthesis. My brain hurts. Just to write those four paragraphs I had to spend hours trying to piece together the story from a dozen articles and a couple books.

Let's move on to reproduction and flowers. Plants produce two kinds of reproductive cells: gametes and spores, the latter of which grow into a plant simply by mitotic cell divisions. Only the more primitive plants, like ferns, rely on spores. More interesting is sexual reproduction. The whole point of flowers, of course, is to attract insects and other small animals so that they'll propagate pollen, each grain of which contains sperm. *Stamens* are the male reproductive structures, which consist of a *filament* and an *anther* on its top. Within the anther is where pollen develops. *Pistils*, the female structures, are divided into three parts: at the top is a *stigma*, a sticky receptive surface to which pollen adheres; the long *style* elevates the stigma to a favorable position for pollen collection; and at the base is an *ovary*. The ovary is what ultimately becomes a fruit. As a reward for their assistance with reproduction, animals are given a nutritious liquid called *nectar* at the base of the petals, pistil, and stamen. (When they're maneuvering around to access the nectar, pollen is scraped off them and new pollen brushes against them. "The petal's color patterns, called *nectar guides*, are virtual road maps directing visiting insects to the sweet food, past waiting stamens and pistils.")

Wind and water can also pollinate plants. In grasses, for instance, "the anthers dangle on quivering filaments," and vast amounts of pollen are borne on breezes so that hopefully some tiny fraction will find its way to appropriate flowers. The most ancient pollen producers are *gymnosperms*, non-flowering seed-producing plants, whose seeds aren't enclosed in an ovary or flower. (The opposite type, the flowering type, is called *angiosperms*.) Their pollen is scattered, frequently, from male cones—hence the name *conifer* trees—which are actually just modified leaves. This system evolved before insects and hasn't changed since, so it has no need of flowers to attract animals. Some flowering plants, on the other hand, are aquatic species that use water to disseminate pollen. For example, the underwater plant called ribbon weed forms female flowers on long stalks that reach to the water's surface, whereas male flowers, formed near the base of the plant, simply float to and on the surface like tiny sailboats. "Propelled by gentle winds, some [of these little sailboats] eventually make contact with the female flowers and transfer pollen."

(By the way, bamboo "trees" are actually grass! This is because their stems are hollow and don't have the same vascular system as trees. In lawn grass, what is most visible is not the stem but the long, thin leaves that jut up from the stem. Even lawn grass grows tiny flowers—if you don't mow it.)

Many species of flowering plants have evolved means of ensuring *cross-pollination*, which is more advantageous than self-pollination. These means include "self-incompatibility, chemical barriers in the stigma that treat a plant's own pollen as if it were from another species; spatial separation of the anthers and stigmas in a bisexual flower; or staggered timing of pollen release and the stigma's receptiveness in each flower." Cross-pollination also happens when separate male flowers (*staminate*) and female flowers (*pistillate*) form on the same plant.

Here's something I didn't know: the reason many flowers close at night and on rainy or overcast days is to protect the pollen from moisture.

A couple of useful paragraphs:

The stage is set for reproduction when, by one means or another, compatible pollen comes to rest on a flower's stigma. Of the two cells within a pollen grain, one is destined to grow into a long tube, a *pollen tube*, that penetrates the pistil's tissues in search of a microscopic opening in one of the ovules, located in the ovary. Germination and growth of the pollen tube is rapid and is promoted by food substances and hormones supplied by the stigma and style. Botanists still don't understand how a pollen tube locates the ovule's tiny pore...

The second of a pollen's cells divides to become two sperm that move through the pollen tube and enter the ovule. Before the pollen tube and sperm's arrival, each ovule must be equipped with an egg, ready for immediate fertilization. A *zygote* is formed when one of the two sperms unites with the egg. The second sperm combines with another cell in the

ovule. The product of that union is a temporary food-storage tissue, called the *endosperm*, used to nourish the zygote as it grows into an *embryo*, the miniature plant within a seed...

As ovules grow and mature into seeds, they remain enclosed by the ovary, which slowly enlarges to become a fruit...

Some fruits, such as peaches, apricots, plums, and cherries, have only one seed in their hard center; strawberries, on the other hand, have a whole lot of tiny, ripened ovaries (the true fruit) on their surface, each with a seed in it. Botanists have classified fruits into several categories. For example, “a *simple fruit* is derived from a flower bearing a single ovary; examples include tomato, orange, grape, melon, and peach. An *aggregate fruit* comes from a flower having many ovaries. Thus, an aggregate fruit is a collection of small fruits borne on a single receptacle, such as blackberry, raspberry, and strawberry.” The fruit’s function is to protect the seed until it’s ready for dispersal. One method of dispersal is to be eaten by animals (the hard seeds pass through digestive tracts without being harmed). Another method is exemplified by dandelions, whose small fruits have feathery parachutes that can disperse them through air. (A botanist’s definition of fruit, by the way, is obviously different from the popular definition of fruit as being something edible and sweet. You wouldn’t want to eat dandelion fruits. Likewise, in the botanical sense, tomatoes, bell peppers, cucumbers, peas, okra, olives, avocados, corn, green beans, chick peas, nuts, etc. are all fruits, since they come from the flowering part of a plant and contain seeds. Vegetables are the other edible parts of a plant, like the leaves, stem, roots, and bulbs.)

The book’s last chapter, on genetics and inheritance, is confusing as hell, being much too cursory. Sporophytes, gametophytes, megaspores, alternation of generations...and genetics is complicated enough even without these weird alternating generations. So screw it, I’m done with botany for now. At least I know a little more than I used to.

Oh the miracles and beauties of nature! And oh, the headaches one gets when reading about them!

*

Understanding Living Systems (2023), by the respected biologists Raymond Noble and Denis Noble, is an interesting book. They argue against Dawkinsian genetic reductionism, which has apparently become a kind of orthodoxy. I suppose I’ve been guilty of it too, like in what I wrote in February.

This is from the preface:

This book addresses four fundamental misunderstandings about living organisms. In the first half of the twentieth century, and particularly in the late 1960s and early 1970s, ideas on living organisms and their evolution were formulated in what became known as the Modern Synthesis. For this there were four main pillars: (1) that changes in the structure and function of organisms in one generation could not be passed on through the germ line—this dogma was formulated by August Weissman in 1883 and, in the mid-twentieth century, became a fundamental part of a gene-centric dogma; (2) that organisms could not alter their genes, so causation was held to be a one-way process, from gene to organism functionality; (3) that the organism was best viewed as a passive vehicle for retaining genes in a ‘gene pool’ and, most significantly, that the behaviour and function of organisms was controlled to this end (this gave birth to the selfish-gene concept, popularised by Richard Dawkins in his best-selling book, *The Selfish Gene*); (4) that evolution occurs through small random changes in genes (gene mutations) that are passively selected in the process of natural selection. What we show in this book is that none of these pillars is correct, or stands as originally formulated. It is clear now that selective changes in the organism can be passed on through the germ line; that there is no hard barrier to the germ line, and that some key factors, such as epigenetic changes, do pass through that; and that there can be no ‘gene pool’ that is separate from the organisms. So the vehicle–gene separation is simply mistaken, both philosophically and scientifically.

The Modern Synthesis led to the view that organisms are passive living systems, which experience environmental changes but play no active role in the process of evolution. On the contrary, we show that organisms are active agents in evolution. This book also addresses another fundamental misconception: that DNA is a ‘secret code’ or set of instructions to the organisms. Furthermore, the evolution of species has involved major rearrangements of the genome, not just small random mutations. Natural selection is also an active process performed by organisms, not a passive one...

I find this critique of the received view very attractive. As the authors say, genes are not “the driving force and the goal of organisms.” They are “part of a regulatory system and not its directors. The director is the self-regulating organism.” They go on: “The organism does not wait for commands given by genes. Just as musical notes can be arranged in many ways to create compositions, organisms use their genetic heritage, implementing a diverse range of possible outcomes. Furthermore, when their heritage is inadequate to cope with environmental stress, organisms can alter their genes. Thus, organisms can change their genetic heritage.”

In essence, the debate is between two positions: are organisms the tools of genes (permitting their survival through generations) or are genes the tools of organisms?

However appealing the authors’ critique is, I have to admit it does seem as though reproduction is the main purpose of the organism, and that reproduction is essentially replication of the *slightly modified* genome. So the organism would then be the tool of genome (semi-)replication. This is a pretty compelling view.

The authors say the genome doesn’t self-replicate, since replication depends on processes in the cell, such as correction of replication errors. Fair enough. But aren’t the enzymes that correct errors in DNA replication themselves coded for by DNA? It seems like DNA itself is doing an enormous amount of the work, though admittedly not all of it.

They also say that “faithful replication is not the purpose of life [because DNA *isn’t* faithfully replicated between generations]. Responding to change [in the environment] is.” But you could still say: replicating DNA *in such a way that it responds to change* is the purpose of life.

This reminder is useful, though: “...Indeed, there are several essential amino acids that the body cannot manufacture, which must be obtained by organisms in their diet. Thus, we do not have genes for these amino acids, and nor do we have genes for a great deal else, including all the membranous processes where much of the complex control of cells occurs. Even the nuclear membrane is part of this active mechanism whereby the cell can select what has access to the DNA.” So, as they say, the cell, in a sense, “controls” and “instructs” its DNA.

Another reminder (this time that *transposons* exist): “The genome can be reorganised... The evidential basis is now substantial, beginning notably with Barbara McClintock’s work in the 1930s, 1940s and 1950s. McClintock showed genome reorganisation in corn (maize), where large domains are moved from one region of the genome to another *in response to environmental stress* [my italics], and even from one chromosome to another.” Remarkable. Another potential basis of evolution, and of environmental feedback into the genome. (But I still don’t understand how it happens.)

What about epigenetics? It’s known that epigenetic modifications—caused by the environment—in the parent can be inherited by the child, but

It is often argued that such epigenetic changes will not persist for more than a few generations, or not become incorporated into the genome. However, evidence from studies of populations living at high altitude contradicts this assumption, where what must have been initially a stress-induced epigenetic change is assimilated into the genome. So populations of humans have adapted to the persistent hypoxia of high altitude in several locations, and recent genome-wide studies have demonstrated the genes involved. In some populations, genetic signatures have been identified in metabolic pathways involved... In

Tibetans, such changes are found in several genes involved in these pathways, and this is an example of adaptation acquired in genes orchestrated by the organism.

Awesome. I did not know that. So epigenetics *is* relevant to evolution! And Lamarck was *partly* right!

Again: “We say that reproduction is not simply a matter of producing a copy; its purpose is not replication but the creation of novelty. This is important for organisms because they experience continual changes in their environment and their interactions with other organisms, including other species. Nothing is static.”

“The goal is not to maintain genes in a gene pool, but to bring about change to enhance fitness. So, far from the gene-centred view that life is a vehicle for maintaining them, genes are changed, often in substantive ways, to enhance survival.” This seems like a fair point. The goal isn’t to maintain genes, certainly not individual genes. The goal is to enhance (or at least maintain) fitness, which can be done by rearranging or modifying the genome.

It’s worth noting that if simple replication were the point of life, why would sexual reproduction have evolved at all? Why wouldn’t cellular mitosis, or cloning, have remained the only method of propagation? Sexual reproduction changes things!

I’d also note that DNA and RNA aren’t exactly “replicators,” as (I recall) Dawkins calls them. Nor are genes. *Cells* are replicators. They replicate themselves, which DNA doesn’t do. (DNA relies on a myriad of external processes that replicate it.)

Another reason it doesn’t make sense to say DNA replication is the purpose of life is simply that for a long period in the history of life, DNA didn’t exist. It’s probable even RNA didn’t exist at the earliest stages.

It isn’t the genome that’s the “organizer” of life, but rather the whole system itself. “Genes cannot do anything unless used by the system of which they are a part; they are tools of our fate, not arbiters of it. Living beings harness genes in their functions, not the other way around.”

A rather exciting philosophy:

...This interdependency of living things is not static, or a fixed relationship; it is one that undergoes continual change, with organisms adjusting in relation to it. This is intelligence. It requires assessment, understanding, problem-solving and relevant action. What happens in one part of the system, to pull it in one direction, is reflected in other regions. The system maintains integrity, not by keeping itself ‘the same’ but by processes of creative change. This brings us back to the idea of shaking the genes up and not simply conserving them.

Reproduction is an instrument of this creative process. Reproduction does not simply replicate. It brings about change. This is most obviously the case in shaking up the genes, life’s toolbox. Transgenerationally, this change is reflected in evolution. Evolution is a dynamic, creative process of adaptation, of change, a moulding of living systems. As such, it has direction. It solves problems. It is part of the intelligence of life. This contrasts with the view of evolution as a passive and non-directed process of random gene mutations passively selected by the environment (natural selection)... Variability is life’s force for dynamic and creative, purposeful change.

One problem with all this emphasis on change and innovation and openness and creativity is that generation after generation, for thousands of generations, the same kinds of organisms behave in the same ways. And the genome mostly determines those ways. Squirrels are programmed to dig; songbirds are programmed to sing; humans are programmed to speak. There’s a lot of truth to genetic determinism. Genes don’t literally *determine* behavior, since the organism reacts in fast and even “creative” ways that aren’t directly determined by DNA. But DNA does massively constrain behavior.

In the end, I don’t know how substantive the whole debate is. People like Dawkins would surely agree with many of the authors’ arguments (particularly ones I haven’t copied here because they’re not very

interesting). But some of their claims are too strong, just as some of the gene-centric claims are too strong. The truth is likely somewhere in the middle.

April

I see Aidan every three weeks, and it's incredible how much his linguistic abilities have changed each time I see him. He's now (27 months) speaking pretty competently much of the time. Pronouncing words better, learning new words all the time, speaking short sentences (The sun is shining, This is an ambulance, Go for a walk, Where did Mama go?, Aidan is coming back, Ah need to put the hat on, and so forth). He's a good boy, sweet and happy and mostly obedient. Except for his nearly constant refusal to eat good food.

Something I've never heard or read anyone comment on is the necessary *gradualness* of words acquiring meanings for toddlers. Initially, even as children are using certain words in the right way, they still must be little more than *sounds* to them, sounds with a use. But over time, they really do become words with a meaning, with cognitive significance. But how long does this process take? How gradual is it? When does a word cease to be just a sound and become a word? We'll never know, because we can't ask kids about it.

Anyway, to return to complaints and laments, specifically self-complaints and self-laments: it seems that I'll never be able to initiate and complete another significant intellectual project, because I'm too fond of reading in all subjects and lack the discipline and obsession to pursue one project to exhaustion. I'll certainly never be able to write a 700-page tome, as I once hoped. Historical research I experience mostly as drudgery. I think all I'll ever be able to do now—all I've been doing for years—is write relatively brief articles.

The unusual breadth and consistent rationality of my mind are worthy qualities, but originally I had hoped for more.

For many years, the creative side of my mind has been slowly declining in relation to the 'consuming' side, the side that enjoys reading and accumulating knowledge. It's been sad to progressively observe the waning of the creative impulse. Those moments of excitement and suspense and sometimes inspiration as I pursued thoughts wherever they led me, or as I carefully crafted literary sentences, are apparently gone for good. Those adventurous, fecund years are all behind me. I ought to have done more with my talents when I still had them!

Reading a book entitled *Infinite Powers: How Calculus Reveals the Secrets of the Universe* (2019), by Steven Strogatz. From the introduction:

Without calculus, we wouldn't have cell phones, computers, or microwave ovens. We wouldn't have radio. Or television. Or ultrasound for expectant mothers, or GPS for lost travelers. We wouldn't have split the atom, unraveled the human genome, or put astronauts on the moon...

...It's a mysterious and marvelous fact that our universe obeys laws of nature that always turn out to be expressible in the language of calculus as sentences called differential equations. Such equations describe the difference between something right now and the same thing an instant later or between something right here and the same thing infinitesimally close by...

...From the old elements of earth, air, fire, and water to the latest in electrons, quarks, black holes, and superstrings, every inanimate thing in the universe bends to the rule of differential equations. I bet this is what Feynman meant when he said that calculus is the language God talks. If anything deserves to be called the secret of the universe, calculus is it.

I knew calculus was important, but I didn't know it was *that* important.

“Three mysteries above all have spurred [calculus’s] development: the mystery of curves, the mystery of motion, and the mystery of change.”

Calculus began with early geometers’ centuries-long efforts to figure out (e.g., calculate the areas and volumes of) curved shapes like circles and spheres. “The breakthrough came from insisting that curves were actually made of straight pieces. It wasn’t true, but one could pretend that it was. The only hitch was that those pieces would then have to be infinitesimally small and infinitely numerous. Through this fantastic conception, integral calculus [in an embryonic form] was born.” What makes curves especially important to figure out is that they’re key to unlocking the secrets of nature, since curves define, for example, the parabolic arc of a ball in flight, the elliptical orbits of planets, and the convex shapes of lenses for microscopes and telescopes. “And so began the second great obsession: a fascination with the mysteries of motion on Earth and in the solar system.” This was the era of the Scientific Revolution. The problem was that existing forms of math, like arithmetic and geometry, couldn’t deal with accelerated motion (changing speed or changing direction). So another kind of math had to be invented, differential calculus. “This time the act of wishful fantasy was to pretend that motion at a changing speed was made up of infinitely many, infinitesimally brief motions at a *constant* speed.”

Isaac Newton was the world-historic figure who “solved the holy grail of calculus: he discovered how to put the pieces of a curve back together again—and how to do it easily, quickly, and systematically. By combining the symbols of algebra with the power of infinity, he found a way to represent any curve as a sum of infinitely many simpler curves described by powers of a variable x , like x^2 , x^3 , x^4 , and so on.” As if this weren’t enough, he “cracked the code of the universe,” discovering that motion of any kind always unfolds one infinitesimal step at a time, steered from moment to moment by mathematical laws written in the language of calculus. “With just a handful of differential equations (his laws of motion and gravity), he could explain everything from the arc of a cannonball to the orbits of the planets.”

Thus, according to Strogatz, the mysteries of curves and motion were solved. (This might be overstating it. I don’t think Zeno’s paradoxes have been resolved on an *intuitive* level, even if calculus somehow solves them mathematically.) But the mysteries of change remained. “Emboldened by the Newtonian paradigm, the later practitioners of calculus asked: Are there laws of change similar to Newton’s laws of motion? Are there laws for population growth, the spread of epidemics, and the flow of blood in an artery? Can calculus be used to describe how electrical signals propagate along nerves or to predict the flow of traffic on a highway?” In modern times, scientists have worked out the laws of change and used calculus to solve them and make predictions.

Calculus has even been used in medicine. In fact, even the subatomic world can be described by calculus. It’s true that according to quantum mechanics, trajectories of subatomic particles have to be described as probability waves instead of Newtonian trajectories. “As soon as we do that, however, calculus returns triumphantly. It governs the evolution of probability waves through something called the Schrödinger equation.” So even where Newtonian physics breaks down, in the subatomic world, Newtonian calculus still works!

So much for the book’s introduction.

I can’t really summarize the book, since it’s pretty dense. But I can quote interesting passages. What calculus revolves around, of course, is the fascinating and paradoxical concept of infinity. More exactly, it’s based on what Strogatz calls the Infinity Principle: “To shed light on any continuous shape, object, motion, process, or phenomenon—no matter how wild and complicated it may appear—reimagine it as an infinite series of simpler parts, analyze those, and then add the results back together to make sense of the original whole.” This is what Archimedes did when he estimated that pi (the ratio of a circle’s circumference to its diameter) is greater than $3 + \frac{10}{71}$ and less than $3 + \frac{10}{70}$:

To probe the mysteries of circles, spheres, and other curved shapes, [Archimedes] always approximated them with rectilinear shapes made of lots of straight, flat pieces, faceted like jewels. By imagining more and more pieces and making them smaller and smaller, he

pushed his approximations ever closer to the truth, approaching exactitude in the [unreachable] limit of infinitely many pieces.

In a sense, Archimedes was almost two thousand years ahead of his time, since the method he used to estimate pi anticipated integral calculus. So did the method he used to calculate the area bounded by a parabola, and the surface area and volume of a sphere, and so forth.

But

When Archimedes died, the mathematical study of nature nearly died along with him. Eighteen hundred years passed before a new Archimedes appeared. In Renaissance Italy, a young mathematician named Galileo Galilei picked up where Archimedes had left off. He watched how things moved when they flew through the air or fell to the ground, and he looked for numerical rules in their movements... Meanwhile, a young German mathematician named Johannes Kepler studied how the planets wandered across the sky. Both men were fascinated by patterns in their data and sensed the presence of something far deeper. They knew they were onto something, but couldn't quite make out its meaning. The laws of motion they were discovering were written in an alien language. That language, as yet unknown, was differential calculus. These were humanity's first hints of it.

Before the work of Galileo and Kepler, natural phenomena had rarely been understood in mathematical terms. Archimedes had revealed the mathematical principles of balance and buoyancy in his laws of the lever and hydrostatic equilibrium, but those laws were limited to static, motionless situations. Galileo and Kepler ventured beyond the static world of Archimedes and explored how things moved...

I won't go through Galileo's and Kepler's laws of motion, but since these thinkers dealt with curves (parabolas, swinging pendulums, planetary orbits, the volumes of curved shapes like wine bottles), they worked on integral calculus. "They channeled the spirit of Archimedes, carving solid objects in their minds into imaginary thin wafers, like so many slices of salami."

However, only when new ideas from Islamic and Indian mathematics had permeated Europe did European mathematicians really find a way forward, "a chance to go beyond Archimedes and break new ground"—with differential calculus. "Differential calculus cuts complicated problems into infinitely many simpler pieces. Integral calculus puts the pieces back together again to solve the original problem." Logically, it would seem that differential calculus should have come first. Not least because it's easier. Calculus courses today start with derivatives, "the relatively easy techniques for slicing and dicing," and then work up to integrals, "the much harder techniques for assembling the pieces into an integrated whole." But historically integrals came first, because differential calculus grew out of algebra, which "took centuries to mature, migrate, and mutate."

In its original form in China, India, and the Islamic world, algebra was verbal, not symbolic. "Unknowns were words, not today's x and y ." But after migrating to Europe around 1200, it gradually evolved into an art of symbols, which made it both more abstract and more powerful. "This new breed, symbolic algebra, then coupled with geometry and spawned an even stronger hybrid, analytic geometry, which in turn begat a zoo of new curves, the study of which led the way to differential calculus."

Around 1630, Fermat and Descartes, working separately, invented analytic geometry, which, for the first time, linked algebra to geometry. It's the xy graph we're all familiar with today, which charts relations between variables. Algebraic equations could be represented geometrically on graphs. The possibilities this presented for math were stupendous. "A whole new continent of curves and surfaces opened up as soon as equations were viewed geometrically. Lush jungles of geometric flora and fauna waited to be discovered, cataloged, classified, and dissected."

Fermat was the better mathematician, and he came up with an early version of differential calculus when he applied algebra to "optimization problems" (which have to do with how to get the fastest, biggest,

most efficient, or whatever, result). Since I don't fully understand Strogatz's discussion and it's too dense to summarize anyway, we can skip it. But one point that struck me is that Fermat was the first person to apply (an embryonic form of) differential calculus to physics, when he calculated how light refracted when it passed from one medium (air) to another (water). It turned out that light travels in the most efficient way—not the most *direct* way (on a straight line through different media), but the fastest. “Of all the possible paths light can take, it somehow knows, or behaves as if it knows, how to get from here to there as quickly as possible. This was an important early clue that calculus was somehow built into the operating system of the universe.” In other words, the reason light refracts through water at a particular angle is that that angle allows it to get from point *a* to point *b* in the fastest way. —It's all so incredible, nature. But so maddening to think the human mind is too limited to fully understand everything, and *why* everything is as it is! Why laws of nature are what they are, etc. We'll never know!

In any event,

Fermat paved the way for calculus in its modern form. His *principle of least time* revealed that optimization is woven deeply into the fabric of nature. His work on analytic geometry and tangent lines blazed a trail to differential calculus that others soon followed. And his virtuosity with algebra enabled him to find the areas under certain curves that had eluded even his most illustrious predecessors. In particular, he found the area under the curve $y = x^n$ for any positive integer n , using little more than his bare hands. (Others had solved the first nine cases, $n = 1, 2, \dots, 9$, but couldn't find a strategy that worked for all n .) Fermat's advance was a giant step forward for integral calculus, one that would set the stage for breakthroughs to come.

He was a genius, but he didn't quite make the decisive leap that Newton and Leibniz did, which “revolutionized and unified the two sides of calculus.” The missing link was what was later called the *derivative*, a concept whose applications “would go far beyond curves and their tangents to include any sort of change at all.”

Here's another paragraph I have to quote:

The pivotal moment in the story of calculus occurred in the middle of the seventeenth century when the mysteries of curves, motion, and change collided on a two-dimensional grid, the xy plane of Fermat and Descartes. Back then, Fermat and Descartes had no idea what a versatile tool they'd created. They intended the xy plane as a tool for pure mathematics. Yet from the start, it was a crossroads of sorts, a place where equations met curves, algebra met geometry, and the mathematics of the East met that of the West. Then, in the next generation, Isaac Newton built on their work as well as on the work of Galileo and Kepler and brought geometry and physics together in a great synthesis. Newton's spark set off the fire that lit the Enlightenment and caused a revolution in Western science and mathematics.

So what is a derivative? It's a rate of change of one variable with respect to another. “Derivatives come up whenever we want to quantify how a change in something is related to a change in something else.” The symbol for the derivative is dy/dx —similar to the ordinary rate of change $\Delta y/\Delta x$, except that the two changes dy and dx are imagined to be infinitesimally tiny. dy/dx is the slope of a continuously changing curve.

Well, I'm not going to summarize Strogatz's long mathematical discussion, since I'm too dumb to understand it. But the point is that Newton and Leibniz solved the ancient problem of how to systematically calculate the areas of regions bounded by curves. Independently, these two guys discovered and proved a fundamental theorem that connected areas to slopes, and thus *integrals* (infinite sums of infinitesimally small pieces) to *derivatives* (rates of change at each point or moment). Previously, it wasn't known that these two operations—calculation of geometric areas and calculation of slopes—were closely related. The

importance of the “fundamental theorem” of calculus can’t be overstated: “it’s the key to predicting the future of anything we care about (in the cases where we can) and to unlocking the secrets of motion and change in the universe.”

Strogatz says calculus was sort of like the Cambrian explosion for mathematics. “Once it arrived, an amazing diversity of mathematical fields began to evolve. Their lineage is visible in their calculus-based names, in adjectives like *differential* and *integral* and *analytic*, as in differential geometry, integral equations, and analytic number theory.” Differential geometry, for instance, “used calculus to shed light on the structure of smooth surfaces and revealed cousins they never knew they had, unimaginable curved shapes in four dimensions and beyond.” Thus evolved non-Euclidean geometry and eventually general relativity.

The logic of differential equations is the logic of the universe, as Newton showed. Even the simple, iconic equation $F = ma$ is a differential equation, because acceleration is a derivative (the rate of change of a body’s velocity).

Strogatz, like other mathematicians and physicists, is awestruck by the fact that this puny animal called *homo sapiens* can, on some level, unravel the mysteries of the cosmos, and he approvingly quotes Eugene Wigner’s famous essay on “the unreasonable effectiveness of mathematics.” But I’m not sure our capabilities are so mysterious. Nature is evidently structured according to *quantities*. So once an animal had evolved that could understand the concept of number—could build numbers in its mind, could grasp a system of discrete infinity (probably because of its possession of language, from which numbers are likely an abstraction, as Chomsky suggests)—the rest fell into place. It became possible to mentally manipulate numbers, which meant mentally manipulate physical entities, the substance of the universe. The real and original mystery is our possession of language, which has made possible our possession of the concept of number.

Anyway, it’s an enlightening book, though its explanations of calculus are hard to follow.

*

Read *The Call of the Wild*. It’s a book that makes you feel. My eyes welled up at the end, from the vastness and the beauty, the majesty and the mythology.

The symbolism and realism run together and strengthen one another. The whole book is wonderfully symbolic and realistic. Even the depictions of Buck’s mental states are fairly plausible. Dogs have mental lives, after all; they aren’t mere zombie-like behavior. Buck may be a sort of mythical *Übermenschian* creature, but his character is drawn vigorously and compellingly.

All the characters are realistic. For instance, Mercedes, the sole woman, is defiantly female, the whining, crying, spoiled brat. The expectation that because of her female weakness she’s entitled to special treatment, and the absence of self-contempt for her weakness and stupidity—these are common female traits we’re all familiar with. “I’m a weak and unthinking woman, I deserve to be treated better than you men!” Likewise, we’re familiar with the bull-headed stupidity of a Hal, an unfortunate type of primitive male. Happily, John Thorntons exist. I laughed when Hal, Mercedes, and Charles crashed through the ice and drowned: it was as if London was wishing the world would be rid of this whole species of soft pathetic self-centered human.

A great book, magnificently, albeit subtly, anti-civilization. Its rawness and cleanliness and virility sweep away the parochial decadence of culture today, the petty stupid academics and craven politicians and money-slaving businessmen and lawyers. Wild nature is brutal and merciless, but it has a purity that beckons.

Also been reading H. P. Lovecraft, to whom I prefer Jack London. But Lovecraft isn’t bad. I don’t know why he’s so beloved by counterculture types, but I was curious, so I thought I’d read him.

Now for *Germinal* (1885), Émile Zola’s classic novel about coal miners in France.

...Well, Zola’s most famous novel isn’t exactly uplifting. My God, what a picture of screaming human misery. It’s almost unbearable at times, the unending descent into ever deeper abysses of misery, every possible type of suffering. But predominantly poverty and hunger. And yet the writing and the overall

conception are so brilliant one has to keep reading. I really am in awe of the stamina and brilliance required to write such a novel (and other great novels). What an imagination Zola had!

There are so many incredible scenes, even beautiful and romantic ones—like Catherine and Étienne trapped in a pit underground on the verge of death, finally consummating their love. A profound, haunting, symbolic image. I suppose the novel contains a bit of melodrama, but it's forgivable. What an impassioned, agonized call for justice!

One emerges from this book bleeding pity for Maheude and all the others, and of course disgusted by a society capable of such cruelty, but also with one's appetite for life whetted. I think of young, innocent, healthy Aidan, so privileged and happy, and I'm very glad I'll see him tomorrow. The world teems with misery, and one should never forget this, but it's still possible to take pleasure in good things. Life's innocent enjoyment of itself, as when a young child runs and shouts around a playground, is still something to cherish. Even if such enjoyment is inevitably transient, it can be appreciated while it lasts.

*

Today Aidan said something that almost counted as a joke, though I doubt he knew it. I was bouncing a ball on his head and he said, smiling, "Ah need to wear the helmet!" He doesn't really ever wear a helmet, but Amina sometimes mentions it to him. Anyway, it was a charming remark.

He also came up to me while I was on my phone and said "Boo!" Then laughed. So he's at the stage of being able to say things to elicit particular emotional responses, on the basis of his own responses when others say those things to him. "Theory of mind," etc. (But of course that theory of mind stuff goes back to before the age of two.) He's developing more of a personality. Sometimes when we're walking in the street he'll say "Hiya!" to people we pass. In general he's quite shy, though.

Aidan has a great memory for words and names of objects, but he struggles with names of colors. It's kind of amazing, actually: I tell him the colors of a couple of objects and a few seconds later ask him what they are, and he frequently gets them wrong. He can't remember how to apply the word even for five seconds! I go over the colors of several objects again and again and again, but he rarely remembers them. Though he's most successful with blue, for some reason. Given his great memory in other contexts, this cries out for an explanation. I suppose color is just too abstract a concept at this point, so he doesn't know what the words are supposed to denote. Evidently toddlers, at least early toddlers, assume nouns are supposed to name objects and people, not properties. Their minds exist too much on the level of immediacy to be able to understand such abstractions.

Anyway, it's occurred to me that if it were necessary, I'd die for Aidan. It's not exactly because I'm "full of love" for him; it has more to do with a sense of what's right, a sense of obligation. But not a burdensome obligation. I brought him into the world, and I want him to live out his life, to have a good life. You immediately acquire massive responsibilities once you create a person. Even without reflection, your priority becomes your child's life. It's an oddly "automatic" thing that doesn't seem to depend either on deeply felt emotions or on logical reasoning or any other factor. It's just a given. I don't feel some sort of palpable, physiological emotion of love for Aidan, at least not ordinarily, though it wouldn't be wrong to say I love him. My actions, at least, indicate I do. There's no question I *care* about him deeply, which is why I'd sacrifice my life for his. To some extent—probably in part because I don't see him often enough—he's still just an external being to me, someone with whom I don't profoundly *identify*. But my simple awareness of the connection between us has an impressive power to motivate. Sometimes I do come closer to really *feeling* something, like, on occasion, when I'm holding him and smothering him with kisses; and there's a notable pleasure in his company, i.e. in his cuteness. Enough of a pleasure to make me tolerate his mother!

*

David Enoch's academic paper "Agency, Shmagency: Why Normativity Won't Come from What Is Constitutive of Action" (2006) is insightful and funny, and reminds me of what I wrote in January. The

whole vast post-Platonic philosophical attempt to ground morality or normativity in something ironclad like *the nature of reason* or *the nature of God*—or, more relevantly and recently, *the nature of action* or *the nature of being an agent*—is doomed to fail. Interesting arguments have been made along the way, but in the end the whole millennia-long project was misguided. The “sentimentalist” theorists of the Enlightenment, such as Hutcheson and Hume, were on the right track, not the rationalist or Kantian or realist theorists who came before and after.

Christine Korsgaard, for example, tries to explicate the nature of action in order to construct a foundation for normativity/morality. Enoch introduces his discussion with this attempt to motivate Korsgaard’s project:

The intuitive idea can be put, I think, rather simply: In order to know what it takes for a car to be a good car, we need to understand what cars are, what their constitutive functions are, and so on. A good car is just a car that is good *as a car*, good, that is, in measuring up to the standards a commitment to which is built into the very classification of an object as a car. Analogously, then, perhaps in order to know which actions are good (or right, or reason supported, or rational, or whatever), all we need is a better understanding of what actions are, or perhaps of what it is to be an agent, someone who performs actions. Perhaps the normative standards relevant for actions will fall out of an understanding of what is constitutive of action just as the normative standards relevant for cars fall out of an understanding of what is constitutive of cars.

If this is the “intuitive idea,” then it’s stupid. Cars have a function. Humans don’t, and actions don’t. That is, there is no general function of *action* as such. Almost everything we do is an action: one might almost say that action is life, or willed life. So there can’t be a good action or a good human in this “functional” sense, the sense in which there can be a good car.

“Action, so Christine Korsgaard tells us, is self-constitution. That your action (partly) constitutes yourself, or perhaps that in your action you constitute yourself, is constitutive of what an action is. From this, Korsgaard continues, an important result follows: ‘Action is self-constitution. And accordingly, . . . what makes actions good or bad is how well they constitute you.’ Korsgaard believes that the whole of morality—and, indeed, the whole of practical rationality, and perhaps even rationality more generally—can be extracted from this insight.”

Okay, so right away we’re in the realm of metaphor and myth. *In acting, you constitute (construct) yourself*. Or, alternatively, *your actions constitute you*. That’s an odd and unnatural way of talking. The fact is that you are who you are, and you act in accordance with that. Your acts neither bring you into existence nor define you, since there are many other dimensions to who you are (your genetic code, your values, your intentions, your talents, your regrets and resentments, your loves and hates, and so forth). Moreover, the idea of *actions doing a good job of constituting you* (“constituting you well”) is meaningless. However Korsgaard wants to flesh that idea out, it’s meaningless from the beginning. Whether you’re a Chomsky or a Jeffrey Dahmer, you’re still “well-constituted” as who you are.

Enoch sets aside such criticisms and makes a different one, which is reminiscent of what I wrote in January. Remember that one of the points of this whole Platonic, Kantian, Korsgaardian, transhistorical project of grounding morality in something objective or non-moral is to provide a knockdown answer to a moral skeptic:

We are to imagine, then, someone who remains indifferent when we tell him that his actions are immoral or irrational. He then reads Korsgaard and is convinced that self-constitution is a constitutive aim of action, so that you cannot even count as an agent and your bodily movements cannot even count as actions unless you aim at self-constitution of the kind Korsgaard has in mind. And assume that our skeptic is even convinced that—miraculously—morality and indeed the whole of practical rationality can be extracted from the aim of self-constitution. Do we have any reason to believe that now he will care about

the immorality or irrationality of his actions? Why isn't he entitled to respond along the following lines: "Classify my bodily movements and indeed me as you like. Perhaps I cannot be classified as an agent without aiming to constitute myself. But why should I be an agent? Perhaps I can't act without aiming at self-constitution, but why should I act? If your reasoning works, this just shows that I don't care about agency and action. I am perfectly happy being a shmagent—a nonagent who is very similar to agents but who lacks the aim (constitutive of agency but not of shmagency) of self-constitution. I am perfectly happy performing shmactions—nonaction events that are very similar to actions but that lack the aim (constitutive of actions but not of shmactions) of self-constitution." Has Korsgaard put us in a better spot vis-à-vis this why-be-an-agent (rather than a shmagent) problem than we were vis-a-vis the why-be-moral or why-be-rational challenges with which we—or at least Korsgaard—started?...

The skeptic has no reason to *care* about Korsgaard's argument regarding his not being a full-fledged agent—unless he really *wants* to be such an agent. As Enoch says, "However strong or weak the reasons that apply to [the skeptic] and require that he be moral, surely they do not become stronger when he realizes that unless he complies with morality his bodily movements will not be adequately described as actions."

In any event, you can see how silly and artificial this whole Korsgaardian project is. An action isn't *really* an action unless it fulfills certain criteria? Give me a break. People act in countless kinds of ways, from hedonistic and "immoral" to compassionate and "moral." It's all actions, it's all bodily movements and intentions and desires and reasons. As I said in January, the *naturalistic* analysis, which doesn't use weird philosophical metaphors and abstruse rationalistic justifications for acting in ways we're socialized to act in, is the best.

(It seems like many modern moral philosophers are in the game of doing what Nietzsche said Kant was trying to do: having got rid of God, they hope to bring him in through the back door. They have a nostalgic yearning for the certainty that came with belief in God, the banishment of doubt, the belief in objectivity, so they try to construct some new rationalistic God—for instance, *moral realism*, or, alternatively, Korsgaard's neo-Kantianism—to ground their values and actions. They're only willing to go halfway to a fully modern, naturalistic stance.)

All this moralistic theorizing is just *unnecessary*! It seems *unproductive*! I sympathize with Orson Welles, who said, "I'm suspicious of philosophy. I have a real philistine doubt about its worth. Anthropology seems to be just at its beginnings, and philosophy kind of at its end." I'll admit it can be interesting to read Korsgaard and others, but in the end they're wrong and their ideas don't contribute much to the world. The project of denying analytical and naturalistic common sense is doomed.

As I remember writing many years ago: "Damn it, man, it would be refreshing to be *wrong* for once!" In its consistency and rationality, my 'system of thought' puts to shame that of almost all other intellectuals. What I ought to do is sit down and spell everything out rigorously, like I said in my twenties I would someday do.

The problem is that there's far too much I'd have to read and cite. I have to make money, after all—probably get a full-time job soon, so I'm not living paycheck to paycheck.

...Okay, was I too quick and glib in those thoughts critical of Korsgaard? Fine! I'll be more serious! Let's embrace the philosophical drudgery! Let's turn to Korsgaard's influential book *Self-Constitution: Agency, Identity, and Integrity* (2009).

First, I want to note again that a Kantian project is *prima facie* implausible, since its whole point is just to find some convoluted philosophical justification for doing what we're socialized (or genetically predisposed?) to do. We want to assuage our philosophical conscience, so we laboriously try to come up with wonderful philosophical reasons to do what society already wants us to do. The conclusion is given beforehand, so to speak, and we try to invent respectable reasons to get to that conclusion. There's something suspicious about the whole thing!

But I should confess I have a soft spot for Korsgaard. Not only because she's an unusually clear writer. More substantively, I like her reverence for Kant. That isn't particularly fashionable, which is sad,

because Kant, despite all the things he was wrong about, was a profound, systematic, and beautiful thinker. Surely one of the top five philosophers in history. I can't but respect someone who loves Kant.

Since his moral system was wrong, though, so is Korsgaard's. The problems start in the book's preface. In its first paragraph. Human self-consciousness, different from the consciousness of other animals, "makes it necessary to *take control* of our beliefs and actions"—because we can't escape having a capacity to control and direct them in a way other animals lack—"but we must then work out how to do that: we must find normative principles, laws, to govern what we believe and do." Really? Why *must* we? What kind of "must" is this? It would seem that plenty of people get by without having any conception of the normative principles or laws that are supposed to govern what they do.

Proceeding to the third paragraph...

If, when we act, we are trying to constitute ourselves as the authors of our own movements, and at the same time, we are making ourselves into the particular people who we are, then we may say that the function of action is *self-constitution*. This conception of action opens up the possibility that the specific form of goodness or badness that applies to human actions—rightness or wrongness—is goodness or badness *of their kind*, goodness or badness *as actions*. A good action is one that constitutes its agent as the autonomous and efficacious cause of her own movements.

Whoa, slow down there! Through our actions it may be true that we're, in some sense, (partially) showing who we are, but that doesn't mean the function of action is self-constitution. Why can't "the" function of action just be to realize desires? Or why can't action as such have no "function" at all?

Now for the second sentence: what I just wrote pulls the rug out from beneath Korsgaard's reasoning, but even apart from that, it's significant that the idea of the goodness or badness of an action *as such* strikes us as bizarre and meaningless. Action is action. It sounds very weird to say certain actions more successfully achieve the goal of *being an action* than others. When a way of talking sounds as artificial as this, you know there's something wrong with it.

Third sentence: um, okay. Some actions don't fulfill their purpose, sure—like if you trip over yourself while walking—and so then you're not being "efficacious." But it's really stretching things to hope to get an entire moral theory out of considerations like this.

It deteriorates from there:

...I also draw on the work of Plato, to explain the kind of unity that a person must have in order to be regarded as the author of her movements. For it is essential to the concept of an action that it is attributable to the person as a whole, as a unit, not to some force that is working in her or on her. [*No. Whatever anyone does, even if they're drunk or high, is an action. The only thing "essential" to the concept of an action is that it be something you do.*] And it was Plato who taught us, in the *Republic*, that the kind of unity required for agency is the kind of unity that a city has in virtue of having a just constitution.

Following Plato's lead, in this book I argue that the kind of unity that is necessary for action cannot be achieved without a commitment to morality. [*This is getting silly. You can't be "unified" without being moral? You can't truly act without being committed to morality? This is such fantastical philosophical nonsense.*] The task of self-constitution, which is simply the task of living a human life [*um, we're all living human lives, simply by virtue of living!*], places us in a relationship with ourselves—it means that we interact with ourselves. We make laws for ourselves, and those laws determine whether we constitute ourselves well or badly. And I argue that the only way in which you can constitute yourself well is by governing yourself in accordance with universal principles which you can will as laws for every rational being. It follows that you can't maintain the integrity you need in order to be an agent with your own identity on any terms short of morality itself. ...The

moral law is the law of self-constitution, and as such, it is a constitutive principle of human life itself.

None of this seems promising, but okay, it's only the preface.

It's at least odd, however, to think of morality as having to do primarily with a type of relation to oneself. Surely the essence of morality, as people understand the concept, is a type of relation to others. If you treat others well, you're moral. Simple as that. Bringing in all sorts of considerations of autonomy, agency, the nature of action, practical reason, self-constitution, self-unity, and the like, in order to show that there's some kind of rational imperative to be moral—rather than accepting that morality is grounded in simple sentiments like compassion and respect, and that's pretty much the end of the matter—makes it seem like we're engaged in nothing more than a highfalutin kind of verbal, philosophical game.

Here's another statement of where she's headed, from chapter 2:

In Chapter 1, I explained the general thesis for which I am arguing in this book: that action is self-constitution. By this I mean that we human beings constitute our own personal or practical identities—and at the same time our own agency—through action itself. We *make* ourselves the authors of our actions, by the way that we act. As I said before, this apparently paradoxical thesis depends on the ideas that action requires agency, and agency requires unity. An action is a movement attributable to an agent considered as an integrated whole, not a movement attributable merely to a part of an agent, or to some force working in her or on her. Since some ways of acting unify their agents better than others, the extent to which a movement is an action is a matter of degree: some actions are more genuinely actions than others. The actions that are most genuinely actions, I will argue, are the ones that accord with the principles of practical reason. These principles are therefore constitutive principles of actions, principles that we must be at least trying to follow if we are to count as acting at all. And this is what explains their normativity, or the way that they bind us.

So what are the principles of practical reason? First there's the hypothetical imperative, that if you will an end, you must will the means to that end, and second there's the categorical imperative, that you must will your maxim as a universal law.

Let's start with the hypothetical imperative. It gets a little strange here. Apparently the hypothetical imperative “unifies and constitutes the will.” Korsgaard thinks we're not necessarily *willing* something whenever we're acting. Suppose I want to write a book: I have to *will* that I sit down and get to work. At many moments I'll want to stop, want to take a break or give up or do something else—all these impulses “will attempt to control or overrule my will, to divert me from my work”—but I have to keep insisting to these desires “I am not you; my will is this work.” “If I give in to each claim [i.e., each desire] as it appears, I will do nothing and I will not have a life. For to will an end is not just to cause it, not even if the cause is one of my own desires and impulses, but to consciously pick up the reins, and *make myself* the cause of the end. The reason that I must conform to the hypothetical imperative is that if I don't conform to it, if I *always* allow myself to be derailed by timidity, idleness, or depression, then I never really *will* an end. The *desire* to pursue the end and the desires that draw me away from it each hold sway in their turn, but *my will* is never active. The distinction between my will and the operation of the desires and impulses in me does not [then] exist, and that means that I, considered as an agent, do not exist. Conformity to the hypothetical imperative is thus constitutive of having a will. It is, in fact, an essential part of what *gives* you a will.”

Okay, so for Korsgaard, the hypothetical imperative has to do not with whims and momentary desires but with a deeper sort of will that expresses your more considered desires, your deeper goals. And your will isn't active except when you're *truly controlling* yourself and your actions in this way. Fine. I suppose she's entitled to interpret concepts like ‘will’ and ‘agency’ however she wants. But at best, you have to say “*in a sense* you're not a *genuine* agent unless you're disciplining yourself to act according to your *deepest will*.” Surely it's more natural to say we're *all* agents, we're all acting most of the time, we're

all willing our acts. But I'll admit that the *self* is less involved, less implicated, in certain actions than others, and that it might be permissible, albeit idiosyncratic, to say you're *most* an agent when your self is, through hard deliberation, relatively "unified"—not flightily distracted—and deeply implicated in what you're doing.

But it's worth pointing out that to talk of "unity" in this way is merely metaphorical, since even if I get distracted from my work by going out to socialize or watching TV or whatnot, I'm still a "unified" self choosing those actions. It's not as though I suddenly become schizophrenic by indulging a desire I have at that moment. I'm still Chris Wright, a self with a unified consciousness.

Again, none of these Korsgaardian arguments seem promising. It's too easy to poke holes in them. So much for the hypothetical imperative. What about the categorical imperative?

I have argued that action is a form of self-determination, and that we can derive the hypothetical imperative from the fact that acting is determining yourself to be a cause. The hypothetical imperative is a constitutive principle of action, for you are not acting unless you are determining yourself to be a cause. But as I've just indicated, Kant thought that the fact that action is self-determination has a further implication. It also implies that the categorical imperative is a constitutive principle of action. For determining yourself to be a cause is not the same as being moved by something within you, say some desire or impulse—or to use Kant's own language now, some *incentive*—operating as a cause. When you deliberate, when you determine your own causality, it is as if there is something over and above all of your incentives, something which is *you*, and which chooses which incentive to act on. So when you determine your own causality you must operate as a whole, as something over and above your parts. And in order to do this, Kant believes, you must will your maxims as universal laws.

I should say again that I find her use of Kant and other old classics appealing, and I find some of these thoughts here intuitively attractive. But there's something a little contrived about them. And, as it turns out, there's something contrived and convoluted about her whole discussion of the categorical imperative, so I'm not about to summarize it. She actually says it's impossible *not* to will maxims as universal laws (but then where does the normativity of the categorical imperative come from?), and that the categorical imperative, strictly speaking, isn't the moral law. So more argumentation, in more chapters, is necessary to get us to the moral law.

As one continues to plow through all the thickets of verbiage, the activity becomes increasingly unrewarding. I'm thinking of Orson Welles again... What's the *point* of all this desperate determination to rehabilitate, by endless convoluted and problematic arguments, Kantian formulations? If they're this hard to expound and defend, Christine, there must be something wrong with them!

Well, I've had enough of this book. It has ingenuity and brilliance, but all the brilliance is in service of a perverse and hopeless project. It's a gigantic exercise in pointlessness. It's the ruins of theology, all this talk of the categorical imperative and the moral law and the unified agent (or the "unified constitution") and on and on. So much verbiage, my God! But I suppose that's what a lot of moral philosophy is: secularized theology. Theology for a secular age. It's hopelessly behind the times.

Korsgaard spent years writing this book, and many more years pursuing thoughts that led to it...and it was all mostly a waste of time. How did she not see how riddled with holes, and how often *merely metaphorical*, her arguments were? The whole damn thing is, in a sense, *imaginary*! Fictional and superfluous!

(William Fitzpatrick also gives compelling criticisms in his article "The Practical Turn in Ethical Theory: Korsgaard's Constructivism, Realism, and the Nature of Normativity" (2005).)

Still, the questions she asks are of course interesting and important. *From whence does moral obligation get its force? What is the source of [our perception of] obligation? What explains the "necessitation"—to quote Kant and Korsgaard—that accompanies obligation, or rather that is the perception of obligation?* As I indicated months ago, I think it's sufficient to provide a psychological, not

a philosophical, answer. You know that people want and expect you to act morally, and you want their approval—you want to be thought of, and to think of yourself, as a worthy person—so you're impelled to act morally on pain of potentially losing the respect of others and even yourself. You're part of the human community, so you take seriously the judgments and principles of this community. You want to belong to it, you want to be bound by its values and norms because that reinforces your sense of self, it helps to *define* your self. Basically, the source of necessitation is just your "conscience," your inner voice of self-judgment and also care and sympathy for others. —But actually, no, it's more than that: there's a human capacity for disinterested moral perception, the ability to look at a situation and judge what is fair or not, what is just or not, and then on account of that judgment to be motivated to act in the moral way—simply because you "disinterestedly" value the idea of fairness and justice. You have a relatively unthinking commitment to it. "I shouldn't steal his money—that's wrong." "She gave me a gift, so the right thing would be to send a thank-you card." Frequently, you're just unthinkingly motivated by considerations of reciprocity and respect. They're the underlying substrate of social life, and you ordinarily accept them without question.

So I guess the most immediate source of the perception of obligation isn't the desire for approval or anything like that; it's your disinterested awareness of what's right and wrong, good and bad. This is probably an innate human tendency resulting from genetic programming, as Chomsky speculates, although obviously the moral capacity can express itself in different ways depending on your society and upbringing. Evidently it comes from the ability to imagine yourself as an other. You know you wouldn't want your money stolen or you'd appreciate a thank-you card or whatever, so you act in the appropriate way towards another person. The force of "necessitation" reflects the force of your valuing of someone else's experience, perspective, and feelings.

All this is, moreover, supplemented by your (typically *implicit*) desire to be thought well of, to be accepted as part of the human community, a person on the same level and adhering to the same basic values as others, which further motivates you to act as you're morally supposed to act. "She would expect a thank-you card, so I should send one. It wouldn't reflect well on me if I didn't." "If someone saw me steal this money, they'd lose respect for me."

It should go without saying—despite some ambiguity in how I expressed myself above—that I think there's no such thing as moral obligation outside of our *perception* of it. There isn't some Platonic or realist or rationalist realm of objective obligations we have to one another. Surely the idea that there is violates Occam's razor. As Orson Welles said, what we really need is anthropology, not this sort of dead, non-naturalistic philosophy.

—As I often say, in order to sketch answers to many of the "big questions" in philosophy and human life, all that's needed are several paragraphs like what I just wrote. You really don't need all the long books and thousands of years of arguments. In fact, there would be vastly fewer (perverse) books and essays today on philosophical questions if it weren't that elite intellectual institutions demand the production of such verbiage in order to have a paycheck and get tenure. It's all mostly for the sake of *institutional* factors—and financial factors—not philosophical ones.

*

I don't know what's going to happen in the next few decades as a result of global warming and ecological destruction, but here's one distinct possibility, or even probability: hundreds of millions of people, mostly in the Global South, will die from heat waves, famine, droughts, and pandemics. They'll try to migrate to places more north, but the northern countries will use their militaries to keep them out. Wars will break out, killing millions. Regions near the equator will become largely uninhabitable. Coastlines will be subject to more and more flooding, which will contribute to economic crises engulfing the North as well as the South. Millions in the North, too, will die from the fallout of global warming. But gradually, as populations decline and economic activity decreases—at the same time as societies are aggressively deploying cleaner technologies (perhaps even coming up with ways to remove carbon dioxide from the atmosphere)—carbon emissions will decline. Will it be too late, though, to prevent a continued indefinite rise in global temperatures? At least the decline of emissions will moderate warming. I doubt humanity will

go extinct, since it seems to be practically the most adaptable form of life in Earth's history. (Aside, perhaps, from some microorganisms, what other entity has conquered the Arctic, the desert, and the tropics?) But humans will have to adapt to a much more extreme and unstable climate than they've experienced in the last 12,000 years.

Much of this could have been avoided if the world had been building thousands of nuclear power plants in the last fifty years, but...oh well! The human species may be remarkably intelligent, but it's shockingly dumb.

May

Something it's easy to forget is that even little ol' me has had a positive impact on hundreds of lives (not to mention the *hundreds of thousands* of people who have read and, in many cases, downloaded my writings). Just by being an über-kind professor who lets students submit papers late or revise their papers or take make-up exams or even submit assignments long after the end of the semester if they present a good case (I change their grades), plus, of course, enlightening them on the *real* history of the U.S.—sometimes students say it's made a big impression on them—I've helped make the world a slightly less absurd place.¹

Speaking of which: Israel. It isn't often in history that a country has sealed a very densely populated area shut and then bombed it to smithereens and tried to starve it into oblivion. Not many things are more evil than that, except maybe the Holocaust and, in a sense, speciescidal capitalism. The enormity of Netanyahu's and Biden's crimes passes understanding. It's too gigantic to truly comprehend. Millions of innocent people, half of them children, *intentionally* smashed into the blood-soaked dirt. Osama bin Laden was a trivial little troublemaker compared to Biden, one of the great mass murderers of the last fifty years. (Don't forget his intentionally provoked and prolonged war in Ukraine. It could have ended years ago, but Biden's inner circle wants to keep it going as long as possible in order to harm Russia.)

...And yet, after reading about the likes of Biden and Netanyahu, one listens to some charming music—not even necessarily classical, just something like Mannheim Steamroller (they have some beautiful songs)—and it's still easy, especially with the help of alcohol, to get misty-eyed about the human species. About its simplicity and goodness. Just think of a group of people playing instruments together! Maybe they're playing the works of some composer, or maybe they're creating original music themselves, it doesn't matter: in essence, they're *playing*, like children; they're reveling in the possession of *superfluous* mental capacities. There is no *reason* for the human ability to play and love music. But we come together anyway and play the fiddle, the drum, the triangle, the oboe, all together in a complex harmony and melody, just because we can. Just because it strikes us as *beautiful*. That's the sole reason, that mysterious perception and enjoyment of *beauty*. No other organism in the history of life has been such as this.

Yes, there is depravity, there are the Bidens and Obamas and Netanyahus. But how can one give up on the species when there is music? *We are the reason that music exists*. What an astonishing species that has such a range of capacities!

*

Been reading some of the contemporary philosophical literature on personal identity, the subject that so tormented me in my early years. (I struggled with it in my college senior thesis.) Most of it is

¹ Here's a comment from this semester, for instance: "I just wanted to thank you again for a wonderful semester and share that I'm actually 36 years old and can honestly say that I absorbed more U.S. history than I ever have in my life in your class. Thank you for being so passionate about the course and for really challenging me with all the essays/reading responses." Another girl loved to talk to me after class and found the readings and lectures fascinating. She was an exceptional student, who said it was the best course she'd ever taken. (Which, I think, says more about how crappy the other courses were than how good mine was.)

admirably nuanced but ultimately unsatisfying. Endless articles and books grapple with the puzzles and paradoxes, but hardly ever do thinkers try to get to the *bottom* of the matter so as to understand what's going wrong and why the subject is so intractable. I'll try to sketch a few ideas here, which have something in common with my thoughts from college.

The questions are pretty simple, at least in appearance. What does it mean for person *A* to be the same as, or identified with, person *B*? (What does it mean for me to say when I look at a picture of myself at the age of 10 that that person was me, or that I am him?) Under what conditions does someone cease to be the same person? Or is that even possible? Exotic thought-experiments have been invented to flesh out and evaluate various concepts, intuitions, and theories, from teleportation to brain transplants to terrible accidents that radically change someone's personality and/or cause him to lose his memories.

It's important to note that the concept of personal identity has multiple meanings and dimensions. We're not concerned, or at least not primarily concerned, with the meaning according to which someone's traits can change so much that we say, "He's not the same person he used to be; he's so different now." We can say this even if he has the necessary psychological and physical continuities for us to say that in a more fundamental sense, we're referring only to one person, a person who has changed.

But even here, with such an elementary conceptual point, difficulties can already arise. Maybe the person's psychological changes are *so* extreme that we're tempted to say he's actually, literally, a different person than the one who inhabited his body years ago. (Think, for example, of Robert Pirsig and "his" earlier self "Phaedrus" in *Zen and the Art of Motorcycle Maintenance*. Pirsig sees them as two entirely different people. (See my discussion of the book many years ago.)) But how would we know for sure? How could we decide one way or the other? What would it even mean to say they're literally two different people?

One already begins to suspect that there's something a little specious about the idea of personal identity. In at least some cases—"borderline cases"—there is no "fact of the matter" about whether *A* and *B* are the same person. It's not a matter of discovery (understanding an objective fact) but of decision, of how we decide to apply the concept. If my brain is transplanted into a different body, is that person me? What if the operation has changed "my" personality slightly? What if it's changed it radically? What if "I," or rather the person in the new body, have lost most of "my" (his) memories, while still having the same personality? Would the person think he was the same person as the one who inhabited the original body? Would others think so? Answers to such questions become arbitrary. Indeed, they're not really substantive or interesting at all. The concept of a person incorporates so many heterogeneous aspects, both physical and mental, and is so fuzzy around the edges—e.g., is someone who is rendered brain-dead by a catastrophic accident the same person as before the accident? ("yes and no" is the answer)—that we should be careful lest the questions we find ourselves asking are meaningless.

In her paper "Personal Identity and the Unity of Agency: A Kantian Response to Parfit" (1989), Korsgaard argues that the same person could occupy a different body. And she poses the question whether the same body could come to have a new person in it. These are not interesting questions. Surely the same body could have a new *self*, i.e., a new sense of self (for the "self" is nothing but the sense of self): this clearly happens sometimes, after terrible traumas that cause someone to lose all sense of identification with the "previous person" who inhabited his body. You could then say, if you want, that there was a new person there. Or, if you preferred, you could say there was only ever one person—whose sense of self had been so disrupted at one point in his life that *for him*, two people had inhabited the same body. These are more like terminological than substantive issues.

And yet there are deep puzzles about personal identity. So deep, in fact, that I'm tempted to invoke Wittgenstein's "Whereof one cannot speak, thereof one must be silent." A paper that briefly hints at them, and that stands out for its perceptiveness, is R. G. Swinburne's "Personal Identity" (1974). Swinburne notes that for most theorists, what it means for *A* to be the same person as *B* is that there are continuities and similarities of mind and body between the two. The point of his paper is to argue that, while such continuities and similarities provide *evidence* of identity (that *A* is *B*), they can't be the *meaning* of identity. He marshals quite a few arguments. For example, if what it means to be me is to have this body and this character and memories, how can I coherently wish that I be someone else in a more fortunate position?

People often have such a wish. “I wish I were you! You’re smarter, better-looking, and more successful.” It certainly seems to be a coherent wish. It’s possible to imagine my being you and your being me. But then the conventional understanding of personal identity appears to be mistaken.

What is to take its place? Swinburne’s alternative consists of two words, which I’ve italicized in the following passage:

Wherein does the identity of persons consist? The identity does not consist solely in the continuity of one or more observable characteristics, for empiricist theories [as he calls them] took all these into account... The only alternative is to say that personal identity is *something ultimate*. It is unanalysable into conjunctions or disjunctions or other observable properties. Bodily continuity, continuity of memory and character, are however the only evidence we have of its presence; it is observable only by observing these.

“Something ultimate.” That’s pretty cryptic. And he says nothing else about it. That might seem oddly lazy and unconvincing, but in fact I think his silence is justifiable, since almost nothing *can* be said about it. It’s true you could invoke the idea of a “soul” or “spiritual substance” or something like that, but I take science and modern philosophy to have dispelled such mystical notions. Rather, personal identity has to do with the bare fact of conscious existence, as I wrote in college. In saying the 10-year-old Chris Wright is the same person as the 43-year-old Chris Wright, I’m saying, first of all, that *this consciousness, this existence-for-itself*, was *that consciousness/existence-for-itself*. It’s the same conscious existence transposed in space and time. (I’m also saying, of course, that there are psychological and bodily continuities and similarities.)

The problem is that what I’ve just said is almost meaningless. What does it mean to say “the same conscious existence”? As conscious existence, all people are the same! In a sense, we’re all the same “existence-for-itself” (consciousness) transposed in space and time. *Your* existence-for-itself, as such, is in no way different from mine—except that it’s *for you*, not me. So there is also something circular here, inasmuch as we’re defining what it means to be me by using the words “for me”—existence-*for-me* (or for-itself). But that isn’t a vicious circularity. It isn’t absurd or viciously circular to say I am *this subjectivity*—the bare fact of this subjectivity as such—and that this subjectivity has existed every waking moment since I was born.

But there are more puzzles. Suppose I worry that after surgery on my brain I won’t wake up. Being in a philosophical mood, I worry that even if someone inhabiting this body wakes up, it won’t be me. It won’t be *this* existence-for-itself but a different one. Even if it isn’t a realistic possibility, it seems imaginable that I’ll never wake up even as *some other consciousness*, some other self, does. And suppose that self has all my memories and characteristics. Then *for him*, he will be me! He’ll think “What a relief, I survived the operation.” But in fact *I* will never have woken up—and no one will be any the wiser.

If that example seems strange, consider this one, from Derek Parfit. (But he doesn’t use it in the way I will.) Suppose I get into a teleportation machine that disintegrates my body and perfectly reconstitutes it on another planet. The reconstituted person, with all my memories and my body and character, will see himself as me, and everyone will take him to be me. He’ll think “I survived, yay!” But maybe, in fact, the machine actually killed me and *copied* me. No one will have the faintest inkling of that fact, and no evidence can conceivably show it to be the case. This is because, as Swinburne says, I am something “ultimate,” something sort of outside the empirical world. (I’m reminded of Wittgenstein’s statement that the self, or the subject, doesn’t belong to the world but is the limit of the world.)

As I wrote in my college senior thesis—a document with brilliant intuitions but terrible argumentation—in my concrete fullness I am more than a bare particular subjectivity: I have a certain cast of mind, a fleshed-out sense of self, a body and memories and thoughts that all, together, define me. (Of course, they can gradually change over time.) But the essential core of it all is *something ultimate*, something non-empirical that we all have in common, namely that brute fact of a particular subjectivity or existence-for-itself, a particular ‘looking-out-at-the-world.’ *This* is the most essential thing I share with my 10-year-old self, for he and I, despite how different our minds are, are ultimately the same existence-for-itself (in a more meaningful, “personal” way than everyone else is the “same” as me).

In reference to *this* thing, it isn't exactly meaningless to ask whether the same person could occupy a different body or the same body could, at different times, have two different people in it. But there is no way we, or even the person in question, could ever know if it were the same person or two different people. So in this sense, again, it does seem meaningless to ask the questions. The person in the new body might *think* he was the same person as in the previous body—as in the case of the teleported person—but he might well be wrong. Existence for that other person might have ended.

Another criticism Swinburne could have given of the usual psychological-continuity criterion and definition of personal identity is one Marya Schechtman gives in "Personhood and Personal Identity" (1990). It's the old objection Bishop Butler raised to John Locke's idea that memory connectedness is the criterion of identity. The problem with the criterion is that it's circular, and that memory isn't reliable:

A madman may think he remembers leading the troops at Waterloo, but this does not make him Napoleon. Therefore, if memory connectedness is to be a criterion of personal identity, we must have some way of distinguishing between real and merely apparent memory. But that distinction is no more than this: real memories are apparent memories in which the person remembering is the person who actually had the experience. The obvious problem with the memory criterion of personal identity, then, is that one must already have a criterion of personal identity in order to define memory. Butler argues that, since the fact of identity is prior to the distinction between real and apparent memory, personal identity cannot be defined in terms of memory connectedness.

Parfit tries to avoid the circularity by using his bizarre notion of impersonal "quasi-memories," but Schechtman argues he fails.

Maybe there's some way around the objection, but the ideas I've suggested avoid it entirely. The mysterious "something ultimate" avoids it, because it is defined in terms of brute existence-for-itself. It doesn't depend on memory. Again, though, there is something unsatisfactory about what I've said, because it's almost meaningless to say that *this* existence-for-itself, this consciousness, is the same as the consciousness of (and that *was*) the being called Chris Wright when he was ten years old. I could be a "different" consciousness, which means a different person, without even knowing it! All the psychological connections—common memories, common traits, etc.—between the past and the present would make me think I'm the same person even if that previous person's life had ended (as in the case of the man killed by the teleportation machine that produces a copy of him).

In the end, I always return to Kant's admonition that human reason has a tendency to go beyond its proper, natural sphere, and thereby gets embroiled in paradoxes. Some things we're destined never to adequately conceptualize.

...At the considerable risk of (even more) repetition, I'll again try to clarify my view, which is the view I've held since the age of 19 or 20. The literature makes a distinction between reductionist and non-reductionist views of the self. As Derek Parfit says in his paper "Personal Identity and Rationality" (1982), philosophers like Locke, Hume, Grice, Ayer, Mackie, and Parfit have been reductionists, while Butler, Reid, Chisholm, Geach, Swinburne, and most others have been non-reductionists. Reductionist views are those Swinburne calls empiricist in the passage I quoted: personal identity consists in other facts, namely continuities of memory, character, and all the rest. The non-reductionist view, of course, is that identity is itself a further fact and can't be analyzed in terms of anything else.

The obviously correct view, surely, is that *both* positions are true in a sense. As we ordinarily talk, *who I am* depends on my personal properties, all my bodily and psychological qualities, including continuities and even discontinuities between my past and present. Insofar as there are discontinuities or differences between my past and present character/body, I'm not quite the same person I was but have changed. Inasmuch, on the other hand, as I'm "numerically identical" to the one-year-old Chris—that is to say, inasmuch as baby Chris was the person who will someday die at an old age—it isn't a question of character traits and memories. It's a question of something brute, something that doesn't change, something that either exists or doesn't exist. What can this thing be? Just *this particular existence-for-itself*. The full

experiential consciousness of this existence-for-itself grows and changes over time, as “my” body and mind change—and this is the sense in which the reductionist view is right (I am this body, memories, desires, intentions, and the like, all bundled together)—but the conscious existence *as such* doesn’t—which is the truth of non-reductionism. As conscious existence, I am not reducible to other facts.

It’s almost uncanny how adept philosophers are at avoiding the right answers to many questions. As I used to say in my twenties, it has to do with their inadequate intuitive abilities, their (institutionally cultivated) preference to remain on the level of endless discursiveness rather than—by means of simple, rational intuitions—trying to go deeper than shallow binary alternatives.

*

Just finished reading the classic black novel *Their Eyes Were Watching God*, by Zora Neale Hurston. A beautiful book dense with poetry and feeling. But perhaps a little overrated. The truth about its value lies between the scorn expressed by Richard Wright and the rapturous praise expressed by Alice Walker.

While reading the Afterword written by Henry Louis Gates Jr., I was strangely affected by this paragraph Hurston wrote about her last encounter with her dying mother:

As I crowded in, they lifted up the bed and turned it around so that Mama’s eyes would face east. I thought that she looked to me as the head of the bed reversed. Her mouth was slightly open, but her breathing took up so much of her strength that she could not talk. But she looked at me, or so I felt, to speak for her. She depended on me for a voice.

I thought of the sad days coming, someday, when my own mother will be on her deathbed. It will be difficult to see her frail and ill, this woman who has been such a dynamo her whole life. A long and full life, from being an adorable toddler to a beautiful and loving woman at the center of her community to, finally, a doting grandmother who likes to travel the world with her husband—and then to end up sick and sad and, perhaps, if my father dies first, alone in her house. I hope her life won’t end in the dismal way her mother’s did and my father’s father’s did. Regardless, her sons will be at her deathbed and it will be a melancholy scene, the passing of an entire life, memories alone remaining until they, too, fade. Even just to think about my mother at the age of 85 or so waddling around the house or the backyard, so decrepit, looking back on the vast past, is sad.

And my father too, once a dashing young man who was the twin brother of Robert Redford, then someday at 90 years old all crumpled and weak. One doesn’t want to feel pity for one’s parents. Their pain and weakness, and then their absence, will be hard for me. It will be just me and Aidan and Amina (and my brothers), and I’ll feel adrift without my parents. The nostalgia will ambush me at night and I’ll look at pictures and think I should have told them I loved them more and called them and visited them more often.

My parents are very good people, which is exceedingly rare in this world. Two of the kindest people I’ve ever known, actually. If their sons are unusually kind too, it is doubtless in large part because of their example.

*

Reading a lengthy history of Western philosophy by W. T. Jones (1975), starting with volume 5, on the 20th century to Wittgenstein and Sartre. Has some useful pages on the Kantian background, against which much of 20th-century philosophy was reacting. Reminds one of how Kant’s emphasis on the creative nature of the human mind—its structuring of experience—helped inspire Romanticism and German idealism. The Romantic exaltation of the human spirit, of creativity and genius and self-expression—which you can see in Wilhelm von Humboldt and the early Marx, as well as poets and many others in the first half of the 19th century (who often used these ideas to critique the capitalist *suppression* of human creativity and individuality)—was partially underpinned by Kant’s philosophy. So was the idea, common to thinkers from

Hegel and Schopenhauer to Kierkegaard and Nietzsche, that the self is essentially *activity*—whether “transcendental syntheses” or “a relation relating itself to itself” or freedom and choice or whatever else—“and not a static, encapsulated substance,” to quote Jones. (In retrospect, of course, Kant only anticipated the more scientific understanding of modern neurobiology and cognitive science that the brain actively and creatively constructs experience.)

Hegel was a development of Kantianism in a “historicist” direction, according to which Mind or Spirit unfolded and developed historically, creating itself and its experiences. Schopenhauer had a different, ahistorical interpretation of Kant, but he too, like all the idealists, emphasized the creative powers of the mind. Again, while there are truths twisted and buried in these theories, it’s only through modern science that you can grasp them without all the speculative philosophical baggage. And you don’t need idealism to explain human creativity! Materialism (science) can get the job done just fine—except insofar as we run up against the limitations of human cognition. But idealism offers no way out of that. It offers only greater mysteries and idiocies.

But in interpreting the intellectual history of the 19th century, it’s useful to keep in mind this Kantian background of the insistence on the multidimensional creativity of the mind. It can be interpreted in idealist and spiritualist, Romantic ways, as it frequently was—in opposition to the hated materialism and vulgarity of the Industrial Revolution—but it needn’t be. There is no reason to think that organic matter that is organized in a certain way can’t be creative or conscious.

One problem with Kantianism, supposedly, was that it could lead straight into skepticism and relativism. Kant had reacted against Hume’s philosophy for this reason, arguing that the reason we could have *a priori* knowledge of the world is that the mind imposes structures on experience. “We can know *a priori* of things only what we ourselves put into them,” as Kant said. So by this means he tried to defeat skepticism. *Certain knowledge is possible*, because our minds structure the world (i.e., the world of their experience). But there was still the thing-in-itself, after all, to which mental categories couldn’t apply. We couldn’t know anything about it! And given the mind’s construction of experience, it seemed, perhaps, that there might not even *be* an objective reality. All was mere appearance. So even Kantianism had skeptical implications, against which philosophers eventually reacted.

Needless to say, since we’re talking about philosophers, confusion abounded. The truth is that science can, probably, get us closer and closer to the true nature of the world-in-itself. But obviously we can never totally escape skepticism. We can never know if we’ve finally understood what the world is in its deepest essence. And we’ll certainly never *intuitively* understand the inner nature of the cosmos. Kant was right about that. (As I’ve been saying for almost 25 years.) We can’t “intuit” the world of general relativity and quantum mechanics.

“Analytic philosophers” like G. E. Moore and Bertrand Russell rejected Kantian skepticism and idealism, but first let’s take a look at Bergson, Dewey, and Whitehead. They were sort of transitional figures between the 19th and 20th centuries. One of the virtues of Jones’ book is that it has long excerpts from the original writings, which in the case of Bergson help the reader see how inadequate the ideas are. All this love affair with duration and intuition (by which one “places oneself within an object in order to coincide with what is unique in it and consequently inexpressible”) and building up a weird speculative metaphysics on this basis, plus a fundamental distinction between instinct and intelligence, a mystical vitalistic interpretation of evolution, distinctions between different kinds of moralities and religions (closed and static vs. open and dynamic)—it’s all mostly of historical interest. One does see with Bergson a step, however confused, towards phenomenology. But, as Lukács said, Bergson belonged to the irrationalist or anti-rationalist tradition in continental thought from the late 18th century to the era of fascism (not that he was a fascist!).

I’m not much more interested in Dewey. Have always considered him a rather flaky and boring thinker, with his slippery, hard-to-pin-down, and unsuccessful attempts to find a third way between various old philosophical oppositions (realism vs. idealism, rationalism vs. empiricism, and so on). Like Bergson, I think he’s mainly of historical interest—although his ideas on education are doubtless of value. He’s very reflective of the Progressive Era with his overriding concern to solve problems, his notion that thinking is

the solving of problems, even that truth is but “processes of change so directed that they achieve an intended consummation.” I don’t see much logical rigor in his thought.

As for Whitehead: his philosophy was the last of the great efforts of speculative metaphysics, and it’s too strange and obscure to be of much interest. It’s a good thing speculative philosophy has passed out of fashion.

Russell was a complicated figure, of course. And I’m not about to summarize his views. More interesting to me is what my own views are. Particularly about physical things and perceptual appearances and all that. (I’ve had a few drinks, so forgive me if my thoughts are a bit slipshod.) My intuitions haven’t changed from years ago. There is no getting around the fact that, necessarily, we’re confronted with only sensations/perceptions/representations, not matter “in itself.” We experience representations/appearances, that’s all. Things appear to us. In that sense, objects are “mental.” They’re in consciousness, they’re sensory/perceptual appearances. I alone have direct access to what I perceive. Which means it isn’t wholly “physical” in some objective sense, some matter-in-itself sense that isn’t perspectival but entirely objective. And yet what I see, what I touch, is (perceived as) *outside* of me, and therefore is not simply “mental,” i.e., contained within my mind, my head, my consciousness. It’s external, or at least I perceive it as such. I’m interacting with external objects. My *emotions* are entirely mental, as are my thoughts. Physical objects are different.

But you see the conundrum. *As I experience them*, physical objects are, by definition, mental and therefore *in my head*. They’re objects of my consciousness, mental objects. But, on the other hand, I experience them as being external, different from my internal thoughts and emotions. So they’re both non-mental (external) and mental.

As I wrote years ago, we can (obviously) view physical objects in our experience from two perspectives. Everything we see and touch is a physical, public object that other people see and touch; on the other hand, everything is private to us and therefore, as we experience it, is never experienced by others. So an object in our experience can be seen as an independently existing object or it can be seen as private perceptual appearances/representations. It can be seen as physical or mental.

Ultimately, given science and rationality, the “representational” point of view is the truth. Each of us has his own private experience of the world, and *as we experience it*, the world, by definition, is mental. But there is certainly a *mind-independent world, matter-in-itself*—atoms, electromagnetic waves, etc.—that none of us ever directly experiences and will never know the full truth of. Science tries to get at it. But we’re imprisoned in our minds. So the objective essence of the world is, in a sense, shut off from us, forever.

So you can say there are three levels, so to speak. There is each person’s cognitive, affective, and perceptual (tastes, smells, pains, etc.) internal life, which we all see as obviously mental and private. Then there is the “external” world as experienced by each person, which is matter and the physical world *for us*. (How the brain constructs it from stimuli.) And then there is the *actual* physical world, nature/matter *in itself*, which science tries to understand.

By the way, if any philosophers will shout “Wittgenstein!” here, as if I’m being pre-Wittgensteinian with all this talk of private experiences and whatnot, I’ll reply, “You’re an idiot! You’ve been indoctrinated into admiring the late Wittgenstein because he was at Cambridge and had known Russell and wrote cryptic stuff that seems profound because it’s cryptic! Grow up and stop worshipping a behavioristically deluded weirdo!”

I don’t know exactly how Russell’s views relate to my own, and I don’t much care. I’m interested in truth, not what Russell thought. (In his long intellectual evolution, some of Russell’s views on these matters are pretty strange. Such as his postulation of “sensibilia,” sensory objects that—somehow—exist even when they aren’t being sensed. As the *Stanford Encyclopedia of Philosophy* says, “Sensibilia make it that the objects of sense, color patches and like, do not simply go out of existence when unobserved. Rather, sensibilia persist and we sample them when we occupy positions that present specific [e.g.] table-perspectives.” Russell was so weird sometimes.)

But I admit that there are peculiar implications of truth (i.e., my ideas). When a bunch of people are together talking about some particular object, like a painting they’re looking at, they’re really talking about a lot of different objects, namely the painting *as each of them sees it*. They’re talking about their

perceptions/representations, interpreted as a physical object that others see. But of course it's really a lot of different objects (which manifest in each person's mental space), a lot of different appearances. I don't see why any of this should be hard for philosophers to accept.

Where are the objects? That seems to have bothered G. E. Moore. Well, again, they're both in the mind and in the mind-independent external world! Everything we experience, as such, is in consciousness, in the head (in some sense). But there is an objective world of molecules and electromagnetic waves and all the inferred entities of physics, and the objects we perceive are, of course, in that world and, *in themselves*, are composed of those entities (not of colors and other qualities our brain constructs). This is why the brain creates our representations, including our common experiences of space and time, in such a way that they appear three-dimensional or "out there"—because there is, in fact, an *out there*. The external space we see and touch is a subjective representation of an objective external spacetime.

I know I've been repeating myself a lot, but I'm just trying to clarify my ideas as much as possible. I honestly don't see any alternative to them, any alternative compatible with modern science.

There is matter in itself, there is matter as we experience it, and there is consciousness—in which experienced matter exists, so to speak, but which is very different from experienced matter (and of course objective matter). Experienced matter is stuff you can touch and divide; consciousness you can't touch or divide. (Hence Descartes' division between mind and matter.) But the former is "in" the latter—therefore mental in some sense—inasmuch as the latter is aware of it. —Anyway, since consciousness is a kind of nothingness, its only quality being that it is *of* things, it hardly needs arguing that it's very different from both experienced and objective matter.

I've avoided the term "sense data" in all this because of its philosophical baggage. "Representation" or "perceptual appearances" is sufficient for my purposes.

When you think about fundamental things like what I've been discussing, you soon see that paradoxes or semi-paradoxes are inescapable. The idea of "mental things that are also non-mental" is...difficult.

...A shorter way of stating the "paradox" is to note, first, that consciousness is a factor in the perception of a table, but it isn't a factor in the table itself. And yet the table, as such, is really just the perception of the table! When we're not looking at it, the table has no appearance, no color and so on, it's just what it *objectively* always is, the inferred entities of physics. The table *as it appears to us—as a table*—comes into existence when we look at "it." It is only our perception of it. (This is the particle of truth in idealism/phenomenalism. But idealists go wrong when they deny that there is the objective world of physics and chemistry.) Conceptually and linguistically we can distinguish between the table and our perception or representation of it, but that's a distinction without (much of) a difference.

This doesn't mean our perception of a table is always "accurate." In certain conditions, it might, say, appear a different color than it "really" is, which is to say than it ordinarily appears.

I should note that I find very mysterious the fact that, despite the mayhem of trillions and trillions of particles and waves zipping around and colliding everywhere, the world appears very stable and fixed. It consists, for us, of discrete objects and organisms. *How can there be such order when there is such flux?*

[See the December entry for more thoughts about "representationalism" and so on.]

Anyway—Russell was wrong about *a lot*. (Very different in this respect from Chomsky.) But he was right about values. His beliefs were, essentially, those I've expressed innumerable times—because they're obvious. Philosophers who disagree are simply, to that extent, superficial thinkers with little capacity for rational intuition. Here are some things Russell got right:

When we assert that this or that has "value," we are giving expression to our own emotions, not to a fact which would still be true if our personal feelings were different...

When a man says "this is good in itself," he *seems* to be making a statement, just as much as if he said "this is square" or "this is sweet." I believe this to be a mistake. I think that what the man really means is: "I wish everybody to desire this," or rather "Would that everybody desired this." If what he says is interpreted as a statement, it is merely an affirmation of his own personal wish; if, on the other hand, it is interpreted in a general

way, it states nothing, but merely desires something. The wish, as an occurrence, is personal, but what it desires is universal. It is, I think, this curious interlocking of the personal and the universal which has caused so much confusion in ethics...

All this is basically correct, though deeper analysis is necessary, such as I provided in my long paper on values in my mid-twenties. Or that J. L. Mackie provided in *Ethics: Inventing Right and Wrong*.

It's always funny to read, and to read about, G. E. Moore, because he was a hilarious dullard. It doesn't reflect well on philosophers that he was influential, helping to found analytic philosophy. But I admit his method of close analysis, *if done well*, can yield insights. But "close analysis" is really just philosophy! (Obviously it need not be close analysis *of language*, which oddly captivated analytic philosophers for most of the twentieth century.)

Speaking of Mackie, it's shameful that I haven't read more of his work. So I'm going to switch to reading him now. Starting with his classic *Problems from Locke* (1976).

It isn't exactly an easy read. But it's brilliant. Does a good job, in the first couple of chapters, of defending both Locke's distinction between primary and secondary qualities and the representational theory of perception to which he subscribed, and to which, in some form, anyone who accepts modern science surely has to subscribe. Despite all the philosophical objections to it that have been proposed since Berkeley. And that were still alive when Mackie was writing. (And probably *still* are.) For instance, "How can I know that the percept, or representation, I see is like the external world it represents?" To which I'd reply: um, it *isn't* like the external world, although it does convey information about the world. Colors, sounds, tastes, smells, and so on convey important information about the world-in-itself that we're interacting with.

But how we experience the world is entirely a product of our brains, and there is no reason to think our experiences resemble how the world is in itself.

Most of the book doesn't grab me, but I will say that Mackie strikes me as a more insightful and much more reasonable thinker than, say, Wittgenstein. And Quine. For instance, he's open to "Chomsky's innateness hypothesis" about language. I don't love his general sympathy with empiricist views (except in the case of values, in which case skeptical "empiricism" is right), but he's surely a more nuanced and reasonable empiricist than most.

*

Sometimes Amina tells me cute things Aidan has said. For instance, on the way home from daycare they walk past a church that has a little statue of Jesus with arms outstretched. Aidan asked "What's that?" and Amina said it's Jesus. So every day Aidan began saying "I wanna see Jesus," "That's Jesus," and one day "That's Jesus and not an octopus," while stretching out his arms. Octopuses have long outstretched "arms," so he associated them with the statue and had to correct himself.

Aidan was probably the first person in history to utter the sentence, "That's Jesus and not an octopus."

I'm taking care of him for a week as Amina enjoys New York. I won't try to record all the adorable things he says and does. But one charming thing is that he's started prefacing sentences, occasionally, with "ummm," since he's heard me do it. "But, ummm, the pickup truck is broken. I need two batteries for the pickup truck." (It doesn't take batteries.) Or if I ask him something like "Do you want a cracker?" he might say "Well...okay." Because he's heard me say that. In his sweet high-pitched voice, much of what he says is delightful and hilarious.

Having a child helps you appreciate how unbelievably stupid one has to be to deny Chomskian innatism. I suppose no anti-Chomskian has ever had a child? I use a word once, and several minutes later Aidan uses it correctly in a different context. For instance, I said "We have to bring the pieces of the train track over here," and an hour later Aidan said "A piece of the truck is broken." I had never heard him say the word "piece" before. But he brought me a tiny chipped-off piece of a toy truck to affix back onto the truck, and, after one earlier hearing, he used the word in the right way in a very different context. How do you explain that except on the hypothesis that the human brain has an incredibly rich array of conceptual

structures built into it, just waiting, hungrily, to be attached to some linguistic sign? He knew right away that “piece” means *a part* of something, and that objects of all sorts have *parts*, even that when something is chipped off an object it is *a part* and can be referred to by the word “piece,” like a segment of a toy train track can.

And Aidan’s constant talking to himself when he’s alone, repeating things people have said or combining words in new ways—is that just “general learning mechanisms” (à la empiricism) or general human intelligence manifesting itself? Why then the *obsessive attention* to speech? Why the repeating everything people say right after they’ve said it? At the very least, this is the *constrained learning* of Konrad Lorenz. In fact, it is a kind of inborn “knowledge” of how the world, the world-for-humans, is structured and communicable to others. The human mind parses all the data it’s presented with in very specific ways, and, as I said a moment ago, it’s on hair-trigger alert—at least at a young age—to associate the innate ways it cuts up the data with verbal sounds or gestures. Its memory for these sounds is almost beyond belief. Two-year-olds hear a sound a few times and can repeat it in appropriate contexts forever afterwards. *On a couple of exposures, its proper use is permanently embedded in their memory.* And that’s true of *thousands* of words! In a sense, that’s a far more impressive cognitive achievement than anything adults ever achieve.

[In fact, empiricism about language learning can be refuted from a single consideration: immerse an adult in an environment where not a single person speaks his language and he has no access to any materials in his language, and he’ll probably never learn the language that’s spoken except for some basic words and sentences. But if you put a child in that environment—which is comparable to the environment an infant/toddler encounters—within a rather short time he’ll become fluent. Obviously this isn’t because of general intelligence, since the adult might well be more intelligent than the child. It’s because of...magic. Biological programming in the child to learn or “grow” a language in his brain, as his limbs grow because of genetic programming.]

June

There’s a tendency to think that someone who has had a large and positive (according to certain values) impact on the world has thereby had a more meaningful and valuable life than others. “Objectively,” somehow, he has had a relatively meaningful life. But that’s not true. The very notion of a “meaningful life” is a strange human construction. It can be defined in any number of ways. A solitary artist can have just as meaningful a life as Martin Luther King Jr., inasmuch as what “meaning” is for him might be different than what it is for King. According to King’s standards, it might not be very meaningful; but according to the artist’s standards, King’s life might not be very meaningful. The realm of values is the realm of “relativism.”

What’s meaningful or valuable is in the eye of the beholder. God doesn’t exist, and there are no “objective values.”

But it’s true that the definition of “meaning” as *having a positive impact on others* is a very understandable and natural one.

Anyway, enough of philosophy. There are more important things to do than philosophy. As the likes of Biden, Blinken, and Netanyahu are cheerfully exploding babies and beheading mothers and empowering torturers, one feels bound to do something, no matter how futile it is.

I saw a video of a boy a couple years older than Aidan whose face was mostly intact but whose head gaped empty, his brain gone, just a big cavity there. I saw videos of babies’ headless bodies held aloft by their parents. I’ve seen charred corpses and scattered limbs. Toddlers shaking uncontrollably in a hospital after being buried under rubble for hours.

I’m so sick of sociopaths determining the course of history. That’s all it’s ever been. Psychopaths and sociopaths enlisting the masses to perform deeds of unimaginable sadism.

As the U.S. and its client states lose their control of most of the world, I’m very worried that they’ll react, eventually, with the use of nuclear weapons. Many in the Israeli government are committed to taking the world with them if Zionism doesn’t triumph. They’re Nazis, except that for the swastika they substitute

the Star of David. The U.S. and Europe, too, are run by madmen, though admittedly they're *slightly* saner than Israel's rulers. Their most recent triumph of political sanity is deciding that Ukraine can use American weapons to strike Russian territory. I guess the calculation is that Putin won't escalate things even further? Or, given the psychopathy of our rulers, they probably hope he will, so they can then respond with more devastating attacks to trigger a spiral into nuclear war that they hope will destroy Russia without destroying the West. That's how the criminally insane would think, so it's doubtless how a large proportion of our elites think.

To return to Gaza, the journalist Jonathan Cook is surely right:

Until seven months ago, Israel's goal was to keep the Palestinians a subjugated, enslaved, hopeless people, confined to a series of concentration camps in Gaza, the West Bank and East Jerusalem. They were expected to remain mute in their suffering and invisible to the outside world.

Over the long term, it was assumed that Palestinians would prefer to flee their immiseration in these permanently occupied, colonised lands.

The slave revolt of 7 October—brutal and ugly as such revolts have been throughout history—was a devastating shock. Not just to an Israel wedded to its racist, hands-on colonial project of subjugating the Palestinian people. It was also a shock to the West's wider colonial project, into which Israel is so tightly integrated.

In Washington's "rules-based order," the only meaningful rule is that what Washington and its clients want, they get. The planet, its resources and peoples are viewed as little more than playthings by the world's superpower-in-chief.

Revolts to this order—whether advanced by Hamas in Gaza, Hezbollah in Lebanon, the Houthis in Yemen or the Islamic Revolutionary Guard Corps in Iran—cannot be allowed to become a model. The "rules-based order" must be restored with a savagery necessary to teach the colonized and enslaved their place.

That was the message of Washington's own black sites needed in its futile "war on terror," from Abu Ghraib to Guantanamo—sites that drew on Israel's experiences of "breaking" inmates at Facility 1391.

The complicity of western establishments in Israel's current genocide is not an anomaly. It does not derive from a misunderstanding or confusion. The western political and media class see the genocide in Gaza as clearly as the rest of us. But for them, it is justified, required even. The colonized and oppressed must be taught that resistance is futile...

The institutional psychology Cook describes is ultimately what's behind the West's participation in Israel's genocide. It's behind what drives politicians like Nikki Haley to write "Finish them!" on bombs that are to be dropped on Gaza. It's behind Biden's refusal to be budged.

There's also the fact that the donor class is fanatical for Israel, and politicians won't go against donors. Moreover, all the old economic, political, military, and cultural ties between the U.S. and Israel militate against reining in Nazis. America's own past is Nazi-esque, and Nazi-esque sympathies have permeated its ruling class for 150 years. (Consider the history of the Cold War, for example.) In its bones, the political class still loves the idea of Western settler colonialism. Dislodge the primitives and make the desert bloom! It just makes sense, from a certain provincial racist and geopolitical point of view. Alienating Arabs everywhere doesn't matter as long as their governments remain subservient. Even Democrats' loss of the presidency is a risk they're willing to take for the sake of class goals.

It's possible, however, that an additional factor is at play: the U.S. government may have decided, like Israel, that it's time they settled the age-old problem of Gaza once and for all. There is no future for Palestinians in Gaza, and for decades there hasn't been. "We might as well finally kick them out and kill them, so the issue is settled!" Where will they go? The U.S. must be talking to countries right now about

taking in refugees. But how will it persuade countries to take them? American wars have already produced millions of refugees in the last twenty years. What in the hell will happen to the Gazans?

*

Published an article about the West's descent into insanity (which seems to have been pretty widely read, judging by the responses to it):

NATO's Endgame Appears to Be Nuclear War

The world is at its most dangerous moment since the Cuban Missile Crisis of 1962. Back then, however, the fear of total destruction consumed the public; today, few people seem even to be aware of this possibility.

It is easily imaginable that nuclear war could break out between Russia (and perhaps China) and the West, yet politicians continue to escalate tensions, place hundreds of thousands of troops at “high readiness,” and attack military targets inside Russia, even while ordinary citizens blithely go on with their lives.

The situation is without parallel in history.

Consider the following facts. A hostile military alliance, now including even Sweden and Finland, is at the very borders of Russia. How are Russian leaders—whose country was almost destroyed by Western invasion three times in the twentieth century—supposed to react to this? How would Washington react if Mexico or Canada belonged to an enormous, expansionist, and highly belligerent anti-U.S. military alliance?

As if expanding NATO to include Eastern Europe wasn't provocative enough, Washington began to send billions of dollars' worth of military aid to Ukraine in 2014, to “improve interoperability with NATO,” in the words of the Defense Department. Why this Western involvement in Ukraine, which, as Obama said while president, is “a core Russian interest but not an American one”? One reason was given by Senator Lindsey Graham in a recent moment of startling televised candor: Ukraine is “sitting on \$10 to \$12 trillion of critical minerals... I don't want to give that money and those assets to Putin to share with China.”

As the *Washington Post* has reported, “Ukraine harbors some of the world's largest reserves of titanium and iron ore, fields of untapped lithium and massive deposits of coal. Collectively, they are worth tens of trillions of dollars.” Ukraine also has colossal reserves of natural gas and oil, in addition to neon, nickel, beryllium, and other critical rare earth metals. For NATO's leadership, Russia and China can't be permitted access to these resources. The war in Ukraine must, therefore, continue indefinitely, and negotiations with Russia mustn't be pursued.

Meanwhile, as Ukraine was being de facto integrated into NATO in the years before 2022, the United States put into operation an anti-ballistic-missile site in Romania in 2016. As Benjamin Abelow notes in *How the West Brought War to Ukraine*, the missile launchers that the ABM system uses can accommodate nuclear-tipped offensive weapons like the Tomahawk cruise missile. “Tomahawks,” he points out, “have a range of 1,500 miles, can strike Moscow and other targets deep inside Russia, and can carry hydrogen bomb warheads with selectable yields up to 150 kilotons, roughly ten times that of the atomic bomb that destroyed Hiroshima.” Poland now boasts a similar ABM site.

American assurances that these anti-missile bases are defensive in nature, to protect against an (incredibly unlikely) attack from Iran, can hardly reassure Russia, given the missile launchers' capability to launch offensive weapons.

In another bellicose move, the Trump administration in 2019 unilaterally withdrew from the 1987 Treaty on Intermediate-Range Nuclear Forces. Russia responded by proposing that the U.S. declare a moratorium on the deployment of short- and intermediate-range nuclear missiles in Europe, saying it wouldn't deploy such missiles as long as NATO members didn't. Washington dismissed these proposals,

which upset some European leaders. “Has the absence of dialogue with Russia,” Emmanuel Macron said, “made the European continent any safer? I don’t think so.”

The situation is especially dangerous given what experts call “warhead ambiguity.” As senior Russian military officers have said, “there will be no way to determine if an incoming ballistic missile is fitted with a nuclear or a conventional warhead, and so the military will see it as a nuclear attack” that warrants a nuclear retaliation. A possible misunderstanding could thus plunge the world into nuclear war.

So now we’re more than two years into a proxy war with Russia that has killed hundreds of thousands of people and has seen Ukraine even more closely integrated into the structures of NATO than it was before. And the West continues to inch ever closer to the nuclear precipice. Ukraine has begun using U.S. missiles to strike Russian territory, including defensive (not only offensive) missile systems.

This summer, Denmark, the Netherlands, Norway, and Belgium will begin sending F-16 fighter jets to Ukraine; and Denmark and the Netherlands have said there will be no restrictions on the use of these planes to strike targets in Russia. F-16s are able to deliver nuclear weapons, and Russia has said the planes will be considered a nuclear threat.

Bringing the world even closer to terminal crisis, NATO Secretary-General Jens Stoltenberg states that 500,000 troops are at “high readiness,” and in the next five years, NATO allies will “acquire thousands of air defense and artillery systems, 850 modern aircraft—mostly 5th-generation F-35s—and also a lot of other high-end capabilities.” Macron has morphed into one of Europe’s most hawkish leaders, with plans to send military instructors to Ukraine very soon. At the same time, NATO is holding talks about taking more nuclear weapons out of storage and placing them on standby.

Where all this is heading is unclear, but what’s obvious is that Western leaders are acting with reckless disregard for the future of humanity. Their bet is that Putin will never deploy nuclear weapons, despite his many threats to do so and recent Russian military drills to deploy tactical nuclear weapons. Given that Russian use of nuclear warheads might well precipitate a nuclear response by the West, the fate of humanity hangs on the restraint and rationality of one man, Putin—a figure who is constantly portrayed by Western media and politicians as an irrational, bloodthirsty monster. So the human species is supposed to place its hope for survival in someone we’re told is a madman, who leads a state that feels besieged by the most powerful military coalition in history, apparently committed to its demise.

Maybe the madmen aren’t in the Russian government but rather in NATO governments?

It is downright puzzling that millions of people aren’t protesting in the streets every day to deescalate the crisis and pull civilization back from the brink. Evidently the mass media have successfully fulfilled their function of manufacturing consent. But unless the Western public wakes up, the current crisis might not end as benignly as did the one in 1962.

*

The videos of children’s blown-up bodies in Gaza are bad enough—heads burst open so they’re just raggedy flesh flapping against shoulders—but seeing a young father crying while holding his baby girl wasting away from malnutrition affected me. There’s nothing he can do, he can only watch as his child slowly dies. This is happening to tens of thousands of people.

Imagine the agony of that father and that little girl.

Ralph Nader estimates that over 200,000 Gazans have probably died so far, not the 37,000 we’re supposed to think. The official number of dead has been stuck at about 35,000 for months, which is completely farcical.

If you want to understand how detestable people in the ruling class are, just consider that the major reason the world is in the hideous state it’s in is that *these people are ensuring it remains in such a state*. It’s in their interest for it to be in such a state. If it weren’t, the ruling class would use its nearly infinite resources to change things—to end war, to end starvation, to abolish nuclear weapons, to defeat global warming, to clean up the environment, to shrink militaries and invest in socially necessary infrastructure. The reason none of this gets done is that it isn’t in the class interest of the owners of the world—who could

get it done if they wanted to, if they pooled their resources and cooperated (as they cooperate on other issues that are important to them, like destroying labor movements).

Of course, institutional structures are to blame. But so are the people who run these institutions, who *aggressively* enact anti-human agendas. They amass trillions of dollars in their own coffers so the rest of the world can toil and starve as their slaves, and the more wealth they get the more they want. They compete to be the world's first trillionaire. It's both unutterably pathetic and cosmically despicable. They're nothing but glorified thugs, Mafia dons, whose criminality makes that of Nero look petty.

Their children and grandchildren will inherit universal death and destruction, but they don't care.

In a sense, I guess you could say I hate them; but in another sense, they're so primitive (morally and intellectually), and humans in general are so primitive (most would behave the same way if they had power), that I just have contempt for them and can't muster much emotional energy against them. "People are hurricanes," as Chomsky has said. You don't hate hurricanes, you only lament that they happen. Even 43 years into life, I still find it difficult to understand and identify with my species.

*

I read Cormac McCarthy's *Blood Meridian*. The novel Harold Bloom said was "clearly the major aesthetic achievement of any living American writer," and that others have called the Great American Novel. I'm somewhat pleased with myself for reading the whole thing; even Bloom said he couldn't finish it the first two times he tried because of the "overwhelming carnage." The main reason I had trouble, for a few days, finishing it is different: its plotlessness makes it pretty boring at times. But the carnage isn't very pleasant, that's true. Some scenes are sickening. On the other hand, after a while I kind of looked forward to the carnage, since it meant that at least something was happening. And yet I grew desensitized to it such that it wasn't as perversely fascinating as in the beginning.

What keeps the reader going and what elevates the novel is that the "neo-Biblical" writing is extraordinarily beautiful and unusual. I'm in awe of the mind that could be so inexhaustibly inventive in describing deserts and mountains and barbarians trekking across deserts and mountains. McCarthy's writing is so remarkable it's able to paint the terrible (true) story of a gang of greedy, bestial murderers as being of timeless metaphysical significance.

I definitely didn't *like* the book, though. It isn't really the kind of book you like.

I couldn't help noticing its resonance in a time when a people who suffered a genocide are carrying out another genocide—in full livestreamed view of the world. (The first livestreamed genocide. Capitalism is always conquering new frontiers!)¹

Incidentally, if this book can be thought of as the Great American Novel, that says a lot about America.

*

Reading William Appleman Williams' classic *The Tragedy of American Diplomacy* (1959/72). Not sure why I haven't already read it, except that I thought it would be a little less sophisticated than, say, Gabriel Kolko. And I was right. But still, it's a very important book, and, in its arguments, more sophisticated than earlier orthodoxy and later "post-revisionism" in the mode of John Lewis Gaddis. (In recent months I've also read other books by "revisionists" like Kolko, Thomas McCormick, Greg Grandin, etc. Bruce Cumings is great too, and Lloyd Gardner.) Only so-called "economic determinist" scholarship is of deep explanatory value.

¹ And yes, this genocide is indirectly a result of capitalism—of American imperialism, domination of foreign countries for the sake of economic and strategic power, the pattern of outright authoritarianism that spreads from authoritarian control of capital over labor, dehumanization of poor people, the enormous American military budget that helps business and helps keep the economy growing, the incredible power over American politics of the Zionist lobby (funded by capitalist oligarchs like Sheldon Adelson), the colonizing project of Israeli business, etc.

Williams' interpretation of American foreign policy resurrects the old Marxian emphasis on the need for foreign markets, sources of raw materials, and opportunities for foreign investment. This emphasis is little more than common sense, since strategic power rests mainly on economic power and the latter entails economic expansion across the world—especially in the era of capitalism, which has the imperative of constant growth (the search for new markets, new investment opportunities, and new sources of raw materials). The power of the state rests on that of business and vice versa, and both, being centers of power, have an interest in always expanding their power. They want to control as much as possible, preferably everything, including foreign countries (if they can). Even apart from the voluminous evidence Williams presents, then, his perspective is, *a priori*, extremely plausible. (As a result, mainstream academics, servants of power, have ridiculed it for sixty years.)

He calls this government policy of ensuring access everywhere to markets and raw materials the Open Door Policy and says (rightly), like LaFeber, that it began in a mature way in the 1890s. The evidence is overwhelming, but here's a salient quotation from the State Department in 1898:

It seems to be conceded that every year we shall be confronted with an increasing surplus of manufactured goods for sale in foreign markets if American operatives and artisans are to be kept employed the year around. The enlargement of foreign consumption of the products of our mills and workshops has, therefore, become a serious problem of statesmanship as well as of commerce.

Williams traces the paths of the Open Door Policy through the decades, but let's skip to the 1940s. His discussion of the early Cold War is illuminating. With good reason, he blames it primarily on the U.S. and its Open Door Policy. After all, America was vastly more powerful than Russia, and "power and responsibility go together in a direct and intimate relationship." (The same is true today: America, being far more powerful and expansionist than Russia, bears most of the responsibility for the hostile relations between the countries.)

The Soviets were so weak in 1945 that they were very conscious of a "need to reach some kind of agreement with America." The latter, to say the least, did not reciprocate. I might note, by the way, that the American "desire to keep the Soviets from establishing any long-range influence in eastern Europe" was quite unreasonable, given that the Soviet armies already occupied the area—were they supposed to just happily withdraw, after all the death and destruction they had suffered??—and the Soviet government desperately, and rationally, wanted a buffer zone to protect the country from any future invasion. But Washington was fixated on having economic access to, and thus (given America's economic strength) domination of, almost the entire world. Here's a salient paragraph:

The drive to achieve [this "open door" goal] began in earnest while the war was still being fought. For his part, Secretary of State Cordell Hull never eased off on the pace he had established in 1933. "The primary object," he reiterated in 1940, "is both to reopen the old and seek new outlets for our surplus production." One of his principal concerns was to break into the British trading system, a campaign in which he was vigorously encouraged and supported by American exporters. Hull's weapons included lend-lease and Britain's growing need for a major recovery loan. The United States made its aid conditional upon the acceptance by England of the open-door principle.

After the war, moreover, American leaders dreaded the possibility of a return to depression and understood that large foreign markets were necessary to prevent that. That was a major reason for the Marshall Plan. (A government subsidy to American business.)

In 1945, Stalin wanted a large loan from the U.S. to help Russia rebuild, but Washington dismissed that request. So he at least wanted massive reparations from Germany and its allies. But the Americans said that, unlike after World War I, they wouldn't lend money to countries so they could pay reparations. These were hardly "friendly" decisions. (They remind me of American refusals—recounted by the economist

Jeffrey Sachs, who strongly objected at the time—to financially help Russia in the 1990s, very different from Washington’s willingness to help Poland.)

It seems that on almost all issues except the status of Eastern Europe, Russia relented under American pressure:

Thus Russia withdrew from Iran, leaving the Western powers in a predominant strategic and economic position. Thus it also retreated from its efforts to modify Western supremacy at the entrance (and exit) of the Black Sea. And thus it acquiesced, though under vigorous protest, when on May 3, 1946, the United States abruptly and unilaterally announced that it was terminating reparations to Russia from the Western zones of occupied Germany.

This American action appears to have significantly increased Russia’s hostility to Washington.

In September 1946, the Secretary of Commerce Henry Wallace made a speech advising a more conciliatory policy toward Russia. For instance, “We should be prepared, even at the expense of risking epithets of appeasement, to agree to reasonable Russian guarantees of security.” This speech got him fired.

The following year was notable for both the Truman Doctrine and the Marshall Plan, which were “the two sides of the same coin of America’s traditional program of open-door expansion.” Contain “Communism”—resistance to American imperialism—so that America could have economic and political power everywhere.

After 1947, the Soviets got more “anti-American” and more authoritarian in Eastern Europe. And things continued from there. (But in succeeding years the Soviets did what they could to lower tensions, for example by sponsoring peace initiatives that America rejected.)

*

Again, I saw a video of a child, at most two years old, eyes closed, lying in a hospital bed, hardly moving and breathing in a labored way, almost entirely covered in bandages, what little skin visible red and blistered. The young Palestinian journalist who posted it wrote, “I held my breath when I saw this child screaming in pain. I could not bear this scene. He was burned all over his body as a result of the occupation army’s bombing of his house.” Later he posted another picture of the same child: “When I visited this boy yesterday, he was in so much pain I broke down and couldn’t take it. I couldn’t stop thinking about him all day. When I finished reporting today, the first thing I did was go to see him, but he wasn’t there. He died a painful death, his only fault being that he was born a Palestinian in Gaza.” The words are horrifying enough, but a picture really is worth more than a thousand words.

That little body with a diaper on over its bandages, quivering and breathing in pain, insensible to everything but pain—that little boy completely ignorant of what’s happened to him and why he’s suffering so, why this sudden change happened, struggling to survive but finally succumbing to his burns—a life snuffed out two years after its birth—that sweet innocent face, awake but eyelids closed—

There’s nothing I can say. There are no words to describe the scene. It shatters me.

I hate this world so much.

And I hate that Netanyahu and his cabinet and Biden and his advisors won’t die swinging from nooses. They’re *perfect enemies of humanity*. “Masters of war,” as Bob Dylan said in maybe the greatest anti-war song ever written. Embodiments of evil who are loved by millions, celebrated, obeyed and worshiped as power is always worshiped.

I hate this world. I want nothing to do with it. I want to take Aidan away and live on an island far from humans except for a few kind people close to me. I want to forget everything I’ve learned about civilization and forget it even exists. I don’t want to see large groups of people anymore, or see tall buildings or cars driving on congested streets, or plaques honoring figures from the past. I never again want to see a newspaper. I don’t want to know about the existence of the internet or smartphones or televisions. I want my mind to be wiped clear of all the pollution and all the evil.

But it's all going to continue, and it's going to get exponentially worse. Unimaginable suffering will engulf the planet. Why was life created in the first place? The mass suffering is unbearable. The cruelty is unbearable.

July

Well, as always, if you focus on the positives and temporarily forget the horrors and the evil, life can be fairly enjoyable. I almost have a bad conscience enjoying myself when the Gaza genocide is unfolding (and the Sudan famine and the Ukraine war and on and on), but that's no way to live. Even Chomsky, who knows more about all the suffering going on than anyone else, having immersed himself in it for seventy years, has somehow been able to enjoy his life. As I've often said, he's the best model of how to live. (Not necessarily in all the specifics—we can't all spend our lives fanatically researching the crimes of the ruling class—but in his humaneness, his moral integrity, his intellectual curiosity, his egalitarianism, his obsessive commitment to *principle*, his hyper-rationality, and his selflessness. No one has ever come closer to perfection than he.)

*

Reading a book called *Speak: A Short History of Languages*, by Tore Janson (2002). The history of language has always fascinated me. For one thing, I can't fathom how such an incredibly rich cognitive system as language came into being, both biologically (genetically) and culturally. But the history of particular languages is fascinating too. For example, English, German, Swedish, Dutch, Danish, etc. come from a common language, called Proto-Germanic. And then there are the languages that come from Proto-Slavic, such as Russian, Czech, Polish, Ukrainian, Bulgarian, and Serbo-Croatian. (These two 'Proto' languages were probably spoken around 2,000 years ago.) And of course French, Spanish, Italian, and Portuguese come from Latin. In turn, these three large language groups belong to the Indo-European languages, all of which come from Proto-Indo-European. Greek, Baltic languages, Celtic languages, Albanian, Sanskrit, Hindi, ancient Hittite, and so on also came from Proto-Indo-European. How one linguistic group originally spread over such a vast area—much of India, the Middle East, and Europe—isn't clear, though it may have involved military conquest or the gradual spread of farming many thousands of years ago (assuming the Proto-Indo-European people were the farmers).

Another stunning story is the spread of Latin, of course. "The Latin language is found in a few inscriptions from around 600 BC... Romans probably acquired the idea of a written language from their northern neighbours, the Etruscans, who constituted the dominating group in central Italy down to the fifth century BC. The Etruscans had adapted the Greek alphabet to the needs of their language, and the Romans in turn modified the Etruscan script to create the Latin alphabet..." From a few thousand speakers and writers, Latin became the progenitor of languages spoken by hundreds of millions today.

*

Sunday afternoon. Field's nocturne no. 11 in E-flat. Especially the first minute and a half. Solitude as usual, because the vulgarity and atomization of my society doesn't permit togetherness. But the simple beauty of this nocturne consoles. It raises mundane existence to something more poetical and transcendent, sweet and pure.

I quite like being alone, most of the time. It's so great to be away from people, to listen to Bach while reading philosophy or a good history book or fiction. One wants to get drinks with friends sometimes, to go on dates or to an occasional cultural or social event, but mostly what I want is to sit at home—preferably with a woman—and indulge in intellectual pleasures. Until people become less vulgar in their musical and cultural tastes, their conversation, their interests and opinions, their treatment of others, I'll always much prefer my own company.

In this context I feel bound to mention, once again, my annoying perception of a difference between myself and at least 95% of “intellectuals.” Their tendencies to irrationality and unintelligence are ultimately expressions of the vulgarity and decadence that afflict most people, in this case the vulgarity and decadence of bureaucratic, power-serving, and not-committed-to-the-pursuit-of-truth institutions. Here’s a fairly trivial example.— A year or two ago I posted something on Twitter to the effect that the music of, say, Bach, Beethoven, and Mozart is on a higher creative level than even the best popular music. Scores of musicians, primarily classical musicians with PhDs, collectively gasped in horror and attacked me for a couple of days. It was actually very fun, debating all these “woke” idiots. Apparently I was a white supremacist for believing such a truism. These classical musicians were able to say with a straight face that the Beatles are essentially as creatively profound as Beethoven. “You’re arguing against people with PhDs in music!” “So what? That only means you’ve been even more indoctrinated than most into a vulgar relativism.” (They were appalled by that comment. “Can you believe this guy? He thinks education entails indoctrination!” Moronic academic snobs.)

“The herd of independent minds,” to quote Chomsky.

Here’s another example of academic unintelligence I came across recently: saw an interview of the wildly overrated philosopher David Chalmers in which he said,

I think it’s possible for an AI system to be conscious. I think it’s possible for a machine to be conscious. The brain itself is a big machine. Somehow that machine produces consciousness. I think if biology can do it, I don’t see why silicon can’t do it. We don’t understand how silicon could give us consciousness, but we also don’t understand how neurons could give us consciousness. So I don’t see a difference in principle.

Great argument. We also don’t understand how iron or arsenic or oxygen or uranium or helium could give us consciousness, but because neurons can, surely all these elements can too! What a dumbass. The brain is a very different kind of “machine” than AI. How do people like Chalmers become famous philosophers? That fact in itself is an indictment of Western intellectual culture.

By the way, I recently made the foolhardy decision to post my journal online. I’m tired of keeping it secret. The great problem is its length. It’s *so* long, *so* full of valuable material, that, ironically, it’ll probably end up being almost totally ignored.

(Aside from Chomsky’s work, I can’t think of a better guide to a rational and comprehensive philosophical-historical-political-psychological-aesthetic worldview than the bulk of this journal.)

*

Reading Laurence Bonjour’s *In Defense of Pure Reason: A Rationalist Account of A Priori Justification* (1998). Should have read it a long time ago, especially since in graduate school I was already impressed by Bonjour’s cogent arguments and philosophical common sense. It’s a brilliant book, instructive and full of careful and fairly convincing arguments.

“One main goal of this book is to arrive at an understanding of the nature, rationale, and limits of the *a priori* variety of epistemic justification. It is obvious that the initial conception of such justification offered above is predominantly negative in character: *a priori* justification is justification that does not depend on experience. But where then does such justification come from? How is the positive idea...of justification by pure thought alone to be understood?” For many empiricists, “there is something mysterious, perhaps even somehow occult,” about a supposed “capacity for direct intellectual insight into necessity” (that is, necessary truths pertaining to reality), a capacity rationalists think is “the fundamental requirement for reasoning and reflective intelligence generally.”

I’d note that since logical deduction itself is *a priori*, and it involves argumentative steps that strike us as logically *necessary*...empiricist qualms are puzzling.

Until Hume, nearly all philosophers throughout history were rationalists in Bonjour’s sense. Even Locke and Berkeley. But Hume insisted that *a priori* justification concerned only “relations of our ideas,”

not “matters of fact.” Kant was actually rather close to this position—according to BonJour—but, with the exception of John Stuart Mill, there weren’t many “clear examples of empiricism” until the advent of positivism with Comte and Mach. Since then, empiricist skepticism about the *a priori* has become increasingly prevalent in the Anglo-American world.

“Moderate empiricism,” as BonJour calls it, is the familiar position that only analytic propositions can be justified *a priori*. What BonJour calls radical empiricism, associated with Quine, is the position that *a priori* justification doesn’t exist at all. (Leave it to Quine to argue for the stupidest idea of all.)

Before examining empiricism in depth, BonJour makes some interesting criticisms of Kant, but I won’t go into much detail. Kant is usually considered a rationalist, of course, but BonJour thinks that’s sort of a false view. For one thing, unlike previous rationalists, Kant rejects the idea that we can know anything about the world in itself from *a priori* reasoning (or from *a posteriori* reasoning). That is, synthetic *a priori* knowledge can apply only to the world of *appearances*, since such knowledge/justification is necessarily, he thinks, a result of the mind’s (*a priori*) structuring of experience. So his rationalism is much more modest than that of earlier thinkers. (Incidentally, BonJour of course accepts—like I did in my journal entries when I was 20—that, on Kant’s definitions of analytic and synthetic, there is indeed synthetic *a priori* knowledge, for example $7+5=12$.¹)

But BonJour thinks even *that* statement exaggerates Kant’s rationalism. We needn’t go into the argument here, though, since it’s rather involved. And I’m not sure how compelling it is. The upshot, for BonJour, is that Kant’s insistence on the impossibility of synthetic *a priori* knowledge that doesn’t derive from the mind’s imposition of its categories on experience gets him into insuperable logical difficulties that end up undermining even his limited version of rationalism.

The problem I have with BonJour’s rejection of Kant’s position is that...the latter seems pretty reasonable. I mean, Kant was wrong that we can’t say anything about the world-in-itself. We can say *a lot* about it (though not with 100% certainty), as science has shown. But can we say anything about it *purely a priori*, with no use of experimental evidence? Surely not. Science needs empirical evidence. So it seems Kant was right that we have no synthetic *a priori* knowledge about the world in itself. All the synthetic *a priori* knowledge we have applies to the world *as we experience it*. And that’s because the mind imposes its own structures on the data it receives from the senses! As Kant said. He was wrong to dismiss the idea that the mind-independent world might be structured in such a way that through mathematics, aided by experimental evidence, we could at least partly understand it. But otherwise his position strikes me as very defensible.

I should also note more generally, against Kant, that, for all we know, many of our synthetic *a priori* intuitions *may* apply to the world-in-itself. Certainly mathematics does, or seems to. That it does isn’t as indubitable as that it applies to/in the world of our experience, but, from the success of science, we have every reason to think it does. Some other *a priori* intuitions, such as that an object can’t be both red all over and green all over, aren’t really relevant to a mind-independent world, since mind (brain) is precisely what creates colors and shapes for us (the world-in-itself has no colors).

BonJour’s basic argument against moderate empiricism (i.e., reliance on analyticity as explaining all *a priori* justification, so that it isn’t necessary to accept synthetic *a priori* justification) is that “no conception of analyticity is capable of providing an adequate epistemological account of the generally acknowledged cases of *a priori* justification”—or perhaps of *any* case of such justification. He goes through the various accounts of analyticity that have been offered and argues that all of them leave unexplained the

¹ As Kant says, “if we look more closely, we find that the concept of the sum of 7 and 5 contains nothing save the union of the two numbers into one, and in this no thought is being taken as to what the single number may be which combines both. The concept of 12 is by no means already thought in merely thinking this union of 7 and 5; and I may analyze my concept of such a possible sum as long as I please, still I shall never find the 12 in it.” This is obviously right. The concept of 12 isn’t contained in the concept of the sum of 7 and 5, in the way that the concept of being male is contained in the concept of a brother. As I noted when I was 20 (discussing A. J. Ayer), you have to carry out a mental operation of synthesis in order to arrive at 12. The arithmetic proposition, while *a priori*, is not analytic (in Kant’s sense), so it must be synthetic.

justification of *logical truths*. They simply take for granted that we can intuitively see the necessity of such truths. But that's no different from the rationalist's position! For example, we can just *intuit* that the relation of transitivity is necessary. If all *B* are *C* and all *A* are *B*, then all *A* are *C*. (If all men are mortal and all Greeks are men, all Greeks are mortal.)

But couldn't an empiricist just say these basic logical and mathematical intuitions aren't really substantive or synthetic, that, as Hume said, they only concern relations between our ideas rather than mind-independent facts? So they're only "analytic"?

I suppose BonJour might reply that logical and mathematical truths, for example, because of their necessity, *are* mind-independent facts. But is that right? In a sense it is, because these truths don't depend on what anyone happens to believe about them. They aren't subjective like that; they're objective. But on the other hand, it's because of the structures of our minds that we assent to them. They express our cognitive architecture. So in that respect they aren't really "mind-independent."

I think Chomsky is right that this whole analytic-synthetic/empiricist-rationalist debate is misguided and confused. The concepts aren't clearly defined. As BonJour himself shows, analyticity has been defined in many not-equivalent ways. And so has the concept of "synthetic," though he doesn't discuss that much.

Anyway, after his long discussion of moderate empiricism, BonJour proceeds to eviscerate Quine's radical empiricism (which he regards, rightly, as hard to take seriously). First, he argues very plausibly that Quine's belief in the unintelligibility of analyticity, and of related concepts like synonymy, is mistaken. Quine's whole rejection of the very idea of linguistic meaning—evidently he didn't like its non-behaviorist connotations—is, of course, an example of philosophers getting so lost in their labyrinths of abstruse argumentation that they become less rational than a guy on the street. And then there's the Quinean "naturalized epistemology" that rejects the very idea of epistemic justification, reinterpreting epistemology merely as psychology. To quote BonJour's paraphrase, "we have a set of beliefs that describe the external world; part of that very set of beliefs describes how the beliefs are *caused* [not *justified*] by observation; but we have no cogent reason for thinking that *any* of these beliefs are true." So what results is an insane form of skepticism. Since Quine hasn't given any good reasons for abandoning traditional epistemology, there seems no reason to take his so-called naturalized epistemology seriously. But it does at least show where you end up if you reject the notion of *a priori* justification in favor of arguing that "all reputable cognitive endeavors can be accounted for on a purely empirical [or observational] basis," as BonJour paraphrases. You end up in arrant absurdity, in fact the veritable demise of philosophy, even of argument itself. (Obviously Quine's position is self-defeating too, since he clearly thinks his arguments are *justified*. But how can they be justified if the idea of justification should be abandoned?)

Quine's whole philosophy amounts to a *reductio ad absurdum* of whatever empiricist and behaviorist considerations led him to formulate it.

As for rationalism, it seems presupposed by thinking itself. As I just, in effect, noted, "if one never in fact grasps any necessary connections between anything, it is difficult to see what reasoning could possibly amount to." That is, "there is ultimately no alternative to reliance on *a priori* insight, if reasoned thinking that goes beyond mere perception or observation is to be possible." However, contrary to what most rationalists have thought, this doesn't mean that *a priori* justification is always *infallible*. "[Historically,] there are simply too many compelling examples of propositions and inferences that were claimed to be objects of rational insight, and hence to be justified *a priori*, but that subsequently turned out to be false or mistaken." At best, we can say that "an apparent rational insight will count as genuine only if it *actually* involves the sort of authentic grasp of the necessary character of reality that ensures truth." But, given the possibility of mistakes, we can't know if any particular case of apparent insight is genuine, and therefore we can't know when an insight is infallible (which means, in effect, it never is). As BonJour says,

a moderate rationalism that abandons the indefensible claim of infallibility should hold instead that...it is *apparent* rational insight (and, correlatively, apparent self-evidence) that provides the basis for *a priori* epistemic justification. Such justification will thus, in common with all or virtually all other kinds of justification, be fallible, since it will be

possible that the apparent insight that justifies a particular claim is not genuine. The moderate rationalist's main thesis is that such an apparent insight still yields a reason, albeit a fallible one, for thinking that the proposition in question is true.

Much of the book consists of a defense of rationalism against a variety of epistemological and metaphysical objections, but I won't go through all that. I think BonJour's arguments are consistently very reasonable. In the last chapter he uses rationalism to solve, or at least sketch the solution of, a particular philosophical problem, namely the famous Humean problem of induction. Philosophers have generally assumed there couldn't be an *a priori* solution to this problem, but BonJour pretty compellingly argues they've been wrong. I might as well say here that I've never been terribly bothered by the problem of induction, namely, how can inductive reasoning be justified? "What sort of *reasoning* moves from the observation of particular cases in which *A* has been followed by *B* [as its effect] to the general conclusion that *A* will *always* be followed by *B*? Hume's initially startling thesis is that there is no such reasoning, that the conclusion in question is not based on reasoning at all but is rather the result of an ultimately arational process: *custom* or *habit*." Well, it's seemed evident to me that if you just supply the premise that *nature is lawlike*, inductive reasoning is justified. It doesn't have to be merely a result of habit. It's true that that premise is itself an example of inductive or abductive reasoning, so using it to justify induction is circular, I suppose. But it's such an overwhelmingly plausible justification that I don't see how it can be avoided. If we take nature to be lawlike—as it appears to be—then inductively generalizing from particular instances is entirely legitimate.

BonJour in effect adopts the stated premise as the solution, arguing that it's *a priori*. Thus, *a priori* reasoning can solve important philosophical problems.

I perused some of the responses to the book by philosophers and wasn't surprised to find a lot of embarrassingly silly stuff. Gilbert Harman, Paul Boghossian, Georges Rey, Albert Casullo—some of their objections were worthy of a rather unintelligent undergraduate. BonJour's response to all their criticisms (in the journal *Philosophy and Phenomenological Research*) was impressive.

I would note, by the way—something BonJour doesn't mention—that the truth of rationalism in the sense of an incredibly rich innate genetic endowment built in to the individual's mind at birth likely entails that rationalism in BonJour's "intuitionist" sense is also true. Humans have substantial synthetic *a priori* cognition (at least on Kant's definition of synthetic) in accord with the architecture of their minds.

Peter Carruthers' book *Human Knowledge and Human Nature: A New Introduction to an Ancient Debate* (1992) is good too, though he has a more empiricist point of view than BonJour. But his empiricism is relatively intelligent, since he accepts that humans are endowed with innate concepts and innate knowledge. It's only the rationalist notion of "substantive *a priori* knowledge" that he rejects. He's wrong to do so, but it's an interesting book anyway.

Actually, in one sense he accepts substantive *a priori* knowledge, but in another sense not. Innate concepts (like causation), innate knowledge (like the very complex "folk psychology" we all naturally use to understand one another), and innate "information-bearing mental structures" (like Universal Grammar) are all *a priori*, "at least in the sense of not having been learned from experience" (though they're *triggered* by experience).¹ And they're surely "substantive." But Carruthers rejects a different kind of substantive *a priori* knowledge. Here's the relevant paragraph:

If the course of evolution has provided us with substantive innate knowledge, either of our own psychology or of other aspects of the natural world, then it will at the same time have provided us with substantive *a priori* knowledge. It is important to realize, however, that the status of such knowledge as *a priori* will be quite different from what rationalist philosophers have generally had in mind when they have employed the phrase '*a priori* knowledge'. In particular, the knowledge in question will not have been acquired merely

¹ The Poverty of the Stimulus argument applies to all of them. They're far too rich to be mere extrapolations from experience. Instead, the mind brings them *to* experience.

through the thinking of it, by a process of reasoning alone. Innate *a priori* knowledge of folk-psychology, for example, would not consist of beliefs that can be discovered to be true just by thinking of their subject-matter; nor would their content be intuitively certain. Rather, we would find ourselves with those beliefs already; and then, provided that they are both true and reliably acquired through evolution, this would be sufficient to constitute them as knowledge...

I'd reiterate that this old debate between rationalists and empiricists over the synthetic *a priori* ("substantive *a priori*") isn't as interesting or clear as they've thought. What's clear and important is that rationalists have been right about innate concepts and knowledge—while empiricists have been right that most or all of these innate mental structures (which provide the framework for our experience) don't give us knowledge of the world-in-itself, and we certainly can't know from pure *a priori* reasoning that they do. We need science to investigate the mind-independent world. So, again, Kant's compromise between empiricism and rationalism was very close to being right. (He was only wrong in thinking it was impossible for us to say anything at all about the mind-independent world.)

August

I find it puzzling that so few people kill themselves. Apparently less than a million in the world kill themselves every year. Life is so hard and so pointless, and so long, but only a tenth of one percent of people commit suicide! Isn't that incredible? What a testament to humanity's innate *life-affirmation*.

Personally, life seems pretty meaningless unless I'm writing.

I guess I should start to do that again, like write articles. However pointless that ultimately is.

I've also been looking for non-academic jobs, and applying to some. But most of even the ones I could potentially do—my god, how '*vulgar*' they seem. How unfulfilling! Bureaucratic, administrative, capitalist, merely *functional*. Utterly depressing.

How do people work five days a week from 9 to 5 (or longer) most of their lives? With hardly any vacations. It seems almost psychologically impossible. But this is the world capitalism has created, where you're *lucky* if you're one of the ones who works forty-plus hours a week from your twenties to your sixties. If you're unlucky, you end up being massacred so that some powerful psychopaths can amass even more power.

*

At 31 months, Aidan's language skills are excellent. It's been an explosion in the last few months. Lots of sentences. "No we don't wanna listen to Scarlatti! We wanna listen to Mozart!" (For him, Mozart = the overture to the *Marriage of Figaro*. That's the only piece he really likes.) "You don't want Daddy to hold my hand." "It's fun to throw rocks into the water!" (Without being prompted by any such statement.) "You want Daddy to carry you." "We need new batteries for the train." "I'm trying to go find the second wheel." "We need a smaller person to go into the [toy] train." "It's gonna be so much fun to throw rocks into the water." "Aidan can go down the steps by himself." All unprompted. His understanding, of course, is far superior to his speech.

He makes mistakes too, of course. For example, he might say, "You want [or 'I want'] Daddy to bite your finger," meaning "I want to bite Daddy's finger." Or "You want to carry Daddy" (or "You want to carry you"), meaning "I want Daddy to carry me." These sorts of mistakes are pretty systematic, and thus are surely very common at his stage of linguistic development. Something about the way the language faculty matures.

He also constantly repeats phrases and sentences he's heard, even long after hearing them. Songs, sentences from his parents, etc. Randomly says them to himself again and again, outside of any appropriate context. All this is evidence for the "language instinct"—as if more evidence were needed. As far as I'm

concerned, science has conclusively established it (contrary to a vast amount of empiricist and behaviorist writing).

*

Reading Reza Aslan's *Zealot: The Life and Times of Jesus of Nazareth* (2013), which made a big splash when it was published. A good synthesis of scholarship. It shows that Kautsky's interpretation, which I summarized here years ago, was pretty accurate: Jesus the revolutionary, who didn't reject violence but accepted its inevitability in the struggle to free Palestine from both Rome and the tyranny of the priestly caste and other wealthy oppressors. A visionary utopian, he wanted to establish the kingdom of God *on earth*. One useful thing about the book is that it describes the many other "messiahs," prophets, and revolutionaries who wandered around Palestine in those years, in some cases violently and successfully challenging the powerful. So much so that Rome finally sent a huge army to crush the Jewish Revolt, around 70 A.D., and utterly annihilate Jerusalem. In the previous century there had been Hezekiah the bandit chief, Judas the Galilean, Simon of Peraea, Athronges the shepherd, John the Baptist, Theudas the wonder-worker, Eleazar son of Dinaeus, "the Samaritan," "the Egyptian," Jesus ben Ananias, Menahem, Simon son of Giora, Simon son of Kochba, and so forth. Plus the Essenes, the Sicarii (assassins), and the Zealots. Jesus the Nazarene was just another of these people, less radical than the Zealots but more radical than John the Baptist. When the Gospels were written, after the annihilation of Jerusalem and long after the total failure of Jesus's messianic prophecies, it was necessary to reinterpret his message so that it was otherworldly. And also more acceptable to non-Jews, more universal, and not so hostile to Romans. So, as Kautsky argues too, the writers injected a healthy dose of antisemitism, blaming not the Romans but the Jews for Jesus's execution.

Jesus himself surely said a lot of otherworldly things—in fact, his preaching was probably rather ambiguous on many points—but the compilers of the New Testament did what they could to excise the Jewish nationalism from his message and make it relatively non-political. Neutering it, but also universalizing it, was key to its success.

A guy named Stephen was the first of Jesus's followers to be killed after the crucifixion. His crime? Saying that Jesus was not only the messiah, and was not only resurrected into eternal life, but was *God made flesh*. A notion totally anathema to Jews. This was the birth of a new religion. To quote Aslan, "The story of the zealous Galilean peasant and Jewish nationalist who donned the mantle of messiah and launched a foolhardy rebellion against the corrupt Temple priesthood and the vicious Roman occupation comes to an abrupt end, not with his death on the cross, nor with the empty tomb [from which he was supposedly resurrected], but at the first moment one of his followers dares suggest he is God."

The original apostles, farmers and fishermen, were limited in their ability to spread Jesus's message because they could neither read nor write. So

The task of defining Jesus's message fell instead to a new crop of educated, urbanized, Greek-speaking Diaspora Jews who would become the primary vehicles for the expansion of the new faith. As these extraordinary men and women, many of them immersed in Greek philosophy and Hellenistic thought, began to reinterpret Jesus's message so as to make it more palatable both to their fellow Greek-speaking Jews and to their gentile neighbors in the Diaspora, they gradually transformed Jesus from a revolutionary zealot to a Romanized demigod, from a man who tried and failed to free the Jews from Roman oppression to a celestial being wholly uninterested in any earthly matter.

This transformation did not occur without conflict or difficulty. The original Aramaic-speaking followers of Jesus, including the members of his family and the remnants of the Twelve, openly clashed with the Greek-speaking Diaspora Jews when it came to the correct understanding of Jesus's message. The discord between the two groups resulted in the emergence of two distinct and competing camps of Christian interpretation in the decades after the crucifixion: one championed by Jesus's brother, James; the other

promoted by the former Pharisee, Paul. As we shall see, it would be the contest between these two bitter and openly hostile adversaries that, more than anything else, would shape Christianity as the global religion we know today.

The story is very well-known by scholars, and I needn't describe it in depth.

But one interesting thing, an unsolvable mystery, is what happened after Jesus died. He would have been just another failed messiah if not for a key difference from all the others: his disciples claimed that after his death he was resurrected. They saw it with their own eyes. Even under torture, they wouldn't recant their testimony. This "miracle" is what sustained the faith of the early Christians. "Without the resurrection, the whole edifice of Jesus's claim to the mantle of the messiah comes crashing down." Who the hell knows what really happened. He obviously wasn't resurrected, but somehow his followers convinced themselves he was. Maybe they stole his body? Maybe they got high together on some drug? Maybe they saw someone who looked like him?

I might as well also briefly mention the conflict between Paul and Jesus's followers in Jerusalem, since I wasn't previously aware of the history. I had the impression that Paul was primarily the one who ended up defining Christianity and founding a new religion, but I didn't know much else. It worked out well for him in the long run that, despite being Jewish, he insisted in his preaching and his letters to the Diasporic assemblies that the Jewish law no longer mattered, the Temple didn't matter, Judaism didn't matter, and justification was by faith (in Jesus) rather than by works. For the destruction of Jerusalem in 70 A.D. essentially brought all this to pass in reality. Judaism became a pariah and the Christian congregations scattered around the empire no longer had any connection to a chief congregation in Jerusalem that insisted they maintain many Jewish traditions.

Christianity after the destruction of Jerusalem was almost exclusively a gentile religion; it needed a gentile theology. And that is precisely what Paul provided. The choice between James's [Jesus's brother's] vision of a Jewish religion anchored in the Law of Moses and derived from a Jewish nationalist who fought against Rome, and Paul's vision of a Roman religion that divorced itself from Jewish provincialism and required nothing for salvation save belief in Christ, was not a difficult one for the second and third generations of Jesus's followers to make.

So Pauline theology, according to which Jesus was God and so on, became dominant.

Until his execution in 62 A.D., Jesus's brother James was the head honcho, the leader of the Apostolic Council in Jerusalem and thus, in effect, of the (relatively few) "Christian" congregations everywhere. He, Peter, John, and the other elders in Jerusalem admonished Paul not to depart *too much* from Judaism in his teachings. They summoned him a couple of times to explain himself, and by the time of his death it seemed that his interpretation didn't have a very auspicious future. Until after the destruction of Jerusalem.

As for James (James the Just), he appears to have been a pretty exemplary character. Like his brother Jesus—or so Aslan argues, plausibly—he had no interest in founding a new religion. (Jesus actually said he was there to fulfill the law, not to abandon it (like Paul).) But he did want Jewish society to be more humane, and he hoped the Second Coming of Jesus, expected soon, would usher in the Kingdom of God. Meaning, essentially, the casting off of Roman rule and establishment of a just society. His views are clear from his epistle in the New Testament—which he didn't write, but which almost certainly expressed his views and was probably written by someone from his inner circle. As Aslan says, this makes it "one of the most important books in the New Testament, because one sure way of uncovering what Jesus may have believed is to determine what his brother James believed." (James revered his brother and was devoted to his legacy.)

So it's significant that James's epistle is passionately concerned with the plight of the poor and bitterly condemns the rich:

“Come now, you wealthy ones, weep and howl for the miseries that are about to come upon you. Your riches have rotted and your garments are moth-eaten. Your gold and silver have corroded, and the venom within them shall be a witness against you; it shall eat your flesh as though it were fire” (James 5:1–3). For James there is no path to salvation for the wealthy who “hoard treasures for the last days,” and who “live on the land in luxury and pleasure” (James 5:3, 5). Their fate is set in stone. “The rich man will pass away like a flower in the field. For no sooner does the sun rise with its scorching heat, which withers the field, than the flower dies and its beauty perishes. So it shall be with the rich man” (James 1:11). James goes so far as to suggest that one cannot truly be a follower of Jesus if one does not actively favor the poor. “Do you with your acts of favoritism [toward the rich] really believe in our glorious Lord Jesus Christ?” he asks. “For if you show favoritism, you commit sin and are exposed as a transgressor of the law” (James 2:1, 9).

For James, and therefore probably for Jesus, *works* were at least as important as *faith*. In fact, they went together. “For as the body without spirit is dead, so faith without works is dead also” (James 2:26).

I suppose some of Aslan’s arguments might be controversial, but he’s indisputably an expert. Remarkably erudite. And his semi-Kautskian interpretation of both Jesus and the early history of Christianity has the ring of truth. *Of course* Jesus was, in effect, a revolutionary, and explicitly politically engaged. Anachronistically but not untruthfully, one can call him an anti-imperialist, an anti-capitalist, a utopian, and a semi-insurrectionist (he gathered scores of people on his way to Jerusalem, where he violently overturned tables, attacked authorities, and caused a near-riot). His concern was with justice on earth—compassion, love, relative equality, freedom from oppression—and he used the ideologies at hand to articulate his subversive values.

With Paul began, in earnest, the domestication and depoliticization of Jesus, together with his universalization. “Faith, not works” is singularly compatible with maintaining the political status quo. No wonder Pauline Christianity triumphed. Just like Lutheranism 1400 years later. As usual, it comes down to class interests and the ideologies conditioned thereby. (Even the class interests of the poor can be served by “faith, not works” inasmuch as sublimating the desire for material salvation into an otherworldly vision provides consolation and prevents the poor from being slaughtered in insurrections. So it can be in the interests of both dominant and exploited classes to embrace Pauline and Protestant ideologies. And of course the Catholic religion too, which served the purposes of both poor and rich. Though mainly the rich.)

*

I’ve decided I can no longer abide my ignorance in matters of diet and health. This is useful stuff to know, and also intellectually engaging. So I’m reading Gary Taubes’ brilliant, albeit controversial, book *Good Calories, Bad Calories: Challenging the Conventional Wisdom on Diet, Weight Control, and Disease* (2007). It argues against the widespread idea that diets high in saturated fats and cholesterol are bad for your heart and your weight, instead insisting that high-carbohydrate diets are, more often, what lead to obesity and heart disease. For decades, until very recently, the Establishment declared that carbs are good for the heart and for weight control, while fats are bad, but the opposite is closer to the truth. Actually, it’s pretty common now, finally, to hear about the downsides of high-carb diets—and even in the late nineteenth and early twentieth centuries it was widely known that high-carb diets can lead to excessive weight gain. (This is also a premise of the famous Atkins diet from the 1970s to the present, along with other diets and many bestselling books from the 1940s on.) But things went awry in the middle and late twentieth century, when influential scientists starting with Ancel Keys got things backward. Doubtless one reason the “good carbs” dogma conquered the culture was that it benefited agribusiness and other corporate interests, which promoted it. (The dairy, egg, and meat industries, on the other hand, certainly opposed it.)

The dogma wasn’t totally absurd, at least *prima facie*. For it was thought that consuming too many calories was what led to obesity, and since fat has more than twice as many calories per gram as protein and carbs, cutting down on fat should lead to losing weight. So should exercise: burn more calories than

you consume. But Taubes argues—on the basis of prodigious evidence—that it isn't the *quantity* of calories that matters but the *quality*.

Let's look at some of the basics first.

[Coronary heart disease] is a condition in which the arteries that supply blood and oxygen to the heart—known as coronary arteries because they descend on the heart like a crown—are no longer able to do so. If they're blocked entirely, the result is a heart attack. Partial blocks will starve the heart of oxygen, a condition known as ischemia. In atherosclerosis, the coronary arteries are lined by plaques or lesions, known as atheromas, the root of which comes from a Greek word meaning "porridge"—what they vaguely look like. A heart attack is caused most often by a blood clot—a thrombosis—typically where the arteries are already narrowed by atherosclerosis.

Cholesterol, on the other hand, "is a pearly-white fatty substance [a lipid] that can be found in all body tissues, an essential component of cell membranes and a constituent of a range of physiologic processes, including the metabolism of human sex hormones. Cholesterol is also a primary component of atherosclerotic plaques, so it was a natural assumption that the disease might begin with the abnormal accumulation of cholesterol..."

Actually, in the 1940s even Ancel Keys insisted that dietary cholesterol (the cholesterol we consume in our diets) had little relevance to heart disease. Like other researchers, he observed, correctly, that eating foods high in cholesterol usually had almost no effect on the cholesterol levels in our blood. A few years later, however, he decided that dietary *fat* is what elevates cholesterol levels. (Hence the still-widespread belief that a low-fat diet is a low-cholesterol diet.) But he had oversimplified. It turns out it isn't the *total* amount of dietary fat that increases cholesterol but rather the fat's degree of "saturation," as well as what's called the chain length of the fats. "This saturation factor is a measure of whether or not the molecules of fat—known as triglycerides—contain what can be considered a full quotient of hydrogen atoms, as they do in saturated fats, which tend to raise cholesterol, or whether one or more are absent, as is the case with unsaturated fats, which tend, in comparison, to lower it." Hence the common notion for many decades that saturated fats are where the real danger is.

The problem is that a lot of research has failed to show that people with high cholesterol have unusually clogged arteries. Besides, "even if high cholesterol was *associated* with an increased incidence of heart disease, this begged the question of why so many people...suffer coronary heart disease despite having low cholesterol, and why a tremendous number of people with high cholesterol never get heart disease." Nevertheless, in 1960 the American Heart Association endorsed Keys' idea that high cholesterol is the leading heart-disease risk and therefore that Americans should reduce the fat in their diets, especially saturated fat. (Strangely, this endorsement was less than four years after the AHA had firmly *rejected* Keys' hypothesis. The evidence hadn't changed, so maybe some corporate lobbying had made a difference? Less dietary fat = more carbs, more sugar, more profits for certain industries, etc.)

Through shoddy science, the fat-cholesterol hypothesis gained popularity in the following decades. For example, it was observed that Japanese men who lived in Japan had low blood-cholesterol levels and low levels of heart disease, while Japanese men in California had higher cholesterol levels and higher rates of heart disease. It was considered largely irrelevant that Japanese men in California who had very low cholesterol levels *still* had higher rates of heart disease than men in Japan. There are plenty of other examples of such flawed research. Keys and scientists who agreed with him saw in research what they wanted to see, and the press reported their conclusions. Sometimes studies coming to opposite conclusions wouldn't even be published. More often, though, they were just dismissed or ignored.

In passing, Taubes mentions the "French paradox": "a nation that consumes copious saturated fat but has comparatively little heart disease." One of the many pieces of evidence against the fat-cholesterol hypothesis. (In fairness, I should note that one study in the 1990s concluded that a man who avoided saturated fat his entire adult life until the age of 90 could expect to live...an extra four months.)

The climate of opinion turned decisively in favor of Keys' hypothesis in 1977, when Senator George McGovern's Select Committee on Nutrition and Human Needs published the first *Dietary Goals for the United States*. It basically endorsed Keys' ideas, despite acknowledging that they were scientifically controversial. "Eat less fat and more carbs!" There was a lot of dissent among the scientific and medical communities, not to mention the livestock industry, but it didn't much change the thinking of the committee. A few years later, the Department of Agriculture published its *Dietary Guidelines for Americans*, which echoed McGovern's report. From then on, more and more scientists (whose funding often depended on government priorities) began to fall in line. Soon the National Institutes of Health, the Surgeon General, the National Academy of Sciences, etc. were enforcing the new "consensus"—which was still based on astonishingly little science. Even international bodies like the World Health Organization have tended to accept it.

Meanwhile, a number of studies have suggested the opposite of the fat-cholesterol hypothesis. In some cases in Japan, Spain, and Italy, increases in fat consumption over decades have correlated with *declines* in heart disease and strokes. Studies of Mediterranean immigrants to Australia suggest that the initially low heart disease rates of these people fall even lower after they've immigrated, despite a considerable increase in their meat consumption. In fact, by the late 1980s Ancel Keys himself told the *New York Times*, "I've come to think that cholesterol is not as important as we used to think it was"! That's a pretty big "whoops," considering the impact of his earlier hypotheses.

Okay, let's shift now to evaluating what Taubes calls the carbohydrate hypothesis. He starts out by noting that "diseases of civilization" have invariably appeared among "traditional" populations that began to be exposed to Western diets:

...The new diet inevitably included carbohydrate foods that could be transported around the world without spoiling or being devoured by rodents on the way: sugar, molasses, white flour, and white rice. Then *diseases of civilization*, or *Western diseases*, would appear: obesity, diabetes mellitus, cardiovascular disease, hypertension and stroke, various forms of cancer, cavities, periodontal disease, appendicitis, peptic ulcers, diverticulitis, gallstones, hemorrhoids, varicose veins, and constipation. When any diseases of civilization appeared, all of them would eventually appear.

This led investigators [in the 1920s and later] to propose that all these diseases had a single common cause—the consumption of easily digestible, refined carbohydrates. The hypothesis was rejected in the early 1970s, when it could not be reconciled with Keys's hypothesis that fat was the problem, an attendant implication of which was that carbohydrates were part of the solution...

It's not easy to summarize Taubes' very rich and long description of the history and the science. As with the fat-cholesterol story, there's a shameful amount of bad science and lack of common sense on the part of authorities. For half a century, diabetologists rejected convincing evidence that sugar and refined carbohydrates were responsible for diabetes, believing instead that fatty diets caused the disease. Some influential researchers also attributed far too much importance to dietary fiber in preventing "diseases of civilization," believing wrongly that a fiber-deficient diet was responsible for colon cancer, polyps, diverticulitis, and so on. (You'll still see claims like this on "respectable" websites, for example.)

Following a remarkable and far-seeing British scientist named Thomas Latimer Cleave (and his collaborator George Campbell), Taubes argues that these modern chronic diseases are largely caused by the most radical change to the internal environment of human bodies in two million years: the introduction of diets high in sugar and refined carbohydrates. Excessive consumption of these can lead to a constellation of conditions now called *insulin resistance syndrome* or, more often, *metabolic syndrome*. These conditions are common to diabetes, obesity, and heart disease. They include, for instance, elevated levels of blood fats known as triglycerides, low levels of HDL cholesterol (now known as the "good cholesterol"), hypertension, chronically high levels of insulin (called *insulinemia* or *hyperinsulinemia*), the increased presence of LDL particles ("bad cholesterol"), a relative insensitivity of cells to insulin (called *insulin*

resistance), and high levels of a protein called fibrinogen that increases the likelihood of blood clots in arteries. The introduction of refined carbs in modern diets has massively compromised the incredibly complex homeostatic mechanisms in the human body that evolved over millions of years.

I have to include a long quotation here:

This whole-body homeostasis is orchestrated by a single, evolutionarily ancient region of the brain known as the hypothalamus, which sits at the base of the brain. It accomplishes this orchestral task through modulation of the nervous system—specifically, the autonomic nervous system, which controls involuntary functions—and the endocrine system, which is the system of hormones. The hormones control reproduction, regulate growth and development, maintain the internal environment—i.e., homeostasis—and regulate energy production, utilization, and storage. All four functions are interdependent, and the last one is fundamental to the success of the other three...

All other hormones, however, are secondary to the role of insulin in energy production, utilization, and storage. Historically, physicians have viewed insulin as though it has a single primary function: to remove and store away sugar from the blood after a meal. This is the most conspicuous function impaired in diabetes. But the roles of insulin are many and diverse. It is the primary regulator of fat, carbohydrate, and protein metabolism; it regulates the synthesis of a molecule called glycogen, the form in which glucose is stored in muscle tissue and the liver; it stimulates the synthesis and storage of fats in fat depots and in the liver, and it inhibits the release of that fat. Insulin also stimulates the synthesis of proteins and of molecules involved in the function, repair, and growth of cells, and even of RNA and DNA molecules, as well.

Insulin, in short, is the one hormone that serves to coordinate and regulate everything having to do with the storage and use of nutrients and thus the maintenance of homeostasis and, in a word, life. It's all these aspects of homeostatic regulatory systems—in particular, carbohydrate and fat metabolism, and kidney and liver functions—that are malfunctioning in the cluster of metabolic abnormalities associated with metabolic syndrome and with the chronic diseases of civilization.

I had no idea insulin is so important for so many functions.

In six very dense chapters, Taubes discusses the history of the science of “the carbohydrate hypothesis.” I’ll try to summarize the main points.

Most of the fat in the body consists of triglycerides, though cholesterol is a type of fat too. Both types are shuttled through the blood in particles called lipoproteins, and the amount of cholesterol and triglycerides varies in each type of lipoprotein. The types include low-density lipoproteins (LDL), high-density ones (HDL), and very low-density ones (VLDL). Most of the triglycerides in the blood are carried in VLDL, while much of the cholesterol is found in LDL. (Some is also found in VLDL.) LDL and, much more so, VLDL are implicated in heart disease and other conditions. Measuring total cholesterol in the blood doesn't tell you how much of it is carried by the bad low-density or very low-density particles and how much by the good high-density particles, so it isn't a particularly useful measurement. (One reason HDL particles are “good,” apparently, is that they transport cholesterol back to the liver, either for excretion or to be used by other tissues that synthesize hormones.)

The amount of (slightly bad) LDL in the blood can be raised by consuming saturated fats, but levels of the more damaging VLDL are raised by consuming carbohydrates. (Moreover, saturated fats also raise the *good* HDL cholesterol.) So, to paraphrase a pioneering researcher in the 1950s-60s named John Gofman,

If a physician put a patient with high cholesterol on a low-fat diet, that might lower the patient's LDL, but it would raise VLDL. If LDL was abnormally elevated, then this low-fat diet might help, but what Gofman called the “carbohydrate factor” in these low-fat diets might raise VLDL so much that the diet would do more harm than good. Indeed, in

Gofman's experience, when LDL decreased, VLDL tended to rise disproportionately. And if VLDL was abnormally elevated to begin with, then prescribing a low-fat, high-carbohydrate diet would certainly *increase* the patient's risk of heart disease.

It's worth noting that not only a low-carb diet but also a *low-calorie* diet can reduce the level of triglycerides in the blood, although for other reasons such a diet might not be very healthy.

Meanwhile, other researchers found (in 1960) that high triglyceride levels were far more common than high cholesterol in coronary-heart-disease patients. "Only 5 percent of healthy young men had elevated triglycerides, compared with 38 percent of healthy middle-aged men and 82 percent of coronary patients." So, again, since a high-carb diet increases triglycerides (carried by VLDL), it's a good idea to avoid such a diet.

Another interesting finding, from 1977, was that the higher the HDL cholesterol, the lower the triglycerides and risk of heart disease. (And vice versa: the more triglycerides, the less HDL.) Evidently there was some mechanism that inversely linked HDL to triglycerides. Unfortunately, the medical and political establishment chose to ignore the implication that, to prevent heart disease (and obesity and diabetes), raising HDL is much more important than lowering either LDL or total cholesterol. For decades, the country would remain in the grip of Keys' simplistic "cholesterol is bad" hypothesis.

In fact, even today we're regularly told that LDL cholesterol is a significant predictor of heart disease, when the truth, according to Taubes, is that high levels of triglycerides are far more dangerous. LDL is a relatively marginal risk.

I've noted that consuming saturated fat, contrary to over fifty years of dogma, isn't very bad, since it increases the good HDL (and the potentially *slightly* bad LDL). Carbohydrates, on the other hand, lower both LDL and HDL, as they raise triglycerides. But another noteworthy fact is that *monounsaturated fat* is good, because it both lowers LDL cholesterol and raises HDL. The reason this is noteworthy is that *the principal fat in red meat, eggs, and bacon—foods we've been told are unhealthy—is monounsaturated fat*. With a porterhouse steak, for instance, about 70 percent of the fat might improve the relative levels of LDL and HDL, compared with what they would be if carbohydrates like bread, potatoes, and pasta were consumed. Thus, "eating a porterhouse steak in lieu of bread or potatoes would actually reduce heart-disease risk, although virtually no nutritional authority will say so publicly. The same is true for lard and bacon."

I've ignored some complications in this summary. In particular, it turns out that LDL particles actually come in seven different types! The smallest and densest of these types are what correlate negatively with HDL and positively with heart disease. So it's too simplistic to say "LDL is bad," as we usually hear. Rather, only the small and dense LDL is bad. Some people have mostly large, fluffy LDL particles, which are harmless, while others have mostly small, dense LDL, which are more likely to cause atherosclerosis. "Small, dense LDL can squeeze more easily through damaged areas of the artery wall to form incipient atherosclerotic plaques." The proliferation of small, dense LDL in the blood goes together with high triglycerides and low HDL. And once again, research shows that the less fat in the diet and the more carbohydrates, the smaller and denser the LDL (and therefore the greater the risk of heart disease). At the same time, the more *saturated* fat in the diet, the larger and fluffier the LDL—which is a beneficial effect.

So what are the actual mechanisms that explain all this stuff? Here's a simplified summary of some of them:

After we eat a carbohydrate-rich meal, the bloodstream is flooded with glucose, and the liver takes some of this glucose and transforms it into fat—i.e., triglycerides—for temporary storage. These triglycerides are no more than droplets of oil. In the liver, the oil droplets are fused to [lipoproteins]. The triglycerides constitute the cargo that the lipoproteins drop off at tissues throughout the body... This lipoprotein has a very low density, and so is a VLDL particle...

The liver then secretes this triglyceride-rich VLDL into the blood, and the VLDL sets about delivering its cargo of triglycerides around the body. Throughout this process,

the lipoprotein gets progressively smaller and denser until it ends its life as a low-density lipoprotein—LDL...

If the liver has to dispose of copious triglycerides [because of a high-carb diet], then the oil droplets are large, and the resulting lipoproteins put into the circulation will be triglyceride-rich and very low-density. These then progressively give up their triglycerides, eventually ending up, after a particularly extended life in the circulation, as the atherogenic [i.e., bad] small, dense LDL. This triglyceride-rich scenario would take place whenever carbohydrates are consumed in abundance...

Lipoproteins that cling to artery walls “begin the accumulation of fat and cholesterol that is characteristic of atherosclerotic plaques,” which cause heart disease.

What does insulin have to do with all this? Taubes’ discussion isn’t ideal, so I’ve had to do some investigating online. Insulin, produced in the pancreas, is released in response to increased blood glucose (sugar) levels. It transports the glucose to cells and tissues that use it for energy, and in doing so, it lowers blood sugar levels. It also takes the glucose to the liver, which uses it to synthesize and secrete triglycerides for storage in fat tissue. Problems arise if the conditions of *insulin resistance* and/or *hyperinsulinemia* (chronically elevated levels of insulin in the blood) are present. Insulin resistance is when cells don’t respond normally to insulin, with the result that glucose doesn’t get into the cells and instead builds up in the blood. If someone who is insulin-resistant eats a carbohydrate-rich diet, his pancreas will have to secrete even more insulin to try to get the glucose into cells; the higher insulin levels will prompt even greater production of triglycerides by the liver, and thus will raise triglyceride levels in the blood. Which increases the risk of heart disease.

Diabetes is a condition of chronically high blood sugar, but not everyone with insulin resistance or hyperinsulinemia becomes diabetic. Some people continue to secrete sufficient insulin to overcome their insulin resistance—but this hyperinsulinemia still causes problems by elevating triglyceride levels in the blood.

I’ve never known much about diabetes, so I’ll describe it briefly. Type 1 diabetes is a lifelong condition in which the pancreas makes little or no insulin, which means cells can’t absorb glucose. It thus builds up in the blood. Type 2 diabetes, which is much more common, is characterized by cells’ insulin resistance rather than the pancreas’s insufficient production of insulin. Ironically, diabetics can sometimes suffer from *low* blood sugar—but this often happens because they’ve taken too much insulin in their therapy or some other medication, or they’ve increased physical activity without eating more or adjusting their insulin dose, etc.

Why is chronically high blood sugar bad anyway? For one thing, it raises insulin levels, which themselves raise triglyceride levels. But there are other problems. Raising blood sugar increases the production of what are called *reactive oxygen species* (ROS) and *advanced glycation end-products* (AGEs), both of which are potentially toxic.

The former [ROS] are generated primarily by the burning of glucose (blood sugar) for fuel in the cells, in a process that attaches electrons to oxygen atoms, transforming the oxygen from a relatively inert molecule into one that is avid to react chemically with other molecules. One form of these reactive oxygen species are *free radicals*, and all of them are together known as *oxidants*, because what they do is *oxidize* other molecules... The object of oxidation slowly deteriorates. Biologists refer to this deterioration as *oxidative stress*. *Antioxidants* neutralize reactive oxygen species, which is why antioxidants have become a popular buzzword in nutrition discussions.

Oxidative stress is an important cause of cancer, arthritis, aging, autoimmune disorders, and cardiovascular and neurodegenerative diseases. So high blood sugar can be very bad indeed!

What about AGEs? These can be just as bad as ROS. Glycation is when a sugar molecule, like glucose, attaches to a protein (or a lipid or nucleic acid) without the benefit of an enzyme to control the

reaction. Since no enzyme is overseeing the process, “the sugar sticks to the protein haphazardly and sets the stage for yet more unintended and unregulated chemical reactions.” If blood sugar levels are fairly low, the sugar and protein will disengage and that’ll be the end of it. But if blood sugar is elevated, the process of forming AGEs will move forward, until a lot of AGEs will bind together and to other proteins, such that proteins that should have nothing to do with each other will be inexorably joined.

Since 1980, AGEs have been linked directly to both diabetic complications and aging itself (hence the acronym). AGEs accumulate in the lens, cornea, and retina of the eye, where they appear to cause the browning and opacity of the lens characteristic of senile cataracts. AGEs accumulate in the membranes of the kidney, in nerve endings, and in the lining of arteries, all tissues typically damaged in diabetic complications. Because AGE accumulation appears to be a naturally occurring process, although it is exacerbated and accelerated by high blood sugar, we have evolved sophisticated defense mechanisms to recognize, capture, and dispose of AGEs. But AGEs still manage to accumulate in tissues with the passing years, and especially so in diabetics, in whom AGE accumulation correlates with the severity of complications.

One protein that seems particularly susceptible to glycation and cross-linking is collagen, which is a fundamental component of bones, cartilage, tendons, and skin. The collagen version of an AGE accumulates in the skin with age and, again, does so excessively in diabetics. This is why the skin of young diabetics will appear prematurely old, and why...diabetes can be thought of as a form of accelerated aging, a notion that is slowly gaining acceptance. It’s the accumulation and cross-linking of this collagen version of AGEs that causes the loss of elasticity in the skin with age, as well as in joints, arteries, and the heart and lungs.

As one scientist says, “Part of the problem with diabetes, and aging in general [is that] you end up with stiff tissue: stiffness of hearts, lungs, lenses, joints... That’s all caused by sugars reacting with proteins.” Wow. It’s amazing what a panoply of negative outcomes—including aging itself!—can be caused by a high-carb diet.

But there is no reason to believe that glucose-induced damage is limited only to diabetics, or to those with metabolic syndrome, in whom blood sugar is also chronically elevated. Glycation and oxidation accompany every fundamental process of cellular metabolism. They proceed continuously in all of us. Anything that raises blood sugar—in particular, the consumption of refined and easily digestible carbohydrates—will increase the generation of oxidants and free radicals; it will increase the rate of oxidative stress and glycation, and the formation and accumulation of advanced glycation end-products. This means that anything that raises blood sugar, by the logic of the carbohydrate hypothesis, will lead to more atherosclerosis and heart disease, more vascular disorders, and an accelerated pace of physical degeneration, even in those of us who never become diabetic.

The reason that refined and simple carbohydrates like sugar and flour are especially bad is that, because they’re easier to digest, they produce a greater and faster rise in blood sugar and insulin after a meal. Complex carbohydrates such as starch take longer to digest, especially if they’re bound up with fiber (indigestible carbohydrates). They still aren’t great, though.

But it isn’t quite that simple, because the sugar we typically eat (sucrose), in addition to having glucose that goes straight into the bloodstream, also has fructose, which instead goes straight to the liver and therefore doesn’t elevate blood sugar. So for a long time it was thought that there’s nothing wrong with consuming a lot of fructose or even sucrose. In 1986, the FDA actually said sugar (sucrose) probably isn’t a dietary evil! A couple years later, so did the Surgeon General and the National Academy of Sciences. As

late as 2002, the Institute of Medicine of the National Academies of Science concluded there was still “insufficient evidence” to warn against consuming too much sugar!

But the point is that when fructose goes to the liver, it’s converted into triglycerides—fat—and then shipped out on lipoproteins for storage. Therefore, the more fructose in the diet, the more fat in the blood. The high-fructose corn syrup flooding the market in these decades (with the blessing of the FDA) thus contributed to the obesity epidemic and the diabetes epidemic. And the increase in heart disease. Fructose also is more prone to forming AGEs than glucose. And it helps cause insulin resistance. As well as hypertension.

—That’s something I haven’t mentioned, by the way: what causes insulin resistance? Later in the book, Taubes gives his answer: chronically high levels of insulin themselves cause it. When cells are having too much glucose constantly being pushed on them because of excessive glucose and therefore insulin in the blood, they get fed up and say “No more!” Websites, whether rightly or wrongly, mention other causal factors too: excess body fat (frequently a result, as we’ve seen, of consuming carbohydrates, which can be converted into fat), physical inactivity, stress, insufficient sleep, certain medications (like statins), etc. In short, the modern lifestyle and diet tends to lead to insulin resistance, metabolic syndrome, and diabetes.

These conditions are also associated with Alzheimer’s disease and cancer. Taubes’ discussion of the former is pretty complicated, but the upshot is that mechanisms have now been identified to make it plausible that eating excessive carbs and increasing insulin levels is a cause of Alzheimer’s. As for cancer, for a long time it was thought that fat and red meat were a significant cause. But by the end of the 1990s, according to Taubes, studies had largely refuted this “fat-cholesterol hypothesis.” Some research, on the other hand, had found that sugar intake was positively correlated with both the incidence of and mortality from colon, rectal, breast, ovarian, prostate, kidney, nervous-system, and testicular cancer.

This fact isn’t surprising, because many studies have shown that insulin provides fuel and growth signals to cancer cells. Already in the 1970s, researchers reported that malignant breast tumors had more receptors for insulin than did healthy tissue (implying that hyperinsulinemia would favor the growth of tumor cells). Also relevant is the insulin-like growth factor (IGF) secreted by the liver and other tissues. IGF sends growth and proliferation signals to cells, including to cancerous cells. But if insulin levels are high enough, insulin itself can stimulate cells’ IGF receptors—and can even make more IGF available to cells. What’s even worse is that tumor cells have more IGF receptors than healthy cells, just like they have more insulin receptors (to get the glucose they need to grow). So the chronically high levels of insulin and IGF induced by modern diets are great for cancerous cells.

In general, then, it seems that people will tend to live longer if they have low levels of insulin and IGF and low blood sugar. Experiments on mice, worms, and fruit flies have supported this hypothesis. When scientists have induced mutations in the genes that control both insulin and IGF signaling, the organisms have lived much longer than usual. For example, in 2003 researchers in Paris reported that mice with only one copy of the gene for the IGF receptor (which meant that cells would be relatively unresponsive to any IGF available in the blood) lived 25 percent longer than mice that had both copies of the gene.

The last part of the book is devoted to the science of obesity and the regulation of weight, which so far Taubes hasn’t said much about. He introduces his discussion this way:

The trouble with the science of obesity as it has been practiced for the last sixty years is that it begins with a hypothesis—that “overweight and obesity result from excess calorie consumption and/or inadequate physical activity,” as the Surgeon General’s Office recently phrased it—and then tries and *fails* to explain the evidence and the observations. The hypothesis nonetheless has come to be perceived as indisputable, a fact of life or perhaps the laws of physics, and its copious contradictions with the actual observations are considered irrelevant to the question of its validity. Fat people are fat because they eat too much or exercise too little, and nothing more ultimately need be said.

A National Academy of Sciences report years ago contradicted this idea when it concluded that “Most studies comparing normal and overweight people suggest that those who are overweight eat fewer calories than those of normal weight.” It’s also noteworthy that percentage of fat in the diet decreased from the 1970s on, when the population’s weight was increasing. Presumably, then, low-fat diets aren’t a good way to lose weight. (Studies have confirmed this. For instance a Cochrane Collaboration study in 2002 and a USDA analysis in 2001. Semi-starvation diets are typically ineffective as a treatment of obesity.)

Regarding the “sedentary behavior is responsible!” hypothesis, evidence accumulated by the CDC and other agencies suggested that in the 1990s, for example, Americans were no less physically active at the end of the decade than at the beginning, despite the continued rise in weight and obesity in those years. Besides, while low-income people tend to be more overweight, they are often the hardest-working people in society. They frequently work at more physically demanding jobs, or they work several jobs to make ends meet.

Or think of the women among the Pima Indians in southwestern Arizona over a century ago. They were usually more obese than the men despite working much harder, spending their days harvesting crops and grinding corn, wheat, and mesquite beans. It’s more likely that their relatively new Western diets full of sugar and flour were to blame.

Exercise just isn’t a good way to lose weight. It rarely works well, especially in the long term. Study after study has confirmed this, not to mention a ton of anecdotal evidence. And it’s hardly surprising: as one physician calculated in 1942, “a 250-pound man will have to climb twenty flights of stairs to rid himself of the energy contained in one slice of bread!” Besides, when you’re physically active, you work up an appetite, so you tend to eat more.

Obesity epidemics, by the way, are hardly a phenomenon unique to the contemporary world. Taubes gives paragraph after paragraph of examples of extreme weight gain among poor populations in non-industrialized or semi-industrialized societies. Here’s a sample:

In a 1959 study of African Americans living in Charleston, South Carolina, nearly 30 percent of the adult women and 20 percent of the adult men were obese although living on family incomes of from \$9 to \$53 a week. In Chile in the early 1960s, a study of factory workers, most of whom were engaged in “heavy labor,” revealed that 30 percent were obese and 10 percent suffered from “undernourishment.” Nearly half the women over forty-five were obese. In Trinidad, a team of nutritionists from the United States reported in 1966 that one-third of the women older than twenty-five were obese, and they achieved this condition eating fewer than two thousand calories a day—an amount lower than the United Nations’ Food and Agriculture Organization recommendation to avoid malnutrition. Only 21 percent of the calories in the diet came from fat, compared with 65 percent from carbohydrates.

Taubes spends many, many pages arguing against the still-common idea that obese people simply eat too much and/or aren’t physically active enough. The upshot of his discussion is that genetic, hormonal, and metabolic processes are why some people get fat when others don’t despite having comparable diets. “Some of us simply seem predisposed, if not fated, to put on weight from infancy onward.” Rather than someone’s getting fat being driven by hunger and sedentary behavior, hunger and sedentary behavior can be driven by a hormonal disposition to be overweight—“just as a lack of hunger and the impulse to engage in physical activity can be driven by a metabolic-hormonal disposition to burn calories rather than store them.” Some bodies are predisposed to burn up excess calories in cellular metabolism and increased physical activity, whereas other bodies are predisposed to store excess calories. “The ability to burn up small excesses...on the order of a few hundred calories [consumed in excess] a day, is ‘well within the capacity of the ordinary person, but in the obese individual the power of flexibility is much less evident.’” Thus, “a critical variable in the facility with which we gain weight is whether we respond to superfluous calories by storing them away as fat and/or muscle or by converting them to heat and physical activity.”

The body's internal regulation to maintain a homeostatic equilibrium is a major reason why dieting often doesn't result in a significant loss of weight. Restricting calories induces a slowing of metabolic rate, i.e., a reduction of energy expenditure in the body (less energy going to cells) to compensate for the loss of calories. People also get lethargic and less physically active because the body has slowed down the metabolism to compensate for the fewer calories coming in. Even semi-starvation diets might not accomplish much, especially in the long term.

Low-carb diets are a different story. By now, it's widely known that people can lose a lot of weight on such a diet, so I needn't go through the many studies Taubes describes. (You can lose weight by consuming as many calories as usual, as long as those calories don't include carbs.) I should mention a few points, though, such as the common objection that one has to consume enough carbs for the brain and nervous system to get their necessary fuel from glucose. Here's a useful paragraph:

Though glucose is a primary fuel for the brain, it is not the only fuel, and dietary carbohydrates are not the only source of that glucose. If the diet includes less than 130 grams of carbohydrates, the liver increases its synthesis of molecules called ketone bodies, and these supply the necessary fuel for the brain and central nervous system. If the diet includes no carbohydrates at all, ketone bodies supply three-quarters of the energy to the brain. The rest comes from glucose synthesized from the amino acids in protein, either from the diet or from the breakdown of muscle, and from a compound called glycerol that is released when triglycerides in the fat tissue are broken down into their component fatty acids. In these cases, the body is technically in a state called ketosis, and the diet is often referred to as a ketogenic diet.

This keto diet, you may know, has become popular for losing weight. And it works: ketosis is when the body burns stored fat for energy instead of glucose, so of course if you stay on the diet long enough, you'll probably lose fat.

But how healthy is a keto diet if you stay on it for years? It seems to be perfectly healthy, despite what nutritionists and authorities may say. In fact, even an *all-meat* diet can be healthy! To give one example, in the early twentieth century the Harvard anthropologist Vilhjalmur Stefansson spent a decade eating nothing but meat among the Inuit in northern Canada, who he insisted were completely healthy and vigorous.

We still constantly hear that a varied diet is necessary for good health, but this appears to be false. You don't really have to eat fruits and vegetables. Animal products contain all the essential amino acids and also twelve of the thirteen essential vitamins in large quantities. Only vitamin C is present in *small* quantities in animal foods. This is why nutritionists think that to avoid scurvy you have to eat fruits and vegetables. But, well, evidently that wasn't true of the Inuit. Nor of other traders and explorers, such as Richard Henry Dana and his sailing crew in the mid-nineteenth century, who ate nothing but meat for sixteen months with no adverse consequences. Nor of Stefansson and another guy when they participated in a yearlong experiment (in 1929) overseen by scientists from Cornell and the Russell Sage Institute of Pathology. They ate nothing but meat, and were continually monitored and tested to make sure they weren't cheating. By the end of the year they were in perfect health: had lost a few pounds of fat, had low blood pressure, no kidney damage or diminished function (as is thought to be a consequence of a high-protein diet), no scurvy, and Stefansson's gingivitis had cleared up.

So why didn't they suffer from scurvy? Because a vitamin-C deficiency is yet another effect of consuming a lot of sugar and refined carbohydrates! (Same with the B vitamins.) So if you cut out the carbs, you don't need a ton of vitamin C. The reason is that glucose and vitamin C use the same insulin-dependent transport system to get into cells, meaning they effectively compete against one another. If you increase blood-sugar levels, the cellular uptake of vitamin C drops. To overcome this adverse effect of sugar, it helps to eat fruits and vegetables.

Another interesting conclusion from scores of experiments is that people can eat fewer calories in the form of fats and proteins and they won't feel hungry, whereas they can eat far more calories in the form

of carbohydrates and will still feel hungry. The medical-research establishment is apparently unable to explain this stubborn fact, but it cries out for an explanation. Just as the idea that you can lose weight while eating unrestricted amounts of fat and protein demands an explanation.

But I want to note, first, how contemptible, destructive, and arrogant the “experts” have always been on these issues. (As on so many others relating to politics, economics, history, and everything else.) “Claims that weight loss occurs even with high-caloric intake, but no carbohydrates, are absurd,” the American Medical Association declared in 1974 and insisted for a long time, dismissing studies, a ton of anecdotal evidence, and the testimony of physicians and patients. Even today you still constantly see false claims and bad recommendations on the websites of organizations like the AMA and the American Heart Association. *You simply cannot ever trust what “the experts” say, on any given topic. Experts are nothing but embodiments of political institutions and interests.* Millions upon millions of lives have been ruined and ended by the perverse medical advice of so-called experts. When good science contradicts their politically approved dogmas, they’ll do everything they can to suppress it and ignore it.

For a long time, “experts” have thought that overeating and sedentary behavior are the causes of obesity, and the cure is to create a caloric deficit by eating less and/or expending more. But the truth is that overeating and inactivity are typically side effects of a metabolic and hormonal defect that prevents cells from getting the energy they need because calories, instead of going to the cells that need them, are being excessively deposited into fat tissue. “We overeat because we’re getting fat, not vice versa.” The body is trying to compensate for the inadequate energy it’s getting—as a result of the metabolic/hormonal defect that causes too much food to be deposited in adipose (fat) tissue—by inducing overeating...which itself then contributes to the obesity and *still* doesn’t allow cells to get enough energy! In a sense, the body is being internally starved even as it’s growing larger and larger.

The hormonal defect is determined primarily by genetic inheritance, but in order for the defect to actually show up it has to be triggered by environmental factors, namely diet. “Since insulin is the hormone responsible for promoting the incorporation of fat into our adipose tissue and the conversion of carbohydrates into fat, the obvious [dietary] suspects are refined carbohydrates and easily digestible starches, which have well-documented effects on insulin.”

In this hypothesis, obesity is another variation on the theme of insulin dysfunction and diabetes. In Type 1 diabetes, the cause is a lack of insulin. The result is an inability to use glucose for fuel and to retain fat in the fat tissue, leading to internal starvation, excessive hunger, and weight loss. In obesity, the cause is an excess of insulin or an inordinate sensitivity to insulin by the fat cells; the result is an overstock of fuel in the adipose tissue and so, once again, internal starvation. But now the symptoms are weight gain and hunger. In obesity, the weight gain occurs with or without satisfying the hunger; in Type 1 diabetes, the weight loss occurs irrespective of the food consumed.

As a brilliant physician named Alfred Pennington wrote in the 1940s-50s, “What happens when low-calorie diets are applied is that the starved tissues of the obese are starved further.” A more rational treatment would be one that makes fat flow readily out of the fat cells, that directs “measures primarily toward an *increased* mobilization and utilization of fuel” by the muscles and organs. He argued that this is what carbohydrate restriction accomplished. As Taubes says, “the cells would respond to this increased supply of fuel by accelerating the rate of metabolism—utilizing the fuel.” Meanwhile, the person’s appetite would decrease because of the accelerated flow of fat out of the adipose tissue, which itself, again, is a result of the faster metabolism, the heightened burning of energy in cells, triggered by a low-carb diet. The person would eat less because his fat tissue was shrinking, rather than—according to the conventional mainstream hypothesis—his fat tissue shrinking because he was eating less.

Of course, obesity is more complex than just carbs, insulin, and genes. For one thing, regarding any particular individual, *where* he gains weight is determined by the *lipophilia* (“love of fat”) of that region. He or she might have a double chin or fat thighs or buttocks or ankles or a “beer belly”—and in many cases, it wasn’t by eating too much or because of a general metabolic defect. It’s more *local* than that. As a German

endocrinologist named Julius Bauer said in the early twentieth century, “the genes responsible for obesity act upon the local tendency of the adipose tissue to accumulate fat (lipophilia) as well as upon the endocrine glands and those nervous centers which regulate lipophilia and dominate metabolic functions and the general feelings ruling the intake of food and the expenditure of energy. Only a broader conception such as this can satisfactorily explain the facts.” Taubes elaborates:

Those of us who seem constitutionally predisposed to fatten simply have adipose tissue that is generally more lipophilic than that of lean individuals; our adipose tissue may be more apt to store fat or less willing to give it up when the body needs it. And if our adipose tissue is so predisposed to accumulate excessive calories as fat, this will deprive other organs and cells of nutrients, and will lead to excessive hunger or lethargy.

Even in cases of undernutrition, the abnormal lipophilic tissue might seize on foods and increase its stock at the expense of the whole organism, which could put the energy to better use. Bauer also suggested that insulin enhanced the deposition of glucose in the adipose tissue, exacerbating the problem of lipophilic tissue.

American “experts” ignored Bauer’s ideas, but research on laboratory animals has supported them. Genetically obese mice will fatten regardless of how much they eat. Even if they’re starved, their bodies will prefer to consume the protein in their muscles and organs rather than the fat in their adipose tissue. They’ll even starve to death while they still have fat in them, far more fat than lean mice that are allowed to eat as much as they want!

Here’s an interesting piece of trivia, by the way. We’re all familiar with squirrels that double their body weight in late summer to prepare for hibernation during the winter. We assume the way they double their weight is by eating much more. It turns out that’s not true. Even if they’re forced in laboratories to eat only as much as they ate in April, they’ll still gain the weight they need. “The seasonal fat deposition is genetically programmed—the animals will accomplish their task whether food is abundant or not. If they didn’t, a single bad summer could wipe out the species.”

Let’s go into more depth about insulin. One of its functions, as I’ve said, is to lower blood sugar by facilitating the entry of glucose into cells—which is why diabetics, who have high blood sugar, need insulin therapy. In 1905, a German physician named Carl von Noorden argued that diabetes and obesity are consequences of the same defects in the mechanisms that regulate carbohydrate and fat metabolism. Updating his ideas to take account of the role of insulin, we can say that Type 1 diabetics, who can’t produce insulin, are unable either to use blood sugar as a source of energy or to convert it into fat (triglycerides) and store it—because insulin is crucial to this process too. So the body allows glucose to overflow into the urine, resulting in glycosuria, a primary symptom of diabetes. In the era before the discovery of insulin and insulin therapy, these diabetics became emaciated and wasted away because they couldn’t store fat.

In obese people, on the other hand, the ability to get glucose into cells for energy is impaired, but not the ability to convert it to fat and store it. So instead of excreting glucose into the urine, they transfer it to fat tissue. Von Noorden argued that over time, as the ability to burn glucose for energy further deteriorates and “the storage of the carbohydrates in the fat tissues also suffers a moderate and gradually progressing impairment” (perhaps there’s less room in the tissue for as much deposition of fat as before?), glucose chronically builds up in the blood, appears in the urine, and the person becomes diabetic. This is the transition from obesity to Type 2 diabetes.

After insulin was discovered in 1921, it began to be used as a fattening hormone for chronically underweight patients. Insulin therapy increased their appetite for carbohydrates, and the latter in turn stimulated their insulin production (to deposit glucose both in cells that burned it as energy and in adipose tissue as fat), in a cycle that eventually brought them to a normal weight. Unfortunately for diabetics, this cycle makes them fatter, even when they’re obese to begin with. So insulin therapy for diabetics is very much a mixed bag, especially because the weight gain increases the risk of heart disease. (It also causes greater insulin resistance in cells, which leads to the need for even *more* insulin therapy, causing greater weight gain, etc.)

But why, on a *molecular* level, do we get fat? What are the *actual mechanisms* going on? Taubes' summary of the science of fat metabolism is fascinating and lengthy, but I can only describe some of the highlights. It was all understood by the 1970s, but somehow it still hasn't been fully absorbed by mainstream thinking about human obesity. Scientists used to think that fat tissue (all over the body—under the skin, between organs, even in bones) is relatively inert, like a garbage can into which fat is deposited, but nothing could be farther from the truth. The triglyceride in the cells of adipose tissue is in a continuous state of flux, going into and out of cells according to the body's momentary needs, all of it regulated by hormones and nerves that profusely crisscross the tissue.

A triglyceride molecule is composed of three fatty acids linked together on a backbone of glycerol. Some of the triglycerides in fat tissue come from fat in our diet, while the rest come from carbohydrates. Fat is stored in fat cells in the form of triglycerides, but it enters and exists the cell in the form of free fatty acids (triglycerides are too big to slip through the cell membrane). It's these fatty acids that, along with glucose, are burned as fuel in cells. As soon as free fatty acids pass into a fat cell, they're immediately repackaged with glycerol into triglycerides, which themselves are continuously broken down (inside the cell) into free fatty acids. Back and forth, assembly and disassembly are constantly going on inside these fat cells. Fatty acids that *aren't* immediately assembled into triglycerides slip back out of the cell and into the blood circulation again, where many of them will be taken up by tissues and organs to be used as fuel. Those that aren't—maybe about half—will go into the liver and be turned again into triglycerides, where they'll be loaded onto lipoproteins (VLDL particles) and shipped back to the fat tissue for storage.

This incredibly dynamic and repetitive process, this continuous flow of fatty acids out of fat cells and into the circulation, depends on the level of glucose in the blood. A single molecule, called *glycerol phosphate*, is pivotal to the whole system. This molecule is produced from glucose when it's used for fuel in fat cells and the liver, and it (glycerol phosphate) is essential to the binding of three fatty acids into a triglyceride because it provides the glycerol molecule that links the three acids together.

In fact, the rate at which fatty acids are assembled into triglycerides, and so the rate at which fat accumulates in the fat tissue, depend primarily on the availability of glycerol phosphate. The more glucose that is transported into the fat cells and used to generate energy, the more glycerol phosphate will be produced [as a byproduct of the burning of glucose]. And the more glycerol phosphate produced, the more fatty acids will be assembled into triglycerides. Thus, anything that works to transport more glucose into the fat cells—insulin, for example, or rising blood sugar—will lead to the conversion of more fatty acids into triglycerides, and the storage of more calories as fat.

So you can already see why a high-carb diet can lead to weight gain: you need glucose to form triglycerides, and the more glucose there is in the blood, the more triglycerides. With low blood sugar, fewer fatty acids are bound up into triglycerides and more can escape into the blood, where they can be burned up as fuel in tissues and organs. With high blood sugar, more glycerol phosphate is produced (by cells' use of glucose as fuel), which in turn increases the conversion of fatty acids into triglycerides, “so that they're unable to escape into the bloodstream at a time when they're not needed” (since the glucose that's circulating can be used for cells' energy needs).

In fact, without at least some carbohydrates in the diet, it may be impossible to accumulate any excess body fat at all. For there won't be any glycerol phosphate to create triglycerides (fat molecules). As an endocrinologist named Edgar Gordon wrote in 1963, “It may be stated categorically that the storage of fat, and therefore the production and maintenance of obesity, cannot take place unless glucose is being metabolized. Since glucose cannot be used by most tissues without the presence of insulin, it also may be stated categorically that obesity is impossible in the absence of adequate tissue concentrations of insulin.” Lower concentrations of insulin in the blood will therefore allow more fatty acids to flow out of adipose tissue, thus facilitating the body's weight reduction.

It should also be clear now why a kind of “internal starvation” can take place in the presence of high blood sugar, insulin, and obesity. For as more and more fatty acids are fixed in the fat tissue (due to

the abundance of glycerol phosphate), energy available to cells all over the body is reduced by the “relative unavailability of fatty acids for fuel.”

Another important point is that fructose is converted into glycerol phosphate more efficiently than is glucose. This is why fructose is considered the most *lipogenic* (fat-producing) carbohydrate. However, glucose is still needed to stimulate the pancreas to secrete insulin. What this suggests is that the combination of glucose and fructose—either in sucrose (table sugar) or in high-fructose corn syrup—is the best formula for stimulating fat synthesis and storing fat in the body’s tissues. No wonder obesity rates have climbed as high-fructose corn syrup has conquered American diets since the 1970s.

What about lipophilia? Why do some parts of the body accumulate more fat than others? Insulin is relevant here, too. It has to do with an enzyme called lipoprotein lipase.

A critical enzyme in this fat-distribution process is known technically as lipoprotein lipase, LPL, and any cell that uses fatty acids for fuel or stores fatty acids uses LPL to make this possible. When a triglyceride-rich lipoprotein passes by in the circulation, the LPL will grab on, and then break down the triglycerides inside into their component fatty acids. This increases the local concentration of free fatty acids, which flow into the cells—either to be fixed as triglycerides if these cells are fat cells, or oxidized for fuel if they’re not. The more LPL activity on a particular cell type, the more fatty acids it will absorb, which is why LPL is known as the “gatekeeper” for fat accumulation.

Insulin is the main regulator of LPL activity, and the regulation functions differently between tissues and sites in the body. “In fat tissue, insulin increases LPL activity; in muscle tissue, it decreases activity. As a result, when insulin is secreted [because of the consumption of carbohydrates], fat is deposited in the fat tissue, and the muscles have to burn glucose for energy. When insulin levels drop [as with high-fat diets], the LPL activity on the fat cells decreases and the LPL activity on the muscle cells increases—the fat cells release fatty acids, and the muscle cells take them up and burn them.” So this is another reason the body tends to lose fat on fatty diets.

LPL activity is also affected by sex hormones, age, weight, and other factors. Women have greater LPL activity in their adipose tissue than men, which “may be one reason why obesity and overweight are now more common in women than in men.” Testosterone suppresses LPL activity in abdominal fat but has no effect on LPL in the hips and buttocks. So increasing fat accumulation in the abdomen as men age may be a result of both increasing insulin and decreasing testosterone.

The obese have increased LPL activity in their fat tissue, so they gain more weight. As for diet, it seems that LPL activity in fat tissue increases with weight loss on a calorie-restricted diet and decreases in muscle tissue, causing fat to remain in fat tissue rather than being burned up by muscles. So this is another reason why low-calorie diets, unless they’re extreme, might not be very effective in losing weight.

The science of fat metabolism, in short, is pretty unequivocal about the evils of carbohydrates (especially carbohydrate-dense starches and refined carbohydrates) and the benefits of dietary fat. And this science was thoroughly understood by the 1970s. Nevertheless, it’s precisely in the 1970s and 1980s that most authorities began saying high-carb diets weren’t the main problem! An enormous amount of evidence, presented at numerous conferences and in journal articles and books, already indicted such diets, but this had no effect on the developing consensus that fatty diets caused obesity and heart disease. I know it must be annoying to people who read my writings how often I harp on the theme that professional “intellectuals,” especially authorities, rarely have intellectual integrity, but as you can see, the evidence is pretty compelling.

To give just one example:

[In the 1960s and 1970s, authorities on nutrition] would readily admit that they didn’t know what caused obesity (why [as they saw it] some people ate too much and others didn’t) and that calorie restriction conspicuously failed to cure it. After nearly twenty years in the field, as Jean Mayer wrote in the introduction to his 1968 monograph, *Overweight*, he was “as

aware as any man of the gigantic gaps in our knowledge—and of the likelihood that many of our present concepts may be erroneous.” He also noted, in his discussion of hormonal influences on obesity, that insulin “favors fat synthesis” and that someone who oversecretes insulin could “tend to become hungry as a result.” But when a physician suggested publicly, as Dr. Atkins did, that carbohydrates raised insulin levels, that insulin favors fat synthesis, and that a diet lacking carbohydrates might reverse this process, these nutritionists would denounce it, as Mayer himself did in 1973, as “biochemical mumbo-jumbo.”

The highly respected Harvard nutritionist Fred Stare ridiculed the Atkins diet, which recommended large amounts of meat and eggs, as “nonsense,” and condemned the author as “guilty of malpractice.” Of course, the exact reverse was closer to the truth.

The American Medical Association, which has a hideous history (it’s an important reason, for example, why the U.S. doesn’t have national healthcare), even officially censured Atkins’ bestselling book, inadvertently demonstrating in its denunciatory report that a man with no ties to the medical establishment had a better understanding of the science of fat metabolism than the establishment.

As I’ve already noted, it isn’t irrelevant that the authorities who were defending sugar and carbs (like Fred Stare’s department at Harvard) received a lot of money from the sugar industry and the soft-drink industry. Taubes gives some sordid examples.

The book’s last chapter before the epilogue is an interesting discussion of the causes of the feelings of hunger and satiety, but I won’t go into detail on that. I’ll just say that, based as usual on his prodigious research, Taubes concludes (following the brilliant French scientist Jacques Le Magnen, who died in 2002) that the sensation of satiety is promoted by “anything that induces fatty acids to escape from the fat tissue and then be burned as fuel,” because the body will be getting the energy it needs and won’t have to keep eating. Contrariwise, anything that induces fat synthesis and storage, such as the elevation of insulin caused by carbohydrates, will promote hunger (at least relatively speaking) by removing the available fuel from the bloodstream. And it does seem from experience that a carbohydrate-rich meal is usually less filling than a protein-rich and fat-rich meal. For instance: “why is it that most of us can imagine eating a large bag (twenty ounces) of movie popcorn—more than eleven hundred calories if popped in oil, as it typically is—but not so the equivalent caloric amount of cheese: say, fifteen slices of American cheese, or a cup and a half of melted Brie?” It’s a good question.

The simple explanation is that the insulin induced by the carbohydrates serves to deposit both fats and carbohydrates (fatty acids and glucose) as fat in the adipose tissue, and it keeps those calories fixed in the adipose tissue once they get there. As long as we respond to the carbohydrates by secreting more insulin, we continue to remove nutrients from our bloodstream in expectation of the arrival of more, so we remain hungry, or at least absent any feeling of satiation. It’s not so much that fat fills us up as that carbohydrates prevent satiety, and so we remain hungry.

The role of insulin in stimulating hunger is also suggested by Le Magnen’s experiments on rats. When he “infused insulin into sleeping rats, they immediately woke and began eating, and they continued eating as long as the insulin infusion continued. When during their waking hours he infused adrenaline—a hormone that promotes the mobilization [i.e., loss] of fatty acids from the fat tissue—they stopped eating.”

In short, this book is an epic takedown of high-carb diets. In fact, it’s one of the best works of popular science I’ve ever read, practically a work of genius in its synthesis of an unbelievable amount of research. It isn’t the easiest of reads, and it’s a bit repetitive, but it illuminates a vast range of phenomena that are systematically obscured by most medical, scientific, and political authorities. One reviewer said it’s “easily the most important book on diet and health to be published in the past one hundred years.” Of course it doesn’t clear up everything—I still have a lot of questions about the etiology of heart disease and other conditions—but on what it does cover, it’s darned compelling.

September

I know we're not supposed to acknowledge that women, like men, are human and have faults, but the fact is that they're human and they have faults. For instance, there's a pronounced tendency for them to be, in some regards, quite primitive and shallow (like men). I was recently on a date at the end of which the woman indicated that I was too thin and not tall enough for her to be attracted to me. (5'10", 165 pounds.) I appreciated her candor, frankly! Usually females hem and haw about chemistry and whatnot, but here at least was an honest one. She was speaking for a substantial proportion of her sex. If I were over six feet tall and bulkier than I am, my dating history would have been very different. Because females love male dominance. *They tend to be hyper-attuned to a man's status.* Male strength indicates status. So does height. Alternatively, you could be fat, but if you're rich or powerful, they'll gravitate to you. And your status will actually matter to them—they won't just be play-acting. If you're a fat emperor or a chubby celebrity, most women will be interested in you, because of your status. They like a Brad Pitt because his handsomeness suggests high status.

(Men are less concerned with a woman's status. They'll still, in all likelihood, want to have sex with a beautiful woman even if society judges her, for whatever reason, to be of a low status. A good-looking man with a low status, on the other hand, will be of little interest to the average woman.)

Anyway, if you want to understand gender relations, one word suffices: *schismogenesis*. David Graeber and David Wengrow use this concept in their book *The Dawn of Everything*, but it can be applied to other domains than they use it for. The most obvious is gender. Men and women naturally define themselves in relation, i.e. in opposition, to one another. Therefore, in probably all societies, women are associated with...female sexuality and a few things closely tied to it (sex, raising children, caring for people, dancing, etc.), while men are associated with...almost everything else. E.g., hunting, politics, protecting the community, providing leadership, creating art and music, writing, philosophy, science, humor, sports, building things, technology, war, exploring the world, and so on. Because of women's biological functions, the feminine realm has typically been rather circumscribed, leaving the rest of life to be dominated by men. It's schismogenesis. A useful (if obvious) concept. Which is why you'll rarely see it used by an academic, at least in the context of explaining gender.

The contrasts in gender roles aren't absolute, but there always have been and always will be contrasting *tendencies*.

Equally obvious, and therefore denied by "gender theorists" (ideologists), is that nature itself has, in some respects, followed a kind of schismogenetic principle in drawing the blueprints for the physiology and psychology of the sexes. Biologically and psychologically, men and women generally complement one another, as Plato and every other minimally sensible thinker has said.

Here's another way to say it. The sexes want to attract each other. Men tend to find relative female receptiveness, giggliness, objecthood, and weakness attractive, so it's hardly surprising that women embrace these (biologically conditioned) roles. Women, on the other hand, find male dominance and strength attractive, so men naturally cultivate those traits. Gender is very simple and natural, notwithstanding sixty years of academic attempts to complicate it.

*

It's starting to bother me more that I only see Aidan every three weeks, that I can't see him at the end of every day. But there's nothing to be done about it. I'm going to miss so much in the next few years. He's a sensitive and adorable little boy. We watched a short cartoon set to "The Flight of the Bumblebee," and near the end a flower managed to gobble up the bumblebee (until he was saved by his friends). Aidan started crying very hard when he saw that, it seemed almost traumatizing to him. But now he loves watching that video, he gets very excited and sometimes anxious in a lighthearted way. "Bzzz! It's going to the flowoo! It's trying to look some for food [sic]." "It's closing [on] the bumblebee! It's trying to catch him!

Oh oh oh oh oh oh!”—while flapping his arms and hands up and down, a movement he often makes when excited or upset. “We can look some for bumblebees later! That’s fun! We’ve got to go outside and find these bumblebees.”

Another time he pointed at a wasp walking on the ground. “A little bug!” “Yeah, a little wasp,” I said. “A little waft,” he repeated. “It’s not a little train.” The conceptual connections children make are pretty funny.

It’s interesting to observe the development of the ability to pretend. Last month, while holding one of his regular conversations with himself, he lined up a couple of toy cars and said, “3, 2, 1, go! We didn’t wait yet. Dere’s a red sign over dere [while pointing]. And the wight turns green, and then we go.” Imagining pretend situations like this is another manifestation of the human capacity to go beyond what is immediately given in sensation, whether it takes the more primitive form of perceptually and conceptually structuring sensations (categorizing them as the kind of thing they are) or the more advanced ability to imagine perceptions that aren’t even there. The human mind separates itself from the environment, cognitively processes it, reworks it in imagination, brings memories into relation with what it sees at that moment, imposes mini-narratives on what it’s seeing, and adds an emotional valence to certain perceptions by considering them in relation to particular desires and fears—including the (empathized) desires and fears of others. When Aidan cried because the cartoon bumblebee was engulfed by the flower, he was implicitly imagining or ‘understanding’ the bumblebee’s fear, its desire to escape the flower, and semi-identifying with it. (He didn’t *completely* identify with it, because he still saw the bee as something separate from him, an other. It wasn’t *he* who was trapped by the flower, it was the bee. But his deep emotional response showed that in some sense, somehow, he adopted the point of view of the bee. The “phenomenology” of all this, of what is going on in consciousness and how such a response to someone else’s experience is possible, is pretty obscure. What is the psychological “meaning” of this intense empathy/sympathy? I should read the great phenomenologist Dan Zahavi to see what he has to say about empathy.)

Anyway... The mind/brain largely creates its world. Observing the maturation of a child’s brain is observing the deepening and enriching of its ability to create its own world, to add more and more dimensions to its perceptual experience.

—Speaking of phenomenology: it’s hilarious that one of the central experiences of life, the domain of intersexual relations, has always been almost off-limits to phenomenological analysis. As far as I know, hardly any phenomenologist has ever probed it in depth! Why? Because of the anti-feminist conclusions you’ll inevitably come to! Feminism has made it impossible to be *intellectually honest* about an overwhelmingly important area of human life. If you say anything some silly feminist won’t like, your career might be jeopardized. I’ve always considered the totalitarian hegemony of an irrational type of feminism to be one of the most striking illustrations of the fraudulence of academia.

*

The brilliant Hassan Nasrallah, leader of Hezbollah, is dead. Israel is killing thousands of Lebanese left and right, plus Gazans—probably more than 300,000 by now. This worse-than-Nazi state is completely out of control, because the U.S. continues to psychotically and irrationally send it all the weapons it needs to carry out its genocidal ambitions. (It’s worse than Nazi Germany because most Germans didn’t fanatically support extermination of all European Jews, whereas nearly all Israelis support extermination of Palestinians.) It deserves to be wiped off the face of the earth, like Nazi Germany.

I accompanied Norman Finkelstein on one of his long daily walks for the first time in over a year. He was “shattered” by Nasrallah’s death, and is writing a book on the genocide and UN human rights organizations’ unwillingness to call it by its name. He’s a good conversationalist, more loquacious than me. A very generous guy too. Apparently some years ago he took in a homeless man for two and a half years, and another homeless guy we talked to had declined Norm’s offer to pay for his college education. He’s befriended many of the down-and-out people in his neighborhood, plus various immigrants and others. Has a great sense of humor too. An unusual person, a “true original.”

He also gave me some dirt on famous leftists. Evidently the great journalist Alexander Cockburn was an asshole, more so (in some respects) even than Christopher Hitchens; Tariq Ali and Perry Anderson are wildly rich (why don't they use their money to expand left-wing media infrastructures and support *Truthout*, *The Intercept*, and other struggling publications?!); Angela Davis charges \$50,000 to give a talk; Edward Said was a fairly typical academic snob; and Chomsky, beneath the humble exterior, is, naturally, very arrogant. But when you're Chomsky, to be arrogant is just to be rational, because he *is* unique. Unlike nearly all academics, he treats everyone, whether a famous Harvard professor or someone educated at a community college, more or less equally—because, as Finkelstein says, he's conscious that they're all beneath him! An interesting case of extreme arrogance motivating, or helping to motivate, equal treatment of everyone, by way of a sense of *noblesse oblige*: he feels an obligation to share his astonishing mind and knowledge with everyone, whatever their status. And he isn't impressed by the status of those in the elite, because he's above them.

October

Dan Zahavi's lengthy discussion of empathy in *Self and Other: Exploring Subjectivity, Empathy, and Shame* (2014) is quite complicated, but it's a good survey of the debates and the ideas that have been proposed. As usual, in the end one is left feeling that there's something misguided and masturbatory about all the incredible subtleties and dozens of little distinctions and scores of disagreements among academics, from Theodor Lipps, Max Scheler, Husserl, Heidegger, and the like to Alvin Goldman, Marco Iacoboni, Vittorio Gallese, Pierre Jacob, and many others. The correct point of view will acknowledge the merits of all the different approaches. Zahavi, of course, favors a phenomenological approach, which “differs rather markedly from recent attempts to explain empathy in terms of mirroring, mimicry, imitation, emotional contagion, imaginative projection, or inferential attribution.” For the phenomenologist Scheler, for instance, we are empathically able to directly experience, to *perceive*, other minds, or at least certain aspects of other minds. “For we certainly believe ourselves,” he writes, “to be directly acquainted with another person's joy in his laughter, with his sorrow and pain in his tears, with his shame in his blushing, with his entreaty in his outstretched hands, with his love in his look of affection...and with the tenor of his thoughts in the sound of his words.”

“For Scheler,” Zahavi writes, “empathy is what allows me to experience other subjects. It neither entails that the other's experience is literally transmitted to me, nor does it entail that I undergo the experience I perceive in the other...” That's certainly plausible enough. Scheler distinguishes between empathy and sympathy: “Whereas empathy has to do with a basic perceptually based understanding of others, sympathy adds an emotional response.”

Likewise, for Husserl's student Edith Stein, empathy (as Zahavi summarizes) “is the basic cognitive source for our comprehension of other subjects and their experiences, and it is what more complex kinds of social cognition rely on and presuppose.”

Anyway, I'm not about to summarize the entire chapters-long discussion. Mirror neurons are, of course, another important element in explaining how we can understand others' states of mind.

My own answer would be more *explanatory* than other phenomenologists', drawing on my analyses from many years ago. We can understand and, to some extent, identify with others *only because we are our own other*, though not in the same way other people are 'other.' Self-consciousness has a kind of self-other structure, inasmuch as it (the self) is aware of itself. (I can, and to some degree always do, view myself as an object for myself, and can evaluate myself, etc.) When I perceive other people and, more or less accurately, their states of mind, the abstract otherness in my own mind is partially instantiated, so to speak, in those other people. It is at that moment associated with them, sort of “projected” (in a very *thin* way) into (my experience of) them, so that they are thinly internalized at that moment in my mind. I'm not actually experiencing their emotions, nor do I have to have experienced their exact emotion at some point in my life in order to ‘understand’ it. But in a thinner way, I can immediately grasp what kind of experience they're having, what their response to it is, *why* their response is such, and what the context is. This can only be

because I implicitly see them as being(s) like me (in the relevant respects), which presupposes that I can sort of project my consciousness, or rather my (human) ‘mode’ of consciousness, into them, albeit while still being aware that they’re *other* than me.¹ (This awareness is possible because I’m other than myself, or, to say it differently, otherness is inherent in my self-experience. So *everything* I encounter is other than me. It’s true that other people are *more* other than me than I myself am, because of the paradoxical self–other nature of my self—I’m aware that I am myself even as I am my own object—but the fact remains that everything, including my own body and mind, is an object to, or other than, me.) In short, neither Zahavi nor, it seems, any other phenomenologists sufficiently emphasize the fact that the self’s self-otherness is what makes possible empathy, sympathy, and all other forms of understanding other people’s minds.

One’s self-otherness is where it all comes from, all our interpersonal experiences. It’s what makes them possible. Otherwise we wouldn’t even have an (advanced) notion of otherness—of others as being other, nor of others (*as* other) as being like us. It’s strange that, from what I’ve read, Zahavi doesn’t truly appreciate this fact. I’m not sure other thinkers do either. (In fact, crazily enough, I don’t recall this fundamental point explicitly being made by any writer!)

...The more you think about it, the more it seems that the otherness inherent in consciousness is the solution to all the questions that have plagued thinkers for centuries about how it’s possible, and what it means, to care about other people. Everyone knows it’s perfectly understandable and rational to care about yourself. But why care about others?? How is that rational or even psychologically possible?? How can people so completely devote themselves to another that they sacrifice every consideration of their own well-being?! Where in the psyche would such “disinterestedness” or “altruism” come from? Given the obvious self-regard of the psyche, it seems inexplicable! Well, in brief, it’s possible because *others are part of you!* They’re instantiations of the *otherness* part of you. In caring about yourself, you care about your entire self, your whole paradoxical self–other nature. Which means you can care about other people to the extent that the *otherness* of your mind (of your self-consciousness, your sense of self) is identified with them. And—incidentally—you’ll tend to care about people more if you sense that they care about you too, because you care about yourself—so, they’re instantiating an aspect of you by caring about you, even as they also instantiate the otherness aspect of you, such that you see them as *others* whom you *identify* with.

But that’s just one case, albeit a common one. I can’t go into all the different cases of why you’d care about some given person more than others.

On the other hand, you might hate people who insult you or attack you or hate you—because, while (like all people) they instantiate an aspect of you, namely your self-otherness, they radically contradict your self-regard. *Everyone* is at least “*thinly* internalized” by you in the moment of interacting with them or thinking about them, and people who (are seen to) obnoxiously challenge your sense of self in some way cause an at least slight self-disharmony. Because of that internalization (of challenge-by-another, which to some degree means challenge-by-yourself, since the other person instantiates your self-otherness). Everything in your experience—including even perception of the physical world—is internalization/self-projection, internalization (assimilation) of objects/others and projection of mental capacities and structures (such that everything you experience is contoured and fleshed out by the structures in your own mind). In perceiving the world and the people in it, you’re perceiving, in large measure, the nature of your mind/brain.

I’ll admit this is all pretty obscure and would require a long exposition in order to be persuasive and systematic. I grappled with some of it around fifteen years ago. The problem with long phenomenological expositions is that they become extremely tedious and offensively masturbatory, almost sickly in their obsessive introspective probing of consciousness. –But in its essence, the core of an explanation of how social life is possible is very simple, so simple that other thinkers seem to have overlooked it. Or at least not fully appreciated its significance. The phenomenology of the self is what explains (the possibility of) interpersonal relations.

¹ Similarly, if I have empathy or sympathy for an animal, it’s because I’m projecting a human or semi-human mode of experience into it (i.e., perceiving it as having such a type of experience). And that might not be wrong! We’re all animals, and it’s possible that our human consciousness isn’t totally different from certain other animals’ consciousness. They do experience pain, after all, and not only pain.

—It’s strange that all of that was inspired by questions about how Aidan could care so deeply about the fate of a cartoon bee momentarily engulfed by a flower. But at least I’ve somewhat cleared up the puzzles in my own mind (on the basis of ideas from my twenties). That bee was, for Aidan, an other—so you’d think he wouldn’t care about it, since it was a separate being from him. But he is his own other and cares about himself, so he can care about other beings too inasmuch as their otherness partakes of his own self-otherness. Besides, he has a less differentiated sense of himself vs. the world than adults do, so he can spontaneously care more deeply about other beings than adults do. His natural innate affirmative stance toward himself and his world spreads out over everything—partly because other beings aren’t as fully other for him as they are for adults.

Ugh, phenomenology isn’t easy.

*

Rachmaninoff’s Prelude in B minor, Op. 32/10; Prelude in D-flat, Op. 32/13; Morceaux de Fantaisie: Elegie and Melodie; Moment Musical Op. 16/5. Sadness, nostalgia. Grading a hundred papers, drinking a beer, tired of life. Tired of my incredibly abusive, mentally ill ex-wife. Tired of creating. It’s annoying to still be mostly unknown. Anyway, nothing ever changes, so what’s the point?

But life itself is a joke, so that’s all secondary. Someday the human species will go extinct, whether in the next two hundred years or when the sun gets hotter, expands, and snuffs out life on earth. However extinction happens, the suffering with which it will coincide will put to shame all the suffering of history. Think of the worldwide suffering of all previous mass extinction events! That’ll happen again, probably many times. How strange and unfortunate it is that life exists. Better eternal nothingness than suffering life that ends in nothingness.

*

Yahya Sinwar, leader of Hamas and architect of the October 7th prison breakout, was killed yesterday. Israel, for some reason, released the drone footage of his last moments alive, when he was the last one left among his men fighting the invaders in a bombed-out building, his hand blown off. His final act was to defiantly throw a stick at the drone hovering near him.

On social media, thousands of people are in awe at his “legendary” death, worthy of a Hollywood movie. And they’re struck by the contrast between him and the cowardice of Israeli leaders. Like so many thousands of his compatriots, he died the death of a hero: bravely fighting psychotic colonizers, laying down his life for the principle of national independence.

Sinwar was a brutal man, like many leaders of national independence movements. And his major legacy is to have provided the pretext Israel needed to complete the genocide of his people. But in his courage, at least, he was exemplary. His martyrdom is an inspiration.

It’s interesting to be living in a time when the stakes are so clear, when there is righteousness and there is evil. However flawed you are, if you’re on the side of the resisters, you’re on the side of the righteous. If you’re on the side of the oppressors, you’re on the side of evil. That’s always been the case, but the genocide of the Palestinians starkly illuminates it.

Liberals lament the genocide of Native Americans—and then side with the genocide of Palestinians. They’re exactly the people who were complicit in the killing of natives in the nineteenth century. Little except the technology and the geopolitics has changed. The morality is the same. And those guilty are the same: the nonentities who constitute the West’s elite, in politics, business, and media.

(For example, contrast Kamala Harris with Yahya Sinwar. Her statement after his death was amusing. “I will say to any terrorist who kills Americans [like the Israeli government?], threatens the American people, or threatens our troops or our interests [like the Israeli government?], know this: We will always bring you to justice. Israel has a right to defend itself, and the threat Hamas poses to Israel must be eliminated. [Etc.]” Harris is a nothing, a kind of negative human space. Just another vapid apparatchik.)

Again: it's interesting to be living in a time when what millions of people are experiencing as an *apocalypse*, the total destruction of themselves and their world, is treated as just another news item alongside others. An entire people and its culture is being erased, even as the rest of us go on with our lives and the powerful actively participate in the destruction—and are rewarded with money, power, and reelection. Because the victims are poor (and Arab), they're of no consequence.

...When you see pictures of the wasteland that Gaza has become, you realize: that's the moral core of Zionism. Just like the wasteland of much of Europe at the end of World War II was the moral core of Nazism. (See the two paragraphs I wrote years ago on the movie *Der Untergang*.) Zionism, especially in its Jewish supremacist version, is a mirror image of Nazism, and so has a moral void at its center. Since the Jews are the chosen people, it is permissible to destroy anything and everything that gets in their way, even if it be, conceivably, all non-Jews everywhere. As the Nazis were willing, if necessary, to kill any non-Aryans, so the Jewish supremacist state is willing to kill any non-Jews. —And Jews too, in fact! Hundreds killed on October 7 were killed by the IDF. —In the end, both Nazism and Zionism come to worship the same thing and nothing else: power. Power not even for a particular group of people, who are all expendable (Nazis killed Germans and Zionists kill Jews), but rather a particular set of institutions. The totalitarianism of Germany meets the totalitarianism of Israel.

—But then you see that Nazism and Zionism, in their practice, are little else but the logic of power itself, a racial version of that logic. As I've written before, power is inherently totalitarian, seeking to colonize everything from the mind to the earth, from language to art. Power takes over everything and, ideally, leaves nothing behind, nothing outside itself. Except ruins.

*

It's incredible that there are still philosophers, scientists, and other intellectuals who believe in, or argue about, the existence of "God." There are lots of them! Anyone who takes the idea of God seriously has already shown his intellectual immaturity. The idea of God is incoherent, ill-defined, completely mysterious, and useless—except for consolation. Rationally and scientifically, it's useless. How do people not understand that it's nothing but a relic of a primitive and superstitious past?

It irks me that idiots like, say, the young British philosopher Philip Goff are taken seriously and even considered influential. Apparently he's "close to 50%" sure that his version of Christianity is true. Okay. And he defends panpsychism, another silly and unscientific idea. ("The basic commitment [of his version of "Russellian monism"] is that the fundamental constituents of reality—perhaps electrons and quarks—have incredibly simple forms of experience." They're primitively conscious. Okay. Whatever. That's a stupid idea, but it also leads nowhere and can't be tested, so what are we to do with it? It's just desperate speculation intended to avoid the traditional difficulties of the mind-body problem, which idiots are still writing about because they can't accept the truism that the human mind is too limited to understand *everything*, that it's perfectly predictable that there are aspects of our experience and the world that will always be mysterious to us. So, instead, these pointless people, in order to earn a paycheck from elite institutions, come up with insane "new" ideas that they can argue about for a few years and make a reputation on. "Most panpsychists," Goff says, "will deny that your socks are conscious, while asserting that they are ultimately composed of things that are conscious." My god, you don't know whether to laugh or cry. How does this get us out of the mind-body problem?! It's pure speculation, *prima facie* incredibly implausible—there's no evidence for it—and we'll never know if it's true because there's no way to test it. Meanwhile, the difference between qualitative consciousness and quantitative matter remains! Panpsychism doesn't get rid of that intuitive difference! It only says: all matter is conscious. Okay, great way to resolve an intuitive paradox. You imbeciles.)

I don't understand why it's so hard for even the trained "thinkers" to think. What is so hard about this stuff?? As I speculated 20 years ago or so, I think it has to do with a relative lack of the capacity of *rational intuition*. Discursiveness is shallow; intuition goes deeper. (And then you flesh out the intuitions in arguments.) But this is only to gesture at an answer. I really can't explain why 95% of intellectuals and 95% of people are so bad at thinking. (See my thoughts on stupidity from ten years ago.)

*

Reading Paul Farmer's brilliant book *The Uses of Haiti* (1994/2006). A student asked me about the specific reasons for America's occupation of Haiti from 1915 to 1934 and its support for the Duvalier dictatorship, and I had to give a rather vague answer because I didn't know enough details. So that shamed me into further educating myself about U.S. interventions in Latin America. (Alan McPherson's *A Short History of U.S. Interventions in Latin America and the Caribbean* (2016) is a decent survey, though not sufficiently materialistic/realistic.) Another great book I just read is David Schmitz's *Thank God They're on Our Side: The United States and Right-Wing Dictatorships, 1921–1965* (1999).

It's obvious but worth repeating that, with the partial exception of the World War II period, the U.S. has pretty consistently been on the side of the (neo-)Nazis, the fascists, the dictators, the military juntas, and the death squads. Americans' self-understanding couldn't be more different from the reality. Whoever has provided "stability" under capitalist rule, suppressing the left and keeping their country subordinate to the interests of American business, has been our ally. Nazi Germany would have been our natural ally if it hadn't been so imperialistic itself. America's leaders loved Mussolini and were happy with Hitler—until the late 1930s. It would be shocking, then, if America *weren't* a close ally of the current Israeli Nazis and *weren't* participating in the most visible and publicized genocide in history. The U.S. ruling class *detests* anything hinting of real democracy, humanitarianism, compassion, or morality. These are inimical to capitalist power.

The genocide of the Palestinians would seem to be the fifth genocide the U.S. has committed or participated in. First was the Native Americans—which should probably be considered scores of genocides because of how many discrete "peoples" (tribes) we exterminated. Second and third—at the very least quasi-genocides—were the Vietnamese and Cambodians ("Anything that flies on anything that moves," to quote Henry Kissinger, is pretty genocidal), and fourth was the East Timorese. Am I forgetting any? That's an impressive record!

But it's the kind of record you'd expect from totalitarian mediocrities. Reading how government officials talk to each other is amusing. For instance, before and during the Cold War they were unsophisticated enough to believe their own propaganda about Communism. In internal discussions, there was a constant paranoia about Communism. "Ho Chi Minh has direct Communist connections...[and runs] a political organization emanating from and controlled by the Kremlin." He has a "clear record as an agent of international communism." Somoza "has his foot firmly on the spark of communism." "How do you tell in Guatemala what is a Communist-front organization and what is not?" "[We have to] eliminate the conditions that promote Communism." "A strong base for Communism exists in Latin America." Iran might "presently slide into Communism and [be] irrevocably lost to us." "If Arbenz is not a Communist he will certainly do until one comes along." "Communism is, itself, an interference with the internal affairs of these countries." "The Guatemalan people revolted against Communist rule." (The rule wasn't Communist at all, and the "people" didn't revolt.) Sukarno "is naïve about Communism." Protests in Venezuela against Vice-President Nixon were "undoubtedly organized by the Communists." "The threat of Communism in Latin America [is] greater today than ever before." "[Uruguay] is in the greatest danger of a Communist takeover." Military intervention "will continue to be necessary to prevent...slippage toward Communism." "Instability may invite Communism." The American University in Beirut (according to Eisenhower) is "under considerable Communist influence" because it advised against a visit by John Foster Dulles. ("If you go and live with these Arabs," Eisenhower opined, "you will find that they simply cannot understand our ideas of freedom and human dignity.") "Argentina's full collaboration is needed in the common effort to resist the encroachments of international Communism." Bosch shows "tolerance of Communist activities in the Dominican Republic." "There has been an increase of Communist sympathizers in the ranks of [Goulart's] Cabinet aides." And so on.

The simple-mindedness of this Manichean worldview speaks for itself. It's as if "international Communism" is some monolithic, centrally coordinated force sweeping the globe! They really believed that! More tragically, Manichean worldviews can lead to extreme violence against perceived enemies. Now

that Communism isn't the foremost devil anymore but rather *terrorism*, I wouldn't be surprised if Biden and Blinken truly believe most Palestinians are potential terrorists. So it's permissible to kill them. It's assuredly the case that most U.S. government officials are still very racist towards Arabs. Israel shares the Western values of freedom, democracy, and human dignity; Arabs don't!

*

To live is to be surrounded by mediocrity. In most cases, the person himself is mediocre. In all cases, he is surrounded by the mediocre.

I'm so suffocated by this environment of mediocrity that I don't feel motivated to do anything. You try and you try and you try...despairingly try to put some beauty and truth into the world, again and again...but it leads nowhere, changes nothing, and only alienates you even more. You end as you began, at the base of a mountain you've been unable to climb even three steps up.

Capitalism is driving civilization off a cliff. Just consider the recent report from the World Meteorological Organization! A hundred years from now it will be a world of ruins.

So much the better, perhaps. Does humanity, capable of Nazism, Zionism, and every other conceivable form of cruelty and stupidity, really deserve to go on for millions of years?

November

The politics and culture of late capitalism are so debased that, for the purpose of escapism, I'm reading books like *The Epic History of Biology* (1993), by Anthony Serafini. Such glorious purity! The self-effacing desire to *know*, to *inquire*! From Empedocles to Leeuwenhoek to Pasteur to the present. So opposite from the debased selfishness and the vulgarity of American politics and culture, the Twitter feeds I scroll daily and the newspaper headlines. People like Peter Thiel and Elon Musk striving mightily to impose a neoliberal fascism on the country because it would be good for business, meanwhile funding research they hope will allow them to overcome mortality, or "the ideology of the inevitability of death" (to quote Peter Thiel, the lunatic billionaire behind the scumbag J. D. Vance). It's a society that exalts people too mediocre even to talk about.

...Speaking of mediocrity: Kamala Harris. And the entire Democratic Party. Trump, a convicted felon, just won reelection. It turns out that committing genocide and shunning every hint of economic populism isn't a winning strategy. Embracing Dick Cheney and his daughter, along with other establishment Republicans, isn't a winning strategy. Following the same playbook as Hillary Clinton in 2016 isn't very smart, it seems. What a surprise. One almost has to respect Democrats' undying commitment to world-historic incompetence.

Of course, it isn't just incompetence. It's shameless corruption, insular elitism, class loyalty, and outright evil. The party has to be burned to the ground. For decades, leftists have been saying you have to reach out to the working class—but the party can't do that because of the class composition of its leadership and its donors. So it loses again and again and again. Republicans *can* reach out to the working class—on cultural issues, which is to say by appealing to racism, xenophobia, homophobia, religion, anti-"liberal elites," and the like. This isn't necessarily what people want to hear most, but at least it expresses *some* recognition, however perverse, of the grievances of those who feel left behind. And in a battle between center-right technocracy and neofascism, neofascism will usually win.

It's very striking. After the weak centrism of Carter, we got Reagan. After the weak centrism of Clinton, we got Bush. After the weak centrism of Obama, we got Trump. And after the weak centrism of Biden and Harris, we got Trump again.

The entire political class consists of fourth-rate people. People immune to compassion, to courage, to rationality, moral principle, intellectual curiosity, and simple kindness. People who value nothing but status and power.

I so despise “centrist” politicians that my disgust at Trump’s victory is slightly adulterated by *schadenfreude*. Apparently there’s a cost for committing genocide after all! (I also have a bit of *schadenfreude* towards the pathetic men-haters and whites-haters whose whole world revolves around identity politics. They bear some of the blame, for having helped in recent decades to direct liberal attention away from class.) I’m a little hopeful, too, that Trump will end the horrific war in Ukraine. But since he’ll worsen global warming and ecological destruction, this will be something of a Pyrrhic victory. Civilization is still doomed.

*

The next four years of attempted dismantling of the “administrative state,” and thus attempted destruction of society, might be the shock that finally starts a real left-wing backlash. People will get “mad as hell” and they “won’t take it anymore.” Economic pain will get worse. Neoliberalism can’t go on forever. The dying off of the repulsive old guard of the Democratic Party may give opportunities for leftists to come to power. Collapse always presents opportunities—for both the left and the right. The center will not hold much longer.

I was depressed and I’m sure I will be tomorrow or the next day, but for now I’m feeling strangely energized. Real progress can’t happen until the Clintonite Democratic Party is burned down, which will, surely, begin in the coming years on the crest of popular rage. It’ll be a long struggle. But the enormity of popular suffering will light the match and put it to the kindling. The Clintons, Obamas, Pelosi and Schumer and Harris and the rest of them will burn on the pyre as the civilized among us dance gleefully around the flames, watching these devils turn to ash, be left behind in the ashes of history. An entire era of unutterable mediocrity consumed in the bonfire. When things fall apart is when heroism enters the stage.

Billions of people are already doomed from global warming, and the horrors ahead of us will defy description. Optimism is unintelligent. But much of the species will survive, and we can struggle mightily to improve the conditions in which they’ll live. We’ll carve out spaces of anti-capitalism, decade after decade. We’ll work without cease to preserve what we can of nature, of beauty and life. We’ll torch the institutions that have brought us to this point and erect new institutions in their place. The remainder of the century, indeed of history, will be a long revolutionary struggle. (The struggle never ends, because a utopia is never reached.)

*

I don’t think I’ve conveyed how disturbed I am by the thought that my journal is fated for oblivion. It’s a kind of cognitive dissonance: that something so valuable can remain unknown seems absurd. And yet it’s almost certain that, in part because of its length, this document is destined to interest and influence hardly anyone.

How can *truth* matter so little? That’s hard for someone like me to understand. The world is a swamp of irrationality, conformism, and institutionalism, so you’d think a massive document guided mostly by logic and truth would be a beacon. The lack of proportion between its merit and its inevitable reception is obscene.

But that’s life, obscene and absurd. Every day, what goes on everywhere: obscene and absurd. At least I can console myself that I’ve given the world something to make it a little more beautiful.

*

I have to keep saying it again and again because I find it so astonishing: *from electrochemical processes between trillions of molecules determined by nothing but the laws of nature, consciousness, intentionality, qualia, and a sense of self emerge*. This fact is the essence of both the mind-body problem and the free will vs. determinism paradox. Neither paradox will ever be resolved. Tens of millions of words have been written about both, but in the end we’re still left with the mystery.

*

Been reading books about Israel and the Middle East, since the issue is so crucially important to the future of world politics. I've been thinking that maybe I should immerse myself in geopolitics and write more about it. I'm sick of having an unorganized intellectual life.

Zionists, of whatever ethnic and religious background, are some of the most morally and intellectually corrupt people in the world today. The things they say and do are beyond belief. The very idea of worshipping a kind of theocracy—a Jewish state is as evil an idea as a Christian state or a Muslim state—is medieval, illiberal, utterly primitive. Typically, they consider it anathema to utter a word of criticism of the Israeli government! Famous “liberal” intellectuals like Isaiah Berlin have held this fascist, state-worshipping position. (He told Chomsky he didn't think Jews should criticize Israel in public. Elie Wiesel was the same, or worse. Robert Nozick too, the supposedly anti-statist “libertarian.”) The anti-Arab racism of Zionists is staggering, in the tradition of Nazism. The enraged, hysterical self-righteousness while committing the most transparent genocide in history shows the depravity to which humans can descend. In a sense, even Heinrich Himmler was on a higher moral level, for he acknowledged how difficult it was to kill Jews, how much “strength” it required, how much you had to suppress your natural human feelings. Zionists don't say that. They say Palestinians are murderers and terrorists (the colonizer's reflexive reversal of the truth) and have to be eradicated, full stop. There's no apparent recognition of how difficult it is to kill hundreds of thousands of men, women, and children; there is only the outraged demand that it be done. (Not in so many words—usually—but that's what they're saying.) I've actually spent a year in something like a state of shock that I'm witnessing what I'm witnessing. In the twenty-first century, I'm seeing the most barbarous Nazism play out on hundreds of social media videos every day! And millions of people are demanding that it continue, until every last Palestinian is gone!

What we're seeing is Nazism reaching out from the grave to keep killing more people, because the creation of Israel was, in large part, a response to the Nazi Holocaust. Now it's Jews instead of Germans doing the killing, but it's still the legacy and continuation of Nazism. The delayed after-effects of World War II. Instead of Europeans being punished for the Holocaust, it's Arabs—who had nothing to do with it. They just wanted to live their lives peacefully in the land they had occupied for centuries. But then the West came in with its bad conscience and its antisemitism—let's send these troublesome Jews over to the Middle East!—and carried out *yet another* genocidal program of settler colonialism.

But it appears that Israel doesn't have much of a future. Just as Germany's genocidal ambitions brought about its downfall, so Israel's Palestinian genocide, and more generally its hyper-militarism, will help bring about its own downfall. The civil war brewing within Israel is one factor, a factor caused by Israel's rightward, fascist shift in recent decades; its being a pariah state is another factor; its addiction to war is yet another. It will be satisfying to see this satanic state collapse, but it'll be terrible to see it take other countries with it.

*

“We want your land, so we're going to kill all of you. Through bombing, shooting, starvation, deprivation of water, denial of medical care, pushing you into the desert, any means necessary to get rid of all you annoying people who are in our way. Your stubborn will to survive is a major nuisance; we've had enough. You all just have to be killed. The men, the women, the elderly, the disabled, the children and teenagers, the babies, the fetuses, all of you. Don't bother pleading to the world: it won't do anything to stop us. In fact, it'll help us! Where do you think we're getting all our weapons from?!”

*

I have to admit it's taken me an inordinately long time to wake up to the unbelievable power of the Israel lobby over the American government. I've tended to agree with Chomsky that the U.S. follows its

strategic interests, that it's happy to buck Israel's policy preferences when they contradict U.S. interests, that Israel is pretty much just a useful Middle Eastern base of the American empire and doesn't overly influence American foreign policy. But I now think that's oversimplified. For example, John Mearsheimer and Stephen Walt present a compelling case in *The Israel Lobby and U.S. Foreign Policy* (2007). Neoconservatism itself is inseparably bound up with Israel and the gigantic, sprawling Israel lobby, which for a long time has dominated political, cultural, and media narratives. "Jews comprise the core of the neoconservative movement. In this sense, neoconservatism is a microcosm of the larger pro-Israel movement."

On the other hand, I think it's also true that support for Israel is only one part of the larger neoconservative movement.

Israel Shahak's books are useful too. And Chomsky himself, in writings and interviews, acknowledges the power of the Israel lobby. While he's surely right that policymakers see Israel largely as an instrument of American hegemony, it's hard to deny that, for many decades, policy towards the Middle East has been massively swayed by pressure coming from Israel and its shockingly wealthy, vast, dominating lobby. (Neoconservatives, Christian Zionists, Israeli officials, media companies, an array of think-tanks, lobbying organizations like AIPAC, wealthy businessmen, pro-Israel journalists and intellectuals, a substantial part of American Jewry, etc.) In the face of all this, the Palestinians never had a chance.

Moreover, it does seem, as Mearsheimer argues, that the lobby has sometimes dragged the U.S. into policies harmful to its own geostrategic interests. Far from being a source of pro-American stability in the Middle East, Israel has tremendously exacerbated anti-Americanism and done much to delegitimize the U.S. in the eyes of the world. You could argue—as Mearsheimer doesn't, because his "realism" isn't particularly realistic—that its having helped motivate the 9/11 attacks (just read bin Laden's famous statement) was actually in the interest of the U.S. government, since it used the 9/11 pretext to expand its power. The U.S. doesn't mind Muslim terrorism, and, from the 1980s on, even encourages it and fosters it! Nevertheless, the fact is that this tiny satanic country on the coast of the Mediterranean has held wildly disproportionate power over American policymaking. The war in Iraq, for instance, was hatched in the minds of neoconservatives and pro-Israel strategists. It's also hard to believe that America would have so obsessively targeted Libya, Syria, and Iran (virtually destroying the first two) if not for Israel's influence.

The fight against militarism has to be, in large part, a fight against Israel.

December

At this point, the U.S. is a pathetic failed state. For the second time, a hyper-corrupt real estate media buffoon is becoming president. The current president just pardoned his sleazy, corrupt son *for any crimes he may have committed in the last eleven years*, despite having a contemptibly low pardon rate of *deserving* people unjustly locked behind bars. Biden continues to participate in the Gaza genocide, while bringing the world even closer to nuclear war with Russia. There is barely any whiff of democracy in this country anymore. Nearly all of us are *subjects*, like in a monarchy. One individual (Elon Musk) is worth over \$300 billion at the same time as, by any *sensible* measure, probably a third of the country is living in poverty or just above it. (The official poverty measure is \$31,000 for a family of four, which is...absurd.) America is both a laughing stock and the shame of humanity.

*

What can you say about a civilization where a few people have the power of life and death over billions? A few people could decide to have a nuclear war. A few people can decide to invade countries and destroy the lives of tens of millions. A few people can decide to worsen global warming and accelerate the semi-collapse of society. All you can say is that such a civilization is profoundly, unimaginably

immoral. And that insofar as the people who run it not only don't democratize it but act so as to make it even *less* democratic, they are profoundly, unimaginably immoral.

Our social system is completely insane. *One man* can make decisions that determine the future of the species. One man can destroy nations, just by saying the word! How do these people who have so much power feel *okay* with that?! How can they not be *constantly dumbstruck* by the *tyrannical* nature of the system on top of which they're perched? Evidently they're utterly without a moral core, and wholly indoctrinated, like some unthinking animal, into acceptance of the despotic institutions they lead. In many cases they seem to genuinely believe the nonsense they spout about "democracy"! To a thinking person, all this is unbelievable.

The world is a freak show, as George Carlin said.

*

Let's turn from the squalor of politics to something more elevated: philosophy. Again.

Reading Michael Huemer's book *Skepticism and the Veil of Perception* (2001). (Saw it mentioned in the *Stanford Encyclopedia of Philosophy*, so thought I'd take a look at it.) It's a decent book, but most of its arguments are wrong. Huemer is a "direct realist" or a "naïve realist," which means he "holds that perception gives us direct awareness of the external world and that it enables us to *know* (some of) what that world is like." We are directly aware of real, physical objects, things external to the mind. Representationalists or "indirect realists," on the other hand, maintain we're directly aware only of representations in our mind, not external, mind-independent things. Locke, Berkeley, Hume, and Kant, for example, were representationalists, whereas Thomas Reid wasn't. As I've said many times, I, too, am a representationalist, a position I see as *obviously* necessitated by science. (Science explains that the nervous system constructs our perceptions, the sensory appearances we're aware of, in fact all our experiences and the objects in them—as the objects we perceive. Physics maintains that the world-in-itself, the genuinely objective, external world, is radically different from the colored, solid, noisy, smelly world of our experience, which is ultimately a mental world, a subjective world.)

According to Huemer, representationalists go wrong in thinking that *mental states are the only things we can be directly aware of*. The truth (he says) is that, *by means of* mental states, we are directly aware of the external objects we perceive—tables, books, apples, and everything else. As he says, "my perceptual experience [of an object with a shape and color] does not count as the awareness of any mental state or event, since no mental state or event has any shape or color" (p. 80). In a sense, he's right: my state of happiness, for instance, doesn't have a color or shape, nor does the mental event of some particular thought I'm having. On the other hand, insofar as something appears in consciousness, it can be called a mental event; and the appearance of a table, for example, occurs in consciousness, so it is, at least in part, a mental event. So in this regard Huemer is wrong.

Contra Huemer, representationalists don't think mental states are the only things we can be directly aware of. We can be aware of mental objects too, i.e., objects of consciousness. And those can have "physical" properties like color and shape.¹

As I wrote in May, perplexities are inescapable when we philosophize about perception and the external world. In fact, I remember back in my twenties pointing out the obvious, that the physical objects of our experience can be interpreted in two different ways, as external physical objects and as "internal" representations. So yes, from one perspective (the commonsense perspective) Huemer is right: we are directly aware of external physical objects. This computer is certainly "external" to me: I can reach out and touch it, I can measure the distance between it and my head, etc. But from the more scientific and philosophical point of view, my experience of the computer, and therefore the computer itself *as I perceive*

¹ Actually, in one sense of "physical," color *isn't* a physical property. For things in themselves are not colored. Color is a secondary quality the brain fabricates by processing electromagnetic waves. But of course color *is* a physical property insofar as the physical world *we're acquainted with* is colored. So it's sort of a quasi-mental and quasi-physical property.

it, exists only in my head. Necessarily. Because perceptions, perceptual appearances, experiences, etc. as such are produced by the brain from sensory stimuli and exist in consciousness, which is, in a sense, in the head. (It doesn't have a specific *location* in the head, but it is an emergent phenomenon of the brain. See my old paper on the mind-body problem.)

It's somewhat disturbing and paradoxical to think that everything I experience, the entire world and all the people and things in it, is, *as experienced by me* (processed and produced in the brain), inside my head/body, in my consciousness, private to me. What an incredible fact! What an astonishing feat! The gorgeous sunset, majestic mountain ranges, hundreds of people I see every day, all of New York City and every other place I visit: in the forms in which I perceive them, all these are only in my mind, in my little head! My little brain/consciousness *semi-creates* all of them, the entire world, the whole universe of my experience!

Another way to state the "paradox" is that the physical things I perceive are hybrid physical-mental. I can cut them up with a knife, for instance, whereas I certainly can't cut up my internal conscious states with a knife. So this cut-up-able quality results from objects' physical nature, their being composed of objectively existing molecules and electric charges. But their solid and colored appearance, however "physical" it looks and feels, is, in a sense, mental, something I give them (i.e., something my brain fabricates).

Huemer quotes Hume, referring to direct realism (naïve realism):

But this universal and primary opinion of all men [viz., direct realism] is soon destroyed by the slightest philosophy, which teaches us that nothing can ever be present to the mind but an image or perception... The table which we see seems to diminish as we remove farther from it; but the real table, which exists independent of us, suffers no alteration; it was, therefore, nothing but its image which was present to the mind. These are the obvious dictates of reason; and no man who reflects ever doubted that the existences which we consider when we say *this house* and *that tree* are nothing but perceptions in the mind, and fleeting copies or representations of other existences which remain uniform and independent.

I don't know if the second sentence is a great argument for representationalism, but in any event, Hume's point of view here is correct.

Huemer goes on to try to refute objections to naïve realism, but his arguments are tortured and implausible. For instance, the argument from hallucination (against naïve realism) says that you can have a hallucination of an object that actually isn't present, and the hallucination might be indistinguishable from what you'd see if there *were* an object present. So what you're aware of in a hallucination is merely a mental image, a representation. And if that's what you're aware of in the case of the hallucination, it's surely what you're aware of in the case of normal perception. All you ever see are mental images, not the external things themselves.

Huemer tries to dispatch this objection by saying "hallucination is not awareness at all. It is, so to speak, pseudo-awareness—that is, a mental state that seems like awareness of something...but is not in fact the awareness of anything, for awareness is a relation between the subject and the world, and the hallucination fails to have the right *relational* properties." Wow, that's dumb. You're not aware of *anything at all* when you hallucinate?! This is a great example of the absurdities in which philosophers sometimes get mired as a result of their convoluted arguments.

Rational intuition is how you find answers to philosophical puzzles. Not convoluted discursive argumentation, which easily leads you astray.

But Huemer does raise an objection to the existence of what he calls sense-data (or "whatever mental states, objects, events, properties, or other kind of mental phenomena we are directly aware of in perception, assuming indirect [i.e., representational] realism is true") that has bothered me for some time: namely, *where are the "sense-data"?* *Where are the "appearances" I'm aware of?* Are they in the head? Do they have no location at all? Are they in the same places as the physical objects they "represent"? I've

suggested that since they're in consciousness and consciousness is a manifestation of brain activity, they're in the head—"in a sense." They're not *literally* in the head, because you can't point to them in the way you can point to neurons or some section of the brain (*understood as a physical object, not a "sense-datum"*). But this is a problem with consciousness itself, not only "sense-data."¹ *Where is consciousness?* My answer in my old paper on the mind-body problem was that consciousness, being a radically emergent phenomenon of the brain, doesn't have a specific location. It isn't the kind of thing to which the property "location" applies. On the other hand, it *is*, in some bizarre non-literal sense, in the head, behind the eyes—for you are aware of the world from behind your eyes, looking out (or not, if you're blind). Consciousness is a very strange and elusive sort of nothingness, temporal but not spatial.

Well, but perceptual appearances are not a *nothingness* in that same way. They manifest, or are, colors and shapes, for example. So they're different from consciousness itself, even if they are *in*, or *objects of*, consciousness.

Everything in my consciousness manifests a brain state. The colors I see, the feeling of solidity when I touch a book, the perception of distance between myself and the book, the sounds I hear—they're all produced through neural processes, i.e., are "radically emergent" from these processes. The image of a distant tree looks far away, but since it's produced by my brain, it's really not far away at all. It's in my head, so to speak (but without a location, because it's radically emergent). The tree itself, the aggregate of molecules that compose it, *is* far away, which is why my brain produces the image so that it looks far away, corresponding to the location of the actual tree.

When you get closer to the tree and you reach out and touch it, you're touching the real, objectively existing tree,² but the *image* of the tree that you're touching—which of course looks like it's at arm's length, where the actual tree is—is still in your head, not "out there." Or rather, *for you* it *is* external—it's the tree itself—but objectively it isn't. Likewise, the way the tree feels on your skin is, obviously, mediated, constructed by your nervous system.

Anyway, while there are perplexities with representational (or "indirect") realism, it's impossible to take seriously any other theory. The idea that what we perceive are actual external things as they "really" are is hopelessly misguided. Just consider the words you're reading at this moment: what you see is not a series of marks on a computer screen but already-interpreted (by your brain) *words*, words and sentences that are "subjectively" invested with meaning. Even if those marks on the screen *were* "objectively" present in the mind-independent world and weren't just constructed by your brain from electromagnetic waves entering your eyes, you *still* wouldn't be seeing them "as they are." You're seeing them through your mental prism of linguistic understanding, philosophical thinking, and subjectivity.

Each of us lives in his own 'solitary' world, his own mind, which creates the entire universe of his experience. This fact may be disconcerting and suggest skeptical and solipsistic conclusions, but that's the price of having the intellectual integrity to follow reason and truth wherever it leads.

*

For the heck of it, I'm reading Howard Robinson's *Perception* (1994), again because the *Stanford Encyclopedia* mentioned it. It argues for what Robinson calls the sense-data theory—which may be an unwise terminology on his part, since that word is so loaded and there are problems with the classical sense-data theories of Bertrand Russell and others. Here's the first paragraph:

The majority of modern philosophers—that is, the majority of philosophers writing since the seventeenth century—have believed that in perception one is aware of some item other

¹ I keep using scare-quotes around that term because of how controversial it is, and because I don't understand it in the way the sense-data theorists of the early twentieth century did.

² More accurately, the electromagnetic repulsive forces in your hand and the tree are what cause the sensation of touch. You don't actually touch the tree's atoms. (This fact is another piece of evidence for the representational theory, incidentally, since it certainly *seems* that you're literally touching the tree. Appearance is not reality.)

than the physical object one takes oneself to be perceiving. So if I see a tree, for example, what I am *really* or *directly* aware of is something which can roughly be thought of as a tree-image, in or before my mind, rather than a mind-independent physical tree in external physical space. The *ideas* of Locke and Berkeley, Hume's *impressions* and the *qualia*, *sensa* and *sense-data* of twentieth-century philosophers are all generally supposed to be of this type. On the other hand, the majority of strictly contemporary philosophers—that is, the majority of philosophers active in the analytic tradition since the Second World War—have denied that one need postulate such entities and affirm that we are, normally, directly aware of the external world itself.

If this is accurate, it's remarkable. Why does intellectual regression occur so often in recent history? (Postmodernism is the best example, but the humanities and social sciences are full of regression.) Evidently it's a manifestation of the bureaucratization of culture, the professionalization, the increasing predominance of groupthink, growing decadence, the *mass*-ification of intellectual life—conferring credentials on people who don't have keen abilities to *lucidly* think. Discursive complexity, pretentious prolixity, problematizing for its own sake become prized over simple insight and intellectual honesty.

Incidentally, Galileo was another thinker who endorsed indirect realism, as you can see here from his reasoning regarding primary vs. secondary qualities:

Now, whenever I conceive of any material or corporeal substance, I am necessarily constrained to conceive of that substance as bounded and as possessing this or that shape, as large or small in relation to some other body, as being one, many or few... But I do not at all feel myself compelled to conceive of bodies as necessarily with such further conditions as being red or white, bitter or sweet, having sound or being mute, or possessing a pleasant or unpleasant fragrance... I think, therefore, that these tastes, odors, colors, etc., so far as their objective existence is concerned, are nothing but mere names for something which resides exclusively in our sensitive body, so that if the perceiving creatures were removed, all of these qualities would be annihilated and abolished from existence. But just because we have given special names to these qualities different from the names we have given to the primary and real properties, we are tempted into believing that the former really and truly exist as well as the latter.

The likes of Peter Hacker and David Armstrong have objected to the famous secondary-quality argument, but Robinson has no trouble refuting their objections. P. F. Strawson and Michael Dummett, for example, apparently argue that the perceptual appearance of the world and the scientific analysis of it don't contradict each other because they represent *different perspectives* on the world. So objects can, "in themselves," be colored from the commonsense perspective but not colored from the scientific perspective. This, of course, is nonsense. When you perceive an object as red and you judge it as red, you're perceiving and judging that it's *objectively red*. *That's the color it has at all times (even when you're not looking at it), the color that is an integral property of it*. So if science says the world in its objective essence isn't colored but is just a lot of colorless atoms and photons and the like, that's contradicting what you see and naturally believe.

Since we're talking about things that are *private* to the individual perceiver, we have to consider what Wittgenstein had to say about the matter. (*Sigh*.) That is, we have to delve into the amazingly famous and amazingly multiply interpretable private-language argument. As Robinson says,

Sense-data, at least as usually conceived, are not public objects in public space, but are necessarily private to individual observers. They are what have come to be called *logically private objects*. The final crisis for the empiricist ["sense-data"] conception of perception was precipitated by Wittgenstein's famous polemic against such private objects. He argued

that such things could not be objects of linguistic reference and, hence, not objects of thought or consciousness.

So the existence of private sensory events/objects isn't even possible!

First of all, whatever Wittgenstein's argument is, one has to note that it's just impossible to *argue away* the existence of private perceptual experiences. When I pinch myself, only *I* directly feel the pain. No one else does. So the pain is private to me, as all sensations and perceptions are private. No philosophical argument can be more compelling than someone's direct experience of physical pain, or the experience of others that *they* don't *directly experience* that person's sensation of pain. Any philosopher who argues to the contrary is arguing against the existence of sensations, and thus is engaging in sophistry that isn't to be taken seriously.

So even before any consideration of Wittgensteinian anti-privacy arguments, we know that "logically private objects" do exist and *no argument can prove their nonexistence*—because all you have to do to refute such an argument is punch a Wittgensteinian in the face. He'll feel pain, which the one who punched him won't feel. Therefore, private sensations exist. Q.e.d.

Likewise, when you say that that object looks green to you and I say it looks blue to me, neither of us can directly access the other's consciousness to understand how he could make such a perceptual "mistake." For consciousness itself is private. You and I have different, conflicting, perceptions, and no argument to the contrary can be more compelling than these kinds of immediately accessible and universally shared experiences (of people having different, therefore private, perceptions).

Galen Strawson has ridiculed sophists like Daniel Dennett for, in effect, denying the existence of consciousness—"It's the stupidest position in the history of thought"—and he has been right to do so.

To quote Robinson again, "There is a common idea behind all versions [i.e., interpretations] of Wittgenstein's argument. This is that there could be no language to describe logically private objects because the kinds of constraints that make for stability of use—and therefore for [linguistic] meaningfulness—are essentially public." Here, again, we can know in advance that the argument is false. For we *do* describe pain, pleasure, colors-as-they-appear-to-us, the taste of food we're eating, an emotion we're feeling, and the like, and all these things are private objects. So obviously, language can describe such things. Since language is public, public language can describe private objects.

Why would someone think public language can't apply to private things? I don't know. Since people experience *the same kinds* of private things, we can talk about them in mutually intelligible ways.

In any event, since I pointed out earlier that perceptual appearances *are actually 'public' when they're judged, as they ordinarily are, as being external phenomena (e.g., physical objects) other people can perceive, all this controversy about private objects doesn't acknowledge the dual character of perceptions, their private/public character.* (Sensations, like pain, are different, only private, though they have public behavioral manifestations.) My perception of this table is private to me, but the content of the perception, the table itself, despite being constructed by my nervous system, is experienced as a public, external physical object. The-table-as-it-appears-to-me is 'unthinkingly' perceived as being the same physical object as the-table-as-it-appears-to-you, so it's "public"—even though, ultimately, it's a mental event that's private to each of us.

Robinson goes into tortured detail picking apart interpretations of Wittgenstein's argument, but he doesn't really make any of these simple intuitive points.

The existence, or at least the ability to talk about, private objects is supposed to be impugned by the following premise (as Robinson states it): "If a word purports to name a logically private object then it is not possible to tell whether one is using it correctly or only seeming to use it correctly." As Wittgenstein says, "Whatever is going to *seem* right to me *is* right. And that only means that here we can't talk about 'right.'" You need some sort of public criterion of whether the word is being used correctly. If there is no such criterion—because of the privacy of the object in question—it's a meaningless word, since you can use it however you want.

But as I argued when I discussed these matters in my twenties, "how it seems to you" *can* incorporate a criterion, namely if the proper use of the word *strikes you with the force of conceptual*

necessity. You aren't arbitrarily *deciding* that some given use of a word as applied to, say, your private sensation is acceptable; you're being *compelled* into recognition of the correct use of the word. If you dip your hand into water that feels cold, you can't possibly assent to the sentence "This water is hot." Thus, yes, whatever *seems* right to you *is*, almost certainly, right—*because you include the 'public' within you. You are your own other—you've internalized the rules of the community (such that you are your own community, in a sense)*—and so you can use the public linguistic standards you've internalized to judge whether you're using a word correctly, even when you're applying it to a private experience.

Anyway, Robinson distinguishes between the traditional interpretation of Wittgenstein and the Kripkean one (again, see my discussion of the latter from my grad school years), and after a lot of labored argumentation against both, concludes that "no known view of language which excludes reference to the private is coherent." He's surely right, but I won't summarize all his arguments.

Having refuted Wittgenstein (or his interpreters), we proceed now to "the paradigmatically contemporary flight from sense-data, [which] takes the form of physicalist theories of perception." Prepare yourself for more perversity and irrationality. Again, if you've read my paper on the mind-body problem or other writings in the philosophy of mind, you know what I think of reductive physicalism, functionalism, behaviorism, eliminative materialism, and any other attempts to analyze away the *qualitative, phenomenal* dimension of experience. Their chief interest is sociological or psychological: their existence shows it's possible for highly educated, seemingly rational and sane people to convince themselves of lunatic philosophies, much more lunatic than even nonsense like religious belief or crazy conspiracy theories.

—Well, on second thought, Robinson's arguments against writers like the Churchlands and David Armstrong are too intricate to summarize. There's no point anyway, since any attempt to reduce the first-personal nature of experience to the third-person (i.e., the private to the public, the qualitative to the quantitative, the phenomenal to the physical) is clearly hopeless.

(To repeat: according to my emergentism, the phenomenal/qualitative *is* physical *in a sense*, inasmuch as it's a mysterious, 'mentalist,' emergent state of the brain. Human cognition is too limited to understand how the mental emerges from the non-mental.)

At this point, you may be wondering why anyone would be so perverse as to deny that indirect realism must be true. Arguments from illusion, from hallucination, from secondary qualities, from science, naturally imply it! And the arguments against it seem weak, forced, convoluted, counterintuitive, and desperate. So what's going on?! Robinson answers:

Resistance to the sense-datum theory is inspired mainly by the fear that such data constitute a *veil of perception* which stands between the observer and the external world. This threatens to engender skepticism, or even solipsism, and runs counter to good, plain common sense.

Horror of horrors! Skepticism! *Anything* is better than *any* version of skepticism! We have to save common sense! Well, I'm sorry, but sometimes common sense can't be saved. I think it's better to accept science and rationality.

Besides, I find the "veil of perception" idea (which is, in effect, just plain science) beautiful. It's wondrous and miraculous that this gray, wrinkly organ in my head can create the infinite kaleidoscope of my experiences, all the sublime sense-perceptions, objects, emotions, and thoughts that constitute my world. This fact inspires an almost religious awe in me. Why should we fear it, or try, futilely, to refute it?

...Incidentally, I emailed the famous philosopher Tyler Burge about these matters, and he sent a long reply. Here's one point he made:

Vision science takes visual perception to be very accurate, in evolutionarily circumscribed circumstances, about the macro physical world. It represents distances, locations, colors, shapes, bodies, movement of bodies, surface textures and surface orientations in extremely accurate ways as long as the surfaces are not too far away (when resolution fails). So the sloganizing about "the world-in-itself" being very different from "the world of experience"

is simply bad pop-sloganizing that survives because it is so vague and so removed from science. A reasonable point can be extracted from the sloganizing, but it is better to think literally and specifically about what science tells us.

He calls it sloganizing, but it's an accurate slogan. Perceptions can represent the world "accurately," but the distinction between the-world-as-perceived and the-world-outside-of-perception is nonetheless valid.

I pressed him a bit more—like on whether he agreed with one or two points in the first paragraph of Robinson's book that I quoted above—and he sent another email:

Robinson's point that a majority of philosophers writing since the 17th century believed that one is 'really or directly aware of something [like] a tree-image, in or before my mind, rather than a mind-independent physical tree' is cherry-picked: Descartes, Reid, Kant, Marx, and others rejected the 'rather than'. [...] Robinson is confused. Most philosophers do accept 'the representational theory of mind'. On this view, one is directly aware of physical objects, not in the sense that the causal relation to them is direct, but in the sense that one is aware of them not *by way of* being aware of anything else, including a tree-image (which may or may not be present, when one perceives a tree). Science does not require one to be aware of (or to consciously represent) the tree-image first; a conscious tree-image may not even be present. More importantly, when it is, it is an aspect of the representation of (and the awareness of) the tree, not something one is aware of at any time prior to being (much less, 'rather than being') aware of the tree, in having the representation of the tree. The conscious perception and the consciousness of the tree occur simultaneously: in fact they are different ways of describing the same thing. When one has a conscious perception of a tree, one is aware of the tree; and the awareness of the tree does not causally depend on the conscious tree-image: it *is* the conscious perception which involves, but is not restricted to, the conscious tree-image (the conscious tree-image is an aspect of the conscious perception of the tree). Everyone (except perhaps naïve realists), everyone including me and Robinson's opponents, believes in 'the existence of mental representations, neural mediations, etc.' Robinson is confused in not knowing science, and in thinking that one is 'really or directly' aware of a tree-image '*rather than* a mind-independent physical tree in external space' (with my italics on 'rather than'). This view is contrary to what we know from science. He is also a misleading historian of philosophy.

'Aware of' in English is supremely tricky, and not a good term for science—or philosophy, unless it is carefully explained. Lacking careful philosophical monitoring and explanation, it is either ambiguous or vague, and certainly tends to engender different (incompatible) inferences in different people. But everything I write above is literally true, regardless of how one uses 'aware of'. What is normally said in developmental psychology—and what I am comfortable in saying, given the way I understand 'aware of'—is that young children are, in conscious perception, directly aware of a tree by having a conscious perceptual representation of the tree, but they are not aware of the conscious perception (or the tree-image). They learn about it only later. Their conscious perception involves conscious awareness (a tree-image), but there is no awareness by the child *of* the tree-image. '*of*' is representational; and the tree-image is not represented by the child: it is an aspect of the representation of the tree; and it (the tree-image) is not represented by the child, or by most adults. It is an aspect, a conscious aspect, of the perception of the tree; but the child (and most adults) are not aware *of* the conscious tree-image—and do not represent it—when they are aware of (and perceptually represent) the tree. The tree-image is never perceptually represented, by anyone. Perception does not represent perceptual images: it represents only the environment. Sophisticated human beings conceive of tree-images, which are real and involve awareness, even though human beings never

perceptually represent the tree-image. To understand this, fully, you'd have to read serious philosophy of perception, not pop arms-length philosophizing by people like Robinson.

There are other ways of using 'aware of'. But none of them should be used to contradict what one knows from science: that it is wrong to say, as Robinson does, that one is really or directly aware of something *rather than* a mind-independent physical tree, when one perceives a tree consciously. In the relevant sense (not causal, but representational), one is directly aware of the tree. [...]

Some of the criticisms of Robinson may be justified, but I think Burge is a bit uncharitable too.

He's right that talk of "direct awareness" is ambiguous and confusing. I'm "directly" aware of the mind-independent tree inasmuch as I'm directly aware of its representation in my mind. But, of course, I'm *not* "directly" aware of the tree in some mystical naïve realist way—the tree-as-it-is-in-itself-outside-of-perceptual-representations.

It's true that children aren't aware of the tree-image *as a tree-image*. They're naïve realists. They don't think of their experiences in terms of images or representations. But what Robinson is saying, in effect, is that they're aware of the mind-independent tree only by means of, or in being aware of, the mind-dependent tree-image. But Burge may well be right that this statement isn't very controversial. (It certainly *shouldn't* be!) So maybe Robinson went wrong there. But then is his whole book based on fundamental misunderstandings of philosophers in the last eighty years? That hardly seems likely. He's a respectable enough philosopher to be discussed in the *Stanford Encyclopedia*.

Burge recommended a (long, dense) book entitled *Seeing: The Computational Approach to Biological Vision* (2010), written by John Frisby and James Stone. So I'm reading that now. It's based on David Marr's highly influential ideas. Fascinating stuff, but the visual system, like everything else in the brain, is so inconceivably complex and mysterious that we'll never have a thorough understanding of it.

Even so, I'm impressed that scientists know as much as they do. They're still mostly in the dark, but it's impossible to deny that the achievements of science, even just in this one area, are stupendous.

*

Reading *Neoconservatism: The Biography of a Movement* (2010), by Justin Vaïsse. A good book, but too "idealistic" like all mainstream scholarly works. If you want to be accurate about history and the ruling elites who disproportionately determine how it unfolds, you have to be cynical in the Marxian and Chomskian way.

By the end of 2025, in some way or other, I'll have published a collection of many of my articles and blog posts in the last ten years. A small left publisher—the same one that published Finkelstein's book on identity politics and cancel culture—is interested in the manuscript, but we'll see if they carry it to fruition.

The brightest spot in my life continues to be Aidan. A smart, sweet little boy. One of those "happy accidents" (to quote the beloved painter Bob Ross) that enrich life more than any of one's best-laid plans can.
