Still no word from Jim. I wonder if *I* have HIV. The thought has been weighing on me. Haven't had any symptoms, but sometimes they don't show up for 10 years. The odds that I have it are vanishingly small.

I don't want AIDS to be my contribution to Jim's life.¹

Among the poems of Tennyson that I've read, my favorite is "Ulysses". Both the language and the themes are heroic. Blank verse is the perfect medium for the communication of its ideas; rhymes would be a distraction and probably a trivialization, and pentameter is more 'driven' and (potentially) impassioned than alternatives. The section on Telemachus provides both a relief from the powerful expressions of an intrepid spirit—which is artistically desirable, as is shown more clearly in the 4th movement of Beethoven's 5th symphony—and a foil to the character of Ulysses, highlighting his restlessness. Also, it divides the poem into two parts: complaints about the idleness of the homestead, and the resolve to set out into the world again. The last part has the best lines:

Come, my friends.
'Tis not too late to seek a newer world.
Push off, and sitting well in order smite
The sounding furrows; for my purpose holds
To sail beyond the sunset, and the baths
Of all the western stars, until I die.
[....]
 and tho'
We are not now that strength which in old days
Moved earth and heaven, that which we are,--
One equal temper of heroic hearts,
Made weak by time and fate, but strong in will
To strive, to seek, to find, and not to yield.

"Tears, Idle Tears" has wonderful pathos without being self-indulgent. There's barely a hint of sentimentalism. Tennyson's fairly easy to read and is skilled at a large variety of poetry. The meter is regular. I like him, though he doesn't overawe me in the way that Donne, Pope, Dryden, Milton, Byron, Keats and others do. (To be fair, I haven't read his longer poems.)

John Donne. Certainly not as easy as Tennyson. It can be hard to follow the course of his poetic arguments. But his talent is dazzling and he's one of my absolute favorite poets.

¹ In fairness to myself, one night he went to a masseuse alone and had sex with her.

Milton:

How soon hath time, the subtle thief of youth,
 Stol'n on his wing my three-and-twentieth year!
 My hasting days fly on with full career,
 But my late spring no bud or blossom shew'th.
 Perhaps my semblance might deceive the truth
 That I to manhood am arriv'd so near;
 And inward ripeness doth much less appear,
 That some more timely-happy spirits indu'th.
 Yet be it less or more, or soon or slow,
 It shall be still in strictest measure ev'n
 To that same lot, however mean or high,
 Toward which Time leads me, and the will of Heav'n
 All is, if I have grace to use it so,
 As ever in my great task master's eye.

I've read ten or twelve poems by Milton, including "Lycidas", and I've decided that I prefer Donne. He's funnier, wittier, easier, more passionate—his love poems rival Byron's—and, I think, more impressive in his word-play (though Milton's language is more lush). He also makes more sense (and he's more a *thinker*: he has an insight into psychology and life that Milton either lacks or can't express with Donne's subtlety and precision). "Lycidas" has passages that are practically incoherent, not only in their use of several voices but especially in the length and obscurity of their sentences. I should read the poem again. An internet article I skimmed suggested that "the irreducible plurality of *Lycidas* accurately represents the complexity and plurality of the human consciousness, and especially the human consciousness suffering the destabilizing pain of grief. [The poem is a lament for the death of Milton's friend.] Moreover, it embodies the indeterminacy of meaning, the distance between sentence structure and truth."

Tuesday, August 24

Sent my application, along with \$675—that's only the beginning!—to the Washington Internship Program.

I want to have my blood tested, but I should wait a month or so. The waiting isn't great. If I had HIV I'd deal with it, I (probably) wouldn't go berserk or anything—my parents would be more upset than I—but on the other hand it's not on my list of things to experience. The thought of the day after the test, when I'm waiting for the outcome, borders on harrowing. I never would have considered any of this if it hadn't been for Jim's imaginings. I wonder how he's doing. I read yesterday that some victims have a week of mono-like fatigue about a month after contracting the virus, which happened to him. I don't know if it happened to me. I've been fatigued for months, so I might not have noticed it.

This seems almost like a dream. It can't be reality! My life is too *ordinary* for this! I would never get AIDS! —But part of me thinks that if something like HIV *can* happen to me, it will.

Arrgh, curse that night!

I can't get past the feeling that it's *inevitable* I was infected. It's too good to be true that I wasn't.

As I was reading Yeats I asked myself whether a work of art can be considered 'worse' if the reason for its structure or content isn't the author's *choice* but his lack of talent. If the reason for Yeats' relative disregard for stringent requirements of form is simply that he didn't have the discipline or genius that Pope had (for example), rather than that he decided 'an obsession with meter and all types of formish consistency is inartistic' or whatever, is his poetry less great than it would be otherwise? This question boils down to whether the artist can be separated from his art. I took a stab at an answer in the thing I wrote on Marquez's book, but I wasn't satisfied with it. It seems wrong (and certainly very difficult) to separate the two, to

judge them separately, to ignore or pay only slight attention to the artist (his abilities, intentions, mental state during creation) when judging his work. On the other hand, to mingle the two elements seems foolish, because then you get into a hopeless muddle and it's a bottomless pit involving psychology, ephemeral mental states, questions about the process of creation, comparisons between artists, extensive research into everyone's statements about his own work, the question of his self-knowledge and self-interpretation, etc. –But this is all artificial. Judging has no 'rules'. –Maybe the reason it 'feels' important to keep the artist in mind is that one of the questions you ask when analyzing art is how well it realized its creator's purposes. That's the subjective aspect, and it's one good way of critiquing it. That's the one time when it's necessary to take into account the artist's intentions. (–No no, you can also judge whether the intentions themselves are 'artistic'.) But there's also an objective aspect, according to which you apply 'external' standards to the work, whatever they are, in disregard of the artist's subjectivity. –But what if, say, Milton didn't care about portraying the plurality of the human consciousness and the destabilizing pain of grief and the indeterminacy of meaning in his poem, and he just wrote with no plan, and when he finished it was a barely coherent jumble with no justification or 'form' as far as he knew? Well, then, from the subjective point of view the poem is a failure, because it's undisciplined, it doesn't embody a plan, it's chaotic. But 'objectively' it isn't a failure? Because interpretations can be thought of to justify its chaos? Whaaaa....? And how can you say a work is *in any way* a failure just because its author didn't have a plan or a clear purpose for it? –Suddenly I don't know where I am and I want to get out.

....It's hard to sleep. Why? Guess. I pass from moments of great stress to moments of absolute relief. I can't think about anything else. If I don't have it—ah, if I find out I don't have it I'll be the happiest person alive! I'll feel like the Hallelujah Chorus from the *Messiah*. The antibodies start showing up after six weeks, and that's about how long it's been, so I *could* get tested this week.

Wednesday, August 25

I was accepted into the program. Now comes the hard part: cover letters, resumé-editing, writing samples. They'll be edited by the agency before they're sent to companies.

Blood test tomorrow. Nervousness.

What I wrote yesterday about the subjective aspect doesn't have to refer only to the subjective. You can also extrapolate purposes from the work while paying no heed to whether they were intended by the creator and then decide whether it fulfilled them and also whether they were worthy of being fulfilled. But but but if the author's purposes were different from those that seem most appropriate does it make sense to ignore them and say Well he's wrong, *these* are the themes.? No no there's a confusion here; you can judge the author and the success of *his* enterprise and you can judge the work and the success of *its* enterprise. They don't have to succeed or fail together, nor do you ever have to *ignore* one. And besides in many cases he can't be 'wrong' or even 'less insightful' (than you, who supposedly know the most plausible themes of the work) because often there isn't a 'most appropriate' set of themes. (So you have to take them *all* into account when critiquing the thing.) –Aaaaah, what...?

Thursday, August 26

It'll take two days to get the results. Grrr.

....Tired and depressed at work. (Nothing new.) I keep imagining the phone call and the words "Your blood tested positive". Dwelling on the negative is I guess the mind's way of preparing itself for the worst. Both the good and the bad result seem impossible, the one too good and the other too bad. Well at the moment the good seems like the obvious one, not 'too good' but *normal*—but in other moments I panic. And even if I'm okay the *possibility* will have been there, I will have come close to wrecking my life on the merest whim, a chance event that's meaningless but could have determined the entirety of my future.

Two days from now this doubt is over. It's in the past, and I'm either looking back on it and

laughing or looking to the future and sighing miserably. But in a way that sigh would be easier than this: it would be *certainty*, and I'd have to adjust myself to the way things are instead of *wondering* and *wondering*. A world in flux can be worse than a bad world in stability. Besides, it might not be so bad. I think I'd handle HIV well: I have the sense of humor and the strength not to get bogged down most of the time or give up on life. Maybe the opposite would happen. I might start living more zestfully. I might lose my inhibitions. HIV would put everything in perspective, all the misfortunes and successes that life throws at me. It might allow me to shuck off my sickly narcissism. It might wake me from my slumber, my years-long slumber. I could see it as an *opportunity to be seized* rather than my death-knell. An opportunity! It could turn out to be the best thing that's ever happened to me. It would certainly *test* me, force me to confront my boundaries, the limits I never perceive because ordinary life is a well-oiled machine. I'd learn more about myself and experience a more surreal side of life (at least for a while).

But I'd still rather not have it.

This situation itself is pretty surreal. But I'm *making* it so. It's my subconscious choice. Because, let's face it: I don't have HIV.

The terror is gone.

Friday, August 27

Jeong-young called me out of the blue. We hadn't seen each other in months. Went to a coffee shop for a couple of hours. I said something offhand about a girlfriend—I forget what, probably some cynical remark—and she said “How 'bout me?”—giggled, then said she was joking. But then told me she'd like to date a foreigner. Etc. So I think she's interested in me. Too bad I already told her I'm leaving in September. I wish I'd called her months ago. I'd love for us to be a couple. She's nice-looking and the sweetest girl imaginable, with a good body I wouldn't mind fucking. We'll see a movie on Sunday. I wonder if we could have a fling...?

Nothing's more predictable than that I'd finally find a girlfriend right before I left the country.

I like Yeats a lot. His poetry is somehow 'heftier' than that of most others I've read. More serious. Maybe because he doesn't feel compelled to force it into an external, inessential form: the meter doesn't have to be completely regular, the rhymes don't have to determine the content, the verse doesn't have to be 'pretty'. It often is, but even then you can tell that the prettiness of the words isn't the emphasis of the poem. The *thoughts* are, and they're expressed in fairly common language because...that's all they require. Though I don't always know what it is that Yeats is trying to express—there are obscure parts in such poems as “The Tower”, “Among Schoolchildren” and “The Statues”—I know he's expressing something definite, something valuable. And though he's almost always able to find a rhyme, it's clear that if he weren't it wouldn't matter because the rhymes aren't the point. The essence of the thought is communicated and nothing more. No excess, no romantic indiscipline in even the most potentially mawkish poems (because of their subject-matter)—like this one (“Aedh Wishes for the Clothes of Heaven”):

Had I the heavens' embroidered cloths,
Enwrought with golden and silver light,
The blue and the dim and the dark cloths
Of night and light and the half light,
I would spread the cloths under your feet:
But I, being poor, have only my dreams;
I have spread my dreams under your feet;
Tread softly because you tread on my dreams.

Very simple, yet thereby more effective. The romantic poets might have extended that poem into stanza after stanza—while exchanging its unadorned language for baroque prettiness—but all it needs are those eight lines.

A. E. Housman wrote mostly ballads. Wasn't a very versatile writer, but his poems are fairly ingenious. Ballads are charming and easy to read—rather 'light', even when their subject-matter is deadly serious, as in Housman's many poems about war and death. He's able to inject humor into a predominantly gloomy mood; he often puts something like a punch-line at the end, as in "Is my team still ploughing?". I wouldn't say he's on the level of Yeats and Tennyson, but he's a brilliant wordsmith.

Saturday, August 28

Last night wasn't easy. Got to sleep at 6, after much terror at the thought of what today would bring. Woke up early. Waited impatiently every minute for the phone call. It grew unbearable. I couldn't sit still. I knew that *the* climactic moment of my life could happen any second. Finally I went to the doctor's office and asked for the result. The nurse told me to wait. I sat there consumed with dread, laughing because otherwise life would have become intolerably serious. She walked towards me, then turned around and walked back behind the curtain, then came out again, and I looked at her with bulging eyes. Her gestures and stuttering, which required interpretation, told me that...I didn't have it! The result was negative! I cheered, thanked her, and strutted out to the elevator as though on Ecstasy. What a relief! I feel exuberantly healthy, electrically alive, better than I've felt in a long time. A whole healthy life is ahead of me!

I've learned my lesson.

...Work sucked away my good mood. But now that I'm alone it's back. I'm going to bed early for once.

I heard that Jim returned a few days ago.

Sunday, August 29

I remember reading somewhere that Robert Browning's poetry is "spontaneous". I agree. Much of it has the breezy insouciance and the freshness of *Don Juan*. Even the most serious poems and the passionate love poems have a conversational tone (partly because many of them are narratives told in the first person). That doesn't mean they're always easy to understand. Browning is also a master of a wide variety of forms (like Tennyson), some of them apparently 'experimental' (as in "Love among the Ruins").

...It pays to gamble. There were awkward pauses during dinner, and I started to think I'd been all wrong about my feelings for Jeong-young and hers for me, but in spite of that I said, at last, that I thought we'd be a good couple. (This is how it's done in Korea, believe it or not. Through *talking*, not through kissing in a highly charged moment.) She agreed. But we didn't know where to go from there, so we talked about something else. I thought 'There must be a *but*, which she didn't say because of her shyness.' Afterwards we walked to a park and looked for a suitable bench for ten minutes. Too much noise and too many people. But we sat down anyway. Once the conversation got into gear it stayed there; the occasional silences were, for the first time, comfortable. I entertained her pretty well, such that eventually she said she wanted to be my girlfriend. This time it was obvious there was no 'but' (mainly because I asked and she said no). Then we talked about Korean dating for a while. It was all surreal, but happy. Very happy. I ached to envelope her in my arms. After an hour of sitting in a haze of sexual tension thick enough to be cut with a knife, we walked to her bus stop. Held hands on the way. Great great happiness. That petite hand in mine, those small legs walking in step with mine... It looks like my last month in Korea will be the best.

Her summer vacation ends tomorrow. She's a sophomore (21 years old).

We also saw a movie, a bad one. (*The Terminal*)

People never call Lord Byron by his name: George. His name was George. George Gordon. No matter how hard I try, I can't picture that man's name as George.

Monday, August 30

I'm surprised at how easy it was to woo Jeong-young. After two dates we're a couple. I called her tonight and asked when she wanted to meet; she left the decision up to me, saying she was free everyday. So we'll meet tomorrow. She'll have to wait for two hours after her classes end, but she doesn't mind.

She's reading English literature in her spare time so we can talk about it.

Andrew Marvell, who lived in the 17th century, wrote some great poetry, but compared to Donne's it's softer, less masculine, less perceptive, less philosophical, less *meaty*. More romantic. I like "To His Coy Mistress" because it has a *message*—a real thought is behind it—and not some clichéd nebulous sentiment(s) about love.¹ This fluffy but dense romantic stuff can wear on my nerves.

My favorite poetry is the traditional kind from the 18th and (especially) 19th centuries, not the modern 'uglier' creations, even if they're Yeats's.

Wednesday, September 1

Wordsworth's poems don't interest me much. They're boring. They treat of the "sublime", but they aren't sublime themselves. The incessant nature- and innocence-worship seem obtuse and unconvincing because the language is prosaic. As Byron wrote, "[Wordsworth,] both by precept and example, shows / That prose is verse, and verse is merely prose."

[Went to a DVD room wth Jeong-yeong, etc.]

Byron, and me: "This journal is a relief. When I am tired...out comes this, and down goes every thing. But I can't read it over—and God knows what contradictions it may contain. If I am sincere with myself (but I fear one lies more to one's self than to any one else) every page should confute, refute, and utterly abjure its predecessor."

Thursday, September 2

We learn from Horace, Homer sometimes sleeps;
 We feel without him: Wordsworth sometimes wakes,
 To show with what complacency he creeps,
 With his dear 'Waggoners', around his lakes;
 He wishes for 'a boat' to sail the deeps—
 Of ocean?—No, of air; and then he makes
 Another outcry for 'a little boat',
 And drivels seas to set it well afloat.

If he must fain sweep o'er the ethereal plain,
 And Pegasus runs restive in his 'waggon',
 Could he not beg the loan of Charles's Wain?
 Or pray Medea for a single dragon?
 Or if too classic for his vulgar brain,
 He fear'd his neck to venture such a nag on,
 And he must needs mount nearer to the moon,
 Could not the blockhead ask for a balloon?

Friday, September 3

¹ Maybe they weren't clichéd in his time, but they are now.

[...]

I read Coleridge's *Rime of the Ancient Mariner*. Don't know what to take from it. That it's bad to kill animals? That life is sacred? Or that seafaring can be quite an adventure? That darkness lurks behind everything, even a wedding ceremony? That the forces of nature are bound in such a unity that if you interfere with one you upset them all? Or is it just a fanciful tale with no purpose worth mentioning? (The "life is sacred" theme, though explicit, is a molehill that can't possibly support such a mountain.)

[...]

I haven't mentioned my job in detail lately because, like Nietzsche, "I want never to paint another image of torture." Work is something I barely survive each day.

Saturday, September 4

My chronic lassitude is debilitating. It's hard not to spend all my spare time lying in bed or watching TV. I want to write a story, and I have a vague idea for one, but doing so would require concentrated thought.

...I can't bear the thought that I'm fated to enter the ranks of the *fairly talented*, the mass of people who are in not the first tier but the second or third. Even the first tier wouldn't satisfy me. I have a neurotic need to be God. I must forge the destiny of my race or not live at all. I want to freeze time so that I always exist and multiply it so that I *am* existence. The prospect of passing gently into that good night paralyzes me—the prospect that I'll be only a name and then not even a name. I want to be an *awesome being*.

But I know fame wouldn't satisfy me. I'm like the Ancient Mariner, doomed to roam from land to land, telling my "ghastly tale", but for a different reason than he did his.

It's odd that I care less about the present than the future, and that I see the present through the prism of the future.

Monday, September 6

Yesterday afternoon Jeong-young and I shopped for clothes for me. Didn't buy any. I suggested we watch a movie in my room—rent a DVD—she liked the idea—so we walked to my house, around the corner of which I thought was a video store. There wasn't. We stood there at a loss. Suddenly Bobbi showed up; she didn't know where the place was but offered to give me one of her movies. So we watched *Pirates of the Caribbean* with no subtitles. Poor Jeong-young. I don't think my explanations of the plot were of much help. We sat on the bed and stared at my computer; I periodically tried to move my arm into a comfortable position on her body. It was weird. Finally at the end I kissed her with no warning. She kissed back. Then we really started slobbering on each other and hugging and necking and all that. During the pauses when I looked up at her—she was in that surely uncomfortable position that's great for guys, with the girl sitting on his thighs and her legs curled around his back—she was unable to look back serenely but had to turn her head cutely from side to side avoiding my eyes timidly, as I told her not to worry and tried to caress away her doubts. She liked hugging best, so we did that mostly. The necking provoked the trembling comment "Isn't it too heavy?" [...] "I've never kissed a foreigner!" She didn't think we ever would. Why? Because I'm a foreigner. She thought we'd do nothing but hold hands for a month! I don't understand females. We had samgyupsal for dinner—delicious!—and then she went home. I didn't and don't feel much of anything for her—I think she's a good person and love holding her hand because it's a hand to be held and kissing her because it's a face to be kissed—and her femininity is attractive—but at bottom we mean nothing to me. I enjoy our time together despite my having to perform what usually amounts to a monologue because physical contact is nice and affection for and (lesserly) from me is gratifying and she's a girl who for a while is mine. I hope she isn't too sad when I leave...but on the other hand all people must on some level want others to be upset when they say good-bye because humans are selfish and vain...but I don't care much either way 'cause I'll never see her again.

I ran into Jim on my way home. First time I'd seen him in weeks. Talked in a coffee shop until 1:30 about HIV and his relative certainty that he has it because of all his symptoms. I did my best to comfort him. He called me today and we had dinner, talking about HIV again most of the time. Lately I've had a stiff neck and a lot of red bumps on my arms, which may be mosquito bites; those symptoms have been worrying me, and our conversations haven't helped. I'll have to get another test, probably two more. Not looking forward to it.

Tuesday, September 7

Dinner with Sun-hyun, the model.

Reading Marquez's *Love in the Time of Cholera*. It's as magical as the other one.

Wednesday, September 8

Not a good day. While doing errands downtown I was assaulted by the preternatural beauty of the ladies and my unslaked lust devoured me alive. It rarefied my consciousness to a state of pure agonized yearning. I sat in a park so that my exhausted soul could exhale freely, undistracted by the city's sights and sounds. At work I had barely enough energy to walk around the classroom.

Thursday, September 9

Met Jim after work. Drank at a bar. More like a restaurant. The DJ did some kind of an auction for three bottles of exotic beer—it took us a while to figure out what was going on—the customers kept shouting amounts of money—I was tempted to join in—and Jim goaded me until I did—“*i-chun won!*”—‘Ah, the *waeguk-in*, oh, how funny, look the *waeguk-in* is bidding!’—then somebody else, then me, then somebody else, and on and on until I reached “*man won!*”, i.e. 10,000—and I won the beer—which was only the beginning. The DJ called me up to the stage and gave a spiel of which I understood nothing, except that he asked for my age, but at last he gave me the beer—but then took it away and made various motions that gave me to understand I was supposed to give it to the girl I liked best in the whole place—so I walked to an unattractive one and gave it to her—figured the pretty girls didn't need more attention—she was thoroughly embarrassed. The guy talked to her; apparently she had a boyfriend, so whatever would have happened if she hadn't didn't. I sat down, confused about why I hadn't gained a beer. But then he called me up again and gave me another, which I was supposed to give to someone else. I did, this time to a gorgeous one. More cheers and instructions and chaos followed. By now I was hoping to get some hooking-up out of this. I waited and stood there foolishly until he gave me the third beer. I didn't know what was going on and I was tired of this game, so I gave it to a boy and sat down with Jim again, who was crumpled over with laughter. In the end I was able to choose one of the beers for myself, a good brew from the Philippines. Then we resumed talking about the Daily Show and HIV and Korea's cultural immaturity and whatever else occurred to us. We'll be “HIV buddies” if we both have it. That'd be kind of fun. Permanent friends united by a shared disaster.

I'll get tested again next week.

Ten days left!

It'd be amusing and ironic if my parting gift were HIV.

Friday, September 10

Dinner with Jeong-young. Then board game café. Jokingly I suggested we stay up all night—“Tell

your mom you're at a friend's house! Let's live it up!" At first she laughed at the idea, but later she latched onto it. I didn't entirely want to but acquiesced, hoping for some lovin'. As we drank in a bar my fatigue nearly overcame me, but walking outside in the fresh air under a blanket of drizzle rejuvenated me. I danced around her and skidded on the paths and compensated for her reticence by making the most noise I could. Then we sat on a bench and barely talked. I was bored, despite my happy-go-lucky act. But I kissed her anyway. Tenderly and passionately, as if she were the love of my life. Like the last time, she seemed distant and passive. I asked her about it. After a lot of hemming and hawing she said she doesn't really like kissing because it makes her fond of the kissee and she's afraid of being hurt. Later she said we're not a true couple—which has always been obvious: we're too different—but it surprised and hurt me anyway. She'd wanted to try this relationship out of *curiosity*. The rain continued to pelt our umbrella and soak my shirt. She said she wouldn't kiss another boy until she'd left college because she wants to focus all her energy on studying, and a boyfriend would be a distraction. After minutes of silence we decided to go home. Lifelessness had grabbed hold of me. Two hours later I'm still locked in its vise-like grip. But now the cause isn't so much Jeong-young—who never meant much to me anyway—as certainty that I have The Disease. Which one? Good question. I have so many it's impossible to tease them apart. But this time I'm referring to the virus. The rash on my shoulders is not reassuring. I like listening to Freddie Mercury, the HIV victim who rose above it. "Under Pressure", while an apt description of my state of mind, is an inspiring song and helps me resign myself to the inevitable. I listen to it and can accept my lot with composure. I've seen too too too much of life not to be calm in the face of every conceivable misfortune. I've weathered so many storms that I can handle anything. At this moment I don't have ambitions, I don't have dreams, I don't have doubts, I don't have anything less than complete fate-loving humane but cynical wisdom. Nothing matters to me. It's all a grain of salt. Why torture myself?

Saturday, September 11

I got the blood test. Last night before falling asleep at 6:30 I decided I had to get it over with. The result won't be ready until Wednesday.

I'm exhausted but it'd be useless to go to bed. There's no escape from wakefulness. I'm trapped in a sleepless nightmare.

Sunday, September 12

Jeong-young and I spent the evening together, shopping, eating dinner, and movie-watching. In the DVD room we inched our bodies closer, then she held my hand, then she lay her legs across mine and rested her head on my shoulder, and finally she asked if she could hug me. I closed my eyes and tried to savor the moment.

Recently she told me that the reason Koreans dislike sarcasm—why their sense of humor hasn't evolved to the West's level—is that it's impolite. The result is that slapstick and silliness are the preferred forms of comedy.

Thursday, September 16

At the clinic the nurse made me wait fifteen minutes to hear the judgment Life or Death. I placed my hand on my chest in a vain attempt to calm my thumping heart. When they brought me into the doctor's office—which they hadn't done at the other clinic—I expected the worst. Why would he want to see me if the result was negative? But it was. I was in the clear. He asked me some questions—"Do you have an unusual coitus history?"—"You mean aside from losing my virginity to a hooker?" I wanted to say—and told me I should get another test in six months.

For three weeks I've had wretched allergies. My life has been a series of sneezes.

Friday, September 17

Jeong-young wanted to help me pack. Came to my room and folded clothes for me and stuffed them into suitcases—much more efficiently than I could have done. We had fun together. Silly, silly fun. I didn't want her to leave—didn't want to be alone again—but her mother called after midnight and demanded she come home.

Lunch with the five teachers I work with. Tomorrow's my last day.

I'm sad and happy. Mellow. I'll never see the students again. Though I'm tired of them, we had good times together and they were a big part of this chapter of my life. The farewells to them today were bittersweet.

You spend a year of your life around the same people constantly but when it comes time for the good-byes it's all over in ten seconds. The good-byes are what relationships come down to—and the depth of the relationship is revealed in the nature of the good-bye. You know how much you mean or don't mean to someone by how he acts when you leave. That's why goodbyes can be awkward: the mask comes off (or it's less concealing than normally).

Sunday, September 19

Last night I had dinner with Eun-young. Then took a nap in a coffee shop before seeing Yu-mi one last time. Around midnight I met Jim, Scott and Bobbi; we drank.

So. It's over. Tomorrow I'll fly to Vietnam; twelve days later I'll go to Thailand. On October 15th I'll come back to Daegu to get my luggage and I'll fly home on the 17th.

I wish I had some deep conclusions I could write about this year. I'm not in the mood to think, though. Something like a resigned, confused sadness has taken over.

[...]

Dinner with Sun-hyun downtown. Walked in a park after. Fountain gushing under the moon—'this is the last time you'll see this, Chris—drink it up—live it up—quietly but not less drunkenly—you may never be here again—though you hope to—so—etch it into the river of your memory.' [Intentionally clashing imagery.]

Stairway to heaven, an ocean of sound rubbing out blemishes of discursion.

Nothing's left. Nothing but names writ in water and shadows and sand-blown souvenirs.

September 27

[...]

But first impressions [of Vietnam] are one-sided, often meaningless. Hanoi is.... I don't know. What is Hanoi?—Thousands of motorcycles on every street weaving and dodging pedestrians who are weaving and dodging motorcycles. Drivers chasing tourists yelling "Hello! Motorbike?"—most taxis aren't cabs. Vendors beckoning you incessantly to rip you off if they can. Opportunistic friendliness. Few English-speakers. A sprawling confusing Old Quarter from colonial times with crumbling European architecture—kept nice-looking in parts—and narrow streets and few traffic lights. Organized chaos. Every man for himself—good luck not getting run over! Astonishment at the ability of this city to function. —The invisible hand guides human pawns even here.—Sultry weather that doesn't deaden the vitality that seeps from their pores like sweat. Great palpable crystallized love of life around every corner in the gutter and the wrinkles on the elderly and the cigarette smoke. A determined optimistic *carpe diem* character like Lisbon's.

I'm staying in the Old Quarter—haven't been anywhere else—don't care to see ugly communistic capitalism—living on a street with lots of vendors selling toys. A man nearby is playing with a wooden life-like snake on the street; two girls screeched and jumped when they saw it. People here are fascinated with toys.

What seem to be peasants walk with their conical wicker hats carrying a device over their shoulders—a stick with rope from each end on which hangs a bucket on each side that they put fruits and vegetables in. Men pedal things like rickshaws alongside cars (which are rare) and motorcycles. Old Europe in the buildings and new/old Vietnam in the streets. —This country is a collision of worlds.

September 21: explored the neighborhood—took motorbike to the lake—walked to Dan chu hotel for hour-long naked massage. My guesthouse manager (my age) asked about my plans—I said I had none—he suggested three or four places to visit and said he'd arrange the trips—I was hesitant but he pushed and pushed and finally convinced me—so I gave him \$400 to pay for all the train, bus and plane tickets he was to schedule. Friendly guy. “You like boom-boom?” he asked. “What do you mean? What's boom-boom?” “With a girl...”—various gestures. “Oh. Yeah that's fun.” “I go to nightclub. Boom-boom. You want to come?” “Uhh...okay...maybe later.” I left the possibility open.

—Might as well finish the story now instead of continuing chronologically. Today he asked again—said we could go this evening before I take the train to Danang. I thought about it. For a long time. But I guess I knew the answer right away. After a couple of beers we drove to a brothel. In the inner chamber six or seven girls stood on display. I had to choose one. Felt remarkably idiotic. Nervous, too—a little. Chose the prettiest girl, who took me to a bedroom/bathroom where we showered. Then she undressed and...etc. We tried only the missionary position. (She didn't want to do anything else.) It wasn't great.

Hard work. All that pumping! (Strange how the body automatically takes over when you're nearing the climax.) And silly. Like wasting time. Fleeting pleasure just isn't a good enough reason for the time and effort it takes. I assume sex with a loved one is much more satisfying.

But *now* at least, for the moment, when I look at girls I can think ‘You're sexy but I know what that amounts to even in the ultimate moment, and I'm not as tormented as I've been.’ I can think: *who cares?*

September 29

Took overnight train Monday evening to the coastal town of Hoi an. Met a Malay and two Brits at the station. Friendly people but typical budget travelers: pushy, rude to natives and maniacal about saving a buck. I followed them around the hotel neighborhood for an hour as they sniffed out the cheapest place. Had I been alone I'd have chosen the first one I saw, as I usually do. (Bargaining is another thing I'm bad at—especially with women. Money matters so little to me that I have trouble acting *serious* enough to insist on a low price.) I haven't seen them since we got our rooms. Wanted to be alone—didn't like their control-freakish style—and hate all groups anyway. Uneventful evening. Didn't explore much of the town. —By the way, the reason Hoi an is worth seeing is that it used to be the main international port in S.e. Asia, 500 years ago. So it was a crossroads for the Chinese, Portuguese, French etc. cultures. The old section is famous and why I came. —At night the Viets had their autumn festival—a 2- or 3-day celebration around the country—in honor of those days' being the exact middle of the something in the lunar calendar—good timing for my trip b/c the festival is a unique chance to see Viets let loose. I saw it in Sapa—more on Sapa later—and Hanoi—more on Hanoi later—and now here. As I was eating dinner some guys playing drums and cymbals marched past, an elaborate dragon composed of two costumed men dancing in front of them. *Several* dragons, actually. They stopped walking and performed for a crowd, impressively twirling and jumping and rearing like horses. The guy in the front was the head and neck, the (crouching, hidden) guy in the back the arse. Wearing golden, red, blue, green... cloths. The Viet crowd just ate it up. They liked it more than the tourists did! For hours the show went on—actors taking turns to catch their breath—the procession (with its huge entourage) marching ten steps, then performing for ten minutes (drumming and dancing), then marching ten more steps and so on, making its way around the town. The daredevils climbed

on each other's backs until there were three levels, the top being the head half of the dragon twisting and barely keeping his balance, potentially falling face-first onto the cement. But the dangerous part was a different set of acrobats nearby breathing fire out of their dragon costume. You know, that thing you've seen a thousand times with the torch and the gasoline-drinking and the spitting it at the fire. The spectators were enthralled like no one I've seen in the West. They were most delighted when the head caught fire and the spitter threw it down from his perch on shoulders into the crowd, where, still flaming, it was kicked around and trampled on by bare feet and could have caused a tragedy. The people laughed and cheered and didn't give a hoot that it was fire they were kicking at each other. Then it was doused and the danger started all over again, the mask eventually catching fire and being thrown into the crowd. No policemen around. The behavior of the masses was exactly the opposite of what it would have been in all but the most insane Western social gatherings. Even grandmothers were screaming with glee. I was like 'Hey people—ya know—that flamy orange stuff there—that's, um—that's fire—ya might wanna stay away from it.' But I learned that at the heart of this culture, despite poverty and oppression and the past, is a carefree Latinish love of fun and pushing the boundary. (I guess that used to be at the heart of our culture too (sort of), but in this age of litigation and P.C.ness it's been mostly killed.) Developing Southeast Asian countries tend to have that optimistic character.

Ultra-heat today. I walked through the Old Town drenched. Extraordinary number of art galleries. On the river, boats similar to the one in *Apoc. Now* that has the puppies and the Vietnamese who are killed by Martin Sheen's gunners floated, waiting 4 tourists. As always, everybody wanted to sell me something and I had to say no to each person 10 times—you think I exaggerate—before he'd leave me alone—and as it was I gave away a lot of money out of compassion. Saw some Chinese architecture—two communal buildings or meeting-places or temples or something—in courtyards—peaceful and indescribably beautiful. Later I rode a bike 3 miles to the beach on the S. China sea. Palm trees, white sand, the souging of the gentle water—old ladies walking around wearing heavy clothes and wide-brimmed hats as protection against the sun selling pineapples and bracelets and blankets. Whole pineapples that they cut up and carved in front of you and you ate like an apple with an irregular shape.

October 1

Doing nothing today. Waiting in Hanoi for the plane tomorrow to Bangkok. But I want to go home.
 –Existential nausea.
 Watching TV in my guesthouse.

October 3

Bangkok. Exploring the area around Wat Po (which is a temple with a colossal reclining Buddha, symbolizing his passage into nirvana). It's more incredible than anything Korea has, but it doesn't really impress me—almost nothing does—I'm as hard as the tile-fragments that encrust the roofs of the temples—and everything I see reminds me of what I don't have—and I'm just wandering around because that's what I'm supposed to do, and my heart isn't in it. Tonight I'll take a bus to the southern beaches and islands of Thailand. I arrived here yesterday. Bangkok isn't as crazy as Hanoi—well, it's very different—and more Western from what I've seen, with more and better restaurants, and more cultural attractions, so I like it better. A taxi drove me to various sites, waiting as I looked at them—and offered to take me to a massage parlor, showing pictures that made my mouth water—but I've had enough of prostitution—loveless love—so I turned it down.

October 5

Ko Pha-Ngan. It's raining. No electricity today on the whole island and Ko Samui too. Watched TV yesterday. (Arrived in the afternoon after 20-hour trip.) Reading now. Desire nothing more than to be far away from third world countries (Korea included, with its backward *culture*). My toilet doesn't flush; no hot water; few comforts; no English anywhere—but at least Thais are quite friendly. I should have spent a year in Bangkok, not Daegu.

October 8

I have to get my life back on track after its year-long hiatus. Having access to books in English will allow me to resume my education—my first priority. Since I'll be writing for a political publication I'll have to learn about society—economics especially but also the history and current policies of the U.S. government. I'll put philosophy and art on hold. That makes sense pragmatically too b/c anything philosophical I write will be more appreciated after I've already made a name for myself, which is easiest to do in relation to politics. Besides, philosophy is harder, and it'll take years to learn enough to expand and improve on the ideas in my thesis (and delve into other areas). I can sort of tolerate my constant questions if I know that sooner or later I'll answer them. (Same with my interest in science.) It doesn't matter *when* I understand humanity and its history as long as *someday* I do. The tasks of the immediate future are to educate myself and, in the process, make a name for myself.

I've been reading Noam Chomsky on the web. Can't comprehend the sponginess of his mind.

—Who am I kidding? It'd take me decades to make a name for myself in journalism. I'd be a bad journalist anyway. But I'll try it and see how far it gets me.

Maybe I should live at home for a few months to teach myself the basics of economics.

October 15

On the 13th I rode an overnight bus from Krabi to Bangkok. Arrived at 5:00 a.m.; went to a guesthouse, slept until 11:00; slouched around the neighborhood of Khao-san, not knowing what to do until my flight to Seoul at midnight. Didn't want to see more temples. One activity I considered deeply for hours was a massage with sex. Wouldn't have thought seriously about it had my ridiculous misadventure on Ko Phi Phi--more about which later--not left me reeling in the mists of blocked lust. Until the evening I sat on benches, walked through parks, walked through markets, walked in circles, approaching the question from every angle. The Vietnamese hooker had been disappointing, but I wondered if that had been a fluke and not a typical hooker experience. Wanted to be sure one way or the other. But I was nervous, didn't want to spend \$60, and couldn't imagine that the simple act of handing money into someone's hand prior to sex *doesn't* necessarily eliminate the eroticism of the act, making it utilitarian. I imagined myself in the bathtub with the girl and getting massaged by her naked and lying beneath her to predict my probable reactions. I remembered that the predecessor had taught me how little pleasure means to me; I knew that I wanted sex really for an emotional connection that would be impossible with a prostitute; I knew that filthy lucre not only distances but also debases the *buyer* as much as the seller; I thought I might be proud of myself for laughing in the face of temptation. So finally I decided against it. Then I had dinner. While eating I watched a beauty catwalk past me with feline grace and I abruptly changed my mind. Hailed a taxi. Inside the brothel was a lobby facing a glass window behind which were seated twenty girls in bathing suits with numbers on them; I had to choose one. Chose the cutest, who was also, it turned out, the shortest. The establishment's classiness didn't mitigate my discomfort, but I put on a bold face. She led me upstairs to a room with a bathtub and a bed. I talked to her as much as I could, trying to break the ice, but her English was minimal. She was only 19. We both undressed and climbed into the bathtub half-full of warm water. She lathered me up--which was more *weird* than sexual. Then we toweled off and went to the bed. No massage. Only foreplay and the real thing. She wouldn't let me kiss her. I couldn't do much, in fact--as with the Vietnamese--because almost everything sexual is more intimate than sex itself [?] and she didn't want

intimacy. So my body did one thing and my mind another. It was lonely and seemed more like a task than recreation. A good feeling, to be sure, but she was down there with her eyes closed, gasping and groaning, and I was up there looking at her disinterestedly, and we were in two separate worlds. Afterwards we lay down for an hour and dozed, holding hands. Her fingers twitching frequently, randomly, were more memorable than the humping. I looked at her tranquil face and felt her twitching fingers and was struck that this was probably the best part--the most human connection (for me, at least). But I was still sad, from the whole situation. Later the real meaning of the ritual was revealed in all its crassness, when she insisted on an extravagant tip.

Downstairs I noticed that the receptionist was more desirable than the other girls and, having learned nothing, wished I could have been with her.

I left Southeast Asia dimly, without pomp and circumstance. Couldn't sleep in the plane. In Seoul I grabbed the first taxi I saw, which, despite the meter, ended up costing \$60 for twenty-five minutes. Furious with myself, I told him to drop me off at the subway (rather than the train station), where the revived memories of this year took advantage of my anger to try to make me cry. But I beat them back! (It was hard with the radio playing "Send in the Clowns".) In Daegu I learned that my flight would be on the 19th. Wrote an email to Jae-eun; called Jeong-young, who invited me to a classical guitar concert tomorrow.

I was on Ko Pha-Ngan for three days. Typical tropical and poor island. The best day, because the least rainy, was the 6th, when I lay sprawled on a beach for four hours reading. That was one of the few times I actually sat back and realized I was on an island in Thailand. Ko Samui was the next stop. Three days again. Rain at all times except the late afternoons. Spent most of my time on the primitive resort isolated from the rest of the island. (Well, the whole island consists of places isolated from each other, with small highways and dirt roads between them, and forests and mountains.) The day I went to Chaweng--a shopping district near a famous beach of same name--there was a downpour that turned the streets into roaring rivers. Damn-near catastrophic, though brief. Water eight inches high and cars trying to drive through it. As usual the rain came in spurts, and it was clear again for enough time for me to do nothing on the beach. A small elephant was being shown off by its owner; I'd never seen one. It must not be very comfortable to ride one of those, with their long prickly hairs and tough rawhide. An amazing sight though. Among the most comical-looking of animals.

Next: Krabi, a town on the Andaman coast. Sunnier skies. On the first day I took a boat to Railay beach. Bad sunburn. But good foot massage in the shade by a Thai lady with a degree in it--or a certificate, or something. On the second day I took a ferry to Ko Phi Phi, probably the most beautiful of the islands I saw. I was supposed to go back to Krabi the same day, but a girl I met persuaded me not to. [...]

In the morning I learned with horror that it was the 13th, the day I was supposed to take a bus from Krabi to Bangkok! For some reason I'd thought I had an extra day when I'd chosen to stay overnight. Bought the earliest boat-ticket to Krabi (1:30), hoping the bus left late in the day. Knocked on Natalie's door at around noon, but she wasn't in. So I left the island \$30 poorer and no sexual experiences richer. Made it to the bus with only half an hour to spare.

Sunday, October 17

Es gibt nothing to do, so I'll jot down memories of the days I didn't write about.

September 22: took a bus in the morning to Halong Bay. Vietnamese tour guide, woman, aged 27, married, cute, is permanently in my memory as having the most personality of any Asian girl I've met. Bearabilized the cramped trip in a bus bursting with fifteen people's luggage by singing for us, talking about herself and asking each of us to introduce ourselves--which would have been the tedious "My name is so-and-so, I'm from this place, I have a job as such-and-such, I'm in Vietnam for this amount of time..." if she hadn't intuited our not-caring-about those details and instead interrogated us on our relationships past and present and advised that we acquire Viet girlfriends b/c they're devoted and they like handsome Western men and besides it's good to "experience" the women of every country you go to--and she herself is often tempted to sleep with Western men but has to remind herself that she has a husband--and her

observations on the appearance and personality of each of us were consistently incisive and funny. We split up at the ferry; she went with another group. Three Aussies and I were placed together--talkative guys; we had a good time--along with a bunch of people we hadn't met, mostly Japanese. I don't know how the bay was formed, but it's unlike anything else in the world: thousands of towers of stone and small mountains covered with foliage jut out of the water, little islands arbitrarily stuck here and there, a majestic sight especially when you're reclining in a chair on top of the ferry under a radiant sky listening to Handel on your headphones. The boat stopped for a while so we could swim in the saltiest water I've ever tasted--or maybe Fiji's was worse. I followed the others in jumping off the top of the boat once, twenty or thirty feet high--not easy for me--I'm still surprised I overcame the reluctance of my gut. We also walked through an enormous cave that had sheltered the Viet Cong's wounded during the American War as bombs were dropped all around outside: it must have been pitch-black and terrifying. And now thirty years later it's a tourist site. Everything yields to tourism in the end (meaning 'eventually' *and--in the end*). The ceiling of the cave was rippled like water, with aspiring droplets frozen in stone. We stayed in a hotel somewhere on Cat Ba island.

September 23: went back across the bay, took a bus to Hanoi. It made a stop at something like a handicraft manufactory, where sixty girls sat at tables creating paintings in thread, heedless of the swarming tourists who watched them and walked around the adjoining shop that sold thousands of products they'd made. One girl noticed I was looking thoughtfully at some bracelets and came over to sell me one. Spoke good English. Petite, warm-hearted, friendly, lovely; she asked where I was from, how old I was, whether I had a girlfriend--the stock questions--but with more interest than I'd come to expect. A fondness for her grew in me and I couldn't bear the thought of leaving in a few minutes. Instantaneous emotional connection between us. I said I was in Vietnam for only ten days; she wished I could stay forever. I wished I could take her home with me--and later I wished I'd said so. My remaining hour on the bus was defined by sadness. That evening I rode a night train to Sapa. The Korean girl in my compartment was shocked to learn I spoke her language.

September 24: Sapa is a poor town in the north of Vietnam near the Chinese border. A mountainous region. I arrived at 6:30, ate breakfast in the hotel, and was assigned a guide who would lead me and two Japanese on a hike that day and the next. Hundreds of little kids from tiny neighboring villages ran around the town in their colorful tribal clothes selling trinkets to tourists, speaking English well--having learned it from the tourists themselves, school being not a very serious pursuit in the middle of nowhere. While hiking I saw a couple of schoolhouses--I *think* that's what they were--near the villages several hours away, but they were so small and dilapidated that I'm sure not much learning goes on there. That day my group walked two miles into a valley and out the other side. On the way down, as we grew distant from the vestiges of civilization in Sapa, we passed a single family's home, a corrugated-roofed two-roomed hut with no beds, no kitchen, no bathroom that I saw, and a porch where a young mother was holding her baby and a grandmother and three or four other people were sitting. It seemed inappropriate to invade their home like this, with the guide explaining to us in his Englimese their customs and how they lived. But I soon realized they appreciated our presence: it was a chance for them to sell the bracelets and necklaces they'd made. For fifteen minutes they trapped us inside their house and reiterated robotically the one phrase they knew and could barely pronounce: "Hello you want this, hello you want this, hello you want this, hello you want this". When I said no and tried to turn away they grabbed me and out came "Hello you want this". It was impossible to discourage them. Finally I bought something from one, which encouraged the others who redoubled their efforts--the guide just standing in the background oblivious to our desperation. Somehow we pried ourselves from them.

The landscape reminded me of New Zealand, but on a larger scale. The terraces on the mountainsides covered in yellow stalks of rice added a human element to the grandeur. Hundreds of terraces everywhere, golden horizontally and green vertically, steps nearly to the summits of hills, perfectly geometrically regular, carved by plows pulled by oxen, a periodic human figure wading in the grass to harvest the rice. Beside the river running through the valleys stood men shaking bowls of rice to separate the chaff in the wind. The whole scene was from a different time, an *epic* time, though rumblings of tractor-trailers and jeeps and dynamite explosions in the cliffs where a road was being built proved that modernity

reaches even into the bowels of the wilderness.

That afternoon, without my knowledge, the guide--a boy my age who'd spent much of the trek talking to me about sex and how promiscuous Vietnamese women are--told the hotel receptionist that I'd said she was beautiful and wanted to meet her. She offered to give me a tour of the town. Unfortunately when she finished work she couldn't find me. And that was the end of that. Later I watched a traditional-music-and-dancing show in a bar.

The next morning I was sick. Contemplated staying in bed and skipping the six-hour hike, but that didn't seem right. So we set off at 9:00. Soon I realized I'd made a mistake. The terrain was rough and it rained off-and-on and I didn't have an umbrella or a jacket. Hour after hour dragged by as I worsened, barely able to walk. Aching muscles, fatigue, runny nose, fever, nausea, chills, hacking cough. Staggering along absorbed all my energy, so I couldn't talk. We passed villages and a lot of cultural oddities I took no notice of. At lunch I suggested I had malaria; one of my companions agreed and put forward many arguments in support of it. I had all the symptoms; I was in a malaria-infested region; I hadn't taken my pills (left them in Korea); I remembered being bitten by a large mosquito the previous day, and he said it was only large mosquitoes that carried the disease (--probably bullshit). Finally we made it to the jeep that drove us for an hour on a distressingly narrow road along a cliff back to town. The weather was cold and I was shivering uncontrollably and beginning to have serious worries. Told the guide I thought I had malaria; he didn't understand. (His English was awful.) Told him I wanted a blood test; his response was "Buh-lut? What? Buh-lut?" He took me to a pharmacy where I bought medicine. But I insisted on going to the hospital. I was in a foul mood and desperate to find somebody I could talk to. He took me to Sapa's hospital, which seemed more like a place to die than to get healthy. Fairly large--an open-air building with a courtyard in the middle and two floors--but almost empty and very unsanitary. After roaming through hallways looking for a doctor we found a nurse who said he'd gone home for the night. Yes. The *one* doctor was gone, leaving his patients to fend for themselves. With gestures I told her I wanted a blood test; she showed me to a room and asked me to wait. On the counter was a stray needle and small bottles of medicines, like morphine. My guide asked me which I wanted. I stared at him in disbelief. I was supposed to choose my own medicine, which would be administered on me by that lone needle, and which I didn't even want in the first place. "No medicine! Blood test! Take blood out! Blood!" Gestures simulating extraction. "Buh-lut?" The nurse came back and took my temperature. More discussion between them, more anger from me, more uncommunication between us. Finally I left. Rode a motorbike to the hotel. But first I went on the internet to learn what I could about malaria. None of the information was reassuring until I read that it takes at least seven days for the symptoms to appear. In my case there'd been only one day. Phew! That night I heard drums and yelling on the streets: the autumn festival. The receptionist wanted to go to a bar with me but I was stuck in bed for fifteen hours.

September 26: hiked again with two Israeli girls and a Kiwi guy. Still sick but not as much. More of the same sights. Villagers shrunken and prematurely aged from malnutrition. 30-year-olds looking like 50-year-olds. But friendly and cheerful. Chickens and naked little boys hopping around. Great open spaces in the valley--a lot of farmland, where men were harvesting crops--and occasional villages with eight or so homes, people waving to us outside or watching TV inside--in houses that barely had places to sleep and nothing but a hole in the ground for a bathroom, and no toilet paper. (Strange priorities they have.) Took a train to Hanoi that night--worse than a Portuguese train, slower and more cramped. Ate prison food for breakfast: plain rice, leaf soup and bean sprouts.

Asked the guide if villagers get married and where they have sex in such close quarters. If I understood rightly, he said that on the weekend there's a "love market": young girls and boys come to town and display themselves to each other. If they like what they see they go off to rut--I don't know where--and if the girl is impregnated they get married. I wasn't satisfied with that explanation but couldn't understand anything else he said. --That custom certainly has the benefit of simplicity. None of this complicated "relationship" crap.

I finished *Love in the Time of Cholera*. How anyone can write that well is beyond me. Now I'm reading *Candide*. And I bought a collection of stories by Kafka. Reading *The Metamorphosis* first.

Monday, October 18

Above when I wrote “sand-blown souvenirs” I was referring to the “sands of time”, not just creating a meaningless pseudo-alliteration.

Last lunch with Jeong-young.

It’s encouraging that millions of people love Eminem. It shows there’s still authenticity in the West, that the Britney Spears-’N Sync-Backstreet Boys sugary pop machine isn’t the hegemonic cultural expression of post-postmodernity. There’s still mass *anger* and *hatred* and the nihilism that negates everything and is only one step away from the desire to change everything. The bombardment of sex appeal hasn’t brainwashed everyone.

Met Jim tonight.

Goodbye Korea! I leave you on good terms and wish you the best. No hard feelings. I’ve forgiven and forgotten--well, not forgotten. But I don’t hate you; you’re not a bad country and your citizens aren’t bad. Just immature and irrational.

Saturday, October 23

I’m home. In America, the land of the ugly. Where are all the pretty ladies I’m used to seeing?

Reading the macroeconomics textbook from my college course, which I didn’t read when I was supposed to. And playing the piano fanatically.

Monday, October 25

Candide hasn’t aged well--not nearly as well as *Rameau’s Nephew*. I had to *force* myself to finish it. “The world is incredibly, incredibly bad, and everyone is unhappy. And I’m going to jackhammer that message into your skull, reader.”

Saw Steiner today. He gave me new meds. Anxiety-reducing, energy-boosting (or so he says).

Reading Pascal’s *Pensées* when I need a break from the dismal science.

Thursday, October 28

Only have three chapters left in the textbook, but today suddenly in a moment of boredom I was inspired to write a book in Nietzsche’s aphoristic style on the state of the modern world and so I’m setting aside economics for the time being and concentrating on that. I think the inspiration came from my taking one of my brother’s Adderall pills. I sat down at the computer more revved-up than I’ve been in weeks. Had no idea what to write, but after a couple of sentences--with no plan--the rest just flowed, more or less. Hours later I’m still propelled by adrenaline.

Interview for internship in D.C. Easy and short. Accepted to a paper called *The Hill*, which reports on...the Hill. I’ll start in the beginning of December.

Monday, November 1

Adderall has its unpleasant side-effects. (Loss of hunger, difficulty sleeping, depression when it wears off.) I need something else.

The book isn’t coming along well. I don’t have enough to say. Nietzsche already said too much;

Christopher Lasch too. So I returned to economics.

Here are a few of the barely readable sections I wrote, in no particular order:

First principles.-- In a book you want to start with first principles. Not in Descartes' sense, but in common sense's sense. You want to say, "Here's the problem, here's the method, and eventually I'll reach the goal that you, reader, have been waiting for." You crave those premises, those tenets, those axioms and proofs that finally lead you to a tidy little climactic conclusion after which you radiate a seraph's smile at the thought that certainty has been attained--sweet certainty! we humans want nothing more!--or if not certainty then the happy permission granted by yourself to sit back and luxuriate in your newfound complacency which although an outgrowth of prior intellectual restlessness discourages you from further inquiry for a time because few pleasures are greater than the proud and conscience-pang-free moment of leisure that follows the completion of a grueling intellectual task, comparable to the exhausted rapturous repose that succeeds a purging bout of love-making when you're lying in bed and thinking silence. You anticipate the climax with more relish than even the reader--because for you it *is* a climax, an ecstatic end to your tormented philosophical musings, a glorious moment of enlightenment in which everything ties together if you're lucky and you've reached wisdom. Your world is for once circular. Complete in itself and self-revealing. Semi-Hegelian in its self-evolution from embryonic mental stirrings to exponential crystallization in the written word to divine revelation in the final synthesis that may after all be a mundane compromise but is no less *certain* (as existing) for that. Your world--shut off from the outside, teeming reality. Above all internally consistent, in your mind, from its first principles to its logically unfolded culmination. What is foreign to its symmetrical beauty you ignore for the time being. You pretend your thought-processes are orderly and artificialize them on paper and present them to the public and sweep the discarded intellectual shavings under the rug and try to forget about them because they corrupt the certainty that you've convinced yourself you've embodied in your work.

But now your brainchild is at the mercy of the vultures that throng around its still living carcass, picking it to pieces, digesting and regurgitating it, mauling it until its form is barely recognizable even in your eyes. You return to it heartsick; what you see is no longer what you saw; and you're disillusioned. It failed to survive out there, among the wolves; its supposed value has been vitiated, its ideas attacked and left in tatters. Your self-enclosed world has been ripped apart, doubt assails you yet again, logic has failed you yet again. Your premises were flawed; presuppositions were unexpressed; counterarguments were forgotten; your prose was obscure; you were too ambitious; you ignored implications; your conclusions were simplistic. Your whole enterprise was an abortion. Systematizing died a century ago and you stupidly tried to resurrect it. You thought you could invent a coherent intellectual universe--whether micro- or macroscopic--you, with your boundless naivete and your Christ-complex that takes you as a vessel for truth. Truth? No no, it's fruitless, don't even try, it doesn't exist, there are too many variables, the world is too ambiguous, too many critics, too many viewpoints, too many agendas, too few facts. You look upon the book that others have spat upon, your beloved theories, and you decide that your goal was impossible, maybe there is no objectivity and metaphysics is a sham, and your creations are nothing but and *must* be mere psychological whims providing more insight into the mind that begot them than the world they tried to unravel. You abandon hope and renounce your dreams and sink into a relativistic quagmire that at least offers the consolation that *no one* is right and you are not alone, because everyone manipulates experience and ideas in such a way as to confirm his innate prejudices and preconceptions, and everyone is bombarded by critics and opposing ideas that claim a monopoly on truth.

You observe society and see that process played out with comic regularity and un-self-consciousness. Academics, following in the footsteps of their forebears the Scholastics, pen tomes wrangling over the minutiae of a centuries-old thinker's ideas and abstruse technicalities accessible to a few people on the planet; economists espouse every doctrine from the classical to the Keynesian

to the monetarist to the--who knows?--the mercantilist?; psychology is and always has been in a state of pluralistic anarchy; philosophy has all but died in this climate of intellectual specialization. And then there are the culture wars, the vicious polarized culture wars, within countries and between countries, verbal and physical. The mass floundering. Nothing apparently is on firm ground. You aren't alone in your anguish; the only difference is that you're aware of it, while others aren't of theirs.

So you stew in your confusion, wondering how it all came to such a pass and if there's a way out.

First love.-- "As I watched I couldn't help thinking they cared less about knowing truth than about being right." "You're a poor observer of human beings. They care less about being right than about being theatrical."

The naïve idealist's despair.-- Philosophy! My eyes glisten at the sight of your death throes! What treasures the Greeks and Romans bequeathed to us, and the ancient Aryans and the Europeans!--what treasures have we buried! The vast thoughts of the Upanishads echoing through millennia, echoing in the orotund voice of primeval civilization, reverberating insights into our selves, our origins, from beyond time's chasm. The pioneering logical rigor and skeptically confident, ambitious idealism of Plato. The heroic struggles of Nietzsche to overcome the nihilism attendant upon God's death by destroying and creating edifices of ideas couched in luminous prose. The noble if quixotic attempts to scale the vault of heaven and look Creation in the eye. The sheer desperate determination to *plow on* in the face of all odds and pierce the veil of Maya just to catch a glimpse, however fleeting, of truth--propelled not by any utilitarian consideration but simply by the mind-devouring obsession to consummate this Wonder that never relinquishes its grip on consciousness. The taming of the turmoil of experience into a *Weltanschauung* and the brief triumphant respite as the thinker contemplates the world he has created, knowing full well that soon his Homeric restlessness will reassert itself, the prospect of adventure and thrilling discoveries will tantalize him, and he'll set solitary sail on seas of uncharted peril. He may not reach his destination--may have to settle for collecting shells on the shore of the ocean of truth--but the *quest* is what electrifies and justifies him. He needs nothing else; and if he is deprived of it he *is* nothing, in his eyes and the world's. He is ignorant of the force that compels him so relentlessly toward his Faustian destiny, but he has no choice but to do its bidding, as a leaf is carried on the wind.

His spirit has dissipated in postmodernity. Now we have the hordes of scribblers scribbling critiques of critiques of dead philosophers' ideas from their spiritual cubicles and receiving a paycheck in return. Immersing themselves in the sacred texts but unable to imbibe the Dionysian essence that wafts from the words to anyone with unslaked thirst for meaning in life. Such empyreal joy is unnatural in a society that worships money, that prostrates itself before The Corporation, and has been bureaucratized into a minutely organized division of labor—a division of labor that places intellectual worker-bees in isolated combs with high walls that prevent them from seeing their aggregate, crushing their latent ambition, if indeed it was latent at all. --Yes, modern bureaucracy has crowded out philosophy and left room only for "scholarship."

An economics equation.-- Late capitalism = subordination of human values to money = subordination of the complete human being to his social function = subordination of the passionate and honest thinker to the service he provides for the System = thinker's resultant fragmented view of the world = thinker's lack of homogenizing influence on mass ideology = chaos of competing values and explanations of everything = widespread doubt and subliminal despair (sometimes dressed up as fanatical certitude) = mass anger with no outlet and nothing to blame it on = incipient nihilism, hatred of the status quo and desire to destroy it with no idea of what to substitute for it = in the end, (one form of) terrorism.

A more Marxist (and realistic) alternative.-- Late capitalism = astonishing technological sophistication and abundance of material wealth = highly evolved divisive economic relations and ever-increasing intricacy of the international (or “social”) and the production-process’s (or “material”) division of labor = continuous exponential enhancement of technological capacity = [1] (a) increasingly labyrinthine social relations that intimidate thinkers into submerging themselves in minute details of scholastic theories--but also, and more importantly, (b) an intrusion of a profusion of inventions into households for every conceivable purpose but especially mindless entertainment, which now becomes the opiate of the masses = (i) deterioration of communal ties¹ and (ii) the cultural centrality of mere images and sound-bites and instant gratification = politicians’ pandering to the whims of the rabble even more than they did in the past, before the advent of mass media....*all* of which = increasing irrelevance and anachronism of traditional value-systems (= religion) that *used* to be opiates = the nagging perception among many that life is losing its “spiritual meaning”, that boredom is creeping into the daily routine, that the youth culture of prurience is undermining “morality”, that homely stability, complacency, simplicity and certainty (= “family values” and “God”) are under attack = panic at the thought of their lifestyle eroding away = massive reaction of Christian fundamentalist fanaticism against the secular society = another ingredient tossed into the boiling cauldron of Western culture....*ALL* of which ingredients = (a) rabid conflicts between social groups and underlying collective uncertainty/apathy/cynicism despite the bold faces exhibited from all sides and (b) an aggravation of inner-city (and rural) despondency obviously due to poverty, a lack of opportunities for advancement, poor parenting, poor education, boredom--and all of which = *a society sick unto death*; [2] constant development of global economic interdependence = insidious extermination of precapitalist ethos and social organizations = large-scale acceptance by developing nations of the loss of much of their former identity, but resistance from the few whose governments disseminate anti-liberal propaganda, as well as from reactionary terrorist organizations = initially an *ideological* war of civilizations (especially the Islamic against the American) but now a *violent* one = in the end, the demise of Islam (due mainly, however, to the “peaceful” spread of capitalism)....*all* of which, and more, complicate the circumstances listed after “[1]”, which complicate the circumstances listed after “[2]”, and, you will admit, make for a fairly ugly picture of the world.

Wednesday, November 3

The great Nausea. At being a citizen of such a country. [Bush was just reelected.] Where prejudice against gays and abortion has power over reason. My need to live a life of theoretic activism grows out of *sheer hate*.

It’s comforting that millions of Americans are as disgusted as I am.

At this point any effort to “save” America is probably doomed in the long run. This country is on the decline. Nietzsche might have compared its decadence with late-19th century Germany’s. But we can still try. And even if there’s little hope for the country, there’s still hope for the world.

But then there must be hope for America in the *very* long run (because whatever affects the world ultimately affects every society in it). Maybe when this identity crisis passes things will get better. They’ll probably keep deteriorating for decades, but after a sufficient number of convulsions maybe we’ll learn to cooperate in order to survive.

‘Have you learned nothing from history, Chris? *Cooperate in order to survive?* What a utopian dreamland you live in!’

Thursday, November 4

¹ Of which (b) is, of course, only one cause. I need hardly point out that this whole passage is a simplification.

I'm not at all disillusioned—disillusionment is impossible when you've already fallen off the cliff and hit bottom—and I was fully prepared for a Bush victory—but my anger and sense of disempowerment have, I think, paralyzed my creativity. The election has made them worse, but they've been there for years. I can't motivate myself to achieve anything difficult and idealistic; The Man is too powerful. The cynicism of critics would crush anything I wrote. It isn't a conscious decision of mine, but an unconscious absorption of the trends of my culture.

I cannot abide the rigmarole about the greatness of America, the goodness of all its citizens. I cannot abide politicians like the “most respected”—and “honest”—John McCain, that opportunist who rejected Kerry's overtures so as to position himself for a shot at the presidency in 2008. I cannot abide people who treat bigoted Midwesterners and their “commitment to moral values” with a grain of seriousness. I cannot abide the conventional wisdom that Bush will make America safer. Indeed, the notion of “conventional wisdom” itself is repugnant.

What I can *least* tolerate is the rhetoric about “reconciliation”, the need to “heal the divides”, “reach across the spectrum” and so forth. What this election has proven, if anything, is the need for radical social change and the *widening* of the cultural gap to the point of civil war.

Glimmers of light: Californians' approval of \$3 billion for stem-cell research. Massachusetts' acceptance of gay marriage. New York's support of Kerry by a margin of 70%. Jon Stewart. —Flickerings of humaneness.

Friday, November 5

Finished the economics book two days ago. Reading Tocqueville's *Democracy in America*.

Monday, November 8

As I read Pascal I'm stimulated to my own thoughts and am tempted to write them down, but I don't because it would be only for the sake of receiving congratulations from my imaginary readers. It wouldn't be for the sake of inquiring into truth or arriving at valuable ideas, or for soothing myself, which are the only estimable reasons for writing nonfiction because others grow out of the desire for fame. But even the ‘soothing myself’ reason is corrupt in its essence, because the relief sought-after functions precisely through the thought that a reader would congratulate me. In any case, I don't write down my ideas because they're superfluous to the quest that guides my efforts, though they might be illuminating to you and would reflect well on me. If a similar variant of the idea has already been communicated by a previous thinker, the person stimulated to its new wording might as well keep it to himself. That's the ‘noble’ thing to do.

On the other hand, the baseness of the motive shouldn't obscure the greatness of the consequence, and the latter should be most important. Though the motive for my writing the preceding paragraph was basically the desire for recognition—which is the motive for *this* one too—the *effect* of it might be beneficial to the reader (by provoking him to think and so on). So that even though (in this kind of context) the motive is almost invariably vain and valueless by any objective measurement (which understands the frivolity and impossibility of satisfaction on the basis of recognition), the thought itself should be communicated if there's a likelihood that it'll enlighten or please the reader. And for any other effects it might have, perhaps on the writer. Besides: being contented, even if for a reason that we feel instinctively to be trivial, isn't necessarily something to laugh at, considering that it happens (in my case) almost never.

Having said all that, I'm still standing by my decision not to record my stimulated thoughts. It would take up too much time. As long as you know I have them, and that I'm even *more* admirable for not

writing them, I'm content.¹

Trying Ritalin now. Scatters my thoughts. Can't concentrate well. Hard to philosophize. Gives me energy, but not the kind I want: it's a sort of restlessness in my chest and stomach that could be confused with nervousness.

Maybe the biological reason—i.e., the *real* reason—that I feel better after I've written an idea that's been bugging me for a while is that the *unexpressed* idea is a form of tension in my brain, pent-up energy, and as Freud said, pleasure is a lowering of "energetic cathexis". Psychologically you could say I'm happy because I've done something to satisfy my desire for recognition, and both explanations may be true, but the biological one is surely less ambiguous and more 'basic', whatever that means.

This Ritalin chases away the wordless intuitions that usually accompany what I write—those comforting intuitions that give *substance* to my ideas and convince me of them. It's a very unsettling feeling.

Section 205. The question I've asked a thousand times but have never encountered in anyone else, until now.

Tuesday, November 9

Reading the textbook on international economics by Krugman and Obstfeld.

Wednesday, November 10

They say that when a country's interest rates increase, its currency will appreciate relative to another given currency² because, other things being equal—e.g., assuming that the expected future exchange rate isn't affected by the change in the current exchange rate—its expected rate of depreciation against the other one will thereby increase (since a hike in its current value means there's a greater distance for it to fall (if the expected future exchange rate is based on a projected depreciation of the currency) or a shorter distance for it to rise (if the future exchange rate is thought to be based on an appreciation) in order to land on the constant expected future exchange rate), reducing the 'real' (as opposed to nominal) profit to be made from investing in the currency with the higher interest rate³ (because its now-higher projected depreciation against the other currency will reduce its real value and partly offset the profit from its higher interest rate), thus enabling companies with unwanted holdings of the second currency (which 'has' the comparatively low interest rate) to sell it in exchange for the first. In other words, those companies won't be able to find buyers of their currency unless they sell it at a depreciated rate against the first currency, because the more they 'depreciate' it the higher the buyer's real rate of profit will be in the future (for the reasons given above). But surely it's less complicated and equally true to say that by buying the second currency at a depreciated rate, companies can acquire more of it with less of their money holdings, which means that what the second currency lacks in favorable interest rates it makes up for in the greater amount that it allows companies to buy. That is, its buyers give up the first currency's higher interest rate but acquire more of the second currency than they had of the first, which means that (at the market equilibrium) they earn as much from the second as they would from the first. This explanation has nothing to do with the expected future exchange rate, which was integral to the first explanation. I don't know what the relation between the two is.

¹ Sarcasm doesn't come across well on paper.

² Actually, all others, but it's simpler to take only one as an example.

³ Or, to be precise: buying assets that yield the higher interest rate, which are denominated in that currency.

[...]

Thursday, November 18

Economics is killing me. Hate it. In the beginning it was cool but now I hate it. Returning to Shakespeare—*The Merchant of Venice*. I decided that since I have no motivation for anything I might as well pass the time enjoyably instead of walking from room to room like a ghost haunted by the past.

Saturday, November 20

Now *Julius Caesar*.

Tuesday, November 23

Reading Kierkegaard's *Johannes Climacus*. Then I'll reread the *Philosophical Fragments*, of which I've read only fragments.

That philosophy constantly revisits old themes and thus seems—*seems*—never to progress proves only that people in all ages must rediscover for themselves the same thoughts that occupied individuals in previous times. It doesn't prove e.g. the richness of the Greek philosophical mind and the paucity of cultures that followed it. —To be sure, most 'thinkers' have these thoughts rediscovered *to* them, by reading, half-mindlessly regurgitating and so on, while a few of us rediscover them *for ourselves*.

The first chapter of the book is a superfluous discussion of the relationship between these two theses: Philosophy begins in doubt, and Modern philosophy begins in doubt. Climacus hears them uttered indiscriminately, as if they're equivalent, by many people; he alone recognizes that they differ. The second one in particular bothers him because he thinks it's either a pointless truism that follows from the first (in which case: why does everyone assert it with such gravity?) or, if it's not a truism, it contradicts the first because it states that modern philosophy is unique by having begun in doubt, which means that earlier philosophies *didn't* begin in doubt, which means that philosophy in general doesn't begin in doubt. K. leaps into a characteristically long and awkward debate with himself to solve this problem, raising all sorts of extraneous questions that hide their insignificance behind big words like 'eternity'. But obviously the solution is that 'doubt' is meant in a different sense in each statement; a different idea is being emphasized, however superficially the two resemble each other. (What the ideas are is clear if you know anything about modern philosophy.) K. may have understood that and chosen to indulge his addiction to verbosity simply because it suited his greater purposes for the book.

Saturday, November 27

The only part of the book that interested me was the unfinished second part. Don't want to read the *P. F.* Instead skimmed Hilary Putnam's *Meaning and the Moral Sciences* today. Boorrrriing.

Sunday, November 28

One of my favorite recreations is to read Plutarch's *Lives*. (The Dryden translation, revised.) Coriolanus and Alcibiades today.

And Montaigne's essays. Very funny. "On some lines of Virgil".

Sangeetha and I are corresponding regularly. Good! Our friendship hasn't died. She lives near

D.C., so we'll probably meet sometime.

Monday, November 29

Read Emerson's essay "The Over-soul". Vaguely Schopenhauerian and mystical. "Transcendental" indeed. The "demonic" in Goethe. He was an elevated spirit but not a rigorous thinker. Nietzsche said "in Emerson we have *lost a philosopher*"—lost him because his education didn't prepare him for philosophy but could have. I understand Carlyle's opinion that there wasn't enough in Emerson for him to 'sink his teeth into'; he wasn't pithy like Nietzsche but diffuse. Nevertheless inspiring and a great man. I read him and my thoughts soar above Putnam and his ilk. E.'s ideas weren't very 'American'—I don't know why Harold Bloom calls him "America's thinker"—aside from their emphasis on individual realization (conceived differently than the archetypal American would conceive it). He's too (—here comes that dreaded word—) elitist!

I read "Heroism" also. Every paragraph anticipates Nietzsche. Makes me love life and myself and the future, less out of self-love than *human-love*, *nature-love*, *war-love*. The thrill of reading those passages! The vigor of prose that punches you in the gut! Emerson's writing is the element in which I thrive.

As for its "truth": while modern scholars and scientists may have a firmer hold on theoretical *veracity*, Emerson comes closer to grasping existential *truth*. He inspires; and if inspiration best grows in the soil of heroic myths, so be it. Self-realization—being true to yourself—raising yourself to your ideal—actualizing your potential—is a form of truth; if you require a scientific 'falsity' to spur you to your heights, if adhering to technical scholarship stifles you, then, by all means, be "untrue"! Let others laugh at your "illusions" while you laugh at their impotence.

As for me, I laugh at the illusions even as I cherish them.

Tuesday, November 30

Rereading Leibniz's *Monadology*, and other writings.

Wednesday, December 1

[...] Reading Lukács's *Realism in Our Time*, a thought-provoking and informative book, though outdated in parts (particularly the last chapter). He was one of the most erudite men in history.

Going to D.C. in a couple days.

Sunday, December 5

Living in the former mayor's mansion with about nine others my age. Rooming with two guys. Watching TV seems to be the favorite activity around here. Not much privacy, so I can't spend hours writing. 'Twould look strange. Can't look at internet porn either. Bummer. The Prozac is helping a little with social interaction.

Tuesday, December 7

My favorite person in the house is Abbey, a pretty, bright, articulate, friendly girl who lives on my floor. She towers above everyone else as a human being. Warm and kind and funny and brilliant.

Wednesday, December 8

Work at 10:00 everyday--or: on the days when I work, which will usually be from Monday to Wednesday. I'll have a part-time job on the other days. If I can find one. Finish work between 6 and 8. Wrote an article today on the history of the Inaugural ceremonies and what the schedule will be this year. Have two other assignments. Called various congressional offices and press secretaries--e.g. the one for the JCCIC--felt very journalistic and cool. I actually *enjoyed work!* At 5:00 went to the Canadian Embassy for a party all interns were invited to; about thirty came; I didn't know any of them. [...]

Friday, December 17

Went to Ted Kennedy's Christmas party; he and a woman (his wife?) did a clever skit mocking Bush, DeLay, Schwarzenegger and other Republicans. They asked us not to report it to the press. Which was funny, because a lot of us *were* the press. I appreciated their trust. I shook Ted's hand and said a few words; wanted to talk to him longer but he was busy. He looked old and tired but still vital and intimidating. It's a strange sensation to be in the presence of history—and an even stranger to discover that history has a hunched back. You think of people like him as giants, larger than life; it's almost surprising to realize they're just humans, as fragile as the rest of us. A single bullet in the head would kill him. It amazed me that such fragility has lasted seventy years. He hasn't been assassinated. That seems remarkable, considering the world we live in. Maybe the world isn't as bad as everyone thinks.

Still working out every day. Miraculously.

Tuesday, December 21

Reading books on Congress and the American government. Also, Jon Stewart's *America (The Book)*, Tom Robbins' *Still life with Woodpecker*, Meg Greenfield's *Washington*, and Viktor Frankl's *Man's Search for Meaning*, which is a record of his experiences in a concentration camp and an introduction to his theory of "logotherapy" (touted as the Third Viennese School of Psychotherapy, after Freud's and Adler's). Abbey recommended it.

Frankl writes that when he lost the manuscript of his nearly completed book in Auschwitz he asked himself if his life was thereby rendered meaningless. After all, if he died in the camp, which he thought he would, he would leave no mark on the world—no books, no children. But he realized that the remainder of his life could still be meaningful if he treated his imprisonment as a chance to *live* his thoughts instead of merely writing them on paper. Auschwitz became for him a *challenge*, a way to test himself, and that's how he reconciled himself to it. When I read that I thought about my own desire to leave something behind me and understood for the thousandth time how pointless it is. To seek any kind of immortality through recognition-from-others (which is the only way humans can achieve 'immortality', whether it be biological or cultural) is misguided;—or, rather, to think that only *thereby* is one's life meaningful is misguided. It doesn't matter if one's achievements are lost when one dies or if they endure for millennia, influencing all of history; the point is that, no matter what, they will eventually be forgotten. *When* that happens is irrelevant. Whether instantly or in a million years, the event means the end of immortality; and when it happens, all the fame one has already achieved means nothing (because the past means nothing¹). Where's the sense in trying to conquer one's mortality by means of beings who are themselves—and whose *species* is—mortal? A better goal to strive for is simply the realization of one's potential, or the achievement of something worthwhile for its own sake, or love of another person—anything but immortality, which is, indeed, also *irrelevant*. —To attain peace of mind you have to live well, whatever that means for you; the

¹ That statement is ambiguous, and in some contexts obviously untrue—but not in this one.

prospect of being forgotten after you've died—which you *will* be, *inevitably* (and that knowledge should itself be comforting, in a way)—has nothing to do with any of this. At the end of my life I'll be happy if I've made the most of it because I'll be *recognizing myself*, and *that's* ultimately the root of happiness—not recognition by others, which is only a means to that end—and if I foresee that I'll be quickly forgotten it won't affect me because I'll have done all I can do and I'll understand the value of my existence and *that's all that matters*.

Wednesday, December 22

The book is impressive for being written by a common thinker, but it's hardly luminous. Frankl says he wants to “humanize” psychotherapy. Beware of mixing humanism and science! It's like trying to reconcile superficiality and depth. Frankl is a naïve child when he dabbles in metaphysics, religion, and ethics, invoking them in his psychological theories. –Just so you're not completely in the dark, the central claim of logotherapy is that man's basic motivational force is his search for meaning. He *needs* his life to have meaning, which ultimately takes precedence over pleasure and everything else. Frankl of course elaborates on this and provides compelling arguments—which convinced me that Freud had oversimplified—but beneath it all is a lack of analytical rigor. He's useful in the way that Feuerbach was to a generation reverent of Hegel: negatively, as a corrective to Freud; not quite for his own sake. But I won't deny that some of his insights and clinical anecdotes are startling.

I wish I'd taken notes as I read. I don't want to go back and do it now.

As a result of last night's entry (which meant more to me than to you because I *intuited* it), I've realized that I crave understanding not primarily for the sake of communicating it (i.e., for fame or out of altruism) but for my own sake. If I were alone in the world I would in fact work *harder* to understand it than I do now, rather than give up from my awareness of death. –That's the test of the true Yes-sayer to life: that he try to achieve as much as possible despite knowing that upon his death all he's done will be forgotten.¹ For then he's living his whole life *in life*, not comforting himself by imagining a Beyond (whether in Heaven or on an Earth that will continue to be occupied by people in whose memories he'll live). *Nietzsche's* test (“the greatest weight”...) has more of the precision of a categorical imperative, but it's also impossible to live up to—so that *no one* (including himself) is a Yes-sayer by his standards, except in certain moments. Moreover, it creates the debilitating burden of feeling the need to affirm everything, and of asking oneself in every instant “Do I will this eternally?” (At least, that's its logical conclusion.)

Wednesday, December 29

I read Thomas Mann's “Death in Venice” and “The Blood of the Walsungs”. I wouldn't say they're gripping stories, but they make you think. Partly because their meanings aren't perfectly clear. Also wrote these haiku:

the sight of flurried
snowflecks riding wind-currents
onto window-panes

ice-rocky river
gliding past ice-stones smoothly
underneath the moon

armless birds making

¹ (By humans, by “God”, by existence...)

unintelligible sounds
symbolize nature

a metal lamppost
scrapes unfeelingly against
the azure cloud-whiffs

I'm handicapped as an artist in that I don't know how to judge my work. I'm better at judging other people's works, though even then my opinions feel totally subjective and I'm rarely convinced of them. But regarding my own, if they're longer than haikus I don't know how to decide whether they're lousy or masterful. (Well, no: I know when they're lousy; I *don't* know when—supposing they're not lousy—they're excellent or on the good side of mediocre.) If a reader who was qualified to judge told me that the beginning of the Book of Joe had promise I'd tackle it again; I quit only because I didn't want to continue a story of whose worth I wasn't sure. If someone could only reassure me that I have talent, I wouldn't need objective confirmations of the value of every project I begin in order to finish it; I'd proceed on faith, trusting that person's faith in me.

Friday, December 31

Writing an essay for grad school applications—writing from scratch, not using those two essays I showed you earlier, which are shit. Doing a textual analysis of aphorism 344 of *The Gay Science*. No, “textual analysis” sounds boring; I'm writing an *exegesis*. I'm exegecizing, as it were. Got my inspiration from Nietzsche's comment at the end of the preface to the *Genealogy of Morals* about the art of aphoristic exegesis.

Saturday, January 1, 2005

Every day I'm reminded that, living in this house, I'm surrounded by pygmies. (With the exception of Abbey.)

I always find it amusing when I'm in clubs that play mostly hip-hop and the DJ suddenly switches to classic oldies and everyone dancing cheers and all the people sitting down run over to the floor to dance. What could be more convincing evidence that people find earlier music more enjoyable than contemporary stuff (despite their continuing to insist that they really do like hip-hop and the rest)?

—What a mistake of an era we live in.

Tuesday, January 4

I'm starting to think that people's lack of interest in me is the clearest sign that I'm an excellent person.

Thursday, January 6

Saw *Eyes Wide Shut* again. Understood for the first time its artistry and richness. It's one of my favorite movies now. In the top ten.

I'm wasting my talents in this internship. I ought to be an art critic—as well as a philosopher, historian, psychologist, biologist, fiction writer, and musician.

One cannot understand this world without living life as a skeptic.

...Suddenly I panicked, aware that I've been wasting myself. So I studied music theory on the internet for a couple of hours. –What a resource! From now on I have to take advantage of it. It can allow people to be more educated than they've ever been in history. (Funny that it tends to have the opposite effect. –A reflection of the people who use it. Every great idea is corrupted upon contact with the masses. [No. Capitalism, not the masses.]

Monday, January 10

I do a good job of writing as colorlessly as I can for *The Hill*, but sometimes I insert a dab of color just to make it more readable. It's never offensive; it's usually funny or poetic. But it can't get past the censor. Mary Lynn erases everything that adds meat to the skeleton; what remains is a sack of bones barely held together. 'The blander, the better!' is her motto. She reworks it all, too, so that the end-product is nothing like what I wrote. And then I take no pride in it. –Well, I took no pride in it to begin with, but by the end I'm *ashamed* of it and don't even want to put my name to it.

Most journalists are wimps. They let the corporate culture castrate them as an offering to the Status Quo.

Tuesday, January 11

I feel a duty to describe for you what a good person I am. [Some irony intended there.] A duty not only to myself, but especially to you. After all, it might benefit you to know that a person as considerate as I walked the planet once. I fill every day with hundreds of little kindnesses that I hardly notice anymore because they're so habitual. To give you some examples— If I'm having a conversation and my partner involuntarily looks away from me for half a second because he feels shy for some reason—usually the result of his difficulty in maintaining eye-contact—I'll instantly look away too, simply to spare him the embarrassment of knowing that I caught his moment of weakness. I'd rather look weak myself than look into the hurt eyes of someone who's embarrassed. Or if he says something that sounds stupid I'll be extra-careful to respond appreciatively, to chuckle at his inane joke more than I would normally. I rarely ignore people's comments. I'll be in a room with eight others and somebody will say something and I'll be the only one to acknowledge him. I'm almost always 'diplomatic,' unless I know the person can handle it. I'm perfectly willing to let people think they know more about some given issue than I do, even when I'm vastly more knowledgeable than they. –The list could go on.

On the other hand...(you knew there had to be an 'on the other hand', didn't you?)...all that goodness is inseparable from a degree of timidity. Goodness = weakness, much of the time. When I'm in assertive, outgoing, energetic moods I'm less of an angel than normally. (I'm also more fun.)¹

Twenty-four years have taught me that goodness in itself isn't rewarded. Only goodness that's flaunted is rewarded. I'm modest; I don't make a show of it. And so it goes unnoticed. –In return for my not 'judging' the unperceptive people who have always surrounded me, they can't resent it if I don't shower them with praises when they do some obtrusively kind act in front of a crowd, like make breakfast for their housemates. In that situation I'll thank them a couple times and remark about how lazy the rest of us are, and that'll be it. Everyone else will be like "Oh my god! You're so wonderful!"

–One can't describe oneself without being dishonest. The act of description overlooks millions of exceptions.

¹ But you're wrong if you think that "normally" I let myself be trampled on and am incapable of being stern. Quite the contrary.

Wednesday, January 12

Partita No. 1, BWV 825. Glenn Gould. The fourth movement isn't the most fun, but it may be my favorite because of its dignity in ecstasy, its simplicity in passion. But no, I can't choose between the movements, they're all perfect.

I don't understand how people can be journalists their whole lives. Writing soulless shallow articles all the time, under a thousand ridiculous constraints, having to suppress themselves in their writing until they only *nominally* exist as autonomous subjects with opinions and personalities. It's like death. I sit at my desk and write as badly as possible and think 'This is what death must be like'. Menial work is worse when it's intellectual than when it's physical or mechanical. I prefer the part of my job that consists of transferring articles to the newspaper's website to the part that consists of being [mentally] a passive conduit of information.

Thursday, January 13

Writing about aesthetic value. You know I tackled the issue before; this time I'm going about it in a different way. A less ambitious way.

Friday, January 14

Today was an "adventure", if you understand that word in the loose sense in which, um...one of the characters in Sartre's *Nausea* understands it...I forget his name...he's somewhere in the middle of the book...a guy the main character meets—I forget his name too—it begins with an R—but I think the first guy is a socialist or something who spends all his time studying in the library and doesn't have much of a life and he asks R (with a hint of envy) if R has a lot of "adventures" (because R has spent years traveling around the world) and R asks what he means by that and etc. etc. So...I did something out of the ordinary today. It's a good story. A long story.

Linda Bayer is the head of my program. She's the one who found me my job. She lives across the street, though we don't see her often. The first time I ever saw her was on Hanukkah. She's Jewish, as are many of my housemates, and we had a quiet Hanukkah celebration together. From our phone-conversations I'd expected Bayer to be a dominating, confident, modern businesswoman who wears a suit all the time. I couldn't have been more wrong. She's a short, frumpy, pudgy, unattractive bohemian type, socially unperceptive, an incessant talker. That was my first impression. Today I was able to fill out the portrait. Abbey works for her; two days ago she asked me if I wanted to pretend to be a W.I.P. staffer for an afternoon. "Uhh... Huh?" She said that Bayer had to make a presentation to representatives from the Korean government who were thinking about sending two hundred interns to her program. It was a very big deal. Bayer wanted to give the best impression possible, which involved renting office space downtown for the day, pretending it was hers and showing it off, and hiring fake staffers. Yes. That was her plan. (It's like something out of *The Sting*!) She judged rightly that the Koreans wouldn't be impressed with her real headquarters way out in Silver Spring, in her house where dog-stench clings to the furniture. So she hired Eric and me to be her accomplices, in addition to Abbey and a few other real employees. I went to her house at around 1:00 today. Her presentation was set to begin at 2:00. She wasn't even dressed. She and another woman were frantically running around stuffing boxes with diplomas, pictures, books and anything else that could be used to decorate offices. At the same time there was some problem involving an extension cord that wouldn't work. At the same time Bayer learned that Mary, the Korean in our house, who was supposed to describe her internship experiences at the meeting, was too sick to go. So Bayer called another Korean and asked her to substitute. But it turned out that this girl had some unfinished business with Bayer, having to do with money that was still owed to her for recruiting someone to the program, and so Bayer had to listen to her explain all the details—which went *on* and *on*—even as she was rushing around barking

orders to us fake staffers about what to do with the extension cord and where to take the boxes and when to let the dog into the house.

Now, to appreciate the humor in the situation you'll have to picture to yourself a comically accurate personification of a control freak. Place this image in the most disorganized setting you can imagine. Keep in mind that today is not just any day; it is the most important day of the year for this panic-prone control freak. Who isn't even dressed, though her meeting is in forty minutes. And add the following: the inherent absurdity of the undertaking; the over-the-topness of it all (—large boxes overflowing with diplomas from Harvard and every other college attended by her and her children, photographs of family and weddings, copies of books she'd written, artifacts from African countries she'd visited, Christmas cards, a letter from Laura Bush, an autographed picture of Al Gore, reams of informational pamphlets); a young Israeli woman who works there part-time, obsequiously following the boss and occasionally hinting delicately that maybe it isn't necessary to take the bongo drums; a girl on the phone complaining about a totally unrelated problem; a young man wearing the Washington Internship Program t-shirt he was given standing quietly observing the scene, ready to help should his assistance be requested but firmly convinced that the best policy for now is to get out of the way and not contribute to the mayhem; another young man (Eric)—a real piece of work, absolutely imbecilic in social situations, possessing a degree of intelligence but psychologically unbalanced, off in his own zone most of the time, muttering incoherently, who has full-body nervous twitches and likes to stuff his hands down the front of his pants—entering and exiting the house repeatedly because he keeps forgetting things in his room, pacing and mumbling to himself detached phrases—“I don't know...” “you're awake now...” “and then I said...”—oblivious of the goings-on.

The Korean girl wasn't shutting up, so Bayer thrust the phone into my hand, saying “She's telling a long story. I can't get her to stop. Find out how much money she wants and make sure she knows where to meet us in an hour”—meanwhile I could hear the voice in the receiver continuing its tirade unfazed by the fact that no one was listening to it. I put the phone to my ear and let the voice wear itself out. When the girl heard a strange masculine voice speaking she changed her tone, so that it was gentler, and started her story from the beginning;—I periodically murmured assent (having no idea what she was talking about)—but soon she thought better of it and said she'd discuss it later. Then she asked about the meeting, said she didn't know how to get to the place, so I ran upstairs to Bayer (trying not to breathe through my nostrils: her room smelled of rank dog-sweat) and asked what was the closest metro-stop, etc. etc. Eventually Don came, a middle-aged guy who provided the only voice of reason but whose lungs were no match for Bayer's, with the result that he could only timidly offer a word here and there as she paused for breath in her rants. He didn't think all the boxes were necessary, but she overruled him, so we lugged them out to the car and finally got underway, having waited an extra ten minutes for her to slather a coat of Elizabethan-style makeup on her now-glowing face. The twenty-minute trip was another source of delight for me, as I listened to Bayer nag and worry and plan and give orders in that clueless, hard-to-take-seriously way of hers. You had to submit to her not because she had a commanding presence but because she just *didn't take breaths* as she talked!

We arrived. Called Abbey, who was already upstairs in the office, to find out if the Koreans had arrived yet. If they had, we were in trouble: we were carrying boxes full of African totems, which might have aroused suspicion. Fortunately they hadn't. We raced upstairs—it was an impressively professional and phallically imposing building—and learned from the receptionist in the lobby that the Koreans were waiting in the conference room. Uh-oh. We snuck past, walked down the corridor to the two offices and unloaded everything. Bayer was in her frantic mode again, entreating us to hurry up so the meeting could begin. I was given papers to pass out to the two Koreans currently being entertained by Abbey. We entered the conference room en masse...and I had the pleasure of witnessing my first board-room meeting. It was awesome. With the introductions over, Don launched into his Bayer-boosting speech: “Dr. Bayer's reputation certainly precedes her. She studied at Harvard, she was a strategic analyst on the staff of the Clinton administration, she's done this and she's done that...” It was indeed hard to believe that this small neurotic Jewish woman had accomplished so much. She spoke next—spoke very well, did a great job—“deserved an Academy Award”, as Eric said. Nevertheless, the tension in the room was at a dangerously high level. The stiffness and formality of the whole charade were terrifying. With the exception of Eric,

who was yawning, rolling his eyes and fidgeting—and, to an extent, the Koreans, who sat there mutely and listened—we were robots programmed to smile on cue and nod gravely and grunt in agreement and raise eyebrows in admiration. It was all I could do not to leap onto the table and rip off my shirt and beat my chest while screaming Tarzanishly “Ohahohahohahohahhh!!!”

Four of us were allowed to leave; we hung out in the offices. Abbey, Eric, the Israeli and I. Poor Eric. Made a fool of himself, as usual. But worse than usual. To give only one example: we were discussing Abbey’s study-abroad in Costa Rica and the Israeli’s plans to teach English in Ecuador, commenting on various cultural differences, and Eric blurted out:

“Yeah, I was raised by penguins in Antarctica. So just imagine what a huge cultural shock it was to come to America!”

“What?” the Israeli said.

“I was raised by...penguins. In Antarctica. It was really cold. So...coming here...”

Silence. “That wasn’t funny,” she said, brutally. But then she laughed and apologized for her bluntness. To make the sudden awkwardness even worse, Eric acknowledged it. “That moment wouldn’t have been so awkward if I hadn’t said the joke twice.”

Two hours later the meeting was over. The final joke of the day was that the Koreans never asked to see the offices, which made all our work meaningless. But I was paid \$100.

Saturday, January 15

New housemate. Victoria. 23 years old. Beautiful friendly intelligent.

...Went to a bar/cub with housemates. Overflowing with college students. Hundreds of gorgeous women. I danced with a *beeeautiful* Chinese girl, talked to her, got separated from her, [etc.], wanted to get her info but didn’t b/c she was with a guy, and then left with Jason. It was a long night, and I can’t possibly describe how frustrating it was. On the dance floor I could barely move, it was so packed. Instead of having fun I contemplated the lack-of-seriousness of the girls around me. These dancing Barbie dolls. I was so horny, I wondered what it would be like to fuck them. It would be pleasurable, yes. But sexual pleasure is meaningless. [...] Creatures so divine *cannot* be merely “dolls”! They *must* have substance, they *must* be worthy of being loved, they *must* be innately good! Sex with such a being *must* be ecstasy, the ecstasy I’ve spent my whole life searching for! –Thus Eros and I debated; thus I lost. Succeeded only in making myself furious at the world. At a world that rewards sleazebags and punishes the best men with the most dignity. Men who won’t ‘dirty-dance’ because it’s demeaning; men who have too much respect for women to treat them like sex-objects. [...] My chest swells with love of the weaker sex. I want to shelter every one of them, make them happy. Nothing matters more to me. Truly. That desire is the meaning of my life. Yet they reject me.

Sunday, January 16

Sprained my ankle last night.

Reading *Waiting for Godot*.

When I write original essays, like the one I’m writing now, I realize I have the potential to be an impressive thinker. Only when I’m not writing them do I lapse into mediocrity and self-doubt.

I’ve always had a guilty conscience about doing all my writing on the computer. It seems improper to change the way writing is done so late in history. What right have I to reject the tradition of millions of artists? If longhand worked for them and it doesn’t for me, there must be something wrong with me; I must be inauthentic somehow. Still, I can’t abandon the word-processor: it’s faster, editing is easier, there remain no records of wretched first drafts, the process of watching text unfold on the screen—line by line, word by word—is addictive—almost beautiful—and the word-processor distances my creation from me,

allowing me to respect it as I can't something written by hand. Writing manually is so cumbersome by comparison that I can't understand how people used to have the patience to write books.

Renée Fleming is the best soprano I've ever heard. Emma Kirkby may be equal...but I don't think so...the soulful beauty of Fleming's voice moves me to tears.

[...]

Monday, January 17

Sometimes I get tired of not allowing myself unjust thoughts. I get tired of being understanding, of knowing that to understand is to forgive. I hate being equal. I want to be able to look at a person and think "You are contemptible, you are *bad*, I'm *better* than you"—to be able to think that with full conviction. I want the freedom of not living scientifically. Too much knowledge is unhealthy. Knowledge is power, yes, but to know is to know that you're powerless. Knowledge is like the panopticon. I haven't been able to think that *liberating* thought for maybe a decade. Do you know what that's like? To have to look on people like Jason as brothers, to know that you can't rightly think "What a loser!"? Do you know what it's like not to be able to revenge yourself for a life of isolation with the sweet malice of pride? To be so honest that you can't help being honest with *yourself*? (—the most devastating and rare kind of honesty.) To *always look at yourself*??

But then the thought creeps up, "You're admirable for having such knowledge, for being so honest." No! I'm not! You're wrong! "And you're even more admirable for refusing to believe something so flattering." No! 'Admirable' has nothing to do with it! I refuse to be labeled 'admirable'! "And you're even more admirable for drawing out your idea *ad infinitum*, for being the best kind of stubborn." No! What do you mean, 'best kind of stubborn'? 'Best' doesn't exist! "And you're even more admirable for having the insight that every advance you make, every refutation you make of my 'therefore, you're better', invites precisely my 'therefore, you're better'. For knowing the irony in the fact that knowing you shouldn't be called admirable is itself a reason for calling you admirable. For knowing the contradiction..."—the *maddening* contradiction!—"...at the very center of human life, the contradiction that, insofar as one is human, one must *evaluate* every fact, including the fact that one knows every *evaluation* is meaningless. And when I've stopped speaking you're going to scream 'No!', and that will merely invite another compliment because we're humans and we can't not judge." No! No! No! If I can't escape the judgment that even *I* must make, I'll at least know that in the world of truth, I'm nothing, and in the world of truth, there is no 'good' or 'bad', and in the world of truth, we're all wrong. And although that means I'm forced to live a split life, I will rise above the pain; I will rise above the shallow compliments; I will rise in the only way one can: *by laughing*.

—And those two paragraphs contain the rational meaning of wisdom,¹ and you haven't understood me.

Tuesday, January 18

Today I represented *The Hill* at a luncheon/fashion show sponsored by the California State Society. Being from the press, I sat in the V.I.P. section with congressmen and other V.I.P.s. My mom would have been awestruck by the sumptuousness of it all, but I was only amused. Congressmen gave short speeches, a priest or reverend or something said a prayer or something for Californians, we gave the pledge of allegiance to "the greatest country in the world"—I couldn't decide whether to laugh at *that* or at the fact that no one else laughed at it—then we had lunch, and then we watched a long fashion show that I couldn't have tolerated had I not been drunk. (Drank two bottles of wine. —Everything was free, of course. It always

¹ The existential meaning is different. It can't be communicated.

is at these parties.) I realized that the purpose of fashion shows isn't to admire clothes but to admire bodies. I doubt anybody gave a shit about the clothes; the *models*, though...our eyes were glued to them. When the first men came out after a round of women, all the women in the crowd whistled and cheered, of course. (Which the men hadn't done for the female models.) At the end of the show they all dressed up as soldiers and patriots and carried a huge flag. The photographer I was with, Patrick Ryan, told me that every show he's seen since 9/11 has ended that way. Christ Almighty.

The wine oiled the gears in my tongue-muscles; I used them to have a great conversation with the girl sitting next to me.

Incidentally, I've attended other events I haven't told you about. Like the press conference at the Mandarin Oriental hotel in honor of the \$200,500 Inauguration package they're offering any couple, which includes five nights in the presidential suite, a private jet to and from D.C., 24-hour butler service, and too much other stuff to list. (I wrote a little piece about it in the paper, which Mary Lynn blanderized.) Free food, delicious, and a tour of the presidential suite. *C'était remarquable*. Something out of a movie. A television crew was filming a segment on it. Funny to watch. Went like this—

Correspondent guy (staring into the camera as we stared at him): "I'm here at the presidential suite of the Mandarin Oriental hotel, where a lucky couple is going to spend four days and five nights. It's like paradise here. This is the living room that I'm standing in; you can see already what a magnificent place it is. And just think: it could all be yours! Hi, I'm Brick Shetland, and in the next few minutes I'm going to give you a private tour of this little slice of heaven. —Okay, let's do it again. Didn't feel right. I was too fast..."

Dozens of policemen and a S.W.A.T. team made us evacuate the building tonight as we were preparing the paper for its publication tomorrow. Presumably a bomb threat. For the last few hours I'd been struggling through detailed technical web-work while drunk. Did a darned respectable job, too.

Wednesday, January 19

Got a job today. Busboy at a restaurant. Training shift next week.

[...]

Sunday, January 23

Finished *Waiting for Godot*. Didn't really enjoy it, but appreciated its existentialist meaning.

Once again, I feel as if modern technology is allowing me to cheat. If I want to describe a rundown church, for example, I can look on the internet to find the right words and then write something like "Corinthian columns with chipped curlicues and severed acanthus leaves"; in the past I would've had to have a large vocabulary. It makes me feel like a hack.

Still, this story is better than anything I've ever written.

Wednesday, January 26

On the way home from work today, while I was on the subway, an Asian man standing near me broke into song. He just...started singing. A nicely dressed, normal-looking fellow. He was reading the words from a book; they were in a different language. It was weird at first. A man sitting next to him, a crotchety old guy with a surly expression seared onto his face, instantly covered his ears. His reaction, in fact, may have been stranger than the actual singing: he didn't look surprised, he didn't look puzzled, he didn't look disgusted; after the first two notes he simply put his fingers into his ears and kept them there.

Later he walked away. No one said anything for the duration of the (long) song; I observed everyone's reaction, and it was, almost without fail, blank. The situation struck me as surreal. But after the first two minutes, in which my one thought was "What the hell?", I started to enjoy it. The fellow had a good voice. This a capella performance on a subway where everyone else was silent, everyone in his own world, thinking his own thoughts—steered by music into a virtually preordained vein:—it was moving. It was spiritual. We were all the same distant atoms as usual, but we were drawn together. I sensed the walls between us dissolving; I sensed my own shyness dissolving; and I wanted to sing myself, or at least speak to everyone as a brother. I realized... 'We're just people...they're just people...what's the point of all this isolation?' The meaning of the song was appropriate: in answer to a question, the man said it was a prayer, and that each day he prayed as often as he could.

Thursday, January 27

D.F.W. has more talent than I do, but he doesn't use it wisely. Judging by the excerpts I've read, his stories won't be timeless classics. They have the mark of *machinery* written all over them, the heartless technological age. D.F.W. is a wizard, but, as a *New York Times* critic wrote, "maybe the wizard should grow a heart".

My hope is that my excess of heart will disguise my lack of wizardry.

Friday, January 28

Began work at 6:00 p.m., ended at 1:30. First day. Not fun. Busboy. Popular, busy Irish pub. Coworkers seem to be jackasses, with a few exceptions.

Saturday, January 29

This job isn't hard. It's just clearing tables, setting tables, and constantly taking care of odds and ends in the back. But seven hours exhaust you, especially on a busy night when you're hurrying back and forth—squeezing through crowds—every second.

Sunday, January 30

On Friday night Sangeetha called me. At around 11:00, when I was working. When I heard the words "It's Sangeetha" I shouted in jubilation, unable to control myself. They must have given me an adrenaline rush or something: for the next five minutes I talked so fast and so much she could barely get a word in. —Or maybe I consciously didn't let her, thinking that's what she wanted, since she seemed sort of shy. She sounded different than I remembered—more like a mature woman. Talking to her lifted me up, so that I finished the night on a second wind. It was a natural high, like being drunk without alcohol. I felt like smiling the whole rest of the night.

Yesterday everyone except Jason accompanied me on my makeover day. Kara and Abbey's idea. They thought it was time I changed my hairstyle. I needed a cooler one. So we went to Pentagon City, found a beauty salon, and I was transformed into an object of lingering looks from girls. Seriously. Abbey and Kara observed the whole metamorphosis. My stylist was a divinely inspired crazy woman. She chattered away the whole time. She loved it; loved remaking someone so out-of-touch with pop culture into a clone of the lead singer of Bare Naked Ladies. I sat there passively, letting her do whatever she wanted, asking for advice occasionally from Kara and Abbey, trusting them more than myself. It seemed to be the highpoint of their week. —Funny how women who normally don't take much notice of you invest a lot of psychic

energy in changing the way you look if you so much as say, “Sure”. Every other priority of theirs, including their own shopping needs, suddenly pales in comparison to making you hip.

After that little adventure we went clothes-shopping for me. It seemed to make them so happy that I decided not to be stingy with my money.

John was the only other guy with us. I was grateful of his company.

I barely socialize with the people at work. They don’t interest me. Essentially I spend seven hours in silence.

...Spoke too soon. Met two new ones tonight. Friendly.

Monday, January 31

There are three newspaper issues a week. Monday, Tuesday and Wednesday. The only days I work, coincidentally. Every day one of my jobs is to put all the articles onto the website. All of them! It takes forever. It isn’t hard, though. I used to respect people who do that sort of thing, thinking it requires a lot of technical skill and ingenuity. It doesn’t.

[...]

Reading Eugene O’Neill’s play *Long Day’s Journey into Night*.

Tuesday, February 1

Called Sangeetha. Lively conversation. She’s as effervescent as I remember. The one intelligent, pretty girl I’ve ever had a real connection with. We’re as comfortable with each other as we were four years ago. We might meet this weekend. Or next.

I’m glad Dean is going to be the DNC chairman. I used to worry he was too liberal to fit into the system, but I’ve decided that “too liberal” is a contradiction. What the party needs is a vision; Dean is the best person to provide that. He’ll give it direction. The reason we lost the election isn’t that we’re too liberal; it’s that Kerry’s team was incompetent. The two things we need are a simple, compelling message, and a grassroots organization (enter Dean).

Besides, Dean is the only politician I admire (from what I know of him). –No, that’s not true. Obama. I hope Obama and Dean represent the future of the party. [Ugh. It’s hard to reread this stuff.]

Thursday, February 3

Nine hours of bussing.

Friday, February 4

Eminem. Such *energy* in his voice! That’s a major reason he’s popular. And he enunciates, unlike every other rapper I’ve heard. “The Way I Am” has always intrigued me by virtue of its explicit nihilism. All his songs are nihilistic, obviously, but in that one he says “I am whatever you say I am...I don’t know, it’s just the way I am”. *I am whatever you say I am*. In that sentence is a world of despair. He has given up trying to define himself; he doesn’t care anymore. He’s so cynical that his identity and his morality are matters of unconcern to him. He *has* no identity; he *has* no morality; and he doesn’t give a shit. And he is the spokesman of an entire culture.

Saturday, February 5

But what a fuckin' whiner. Whines about everything. [...] –In interviews M&M complains like a child about all the pressure he's under. In one of his songs Freddie Mercury complains about the same thing, but in an uplifting, inspirational way. I'm not thinking of "Under Pressure"; no, I'm thinking of "We are the champions": "I've taken my bows - And my curtain calls - You brought me fame and fortune and everything that goes with it - I thank you all - But it's been no bed of roses - No pleasure cruise - I consider it a challenge before the whole human race - And I ain't gonna lose." See, he construes it as a challenge, not as an excuse to be an asshole.

I'm making a great effort not to moralize in my story. I don't want it be a black-and-white contrast between bad Western civilization and good Sapa backwardness. (It takes place in Sapa, though I don't name the town because I take liberties in describing it.) I want it to be ultimately a sad portrayal of man's fate, of the fact that the Demon who has corrupted society is latent in everyone, even in simple Sapa villagers; and in the end all you can do to avoid anguish is to seek a kind of immortality in the grandeur and simplicity of nature.

A problem I have with Nietzsche's *amor fati* is that...if you're grateful for everything that happens to you, doesn't gratefulness lose some of its force? No matter what it is...you're grateful for it. That kind of gratitude seems forced, insincere, as though it arises from some ulterior motive—as indeed it does, namely the desire not to cry all the time. The tacit reasoning behind it is 'How can I be happy? Oh!—here's a good way! I'll tell myself that everything that happens to me is in some way beneficial.' That gratitude originates in sickness, as Nietzsche surely knew. He knew he was a decadent, after all.

On the other hand, *amor fati* needn't be an all-encompassing love. In fact, it isn't. It's just a vague outlook on life, a mode of experience grounded in self-confidence and self-love—which is also love of life. Love of life isn't love of *everything* in life, every piece of ugliness. I needn't be "grateful" for all my pain in order to have *amor fati*—though I can't be bitter, either. I have to accept it. I have to accept it with a forgiving smile, knowing that I've learned from it, that it's given me satisfaction, and that it's played a part in the formation and perpetuation of my good will towards myself (and thus life).

As for Nietzsche's equation of strength with love of life...I think he may have been wrong. Was Flaubert weaker than Goethe just because he wasn't as well-disposed towards life? What does 'weakness' mean? An inability to accomplish great things? Well, Flaubert did accomplish great things (though not as great as Goethe's). Is it resentment, bitterness, a lack of self-confidence? Surely that begs the question. Besides, such qualities can give their bearer a fierce determination, i.e., a kind of strength. –Anyway, no one has real control over whether his dispositions say Yea or Nay.

Tuesday, February 8

Joined JDate: Jewish dating. Kara and Abbey have been doing it for a while and they said it's worth the price, and Match.com was yielding zero results, so I let optimism win out over cynicism for the billionth time in my life and paid \$35. It was the first good investment I've made in ten years. Already received emails and IMs. I'm actually excited! When was the last time I was excited?—not including moments of inspiration while writing stories. When...? Lord knows. I'd forgotten what it felt like to be excited over something involving girls.

Thursday, February 10

Talking to Dorothy is both a delight and a source of pain. She has the mannerisms of most Korean women, which I can't resist. She's unaware of her cuteness, which I can resist even less. She's intelligent, personable (though shy), has a beauty made earthy and intimate by its flaws. But she has a boyfriend in Korea, and her English isn't fluent, and I live with her—all three of which do not bode well for the possibility of a relationship. She asked her mother to send her a Korean textbook she could use to teach me

the language. Seems excited. It boggles my mind that girls can get pleasure out of relationships they perceive as totally asexual. –Well, even with Koreans there’s always sexual tension—*more* so than with Americans, ironically—...but they’re somehow unconscious of it, or it doesn’t mean the same thing to them that it does to Westerners.

Sometimes I wonder why *I’m* always the one who has to rise above his humanity, to forgive and be kind and understanding and never do anything morally questionable. I think, if everyone else can be flawed, why can’t I? So I do things that my instincts revolt against, like visit prostitutes.¹ But in my better moments I realize that I should try to be excellent precisely *because* few others are. I should take advantage of the unique combination of elements that compose me to prove that integrity and goodness *are* possible—to use *myself* to convince myself there’s hope for mankind. But then I think, ‘I know I’m capable of living as if under the eye of the Moral Panopticon. And being *capable* is all that matters, for my purposes. Knowing I’m capable of “integrity” and “goodness” implies that integrity and goodness are possible. I also know I’m capable of something approximating evil. So what’s the point of living a saintly life under these conditions? Doing so has no bearing on the question of whether you’re a “good” person,² or whether humans in general are good, because (1) you already know you *can* be, and (2) you know you can be a bad person as well. So, whether you live morally or not, you remain the same kind of person ‘underneath it all’. The appearance may change, but the essence is the same. And that makes you think “Why should I go to the effort of changing my appearance (the way I act) if that won’t affect my essence (my potential, the way I *am*)?”’ Thus I persuade myself it’s acceptable to be amoral, or even immoral. But of course it doesn’t feel right. And that reasoning has some pretty scary logical consequences, for example that rape is okay. –But you could insert the caveat ‘...unless your action harms someone’, as paying a prostitute does not. (Yes yes, I know one could quibble about that, but that’s the least of the problems facing the ‘immorality is okay’ argument.) That, however, is only a postponement of the inevitable, namely the realization that (1) maybe acting virtuously at all times *could*, in the end, change who you are (your dispositions), and (2) even if it couldn’t, by living a morally impeccable life (i) you’d confirm what is, after all, at the moment only a belief (that you’re capable of such a life), and (ii) you’d feel good about yourself, and (iii) you’d set an example for others, and (iv), depending on how dedicated you are, you could make the world a better place.... But in spite of all that, if I see a box of cookies that isn’t mine lying around the house it’s possible I’ll take one of them, thinking ‘Who cares?’ But I’ll know I shouldn’t. I might not understand why, but I’ll ‘know’ it. Ultimately, that intuition should be all that matters. Arguments will always be available for either side, for and against it, but the intuition itself cannot be argued away. And generally speaking, you should trust your intuitions more than your reason.

Friday, February 11

Finished *Long Day’s Journey into Night*. Now *that* is what I call good drama. To do it justice, to fully understand it, you’d have to be O’Neill as he wrote it, weeping convulsively, his tears smudging the ink on the paper. Clearly it was written for no one but himself—and maybe his wife—but it contains universal philosophical themes nonetheless. Its metaphysics is like Faulkner’s in *The Sound and the Fury*: the past is the present and the future; there is no escape from it. We live in the past, even if we try to ignore it. The present is essentially only the edge of the past; the future will be the present and is therefore dominated by the past. Psychologically it’s an extraordinarily complex play, revealing the contradictory essences of each character—his strengths, his flaws, his hopes, the experiences that have made him what he is—in dialogue that faithfully depicts the innate volatility of people—the way they’d act if they didn’t have to wear masks. It’s a tragedy in the grand tradition. All its characters are tragic: having virtues but

¹ What Montaigne said of himself is true of me: my reason is more depraved than my instincts.

² Most people act morally just because they want to think of themselves as a ‘good person’—even though, if what’s true of me is true of them (as I’m sure it is), acting morally has no bearing on the question of their worth.

forced by circumstances to succumb to their weaknesses, and to turn against each other, and to deny themselves even as they have deep self-understanding and know they're denying themselves—and that they can't do anything else. It's free will versus fate. Fate wins.

Reading it, I was amazed at how contingent an individual's identity is. Had I lived O'Neill's childhood, who knows what kind of person I'd have become? Probably suicidal, like him. —But then again, a core of me would have been the same as it is now, a genetic core.

Sunday, February 13

I'm making a great effort to avoid an excess of sentiment in the story. Sentimentality has always been the literary fault I'm most prone to; with this story I want to put it behind me.

I write as Tom Robbins does (according to an interview I read).¹ I begin with only the vaguest idea of what's to follow. In this case I began with the idea that an American tourist would spend a few days in Sapa, and I'd use his experiences to write a final farewell to a world of simplicity and beauty that's being killed by capitalism. I also wanted to incorporate somehow the notion that the pure ideal of Woman is equivalent to the ideal of Nature. To love one is to love the other. The beauty of each is the beauty of the other. I started with a stream-of-consciousness passage because I was in the mood to write a stream of consciousness. I rationalized that mood by thinking 'I'll write about a dream he has in a hotel in Sapa, and in this dream will be a condensed version of the story's themes.' To rationalize my inclination to write lucidly and beautifully rather than in the cryptic but realistic style of Joyce, I thought 'The whole point of the story is to praise beauty, so thematically it makes sense for me to write an (unrealistically) eloquent dream.' I started the dream with a description of an (Asian) girl's hair in language that evokes nature—e.g., a man is walking through a forest of black trees on scalpish white flaky soil, etc.—then I broadened it to encompass all of nature—even the universe, where the man can “breathe as on Earth without struggle” because he *is* the universe, he is a natural being like the girl (who, however, represents specifically the *aesthetic* side of nature)—and at the end I brought it back to the girl, again describing her features with terms borrowed from nature (like 'obsidian', 'chestnut', 'alabaster', 'raven', etc.), and the man is full of love for her (and thus nature). Then I thought, 'Okay, what now? Hmmm... [Five minutes of thought.] — He gets woken up by the telephone, his wake-up call to get ready for the tour.' When I wrote that the phone's ringing “jarred” him, I realized (taking my cue from the unpleasant connotations of “jarred”) that 'I can have technology represent Western civilization! And throughout the story there can be a conflict between technology and nature! Yay!' The boy hangs up the telephone and slides back into his dream as he turns the pillow over to the cool side—which is a simple pleasure, sensuous, and therefore in opposition to the telephone's (technology's) brutal complexity.² I wanted to have two Japanese girls accompany the boy on his tour because that would give me an opportunity to write about women. I added Clyde as The American. I went through a long debate with myself, which lasted for several pages, as to whether the Japanese girls would ultimately be the female prototype I needed. I decided they wouldn't, because otherwise I'd be mixing Japan with Vietnam—two very different cultures—and contaminating the purity of the 'Vietnam is awesome' theme. But then...how could I justify having those girls in the story? I realized they could represent what happens in the first few decades of capitalism's invasion of a formerly traditional society: they'd retain some feminine virtues (like beauty and a degree of innocence), but their corruption would be starting to show itself. As evidenced in the clothes they wore, their shallowness,³ etc. I'd need a Vietnamese girl to be the prototype of Goodness (or Woman, Instinct, whatever you want to call it—as well as Vietnam itself, because (in my story) Vietnam is Nature...and Nature is Woman, so Woman is Vietnam.

¹ To understand this paragraph you'll have to skip ahead to the copy of the story I'll eventually put into this journal.

² By the way, 'cool' is a recurring motif. Whenever you see that word, think 'The author approves of this situation.' Think 'fresh', 'alive', 'pleasant'—or, in short, 'the area around Sapa', i.e., majestic nature and deep living.

³ You'll notice that most of the tourists are shallow. Like the guy who says “Wow” when he sees the church and takes a picture of it.

Vietnam is a frail, transcendent woman, sickly but otherworldly.). Some villager Martin would meet later. When I wrote the dialogue between Martin and Le I wanted to portray (1) the lack of self-consciousness of tribal Viets—as opposed to the self-consciousness of American tourists—(2) the friendliness, sincerity and warmth of people who haven't been hardened by Western civilization, and (3) the fact that greed is inherent even in simple peasants—and thus that the seed that sprouted capitalism (that's always sprouted strife) is latent in Vietnam too, so its corruption is inevitable. These three were supposed to be themes running through the whole story. But soon I grew disgusted with the dichotomy that was developing between 'good primitiveness' and 'bad civilization'—even when tempered by theme (3)—and I went through a crisis of writer's block—right around the time when I was writing Martin's reflections on Western society, which were becoming too moralistic—and I decided I had to be more unbiased—had to acknowledge the strengths and flaws of each civilization—and the real tragedy (or, perhaps, tragedy #2) could be mankind's inability to unite the respective strengths in one culture. I proceeded with Martin's analysis of the West until, upon rereading everything, I saw that in the context of the story it popped out of nowhere and didn't make sense. So I inserted the part about the traditional-music concert. That had to be the prelude to the discussion of Western music. (I'd originally planned to have the order reversed, but it wouldn't have worked.) That's as far as I've gotten. —The point is that after almost every paragraph my conception of the story changes. And I never know what's coming next. It's all improvisation. And I often get my thematic ideas from accidents in the process of writing—for example, a certain sentence will trigger ideas that'll change my perspective. It occurred to me today out of the blue that I could introduce the Female as a performer in the concert, whom Martin would meet again (fortuitously) later.

I still don't know how I'll order all the themes that keep bouncing around. But, you know, if I get into a bind I can always rely on the cop-out 'Let the reader take from it what he will.' ...It just occurred to me that the plight of Vietnam, in being the plight of beauty in modernity, can also be the plight of the ancient concept of 'woman'. Its death can be the death of the "chauvinistic" but poetic ideal of women, bound up with some of the assumptions of chivalry that are no longer politically correct. Maybe *that's* the way I can link Woman, Vietnam, Nature and Beauty. They're all otherworldly, they're all tied up with instinct and the primordial, they're all dying.

...No, it's too early to go off on thematic rants like that. Screw the 'Woman' idea. Screw the pure symbolism. The story is more complicated than that. The characters are characters, not just symbols. I have to let the themes appear when they're ready. They show themselves only when they want to; it's useless for me to plan ahead. My job is to write the sentences, not to create the meanings. (They use me as a vessel.)

...It's obvious to me that there's something deeply impious about sex. How can Christians fail to see that?¹ Any kind of sex is impious. It's depraved, barbaric, degrading; it certainly turns one's eye away from God. [...]

Also, sex is inherently somewhat degrading to women. Penetration is violation. Thus, if morality is something like a duty to uphold human dignity, sex is immoral. (Which shows you how silly, from one perspective, the idea of morality is.)

Monday, February 14

I'm sure that most people who've read it haven't understood Nietzsche's claim that he writes because he wants to be *rid* of his thoughts. They've skipped over it, as they skip over everything he writes. But he has a point: in the case of certain people, a single idea will continually reappear in their minds until they write it down. It'll pop up randomly day after day, week after week, month after month....but when it's been written, it's gone, perhaps forever. Extraordinary, isn't it?! Some people have a *need* to write; if they can't, they live in agony. How can that be explained? What's the biological/psychological cause?

You know what faith I have in the power and truth of instinct. Initially I'm always skeptical of it,

¹ Unconsciously they do see it, as is obvious from all the restrictions they place on sex.

but after analyzing it I generally decide there's some kind of validity to it or a 'reason' for it. Genius is instinct, goodness is instinct. Even ordinary everyday intuitions, as in understanding a joke or in judging a person's qualities, usually are true. That's why I'm distrustful of my merely *reasoned* objections to women's instincts in deciding what men they want. I argue that their choices tend to result from a lack of insight into character, but it's hard to believe that nature would implant in hundreds of millions of young women what I've thought is a nearly complete incompetence when it comes to choosing their mate. Nature usually does a good job. So maybe they're right: maybe I am at heart an unimpressive person they can't love. Maybe they have more knowledge of me than I do myself. This possibility is the main reason I let my rejections get me down. But there are plenty of arguments against it: for example, women didn't like Nietzsche, and look how wrong they were! He was not only a genius but a kind, brave, loyal man. Another example: when I'm outgoing, women suddenly are attracted to me—even though I haven't really 'changed' in any way: I'm still the same person; I just act with less regard for others' opinions/feelings than normally. (Put differently, I'm less kind to myself and to others.) As if that were a good measure of my worth, or even of my ability to protect and provide for a girl! (which—let's face it—is the only thing nature cares about in this case) Besides, if it *is*, in some twisted way, a measure of my overall 'worth' in nature's eyes (—and, you have to admit, who could be wiser than nature?) or of my ability to provide for a woman, the point is that it's been in me all along, latent. Therefore, it seems after all that women's intuitions, even when they bear on something as important as the mate they choose, are often wrong.

I'm not trying to shift the blame, though. I understand, in spite of all that, that much of it lies with me.

—Don't take any of this too seriously, I beg you. I'm just bored. I'm at work, waiting for articles to be written so I can post them on the website.

Tuesday, February 15

You read Dylan Thomas and you think 'Here's a good writer (albeit too fond of word-play); he must have been an Other, someone you'd look up to and want to impress'; then you look at his picture, and you think 'Maybe I spoke too soon. He must have been an eccentric nerd with not a very strong character, judging by his weak chin and flabby face.' And you realize: someone can be an exceptionally talented writer and thinker--not that *he* was--and yet not be a person you'd admire. You might not even care what he thinks of you. Generally you care only in the case of someone who has charisma. *Charisma* is the all-important element. It is what defines the true Other. Now, such a person is someone whose recognition you seek. He is your link to immortality (since being recognized is the only way you can be immortal). I.e., in order for recognition to really satisfy you--in order for it to validate in your eyes your human worth, through which validation you achieve a kind of immortality--it has to be by someone with charisma. The more he has, the more 'validating' his opinion is. (Think about it: would you really cherish fame that lasted for centuries or even millennia if it were only in the eyes of retarded people? Or ugly bookish nerds? Or idiotic obnoxious cowboy-types (who, as I understand the term, don't have 'charisma')?)¹ No. That immortality wouldn't be *real* immortality, the kind that actually *means* something, the kind that's validating.) Now, one of God's functions--perhaps his main one--is to be the being whose recognition you most seek, the truest avenue to immortality. He is, as it were, infinitely charismatic. He's more self-confident, more wise, more good,² more powerful than anyone. --The logical implication of all this is that charismatic people are closer approximations to God than anyone else. Said in a more general way, we instinctively judge them as more valuable human beings than others. This is why I wrote all that crap yesterday. Most of the time I'm not very charismatic, and therefore, on the level of instinct, I'm not perceived as 'valuable' or God-like. Unfortunately, I trust instinct/intuition more than reason. Especially in this case, since almost everything humans do is done indirectly for the sake of immortality [no: recognition] and thus (assuming God's

¹ I'm using the word in a loose sense. It's hard to explain.

² Goodness isn't necessarily implied in 'charisma', but it doesn't hurt.

from the fact that ‘asshole’ and ‘bad person’ and ‘evil man’ have no meaning,¹ you’re writing him off as ‘*this, and only this*’—you’re ignoring his individuality, his humanity, treating him as a *thing* (in true Sartrean fashion)—before trying to understand his position or the experiences that have led him to it. You’re *wrong*. He’s not a ‘bad person’. To understand is to forgive. —And yet, I, more often than most people, feel palpable hatred and disgust for conservatives like him. That implies that I’m passing judgment on them, I’m treating them as ‘things’—because whenever you pass judgment, you treat the judged as a thing (as *set, finished, immoveable, able-to-be-pinned-down*). In order to live in truth, you cannot judge people. You cannot even say that a person is ‘kind’, or ‘shy’, or ‘intelligent’, or anything static like that, because it’s a lie. —But, goddamn it, it’s *fun* to despise conservatives! Like Tom DeLay. I *love* hating that man. And Sean Hannity. What a *dick* he is! And Ann Coulter! What a repugnant person! Seriously, part of me can’t understand how such people are *not* ‘bad’, bad in their essence. —I’m trapped between these two extreme positions. It’s distressing. I fluctuate from one to the other, and I’m never sure of myself. —‘Those people *must* be ‘bad’ (for a variety of reasons), but they *can’t* be ‘bad’ (for an even greater variety of reasons).’ Somebody help me!

Thursday, February 17

I’m amused by the fact that pop culture—almost everything in pop culture—movies, music, shows—revolves around the act of putting a penis into a vagina. However, it’s only in the case of soap operas, sitcoms like “Friends”, and teenie-bopper dramas like “Dawson’s Creek” and “The OC” that I’m carried away by the hilarity of it. What happens on those shows is deadly serious to the characters, even though it all translates into “I want you inside me”; “No, I don’t want to be inside you”—or the opposite. That’s why millions of people watch: sex is just beneath the surface. All the drama and interest of the shows exists because viewers empathize with the characters; and they empathize with the characters ultimately [unconsciously] because sex is at stake.

To return to what I wrote yesterday: the troubling thing is that people want to feel anger at someone who ‘cuts them off’, or who disagrees with them, or who treats them rudely...but in a sense they’re wrong. Because when they’re angry they’re passing judgment on the person. They’re angry not at his *actions*, but at *him*. Of course, it’s because of his action that they’re angry, but the act makes them angry not at itself but at the person who did it. When I’m walking across the street because there’s a green light but a car runs its red light and drives right in front of me, I’m mad at the *person*, not at what he’s done. I don’t think “That act enrages me, but it doesn’t necessarily reflect on the character of the person who did it, and I fully respect him and feel no resentment”; I think “What a bastard!” But, of course, I’m capable of doing the same thing he did, and I don’t think of myself as a bastard. So, at the very least, I’m being inconsistent.

On the other hand, if we never have the right to be angry at anyone (because of the ‘static’ judgment implied in the anger), neither do we have the right to *love* anyone—because of the static judgment(s) implied in it. ‘She’s a wonderful girl—outgoing, funny, intelligent...’ Those are generalizations, and as such are not entirely true. “Okay,” you’ll say, “fine! But what if I insert the word ‘usually’ before each of those adjectives? No longer is the judgment ‘static’. No longer is it a generalization. *Now* do I have the right to love her?” —I don’t think I like your tone, mister, but I’ll pass over that.— Yes, I suppose you do. —But something’s strange here. It seems to me that even though love and anger are both emotions, they have to be treated differently in this context. “What do you mean?” ...Give me a minute, I’m thinking... Yes! I’ve got it! Anger/hatred/contempt posits a division between the angered one and the object of his anger, which (division) is based on the perception that the first is superior to the second; love/respect/understanding posits a unity.

—Wait. Before I finish that thought, I should mention (lest I forget) that I can’t help thinking that some actions *do* reveal a lot about one’s character. They can’t just be done by anyone. But which are they? Any list I made would be fairly arbitrary and subject to disagreement. *Another* side of me (as you already

¹ See the essay on values I still hope to finish writing.

know) thinks that *every* action/thought, taken in ‘isolation’, can be done by anyone; i.e., everyone has the potential to murder, to steal, to act stupidly in given situations, and therefore when you judge someone who actually does one of those you’re tacitly judging yourself. It doesn’t matter that you haven’t done it; the point is, you *could*, if you willed it. –But, you’ll say, you *haven’t* willed it, and that’s the difference between you and him. –But, damn it, you could! –But you haven’t! –But you could! –But you haven’t! —The problem is, I understand both arguments, and I can’t decide in favor of one or the other. They both make sense. –Besides, eventually there has to be a limit to what you have even the *potential* to do. You can’t do *anything*. So that brings me back to the initial question: where is the limit? Where do I draw the line between *his* character and *mine*?

To finish the other argument: Emotions/judgments that imply that you’re ‘looking down’ at someone, that you’re treating yourself as superior, are wrong, because...etc.¹ Emotions/judgments that imply respect for a person are not wrong—or are *less* wrong, in the case of broad generalizations like ‘He’s good’ or ‘He’s intelligent’—because to respect/forgive is to understand² (for all the reasons I’ve set forth in the past), and to understand is to have knowledge (i.e., to be right). And understanding/respect/forgiveness have more in common with positive generalizations like ‘She’s good’ than negative generalizations like ‘She’s a bitch’, and therefore positive generalizations are ‘less wrong’ than negative ones. That’s why anger and contempt are less justified than love and respect.

By the time I finish this journal, it will be the single most intellectually fruitful document in history. And the single most *humane* document, as in ‘laying bare humanity’—and *understanding* it—and *loving* it, despite everything.

The problem from three paragraphs ago.— Maybe the difference between you, who don’t steal even though you can, and someone who *does* steal, is that (chances are) it’s easy for him, while it’s not easy for you. You have to *will* it, because you don’t want to steal; he *does* want to, and therefore stealing is easy for him. So you’re not necessarily wrong in coming to conclusions based on a single action. You can’t be *certain*, but there’s a high probability you’re right. Of course, the more actions you observe, the better qualified you’ll be to judge what kind of person he is. Still, to pass a sweeping judgment on his worth as a person is too easy and tempting (and ‘static’, i.e., unmindful of his dynamic humanity) to be justified (even assuming—what is doubtful at best—that ‘worth’ is a meaningful concept).

Sometimes a person’s opinions reveal his character more than his actions do. His opinions are sincere; his actions need not be. Tom DeLay’s homophobia reveals a lot about him. Homophobia is based on ignorance; therefore, insofar as he’s homophobic, he’s ignorant. However, that doesn’t necessarily mean he’s ‘bad’. Or...does it? Is he ‘bad’ to the extent that he’s homophobic (because ignorance, especially when it harms people, is bad)? Philosophically and scientifically, no. (‘Bad’ is meaningless, etc.) But in the way that the word is commonly used—to signify heartlessness, ignorance, prejudice, and so on—it does apply to him (in this context). Now, to think that heartlessness and the rest are bad is wrong or confused, because, again, ‘bad’ has no clear meaning, but those qualities certainly tend to have harmful effects, and intuitively we ‘know’ they’re somehow not good, and therefore there *is* some substance (though only *some*) to the judgment that DeLay is bad insofar as he’s homophobic. Not that that has much practical relevance. It’s just satisfying. What really matters is that his opinion is wrong and must be fought against.

Sunday, February 20

I hate to keep harping on this theme, but I’m tired of being pestered by a thought that interrupts me when I’m trying to write the story.— Women want it both ways. They want to be treated like princesses, i.e., coddled and doted on like children, but they also want to be thought of as completely equal to men. I’m

¹ See the foregoing, and past entries.

² Or, at least: to understand is to respect/forgive.

sorry, but...it's one or the other! Are you children, or are you men? Choose! *Or*, if you're so inclined, you can be *honest* and admit that you're neither one nor the other: you're *women*, with your own peculiar strengths and weaknesses, different from men's—and therefore you're not “equal” to [or rather the *same as*] us, whatever that means. My advice to you is to stop trying to be men. Accept yourselves! Love yourselves! I'm 100 percent in favor of women as politicians and businessmen and scientists and philosophers and everything that's traditionally been thought of as a man's jurisdiction. I'd vote for Hillary as president partly because she's a woman. I wish *every* person in government were a woman, if only to see whether they could do a better job than the men have. But, for God's sake, judging by all the evidence, you have different needs and, to some extent, abilities than men. [...]

Basically, the impulse that produces a Mary Daly is the refusal to be labeled. People are dynamic, changeable, and shouldn't be judged as '*this*'. Becoming such an object, something essentially *frozen*, is, surely, a negation of one's humanity! Nobody wants to be frozen! –It's the thing Sartre described in his mystifying way. (The “look”, etc.) The impulse is commendable. Futile, but commendable. Try ‘refusing’ to be labeled ‘shy’ or ‘kind’ or ‘boring’ and see how successful you are:—not only are you destined to fail, but, more importantly, those labels are based on reality. They may be insensitive and ‘over-generalizing’, but usually they have some basis in fact. You aren't so dynamic that you can change your identity on a whim: you have innate dispositions that determine, to a great extent, who you're going to be. [...]

I'm nervous. Tomorrow I'll meet a girl I've been emailing through JDate. Trina. Lives in Bethesda. She's scarily intelligent. Writes well. Her emails are as formal as letters. We have personalities and interests in common, but...that could turn out to be bad. I'm worried our mutual introvertedness will clash. I'll have to drink a couple of beers before I go.

Judaism is very important to her. She was upset when she found out I'm not Jewish. Said she's never dated a goy. But still feels “very compelled” to meet me.

Monday, February 21

Intellectual conversation for the first time in months. Quite articulate on both sides. We liked each other, but I don't think we clicked romantically. (She doesn't laugh enough, isn't silly enough, isn't feminine enough.) I can't read her, though. She's too introverted. And mellow. Not quite my type. Made me mellow too. But I want to see her again.

Talking to Trina (who was granted a fellowship to do research on schizophrenia in the National Institute of Health) jolted me into recollection of the fact that, even though I can't contribute to neurology and therefore have nothing ‘legacy-wise’ to gain by studying it, I find the brain so fascinating that I have to educate myself on it. Ergo: I'm using the internet to give myself a crash course.

She's also volunteering at a battered women's shelter.

And she's one of the most intelligent, interesting people I've met.

Tuesday, February 22

What have I been doing these past few years?! Not learning about biology?! How is that possible?! How—and why—have I been avoiding myself? Reading this stuff is like listening to Bach! The same disbelief, the same insights into essential reality.

Wednesday, February 23

Need a break from biology. Learning about computer science. *Finally*. I decided to stop postponing the inevitable.

‘What’s it like to be an artist?’ you ask. ‘Why do they write so much? Why do they feel the need to create?’ –If you want the psychological and neural causes, you’re asking the wrong person. But I can tell you how they translate into subjective experience;—how the artist feels his ‘need’: the longer he abstains from writing, the more restless he is. When you’ve been watching TV for five hours and *have* to get outside and do something...that’s sort of how I feel when I haven’t written anything for five days. Especially if there’s something in particular I’ve been meaning to write. In that case my feeling will be like the one you have when you’ve just hung up the phone and realize there’s something you forgot to say to the person on the other line. Another way to think about it: writing ‘calms’ me.

Thursday, February 24

Computer science quickly loses its charm.

Mozart’s Fugue in C-minor for two pianos was, obviously, centuries ahead of its time. I’m not surprised that Beethoven was so disturbed by it that he felt the need to copy the entire score, just to understand its harmonies.

That nature produces people like Mozart proves it loves mankind.

On the other hand, that it produces people like L. Brent Bozell III, president of the Parents Television Council, proves it has a wicked sense of humor.

Yes, some acts *do* reveal more about one’s character (personality) than others. There are two kinds: those that are idiosyncratic, like being witty, creative, skilled at something—acts to do which you either *have* the potential or you *don’t* (for example, it’s impossible for me to be as witty and self-confident as Jon Stewart)—which category includes the way you *feel* when you do certain things (like, whether you enjoy them), because other people simply might not have the *ability* to feel the same way; and those that continually recur. Some people are always kind, or they’re always mean. Everyone has the ability to be kind or mean on occasion—and one can always *force* oneself—but not everyone has the *inclination* to be kind or mean (which inclination translates into repeated acts of either kindness or meanness). ...I suppose this second category is essentially the same as the first. In both cases, an individual either *is* or *isn’t* a certain way; he has no control over it.

See the third chapter of my senior thesis.

Friday, February 25

As you know, my talents aren’t a source of much pride. But for some reason, my *body*—after I’ve worked out for a few weeks—is. On some level I’m more proud of having a muscular body than of being philosophically, musically, literarily talented. Probably b/c I’m used to having those skills, so they don’t excite me anymore. Also because, insofar as I’m a man, *feeling* like a man is the greatest source of pride. Just as feeling like a woman is a source of pride to women. –But the situation isn’t quite parallel. Although women do want to feel like the stereotypical ‘woman’—i.e., feminine, pretty, giggly, relatively receptive and passive¹—they also want to compete with men. They want to be independent, strong and masculine: they want careers, they want to be go-getters, they tire sometimes of being insecure, vain and makeup-y. The two ideals conflict and cause, most likely, a great deal of anxiety. If a girl is *pure woman* she’s probably a bit self-contemptuous (or at least very insecure); if she’s *pure man* she may be a bit self-disgusted. Men, however, want only to be men. We suffer from no conflict between a feminine and a masculine ideal. [See

¹ Even the most independent women—typified by Hillary Clinton—want a man they can look up to, who’s slightly ‘above’ them in some way [literally and figuratively], who is periodically able to make them feel ‘lesser’ and dependent. That’s why Hillary fell in love with Bill, who, as everyone recognizes, is more charismatic and dominating than she.

Simone de Beauvoir's thoughts on how men, unlike women, are not "divided," which I quote in the third chapter of *Notes of an Underground Humanist*.]

Trina and I are going to the National Gallery of Art on Sunday.

Here's another thing I'm proud of: I can rap all of "White America." As a connoisseur of words, it's impossible for me not to enjoy Eminem.

Saturday, February 26

Reading about all of human biology, not just nerve cells. Concentrating on genetics for now. Some review of high school science—it's amazing how much information is still stored in the memory cells after years, after you thought you'd forgotten it all, when in fact all you needed was a stimulus to call it to your mind—but a lot of it is relatively new. *Finally* I'm beginning to understand the relation between Mendelian genetics and molecular genetics. That's always confused me.

To try to describe my awe would be futile. My awe at what evolution is able to accomplish. It isn't just 'surprise' or 'wonder' or 'shock'; it's a *destructive force*, a life-altering revolution. Even though I've known about this stuff for years, every time I think about it a new mental revolution occurs. My worldview is turned upside-down.

Tonight at work my presynaptic neurons allowed the serotonin they'd fired to linger for an unusually long time in the synapse before re-uptaking it, with the result that I was happy and confident the whole evening. Whenever I act that way I'm startled by how much it *feels right*—how much it *is who I am*.

...I'm both grateful to Nietzsche and angry at him. He's made it easy for me to be who I am—which is good. But, on the other hand, he's made it easy for me to be who I am—which is bad. He's made it *too* easy! If he hadn't existed, I would have been alone. I couldn't have followed in anyone's footsteps. I would've had to be completely original—not necessarily in my *ideas* but in my *being*. I'd've had Marx to idolize, yes, but he was too different from me to truly *identify* with. Sometimes I think I'm Nietzsche's reincarnation. Not because I want to think well of myself; simply because we're quite similar.

Sunday, February 27

Date went well. Better than first.

What possible significance can *anything* I've cared about have in comparison with intimacy?

Monday, February 28

For the past few minutes I've been asking myself when was the last time I was this happy. I can't remember. Being happy... How refreshing it is!

I'll see Trina on Thursday. So far I haven't dared to hope that it would turn out well between us, but I can't stop myself anymore. I hope. And I *think*— I think we'll get together. We're (almost) perfect for each other. I have no reason to be pessimistic this time.

Halle-fucking-lujah!

She was one of the valedictorians of her class.

Our conversations are remarkable. We each write a short essay every time we speak.

Tuesday, March 1

I have to agree with my thesis: there's no 'dualism' between empirical and phenomenological

psychology. And, after talking to Trina, I'm not worried anymore about the biology-psychology 'dualism'. She easily explained why it isn't problematic. Ironically, her arguments were ones I'd suggested in my thesis; apparently I decided somewhere along the line, after I'd written them, that they weren't sufficient. But I was wrong. I have no idea why I made such a big deal over nothing.

Wednesday, March 2

Reading about everything from the immune system to Boolean logic to cancer to CDs.

Why am I attracted to women and not men? ...I don't know. It's an unconscious response that can't be 'felt' on the level of consciousness. All I know is that when I see a pretty girl, for some inexplicable reason I want to kiss her. I'm aware of nothing between the cause and the effect—no intermediary (such as a 'feeling') that can logically link the two. Prettiness triggers an arbitrary desire to kiss it. There's no phenomenological explanation for that absurd reaction. —Christ, this is maddening! To want something but not to know why! For months I've been bothered by this problem. —Incidentally, if you'll say "The reason you want to kiss a pretty girl is that it'll be pleasurable", or, alternatively, "The reason is that you have an X and a Y chromosome rather than two X's, and therefore...[etc., etc]", you're missing the point. The pleasure of the kiss has nothing to do with it. If it did, my desire would be a rational calculation—a means to an end—something *a posteriori*, based on knowledge acquired through experience. But the desire is not rational. I wanted to kiss girls long before I knew that kissing was pleasurable. It never enters my mind that 'to kiss her would feel good'; I think only 'I want to kiss her'. The biological explanation, on the other hand, has nothing to do with my desire to kiss. Doubtless it's the fundamental cause of it, but as far as I'm concerned—as far as my consciousness, or my desire, is concerned—I couldn't care less whether my chromosome is an X or a Y. So, to repeat: the desire is *sui generis*. It exists in a vacuum; it has no meaning.

...I think I'm confusing two aspects of the problem. But I'm tired, so I'll continue this in the morning.

Thursday, March 3

We decided we couldn't overcome the lack of chemistry.

Although the decision was mutual, I was disappointed.

We're still 'friends'. We enjoy each other too much to end the relationship.

Don't want to write about the details. Don't care enough. Deep down I always knew I was wrong to hope. And from now on I'll know I'm wrong to hope.

This should indicate to you how hateful life is to me right now: I'm not going to write about it.

Friday, March 4

15 hours of bussing.

Sunday, March 6

I'm going to try to be objective for once.-- Am I glad I was born? Tough question. Sometimes I am, sometimes I'm not. But when not swayed by emotion I can look at everything in perspective and decide that, ultimately, I don't care one way or the other. Both happiness and suffering are insignificant. For a moment we're happy, for a moment we suffer--whether that 'moment' be seconds or years--and only after it's gone do we understand that it amounted to nothing. Precisely because it's gone. "But you're forgetting the 'warm glow of memory'." No I'm not; *you're* forgetting that the warm glow of memory is itself gone-

--even as it's happening. The instant before we die we look back on life and think, "So that's what all the buzz was about. *That*. And now it's nothing." Or we can think, "What a great life I had! I'm glad I was born!"--and then promptly die: an event that disintegrates our last thought and therewith every experience whose shadow still lived in our memory. In being forgotten, life is rendered meaningless, for meaning exists only in human consciousness. --What does all this mean? It means humans are equal; it means envy is short-sighted; it means pride is misguided; it means all emotions, which implicitly presuppose the permanence of themselves and of their object, are senseless.

It means that the central tenet of Buddhism is true.

Yet its truth doesn't mean you ought to live your life by it. Not only is 'ought' a futile idea--as is shown by the foregoing itself--but there are plenty of arguments in support of doing the *opposite*: of ignoring this 'truth' and living a 'lie'. E.g., nature programmed us to forget the fact of universal transience, and thus to ignore it (transience) is to live 'according to nature'--which is, in a way, synonymous with 'living truly'.

The song "Light as the Breeze"--which I've praised before ("it exalts Woman as the final resting-place of the soul", "Woman is what's left of God", or some such crap)--touches on the contradiction between Ideal and Real inherent in love. "She says [to her lover], 'Drink deeply, pilgrim, but don't forget there's still a woman beneath this resplendent chemise.'" As a man, when your love is truly ecstatic you love the chemise; as a woman, you love the...I don't know...the warrior, or his strength, or whatever it is that women love. Both men and women tend to ignore the person beneath the image (although the image is based on the person). This isn't the case at all times--at 'mundane' times--but at the happiest moments it is. The beloved becomes a Platonic Form in the eyes of the lover, a 'principle'--such as Beauty or Strength--a personification of the ideal. Maybe you'll object that, on the contrary, he/she is loved as a *person* who happens to *have* these qualities, but you're wrong: the beloved's status as an autonomous, full person is overlooked. In loving him, the lover is loving all that's good in the world. Any beauty that life has is *in him* (the beloved), magnified. Nothing else has meaning. His flaws don't exist--or if they do, they merely add to his perfection. The lover is happy that he possesses something perfect. Furthermore, he's equally in love with the knowledge (however half-conscious) that the beloved is his *possession* as he is with the beloved himself (--though obviously in different senses of the word 'love'). That is, his love would have a radically different character if he didn't *possess* the Other: it would coexist with despair rather than happiness, and would thus *itself* be very different. --So, this is what's meant by the saying 'We kill that which we love'. We see it not as an autonomous living being but as an embodied principle;¹ moreover, in *possessing* the principle, we negate the person's individuality in yet another sense. What about the well-known phenomenon of 'If I can't have her, I'll kill her!?' --Why kill her, you ask, when it's seemingly so contrary to love? Well, surely it's a striking parallel that to possess *is*, in a sense, to kill. It suggests that the will to power is behind the will to love: you have 'power'² over the beloved by making her yours, as you have power over her by killing her. I hate that 'will to power' formulation, though: it smacks of 'This term sounds so cool I'm going to make it the central doctrine of my philosophy!' And it's too pat. I'd rather reduce it to something more fundamental and less vague--and less metaphorical--like the desire for immortality or 'meaning'. That is, requited love is recognition from someone you esteem more than anyone else, and being recognized by such a person is a way of overcoming time/death. That's why requited love feels so much better than unrequited love: in the latter kind, the lover isn't being validated and is thus a slave to time and death. He has no control over his passage through time; he continuously dies and is reborn only to die again--whereas in love he never dies; yet he feels as if he's being perpetually reborn. The moment is always fresh and new to him. Death isn't even on the horizon, much less defining him in every moment. (Of course, it

¹ Remember what Aristotle said about the concept 'dog'? It can't exist unless the dog dies. I.e., the concept is a negation of the living dog. --Applying that idea to this context involves a slight distortion of it (and I'm not referring to the substitution of 'person' for 'dog'), but still, it's kind of cool that Aristotle's intuition supports what I'm arguing.

² I put scare-quotes around that word to remind the reader—who I hope doesn't need reminding—that it's a much more subtle idea than the one commonly associated with the word 'power'.

is, for he hasn't transcended the human mode of consciousness, but he's less aware of it than normally. Why? Because he's intoxicated with his 'respect' for the beloved?—and especially with his validation *by* her? No: the lover is fixated on the Other, not on his validation.¹ --Well, that's not a good argument.² He's equally obsessed with the Other when his love is unrequited as when it's requited; the only difference between them is that in the latter case he's loved (validated), and so this difference must be why requited love is pleasurable and the opposite kind isn't, which means that part of him *is* fixated on being validated—a half-conscious part—and this fixation plays the decisive role in making him happy. But still...this is a poor explanation of the pleasure that love bestows. Love is a compelling physical pleasure; the satisfaction gained from the knowledge of being validated, however, can only be intellectual. --Neurotransmitters and “action potentials” and the like are the direct biological cause of the lover's euphoria, but to rely solely on them in an explanation (i.e., to ignore psychology) is a cop-out, because you haven't made any headway toward understanding the psyche. What you've understood is the biological *basis* of the psyche, not the psyche itself. --So...I don't know where this leaves me.

Incidentally, I now think that the “striking parallel” I mentioned above is nothing but a coincidence, founded on my use of a particular metaphor.

Monday, March 7

Had a fight several days ago with a housemate named Rose. Nineteen-year-old self-centered bimbo with a nasal voice. I wanted to watch the Daily Show, she wanted to watch Sex and the City—as usual. As the argument escalated I stopped caring about the show and wanted only to teach this spoiled little brat a lesson. What makes the incident interesting is that we both were—and are—convinced of the other's inferiority. (Ignoring what I've written about value-judgments,) I *know* I'm a better person than she is—in most ways—and she *knows* she's a better person than I am. In a sense, we're both wrong. But in another, 'human-centric', unphilosophical, sense—manifested in the fact that the majority of people would side with one or the other of us—one of us is right. And that one is me. 'But how do you know?' you ask. 'You're just being arrogant and closed-minded. After all, she thinks the same thing: *she's* right. Why are you so sure you have more insight into the matter than she does?' But if she thinks she's right, then, by your logic, she's being arrogant and closed-minded too. The reason it doesn't occur to you to apply the same criticism to her is that, in her not having my inquisitive mind, she doesn't feel the need to validate her spontaneous dislike by explicitly telling herself she's right. If she *did*, then you'd say to her what you said to me. —But there's something idiotic about a position that allows one to think that someone else is inferior—as yours does—but doesn't allow one to reaffirm the spontaneous judgment by telling himself he's *right* and the other is *wrong*. The 'reaffirmation', after all, is implicit in the spontaneous judgment. So by rights you should criticize the initial judgment, not the 'after-the-fact' opinion that it's right. But you don't; you think not that the mutual conviction of the other's inferiority is closed-minded/arrogant but rather that the mutual conviction that one's own 'prior' conviction is *true* is closed-minded/arrogant. Why? Surely because you yourself constantly judge a person's worth—and you *don't* follow that up with a reassurance to yourself that you're right—and thus to criticize such a judgment would be to criticize yourself. On the other hand, in this age of political correctness, there's something unpleasant about a person's being convinced he's right and the other is wrong; therefore, you indiscriminately condemn all such convictions, without knowing that you yourself constantly have them. —In short: that both Rose and I think we're right doesn't mean I'm being narrow-minded by telling myself on a 'second-order' level that, despite our equal self-certainty, she is in fact wrong—just as it isn't narrow-minded to believe on a 'first-order' level that she's inferior to me

¹ By the way, I'm not going to close the parentheses.

² (Now that I stop to think about it, I can see that I anticipated the following sentence in the one that began “Furthermore, he's equally in love with the knowledge...” (as well as the one that followed it). The difference between the two is that earlier I talked about the lover's possession of the beloved, whereas now I'm talking about his validation by her. The two terms refer to the same phenomenon.)

in many ways. If there's a truth and a falsity, then one of us is right and the other is wrong—and it just so happens that I (who have a mind more capacious than hers and can thus evaluate arguments more disinterestedly) am right and she is wrong.

But if we both equally 'know' we're right—if we're both equally certain—and yet she isn't, then my 'knowledge' must be just as fallible as hers. Which means we're back at the beginning: despite all the arguments I've put forward, as well as ones I haven't, there's no reason to think I'm right. The obvious way out of this dilemma is to recognize that my experience of knowledge is different from hers. It's 'clearer', broader, more self-conscious, and based on good arguments and close observations. Hers is only an unreasoning dislike that doesn't even ask itself if it's justified. [These speculations broaden beyond that one trivial example.]

Tuesday, March 8

What is existential "meaning"? Nothing but the power to produce effects. An experience has meaning if it has an effect: e.g., Frankl's life in Auschwitz had meaning because he could use it to teach himself facts about the world. He gave it meaning: that is, he decided it would cause a particular psychological effect. If an experience has no effect on anything, it has no meaning. —You can argue against that hypothesis all you want, but in the end, if you're honest, you'll have to agree with it. Therefore: in the long run, life has no meaning, because it ceases to have effects.

Wednesday, March 9

This just became the best day of the week. I received the CD I'd ordered of Yo-yo Ma playing Bach's cello suites.

Thursday, March 10

It's humbling to reflect that the social conditions that allowed for the highest possible realization of musical genius--the conditions that prevailed in 18th and 19th century Europe--were contingent. A New World didn't *have* to be discovered; the colonies didn't *have* to produce enough cotton to jump-start the Industrial Revolution; feudalism didn't *have* to decay in the ways it did. All these circumstances were accidental. Yet their artistic byproducts were, surely, *necessary*. I can hardly imagine a world without classical music. Surely everything that existed prior to Bach is justified only as a necessary precondition for his music! The music of those two great centuries cannot have been a historical accident; it cannot have been merely a superstructural expression of inessential social developments! It's too logically beautiful! It's too aesthetically perfect! Without it there'd be only a long dreary record of musical *attempts*. Few *achievements*. With its arrival came the solution to the question of how the grandeur of the human tragedy could be portrayed in symbols. Through such pieces as the Sarabande from S. 1012 mankind succeeded in grasping the infinite and playing it on an instrument.¹ --And yet the music was accidental. --That means *we* are accidental. And that means there is no God.

Is it really the case that we needed *those* conditions to produce such art? Isn't it possible that in the future we'll be able to do it again? Or is the opportunity gone forever?

Friday, March 11

¹ That isn't just a rhetorical exaggeration. It's the truth. If you could listen to the Sarabande in such a way as to appreciate its perfection, you'd transcend human consciousness.

This morning I woke up at 5:00 thinking I had to finish the book of ‘aphorisms’ I’d started. I must have been dreaming about it, because the second I was conscious I had this epiphany. It would be a way to sum up my youth; it’s the only book I’m capable of writing at this time of my life; excerpts from my journal would provide over two hundred pages of it. Didn’t fall back asleep until 8:00. Couldn’t get my mind off it. --‘How would I begin it? How would I organize it?’ Etc. I’m excited. Nothing like it has been written in a hundred years. But I’m impatient. I want it to be finished. I’m obsessed with the need to make the world *feel* again. And *think* again. It’s been running on autopilot for too long.

Saturday, March 12

I’ve been going about this book thing all wrong. I’ve been trying to write the sections in the order they’ll appear, with the first one first and so on. No headway made. But Nietzsche’s way is better: write down the thoughts as they come to you and put them in order later. Just write down scattered thoughts.

...I’ve reached the point in my life when writing, in and of itself, doesn’t provide me with much relief. It used to be that if I wrote something in my journal I’d feel satisfied and ‘rested’. Journal-writing would be enough. But no longer does it alleviate my restlessness. Even the instant after I finish a philosophical entry I still feel ‘bottled up’--and as the satisfaction of writing wears off, minute by minute, my restlessness increases. In general, my thoughts seem to crave a more exalted arena. They want to burst out into the world. They want to roam freely in minds other than my own.

This situation has come about abruptly. Four weeks ago it was merely nascent. The more I wrote of the Vietnam story, though, the more I realized I had to publish a book in order to be (temporarily) happy.

Friday, March 18

Wasn’t accepted into Tufts or UW Madison.

Saturday, March 19

I don’t feel the need for a girlfriend anymore, now that I’m writing this book. The book is my girlfriend. And my daughter. --I have an incestuous relationship with it.

I think about it constantly. Always composing aphorisms in my head.

Tuesday, March 22

Lately I haven’t had the need to eat as I’ve been writing. My hunger has never been more than mild; I’ve been eating one-and-a-half meals a day. I keep postponing each meal:—‘I’ll eat after I finish this paragraph...’

When he was writing, Yeats’s family members had to remind him periodically to eat. He actually forgot about food. For the first time I understand that.

Saturday, March 26

Reading about structuralism, poststructuralism and deconstruction. Derrida, Foucault, etc. I can’t ignore these topics in my book.

Monday, March 28

The day before yesterday I was certain of my mediocrity. Yesterday I was confident of myself. Today I'm doubting myself. –Back and forth, back and forth. It's hard to be me. Maybe I'll take a nap. I find that's the most profitable thing to do when I'm self-dissatisfied.

The task I've set myself is overwhelming. *Nobody* can achieve it. –And yet, I can feel the potential within me. I just don't have sufficient knowledge yet. I have to acquaint myself with all of 20th century philosophy. Damn! I wanted to publish this book sometime in the next couple of years.

After reading about Gould's theory of punctuated equilibrium I'm inclined to accept natural selection and random variation. P.E. answers most of the questions I had.

A main reason that philosophy interests me more than (most) science is that it's so much harder! Philosophy lacks science's support system: empirical observation. E.g., given the fossil record, punctuated equilibrium seems *obvious*.

Tuesday, March 29

When I've tried to educate myself (like in Korea) merely for the sake of having knowledge I've lost interest after a few months. Only if my goal—my *immediate* goal—is to *create* (as it is now) can I motivate myself to learn as much as I have to. In the last few days I've been reading obsessively. And I'll keep doing it. Just because I want to get the reading part of my task over with.

Jacques Lacan is quite interesting.

An analogy: Nietzsche is to Derrida as presence is to absence.¹

Here's an intriguing profile of Lacan that, crudely, applies to me as well:

Lacan seems above all to have been one of those intellectuals who have become completely unhinged from their own emotional life and from ordinary human relationships. The tragic predicament of such thinkers is that, driven by terrifying feelings of insecurity and emptiness, they mistakenly conclude that intellectual truths can be an adequate substitute for emotional warmth. Craving distinction and imagining that abstract intellectual formulations can alone fill the void they feel within them, they develop a voracious appetite for such formulations, anorexically judging their goodness by the degree of difficulty or abstraction they possess. Believing that what they have devoured is intrinsically nourishing, they are impelled to share their 'truths' with others. Like a starving man who compels others to eat the diet of stones he believes has saved him, they give abundantly of their poverty out of a genuine conviction that they are enriching others.

We are, though, damn it! We're not forcing people to *eat stones*; we're *encouraging* them to *learn* about themselves!

Sunday, April 3

I saw Sangeetha last night. It was a disappointment. She and a few of her friends were at her boyfriend's apartment. I was bored. Judd, her boyfriend, didn't seem very interesting. Which is why I thought they were a good match.

¹ [The presence/absence dichotomy is important to Derrida.]

Tuesday, April 13

There's no way around it. I have to acquaint myself with philosophies of language before continuing my book. My ideas in this sphere will influence the mode of presentation of my ideas in all other (philosophical) spheres.

One lesson I've learned already is that if 'solutions' are going to be reached for many of the problems that occupy academics, they will somehow have to *cut through* those problems rather than treat each of the (more valuable) discussions individually.

It seems to me that if the notion of *intuition* is explained, a good many problems will evaporate. People commonly say things like "it's intuitively plausible", and the sense of a sentence is provided by intuition, and intuition yields insights more quickly and powerfully than chains of logic do—and so there's something very fundamental about intuition. —But Bergson didn't know what he was talking about.

Thursday, April 14

I just discovered an online research library called Questia. Thousands and thousands of books, articles, encyclopedia entries... I'm in heaven.

Friday, April 15

Reading Noam Chomsky's *Knowledge of Language: Its Nature, Origin, and Use*. Good book. (Occasionally tedious.) I agree with basically all of Chomsky's ideas (all the ones I've read). It seems to me, though, that his criticisms of Saussurean linguistics (as narrow, etc.) are ill-founded: *langue* surely is similar to "I-language", while *parole* is similar to "E-language". Saussure's ideas are inadequate in other respects, e.g., in the too-imprecise distinction between signifier and signified. (It's unclear whether the latter refers to—in Fregean terminology—sense or reference or "ideas" or all three.)

...Reading writings of Michael Dummett on Frege.

The more I read, the more my mind brims over with ideas. I've been making a terrible mistake in not acquainting myself with contemporary philosophy (particularly the analytic tradition).

Tuesday, April 19

P. F. Strawson's paper "On Referring" is an excellent refutation of the theory of descriptions. Strawson seems to have been one of the few analytic philosophers who has/had common sense. —Russell's reply to Strawson is bizarre, apparently based on misunderstandings.

What Kierkegaard said of Hegel's ideas applies to the theory of descriptions: to refute it, only common sense is necessary. It's perverse to call the statement 'The King of France in 1905 was bald' false rather than neither true nor false.

Friday, April 22

I never take my own writings as seriously as I take others'. I can happily read a book by, for example, C. G. Prado, but when I turn to what I've written, I no longer care about any of it. Knowing that I've written it makes me despise it. How can anyone possibly respect anything he's written??

Saturday, April 23

Althusser's article on ISAs, while poorly written, is profound. Very thought-provoking.

Monday, April 25

At work today I wrote a short poem about BWV 999. Each line has one syllable more than the previous—and in the last half, one less. Thus: 3, 4, 5, 6, 7, 8, 9, 10, 10, 9, 8, 7, 6, 5, 4, 3. The first and last lines are simply the number of the piece. The problem was, I didn't know which BWV it was—so I was reduced to hoping that its number could be expressed in three syllables. When I got home I checked;—and it turned out to be 999. The *perfect* number! (If you read the poem [below], you'll know why it's perfect.)

Thursday, April 28

I'm looking forward to graduate school, if only so I can talk to intelligent people again. People in the real world are hateful and don't have minds.

Friday, April 29

I started my new job today—at a restaurant in the Hotel Monaco. There's no comparison between it and Finn Mac Cool's. It's professionals vs. amateurs. The people are nicer and the pay is better.

Sometimes I forget how great people can be. When I'm confronted with assholes for weeks on end, I forget that not *everyone* is an asshole.

Sunday, May 1

I've been jumping from subject to subject—linguistics to Marxism to feminism to psychology and back to linguistics...—but that's the wrong way to proceed. I'll try to focus on each for a fairly extended period of time before I succumb to the desire for something new. I wanted to stick with Marxism for a while, but while writing the section “In defense of historical materialism”—specifically, after reading Althusser's article—I realized that the discussion of ideology presupposes a knowledge of psychology;—and those two subjects are so broad that it'll take me a while to read everything I have to. So I'm back to the philosophy of language. A week or two ago I took a break from it when confronted with the related problems of the nature of intuition and the indescribability of most mental experiences (such as intuitions). What really confused me, and still does, is that certain sensations seem to be describable in informative, meaningful ways, while others don't. What's the difference between them? I think this is the issue that Wittgenstein grappled with in (parts of) the *Philosophical Investigations*. At the moment I'm reading Jerrold Katz's book *Sense, Reference and Philosophy*. It's more interesting, and its ideas more plausible, than anything Bertrand Russell ever wrote.

Monday, May 2

My feelings for Noam Chomsky approximate reverence. He's one of the (very) few *sensible geniuses* of the twentieth century. He's always been there on the side of common sense versus obscurantism or irrationality. Chomsky against behaviorism. Chomsky against Foucault. Chomsky against

deconstructionism. Chomsky against empiricism. Chomsky against the U.S. government.

It's comforting to know I can email him whenever I want (though he'd ignore me [not true]). To have such easy access to such a person!

Tuesday, May 3

I wrote a few limericks. It was damn fun.

Wednesday, May 4

I want to write a poem about Farah Ahmedi. The 17-year-old girl who, years ago, stepped on a land mine in Afghanistan, lost her left leg and had the bones of her right leg fused together, then lost her father and two sisters in a bomb that destroyed their home, then repaired her prosthetic leg with tape and glue and climbed the mountains with her (physically and emotionally frail) mother into Pakistan, then (to avoid living in refugee tents, which she thought would be bad for her mother) took a job as a servant in someone's house, then applied to the World Relief and emigrated to the U.S., then won an award for 'best autobiography' and is now somewhat of a celebrity. Through it all she stayed optimistic.

Writing books and poems (especially limericks!) seems frivolous—*contemptible*—when you read about someone like that. So much so that I've lost my ability to write for the rest of the night. I guess I'll watch TV.

Monday, May 9

I'm more interested in psychology than the philosophy of language—and I have a better chance of contributing something interesting to the former discipline in an absence of technical expertise than I do to the latter—so I'm focusing on psychology now. Reading about Kohut, Lacan, Adler, Jung and others.

Wednesday, May 19

The "Book of Joe" is becoming a strange, delicate mixture of satire and sincerity. To write in the Biblical style without occasionally being forced to sound tragic (as opposed to comical) is impossible. It's still mostly satire, of course; even the 'sincerity' is made somewhat vulgar by its proximity to vulgarity. Joe rises periodically to tragic heights, but he can't distinguish between his noble and his base impulses, so they run together; one follows the other as if they're of equal value. An obvious theme (or several) can be extrapolated from this.

No matter what I write, philosophy always manages to creep in—through no effort of mine.

Thursday, May 20

Example: Joe periodically lets slip his self-loathing (as when he denounces the "wealth-monger"), which many businessmen unconsciously have.

Saturday, May 28

Whenever the characters rise to nobility in their sentiments and modes of expression, they suddenly

fall back into mediocrity by a single word or sentence. --In this age (in *every* age, but especially this one), nobility is a short-lived, self-contradictory thing; no one can remain 'noble' for more than a brief period of time before returning to reality.

Occasionally Joe nearly realizes the error of his crass ways and repudiates Mammon, but each time his mind is brought back to money. And in the end, after he has come within a hair's-breadth of understanding the true meaningfulness of life--which would entail his continued (financial) abasement, and thus that the satire become a tragedy--he will be restored to his former prosperity and therewith his trivial existence.

Of course, the redemptive power of suffering--and the wisdom it can impart--is primarily what's hinted at in Joe's gropings toward enlightenment.

(The pagan imagery is significant as well, though for different reasons.)

Sunday, May 29

For the past year or so--or maybe two years--my nightly sleep has been "unrefreshing". I wake up tired. And then, as I've told you before, my tiredness persists through most of the day. If the world and I didn't hate each other, probably none of this would be the case.

Monday, June 6

Skimming *The Antichrist*. Brilliant perspective on Christianity. By no means the 'definitive' one, but highly original and thought-provoking. It is also, of course, flattering to me, as are all of Nietzsche's writings. Section 57, for example (the second half).

Other sections are too "shrill" for my taste. Like 59. Too much hatred of Christians. Too much idealism of the past. Too much Hegelianism--'history is moved by mind, not by economics or anything materialistic and mechanistic'. But I understand Nietzsche: his physical and emotional misery were the reasons for these flaws. 'I know of no more heart-rending read than Nietzsche: what must a man have suffered to have such need of being vitriolic!' [A paraphrase of something Nietzsche said about Shakespeare.]

Wednesday, June 8

I'm extremely bothered by the imperfection of Joe's Book. I constantly reread it and change a word here, a word there; I want it to be incapable of being criticized in any way. But in order for that to be possible I'd have to read all of Shakespeare's works, all of the Bible, all of Milton and Dryden and Pope and Donne and Byron and Keats and hundreds of others and assimilate their expressions and create my own from this fertile soil. That every passage I've written could have been written differently without necessarily sacrificing its quality *appalls* me. Unless it's *necessary*, it's *worthless*. Therefore, it's worthless.

Any chapter I write that doesn't cost me many hours of painful effort...I don't trust. The chapter on the Muslim was uncomfortably easy; I'll make sure that no others are the same.

Thursday, June 9

I'll get tuition remission next year by being a TA. 'Tis a relief--though I'm not confident in my TAing skills. I think I'll go to a therapist regularly in the fall, simply because it's time I started living.

...A third of my life has passed. A third!! Death is going to hit me before I know it.

--Ah, but when I listen to Paul Simon it doesn't really matter.

I'm going to start drinking protein shakes everyday and working out again. The 'muscular' feeling is an essential part of happiness.

I've changed my mind about Lacan. He doesn't impress me.

Friday, June 10

I need a break from the satire. Returning to psychology and sociology. I read a little today (Margaret Mead et al) and realized that, once again, I'll have to revise—no, *rewrite*—most of my book, to make it more scholarly.

Sunday, June 12

Maybe you think it's a sign of my immaturity that I want my book to deal with everything from linguistics to Marxism to psychoanalysis to religion to the philosophy of art... [Yes. I do think that.] But really the main reason for this ambition is that I can't address any of these topics satisfactorily without addressing them all. Whenever I write about one, I find myself inadvertently crossing over into another.

Wednesday, June 15

Tonight I passed a beautiful girl on the sidewalk walking her dog; I hesitated for an instant as if to talk to her, but...then I walked on. I don't know why. It was a case of love at first sight, and afterwards I could have died with regret. And in fact, I will: I *will* die with regret, when I die. A lifetime of regret will pass away in that moment. Wasted opportunities, chances at happiness brushed aside. So much cowardice.... So instead of running back and introducing myself to her I put on my headphones and listened to Scott Joplin's "Solace".

Now there's no longer the same emotional pain, but there's still the uncertainty—the 'what would have happened if...' uncertainty. Maybe that girl would have been the love of my life. I'll never know.

I'm tired of myself. I've lived too long in this body, this psyche.

Frege was the last of the truly great (profound, 'pithy', epoch-making) philosophers. The 20th century didn't produce any—with the possible exception of Wittgenstein. He was extremely confused (especially late in life), but he had periodic flashes of profundity. Still, even Wittgenstein wasn't a Frege.

Heidegger? Sartre? Husserl? Any of the great logicians? No, no, no, no.

I'm simply not interested in most people. That's a major reason I'm shy/introverted. And I've gotten into the habit of not initiating conversations—which is ironic, because once the other person has said something as simple as "hello" I'm usually good at continuing the conversation, and even being the one who carries it. This anti-social habit is hard to break out of. I simply lack the 'impulse', or the 'energy', to start a conversation. When I saw that girl tonight I thought, "Tell her her dog is cute." And, of course, it wouldn't have been hard for me to do that. I wasn't 'afraid' of it; I wasn't worried or nervous; if she'd said something first I would have talked with enthusiasm, animation and (maybe) charm, as I usually do with people in whom I have some slight interest. But the *inertia* of my introvertedness got in the way. That's really all it was. —But then again, there may have been *some* fear. I suppose I was worried I wouldn't be entertaining. I'd ask her what kind of dog it was, etc., not caring at all (which was possibly another element in my reluctance to talk)...but where would I go from there? That kind of worry wouldn't occur to me, though, if I had *energy*.

Saturday, June 18

Working out every day, drinking protein shakes, eating more. I wish I'd done this in college. It would have made life easier.

Sunday, June 19

Unless you've tried it yourself, you can't imagine what an effect 'working out' has on your mind—your wit, your self-confidence, your happiness. It's like I'm taking a (not very powerful) drug.

Thursday, June 30

Canada, Holland, Belgium and Spain have legalized same-sex marriages. It has become a world movement—or, at any rate, a Western one. America, being the most prejudiced, will be the last country to follow the trend, but eventually it'll have to.

...One of my goals is to surpass Swift as the foremost prose satirist in the English language. It shouldn't be hard. "A Modest Proposal" is heavy-handed, and *Gulliver's Travels* has much that is unnecessary, even poorly written.

Saturday, July 2

Working out is bullshit. After the first week it stops having an effect on your mindset (and behavior), and it no longer even builds up your body. And the lifting itself is fucking incredibly unpleasant. I almost threw up yesterday after I was done. Leaned over the toilet, etc. It took me two hours to recuperate.

If I continue, I'm going to do it with less frequency. From what I've read, that might help. Less frequency but more intensity (if that's possible). —And yet, Ed Norton apparently gained thirty pounds of muscle in three months (for *American History X*) by lifting weights non-stop and drinking protein shakes. Besides, it seems like common sense: the more you work out, the more muscle you'll build.

So maybe I'll *increase* the frequency. I'll work out not only every day, but several times each day.

...Yeah, I'm starting a new routine. The old one never worked for me—the hour-long sessions four times a week. Instead I'm going to do short ones (thirty minutes or so) twice a day, focusing on 'heaviness' and few reps (6-8) rather than a lot of reps (12-20) and less heaviness. Also, more protein-drinking and -eating.

Thursday, July 7

Imagine if somebody wrote something comparable to the Ninth Symphony nowadays. If he took a poem written a few decades earlier and set it to music like that. Imagine... What would that be like?

What a time that must have been, when geniuses all lived together and audiences could hear poems written by Schiller and Goethe in the music of Beethoven and Schubert. They'd go to a concert and be like 'Hey, that's one of Schiller's poems! Cool, man!' The poet would perhaps be in the audience, and the composer might be conducting the orchestra, and at the end they'd both be congratulated, and everyone would feel this natural but strange (to us) intimacy... Audience members could go right up to Beethoven and ask him questions about the piece, about his intentions...¹

¹ (Maybe writing their questions on a piece of paper, or shouting in his ear.)

That was the culture to live in.

Tuesday, July 12

For weeks I haven't been writing (the theoretical part of) my book. Only the satire. And I've been reading;—reread Therborn's book from my summer in Madison, and just finished Piaget's *Psychology of the Child*. Etc. Skimmed various writings of Winnicott's, which didn't seem very valuable.

...I repudiate the story I wrote in Korea called "Atrabibulous". I can't even read it anymore.

Saturday, July 16

[...]

The manager gave me the day off. It feels like I've been given a second chance at life—a reprieve from a death-sentence.

Reading a collection of Jung's essays, *Contributions to Analytical Psychology*.

One of the things I've been worried about in my satire is whether the Mammon = God equation is clear enough in the beginning, or whether, if it's clear, it seems forced. And when religious characters enter the scene, the situation becomes more complicated: they don't identify God with Mammon. At the end I hope to justify the assumption throughout—which is really the backbone of the satire—that Mammon (i.e., not just money but also greed, selfishness, etc.) is God, by the long speech he'll give to Joe describing his power.

Thursday, July 21

The poet's chapter is the hardest yet. While it's difficult to write in the biblical style without sounding absurd and artificial, it's almost impossible to do so in the romantic style. You can see from the poetic line I dissected on July 13th [in a deleted entry] that *sheer shit* is usually the result. When you're in the process of writing it, it doesn't always seem that bad; but when you come back to it a few hours later, you can barely read it without averting your eyes or keeping a straight face. Lines like this--"What need of Cupid's shafts when one's beloved hath eyes that pierce the heart?"--come dangerously close to the borderline. They're (possibly) acceptable in my satire only because it's a satire. (A bit of exaggeration is essential to satire.)

Friday, July 22

Jung wasn't a very good writer. E.g., it takes him forever to get to his point. Freud comes right out and says what he wants to say; Jung goes through pages and pages of verbiage, which include stupid apologies, disclaimers, hesitations, irrelevances, bad metaphors, philosophical digressions, and a lot of repetitiveness.

Watched a documentary about Tupac Shakur. The guy was amazing. What would he be doing now if he hadn't died?--at 25. 25!! He was still a boy! But his charisma was that of a mature movie-star.

Thursday, July 28

I wrote a little story, below. (There are three levels of significance to the title.) The protagonist is

vastly different from me, just so you know. He represents certain cultural trends, etc.

Everyman Comes

He looked in the mirror. With his hair slicked back and his shirt unbuttoned at the top, so that a tuft of chest hair stuck out, he looked good. He looked sort of like how he'd looked a long time ago, when he was a child, on one Halloween--maybe he was about thirteen years old--and he'd dressed up as a vampire, with his hair slicked back (with so much gel it gleamed in the bathroom light) and blood seeping from his mouth and eyes as he curled his lips wickedly, to pose for the picture his mother was taking. "Wow, you're scary!" she'd said. He'd liked how he looked and wanted to keep the same hairstyle everyday, but his mom wouldn't let him. "It's too sleazy!" she said. But now as he looked in the mirror he thought Aaaaah, fuck her. I was right; it looks good. I'm gonna keep it this way from now on. Maybe this way I'll get more women. --Nahh, fuck it, I have too many already.

He walked out the door and swaggered down the hall. No one was there to see him. He went into the elevator. He saw his reflection on the bronze-colored doors as they closed--a little smudged, but actually he looked even better that way. It was something about the lighting and the smudge; maybe it was the lack of detail in his image that made it more attractive. Soft lights and shadows are generally best, but metallic smudges work too. He stepped outside. The street was crowded. *I'm home again*, he thought. --Damn, that was a fucking good movie. *I'm home again*. And Chris O'Donnell is like, home? We're in a hotel room, man. In the middle of New York, nowhere near your home. Crazy blind man. But Al was right. And now here I am. God must have been a fucking genius. Two breasts perking out at you--two! Not one, not three, but two! Look at all these fucking breasts, man, bouncing along past. And these legs, and all these asses! "Hey babe, what's up?" No answer. Bitch.

He walked towards the subway. He chose his path carefully: behind girls wearing shorts that got wedged in their butts as they walked. Or skirts that ended where the thighs began. That little fold where the buttock started--that was his favorite spot on a woman's body. Her whole essence was contained in that fold, that cute, provocative, soft, sweaty, paradoxical fold. A girl with long hair wearing a lacy top and a sparkly silver mini-skirt undulated past him; he turned his head so his eyes could follow her till she turned the corner. God *damn*, I wouldn't mind fucking that. But there are more where that came from.

A homeless man was curled up in the fetal position on a bench, his head resting on a plastic bag stuffed with something. People walked past without noticing him. He was shaking slightly--sobbing, maybe? Poor guy. Somebody ought to shoot him, put him out of his misery. That'd be compassionate. And it would save us from the pain of compassion, too. And there'd be one less bum. I wish I had a gun. --No, I don't. Don't need it.

He walked on, following the girl in front of him.

On a whim, he took a detour. Down an alley--dumpsters crouching in the shadows. The smell was bad; it kind of made him choke. Electrical wires hung overhead. A boy and girl were kissing somewhere; he could hear their whispers and gropings. And slurpings. Maybe the boy was getting a blowjob. Yeah, the slurping was rhythmic. Now he could hear groans and words of encouragement. He figured they were behind a dumpster somewhere. Then he saw them--the girl kneeling, her head bobbing mechanically, her cheek bulging out absurdly; the boy grimacing, his eyes closed tightly, his hands resting stupidly on her mechanical head. She turned to look at the stranger who was standing there smiling, still with the erect appendage in her mouth, and a hilarious look of mortification widened her eyes. "Sorry!" he said, "I'm leaving. You're doing a good job. Keep it up." Stupid girl. If you weren't already embarrassed you shouldn't be now. Having a cock in your mouth. What could be more disgusting? --I can't wait five hours. I need some now. Just to tide me over. Just a short one.

It took a while to get to the place. All the alleys he walked through were dark and cluttered

with dumpsters. The smell was stifling. He was relieved when he saw the girls up ahead with their skimpy clothes; the air was fresh there. “Hey ladies!” “Hey sexy.” “What’s up?” “Damn, you’re gorgeous.” “Over here, baby!” “You want some of this?” “You look ready, all dolled up.” “You want to come inside with me?” He picked one and they went inside.

The hall was close and musty, with yellowing strips of wallpaper peeling off the walls. Made him kind of claustrophobic. They entered a small room with a small bed and a chair next to the wall. “Okay honey--you look good tonight--you want the same thing you got last time?” Her curtness was unattractive. “You’re not very romantic tonight,” he said. “I’m sorry baby. I’m just tired.” “That’s okay. I’ll do the work this time. Just a quickie. I’m going clubbing.” “Okay.” She pulled the t-shirt over her head, exposing her pert little breasts, and then she stepped out of her skirt. It fell to the floor in a heap and lay there motionless, in a rumpled circle around her feet. She had a beautiful body. He had a sudden urge to slather it with oil; he thought it would look irresistible all shiny like that. She sat on the bed and unzipped his pants. Then she pulled them down and set to work hardening his piece of flab. He rubbed her breasts at the same time; it helped. He thought about her nakedness, and about the story in the *Vagina Monologues* (which he’d recently seen) about a woman who liked it when her boyfriend stared for hours at her cunt, fascinated by it. This aroused him quickly. He raised the girl and put her on the bed in the doggy-style position. She moaned and gasped as he thrust in and out rhythmically, feeling her cleft with two fingers. It was hard work in the beginning, as always, but at the end his reflexes took over and the thrusts became very swift and mechanical. Afterwards they lay together on the bed in silence.

He was glad when he left the hallway that smelled of vomit and emerged into the cool air. The street was full of people with dicks and people with vaginas displaying themselves; he smiled and said hello to passing ones. Then he walked to the subway. She’s a fucking fine girl, he thought. Next time I’ll pleasure her more. She was faking, I know it. Sucks when I don’t pleasure the girl. Even a hooker. It’s more fun that way anyway.

He got into the train and looked out at the dark tunnel as it sped by. Electric lights shined in random spots. He saw his reflection in the window and noticed that the sex had messed up his hair; he reshaped it until it reminded him again of his old Halloween costume. Slick. Cool. Confident. It looks good, he thought. Looks like the time I lost my virginity, with that girl--what was her name? She was so cute and innocent. Wasn’t as wild as I’d hoped. Kind of boring, actually. Sort of. I was nervous. Eager to please. Both of us were. Timid, hesitant. But passionate--in a quiet way. Really turned-on. The noises she made! Squeaking, squealing, like a little doll you squeeze and it lets out air. I was careful not to hurt her.

He sighed and was sad a moment. The train stopped and he went up the escalator to the surface. On seeing all the made-up girls with their boyfriends feeling their asses he thought Yeah, *this* is what I’m *talkin’* about! Look at all these sexpots just itching for it. He walked to the club where he was meeting his friends. Hip-hop music was blaring behind the neon lights. He looked through the windows at the dance floor, where people squirmed and grinded against each other, barely able to move from the crush of bodies. He could almost smell the sweat. And he knew he’d be tasting it soon, along with shots of vodka. Smiling broadly he thought *I’m home again*, and strode with a swagger into the pumping chaos.

Part of me agrees with Goethe that an artist shouldn’t assist in the interpretation of his work. The reader will be less impelled to probe the themes of a work if the artist has already told him what (he thinks?) they are. Thus, the reader may, paradoxically, get less out of the work than he would have otherwise. But this is unsettling. It means that the profundity of art—its ability to make us think—is based primarily on ignorance of the creator’s intentions. We have an ingrained assumption that art isn’t completely separate from the artist, but the only reason that it really means anything to us is that it *is* separate, in a way. That is, one of the supposed fundamental characteristics of art would vitiate it if the spectator could ever fully appreciate it (the characteristic)—i.e., see it ‘played out’ in a particular instance (by knowing the artist’s intentions, etc.). Therefore, a devastating contradiction is at the very center of a work of art. The latter’s

fulfillment—viz., a ‘spectator’s’ complete knowledge of how it relates to the artist¹—is at the same time its (partial) negation, in that it thereby ceases to be thought-provoking.

Maybe that’s wrong. Even if we knew what, say, Marquez’s intentions were in his story “A Very Old Man with Enormous Wings”—even if he told them to us and assured us that he had had no other intentions besides those—we could still try to glean more themes from the work. But the point is, would we have a *reason* to? Not really, because there’d be no reason to expect that there would *be* any more. The work wouldn’t exist if the artist hadn’t created it, so why should we look for meanings other than those intended by the artist? It’s his baby, not ours (despite what postmodernist literary theorists—rebels without a cause—would have you believe). If a machine randomly created a piece of writing, would we labor to discover its “meaning”? Would we have any reason to? No. We think an artwork has (a) meaning only because it was created by a being that can create meaning; therefore, in looking for meaning, we’re tacitly looking for the *artist’s* meaning, the meaning intended by the being who gave the work meaning (or, less ambiguously, whose (past) existence (i.e., whose authorship) alone justifies our conviction that the work has (a) meaning—which suggests, strongly, that the meaning we’re looking for is in fact the one intended by the artist (because, again, his having created it is the only reason we think it has a meaning)).

Nevertheless, we should, of course, continue to analyze art as we always have, paying scant attention to the artist’s subjectivity, because this method allows us to get the most out of it. It may be an ‘illusion’, but so is everything that makes life worth living and gives humans dignity.

Sunday, July 31

This was my last day at the restaurant. The goodbyes were unsatisfying. Short and abrupt. A trifle awkward. Not that I’d expected anything else.

Tuesday, August 2

I’m bothered by the randomness of the literary references in my satire. A few are thematically justified—the Ecclesiastes ones, the Jeremiah, the Donne, the *Timon of Athens*, the Keats, the Koran, the Ovid, the Gospels—but even these are essentially random. There’s no method behind my choices; I just take what seems appropriate, as sort of a nod to my betters. What’s the point? Why don’t I just make the whole thing my own? What has the inclusion of literary allusions to do with the purposes of the satire? Justifications can be thought of, but they’re contrived. What it comes down to is that the display of erudition is self-indulgent and pretentious—though it also enriches the work.

Wednesday, August 3

Another chapter of my life is over. Another chapter that has meant little to me. Tomorrow I’ll leave D.C.

Sunday, August 7

Truly, it’s fun to be alive. It’s amazingly enjoyable! Just to have a future stretched before you—

¹ I call this a ‘fulfillment’ because, by looking to the artist for the meaning of the work (which we invariably and inevitably do), we presuppose that the artist’s subjectivity is itself essential to the work. (You’ll object that we don’t “invariably and inevitably” etc., but you’re an ass. Unconsciously, intuitively, irresistibly we look to the artist for an explanation of his work—even if we (like Barthes) pretend not to.)

and to read, or write, or talk—and to think—and just to *exist*. Existence itself is somehow satisfying.

We're in New Hampshire, in a cottage on a lake somewhere in the mountains. It's surprisingly fun so far.

Thursday, August 11

I've been trying to write poetry lately. It isn't quite as bad as the 'poetry' I used to write in college, but I don't think it's very good. Why not? Why is it impossible for me to write poetry? I'm pretty good at prose, but I feel a 'block' when I try to poeticize. (Less so in the 'free verse' style, which is really just prose written in short lines.) I won't give up yet, if only because I want to be *certain* I have nothing to contribute to the medium. (In general, I'm bothered less by the knowledge that I lack a given talent than by the belief that I have it but am wasting it.)

Examples of my "poetry":

New Hampshire

alone in the night
 on the rock beside the black glass lake rippled by loons
 two hours ago,
 disturbed by a plash and a plash, and a cricket over there,
 and the purple-yellow moon-smudge double-image sinking
 towards an unattainable convergence in the black of the curve of the hills,
 and the sandbar-island fading into the thick flat gray of the night
 (tree-like shadows jutting up to an interruption of the sky),
 the thickening gray of the night presided over by a few transient stars
 stilly,
 and the shore's dirt-sand coolly damp on the rough sensitive skin of the
 sole
 of the foot,
 lit up gloamingly by a lantern in the cottage,
 as the dirty peeling paper of the birch trees behind me falls
 without noise
 into the green carpet of vinca vines
 beside the sturdy, stoic gray white trunk...

above the imagined lake shine stars unhindered by the moon;
 the lantern has gone out,
 all that remains is the still sand and the single splash and the descending black
 and the blanket of nature's nocturne...

999

the Prelude to
 a minor sadness
 guitar-strummed Bachishly
 in my wraith-like, waif-like soul
 that shudders on the major third
 after minutes of minor sadness

and thinks of the virgin's quiver in her
 expectant naked lover's silent arms,
 the soundlessness of Venice at dawn,
 the flap of the butterfly's wing,
 the dying gasp of Jesus,
 the sweet surcease of strife
 and we are at one
 in the forlorn
 999

time
 grimly
 pressing on,
 on, on, on, on,
 mowing down our love
 of love and life and self,
 impersonal, disdainful,
 proud, yet life-uncomprehending,
 lonesome in its omnipotency,
 pitiful in its self-destructive zeal
 fueled by self-hate, rancor, envy
 of unmechanical beings
 who have knowledge of *passion*—
 a lingering moment
 whose memory is
 forever and
 overcomes
 deathly
 time

birth
 of love
 turmoiling
 in a death-heart
 bled dry of wet hope
 and tears and all feeling
 pleasure-killed by brutal life
 a universal murderer
 is a violent shocking redemption
 that dissolves the calluses on my soul
 painfully in a deluge of tears
 wetting the face of love's midwife
 holding my new newborn heart
 in her caressing hands
 caressing new life
 from old stale death
 which has died

in re-
birth

The Fall

I rise from dreams in a grog-haze,
 Stumbling from my feet to the ground
 And to my feet again, and to the ground,
 The shadows playing on the sun-brown dirt—
 Rise and swirl, disappear, reappear, whirled world.
 Sit, not stand, on the sun-blached knoll
 Atop the sunny hill
 Above the low ant-civilization below,
 For if I fall I shall fall *there*.
 Sit, not stand; my dreams have left me reeling,
 Feeling for unreal feelings, groping
 In the dark effluence of memories,
 Alone in shadows under the singing thrushes,
 Pasty-faced at break of day.
 I listen swimmingly to the singing thrushes,
 Swaying motionlessly to their song,
 But dare not raise my eyes for vertigo.
 Am drunk from the night's orgies,
 From naked nature-solitude and midnight
 Moon-singing; I cannot face the sun,
 Nor soberness, nor the drying-up of feeling—
 Nor the low ant-civilization below.
 The languor of the senses is not that of the mind.
 In yellow puddles my claret mind imbibes
 Itself (the self-intoxication of the night),
 In dusk-yellow puddles made shallow in me.
 Dissipant haze around me, sun-dispelled,
 Tasting of autumn, damp leaf-decay,
 Strong wet soil, gray dawns gone.
 Waving shadows tossed in the wind;
 Hanging willows blown in the wind;
 Dandelion down dead in the wind,
 Whispering passively past my ears.
 Whispering...
 Rise to my feet, stand on the hill's edge,
 Looking down, balancing—trying—
 Beaten by sunbeams, drawn to singing,
 Pulled by the cacophony of the real below,
 Tumbling in whirling confusion,
 And I fall...
 And I fall.

Unfulfilled love

I trace my finger along the curve of your back,
 the cruel curve of your back,
 wracked with the longing to *be* the curve of your back,
 to fill with love love's lack.

I kiss your wet, fresh, shower-scented hair,
 your streaming, maddening hair,
 my lips longing to be *one* with your hair—
 but cruel life doesn't care.

the night hour—
 the hour of searing tears
 and soothing despair

music reminds me
 "At least I have suffering!"
 and *amor fati*

whispers come floating
 from fluid sleep-consciousness
 to a drifting me

the sunset's sunburn
 soothes itself with its frozen
 splash of soft colors

worm-devoured corpse,
 eye-sockets mud-encrusted,
 dew on the nose-tip

glistening green fangs
 spread apart, piercing the fly,
 dissolving it

pink petals

of the plucked blossom
 drift to the ground—
 silently

There once was a leader named Bush,
 Whose brain had less sense than his tush;
 He was elected twice
 As we all cried, “Christ!”—
 But Christians told us to shush.

The not-so-noble lie

“America is a democracy!”
 —So says our aristocracy;
 But I disagree:
 It seems to me
 That our country’s a ‘corporate theocracy’.

Or perhaps it’s an ochlocracy;
 It sure ain’t a meritocracy,
 With Bush at the top
 And power with the GOP.
 Actually, I’d prefer a ‘gynocracy’.

“Revolutions now and then,”
 Said Thomas Jefferson,
 “Are desirable:
 For a hierarchy
 To become entrenched is a sin!”

A social ill

The disease of the ‘academic’
 Has become, by now, systemic:
 An *irrelevance*
 That’s proud of its
 Status as an epidemic.

Actually, as *teachers*
 I do respect these creatures;
 As *thinkers*, though,
 They’re very low—
 They seem to me like leeches.

I had a strange dream last night:
 The world was engulfed in white light,
 And we were made deaf
 By a thundering laugh—
 “You people are not very bright!”

I once knew a man from Hong Kong
 Whose schlong was not very long;
 Still, women loved him
 Because he rubbed them
 In ways that were downright *wrong*.

Of every man—to be honest—
 I’m by far the most Don Juanest;
 Were ’t not for my shyness
 (A barrier to vaginas),
 Women would find me the funnest.

Said to me once a joker,
 “With a woman, first you must *stoke* her
 (Unless I’m a liar,
 A woman’s a fire);
 Only *then* will she let you poke her.”

Yes, women are vain and fickle;
 Yes, their psyche is quite a pickle;—
 But I love them regardless,
 As much for the sex
 As for their adorable giggle!

A shameless trivialization of great music

I’m fond of passing judgment
 (As should be by now apparent),
 And so I will
 Apply my skill
 To a critique of music’s parents.—

I'll start with Bach—the dude
 Who mastered the art of fugue:
 His polyphony
 Kicks homophony's
 Ass (not to be rude).

Vivaldi is much too simplistic—
 Aside from th' ingenious “Four Seasons”,
 A piece that sings ‘Italy!
 Italy!’ —So prettily!
 Not to listen is masochistic.

Schubert: of melodists,
 He may have been the greatest.
 (In this respect,
 He's among the select
 Of all the classicists.)

While I prefer Mozart to Haydn,
 In that he was more of a fightin'
 Man (—was against
 Trite conventions),
 Haydn was still a Titan.

As for the romantic Schumann,
 (Whom Nietzsche considered a woman),
 His tunes sound like *chopping*
 Compared to Chopin—
 But listen to Op. 92, man!

I've reservations 'bout Brahms:
 His music is made of bronze;
 Heavy, metallic,
 And far too phallic;
 And yet, it has its charms.

I'll 'pass' on Debussy:
 His music is none too 'juicy';
 In “La Mer”,
 There's nothing there!
 (I'm rather choosy, you see.)

[Deleted one on Wagner]

But Georg Handel...ahhh!
 I love (most of) the “Messiah”!
 And the Arriving
 Of Sheba's Queen:—
 That music screams *Hallelujah!*

I'm in love with Amadeus:

His music is my Deus;
 It fills with mirth
 Even stones and earth,
 Like that of Orpheus.

Rossini's a vulgarized Mozart—
 The masses were fond of his art;
 And yet, I admit,
 When I listen to it
 A *race* takes place in my heart.

Dvořák can be *sublime*—
 Though rarely; most of the time
 He's not. But still...
 I *adore* "Měsíčku
 Na nebi hlubockém".

And what about Franz Liszt?
 —I think too *virtuosic*;
 But I like "Les Préludes"
 Better than the Études
 (*Ausser* the Paganini Variations).

I can't forget Chopin!
 —Of whom I'm the greatest fan:
 Ballades, Scherzi,
 Nocturnes, Concerti...
Everything is a gem!

From the country of the Russky,
 None compares with Tchaikovsky—
 Not Rachmaninov,
 Not Prokofiev,
 And certainly not Mussorgsky!

I haven't heard much Verdi,
 But what I have, is worthy:
 Vibrant, virile,
 Vivid, vital;
 I'm moved to tears by *Aida*.

I know even less Puccini,
 But what I've heard is *dreamy*:
 Arias of
 Pining love;
 Thus, "Nessun Dorma" (e.g.).

The 'tonal' tradition's demise
 Occurred with Schoenberg's rise;
 The twelve-tone scale
 Was the coffin's nail.

—That music gives me hives.

I've saved the best for last:
 Ludwig! —Hear the brass
 Band's fanfare!
 Hark!—waving banners!
 That man was simply the Master.

Monday, August 15

I'm at the university. It's wonderful to be back in this setting. This liberal arts setting. Where I'm *free*. I've been running away from myself these past two years. This is where I belong. --And I'm friendlier in a university environment than outside it (though I'm friendly there too). Around young, intelligent people who are here for the common purpose of being educated. In short, "I'm home again!" --Or rather, 'for the first time' (seeing as, when I was in college, I didn't *know* that was my home¹).

I can tell I've matured since I left Wesleyan. This whole situation feels infinitely more comfortable and 'easygoing' than it used to. (My increased muscle mass has something to do with this. Vanity, thy name is *homo sapiens*!)

Thursday, August 18

Spent the day preparing for the online telecourse on art I'm teaching. --It's bizarre that I'm a college teacher. What's the world coming to?! Someone as not-strict, as *goofy* as I teaching a course?? No! The System is flawed when it allows that to happen. But it's going to be fun impostoring as an authority-figure.

People go through years of training to be professors, but they hire people with no training whatever to teach their courses. In other words, the trained ones don't teach, while the untrained ones do. That's fucked up.

Late in life I won't give a damn about my theoretic contributions. I'll care only that I temporarily improved Jae-eun's life, and Sofia's, and had an impact on Sangeetha and others. Truly, that's all that matters. Philosophy? A diversion. Even art is preferable: it makes life bearable.

The only thing that matters in life is confidence. If you're not self-confident your life will be hard; if you are, people will like or least respect you. It's a goddamned idiot's world.

Friday, August 19

My unproductiveness has its origin in the agnosticism of my society. I can't read anything anymore without yawning. Nothing has meaning—nothing has the *weight* to have meaning.

I spend a lot of time staring at the wall.

If I make it to the end, the achievement of which I'll be proudest is having made it to the end. And my greatest claim to fame, for better or worse, will be my journal—because it's the journal of a disease. The most complete self-diagnosis of a disease *ever*.

What is there left to do?? What is there left to feel?? What is there left to hope for?? This malaise,

¹ Youth is wasted on the young.

this malaise! Love is a cliché, inspiration is dead, social reform defeats itself. Civilization has defeated itself.

Saturday, August 20

I just read about the debate (in the 1980s) over Richard Serra's sculpture *Tilted Arc*, the 120-foot-long, 12-foot-high slab of rusted steel that reached across a popular plaza in Manhattan, partially obstructing the entrance to the federal building next to it and completely wrecking the public's enjoyment of the plaza. *Tilted Arc* was eventually destroyed, thank God. What an (ob)noxious creation it was! And what a pretentious cretin Serra was! This notion that if something, no matter how puerile or ugly or simplistic, can be given a profound-sounding justification ("I am interested in creating a behavioral space in which the viewer interacts with the sculpture in its context... The arc divides space against itself... We can learn more about ourselves, about the nature of our social relations, and about the nature of the spaces we inhabit and depend upon by keeping *Tilted Arc*...") it has the dignity of great art is symptomatic of our cultural decline. Minimalism is how 'equality' and nihilism manifest themselves in art. Something like *Tilted Arc* requires no talent and only a nominal amount of creativity.

Sunday, August 21

I could read *Don Juan* for hours—days—weeks—months. Its sentiments are so in tune with mine—its Ecclesiastical sentiments—and its style—that its genius is but a secondary reason for my infatuation. But what genius! It's a poem unlike any in the English language—any in *any* language—surpassing even Pope's *Dunciad*. Yes, its power is a negative one, unlike Shelley's or Keats's, but I don't consider that a point against it. It's still as timely as it was when written, and it'll *always* be timely, because life, after all, *is* nothingness. And yet beneath the sophisticated cynicism is a heart-rending despair, and an idealism, and a passion for life, and a yearning for salvation.

Monday, August 22

Reading (a condensed version of) Gibbon's history of Rome.

...Couldn't believe my eyes when I read this: after the murder of Pertinax by the Praetorian Guards, they held a public auction, where Julian bought the empire for two hundred pounds. I'm not exaggerating. He acceded to the throne solely because his bid—of *two hundred pounds*—was the highest. (Three months later, of course, he was murdered.)

Tuesday, August 23

Session with a therapist.

The good person who goes astray from being tired of his goodness. The good person who wants to be bad, so he can go back to being good with a good conscience.

The romantic desire to be bad enough to need redemption—and yet to have the capacity for it (to have a fundamental goodness). Byron. Wanting to be God and Satan—*everything*. Wanting to create the world, its evil and its good. (Extreme narcissism.) But not very self-conscious in him: 'I'm deep and complicated; I'm admirable because I'm bad yet *yearn* to be good.' In me: 'I'm deep and complicated; I'm admirable because I'm good yet want to be—and have the ability to be—bad, so that I can (have the need to) reaffirm my basic goodness through redemption and thus be *transcendentally* good.' Divine narcissism.

—Two motives: to be complex and to reaffirm primitive goodness.

—Wanting to sound existentialist and obscure. Sartre in *Baudelaire*. (Sartre *everywhere*.)

Gibbon: writing = the foundation of civilization, culture.

The conflict b/w wanting to be great and wanting to have fun; wanting to write/create and wanting to live. The first is morbid (from death), the second life-affirming. —The ordinary man as the lover of life? No, usually not. As automaton;—but for the ‘great man’ (a certain kind) life isn’t enough: he devalues it. Cares more about death (immortality). The machine vs. the denier: what’s worse?

Thursday, August 25

Most of what I wrote for my book will have to be taken out of it. It’s too similar to what Nietzsche did, and it’s juvenile and vain (and repetitive). But I don’t want it to be lost forever, so here are a few selections, ordered randomly:

The dialectic of the ‘thinker’.-- This dialectic has three stages.¹ The first is the most common and natural: it consists in the pursuit of objective, ‘eternal’ truth. A reality is assumed to exist independently of one’s interpretations; the task of the thinker is to reproduce it in language, to provide a logical ‘picture’ of it in propositions. This is possible because (to borrow from the *Tractatus Logico-Philosophicus*) propositions--those that have ‘sense’--are supposed to have the same logical structure as the world.² This first dialectical stage conforms to common sense, but it is based on errors, or at least unquestioned assumptions: (1) that the truth or falsity of a proposition is determined by its correspondence or lack thereof to an objective reality;³ (2) the law of the excluded middle (that every proposition is either true or false);⁴ (3) (*in most cases*) that, because certain propositions relate to a metaphysical world (i.e., a world not accessible to empirical observation), such a world exists.

The second phase is a reaction against the first. It is the phase of skepticism. It has several manifestations: it may reject the idea that truth is ‘fixed’ and eternal; it may deny that humans can know truth; it may assert that truth exists but that it is relative to individuals or to cultures; it may ‘deconstruct’ the notion of truth itself, declaring that it is senseless or based on ‘binary oppositions’ that are culturally fabricated. Such thinkers as Aenesidemus, Carneades, Sextus Empiricus, and--in more modern times--Derrida, Foucault, and their fellow poststructuralists/postmodernists have been skeptics.⁵ One of the unifying features of their positions is that they are self-contradictory. For example, the Pyrrhonian skeptic believes that judgment ought to be suspended on all questions (because, e.g., everything is relative to one’s subjective nature and the concepts one employs in judging) even as he makes the judgment that everything is relative to one’s nature and the concepts

¹ What follows is, of course, merely an approximate characterization, a somewhat artificial schema that bears little relation to historical chronology. [I now (a year later) understand how inadequate this section is.]

² While this idea is not always made explicit, it is a presupposition. Thinkers describe states of affairs (or ‘facts’) by relating concepts to one another in ways that are supposed to reproduce the relations inherent in the states of affairs--which is possible only if the theoretical edifice has essentially the same structure (whatever that word is taken to mean) as the ‘real’ one. See the next section for a discussion of ‘concept’.

³ Even Kant and Hegel presuppose this notion. In fact, every thinker does. I’ll explain why later.

⁴ The reason why this law is presupposed is that if reality has the same structure as propositions, it must either contradict or agree with them.

⁵ No doubt the latter would contest that claim, but essentially it is true. Poststructuralists/postmodernists use different arguments (or, in some cases, the same arguments, but with more modern language) than their ancient forebears did, but their outlooks on the world have much in common with those of ancient skeptics. Richard Rorty, for example, thinks that “there is nothing beyond vocabularies which serves as a criterion of choice between them” (Rorty, 1989:80). In other words, there is no reality outside discourse. Now, if that isn’t skepticism (relativism, nihilism), I don’t know what is.

one uses. Put differently, he thinks it is true that one cannot know truths.¹ Similarly, in the act of proposing the idea that every perception of reality is determined, at least in part, by the discourses or languages one happens to be formed by, the postmodern philosopher is positing that this particular perception of reality is an exception. Otherwise there would be no reason for him to believe it. Why should he believe in the truth of an idea that only expresses some arbitrary discourse or culture? ‘It is a fixed truth that there are no fixed truths.’ That is his position, in a nutshell.² In deconstructing truth(s), this philosopher is constructing new ones--which, as such, have the form of eternity³ and thus contradict his determination not to believe in eternal truths.

The third stage involves the recognition that the skeptic’s ideas are not as radically different from those of the ‘dogmatist’ (for want of a better term) as he believes. Both consist of fixed truths. In this stage, the philosopher will appreciate the irony--the *absurdity*--inherent in the situation of any thinker: the nature of language and cognition compels him to have beliefs and act in ways that he may want to oppose. He may believe that the idea of truth is meaningless, but in expressing his belief he is describing a truth. He may even supplement his position by saying that the idea that truth is meaningless is itself meaningless (because it is expressed as a truth)--but then *that* statement becomes a truth. And so on, ad infinitum. He has no way out. He is *forced* to believe in the existence of truth. Similarly, if he believes that truth does not consist in correspondence with reality, or that values are meaningless, or that the self does not exist, he cannot act on his belief (as I’ll explain later).⁴ He may think that there is no metaphysical reality--but this is a metaphysical statement, in that no empirical observation can be relevant to it; therefore it is self-contradictory. In short, he understands and accepts that his skeptical ideas refer to themselves;--and he accepts that (if the history of philosophy has shown *anything*, it is that) in many contexts it is impossible to be certain if/when one has achieved ‘knowledge’;--and he accepts that doubt is inevitable--and that he believes what he doesn’t and he doesn’t believe what he does--and that his goal of understanding truth is probably unrealizable. And yet in spite of all this he will continue to philosophize--but for a different reason than philosophers did in the past. All the absurdities that plague the activity of thinking will finally convince him that it’s a *comedy*--that *life* is a comedy--that humans are trapped in the space between truth and ignorance, reason and unreason--that the most appropriate reaction to all this is *laughter*--that *laughter* is the most sensible mode of existence--and that, far from worshiping this trickster called ‘truth’, his best policy is simply to pursue self-ennobling self-expressions. Why? Because that’s all that’s left for him. And because that’s what his theorizing ultimately was anyway. And because his intuition tells him that such self-expression functions as an end in itself (in that it ‘affirms’ him and gives his life ‘meaning’). And because it’s the only way he can, at least on one level, prevent himself from continuing to be tricked by language and life. In other words, the only way for him to accomplish his goal of understanding truth is to *live* it. Many truths are opposed to life, but this one, the most fundamental, *is* life.

Certain thinkers have foreshadowed the third stage of the dialectic. Hegel was the first: the revolution he inaugurated in philosophy consisted in his recognition that thinking is self-expression, that every system of thought is an expression of a culture and of the individuals who believe in it (the system). Marx, Kierkegaard, Nietzsche, and various poststructuralists incorporated Hegel’s insight. All of them, however (with a couple of exceptions)--including Hegel--failed to take the

¹ Various philosophers have tried to salvage the skeptic’s position by claiming that he rejects only realist truth (truth that relates to a real, objective world), rather than truth based on anti-realist theories like coherentism, pragmatism, etc. This defense is sophistical, as I’ll argue later.

² No artificial, ad hoc Russellian invention can provide a way out of this “paradox of self-reference”. To postulate a “hierarchy of languages” is futile, because in natural languages there is no such hierarchy.

³ See the next section, in which I argue that truth is necessarily ‘fixed’.

⁴ That’s true of the last two examples for different reasons than it’s true of the first: in their case it has nothing to do with the problem of self-reference. But they’re relevant because they illustrate the paradoxes into which the thinker is forced by language and the nature of human life.

idea to its logical conclusion: they took their ideas ‘seriously’, as if they were products of pure reason, forgetting that they were primarily effects of psychological, social, and biological forces--and thus these thinkers remained partial prisoners of more primitive ways of thinking and succumbed to self-contradictions. The only two who carried Hegel’s idea to its conclusion were Nietzsche and Kierkegaard. Even Nietzsche, however, occasionally forgot Hegel’s lesson (which he had independently rediscovered and taken in a different direction); Kierkegaard made the opposite mistake when he insisted that ‘objective thinking’ by its nature *lied*, that language could never be more than an ‘approximation’, that only *subjectivity* could be absolutely true (because it does not describe anything; it simply *is*). Contrary to Kierkegaard, the ‘thinker of the future’ will understand that in some contexts objective descriptions are true and can be *seen* as such, but that in many, doubt will remain.

There is both a factual and a normative dimension to our resolution of the dialectic. We have analyzed the factual; the normative is equally important.-- Knowledge is worth seeking not for its own sake nor for the sake of its utility, but solely for the sake of affirming one’s humanity. This insight has been appreciated all too rarely in the past. As soon as the pursuit of truth becomes spiritually deadening, a different activity should be chosen. If one finds oneself growing *stunted* from too much analytical philosophizing, one should take a break from it. If one has a guilty conscience from probing too long and too deeply into nature, one should seek relief in superficiality. There is nothing intrinsically valuable about truth; to seek it at all costs is both misguided and dangerous.

--The thinker of the future will be both philosophically and ‘humanely’ advanced over his predecessors.

Outline of a theory of language.-- What is a word? What is a concept? What is a sentence? These three questions will guide the following discussion.

Ferdinand de Saussure’s investigation into the nature of a linguistic sign is a good starting-point. He defines morphemes, words, and sentences as signs, and he divides the notion of a ‘sign’ into two constituents: the signifier and the signified. The former can be called the “sign vehicle” (Hanks, 1996), or the physical manifestation of the sign: it is the “sound-image” which, in itself, has no meaning, but acquires meaning by being associated with a concept, i.e., a signified. By “sound-image” Saussure does not mean “the material sound [or the written representation],¹ a purely physical thing, but [rather] the psychological imprint of the sound, the impression that it makes on our senses” (Saussure, 66). This is, unfortunately, a bad way of expressing his idea. What is the psychological imprint supposed to be? One’s awareness of the signifier? What are the characteristics of this imprint? Is it some kind of an intuition? Moreover, how can such an imprint be a signifier? Does Saussure mean that the experience of recognizing the “physical thing” is *itself* the signifier? No. Clearly he means that the physical thing itself is the signifier, but only by virtue of its relation to consciousness. Before it enters into this relation it is merely a series of vibrations passing through air; it can be a potential bearer of significance only if consciousness is aware of it (and can thus associate it with a concept). --The difference between the sound itself and the sound-image is admittedly subtle. They are both meaningless. However, inasmuch as the sound-image (viz., the sound as consciousness experiences it) has the potential to become part of a sign, unlike the ‘sound-in-itself’, it can be meaningful. Of course, as the signifier *in itself*--i.e., as abstracted, conceptually, from the signified--the sound-image remains meaningless, but in the concrete reality in which consciousness experiences it, it is part of an ‘immediate’ synthesis between itself and a concept and is thereby interpreted by consciousness as having meaning. --The objection may be

¹ Saussure seems to privilege the spoken variant of the signifier over the written, virtually to the point of ignoring the latter. I, however, will understand ‘sound-image’ to refer to both the acoustic and the written signifiers. Nevertheless, for the sake of brevity I will generally discuss only the acoustic version.

raised that this ‘revision’¹ of Saussure’s position implies that when a person thinks a sentence without saying it, he is not thinking a sentence, because (as I have defined them) no signifiers/signs are coming into play. The answer to this criticism is that the ‘internal images’, the ‘conscious residues’ of the signifiers, which pass through the mind of the thinker, themselves function as signifiers.² This is intuitively obvious and need hardly be argued for. The residues can be called ‘derivative signifiers’.³

The sign is a union of the signifier and the signified. The latter is the concept to which the former has been psychologically attached. It is not the *reference* of the concept (if the concept indeed has a reference; see below). But what does ‘union’ mean in this context? According to William B. McGregor, the linguistic sign is composed of a “structural link”, an “indissoluble link”, between the concept and the sound-image (McGregor, 1997). While this does not *define* the union, it at least *describes* it. The union is so close that when a signifier is spoken, it instantly conjures the associated concept. For example, I find it impossible to separate the sound ‘tree’ from the concept ‘tree’: as soon as I utter the word--even if I make an effort to ignore the concept and concentrate only on the sound(-image)--I am aware of some kind of a conceptual overtone. The link is effectively indissoluble: to dissolve it is beyond my power. (Clearly the reason is grounded in biology: neural mechanisms ‘fix’ the two components together.) On the other hand, in the case of this particular word the indissolubility operates in only one direction: I can think the concept ‘tree’ without uttering or imagining the sound-image, simply by ‘intuiting’ the idea of a tree. Likewise with ‘table’, ‘grass’, ‘paper’, and many other nouns. Somehow I can make myself aware of the concept without at the same time being aware of the word.

I cannot proceed with this discussion, however, until I have clarified a few things. While the foregoing usage of the word ‘concept’ may be consistent with the way it is commonly used, I shall revise it. [...]

My method.-- No doubt you think that my use of the aphoristic style is naked apery of Nietzsche--that, being a mere boy of 24, I’m letting my adolescent enthusiasm for (one of) my idol(s) unhinge my reason, which should tell me that I’m effectively plagiarizing him. As my defense, I won’t dwell on the fact that a literary style’s use in the past is not an argument against its use in the present. Rather, I’ll point out that this is the style most appropriate to extreme philosophical skepticism--and therefore that for me *not* to use it would be both an artistic and a philosophical blunder. I freely admit that I’m unsure of my beliefs. My life consists of intellectual levitation. I have absorbed the trends of my culture and hover between conflicting world-views. I recognize the truth in every philosophy from Marxism to psychoanalysis, from Hegelianism to poststructuralism; I recognize the value of every ethical position from Christian morality to nihilism; I have sympathies for every political doctrine from democracy to benevolent despotism. I cheer the march of science even as I fear it. I support globalization even as it horrifies me. I am a mess of contradictions. --Under these circumstances, you can hardly blame me for rejecting the academic tradition of patient scholarly rumination and submersion of oneself in texts. Doing that would get me nowhere.

In an intellectual climate as uncertain of itself as ours is, disjointed reflections such as these are a representation of content in form. Any argument that any thinker proposes nowadays (outside of the natural sciences) is open to attacks from a hundred fronts; if it is not demolished, it is ignored. All other theorists will continue going about their business, writing articles and books that have no effect on anything. Including--in most cases--the pursuit of truth. So I’m following a different tack. I’m working out my ideas atomistically, proceeding through the disciplines randomly, in the hope

¹ It really is not a revision.

² The vagueness of ‘internal images’ is not a flaw in that argument: the objection has already presupposed their existence, and therefore to answer it I need not define them.

³ In a moment I’ll inquire into the nature of such ‘images’ in consciousness.

that by the end I'll have made some slight contribution to pointing the way towards a single coherent *Weltanschauung* (which will, in fact, have to be a combination of many). This method seems to have the potential to be more fertile than the academic one.

A self-contradictory thought.-- The act of thinking posits control over itself. Even the act of thinking that the act of thinking does not control itself posits control over itself.

A phoenix out of the ashes.-- This thinker's intellect is in a ferment; this *society's* intellect is in a ferment as well. But there is a difference: the second is the ferment of decline, the first that of ascent.

We must not let 'humanism' die.-- That the questions I'm asking may already have been well-answered is not a reason for me not to ask them. As humanists, we must never cease independent thinking, no matter how much science has explained or how superfluous such thinking seems. Insofar as it cultivates the self, it is valuable. Insofar as it prevents the self's dehumanization in this alienated age, it is necessary.

The goal is the journey.-- The purpose of asking questions is not to find answers. The purpose is to ask questions.

Don't "love life for its own sake".-- Every great achievement has its origin in a lack of love for mere *life*.

Incoherently coherent.-- Richard Rorty is, if nothing else, consistent: if everything is merely a "vocabulary," and if vocabularies as such as not *true*, then it's pointless for Rorty to try to advance a defensible philosophy. Hence, he doesn't.

Apologies for a lack of will.-- People who deny the possibility of, or the need for, a global theoretic perspective--a perspective that understands the world as a totality and attempts to reproduce the outlines of this totality in thought--forget that their position is a reflection of them. It says something about them. "What does it say?" It says they have no intellectual ambition.

Weaklings.-- Postmodernists operate under the ridiculous delusion that they are continuing in Nietzsche's footsteps. They think Nietzsche was a relativist! They think he would have approved of them! The truth is, he would have contemptuously repudiated the likes of Derrida and Rorty, for not having a will to truth. (Even if their ideas are true--which is inconceivable--their lack of ambition would have damned them in Nietzsche's eyes. He cared less about knowing truth than actualizing will.)

A prerequisite for aesthetic appreciation.-- Why do most people not like classical music? I've never understood it. Often I've tried to imagine being another person just to imagine myself not liking Chopin. People say it's because such music is "boring", or because it "doesn't have words", or

because it's "too quiet". But this is precisely what I don't understand. Much of it, I admit, is indeed boring and ponderous--Wagner comes to mind, and some Strauss, and some Brahms--but how can such pieces as Tchaikovsky's first piano concerto not thrill the listener, or such pieces as Chopin's Nocturne in D-flat major (op. 27, no. 2) not transport him to a realm of aristocratic delicacy of feeling, or such pieces as the first movement of Beethoven's seventh symphony not make him want to dance and jump around the room? I suppose the answer is partly that, in *any* kind of music, you must first become 'acclimated' to it through repeated contact before you know how to interpret it--before you're 'open' enough to it to allow it to govern the way you feel while listening. You have to have assimilated it. This is why I truly enjoy a piece of music only after I've heard it at least twice. I have to 'orient' myself in it first; I have to have a vague idea of what's coming next, and where it's headed. During the first exposure I always feel 'guarded' against it, as if I'm challenging it to impress me. "Do your best!" my subconscious says. "I'll find flaws! I'll find passages that feel forced." Only after it has convinced the skeptic inside me can I let down my defenses. Then, even the passages that I thought initially were 'forced' (or 'awkward') feel more and more natural, until finally the whole piece takes on an air of necessity. The changing of a single note would damage it. --The appreciation of *styles* of music operates by much the same principle. Currently I have a deep aversion to most traditional Asian music, but if I listened to it day after day for months I'd probably learn to enjoy it.¹

Too sophisticated.-- I suspect that a certain degree of intelligence in the listener is essential if he is to enjoy classical music. Because it generally lacks the simplistic lyrics of pop music--*any* lyrics, in fact--the use of one's imagination takes on a central role in the act of listening. One must be susceptible of subtle emotions and subtle stimuli; one must have an attention span that most people lack. The *complexity* of such music heightens the necessity of intelligence. To follow diverse threads and motifs through a long piece is not easy. Thus, one reason classical music is associated with elitism is that elitists typically have the mental capacity to appreciate it.

No joy without sorrow.-- The heights appear as such only when we look at them from the depths. To test the truth of that hypothesis, I suggest you listen to pop music (in the 'Britney Spears' sense) for a few minutes; then listen to Franz Liszt's piece *Les Préludes*. If you have a poetic soul, the sudden change from ingesting dirt to imbibing a vintage wine will intoxicate you. Your appetite for life will grow tremendously. You may not be able to contain your enthusiasm; your heart will leap to your throat and you'll start shouting senseless noises of jubilation. The finale of Liszt's piece may give you a heart attack: the notes rushing to their climax, pounding on your ears like drums, and then the horns that blare a single note (--that single note which is both a call to battle and a signal of victory!--) as the rest of the orchestra continues its climb to the final triumphant chords... You'll realize that pop music is redeemed by virtue of its function as a reminder of the muck that humans can and must rise above in order to achieve moments of immortality.

The significance of art.-- The overture to *Fidelio* would violate artistic principles in its shamelessly unsubtle glorification of life were such glorification not the most important principle of all.

The pinnacle of wisdom.-- No philosopher has expressed more insight into the nature of life than Beethoven did in the second movement of his last piano sonata.

¹ To be honest, that seems impossible. But it probably isn't.

An effect disproportionate to its cause.-- The pain of loneliness is rarely acute--it's a gentle pressure on the chest that ebbs and flows--yet it causes a longing for death.

A cause disproportionate to its effect.-- The pain of a splinter jammed under a fingernail is excruciating, yet to wish for death as an escape from it would be ludicrous.

Two possible explanations.-- (1) One knows that the pain of the splinter is temporary; one *feels* that the pain of loneliness is permanent. Why? In being less urgent than the other, it allows one's thoughts to roam, to regret, to predict, while in reaction to the stabbing pain of the splinter one feels only an immediate and forceful *rejection*. (2) In spite of the softness of loneliness, it is intense. For it is more a phenomenon of *consciousness* than physical pain is, and as such it has more proximity to the self.¹ As an emotion it floods and drowns one's thoughts in an ocean of sighs.

My gratitude to music.-- Music has allowed me to maintain the illusion that my pain is noble.

My masochism.-- It is precisely in those moments when my pain is at its peak that I think I want never to be contented again.

The loner.-- He who lacks relationships with people manufactures relationships with thoughts.

Unity of opposites.-- A woman nursing her baby feels as if that animal act is the pinnacle of her humanity.

From the outside.-- A being not from our species observing a rock concert would conclude that we are creatures who operate on the level of instinct and have no notion of free will. When *we* watch a community of monkeys scream and go berserk in the excitement of a hunt we think, "How bestial!", forgetting that their excitement is based on utilitarian concerns and is thus rational, while *ours*--in a rock concert--looks equally bestial and is senseless to boot.

From the inside.-- A dog sees its fellow dogs as we see our fellow humans.

Homo sapiens in its natural habitat.-- In communities of apes, the dominant male gets the most sex.

The laughing-stock of the animal kingdom.-- The mating rituals of *homo sapiens* are surely the most bizarre of any species. Have a look inside a nightclub to verify this.

¹ I don't know what "proximity to the self" means.

The human tragedy.-- In trying to raise himself above nature, man has lowered himself beneath it.

God as Shakespeare.-- My love for humanity is not admiration of beauty; it is pity for a tragic hero.

Two instincts: to enforce equality, and to idolize.-- He who aims to rise above the crowd faces opposition from all sides, which, however, has a common source: the universal desire to keep him at one's own level;--not to let him think he is superior. The most extravagant means will be employed to keep at bay his ambitions. But if he perseveres and triumphs, he is revered as a god.

My arguments for and against Nietzsche.-- Pro: he's made it easy for me to be myself. Con: he's made it easy for me to be myself.

A science that isn't.-- That my reflections are not superfluous is a rebuke against the "science" of psychology.

The pitiless sex instinct.-- The vindictiveness of women towards one another, even when not for the sake of a man, originates in their Social Darwinistic competition for a mate.

In praise of folly.-- The more seriously you take yourself, the less seriously you should be taken.

Dare I hope?-- Is it really the case that only an aristocratic society evolving from feudalism to capitalism, throwing off the dead weight of institutionalized religion, reveling in its newly discovered individualism, could have produced classical music? Isn't it possible that in the future we'll be able to do it again? Or is the opportunity gone forever? What's the connection between the social conditions of premodern Europe and its art? Hundreds of fortuitous concurrences were necessary to produce that kind of music, as they are in the case of every social phenomenon. The growth of technology, the development of science, the development of commerce, the duality between sacred and secular traditions, the role of patronage, the use of monophonic and polyphonic musical styles, the adoption of the well-tempered scale, the increasing sophistication of musical notation--all this and much more contributed to the birth of baroque music and its evolution to classical and romantic. So it is indeed likely that only *that* society could have invented such music. But that doesn't mean that the opportunity to compose it is gone! And yet it seems to be: though geniuses on the level of, e.g., Schubert have surely been plentiful in the last hundred years--as they surely were in the eons before the Enlightenment--not one has realized his potential--as none did before the Enlightenment. That suggests that somehow our culture nips Schubertian genius in the bud--that not only does it *discourage* it; it *kills* it. (After all, if it merely discouraged it, a few people would probably have managed to rise above the rest.) --'Somehow'? No; the cause is obvious: in his childhood and adolescence the would-be composer internalizes what he hears--rock 'n' roll, pop, jazz, whatever--to the extent that in the end he can't reproduce music from two centuries ago.

Still, nothing is inevitable. I'll hold onto my irrational hope.

A meaningless word.-- What is forgiveness? What does it mean if someone "forgives" me? "It means he no longer feels resentment towards you for a transgression you committed," you'll say.

You're wrong. His lack of anger (or resentment) is only an *implication* of his forgiveness. The direct meaning of it constitutes a *judgment* of someone. To forgive is to judge that a given person does not deserve to be an object of resentment or anger. But what does *that* mean? Why doesn't he "deserve" it? Because--according to the forgiver--he is not a 'bad' person. His transgression was not a result of some innate evil; rather, there were "extenuating circumstances", or he was subject to a momentary lapse of reason, or he didn't "mean" it (if 'it' was, for example, an insult). But we have already seen that 'bad' is meaningless. Therefore, forgiveness is meaningless. This can be seen more clearly through an example. If I 'forgive' Bill Clinton for not sending troops into Rwanda during the genocide, what have I done? What is different now, after my act of forgiveness? The only difference is that I'm no longer angry at him. The forgiveness *itself*--the judgment--is meaningless; it posits no 'concrete' or 'observable' change in a state of affairs. In other words, the sentence 'I forgive you, Bill' has no obvious content, no content that can be pinpointed or 'clearly grasped', as the meaning of 'I'm not angry at you' can.

Furthermore, what *right* has anyone to forgive another person?--to judge that he's 'not bad'? Such a judgment can come only from a perspective that takes itself as superior to the judged. Whether or not the judge actually *thinks* he is superior, the act of judging a person's worth presupposes that one has the *right* to such a judgment, i.e., that one has immediate and infallible knowledge of what is good and bad--and, moreover, that one is oneself 'good' (because, *in the instant of the act*, without such an assumption the judgment has little force). But these two presuppositions are clearly fallacious.

--In short, forgiveness is nothing but a gesture towards reconciliation. The concept of forgiveness originated because such a gesture is essential to communal living.

God's gravestone.-- 'Here lies One Who had a pathological obsession with possessing absolute power, such that when He lost it He died of a broken heart. C. 900 B.C.E. to c. 1790 C.E.'

A distinction.-- Modesty is dishonesty; humility is enlightenment.

Clothed animals.-- During conversations one should make it a habit to picture one's interlocutor naked. This will make the conversation much more entertaining.

Love and the inequality of the sexes.-- A woman wants to attach herself to a man. A man wants a woman to attach herself to him.

A living God.-- If God were not dead, he would be *death*. An oppressive death.

Remarks overheard in the subway.-- Two men sat down next to me, clearly of the blue-collar class, one of them holding a copy of a newspaper on which was printed a giant, unflattering photograph of Joe Ratzinger (looking fairly aged). The man looked at it. "That the new pope?" "Yup." "He ain't gonna last long." "They keep picking these dudes that ain't gonna last long." Then they talked about basketball. --I realized that, sometimes, the less education one has, the more sensible one is.

A remarkably idiotic idea.-- I'd like to know who first conceived this notion.-- Science and religion are compatible: one is concerned with truth (reason), the other with faith. They have two separate

mental ‘spheres’ which are unrelated, and hence their ideas can be believed at the same time without the believer’s being embroiled in contradictions. It is consistent to believe both that the world was created six thousand years ago and that it was created fifteen billion years ago--that a man named Jesus Christ was once resurrected and that resurrection is impossible--that a woman named Mary gave birth to a child without having had sex first and that sex is necessary for a woman to give birth to a child--that there is a place where we reside after death called “heaven” and that such an idea is senseless. Reason rejects ideas that faith salvages merely by virtue of naming them “objects of faith”. If they’re “objects of faith”...then it’s inconceivable for anything to be wrong with them! By applying the magical phrase “object of faith” to any idea, one can raise it to such a level of intellectual respectability that even to *argue* against it is futile. --Even (so-called) scientists and philosophers subscribe to the belief!

Catholicism’s lack of a fashion sense.-- The awesome power of religion is revealed in the fact that the pope consents to look like a clown in the name of God.

But that’s also a *refutation* of religion. If God existed, he wouldn’t let his representative on Earth deprive himself of dignity.

(Nor would he let a senile, decaying old man represent him. He’d choose someone young, like Jesus.)

Pity the handicapped, don’t mock them.-- Sometimes I feel guilty making fun of conservative Christians. Wouldn’t you? Wouldn’t you feel guilty (eventually) if, for example, you repeatedly pushed a young child who was learning how to walk, so that he kept falling down and getting up and falling down again? Or if you ridiculed the way a sufferer from Downs syndrome talks? Wouldn’t you think, “This is unworthy of me. I’m being cruel and unfair.”? You should *help* such a person, not *laugh* at him!

The impossibility of two consciousnesses.-- I’ve never understood why you aren’t flabbergasted by the fact that more than one person exists. You are a world unto yourself, without boundaries; yet there is not only *one* other such world: there are over six billion! Or, more accurately, over *sixty* billion! Somehow, an unbounded world is finite: it is compatible with the existence of billions of others. The same paradox operates in general relativity: even though the universe is unbounded--it has no center, no ‘edges’--it’s finite (it doesn’t extend in an infinite straight line in any direction).¹ Each of us is, quite literally, his own universe.

Do you understand the paradox? To describe it is difficult. Essentially it is that, from the perspective of one’s own consciousness, it’s inconceivable for there to be *another* consciousness. And yet there is. Which means humans will never completely understand the world.

Unconscious philosophers.-- We’re all solipsists, whether we know it or not.

The self-identity of banality.-- Mediocre minds think alike even more than great minds do.

A lesson learned from observing Dubya.-- Stupidity is as predictable as genius isn’t.

¹ If you travel along a straight line for a long enough time, you’ll eventually return to your starting-point.

To retain the spectrum but lose its extremes.-- My hope is to bridge the gulf between the academic specialist and the herd animal, while lopping off the two ends.

So-called opposites.-- In narrowing himself to the point of self-oblivion, the specialist merges with the commoner.¹

The art of living in society.-- I've perfected the art of pretending to be superficial around people.

The counterintuitiveness of compassion.-- It is less humane to try to raise others to one's own level than it is to lower oneself to their level.

"Football + beer = happiness!"-- The male's love of watching sports is more incomprehensible to me than the female's love of shopping.

Almost too obvious to be argued for.— Political correctness frowns on the notion that women are somewhat passive in relation to men. The conventional wisdom is that because people are molded by their social conditions, neither males nor females have anything like an intrinsic essence—and that even if they do, passiveness has nothing to do with the nature of women. Several facts support that thesis: (1) in some relationships the woman is more dominant than the man; (2) in some cultures, women have been held in high esteem; (3) in the last century, Western women have become increasingly political, professional, and independent. On the other hand, facts can be found that support the opposite thesis: (1) the vast majority of cultures, and arguably *all* of them, have been rather patriarchal, including ones as varied as Sumer, China (throughout its history), India (throughout its history), Japan, ancient Greece, ancient Egypt, Rome, Europe (throughout its history), the Middle East (throughout its history), the Incan and Mayan civilizations, the Native Americans, the United States, New Guinean tribes, traditional Samoa, etc.;² (2) women are physically weaker than men; (3) men have always been attracted to relative weakness and vulnerability, while women have always been attracted to strength; (4) social customs have nearly always dictated that, in the sphere of romance, men are supposed to approach women, not vice versa; (5) in ballroom dancing, men are the 'leaders' and women the 'followers'; (6) in the act of sex, the man is the aggressor, the penetrator; (7) women have always been associated (by both sexes) with children; (8) languages include thousands of subtle references to female passiveness—e.g., the term 'womanizer': the notion of a '*manizer*' is considered laughable, because men are rarely passive enough to be romantically manipulated or 'swept away' by a charismatic woman; (9) women have almost always been expected to decorate themselves, to treat themselves as ornaments and objects—and generally they've *enjoyed* this (and still do); (10) in accusing men of imposing their ideas on women (ideas of how they should look, how they should behave, how they

¹ There are exceptions. Example: Noam Chomsky.

² Helene Cixous acknowledges this in her essay "Sorties" in *The Newly Born Woman* (1975). Of course, she denies its significance. "History has never produced, recorded anything but [phallogentrism]. Which does not mean that this form is inevitable or natural." No argument is offered in support of that claim. Now, I admit that *political* patriarchies are neither inevitable nor 'natural', per se; however, the idea that men are relatively active and dominating is far more natural than 'vaginocentrism'.

should think), feminists have assumed that women are inherently more passive than men;¹ (11) the increase in their civic participation during the twentieth century is by no means an argument against women's being *relatively* passive compared to men; (12) women naturally tend to be relatively 'communal', while men tend to be more individualistic and competitive; (13) it isn't even remotely conceivable that men could let themselves be treated—for millennia—the way women have let themselves be treated, all over the world. I could extend this list for pages. The point is that every significant culture and, it seems, virtually every individual in history has been *saturated* with the idea that females are more passive than males. The idea is inseparable from the way that humans think and act, and it shows itself a thousand times each day.

But what does 'passive' mean? Several things. Physical weakness, for example (relative to men).² And (comparative) unaggressiveness, unassertiveness. More generally, it means that men have a more substantial otherhood than women do. [...] –The popularity of the show "Sex and the City" was a testament against radical feminists. Why did women like it? Because it was silly? Because they felt better about themselves after seeing how vain and shallow *other* women are? No. Because they identified with it! They identified with a show that was, essentially, middle school with adult language. [...]

That makes sense biologically. Nature wants each woman to find a man who loves her, because if he does he'll probably stay with her and take care of her and her child. On the other hand, nature doesn't necessarily want a man to love the woman he has sex with, because in staying with her he won't spread his seed in as many women as he might have otherwise--which means he'll beget fewer children--which nature frowns upon. "Be fruitful and multiply!" is the categorical imperative that men are programmed to follow. "Be careful in your choice of lovers!" is the imperative that women follow.

A refutation of the dogma that the sexes are "equal."-- The definitive relationship between man and woman is the romantic or erotic one. And who would deny that in this relationship the woman tends to be the relatively 'weak', 'vulnerable', 'submissive' one? [Again, I'd remind you of the mechanics of the sex act.]

Another refutation.-- It's easy to forget that the human species has lived out 95% of its history in hunter-gatherer societies. Clearly our biology was designed for such a state. The differences between the sexes are explained by the fact that they were useful in our original state of nature. Unfortunately they occasionally conflict with the values of modern society.

It's ironic that feminists tend to congratulate themselves on their historical perspective (which they equate with the idea that social conditions determine behavior--i.e., that as history progresses, human behavior changes). In fact, historical perspective is precisely what they lack. If they could 'take in the whole picture' [...] --if they studied in depth the thousands of societies that existed after the superseding of mankind's primitive state, societies in which women were *still* restricted to the domicile and its corresponding 'passiveness';--in short, if they looked at *all of history* and then 'opposed' to it the 'modern age',³ i.e., the last forty years (and mainly in the West), in which women have become relatively career-oriented, and in which relativistic (politically correct) philosophies have been invented that are supposed to represent the pinnacle of human knowledge, and are treated as such by feminists, but are actually nothing but byproducts of our culture's divisiveness--and, thirdly, in which (culture) women continue to be seen by everyone as innately

¹ Otherwise, how would men have been able to be the tyrants that feminists say they are? It had to start somewhere! There has to be some natural basis for it! Otherwise it's inexplicable.

² Obviously there are women who are stronger than, say, me. But this is irrelevant.

³ Which cannot be 'opposed' per se, since it shares every previous society's preconceptions about gender.

passive/weak/submissive in comparison to men (a view not always explicit, but which is revealed by behavior);--if feminists could appreciate all this, they'd understand that their radical philosophies are fatuous.

The 'femininity = relative passiveness [or receptiveness]' equation is, in Jungian terminology, an archetype shared by everyone, including feminists. To imagine a society in which it doesn't exist is as impossible as imagining a society whose members lack the sex instinct.

It is certainly true, however, that societies have tended to exaggerate the extent of female passiveness, inasmuch as they've assumed, e.g., that women don't have the ability to compete professionally with men, or that their only proper role is inside the home or (earlier) working the fields. The last forty years have invalidated these assumptions and exposed them for what they are: cultural fabrications--which, however, are grounded ultimately in the biologically determined natures of women and men.

Another refutation.-- Ex nihilo nihil fit.

The 'gender = social construction' myth.-- "Science is wrong, anthropology is wrong. Humans are a *tabula rasa* that passively absorbs cultural trends. Empiricism, yay! Common sense, booo!"

Huh?-- There is something extremely comical about a sex that feels it is perfectly natural to think and act in a certain way but accuses you of misogyny when you point out that it tends to think and act in this way.

Phallogentric historical progress.-- If reason and logic are phallogentric, then thank God for phallogentrism! Without it we'd be living in the Dark Ages.

A random question.-- Why do women commonly have long hair and men short hair? How did this originate? Surely it isn't biologically innate--and yet, as far as I know, there has never been a culture in which women had *short* and men *long* hair. But what possible point could there be for an innate tendency in relation to *hair*? --Probably the reasons for the universality of sexually differentiated hair lengths are that (1) it makes the task of immediately distinguishing between the sexes easy and (2) long hair is more easily manipulated in aesthetically pleasing ways than short hair, and since there *is* a culturally universal expectation that women beautify and decorate themselves (so as to attract mates), it's natural that women rather than men have long hair.

Maybe the fact that men often become bald also has something to do with it.

Another question.-- Why is facial beauty (feminine and masculine) important in attracting mates? What evolutionary advantage does such beauty have? If you'll say that people unconsciously make the connection between a beautiful mate and beautiful children (the implication being that they want attractive children, so that *they* can find mates), you're begging the question. Beauty isn't like the feminine instinct for nurturing or the masculine instinct for dominating, which serve obvious purposes; universal ugliness would surely not be disadvantageous in the way that a universal absence of the maternal instinct would. In fact, it would have no practical effect whatsoever. --The solution to this problem may be that we unconsciously associate a good face with healthy genes (which can be passed on to our children). This, in turn, may be because (1) beauty projects self-confidence (which, as we have seen, is also related to the universal desire for recognition and is

therefore, in addition to its importance as an indicator of gene quality, desirable ‘for its own sake’, i.e., from the ‘self-centered’--or, ‘not child-related’--perspective of the potential mate, which consists in his desire to be recognized); (2) a pretty face may, for whatever reason, be unconsciously interpreted as *directly* signifying health and good genes; and (3) the good body that generally comes with an attractive face *does* directly signify healthy genes. Moreover, such a body has clear functional benefits: for example, large breasts are ‘maternal’, and, in the case of a man, a muscular body is related to the ability to protect and dominate. (In this connection it must be noted that a pretty face *in itself* does not have great force in triggering sexual attraction; only if it coexists with an acceptable body is it essential to such attraction.) Also, beauty is associated with youth, which is associated with health and the ability to impregnate/be impregnated. --On the other hand, there are plenty of ugly young people. But maybe we unconsciously interpret the youthfulness of a beautiful person as more pronounced than that of an ugly one.

You see I’ve approached the original question from a functionalist perspective. One could also approach it by describing the biological mechanisms of attraction to beauty. Or one could analyze the psychoanalytic/psychological causes. Or, lastly, one could ask what are the *phenomenological* causes--the ‘subjective’ reasons that are (or *should* be) immediately evident to us (such as a ‘feeling’ that occurs when one looks at a beautiful face).¹ These explanations, however, would presuppose the functionalist as the most ‘fundamental’, given that most species-behavior seems to have evolved on the basis of its relevance to an individual’s survival and the perpetuation of the species.

On beauty.-- Facial beauty cannot be described or conceptualized. Recognition of it is solely intuitive. If you try to describe an attractive person by saying, “She has prominent cheekbones, full lips, tanned skin and sultry eyes”, you have not explained why she’s beautiful. Any of these features is compatible with ugliness--even all the features together. Beauty is holistic: it consists not in an aggregate of isolated features but in the totality of relations between them--relations which, to repeat, are not conceptualizable or denotable. We grasp them in an instantaneous intuition, but cannot really reproduce them in words.

Indeed, this is true of *any* kind of beauty: musical, poetic, ‘sculptural’, natural... To say that the beauty of some given thing consists in symmetry, or in vibrancy of color, or in the pithiness of its words, or in a perfectly balanced composition, is only to *hint* at it--to ‘gesture’ at it; we can never fully explain it.

What is the significance of this?

(is that true of *all* aesthetic qualities?)

A whisper from the divine.-- People sometimes wonder why God is silent. They devote themselves to him, they supplicate tearfully for the sake of a beloved one, but he doesn’t answer. In their agony, in their loneliness, they may come to doubt his existence. But I say, “Take heart, faithless one. Listen to the Adagietto from Georges Bizet’s L’Arlésienne Suite No. 1. God will be speaking to you. And he will heal you.”

Draw your own conclusions.-- During my first sexual experience I remained excited and fully aroused as we kissed. But after our clothes had come off and I’d made my way down to her nether

¹ That question is the most difficult and provocative of all. See the next section. [But not the next in this journal.]

regions, my interest suddenly waned. As soon as I was confronted with “it”,¹ I became bored. Even disgusted. With the whole situation. I wanted to stop immediately. --Lest you think otherwise, it wasn't, as far as I know, from nervousness. My only thought was, “What a waste of time!”

Man alone with himself.-- There's something poignant about masturbation.

A “closed-minded elitist”?-- This elitist is more open-minded than anyone he has ever known. His knowledge of this is precisely why he's an “elitist”.

Compassion in nakedness.-- The great Charade that defines human life is not only irrational; it is harmful. The fanaticism with which we conceal ourselves from each other is as baseless as a puritan's prudishness--and it allows for hatred and complacency, which allow for misery. I'm never more fond of people than when I'm walking in the middle of a crowd and suddenly realize that beneath our clothes are naked bodies, that within our minds are silly thoughts. I stop short as if thunderstruck; I look around at the bustle, my gaze riveted to everyone and no one, and a calmness passes over me. All my petty quarrels dissolve in a transcendent love. No object of hate remains for me but the universal love of privacy. For those few moments I'm impervious to any concern, and my only desire is to devote myself to altruism. Knowing that *we're all the same* is a wonderful, liberating experience.

But in order to stop hiding ourselves from each other we must first stop hiding ourselves from ourselves. That is the source of our societal charade: our *inner* charade. [Nope. That's backwards.] We all think we're superior to others--which itself shows that we *aren't*. The sciences have demonstrated that we're equal; our intuition supports that claim. So why do we ignore it? --If we could live according to truth, life would be much better than it is now.

(against liberalism, privacy, etc.)

A plea.-- We're alone. As far as we know, we're *alone* in the world. We have only each other. We have no God, we have no heaven, we're aware of no extraterrestrial companions. Try to imagine that. In the crushing darkness of the universe there's a speck of a planet on which live specks of life, carrying on as if existence revolves around them, as if they have the luxury of time and strength and they can bend circumstances to their will. They fight each other, they hate each other; their brutality has no bounds. In their laughable self-importance they think they have the *luxury* of being able to hate each other! They can't see that in the immensity of an inhuman cosmos they rise and fall together, that their only chance for survival is to cooperate. Is it not enough that the *universe* is callous to us? Must we be callous to *ourselves* as well? Despite everything we've been through, we remain as ignorant as in the beginning. *We still* refuse to try to understand each other! --Maybe nature wanted it this way. Nature wants us to compete, as she wants all animals to compete. But, for God's sake, we aren't mere *animals*! We have free will; we have dignity. We can turn around in our tracks and spit in nature's face, shout “I'm tired of you pushing me down this road! I'm setting off on my own!”--leave nature behind, work together to build an *unnatural* society, be *humanists* for the first time ever! We can rise above ourselves! That's what makes us human. And now we finally have the means to do it. Technology has placed the ideal within reach. Soon we'll be able to do the unthinkable--*if we work together*--: overcome economic scarcity! Make greed

¹ Aaaaahhhh! Horror of horrors! “IT”!

superfluous! Make money superfluous! Make the world *human*! It's in our power; whether it's in our *will* is another matter.

Or...-- If we so choose, we can be complacent, accept the ways of history but not learn from them, follow tradition, and commit collective suicide in a series of nuclear wars--right as we're reaping the effects of global warming.

Against Nietzsche.-- The goal of humanity *can* lie in its end, if we want it to.

My love of mediocrity.-- I'm grateful that most of the human race is insipid. I like watching clowns perform. They frighten me sometimes, but ultimately they're merely funny. Without them, my life would be too serious: I'd have too much respect for the world; I wouldn't laugh nearly as often as I do. Yet at the same time my life wouldn't be serious *enough*: I would have no opponents, nothing to fight against, no goal to work towards. The best argument against a utopia is that it would be boring. Without conflict, what value can life have? Inherent in self-consciousness is an element of dissatisfaction--of emptiness, of otherness, of 'compulsion' toward something outside of consciousness. In Hegelian terms, the nature of consciousness is to transcend itself, to always be beyond itself, oriented toward an Other (which can be itself, because it is its own other). Thus, conflict is at the heart of the self. Conflict *is* life. As we've seen, the universal need for recognition results, at least in part, from this dialectical nature of consciousness. The culmination of recognition is when the other acknowledges your superiority vis-à-vis him--when you become that which he wishes he could be. Through the desire to be recognized, then, the conflict inherent in the self is projected into the world as the conflict of each against all. Everyone implicitly wants to be better than everyone else. Hence, it pleases me that in some respects I'm 'better' than the majority of people;--and I want to *continue* to be better, even in a utopia. I want to be God, in fact. [Cf. Sartre's ideas. To some degree, the urge is implicit in us all.]

So it seems I'm being self-contradictory in hoping for the creation of a better society than the current one. I *could* answer this by invoking the fact that I'll be dead when the new society is born, so it won't affect me, but there's still a contradiction: I hope for this society because I think it would be good for mankind, even though, if what I wrote above is true, that's wrong. Apparently, then, in being warm-hearted I've proven myself unintelligent, in accord with Nietzsche's formula in section 235 of *Human, all too human*. My last attempt at self-defense is to say that I don't want a true "utopia", whatever that word means; I want merely a world that is no longer a home to billions of oppressed people. [...] The point is that oppression, on the scale it has always existed on, is unnecessary for spiritual well-being and can possibly be eliminated if the good portion of mankind works together.

But not self-contempt either.-- Pride is somewhat irrational. The prouder you are, the less reason you have to be proud.

A necessity.-- All the beauty of life means nothing if you cannot see your *own* beauty.

Egoism parading as altruism.-- My self-centeredness/desire-to-be-thought-well-of takes unusually subtle and sophisticated forms. It understands that in order to be liked, it's imperative that you give the impression that you like/respect the other. If you catch him in a moment of weakness, he'll

probably resent and dislike you for having embarrassed him. If, on the other hand, he catches *you* in a moment of embarrassment--provided it doesn't happen too often--he won't like you any less for it. My subconscious, in having appropriated this insight, causes me to act accordingly. Thus, I'd rather look weak myself than look into the hurt eyes of someone who's embarrassed;--and if I do, it torments me afterwards. Why? Not primarily because I pity him; rather, because I know that he resents me. So, for example, if I'm having a conversation and my partner involuntarily looks away from me for half-a-second because he feels shy for some reason--usually the result of his difficulty in maintaining eye-contact--I'll instantly look away too, simply to spare him the embarrassment of knowing that I caught his moment of weakness. Or if he says something unintelligent--especially if I have the impression that he instantly realizes it was unintelligent--either I'll be careful to respond appreciatively, to chuckle at his inane joke more than I would normally, or I'll immediately follow it up with a comment that takes attention off of *his*. This kind of behavior may seem wonderful and altruistic, but it isn't. --Admittedly, *in the moment*, on one level, it is altruistic--inasmuch as I'm conscious of no selfish motives; as far as I'm concerned, my act is a spontaneous expression of compassion (unmediated by ulterior motives)--but unconsciously it *isn't* altruistic. Sometimes my mind works fast enough for me to be aware of this even before I react to the embarrassing situation: an instant after I perceive the (potential) source of embarrassment, it flashes through my mind that I'll feel uncomfortable unless I deflect his and my attention from what just happened, so I improvise some kind of distraction. Granted, the discomfort that I try to forestall isn't *necessarily* a result of my (half-conscious) knowledge of the other's resentment against me; it might be, for example, a result of a sincere desire on my part that he not be embarrassed, which in turn results from 'pure' altruism. But this is implausible--largely because "pure altruism" seems meaningless.

I won't deny that it's possible there's another reason for my altruistic behavior in this case; I *will* deny that my desire to be liked has nothing to do with it.

Causes.-- How can there be multiple causes of phenomena? How can, say, one's desire to have sex be caused by the sex drive and *also* by one's desire for recognition? What does this 'also' mean? How do the two causes interact? What is the relation between them?

how can motives we're unaware of explain our behavior?

Wonder vs. knowledge.--

“Science! true daughter of Old Time thou art!
 Who alterest all things with thy peering eyes.
 Why preyest thou thus upon the poet's heart,
 Vulture, whose wings are dull realities?
 How should he love thee? or how deem thee wise,
 Who wouldst not leave him in his wandering
 To seek for treasure in the jewelled skies,
 Albeit he soared with an undaunted wing?
 Hast thou not dragged Diana from her car?
 And driven the Hamadryad from the wood
 To seek a shelter in some happier star?
 Hast thou not torn the Naiad from her flood,
 The Elfin from the green grass, and from me
 The summer dream beneath the tamarind tree?”

The poet in me understands Edgar Allan Poe's bitterness toward the scientist. The poet cherishes life only so long as he can marvel at it. He prefers myth to "dull reality", wonder to knowledge. His ignorance of truth allows his fantasies to roam freely, unencumbered by the pangs of a guilty intellectual conscience. The 'scientist',¹ on the other hand, (in his pure form) cares nothing for flights of fancy; he wants only to chase away the confusion of not knowing truth. He hates living in doubt; he feels as if doubt forces him to put his life on hold. To always speculate on the causes behind phenomena is debilitating.

I'm neither one nor the other, though I share traits with both. I relish the experience of wonder: it gives *magic* to life; it substitutes the Universe for God. Through wonder I can *strive*; I can worship a world that is beyond me--beyond my existence and my limited capacities for understanding. But unlike Poe, I don't enjoy not having knowledge. I have little need of romantic self-delusions. In other words, he hates reality and wants to avoid it; I love reality and want to seek it--but never to attain it completely, because then life would cease to be 'beyond' me, superior to me: it would be *equal* to me and thus unworthy of being respected. No longer would I have goals: in *understanding* them (their causes, their mechanisms, their transience) I would despise them. So I work feverishly to gain knowledge even as I hope that I fail. And yet, I can't tolerate living in confusion--which means I hope that I *don't* fail. Which is worse: living in confusion or understanding everything? Which is better: knowledge or wonder? Admittedly, the two aren't always mutually exclusive--in fact, an increase in knowledge can often increase wonder; for example, the more I learn of neurology, the more stupefied I am--but, ultimately, the perfection of knowledge is the negation of wonder. I suppose the answer is that, inasmuch as I'm human and not divine, I'd rather continue to live in confusion (i.e., wonder) than know everything.

Lessing was right to choose the hand that offered striving rather than truth.

The will to achieve.-- Goethe was right: a "lack of time" is a poor excuse for not realizing one's ambitions. Life is long. If one is sufficiently determined, one can accomplish anything.

The world is waiting for someone to tie together all the threads of human thought.

Nature vs. historical progress.-- As far as nature is concerned, we're still in a hunter-gatherer state. Always remember that. Your understanding of yourself and of society will benefit immeasurably.

Sublimated blood-lust.-- When I watch pro-wrestling I'm reminded that only the effeminacy of our culture's ideologies prevents a return of gladiatorial games. (The difference is that *atheists*, not Christians, would be thrown to the lions.)

History loves gays.-- Insofar as the word 'inevitability' has any meaning when applied to historical events, it's inevitable that gay marriage will eventually be permitted in most or all states. Alexis de Tocqueville hit the nail on the head when he said that the movement of history is towards equality. There are indeed periodic regressions, but they don't last forever. Equality always finds a way to triumph. If homophobes weren't blinded by their bigotry they might see this.

Excuses.-- The "constitutional" objections, the religious objections, the social objections to gay marriage are nothing but masks for visceral prejudice. They're weak attempts to lend an aura of

¹ By that I mean the philosopher, the psychologist, the natural scientist, the social scientist, etc.

respectability to an irrational, disgusting hatred. I look at Tom DeLay and I see a man who would have been a fanatical segregationist in the 1950s.

Why does equality win?-- Most likely because the downtrodden masses--people with a vested interest in making social conditions equal--are willing to fight until they've achieved their goal, no matter how long it takes. That their numbers usually overwhelm those of their oppressors is an added advantage. But a more complete explanation may be that as a society's technology develops, it (the society) becomes increasingly urbanized, which highlights (and sometimes enhances) distinctions in wealth/power and fosters a collective consciousness among people in similar conditions, which leads to mass movements, which leads to equality.

A very pious person.-- Nihilism is my religion, hedonism my sect.

Religion as a hypothesis.-- Atheists may, after all, be wrong. God may be laughing at me even as I write this. "Ha ha!" he chuckles. "Guess where *you're* going in sixty years!" But I laugh right back at him, "Even if you exist, we don't need you! At this stage of history you're an afterthought. We're doing a fine job of understanding the world without having to invoke a Divine Paradox. Science has proven its power; religion has no arguments in its favor: we might as well ignore it. Maybe in the future we'll learn of a critical gap in science that can be closed only with the help of religion, but for now we're doing okay on our own."

No respect for the dead.-- I feel like I'm beating a carcass.

Nietzsche said it best.-- "When we hear the ancient bells growling on a Sunday morning we ask ourselves: Is it really possible! This, for a Jew, crucified 2000 years ago, who said he was God's son? The proof of such a claim is lacking. Certainly the Christian religion is an antiquity projected into our times from remote prehistory; and the fact that the claim is believed--whereas one is otherwise so strict in examining pretensions--is perhaps the most ancient piece of this heritage. A god who begets children with a mortal woman; a sage who bids men work no more, have no more courts, but look for the signs of the impending end of the world; a justice that accepts the innocent as a vicarious sacrifice; someone who orders his disciples to drink his blood; prayers for miraculous interventions; sins perpetrated against a god, atoned for by a god; fear of a beyond to which death is the portal; the form of the cross as a symbol in a time that no longer knows the function and ignominy of the cross--how ghoulishly all this touches us, as if from the tomb of a primeval past! Can one believe that such things are still believed?"

Two very different sources of respect.-- Knowing that the great men of the past would approve of you more-than-compensates for a lack of approval by your contemporaries.

Technology in the service of humanism.-- If someone like Friedrich Nietzsche had been told that in a hundred years there would be an electronic network around the world allowing billions of people to share information at rates of speed measured in fractions of a second--and that this network could store nearly infinite amounts of data, including millions of books, and that it could all be accessed with a few movements of one's fingers--his reaction might have been to shudder with joy and envy

at the thought of the vast education that one could acquire by not even budging from one's chair. -
 -The internet has made it possible for humans to be exponentially more knowledgeable than they have ever been. Funny that it tends to have the opposite effect. --A reflection of the people who use it. (Every great idea is corrupted upon contact with the masses.)

Hateful people.-- Without our ability to forget, misanthropy would be universal.

A strange reaction.-- Why does "rolling one's eyes" universally signify that one considers a given idea or person idiotic? How can there be a connection between that judgment and the tilting of one's eyes in a vertical direction? Is it genetically innate? That seems unlikely. But how else is its universality explicable?

Another strange reaction.-- In the movie *Shrek 2*, when Puss in Boots gives his 'puppy dog' look Shrek can't resist cuddling him. Everyone, from every culture, understands Shrek's reaction (on an intuitive level). Why? Why do we instinctively recognize 'cuteness' when we see it?--and why does cuteness cause an urge to hug it?--and why do we interpret the 'puppy dog' look in particular as cute? Genetics is the answer. [??] Both the human recognition of cuteness and the common reaction to it serve essential evolutionary purposes: they cause the parent to love his child, to feel tender towards him, to show him affection, which he needs in order to become a well-functioning adult. If children were not cute, parental love would be difficult; parents could not forgive the child for all the hardships he causes them. (The parent's knowledge that he *made* this being is also an important source of love--in that it validates the parent's worth in his own eyes; i.e., the child is a crystallization of the parent's human value--but without cuteness, that knowledge would have little force. For who wants to be the creator of something unattractive?)

The character of the puppy-dog look isn't obviously explicable in these terms. No human child ever exhibits that expression. The best explanation for our reaction to it is that it's a relic of an earlier evolutionary stage that has not been completely overcome in our psyches.¹ (Our possession of the reptilian brain is a parallel). Other animals evidently rely on this adorable look as a cause of the affection *they* feel for their young; their reaction persists in us, which is possible because we evolved from them. This suggests, by the way, that the way we feel (in this case) is similar to the way *they* feel.

What is cuteness?-- We say that young children are cute, but also that octogenarian couples walking hand-in-hand are. We say that an attractive woman is cute, but also that an attractive man is. A squirrel nibbling an acorn is cute, but so is a young woman studying her homework intently. Actions can be cute, and so can facial features. --What properties can possibly be shared by such a wide variety of situations? One's first inclination is perhaps to deny that there are such qualities. One might adopt Wittgenstein's stance and say that these situations share only "family resemblances", i.e.,

Common sense.-- Insofar as common sense is common, it is not sensible; insofar as it is sensible, it is not common.

¹ If you'll say, on the contrary, that its helplessness is why the look is irresistible, (1) my explanation doesn't contradict yours, and (2) you've explained nothing. The question is, why does that look seem helpless? And why do we have such a reaction to helplessness?

The usefulness of weakness.-- If most people were not cowards, society would be ungovernable.

Nausea and love.-- When I think about people abstractly--when I read the newspaper, when I watch television--I usually agree with Shakespeare's Coriolanus:

Who deserves greatness
Deserves your hate; and your affections are
A sick man's appetite, who desires most that
Which would increase his evil. (*Act I, scene I*)

That's putting it mildly. At such times my disgust suffocates me. I rival Timon of Athens in my misanthropy. I can't bear to live in a world where every little mediocrity feels as if he is interesting enough to write his "memoirs" or to expose every revolting detail of his wretched life on "reality shows" with names like "Fat Actress" and "Trading Spouses"--a world in which people know and care more about the lives of Hollywood celebrities than they do about their own--the word 'shame' having no meaning to them--*especially* shame in front of oneself;--a world in which the adjective 'stupid' would be the most universally applicable if it weren't such an understatement;--a world in which a midget like George W. Bush can become leader of the most powerful nation, in which the citizens of this nation have more concern for the life of a vegetable like Terri Schiavo than for the suffering of billions of people around the world and politicians are so hypocritical as to preach gospels of love and life with the fervor of proselytes while simultaneously snatching love and life from whoever happens to be a convenient political target--like homosexuals, like Iraqis, like "suspected" terrorists;--a world that has learned nothing from five thousand years of slaughter and misery and will *never* learn *anything* because its inhabitants are apes who think they're gods.

But then I walk outside, away from the bitterness of solitude. The sunlight quickly dispels my hate. [I've deleted the rest because it was too sentimental.]

In defense of historical materialism. Part I.-- In its broad outlines, historical materialism is correct. Marx's utopian hopes may not come to fruition, but they don't logically follow from the basic theses. --Or rather, the latter can be revised so as not to incorporate the idea that communism will necessarily occur, or that it will occur only after a revolution that culminates in a dictatorship of the proletariat. Such a revision might look something like the following.

The first and most essential task for any animal is to secure the means of its biological existence. Man is unique in that he is able to modify nature in order to achieve his goal: he is able to use tools. Indeed, in most situations he is *required* to use tools. Therefore, the nature of the methods he employs to produce his food is based on the given state of technological development. (I.e., because he has to use tools, whatever tools he has at hand will determine--or rather, condition--the nature of his production methods.) If, for example, technology is on the order of bows and arrows--and tools for agriculture have not yet been invented--the mode of production will necessarily be 'hunting and gathering'. On this primitive level there will be very little flexibility between possible relations of production: they will be primarily cooperative, with few distinctions in status among the productive members of society. A leader or two may emerge, but given the society's degree of poverty they will have few exclusive privileges. They will essentially be 'first among equals'. Relations of production as advanced as those of slavery (for example) will be impossible, because there are not enough resources to support a class of idlers as well as the 'police-force' needed to keep the slaves under control. If, however, a "social surplus product" exists--if

technology¹ has advanced to such a point that it allows for the production of more resources than the community must consume immediately in order to survive (thus making it possible to store an excess)--cooperation ceases to be the necessary rule governing relations of production. Fewer people need be directly involved in the production process (the process of harvesting crops, hunting animals, building shelters, etc.). The possibility of *directors* emerges: a class of people who oversee the production process without taking part in it. Slavery becomes possible. --In short, (1) the degree of technological development influences the character of production relations more than the latter does the former, and (2) the former is the fundamental force conditioning the latter.²

Man is a social animal: he lives communally. An important reason is that his best chance for survival is in communal living: it offers him protection, cooperation in the struggle to feed and shelter himself, etc. His biological existence is rendered more plausible by his living with others. That being the principal function of the community, the community will be organized so as to allow for the perpetuation of the existing methods/relations of production.³ This perpetuation is an absolute imperative. The social structure will thus grow (organically and unconsciously) out of the relations of production.⁴ In prehistory, this causal mechanism is fairly easy to see. It should not, however, be understood as operating chronologically: social relations (political, legal, familial) and production relations come into existence at the same time. But because the range of feasible relations, or methods, of production is already directly delimited by the existing conditions of technology—while the set of possible social relations is not; productive technologies can bear on social relations only via an intermediary, namely the production relations themselves—other social relations cannot influence methods of production as much as the latter can the former. Nevertheless, relations between the two spheres are reciprocal (or “dialectical”): each conditions the other. As society becomes increasingly complex, this becomes more obvious. In fact, the thesis that production relations are the basic determinant of social relations grows a little more dubious--partly because the distinction between the ‘social superstructure’ and the ‘economic foundation’ becomes less clear (the two blend into each other), and partly because the relations between the two become more noticeably dialectical. For instance, a political event such as the invasion of a country may result ultimately in an alteration of its technology and economic structure. Still, what was a historical law in the beginning (for hundreds of thousands of years) must *remain* a law. Nor does it stop being logically compelling as it becomes less empirically verifiable (or falsifiable). Thus, if one analyzes any given ‘slice’ of historical time in a particular society--for example, France under Louis XIV--one will find that, on the whole, the social relations seem to be ‘harmonious’ with the production relations and the state of technology. (For example, the asymmetry of the relations between serf and lord under feudalism made political democracy extremely unlikely, even impossible; the more natural organization was an aristocratic hierarchy, with a monarch at its head.) To suggest that this is because, e.g., the nature of an ‘already given’ political order required a certain set of production relations--in other words, that the *latter* were derivative--is intuitively absurd.

Historical evolution--by which I mean the increasing complexity of social structures, within societies and between successive ones⁵--is made possible by two facts: (1) natural resources, totally

¹ Or, as Marx would say, the “forces of production”. For the present I’ll assume that these terms are synonymous. Later we’ll see that labor-power and the physical sciences are also forces of production, albeit derivatively.

² For a closer examination of the definition of ‘production relations’, as well as ‘mode of production’, ‘means of production’, ‘superstructure’ and so on, see the following sections. (Incidentally, I will answer objections to all these ideas later. At the moment my purpose is only to give a broad overview of the theory.)

³ In relatively advanced societies, the process of instituting and ‘reproducing’ this organization is by no means as simple as that sentence makes it sound. See below.

⁴ However, it will not ‘mirror’ them (whatever that metaphor is supposed to mean): the State and all cultural institutions have a degree of autonomy from the production relations, and cannot be wholly explained by them.

⁵ That is a narrow definition of historical evolution, inasmuch as it ignores ‘micro-evolutions’ from year to year. However, one cannot provide a single general explanation of the latter, since they are made possible purely by the particular circumstances that obtain in a particular society at a particular time. [But it’s (stupidly) narrow in another

unmodified by humans (through hunting or agriculture or whatever), do not exist in a sufficient quantity to satisfy man's desires, and (2) people have a compulsion to be recognized by the Other. (Neither of these factors could result in historical progress without the other.) The desire for recognition has many behavioral manifestations, varying from person to person and within each individual, as well as many degrees of force. Some people, for example, are perpetually dissatisfied with themselves; if they have talents, they may use these to convince themselves and others of their worth.¹ If their talents are political, economic, scientific, or militaristic they may end up directly contributing to historical evolution. Now, the scarcity of resources ensures that there will always be a demand for inventors. In some eras, of course, it will be more pronounced than in others: for instance, in relation to capitalism it is both a prerequisite (since this dynamic society cannot come into existence except on the basis of a relatively sophisticated level of material and theoretic inventions) and built into the system (for without continual invention, capitalism could not perpetuate itself²), while in feudalism it was unnecessary (indeed, dangerous). However, there will never simply stop being a use for it. Thus, there will always be people willing to be 'inventors'-- theoretic and practical--in order to achieve recognition [not only in the narrow sense of *fame*, but more broadly, including 'self-recognition']. In certain societies, invention will proceed at a slow pace because there is not much demand for it; it may even, for all intents and purposes, cease. If this happens, the evolution of the social structure *in toto* will effectively cease as well, because-- this is the main point--social relations become noticeably more complex only as technology and production relations do. (Empirical investigations would support that claim.) That is, society evolves only *as a whole*, and fundamentally on the basis of an economic evolution made possible by the assimilation of new technologies invented by people who want recognition. The role of individual inventors (not only in the 'Thomas Edison' sense, but also in the modern 'Research & Development' sense, and in the 'Albert Einstein' sense, etc.) is, therefore, more important than orthodox Marxists have admitted--which implies that the role of individuals in general is more important,³ which means that historical trajectories are not inevitable (because 'inevitability' requires deterministic scientific laws and denies the importance of individual initiative).

As we have seen, the nature of a particular set of production and social relations may halt the development of technology. No right-minded Marxist would deny this, provided we qualify 'halt' with 'temporarily'. He might say that *obviously* the growth of technology can be obstructed--in fact, it *must* be, eventually, because it is a *progressive* force (with no intrinsic limitation on itself) and, as such, will come into conflict with the *conservative*, 'inertial' production relations⁴--but that, given enough time, it will push the obstruction out of the way by some means or another. If the production relations continue to impede the growth of technology, the conflict between the two will result in a revolution which will overturn the existing relations of production and substitute new ones in their place; under these new relations, technology will resume its temporarily fettered

way too: it doesn't apply to the disintegration of societies, since generally this isn't accompanied by an increase in the complexity of "social structures".]

¹ They need not be aware of that motive.

² The reasons for that relate to economics, and as such lie outside the purview of this book.

³ I'll expand on that theme in subsequent sections.

⁴ The characterization of production relations as inertial is misleading (as Michel Pecheux notes in his essay "The Mechanism of Ideological (Mis)recognition"). Their perpetuation (or 'reproduction') does not proceed by itself; it is not a 'given' that continues indefinitely unless something occurs to disrupt it. Rather, it is a dynamic process that requires active consent on the part of the masses and dissemination of particular ideologies through such "ISAs" as the educational system and political apparatuses. There is always the potential for conflicting social forces (especially between classes, but in general between groups of any kind) to tear apart the society; thus, the reproduction of the economic structure is anything but a given. Nevertheless, inasmuch as a revolution is far more difficult to achieve than the mere continuation of the status quo, the economic structure can be described as 'inertial'. Our later analysis of ideology will provide insight into why the maintenance of the economic and political status quo tends to be fairly unproblematic (from the perspective of those in power).

development. (And, of course, new social relations will grow organically out of the new production relations.) This is all supposed to happen purely on the basis of the internal functioning of the society, i.e., not by means of an ‘external’ catalyst such as an invasion or the discovery of new resources. If such a catalyst is required, then inevitability cannot be said to apply to historical progression--or, at any rate, to historical progress as Marxists conceive it. We have already rejected the idea of inevitability, however; likewise, we shall reject this schematic account of the nature of revolutions. It is largely futile to speculate on the question whether, given enough time, every society must undergo such an experience as was just described; however, common sense, logic, and empirical investigations suggest that the answer is ‘No’. Would feudalism have made the transition to capitalism if the New World had not been discovered? One cannot say for sure. What is clear is that no society is a closed system--that ‘external’ forces come into play constantly--and that to ground the notion of historical progress in the concept of inherent ‘contradictions’ between categories of a society smacks of the Hegelian idealism that Marx rejected. It is, ironically, an ahistorical reification, in that it applies a notion derived from logic to every society that has existed;--and, as such, it betrays the spirit of Marxism, which insisted originally (in *The German Ideology*) on the particularity of *men* and eschewed talk of *Man* (or *Society*; it amounts to the same thing). Thus, we must revise Marxism in order to save it from itself.

Certainly there are *tensions* between elements of a society; this is practically a truism. The stronger, and (in most cases) mistaken, claim is that there are *contradictions*--between, first of all, the demands of technological development and those of production/social relations, and, secondly, between the economic class that represents the nascent mode of production and the class in whose interest it is to perpetuate the *existing dominant* mode of production--contradictions that are necessarily resolved in the same way every time, viz., the ‘progressive’ way. Admittedly, the idea of continual technological development does conflict with the idea of the permanence of a given mode of production. Technology could not have reached its present state if the ‘hunting and gathering’ mode were still dominant, or if feudalism were still dominant. However, this contradiction has rarely mattered to societies--which is to say that it has rarely manifested itself, which is to say that it has rarely concretely existed. The vast majority of social organizations have been revolutionized (or destroyed) not from some apocalyptic conflict between the growth of technology and a conservative culture, but from military invasions. Ancient Rome succumbed to barbarian incursions precisely because an industrial revolution *failed* to occur--because, that is, the production/social relations became so stagnant that industry could not take hold. In this case, the ‘inertia’ of the economic structure and its ‘corresponding’ culture proved more powerful than the supposedly intrinsic tendency (as G. A. Cohen calls it) of technology to develop. The reason, of course, is that technology in itself *does not have* such a tendency; as a byproduct of the human urge to be recognized, its character depends on the acts of individuals, which means that an element of contingency is inescapable (given free will¹). Indeed, unless the society places (or is beginning to place; see footnote _) an economic and cultural value on invention, production relations *in toto* will never be revolutionized as Marx said they would (i.e., ‘from within’). Perhaps only once in history has the Marxian doctrine been borne out: in the Western European transition from feudalism to capitalism. That was the only time that a society, of its own initiative, revolutionized its production and social relations on the basis of a technological foundation developing so rapidly that a complete societal change was virtually inevitable.--Or, more accurately, the contradiction was not between

¹ Before you raise the inevitable objection, let me explain that I’m not making a metaphysical claim. In this context, ‘free will’ means only ‘the ability to make choices’--e.g., the ability to choose whether to invent a piece of technology. ‘Choose’ implies a type of freedom, namely the self-evident type that accompanies every intentional act. (A robot programmed to act in a certain way cannot properly choose.) If you’re going to deny that some kind of self-evident freedom accompanies (self-)consciousness, then I have no recourse but to state the obvious: you don’t know what you’re talking about. You’re focusing on mere words rather than trying to understand what they refer to. (See the above quotation from Heraclitus.)

the *technology* and the *production relations*, but between, on the one hand, the new technology and its ‘corresponding’ production relations developing in the interstices of feudal society and, on the other hand, the old production relations that still predominated.¹ All other economic revolutions have either been imposed (externally, as in colonialism, or internally, as when Stalin enacted his Five-Year Plans) or have been lengthy (millennia-long) processes resulting from complex interactions between social forces and the natural environment--interactions which, although they have been based on the given state of technology, have had little or nothing to do with pressure placed on the existing mode of production by nascent relations of production that permitted relatively more rapid technological development.

Thus, Marx’s theory of revolution applies only to the modern age, and even then its application is limited. The reason why the transition from feudalism to capitalism is the only event it describes more or less accurately is that this was the only time in history when technological development ‘snowballed’--proceeded more and more rapidly and extended farther and farther--changing social relations in its wake--until finally an effective feudal reaction against it was impossible, and a complete social revolution was necessary. (The reasons for the uniqueness of Western Europe between the fourteenth and nineteenth centuries are irrelevant to the present argument; they involve the fact that the discovery of the New World and the decay of feudalism coincided). The theory is relevant only to circumstances in which technological growth is so precipitate that it is headed for a collision with the prevailing production relations (which, as we have seen, are inherently conservative, functioning to perpetuate themselves). Empirical verification of its tenets will be possible during the transition from capitalism to socialism (on which, see below).

We have yet to examine the idea that social being determines consciousness. This is essential to historical materialism, especially if by ‘consciousness’ we mean not only the literal phenomenon that takes place inside the head but also the cultural phenomena of art and ideologies. We shall refine our definitions in the following sections; for now we’ll say that the superstructure (a potentially misleading term) consists of educational, political, legal, and artistic *institutions*, while ‘consciousness’ refers to the sets of *ideas* that are current in those institutions (as well as in economic institutions)--and in society as a whole. The institutions are composed of relations between people: [this is as far as I got]

The death of Marxism?-- I laugh whenever I hear the pronouncement that Marxism is dead, that it’s no longer relevant. Because most people have ignored it for fifteen years, it’s considered dead. Fifteen years! Not even *fifty* would justify that judgment. Philosophies rise and fall and mutate and rise again, depending on social circumstances. According to the intellectual eunuchs who hate

¹ One may object that the technological growth was originally made possible by means of the new production relations themselves--and that therefore those were the fundamental determinants of the revolution--but I’d counter that the relations of production had come into existence only because agglomerations of former serfs (etc.) in towns had given rise to new conditions/means of production. The issue, as you can see, is subtler than ‘Either this determined that or that determined this’. The collective process was in increments; at each step, technology and production relations influenced each other. This was possible because, as I wrote above, before the society as a whole adopted the new production relations, they spontaneously developed ‘en miniature’ in the interstices of feudalism. The more they developed, the more technology did--and the more technology developed, the more they did. Social relations in the towns necessarily evolved at the same time, becoming more egalitarian, etc. (because the production relations were more egalitarian). This process worked its way insidiously through the society until it had finally made obsolete the feudal production, political, and legal relations; a political/social revolution ensued (in France and England), with the result that ultimately the new mode of production with its ‘corresponding’ superstructure was dominant. (However, Althusser is right that such a revolution never overturns all social relations: residues of the previous era cannot be eliminated.) --Underlying the whole process, though, was the fact that, because production involves tools/machines, production relations presuppose (are based on) the state of technology. [This historical description is of course inadequate, but it has elements of truth.]

Marxism, fifteen years is the same thing as eternity. “When the Soviet Union died, Marxism died.” What a confusion! The Soviet Union’s existence was an argument *against* Marxism. Its death was Karl Marx’s *triumph*--his vindication over Lenin and Stalin, who perverted his doctrines.

That so-called Marxists have taken seriously the conventional wisdom shows how little they understand Marx. They haven’t even absorbed his idea that ideologies grow out of “social being”. The anti-Marxian dogma is part of the ideology of late capitalism. Marxism itself is an ideology, of course--albeit a comparatively scientific one, in that it is a result of sustained analysis of history and society--and in its original form it was appropriate to a set of conditions that have passed. Given the existence of new conditions (scientific, political, economic), the ideology must be revised to take account of them;--and eventually the revision will have to be revised, etc. This necessity of revision doesn’t mean that the theory’s basic intuitions aren’t ‘true’, in some sense; it means only that new experiences always yield new insights¹ and hence require refinements even in modes of thought that approximate truth. Marxism will continue to evolve because truth is opaque, and no society will ever achieve complete knowledge.

A distinction, however, must be made between two types of ideologies. The first includes such phenomena as the natural and social sciences, and any mode of thought that results from an effort to penetrate appearances and understand essences; the second includes modes of thought that grow ‘spontaneously’ out of social conditions--i.e., that are adopted by the masses. Marxism as the brainchild of a few intellectuals who wanted to understand reality belongs to the first type; Marxism as the belief-system of millions of Russians belongs to the second type. The popularization of any philosophy is its vulgarization. Supposing, for the sake of argument, that it were possible for a system of thought to be absolutely true, and supposing that Marxism (in the scientific sense²) were able to realize this truth, at the moment it did so it would cease to evolve. In its *other* manifestation, however--its popular manifestation--it would continue to evolve as long as society existed, because changes in conditions would necessitate changes in the ideology. --It may seem a meaningless verbal dispute to call the ‘scientific’ variant of any philosophy an “ideology”, but inasmuch as superfluous controversies raged throughout the twentieth century on the scientific pretensions of Marxism--“which is, after all, merely an ideology, and therefore, by its own ideas, not ‘true’!”--my distinction is worth keeping, as showing that such controversies are products of confusion.

Delusions of grandeur.-- In every writer is a partially suppressed sense of greatness. (The publishing of a book is a remarkably presumptuous act.)

To simplify.-- To idolize is to misunderstand.

Indirectly proportional.-- The larger a woman is, the smaller she is as an ‘other’.

Return to an earlier theme.-- Do I believe any of these thoughts I’m writing? Or am I just ‘expressing’ myself--getting things off my chest--unconcerned with their truth or falsity? Do I ‘transcend’ everything once I’ve written it? Leave it behind me? Or do I carry it with me? --The

¹ That’s why the progression of history is, on a broad scale, a progression towards truth.

² I mean ‘scientific’ in the loose sense of ‘concerned with analyzing reality’. Social sciences can rarely aspire to be scientific in the sense of the natural sciences, the hypotheses of which can be subjected to tests designed either to falsify or to substantiate them. (Karl Popper was an ass to think that that fact somehow invalidates social sciences.) Even so, many Marxist ideas can be falsified. For example, I limited the range of applicability of the theory of revolution because most historical events have contradicted it.

details of my thoughts I leave behind: not only do I forget them, but when I reread them I tend to be skeptical of them. I also tend not to care anymore. Once they're on paper, I have no use for them. And yet, despite my philosophical skepticism, it doesn't seem possible that most of my ideas are wrong. My worldview is unassailable. The whole thing makes perfect sense and is borne out by hundreds of observations I make everyday. It doesn't matter from what angle I attack my major beliefs: they remain impervious--given, that is, mankind's current body of knowledge and experience. Inasmuch as new historical experiences will always yield new insights, and new scientific theories will necessitate revisions in older ways of thinking, my worldview is vulnerable and amounts merely to a historical phase. --But that doesn't bother me. My goal, after all, isn't to find truth. It's to encourage you to find it for yourself.

The more treason, the merrier!-- I admire traitors (as such) more than patriots (as such). Traitors stand apart from the mob.

How I justify revealing intimate details of myself to the world.-- If Montaigne could do it, then so can I.

From the phenomenologists.-- In every human consciousness (excepting cases of pathology), there is a pre-reflective self-consciousness. It accompanies every experience, such that in being aware of the principal object of the experience, one is implicitly aware of the experience itself, as well as of the *awareness* of the experience, and of the awareness of its object. This means that one is aware that the experience is one's own even without thinking "The experience is mine". "Every positional consciousness of an object is at the same time a non-positional consciousness of itself. ...[If I am, for example, counting the cigarettes in a case,] it is very possible that I have no positional consciousness of counting them. Then I do not know myself as counting. Yet at the moment when these cigarettes are revealed to me as a dozen, I have a non-thetic consciousness of my adding activity. If anyone questioned me, indeed, if anyone should ask, 'What are you doing there?' I should reply at once, 'I am counting'" (Sartre, 1956, liii). Imagine, for example, the consciousness of an animal: it is clearly aware of its experiences (otherwise it would be unable to react to them), but it is surely not even *implicitly* (non-positionally, non-thetically, non-reflectively) aware of being aware of them. Therefore it has no conception of the experiences as 'its own'; it has no conception of itself. When I listen to a melody--when that's my *primary* activity, i.e., I'm not at the same time focusing my attention on reading or writing--I am reflectively aware of the melody and pre-reflectively aware of (1) listening to it, (2) my awareness of listening to it, and (3) my awareness of the melody itself. They're all bundled together in the same intentional act, and together they allow for my pre-reflective knowledge that the experience is my own.

Admittedly, when I'm absorbed in listening to a melody I am, properly speaking, not really aware of being aware of it--nor even of listening to it; I'm aware only of the melody itself. Sartre's example, however, shows that in some indescribable way, dubbed "pre-reflective", I am aware of the experience and of my consciousness and of its being mine. For, if somebody asks, "What are you doing?" I'll respond without a moment's hesitation, "I'm listening to a melody." That it's impossible to describe an awareness (except by using the ambiguous term 'pre-reflective') which is both self-conscious and unconscious points to an inadequacy in language--a *necessary* inadequacy--which cannot conceivably be remedied, due to the fact that logic opposes consciousness to unconsciousness and rejects the idea of a state in between, which is both conscious and unconscious, or 'partly conscious', or 'pre-reflective'. Intuitively, any intelligent person should know what is meant by 'partly conscious'--e.g., in a riveting conversation I'm partly but not wholly conscious of myself--but logic rejects the possibility of such a 'half-existence', a 'half-

consciousness’;--and since language is based, ultimately, on logic, language will never be able to describe it without using words that, in themselves, do not have a clear meaning. Thus, the inadequacy of language is fundamentally that of logic: logic denies the possibility of an experience that is self-evidently possible. Its inadequacy is something with which phenomenologists must cope, relying on the intuitive/imaginative talents of the reader to bypass logic’s superficiality.

The other type of self-consciousness is reflective. It is explicitly self-conscious; it has consciousness as its object in much the same way that, in the example cited above from Sartre, the cigarettes were the object of consciousness. However, there is a difference: a clear demarcation does not exist between the observing and the observed consciousnesses--in fact, they are one and the same--while it does between consciousness and the cigarettes. Similarly, there is no clear boundary between reflective and pre-reflective self-awareness. Nor do those two terms do justice to the full range of possible degrees of self-awareness. They all ‘blend into’ each other: in different situations I’m aware of myself to different degrees. To argue for that is difficult, but fortunately unnecessary: one has only to observe one’s consciousness at various times to verify its truth. Of course, as soon as one observes consciousness one is already reflectively self-aware, which means it is inherently impossible to ‘observe’ *pre*-reflective self-consciousness, but the latter kind can, to an extent, be ‘verified’ by *recalling* it an instant after it has passed.

There is also a pre-reflective and a reflective awareness of the body, but I’ll pass over those for now. I’ll say only that the reflective awareness of the body is not what I’m referring to here by ‘self-consciousness’; I’m referring to consciousness of consciousness.

Given the foregoing sketch, what is the relation of the self to the ‘two’ types of self-consciousness? Quite simply, it *is* the two types. [...]

Values are meaningless.-- This has been understood by a select few for centuries, but in our sanctimonious culture it’s worth reiterating. Both moral and nonmoral values are meaningless, or at least semi-meaningless. ‘Good’, ‘bad’, ‘right’, ‘wrong’, ‘beautiful’, ‘sublime’, ‘ugly’--in short, any concept that implies either approval or disapproval--‘good’ or ‘bad’--‘ought’ or ‘ought not’--has no concrete meaning. However, past thinkers have made this categorical declaration and have thereby gained nothing. Logical positivists, for example. In his book *Language, Truth, and Logic*, A. J. Ayer arbitrarily asserted that “a sentence is factually significant [i.e., meaningful] to any given person if and only if he knows how to verify the proposition which it purports to express--that is, if he knows what observations would lead him, under certain conditions, to accept the proposition as being true or reject it as being false.” On the basis of this dogma he proceeded to reject metaphysics, ethics and aesthetics as being meaningless blather, since no observations can verify or falsify their claims. What he failed to notice is that they aren’t meaningless blather. There’s a difference between “Raphael’s painting ‘School of Athens’ is a masterpiece” and “wergju tillek schinzovitch lulu friggledeegorp”. One is meaningful and the other isn’t. Ayer apparently didn’t recognize this, or he didn’t feel the need to explain it. I don’t feel the need to explain it either--that isn’t my goal at the moment--but, if you say each word slowly and focus your attention on how your consciousness feels as you do so (*explore* your consciousness), you’ll see that a barely perceptible ‘intuition’ corresponds to each word--while, when you say ‘friggledeegorp’, you can perceive no such intuition. It ‘reaches out’ to nothing (no other ideas) in your consciousness--it coexists with no intentional ‘overtones’--while words do.¹ In Saussurean terminology, this is

¹ Academics will laugh at the vagueness of those two sentences--‘What is “intuition”?’ ‘What is “intention”?’ ‘What is “overtones”?’ ‘What is “ideas”?’--and they have a point, but the partial validity of their objections doesn’t mean that my description has no value. There comes a time when one has to stop insisting on “logical precision at all costs!” if one wants to make any progress whatever. After all, academics have been insisting on it for decades, and look how little headway they’ve made! Anyone who is honest and intelligent will admit that he has an intuitive understanding of what I mean by the disputed terms.

because a word is a union of a signifier and a signified: a “sound-image” and a concept.¹ ‘Friggledeegorp’ is a sound-image but not a concept; it neither is a signifier nor ‘indicates’/is a signified. Value-words are and do, which is why value-judgments are not completely meaningless.

However, they are not completely meaningful, either. This is illustrated by the possibility of the following dialogue.

A: “Raphael’s painting ‘School of Athens’ is a masterpiece.”

B: “What do you mean?”

A: “It’s beautiful.”

B: “What do you mean?”

A: “It’s a sublime work of art.”

B: “What do you mean?”

Only if A says something like “It’s perfectly symmetrical” (which it isn’t, incidentally) can B say, “I understand!” But then B can retort, “Your identification of beauty with symmetry is arbitrary, and I disagree”, and once again they’ll be back where they started: in a debate over the meaning of ‘beauty’. It may seem that this debate exists because ‘beauty’, like all ‘value-words’, is simply *vague*, but that isn’t a sufficient explanation. After all, terms like ‘capitalism’ and ‘socialism’ are vague as well, and yet it’s conceivable that the debate over their meanings may one day be resolved--as it *isn’t* conceivable that the debate over the meaning of ‘beauty’ will ever be resolved. It’s been going on for thousands of years, and it will continue until our species extinguishes itself. --So what’s the difference between the two types of words, between value-words and all others?

Before answering that question it may be wise to elaborate on the preceding. Any given value-word can be defined in two ways: (1) by reference to another value-word. For example, ‘good’ means ‘not bad’, ‘hideous’ means ‘very ugly’, ‘ingenious’ means ‘extremely intelligent’, etc. These definitions accomplish nothing. An ambiguous term is substituted for an ambiguous term. (2) A word with an agreed-upon definition can be substituted for the disputed word. This substitution, however, is necessarily arbitrary. For instance, one can declare that artistic beauty consists in ‘realism’, or that moral goodness consists in ‘compassion’, but if someone asks “why?” no satisfactory answer can be given. The conclusion that “compassion has more value than hate” cannot be reached through a process of purely logical reasoning (unless you start with premises that are themselves not grounded solely in logic or facts). At some point in the argument a “leap of faith” (to quote Kierkegaard) must be made. --What this amounts to is that value-judgments are never logically justified. They have no validity [except *relative* validity, relative to certain values].

The reason for this is that they commit the fallacy of inferring from the fact of one’s aversion or attraction to a given thing that the thing objectively possesses the corresponding property (of--to simplify the matter--‘badness’ or ‘goodness’), the property that provokes the reaction. Now, it does indeed have properties that provoke the reaction--it must; otherwise the reaction would be inexplicable--but it does not have a property that is effectively a crystallization of the reaction. The tacit reasoning behind such statements as ‘The painting is sublime’ is that because it inspires awe it has the intrinsic property of inspiring awe, which is called ‘sublimity’. Of course, the judger may protest that he means only that *he* finds the painting sublime, not that he thinks it is ‘objectively’ sublime and that everyone should agree with him, but his objection is futile. The form of language forces on him the idea that the painting has the property of sublimity. ‘*It is* sublime’, not ‘*it makes me feel* sublime’. It doesn’t make a difference if he rephrases his opinion to “*I think* it is sublime”; the new phrasing means ‘I think it objectively has sublimity’--which it doesn’t and can’t, because sublimity is merely the projection of a reaction in the perceiver. Therefore, no definition we give to the word will be satisfactory: the definition isn’t the problem; the word *itself* is. Any definition will be disputed because there is no analytic connection between it and the word, which is because the word has no ‘analytic’ connection with concrete objects or concrete descriptions, which is

¹ See my prior discussion of those terms.

because it refers to a nonexistent reification of the feeling of approval or disapproval.

But what does it mean to say that a word/sentence is only a *little* meaningful? How can it be partly but not wholly meaningful? The answer: in the case of a word, it has meaning inasmuch as it is associated with a concept, but it lacks meaning inasmuch as the concept is not clearly differentiated from other ones. For example, the concept ‘meaningful’ is itself not very meaningful, since it can be used in a variety of dissimilar contexts and is thus associated with a variety of dissimilar words (which are more clearly defined than it is).¹ (One may object that, e.g., ‘hard’ can be used in very different contexts even though its definition is fairly clear; my answer is that the word ‘hard’ signifies not *one* concept--like ‘meaning’--but *several*: e.g., difficult, not-soft, etc.) Value-judgments, on the other hand, are meaningful inasmuch as they’re composed of concepts related to one another in accordance with the syntactic rules of a given language; they’re meaningless inasmuch as the key concept in them--the ‘value-concept’--is supposed to refer to (or ‘name’) a definite quality in an object, which quality, however, doesn’t exist.

The following sections will present additional arguments against the meaningfulness of values.

Paradoxical.-- Though Hegel was an intellectually dishonest thinker (which, however, didn’t prevent his being one of history’s greatest philosophers), his fundamental intuition was right: mankind is nature’s self-consciousness. In our attainment of power over nature, nature has achieved power over itself. That’s commonly understood, in an abstract way, but rarely is it *imagined*. *Intuited*. Think about this: when you study neurology, billions of cells in your brain are trying to understand themselves. They’re looking at pictures of themselves, they’re learning how they operate--they’re learning that dendrites are stimulated by neurotransmitters released into the synapse, that action potentials traveling along axons are sped up by a myelin coating on the cell--and then they cooperate with each other to feel collective amazement at the fact that these impossibly intricate biological processes are occurring inside them, and then they reflect that despite all this newly acquired knowledge they still manage to delude themselves by maintaining the appearance of a single self that is doing all their thinking for them... They ascribe all these ideas to *us!*--to self-consciousness!--to consciousness of consciousness! We get all the credit for their work! I almost want to reprimand them: “You should have more self-respect, guys!”--until I remember that this would really be *them* reprimanding *themselves*; I’m just the (nonexistent) intermediary they create so as to perpetuate their own existence (because without the illusion of a self--i.e., without self-consciousness--this being that is called ‘me’ couldn’t survive, since humans rely on communication, and communication relies on self-consciousness). And through these cells nature has reached the point at which it can control itself: it can genetically engineer organisms, it can self-consciously create new elements, it can revel in its newfound power by blowing up nuclear bombs. --For all we know, bombs are nature’s way of partying! Maybe wars happen because nature gets bored occasionally and wants to pit itself against itself and see who wins. --In the end, it will probably be able--through us--to decide the course of its own evolution. ‘I want to create a race of supermen. The movies I’ve made exploring the horrors of this scenario are, after all, only movies: in reality I’ll be able to do it better.’ And so nature, in its over-confidence, will end up destroying the animal that allowed it to realize itself, and it will have to start from the beginning again,

¹ Examples: ‘Life is meaningless’ can signify (1) ‘Individual lives don’t have a purpose’, (2) ‘Life is fragmented; there is no thread that ties it all together’, (3) ‘Humans are merely effects of mechanistic physical forces’, (4) ‘Heaven doesn’t exist, so whatever we do in this world ultimately has no consequence’, (5) ‘There is no grand narrative behind history’, etc. ‘This movie is meaningless’ can mean (1) ‘The plot is incoherent’, (2) ‘There is no “message”, no “theme”, being communicated’, (3) ‘It isn’t relevant to reality’, etc. Thus, in Saussurean language, the concept ‘meaning’ lacks ‘value’ (or meaning) to the extent that it cannot be differentiated from other words--which is related to its possible use in different contexts--which is related to its inability to be clearly defined--which is related to its lack of a definite ‘signified’. (clarify!!!)

propelled by its will to power.

Yes, nature has its demon, just like we humans.

Nature's desire for recognition.-- Had man never been created, what a ridiculous comedy the universe would be! All this pageantry, all these spectacles, all this beauty for nothing! It would be a play performed for no audience, with no purpose. The beauty of the sunset, of Vietnam's landscape, of an evolutionary equilibrium that is an *artistic masterpiece* would have no observer, no 'other' to appreciate it! It would not exist; it would be dead. A brute fact opaque to itself. *Man* created it. In nature's creation of man, nature created itself. Perhaps that's why *homo sapiens* was born: nature had reached the point at which it was no longer merely *in-itself*; it was becoming *for-itself*, in the evolution of progressively higher intelligences. Man was the necessary culmination. -- Just as humans need an other, so nature needs an other. We are nature's other; we are what allows it to fully exist, as we are what allows *us* to fully exist, as self-conscious beings.

We are the most advanced crystallization of nature's will to power over itself!

What is charisma?-- Goethe tried to explain Napoleon's phenomenal rise to power by invoking a mysterious force called the "demonic". The idea had existed since the time of the ancient Greeks (though its meaning had changed over the course of millennia). Although Goethe couldn't give a precise definition of it, he often identified it with the creative power of "geniuses", a power that couldn't be reduced to rational causes. When applying it to people like Napoleon, however, who weren't creative geniuses, he meant the following (from *Dichtung und Wahrheit*): "[Men possessed by the demonic] are not always superior in mind or talents, seldom do they recommend themselves by the goodness of their heart. Yet, a tremendous power goes out from them; they possess an incredible force over all other creatures and even over the elements; nobody can say how far their influence will reach. ...the masses are always attracted to them." Aside from the reference to the elements--where Goethe went a little over-the-top--the description fits men as varied as Alexander the Great, Julius Caesar, Hitler, Gandhi, Napoleon, and Martin Luther King, Jr. They have some ineffable quality in common; they possess some unconscious, unrational force: the "demonic". Goethe's mistake was to suggest that it is qualitatively different from similar, but less powerful, traits in other people. We moderns have substituted the (somewhat different) idea of "charisma" for the idea of "the demonic", but we remain ignorant of its nature.

The first important insight is that charisma isn't 'one' quality. It's a combination of several. The most obvious, and most essential, is self-confidence--or the *projection* of self-confidence. Every charismatic person has this. Most such people are also skilled with words, and they intuitively 'know' what a given person (or people) wants to hear. That is, unconsciously they have a deep understanding of human nature. This contributes to their persuasive powers. People enjoy being near them; it tends to make people feel good about themselves. Their sense of self-worth is validated when a charismatic person takes notice of them. If, for example, he expresses gratitude to them, they feel important. If he assigns them a task, they go above and beyond what is requested. If, on the other hand, he criticizes them, they feel crushed.

To say that such power derives from self-confidence, from skill with words, from intuitive knowledge of humanity, explains little. *Why* does it derive from self-confidence? To understand this, we need to have a fairly firm grasp of human nature. The philosopher Hegel may be of use here. By Alexandre Kojève's interpretation of him, Hegel believes that the desire to be recognized is what propels humans to create their history. By 'being recognized' Hegel means 'having one's self-worth be confirmed in the mind of another human being', i.e., 'having another person affirm the value of one's humanity'. Everyone seeks recognition; everyone wants to be seen as valuable.

The logical conclusion of this desire is the desire to represent another's¹ self-ideal, that which he wishes *he* could be. (This desire can be compared with Nietzsche's "will to power".)

To elaborate on that.-- Most human cultural activities--i.e., *not* biological ones like eating and defecating²--are done ultimately, or at least *partly* (which is, admittedly, a vague word), for the sake of recognition. People participate in the business of society because they want to be recognized. Lawyers, doctors, businessmen, artists, even janitors pursue their various avenues to recognition, whether it be through wealth, power or simply the possession of a respectable job. Everyone cooperates (and competes) to create history on the basis of this desire.

Now, what Hegel and Kojève fail to note is that we crave recognition from certain people more than from others. Instinctively³ I respect, e.g., Jon Stewart more than Michael Bolton, Bill Clinton more than George Bush, an adult more than a child. In turn, I'd like to be respected by one more than the other. The reason for both judgments, 'in the final analysis', is that Jon Stewart, Bill Clinton and an adult are, respectively, more charismatic (in a sense) than Michael Bolton, George Bush and a child. Their charisma causes me to believe on an intuitive level that they're 'valuable': unconsciously I judge that their value is equal to or greater than my own. What this value consists in is a question with which my intuition is unconcerned.⁴ It recognizes only that, somehow, these people are 'valuable'. But a vague definition can be extrapolated from the intuition: Bill Clinton, the quintessentially charismatic person, is *more* of an 'other' than most people are. Phenomenologically speaking, his otherhood has more 'substance'; he seems outside of mundane life somehow--larger than it, independent of it. He's a *principle* rather than a mere mortal. [I don't mean *morally*.] By impressing him I'm impressing a being whose subjecthood is so 'heavy' that it's actually 'objecthood', that it represents something (perceived as) nearly immortal, that it's an ideal rather than a human animal who is doomed to die. The basic source of his charisma--of *any* charisma--is his self-confidence; his talents, such as his conversational skill, merely add to the perception that he's supremely confident. The reason for the importance of self-confidence is that it's the one characteristic that creates the impression that its bearer is independent, autonomous, that he is above life by not needing recognition from others to validate his own self-certainty.⁵

The question can still be asked, however, "Why do we want recognition especially from a person we perceive as 'above life' or 'above us' or 'immortal' in some way? Indeed, why do we desire recognition at all? What is the *fundamental reason*?" See the next section [never written] for the answer.

Wisdom rarely increases with age.-- Why do adults think they have the right to laugh at the "silly" games of children? "Oh, how cute, he's playing 'cops and robbers' with his friends!" "Look, he's building a fort! Isn't that precious?" "The little angel is playing with her dollhouse!" --What condescension! What smugness, disguised as fondness! I'm inclined to think that children have more right to laugh at *us* than we do at *them*. A ten-year-old peeking into a bar through a hole in the wall might say something like "How charming! That woman who's wearing a tight shirt to show off her breasts is giggling at whatever idiotic thing that man just said. Oh look, now he's

¹ Incidentally, in Hegelian terminology another person is called simply "the other", because he exists in opposition to the self. (As I'll explain below, one is one's own other as well.) I'll follow his terminology. I'll use the term 'Other', with a capital 'O', to refer to the idea of 'others'--as a single all-encompassing abstraction--rather than to a specific individual.

² The case of sex is more complex. I'll return to it.

³ The significance of that word will be understood when I return to it in subsequent sections.

⁴ You can examine your own intuition to confirm that.

⁵ It's irrelevant that such a person does in fact want to be recognized (often to an abnormal degree). The point is that he seems certain of himself.

whispering to her, with his hand on her leg. Ha! They're so innocent! All that flirting, all that fun pretense, simply because there's a chance his penis will be in her vagina later--and they both know it, but they can't say it because that would ruin the game! Jeez, they're even more engrossed in it than I am when I'm building my fort! --What's wrong with that guy over there? He's singing loudly and falling against tables. Not even little Jimmy is that wild!" I shudder to imagine what a child in a casino would think of us. Thank God the wisdom of children is tempered with innocence!

"The child is father to the man."-- Adults are more childish than children. After all, the latter are perceptive enough to *know* they're children!--which is more than I can say for adults.

Nietzsche was right. Again.-- Anyone who is strong enough to accept suffering should not accept Buddhism.

Quotations from Roosevelt.-- "The only thing we have to fear is fear itself." "The only limit to our realization of tomorrow will be our doubts of today." "The test of our progress is not whether we add more to the abundance of those who have much; it is whether we provide enough for those who have little." --Noble sentiments, which we respect until we're asked to act upon them.

Most of that was nothing but the prelude to the main course. The *hors d'oeuvre*, if you will. I was purging myself of the *ad hominem* drive before hunkering down and getting scholarly.

What I wrote on historical materialism was a little confused. For example, Marxists wouldn't say that every (major) civilization, "given enough time" (i.e., left 'undisturbed' by accidental external influences), would undergo an economic revolution in the manner that Marx outlined. They'd say instead that if it didn't, it would eventually collapse. So my Rome example actually provides *support* for this aspect of orthodox Marxism. I also failed to explain why "snowballing" technological development has the power to break through conservative social and production relations. (Reasons can be easily thought of, though.)

I'd intended to address such problems as the nature of functional explanations, the definition of 'contradiction' and 'tension' (and all the other terms), the issue of methodological individualism versus holism, the mechanisms through which functional explanations work, etc. etc., in the following sections.

Friday, August 26

Can't stand being alone anymore. I'm around people so often here that when I return to my room it feels like a cave. --Dinner with Sandy, the German, last night in the city. Wednesday night went to a bar with philosophy professors and students. This morning went to the gym with Kate, the Brazilian. "MTV beach party" tonight. Cocktail party in the phil. dept. this afternoon. Dinner with Miho, the Japanese girl, tomorrow. Grocery shopping with foreigners today.

Courses: phil. of art, phil. of social sciences, epistemology proseminar.

Coming from the MTV culture, it's refreshing to be sweetly sad and alone again.

I'm sick of pretending to be cheerful and youthful when all I want to do is lie in bed peacefully with someone I love.

Saturday, August 27

Reading an anthology called *Contemporary Debates in Epistemology* (eds. Steup and Sosa) for the

proseminar. Halfway through the Dretske, which argues against the principle of closure (= the idea that if S knows that P is true and knows that P implies Q, then, evidentially speaking, this is enough for S to know that Q is true). I think all the controversies over the definition of knowledge and the definition of the terms one uses to define knowledge and the question of how one knows when one has knowledge and so on are misguided. Knowledge is a semi-meaningless idea. Its definition, vaguely stated, should be unproblematic: one has knowledge when one has a true, justified belief the truth of which one is certain. (Even “Gettier-style counterexamples”¹ and “Goldman’s barn case”²—as my prof explained them/it—don’t pose a problem to this definition, because in both cases one can say that the belief in question, in being *accidentally* true, isn’t completely justified (due to the believer’s not having all the relevant information) and is therefore not, strictly speaking, known.) But the ideas of ‘certainty’ and ‘adequate justification’ cannot themselves be defined except in ways that beg the question, such as ‘certainty = the absence of doubt’. (What is doubt?) Thus, knowledge can’t be clearly defined, and skepticism is ineluctable.³ —In any case, the idea of ‘knowledge’ (the senseless rigor of which is highlighted by the fact that the term ‘*absolute* knowledge’ is effectively its synonym) is, practically and philosophically speaking, irrelevant. *Who cares* whether (we know that) our beliefs, or *any* beliefs, are incapable of being wrong? It doesn’t matter! The corollary of this is that skepticism⁴ too has no great relevance; the impulse to defeat it arises from the valueless longing for some kind of unattainable psychological security. It’s fanciful and shouldn’t be taken very seriously—but, nevertheless, it can’t be refuted. Descartes’ evil demon exists as a permanent, though ridiculous, possibility.

... ‘Knowledge’ has a subjective and an objective aspect. On the one hand, it’s a mental state—a strong version of ‘belief’, namely *certainty*—while on the other it presupposes that the proposition of which one is certain is objectively true. Now, both sides are open to attack. ‘Certainty’ is the absence of doubt; but what does this absence mean? If I see a spot and say “I see a spot”, is it possible for me to doubt it (by asking whether I *know* it)? Yes and no. Inasmuch as it occurs to me that I may not be seeing a spot, that I’m being “massively” deceived, I do doubt it. My doubt may be unclear and apparently ‘empty’, but since the proposition’s negation occurs to me, there is, in a sense, doubt. I think ‘In some metaphysical world, I may somehow be wrong’. But my doubt can’t be effectively *grasped*, as it can when I doubt whether I’ll ever get married. I can easily understand what it would be like to remain a bachelor; I can’t understand how I could be wrong about the spot. Nevertheless, since the ‘abstract’ possibility of my wrongness flits across my mind, I do in a sense doubt the proposition. So I don’t have *complete* certainty, and I don’t have knowledge. What about the person to whom it doesn’t even occur that his belief is wrong? Assuming such a phenomenon is possible (which I doubt⁵)—i.e., assuming he really does have “certainty”—does he have knowledge? No, because his belief might not be true. Can a belief *ever* be determined as true beyond a doubt? In the most rigorous sense, no. But, again, the doubt will often appear meaningless.

Does my loose definition of doubt seem perverse? Probably. But it’s necessary: how else can one account for the existence of these sorts of questions? Clearly philosophers have *some* kind of doubt—and *all* kinds are incompatible with knowledge in the strictest sense.

The idea of ‘justification’ is problematic also. Surely I’m justified in saying “I see a spot”, but am

¹ Example of such an example: “Suppose your colleague Brown tells you that he owns a Ford. You infer: (1) Someone in the office owns a Ford. You believe (1), and your belief is justified. Suppose, however, that unbeknownst to Brown, he went bankrupt. The bank confiscated the Ford. But another colleague Smith happens to own a Ford. Then (1) is true. Yet it seems that you do not know it.” Right. Because my belief wasn’t justified enough for me to claim to know it.

² “S is driving in the country and stops in front of a barn. Unbeknownst to S, S is looking at one of the few genuine barns in an area spawned with barn facsimiles. The facsimiles are so realistic that if S had stopped in front of any of them, S would have been tricked into thinking he was looking at a real barn. But by luck S has stopped in front of one of the few real barns left in the area. The standard intuition is that S does not know he is looking at a real barn, because he could easily have had the same belief while looking at a facsimile.”

³ Maybe that conclusion doesn’t follow.

⁴ The thoroughgoing kind that questions even ordinary knowledge.

⁵ It could be argued that in affirming a proposition, one ‘implicitly’ recognizes the possibility of its falsehood. Would that be doubt? In the (almost meaningless) exclusively philosophical sense, yes.

I justified in saying “I know I see a spot”? If what I wrote above is true, then I’m not (because (1) I doubt the proposition and (2) there’s no way to determine *conclusively* its truth-value). But it’s odd to say the first proposition is justified and the second isn’t, because in saying the first is justified I’m effectively saying it’s true, which would appear to mean both that I know it’s true and that its truth-value can be determined (and therefore that the second is justified as well). But do I *know* the first is justified? As soon as I add the word ‘know’, I become doubtful. That’s always the way it is, in every context! I consider myself justified in saying (it’s true that) the table is brown but *not* justified in saying I *know* the table is brown. Why? Because my uttering the word ‘know’ introduces an element of doubt (really *confusion*) that has its origin in the meaninglessness of ‘know’ (as used in this context).

...Ever since skimming *On Certainty* (at Mendocino) I’ve been attracted to Witt.’s idea (—Does he make it explicit? I forget.) that most of the paradoxes and intuitions and counter-intuitions about knowledge can be explained-away/reconciled by hypothesizing that there are two kinds of knowledge: the ‘commonsensical’ and the (almost meaningless) philosophical. The duality, I think, arises from the schism in our nature between the animal mode of apprehending reality and the ‘intellective’ mode. Expressed in linguistic terms, it’s the ‘ordinary language vs. philosophical language’ dichotomy.

(I wish the library had a copy of W.’s book!)

Miho’s a nice girl, but she’s an airhead. I asked her what her greatest passion in life is; her answer was “shopping”.

Sunday, August 28

Contemporary epistemologists are confused. They’re going about the problem(s) in the wrong way. As I said a while ago, the only way to a solution is to *cut through* the difficulties, to get *below* them, as Wittgenstein tried to do.

Ridiculous that people are still doing philosophy in this age! It’s dead! Look around: there’s no place for it, and there’s nothing exciting to say anymore anyway. All we philosophers are obstinate deniers of reality. We might as well embrace pop culture or dehumanizing science and wait for the nuclear war.

Dretske’s strategy, more or less, is to argue that an abandonment of closure is the only way around skepticism. But his arguments are muddled. He thinks that “closure tells us we have to know there is an external world in order to see there are cookies in the jar [that we’re looking at]”, but he’s wrong—in a sense. I can “see (hence, know)” there are cookies in the jar without knowing there’s an external world if I define cookies not as mind-independent objects but simply as ‘those things I see (which may, after all, be mind-dependent)’ (because in this case my knowing there are cookies wouldn’t imply there are mind-independent objects). On the other hand, if I define cookies as mind-independent (as D. seems to do), then yes, I do have to know there’s an external world in order to know there are cookies, because the existence of mind-independent cookies logically entails there are mind-independent objects. If I can’t know there are mind-independent objects, and I define cookies as such, then—oh well—I can’t know there are cookies. Dretske may be right that an abandonment of closure is the only way around skepticism, but he’s wrong that closure can be abandoned. Doing so is tantamount to denying logical entailments.

—This is what Dretske’s position comes down to: ‘Even though q follows from p, and I know that p is true, it’s possible that q is false’.

Friday, September 2

Suicidal thoughts. Same old same old same old.

Leaf-lonely,
 lilac lay lovelessly,
 lacking life's lively lilt,
 looking
 dead.

In a paper by Denis Dutton on artistic forgery, he writes the following: "Consider for a moment Smith and Jones, who have just finished listening to a new recording of Liszt's *Transcendental Études*. Smith is transfixed. He says, 'What beautiful artistry! The pianist's tone is superb, his control absolute, his speed and accuracy dazzling. Truly an electric performance!' Jones responds with a sigh. 'Yeah, it was electrical all right. Or to be more precise, it was electronic. He recorded the music at practice tempo and the engineers speeded it up on a rotating head recorder.' Poor Smith—his enthusiasm evaporates." Would your enthusiasm evaporate too? My guess is yes. But why? What does that say about your expectations, and the way you experience art? —It says your enjoyment is intimately connected to your assumption that it's a human being that performs/creates whatever it is you're admiring. (Your reaction would be the same if you were looking at a magnificent painting or sculpture etc. and learned that a machine had created it.) Unconsciously you expect art to 'glorify' him who creates it (and thereby mankind). If it doesn't do so (as in Dutton's example), it doesn't interest you. Whether it does so through hatred or ugliness or beauty or love is secondary; the main point is that it be an *achievement*. Because the *David* is a greater achievement than, say, *Tilted Arc*, or Duchamp's *Fountain*, it's appreciated more—and it fulfills art's most immediate purpose more effectively. (Maybe you'll ask what it means for something to be an 'achievement'. You'll say "You're begging the question!" In the way I'm using the word, the impressiveness of an achievement is a quality we—crudely—understand through intuition. It refers to the complexity, the ambition, the skill displayed. We intuitively see that the *Eroica* symphony is a greater achievement than the *Pathétique* sonata; this is the main reason for our judgment that *as art* it's more impressive. Obviously, though, this mode of evaluation isn't adequate. Other criteria have to be introduced to clarify and refine our judgments.)

Saturday, September 3

I have no qualms about saying, "I know there's a desk in front of me". The 'I know' part seems unnecessary and strangely meaningless, but I feel entitled to it. However, if someone asks me, "But do you *know* there's a desk in front of you? Do you *really know* it?", I'll start to have doubts. I'll think 'maybe, after all, I'm wrong somehow'. —In short: I know there's a desk here, but I don't *know* it. The emphasis changes the word's meaning—even though it remains, on some level, meaningless.

The reason that *absolute certainty* is impossible (indeed, inconceivable (hence meaningless)) is that self-consciousness can't help positing an external world (or rather, the externality of the world), i.e., an external truth. Because it's both of itself and of an object—a world—'opposed' to it, it's aware that this object is outside of it, and that it can never have direct, intuitive access to the interior of this object. The division between self-consciousness and the world (which is also that between self-consciousness and itself, since it's aware of two things at once) is what makes negation not only possible but implicit in the nature of consciousness—and this permanent presence of negation, as I wrote earlier, is why we can't overcome doubt. As long as we can imagine an alternative, we can doubt. When I 'naïvely' affirm a proposition, as in the above example, I'm concentrating on what I'm 'naïvely' aware of. But when I ask myself whether I truly know I'm right, I'm concentrating—possibly in a confused, half-conscious way—on the dualism between myself and an objective reality. I'm concentrating on the possibility (really the *necessity*) of negation.

Am I justified in my belief that Bush went to New Orleans after hurricane Katrina had devastated it? Yes. I read it in the *Times* and saw photographs. Do I *know* he went? No. It's possible the information I

read was mistaken. And anyway, I'm not in a position to decide whether I know it; only someone who has immediate evidence of, or access to, the truth can decide that (because knowledge isn't knowledge unless the belief is true). —Now, that my belief is completely justified as a belief but not as knowledge—i.e., that I'm being entirely rational in being convinced of its truth even though (I recognize that) its falsehood is a possibility—is a strange contradiction, which shows that, in a sense, the concept of knowledge is superfluous, or at any rate, not very useful.

Monday, September 5

Barthes, “The Death of the Author” (—reading it makes you grateful for the death of the author); alternative title: “Rolando Furioso”, in honor of its author's chugging along blithely through a minefield of logical fallacies and confusions. Four pages densely packed but somehow void of meaning.

Bell, “The Aesthetic Hypothesis” (—yes, it's a *pretty* hypothesis, but that's all); alternative title: “How Not to Have Common Sense”. Oh Clive, you cute little Brit;—‘I fancy theory, my dear; what say you? Shall I try my hand?’ ‘Nay, love, 'tis time for tea!’ ‘Ah, right then. Cheerio, my good friend!’

Collingwood, “The Principles of Art” (—you *won't* find them here); alternative title: “I Have No Idea What I'm Talking About”. Art isn't a craft; it's an *idea*! Yea, and an expression of emotion! There is no technique in art; and the only kind of art is *good* art! (But clearly *good theory* is *not* the only kind of *theory*.)

throat parched with slakeless thirst for facile fame,
 a desert-fountain whose truth is
 a cruel longing to die
 in others' minds
 and thus
 be
 reborn
 in this cruel life,
 but it's a delusion,
 for the desiccate springs of joy
 can be replenished only from *within*

Tuesday, September 6

What insane instinct drives philosophers to go to preposterous lengths to find a way around skepticism? It's like they shudder even to *think* about it. Nerds. Says Dretske: “[Skepticism] is a last resort. If the only choices are skepticism or the rejection of closure, then—too bad—we had better learn to live without closure.” Yes, it's better to throw aside logic than to accept (the impossibility of refuting) skepticism.

The Republican party is straining its sinews to dismantle the country. Everything it does is counterproductive. The “Homeland Security Department” takes funding away from the Federal Emergency Management Agency, and what's the result? Catastrophe on a biblical scale. It's foreseeable and preventable, but Incompetence is the malevolent despot that oversees our safety. And now the deficit is going to be astronomical—as it already was—and Congress will continue to insist on cutting taxes (or at least expenditures), and on crusading against gay rights, and on legislating Creationism, and on ignoring prophecies of global warming, and on driving this country right into the shithheap of history.

I find it all terribly amusing. It's happened a thousand times before. How can you not sit back and laugh at the rodents scurrying pellmell into the trap? Look at Bush! Look at “this coward we have

empowered”!¹ *He’s leading us! King Rat! It’s the blind leading the sighted! And we can’t do anything about it!*

Still, as I said, it’s a great show.

Man is a disease. He must be quarantined from himself.

Wednesday, September 7

Reading Norman Mailer’s *Advertisements for Myself*. Ought to have read him years ago. My writing might have benefited; it might even—dare I say it?—have been something not to be disowned.

He criticizes passages of his as poorly written, which when I read leave a decidedly favorable impression. What does this mean? Is he being dishonest or do I lack the critical faculty?

I can’t imagine that the overripeness of our culture doesn’t make every esoteric project otiose. I can’t fathom the relevance anymore of art and intellectual matters. Philosophy, let us admit, is in its yellow leaf; this is uncontroversial, though painful for me, given that philosophy is, was, or would have been my vocation. Psychology and the social sciences don’t fare much better, given the imperative of specialization as well as the public’s apathy. Literature is passing away, losing its powers to engage society’s imagination and tap the vein of rebellion—or (at any rate) discontent. Music died decades ago. Even political activism founders on the rock of the System. My floundering, my depression, itself seems merely comical and narcissistic. When everything is pointless and society has reached the end of time, and whatever one does will not matter in the long run, is it not presumptuous to ascribe *weight* to oneself? Truly, I might as well follow Byron’s example and give myself up to masochistic hedonism.

And yet none of this matters. I am who I am: my “evil hours” notwithstanding, I’ll never stop fighting.

Thursday, September 8

I reread the last two years of this journal. Though its onanistic excesses made me see myself as God sees mankind, I’ve profited from the activity. I know better now how to craft these entries in such a way that the reader isn’t led to prefer Pepys’s diary over mine. I’ll be more careful from now on.

Friday, September 9

Evening with lovable anarchist Sandy. (A common occurrence.) She made dinner. Funny happy passionate girl. Invited me to San Francisco with her and her European friends during Thanksgiving.

We discussed examples of New Orleans-style anarchism. Hundreds of people with no money getting together to form makeshift communities—which were then, of course, destroyed by officials. Here’s an account that should set you smoldering, if there’s an ounce of humanity in you:

Hurricane Katrina-Our Experiences
Larry Bradshaw, Lorrie Beth Slonsky

Two days after Hurricane Katrina struck New Orleans, the Walgreen’s store at the corner of Royal and Iberville streets remained locked. The dairy display case was clearly visible through the widows. It was now 48 hours without electricity, running water, plumbing. The milk, yogurt, and

¹ From Eminem’s song “Mosh”.

cheeses were beginning to spoil in the 90-degree heat. The owners and managers had locked up the food, water, pampers, and prescriptions and fled the City. Outside Walgreen's windows, residents and tourists grew increasingly thirsty and hungry.

The much-promised federal, state and local aid never materialized and the windows at Walgreen's gave way to the looters. There was an alternative. The cops could have broken one small window and distributed the nuts, fruit juices, and bottle water in an organized and systematic manner. But they did not. Instead they spent hours playing cat and mouse, temporarily chasing away the looters.

We were finally airlifted out of New Orleans two days ago and arrived home yesterday (Saturday). We have yet to see any of the TV coverage or look at a newspaper. We are willing to guess that there were no video images or front-page pictures of European or affluent white tourists looting the Walgreen's in the French Quarter.

We also suspect the media will have been inundated with "hero" images of the National Guard, the troops and the police struggling to help the "victims" of the Hurricane. What you will not see, but what we witnessed, were the real heroes and sheroes of the hurricane relief effort: the working class of New Orleans. The maintenance workers who used a fork lift to carry the sick and disabled. The engineers, who rigged, nurtured and kept the generators running. The electricians who improvised thick extension cords stretching over blocks to share the little electricity we had in order to free cars stuck on rooftop parking lots. Nurses who took over for mechanical ventilators and spent many hours on end manually forcing air into the lungs of unconscious patients to keep them alive. Doormen who rescued folks stuck in elevators. Refinery workers who broke into boat yards, "stealing" boats to rescue their neighbors clinging to their roofs in flood waters. Mechanics who helped hot-wire any car that could be found to ferry people out of the City. And the food service workers who scoured the commercial kitchens improvising communal meals for hundreds of those stranded.

Most of these workers had lost their homes, and had not heard from members of their families, yet they stayed and provided the only infrastructure for the 20% of New Orleans that was not under water.

On Day 2, there were approximately 500 of us left in the hotels in the French Quarter. We were a mix of foreign tourists, conference attendees like ourselves, and locals who had checked into hotels for safety and shelter from Katrina. Some of us had cell phone contact with family and friends outside of New Orleans. We were repeatedly told that all sorts of resources including the National Guard and scores of buses were pouring in to the City. The buses and the other resources must have been invisible because none of us had seen them.

We decided we had to save ourselves. So we pooled our money and came up with \$25,000 to have ten buses come and take us out of the City. Those who did not have the requisite \$45.00 for a ticket were subsidized by those who did have extra money. We waited for 48 hours for the buses, spending the last 12 hours standing outside, sharing the limited water, food, and clothes we had. We created a priority boarding area for the sick, elderly and new born babies. We waited late into the night for the "imminent" arrival of the buses. The buses never arrived. We later learned that the minute they arrived to the City limits, they were commandeered by the military.

By day 4 our hotels had run out of fuel and water. Sanitation was dangerously abysmal. As the desperation and despair increased, street crime as well as water levels began to rise. The hotels turned us out and locked their doors, telling us that the "officials" told us to report to the convention center to wait for more buses. As we entered the center of the City, we finally encountered the

National Guard. The Guards told us we would not be allowed into the Superdome as the City's primary shelter had descended into a humanitarian and health hellhole. The guards further told us that the City's only other shelter, the Convention Center, was also descending into chaos and squalor and that the police were not allowing anyone else in. Quite naturally, we asked, "If we can't go to the only 2 shelters in the City, what was our alternative?" The guards told us that that was our problem, and no they did not have extra water to give to us. This would be the start of our numerous encounters with callous and hostile "law enforcement".

We walked to the police command center at Harrah's on Canal Street and were told the same thing, that we were on our own, and no they did not have water to give us. We now numbered several hundred. We held a mass meeting to decide a course of action. We agreed to camp outside the police command post. We would be plainly visible to the media and would constitute a highly visible embarrassment to the City officials. The police told us that we could not stay. Regardless, we began to settle in and set up camp. In short order, the police commander came across the street to address our group. He told us he had a solution: we should walk to the Pontchartrain Expressway and cross the greater New Orleans Bridge where the police had buses lined up to take us out of the City. The crowd cheered and began to move. We called everyone back and explained to the commander that there had been lots of misinformation and wrong information and was he sure that there were buses waiting for us. The commander turned to the crowd and stated emphatically, "I swear to you that the buses are there."

We organized ourselves and the 200 of us set off for the bridge with great excitement and hope. As we marched pasted the convention center, many locals saw our determined and optimistic group and asked where we were headed. We told them about the great news. Families immediately grabbed their few belongings and quickly our numbers doubled and then doubled again. Babies in strollers now joined us, people using crutches, elderly clasping walkers and others people in wheelchairs. We marched the 2-3 miles to the freeway and up the steep incline to the Bridge. It now began to pour down rain, but it did not dampen our enthusiasm.

As we approached the bridge, armed Gretna sheriffs formed a line across the foot of the bridge. Before we were close enough to speak, they began firing their weapons over our heads. This sent the crowd fleeing in various directions. As the crowd scattered and dissipated, a few of us inched forward and managed to engage some of the sheriffs in conversation. We told them of our conversation with the police commander and of the commander's assurances. The sheriffs informed us there were no buses waiting. The commander had lied to us to get us to move.

We questioned why we couldn't cross the bridge anyway, especially as there was little traffic on the 6-lane highway. They responded that the West Bank was not going to become New Orleans and there would be no Superdomes in their City. These were code words for if you are poor and black, you are not crossing the Mississippi River and you were not getting out of New Orleans.

Our small group retreated back down Highway 90 to seek shelter from the rain under an overpass. We debated our options and in the end decided to build an encampment in the middle of the Ponchartrain Expressway on the center divide, between the O'Keefe and Tchoupitoulas exits. We reasoned we would be visible to everyone, we would have some security being on an elevated freeway and we could wait and watch for the arrival of the yet to be seen buses.

All day long, we saw other families, individuals and groups make the same trip up the incline in an attempt to cross the bridge, only to be turned away. Some chased away with gunfire, others simply told no, others to be verbally berated and humiliated. Thousands of New Orleaners were prevented and prohibited from self-evacuating the City on foot. Meanwhile, the only two City shelters sank

further into squalor and disrepair. The only way across the bridge was by vehicle. We saw workers stealing trucks, buses, moving vans, semi-trucks and any car that could be hotwired. All were packed with people trying to escape the misery New Orleans had become.

Our little encampment began to blossom. Someone stole a water delivery truck and brought it up to us. Let's hear it for looting! A mile or so down the freeway, an army truck lost a couple of pallets of C-rations on a tight turn. We ferried the food back to our camp in shopping carts. Now secure with the two necessities, food and water; cooperation, community, and creativity flowered. We organized a clean up and hung garbage bags from the rebar poles. We made beds from wood pallets and cardboard. We designated a storm drain as the bathroom and the kids built an elaborate enclosure for privacy out of plastic, broken umbrellas, and other scraps. We even organized a food recycling system where individuals could swap out parts of C-rations (applesauce for babies and candies for kids!).

This was a process we saw repeatedly in the aftermath of Katrina. When individuals had to fight to find food or water, it meant looking out for yourself only. You had to do whatever it took to find water for your kids or food for your parents. When these basic needs were met, people began to look out for each other, working together and constructing a community.

If the relief organizations had saturated the City with food and water in the first 2 or 3 days, the desperation, the frustration and the ugliness would not have set in.

Flush with the necessities, we offered food and water to passing families and individuals. Many decided to stay and join us. Our encampment grew to 80 or 90 people.

From a woman with a battery powered radio we learned that the media was talking about us. Up in full view on the freeway, every relief and news organizations saw us on their way into the City. Officials were being asked what they were going to do about all those families living up on the freeway? The officials responded they were going to take care of us. Some of us got a sinking feeling. "Taking care of us" had an ominous tone to it.

Unfortunately, our sinking feeling (along with the sinking City) was correct. Just as dusk set in, a Gretna Sheriff showed up, jumped out of his patrol vehicle, aimed his gun at our faces, screaming, "Get off the fucking freeway". A helicopter arrived and used the wind from its blades to blow away our flimsy structures. As we retreated, the sheriff loaded up his truck with our food and water.

Once again, at gunpoint, we were forced off the freeway. All the law enforcement agencies appeared threatened when we congregated or congealed into groups of 20 or more. In every congregation of "victims" they saw "mob" or "riot". We felt safety in numbers. Our "we must stay together" was impossible because the agencies would force us into small atomized groups.

In the pandemonium of having our camp raided and destroyed, we scattered once again. Reduced to a small group of 8 people, in the dark, we sought refuge in an abandoned school bus, under the freeway on Cilo Street. We were hiding from possible criminal elements but equally and definitely, we were hiding from the police and sheriffs with their martial law, curfew and shoot-to-kill policies.

The next days, our group of 8 walked most of the day, made contact with New Orleans Fire Department and were eventually airlifted out by an urban search and rescue team. We were dropped off near the airport and managed to catch a ride with the National Guard. The two young guardsmen apologized for the limited response of the Louisiana guards. They explained that a large section of their unit was in Iraq and that meant they were shorthanded and were unable to complete all the

tasks they were assigned.

We arrived at the airport on the day a massive airlift had begun. The airport had become another Superdome. We 8 were caught in a press of humanity as flights were delayed for several hours while George Bush landed briefly at the airport for a photo op. After being evacuated on a coast guard cargo plane, we arrived in San Antonio, Texas.

There the humiliation and dehumanization of the official relief effort continued. We were placed on buses and driven to a large field where we were forced to sit for hours and hours. Some of the buses did not have air-conditioners. In the dark, hundreds of us were forced to share two filthy overflowing porta-potties. Those who managed to make it out with any possessions (often a few belongings in tattered plastic bags) were subjected to two different dog-sniffing searches.

Most of us had not eaten all day because our C-rations had been confiscated at the airport because the rations set off the metal detectors. Yet, no food had been provided to the men, women, children, elderly, disabled as they sat for hours waiting to be "medically screened" to make sure we were not carrying any communicable diseases.

This official treatment was in sharp contrast to the warm, heart-felt reception given to us by the ordinary Texans. We saw one airline worker give her shoes to someone who was barefoot. Strangers on the street offered us money and toiletries with words of welcome. Throughout, the official relief effort was callous, inept, and racist. There was more suffering than need be. Lives were lost that did not need to be lost.

Sunday, September 11

Massive wet t-shirt party last night in the backyard of a frat house. It was like one of those "Girls Gone Wild" porn videos. They danced on a catwalk, hundreds of people looking up at them, and, in the course of the night, tore off their soaking shirts, their dresses, their underwear, making out with each other, "eating each other out", bending over to give us some nice views of their unmentionables. Remarkably good bodies. I forced myself to leave with Sandy before I wanted to. (In fact, it was I who suggested we leave. I don't know why.) Apparently last year they made use of cucumbers in some Amsterdam sex house-ish ways. The women in the crowd enjoyed the spectacle as much as the men, yelling at the girls to "take it off!", etc. (The male version of the exhortation was "Eat it! Eat it! Eat it!")—Yes, women like being objects. —I got quite "hot and bothered". Didn't dwell on the fact that I'd become an animal.

Earlier in the day, went to the Forest Park art museum with Sandy and two friends.

How do you explain the female enjoyment of wet t-shirt parties? Men would be repulsed watching fellow men strip-teasing. —Or would they? I suppose it isn't hard to imagine men on the sidelines cheering, in jest. But they probably wouldn't yell anything like "Take it off!" And they wouldn't be as eager, as invested in the situation, as women are in the parallel case. To say that homosexuality, or at least bisexuality, is more natural for women than it is for men isn't a good explanation (though it's probably true). A better one might be that women (have been conditioned to?) see themselves from the male point of view, as objects, and thus unconsciously identify with the exhibitionists;—but that still isn't (remotely) adequate. (What does 'unconsciously identify with' mean? Etc.) Both factors, and surely others, are relevant.

Monday, September 12

Taking Paxil again. And going to therapy. Maybe the combination will have an effect.

If I can't stamp myself into the social order, what's the point of doing anything? This is the problem I've been struggling with.

Saturday, September 17

I saw the movie *2046*. Its effect on me is comparable to the effect that the song "Gloomy Sunday" had on Germans in the '30s: I'm in the mood to kill myself. Not in the *ugly* sad mood, but the *beautiful* one. Partly because I'm in love with Ziyi Zhang. But the movie itself was a masterpiece. 'We all exist in the past; our memories guide us through life, try as we might to escape into the future, away from them. They always find a way to pull us back.' And what music! Not only the aria "Casta diva"; the whole soundtrack transports the film to the realm of immortality (as if it even needed this extra polish!). It's a cinematic opera, an infinite work of art.

Oh, but Ziyi... Luckily the Sarabande gives a purpose to my pain.

Monday, September 19

Reading *The Naked and the Dead*.

Sunday, October 2

Reading Sylvia Plath's journal. A history of narcissistic misery. No one as pretty as she should have been allowed to suffer so. [Ironic humor, obviously.]

And *On Certainty*, partly so I can talk to Sandy in German. (A refresher course.)

My therapist = young lovely lively lady, psych grad student. Enjoy our sessions, in which I spiel about myself in great detail, laying it all bare. They're of no use to me except in that to confide in someone is de-burdensome (especially a laughing girl like Mika). Told her that it's a strange world when you have to go to a therapist just to talk about yourself, since you'd be a bore if you did so with your friends.

Been active lately. Moved to an apartment with an Indian roommate. Partied with philosophy professors two nights ago. Saw Count Basie Orchestra perform last night with Sandy, Jennifer, *jolie* Delphine (*français*), and two others. (Very skilled band but a let-down: tuneless jazz.) Frequenting the gym. Drinking every weekend of course, and often during the week. Going to the Homecoming dance on Saturday, Sandy's birthday party on Friday. U.s.w.

Graded my first batch of papers. Felt like my father. But it ain't too exciting.

Am Anfang war der Zorn.

Monday, October 3

(Some) skeptical hypotheses are really quite muddled. It may indeed be the case that a demon is deceiving me by making me think that the things I see constitute an external world or whatnot, but it's nonsensical to suggest that I may 'actually' be a brain in a vat. The I that I am is *right here*; the word 'I', as applied to myself, has no meaning outside of my immediately existing, immediately self-present self here in this world. I can't be two beings at once: I can't be *this self* and a brain in a vat somewhere in the 'background'. It may be the case that a brain in a vat is producing all my experiences, but *I* am not that brain. –How terribly obvious this is! Yet philosophers seem not to take it into account.

So then do I *know* I'm not a BIV? Meaningless question. Because certainty is meaningless, and because I don't have direct access to truth (and in order to know something, I have to have access to

metaphysical reality). The most I can say is that my being a brain in a vat is inconceivable. —Again, the question doesn't *seem* meaningless because 'know' has meaning in certain (unphilosophical) contexts.

But it seems that if I don't, after all, know something, then I'm doubting it—even where (as here) doubt has effectively no content and no force. So am I doubting the proposition that I'm not a BIV? I guess so—but only in the sense that I recognize that a metaphysical world of truth may be hidden from me, a world in which, perhaps, logical self-contradictions (like the one in question) may somehow be true.

Wednesday, October 5

Read *Stanford Encyclopedia* entries on formal logic (modal, etc.). Eventually had to stop, so as not to asphyxiate in the miasma.

Thursday, October 6

Listened recently to an interview with Norman Mailer in which he discussed two “immensely useful” expressions he'd learned from someone: ‘Work is a blessing’, and ‘No one ever said it had to be fair’. The contexts: when he's sick of working on a novel, dispirited, eager for it to be finished, Mailer tells himself “Work is a blessing”, and his attitude immediately changes. And when he's feeling sorry for himself, is perhaps weary of life, he says “No one ever said it had to be fair”. I can confirm that these two sayings are immensely useful. I've taken to murmuring them when I feel a twinge of self-pity, because it vanishes. In the past, in life-disliking, self-pitying moments I've told myself “Aaah, it's all bullshit anyway”, and this has comforted me (on account of its truth), but I prefer “No one ever said it had to be fair”. It's more encouraging. —Still, I can't help myself from uttering the ‘bullshit’ phrase many times a day.

Sunday, October 9

A passage from Emerson's journal, tapping the androgynous wisdom of the Gnostics and Carl Jung and Virginia Woolf, and full of psychological truth: “A highly endowed man with good intellect & good conscience is a Man-woman & does not so much need the complement of Woman to his being, as another. Hence his relations to the sex are somewhat dislocated & unsatisfactory. He asks in Woman, sometimes the Woman, sometimes the Man.”

Read articles on set theory (supposedly the foundation of mathematics), Gödel's incompleteness theorem, the analytic/synthetic distinction, Putnam's refutation of the BIV argument (groan, yawn), usw.

Monday, October 10

Reading *Philosophy of Mathematics* (eds. Putnam and Benacerraf), a large selection of classic writings. My appalling perplexity about mathematics, logic, the *a priori*, analytic statements and so forth drove me to it.

Why is the idea of death terrifying? Partly because nothingness is inconceivable. The only thing we can relate it to is sleep, but we have no conception of what *sleep* is either (because, properly speaking, we don't experience sleep). Actually, the idea of sleep is itself scary;¹ it doesn't usually seem so because it's such a common occurrence and is so obviously harmless (given that it's always succeeded by

¹ Every night in bed I'm appalled, and fascinated, by the thought that soon I'll be unconscious.

consciousness) that we don't dwell on it. But we shrink from the idea of an eternal dreamless sleep. So, aside from the unpleasantness of our knowledge that something we've never experienced (and can't even make sense of) is going to happen to us,¹ why are we disturbed? Probably also because the notion of eternity is essentially as frightening as that of nothingness. (An eternal life may be as terrible a prospect as an eternal death.) Why *this* is so, I don't know. And what the *other* reasons are for our fear of death, I don't know. In fact, I doubt that there *are* other ('rational', 'conscious') reasons. Nature simply hardwired us to have a visceral fear.

Biological explanations like that are unsatisfying.

By the way, the absence of a sufficient rational justification of our fear shows how little autonomy we have, how little free will.

Tuesday, October 11

We consider Giordano Bruno admirable, even heroic, for consenting to be burned at the stake rather than recant his Copernican beliefs; yet we consider Galileo much more sensible for choosing such a recantation over death. It seems almost *stupid* to suffer an agonizing death for the sake of an abstract principle, but at the same time it's more admirable than the alternative. Strange, *n'est-ce pas*? I suppose it makes sense, though. Prudence, common sense, reasonableness are qualities we all have, and are therefore not noteworthy; irrational courage is rare. Hence we admire its possessor. —Of course, analytically speaking, Bruno's choice is not necessarily more 'noble' than Galileo's. The motivation behind Bruno's courage is something like fear of being humiliated, fear of self-contempt. So in a sense ('in the long run') the 'cowardly' way is actually more courageous (provided one has the capacity to suffer from humiliation and self-contempt).

Wednesday, October 12

Excerpt from one of Joyce's letters to Nora:

Darling, do not be offended at what I wrote. You thank me for the beautiful name I gave you. Yes, dear, it is a nice name. 'My beautiful wild flower of the hedges! My dark-blue, rain-drenched flower!' You see I am a little of a poet still. I am giving you a lovely book for a present too: and it is a poet's present for the woman he loves. But, side by side and inside this spiritual love I have for you there is also a wild beast-like craving for every inch of your body, for every secret and shameful part of it, for every odour and act of it. My love for you allows me to pray to the spirit of eternal beauty and tenderness mirrored in your eyes or to fling you down under me on that soft belly of yours and fuck you up behind, like a hog riding a sow, glorying in the very stink and sweat that rises from your arse, glorying in the open shame of your upturned dress and white girlish drawers and in the confusion of your flushed cheeks and tangled hair. It allows me to burst into tears of pity and love at some slight word, to tremble with love for you at the sounding of some chord or cadence of music or to lie heads and tails with you feeling your fingers fondling and tickling my ballocks or stuck up in me behind and your hot lips sucking off my cock while my head is wedged in between your fat thighs, my hands clutching the round cushions of your bum and my tongue licking ravenously up your rank red cunt. I have taught you almost to swoon at the hearing of my voice singing or murmuring to your soul the passion and sorrow and mystery of life and at the same time have taught you to make filthy signs to me with your lips and tongue, to provoke me by obscene touches and noises, and to do in my presence the most shameful and filthy act of the body. You remember the day you pulled up your clothes and let me lie under you looking up at you while you

¹ Though, of course, it won't happen to us, since we'll be dead. But this is part of the paradox.

did it? Then you were ashamed even to meet my eyes.

Mailer called Joyce the only genius in the 20th century to have written in the English language.

Friday, October 14

Had I a gun, I'd have to follow Tolstoy's example and hide it from myself.

It's paradoxical to think that if I killed myself, despite oblivion the world would go on and my parents would never be happy again. The possibility of oblivion and existence coexisting is incomprehensible.

I'm glad I'm not naïve enough to care that hardly anyone would care if I died. The desire to be mourned is not only selfish and vain but ignorant. Even your closest friends would mourn you for only a short time. Your team would keep ploughing without you.

Saturday, October 15

Returning to the question from Thursday [deleted]: I'd feel a similar but milder shame (or guilt?) if I were unjust to, say, Jim or Sandy behind their backs. A possible reason is that I'm accustomed to thinking of them fondly, so the expression of 'dislike' would produce a kind of cognitive dissonance. Biologically speaking, this might be caused by a circumvention of the established pathways between the clusters of neurons associated with Jim or Sandy and those associated with approval and disapproval: the bypassing of the deeply ingrained connection between 'Jim' and 'fondness' in favor of a new connection between 'Jim' and 'dislike' causes an unpleasant sensation in consciousness that we have labeled 'shame' (or guilt). This sounds fanciful, though¹—and in any case it can't be the whole explanation, for a variety of reasons. E.g., I don't feel the same self-displeasure when *thinking* the 'unfaithful' thought as I do when *saying* it. (According to the explanation, this shouldn't be the case.) The presence of another person who hears the statement is an essential (part of the) cause of my shame.

Maybe it's as simple as: I "half-consciously" recognize that the person I'm denigrating would think less of me if he were there to hear me; and because I like and respect him, his tacit disapproval makes me insecure. (What the mechanisms are, I don't know.) This insecurity is what we call 'shame'. —While I'm skeptical of that account, its plausibility is heightened by the self-evident fact that in situations of *acute* shame (as when I was caught stealing a magazine all those years ago), one is terribly insecure. Still, it seems as if insecurity isn't the only ingredient in that emotion; there's also a self-disgust and so on, which is of course caused by the other's disgust—and which is, therefore, I suppose, merely a component in the overall insecurity.

And yet, when I said that stupid thing about [blah], I had the distinct sense that I'd done something wrong—which was related to my feeling a little sorry for him. Self-insecurity was the furthest thing from my mind. I was more pained by (what I imagined as potentially) *his* insecurity, *his* embarrassment. [...]

Philosophers who try to define causality make Sisyphus's task seem rational. Not to mention easy.

¹ Why? (Why is it intuitively implausible?) One reason (there are many!) is that the creation of a new neural pathway is surely painless! Why? Because it happens all the time, yet I'm never conscious of corresponding pain. So my reasoning is inductive: based on a variety of particular examples, I've made a general conclusion (*viz.*, that the forging of a neural connection is always painless). —My social science and epistemology courses have taught me to be curious about the methods of reasoning I employ. (Incidentally, I still agree with my conclusion from years ago: *a posteriori* intuitions like the one in question are an instantaneous 'processing' of reasons, which one can then 'unpack'. I suppose *a priori* intuitions, like $2 + 3 = 5$, are the same—which means effectively that in most cases they're an understanding merely of the necessity of a given proposition, since the reasons for it are, essentially, the necessity itself.)

No definition could possibly be adequate, i.e., a *substantive explanation*. Here's a recent attempt, the virtue of which was supposed to be its enshrinement of common sense: "*c* causes *e* if and only if the intrinsic relation that typically accompanies causal dependence holds between *c* and *e*." Very enlightening. Here's another (very famous) one (David Lewis's): "where *c* and *e* are two distinct possible events, *e* causally depends on *c* if and only if *c* occurs [funny arrow-shaped thing with a circle attached to it] *e* occurs and *c* does not occur [funny arrow-shaped thing with a circle attached to it] *e* does not occur." The '*c* [funny arrow-shaped thing with a circle attached to it] *e*' relation is defined as 'If *c* were (or had been) the case, *e* would be (or have been) the case'. Expressed in a human language, Lewis's definition is essentially "If *c* occurs, *e* occurs, and if *c* had not occurred, *e* would not have occurred." Again, you can see how tremendously illuminating that is. Lewis's theory is an influential version of the (—prepare to be impressed by a big word—) "counterfactual theory of causation". [This theory, in any case, is wrong, or overly simplistic. Read Michael Scriven's paper "Causes, Connections and Conditions in History".]

The point is that all such definitions are either circular (in some cases) or simply uninformative, given that we can't understand them without reverting to our intuitive understanding of causality (which, moreover, has somehow, inexplicably, more *content* than they do). The causal relation is essentially unanalyzable, irreducible—which makes sense, given that it structures experience. I'm also inclined to think that the proposition "In order for something to happen, it has to be caused" is synthetic *a priori* (since it makes a claim about experience but is obviously justified on some other 'intuitive', 'innate', 'logical' basis than experience—as is evidenced by our conviction of its *necessity*, i.e., our inability to conceive of an uncaused event).¹ In other words, causality is a form (or rather *foundation*) of experience that we don't learn *from* experience but bring *to* it, ontogenetically and epistemologically speaking. [This doesn't mean that causality doesn't hold in the world-in-itself. There's nothing inconsistent about saying both that the idea of causation is justified *a priori* and that causation applies to the world independently of us.]

By the way, Bertie Russell thought we could dispense with the notion of causation altogether. He seemed not to recognize that we can't.

Sunday, October 16

What am I going to do with my life? What am I going to do with my life? What am I going to do with my life? What am I going to do with my life? What am I going to do with my life? What am I going to do with my life? What am I going to do with my life?

Tuesday, October 18

Sat on the couch for four hours and thought about the meaning of art (and 'game' and 'play') and what the rules are for determining the extension of the class 'aesthetic qualities'. [...]

Lay down in darkness on the rug on which I sleep (for lack of a bed) and got to thinking unwittingly about Sangi sweet Sangi and the night we lay together whisperlessly in the hotel in Berlin and when she asked if she might hug me and I said yes and when she kissed me against her conscience and struggled with herself as I lay there quietly letting her sift through her feelings because her torment was too private for words to have been humane and my desire was too strong for words to have been honest. But her regret

¹ I can hear you say "but what about quantum mechanics?" I answered this objection years ago; here it is again: we don't, and can't, experience or intuit the world of quantum mechanics, so your objection is beside the point. Similarly with all those non-Euclidean geometries and relativistic structures of spacetime and whatnot, which are supposed to refute Kant. Kant's claim (about causality and the synthetic *a priori* structure of space and time, etc.) applies only to experience, not to the world "in-itself". You can't tell me that it's possible for a human being to experience a world in which causality doesn't hold, in which $7 + 5$ doesn't equal 12, in which space has four dimensions.

passed and so we lay there happily, and in Freiburg we were happy and in Paris we were happy and in Venice we were happy, and I was never happy again.

Wednesday, October 19

–Aaaaah, rhetoric. The night will do strange things to you.

To be honest, I've been quite happy lately. (The past week was an exception, for trivial reasons.) And I think that in the following months I'm going to be happier than ever, for the excellent reason that I'm popping pills like Eminem's mother. I started yesterday. Went to Walgreen's and bought several bottles of strong energy pills, which I'm taking with my regular (unauthorizedly high) doses of Paxil and Wellbutrin. I've also discovered an energy drink that makes "Jolt" seem like water. Drank too much of it yesterday, which resulted in three hours of sleep and the uplifting thing I wrote above.

(Btw, no more useless therapy.)

Bill O'Reilly, the human stain, was on the Daily Show. Watching him was of course like having adrenaline injected directly into my heart. Murderous thoughts placed my hands around his neck. But how do I justify my anger? Its *causes*, after all, are irrational enough: physical stimuli + neurons etc., or unconscious psychological reactions etc. The question is, is it rational? (Or: can it be *made* rational?) –On second thought, that's not what's bothering me. Anger is *necessarily* 'irrational' [or rather unrational, since it isn't self-contradictory]. *This* wouldn't bother me if I believed with an acceptable degree of certainty that the convictions by which I (delusively) justify my anger are truer than his. You ask "What, you seriously think *he* may be right and *you* wrong?!" Well, I simply can't understand how a man with some intelligence could be vehemently certain of beliefs and yet not be 'justified' in them (in some loose sense of the word). This question is at the heart of the uncomfortable doubts I've felt for eight years about the justifiability of my world-view. (I've often told you I'm never "sure" of my beliefs. Well, this (question) is a major reason for that.) Unless I can explain how, or why, billions of people (Christians, conservatives, etc.) are wrong and I'm right, I'm being somewhat intellectually dishonest by continuing to believe as I do. What I have to understand is *what allows* all these people to be as terribly wrong as they are. If they in fact are, then they must 'lack' something that I have, some capacity. Or maybe I lack something they have. The point is, there's an 'inner' difference between us. What is it? It's easy to say they're "stupid", or, more rigorously, that they have some kind of 'mental block' that prevents them from being wholly rational about certain things, but that explains nothing.

The apparent (superficial) validity of the postmodernist position disturbs me: everyone has his biases, everyone has had his beliefs formed in and by a certain environment; therefore, it's probable that no one is more justified ('objective') than anyone else. The conclusion doesn't logically follow, but it's natural to be led to it by the premises. What does it mean to say it's wrong, though? How *can* it be wrong? We all do have biases; we all do have 'extra-rational' inclinations and influences that lead us, more or less, to our beliefs. The postmodernist might say that my biases just happen to be more 'accepting' and 'tolerant' and 'less misanthropic' than O'Reilly's; that doesn't mean I'm right (because such qualities have nothing to do with truth). –The obvious answer to this is that *some* biases (a better term is 'psychological conditions') are more conducive than others to an objective inquiry into truth. For example, O'Reilly justified his hatred of the French by invoking the fact that even though "we bailed them out of World War II", they aren't loyal to us [to the U.S. government, that is]. From this premise (and maybe one or two others—e.g., their ostensible arrogance), he concludes that they're hateful or whatnot. I, on the other hand, justify my neutral attitude toward the French by invoking the 'facts' that (1) WWII was a long time ago, and (given the disappearance of prior generations and the birth of new ones, as well as the constant emergence of new cultural movements, etc.) it's unreasonable to expect a country to act gratefully to another forever;¹ (2) in

¹ This is the argument set out (fairly) explicitly: (1) WWII was sixty years ago; (2) sixty years is a sufficiently long time for the 'collective consciousness' of the people of most countries to lose its memory (or at least its belief in the

the case of such decisions as whether to go to war (in Iraq), it would be irresponsible for politicians to let considerations of ‘gratitude’ override legitimate qualms (moral or otherwise) they might have about military action; (3) if French arrogance is systematically compared to American arrogance, the latter will probably be seen to be *at least* as extreme as the former; (4, 5, 6...) a blanket condemnation like O’Reilly’s is the most indefensible kind of inductive conclusion,¹ no nation is perfect, America has plenty of faults... In short, if O’Reilly’s arguments and mine were lined up and compared, mine would trump his. –If I systematically refuted all his beliefs like this, the (inductive [*abductive*]) conclusion would be that my ‘*a priori*’ psychological conditions, while themselves as extra-rational as his, make possible a more generally valid deployment of the principles of logic and induction than his do, which would effectively mean that I have a firmer grasp of truth than he does. (It could also be said—though it would be unnecessary and redundant—that, postmodernist relativism notwithstanding, my mind is more ‘objective’ than his, which allows for its greater insight into truth.) The answer to the question, then, as to what it is that I have and he lacks, is: a better understanding of induction (and maybe logic in general), made possible by, for example, my comparative patience and dispassion.

Incidentally, my original question (“How can an intelligent man be certain of his beliefs yet not be ‘justified’ in them?”) was a poorly phrased dead-end. ‘Intelligence’ is a useless concept in this context. O’Reilly is ‘intelligent’ in some respects but not in others.

What about my atheism? It’s based on the argument that there’s no reason to believe in God and many reasons not to. This is, of course, abduction again. For instance, in all of science and all empirical observations (that *I’ve* made) there is nothing that logically implies (or even inductively (strongly) suggests) a divine intelligent being; hence, I conclude that the concept of God is superfluous. Maybe you’ll say that Einstein thought differently, and therefore etc. But why did Einstein think differently? Let’s say it was because he thought the universe was too wondrous a thing to have been produced by chance. I say in response: there’s nothing, logically speaking, that links ‘wonder’ or ‘awesome beauty’ or ‘perfect mathematical consistency’ or whatever to ‘intelligent creator’. All we have to go on are a hunch and a few feeble analogies refuted by Hume in *Dialogues Concerning Natural Religion*. Or maybe Einstein would say that free will can’t be accounted for on the assumption of a mechanistic universe. My answer is, Why not? Sure it can! There’s no contradiction in the thought that the brain causes actions which we mistakenly interpret as having been directly caused by intentions. Admittedly, this raises the question of epiphenomenalism and so on, and it may even prove to spawn too many problems for our meager intellects to solve, but even this wouldn’t be a reason to reject it. We’ll never understand the exact workings of the nervous system, but we don’t conclude from this that there *aren’t* “exact workings of the nervous system”. –Maybe that argument isn’t convincing. Here’s another: our difficulty in understanding my hypothesis is due ultimately to the paradoxical nature of consciousness, which both the theist and the atheist have to deal with. So it isn’t *my* problem; it’s *ours*. –Anyway, what all this comes down to is that (my cast of mind is such that) I need a logical or inductive reason for all my beliefs, while, in general, the Christian doesn’t. Or, more accurately: some Christians may, but their reasons are less sound than mine, which means (if you want) that, in a sense, they’re less intelligent (or rational, or analytically minded) than I am. Most Christians,

relevance to contemporary affairs) of an event; (3) this loss of memory will cause any country not to take into account the event in question in its dealings with other countries; (4) a consequence of premise (3) is that if the event in question would seem to suggest that the country in question should act gratefully to another, it will not; (5) to single out one country on the basis of a fact that applies to many (or all) is groundless; therefore, the country in question should not be criticized for not acting gratefully to another on the basis of the event in question. O’Reilly’s argument is this: (1) Any country that has been liberated from an oppressor by another country should act gratefully to the latter for at least sixty years; (2) the French have not done that; therefore, (3) they are not acting as they should; and therefore, they are, on the whole, bad people. Now, premise (2) in my argument is an inductive generalization, and as such is fallible; however, O’Reilly’s argument begins with an arbitrary premise and ends with a more fallible inductive generalization than the one I used (in that mine is extrapolated from a greater variety of phenomena). (I won’t cavil about the meaning of ‘bad’—but, strictly speaking, any value-judgment is problematic.) Therefore, my argument is stronger.

¹ This criticism of his induction has a different foundation than the one offered in the previous footnote.

though, don't even need a (rational, i.e., logical or inductive) reason for believing in God; they just....*believe*—because it's comforting.

Thursday, October 20

Haven't been tired during the day for weeks. *Es ist ein sonderbares Gefühl.*

I've come to appreciate for the first time how much of my thinking is done unconsciously. Generally I'm aware only of an argument's conclusion and one or two of its premises (or none at all), when there are ten or more.

Friday, October 21

See entry August 17, sentence 3 ("if my memory doth not greatly err"). Erstwhilely it disliked me to *lesen* the tabloids *weil* to be informed of the latest debaucheries of the most pampered people on the planet was less than uplifting; howbeit, *jetzt* I perceive that learning of z.B. Brad Pitt's undeserved happiness with Mille. Angelina *Jolie!* maketh me to rejoice, for that I am involved in Mankind and shall nevermore gleefully send to know for whom the bell tolls. *Ich gratuliere dich, Brad! Und du, das Leben, ich liebe dich leidenschaftlich! "Warum?" fragst du?* Because I am but a machine stimulated by chemicals, which are themselves stimulated by pills. *Ich bin nun wie der Dalai Lama, der jeden liebt, und den jeder liebt.*

The universal prejudice that it requires "character" (and is thus *admirable*) to take pleasure in another's pleasure is the opposite of the truth. Unless "character" means "happiness" and happiness is admirable. Sympathetic joy is nothing but a symptom of self-centered joy. People who don't feel it shouldn't be *criticized* but *pitied*. Bill O'Reilly should be pitied.

The one problem with these pills is that they kill my appetite. But that's a small price to pay for having an insatiable appetite for life.

During Rita, the lone FEMA worker in New Orleans sent frantic emails to Michael Brown pleading for help, describing the terrible conditions in the Superdome. In one of them he wrote, "Sir, I know that you know the situation is past critical. The sooner we can get the medical patients out, the sooner we can get them out." A short time later [reports the *Times*], Brown's press secretary, Sharon Worthy, wrote colleagues to complain that the FEMA director needed more time to eat dinner at a Baton Rouge restaurant that evening. "He needs much more than (sic) 20 or 30 minutes," Worthy wrote. "Restaurants are getting busy," she said. "We now have traffic to encounter to go to and from a location of his choice (sic), followed by wait service from the restaurant staff, eating, etc. Thank you."

—"Brownie, you're doing a heck of a job!" said Bush.

Saturday, October 22

People tend not to take seriously Freud's idea of female penis-envy, but I think it may have a kernel of truth. Women, after all, tend to be more insecure about their genitals than men do (see Joyce's letter to Nora): they're shyer about them, are probably more disturbed (though they might not know it) by their 'dirtiness' or whatever, and see them as something of a weakness. That the vagina is a hole, an ugly smelly bloody hole, seems somehow important to female insecurity.

If you think about it, the act of hugging is absurd. Even more absurd than sex. Extending your arms, walking towards someone until there's not an inch of space between you, closing your arms around his back and holding them there tightly for a while, your cheek rubbing against his, and then backing away

from him and letting your arms sink to your sides. What is the point of this bizarre ritual? It seems utterly random and senseless. Of course the answer is, “It feels good; it’s a way of demonstrating affection; it has important social functions; etc.” But beneath these answers lies the stubborn fact of its senselessness, its bizarre animality.

Sunday, October 23

Went to a state park in Illinois with Sandy and her friend Josh and hiked around the hills through forests. I was full of energy, forging trails through thickets (thistles sticking into me, burrs covering me), climbing up small cliffs, walking faster every time I felt my heart wheeze and gasp. Sandy was pleasantly surprised, while Josh—this big sturdy guy my age, nature-lover and frequent camper—straggled behind, whining about our pace. He was kind of annoying the whole time, making childish jokes and generally having a weak personality (which I enjoyed dominating). When we stopped to take breaks or to take in the vista from designated peaks, my energy predictably left me and I was left yawning and yearning for bed. But as soon as we started up again I became the trailblazer (avoiding the beaten path). Sandy observed, perceptively, that I’m bipolar. I observed, silently, that hiking is my favorite activity.

Although it was a good day and I was quite happy (not least because of Sandy’s flirtatiousness and obvious attraction to me), I didn’t let myself feel anything like untarnished contentment. I never do. Whenever I see that I’m the object of undue attention, that everyone seems to like me, that girls laugh at every lame joke I make, my cynicism asserts itself and tells me that people are fickle, that my popularity is only temporary, that my personality can’t support it for more than a few hours. I even start to feel a little contemptuous of these people who gravitate to me like iron filings to a magnet, these people who aren’t perceptive enough to see that I’m *always* ‘this way’, who will leech onto some other guy as soon as they sense my wit flagging and my confidence waning. I tell myself how contingent and silly is the charade!—how little meaning it has! And how much effort it takes to master! So I stop trying, I self-consciously stop trying to justify the attention. Whenever I’m at the top of my game I quit arbitrarily. “Don’t let yourself be giddy and happy, Chris. It’s naïve.”

I was in rare form at the party on Friday night. Got two phone numbers. Girls who play classical piano, a French and a Vietnamese.

Monday, October 24

For the last month or so I’ve been itching for a confrontation of some kind. Preferably a violent one. I’ve wanted to test the limits of my new-felt maturity/confidence. Example: the day before the homecoming dance I went shopping with Delphine for a dress and shoes (four hours of divine patience on my part); on the way home in the metro a (black) guy and girl were shouting brutal insults at each other. The guy was worse, though: he was calling her a fat whore, a bitch, etc., while she was unsuccessfully trying to fight back. All the passengers, and the fighters’ friends, were listening timidly. I walked over to the shouting match and just stood there, staring; the shouters ignored me. A dangerous excitement seized me; I longed to defend the girl. Don’t know why; partly from pity, but mostly because “the imp of the perverse” had emerged from his lair. I was on the verge of interrupting the guy when I realized that he and the girl were actually friends, and that my barging into a private conflict would be inappropriate. I was disappointed.

Wednesday, October 26

Finished *The Naked and the Dead*. Written when the author was my age, it’s a striking achievement. Mailer’s knowledge of life and humanity wasn’t much deeper than mine, but his skill with words was.

It's possible to have two or more thoughts in the same instant. (E.g., self-awareness, awareness of the piece of paper in front of you, and a vague thought about someone you know.) Indeed, it's possible we're *always* having two or more thoughts in the same instant. That people don't realize this—and that it's hard to decide for or against the hypothesis in the last sentence—and that logic seems to suggest that having two thoughts at once is nonsensical—shows that there's something radically misguided about how we conceptualize consciousness and the self, and that logic is provisional (though also *a priori*).

Reading things by and about Wittgenstein reminds me of Prado's book on Foucault. In expositing Foucault's notions of archeology, genealogy, ethics and so on, Prado returns half-a-dozen times to the question of whether F's claims about truth are cogent. The problem is that, given F's disavowal of the project of understanding "ahistorical" truth, how are we to interpret his own ideas? Are they not supposed to be true? Are they, as F seems to suggest, merely alternative "fictions", or narratives meant to undermine prevailing power-structures, or "problematizations of established truths" undertaken purely for the sake of problematizing established truths (whatever that means)? Prado repeatedly acknowledges the force of the "relativism" charge, and he repeatedly postpones answering it. Again and again he offers tentative, 'experimental' defenses of Foucault, but always he implicitly recognizes their inadequacy and says effectively "Keep reading; I promise to get to the bottom of this!". His postponements eventually become comical. In the penultimate chapter, devoted solely to the Foucauldian conception(s) of truth, he fails to come to a conclusion, instead saying, *again*, "I'll return to this in the last chapter". When finally he has to face the music and tell us why we should take Foucault seriously (as a philosopher), he gives the following hilariously pitiful answer: "The point of [Foucault's] ceaseless problematization of established truths and knowledges is to enable us to resist being wholly determined by power-relations.... [The purpose is to] 'promote new forms of subjectivity', [which] can be accomplished only by changing the truths, knowledges, and discourses within which we are defined and in terms of which we define ourselves. A novel Foucauldian construal is not a thesis to be assessed for truth; it is an opportunity, a perspective-shifting idea that, like a concept as understood by Canguilhem, admits of quite diverse development. The construal's cogency, then, is not a function of its initial content, but of how it is taken up." In other words, the only value of the ideas is in their usefulness in fighting the Man!

—My point is that Prado's tap-dances have forerunners in Wittgenstein's and his expositors'. You could read about Wittgenstein all day and come away with nothing but a question-mark. All this mumbo-jumbo about conventions, games, linguistic "rules"—Why in the hell have philosophers seized on this "rules" idea like it's too brilliant for words?!—all this shit *cannot* be as ingenious as everyone says if it can't even be coherently expressed! Whenever you read about the "private language argument"—of which there are as many interpretations as there are interpreters—you're assured it has some kind of earth-shaking significance even as the interpreter's account fails to be minimally intelligible or defensible. Any objection you have to it—to *anything* Wittgenstein says—is answered with "You're misunderstanding him!" "But—" "No, you're misunderstanding him!" Chomsky is right that ideas worth expressing can be expressed in fairly clear language.

Thursday, October 27

I can't help being impressed every day by how *easy* and *fun* life is when you're confident and popular. Responsibilities don't bother you, nothing is stressful, boredom is rare (because friends are distractions).

Getting drunk now. And every night this weekend.

Saturday, October 29

Chopin's 19th nocturne. Near the end, about 2 min. 20 sec. into it, when it gets quieter (and also at around 1 min., briefly). Makes me think of the cover of Rubinstein's CD of Chopin selections, the photograph of him wearing a straw hat in a sunny climate, smiling. Think of lying on a beach under a palm tree, the susurrus of the wind caressing you.

Maureen Dowd—for whom, admittedly, I have not a particle of respect—agrees with me (in a *Times* “essay”) that the feminist movement has long since been waylaid by vaginal vanity. This is the considered opinion of a self-proclaimed forerunner of Sarah Jessica Parker's Carrie Bradshaw: “It was naïve and misguided for the early feminists to tendentiously demonize Barbie and Cosmo girl, to disdain such female proclivities as shopping, applying makeup and hunting for sexy shoes and cute boyfriends and to prognosticate a world where men and women dressed alike and worked alike in navy suits and were equal in every way.” So, at least Dowd's honest, if nothing else: women have “proclivities” toward—*cough*—objecthood (i.e., subordination).

Monday, October 31

Natural-selectively speaking, what's the functional explanation of why women laugh more than men, and why men are expected to make women laugh (far more than vice versa)? Well, the main function of laughter is obviously to encourage ‘fellow-feeling’, communal bonding and so on. (Laughter is essential to raising the comfort-level of a social gathering—probably because it's a ‘relaxing’ discharge of energy that would otherwise be occupied in self-consciousness and mutual distrust/desires-to-dominate—and the more people laugh, the more they like each other.) This ties into the sexual relationship in that the male's job is to make females comfortable with him, so that they not only want to fuck but want to have this man around always to protect them and their child. It's far less important for the female to make the male comfortable, because, from his perspective, all that nature wants him to do is fuck her and move on.¹ His ‘comfort-level’ is irrelevant to whether he'll be successful in cock-impaling her. A second aspect: females want a male who dominates, and the ability to make people laugh is intimately related to the ability to dominate.

But what *is* laughter? And what causes it? In every context I can think of, being funny involves being unexpected and/or being (socially) inappropriate. (Examples: punchlines, the diarrhea song, someone's slipping on a banana peel.) Often there is an element of “being *schadenfroh* with a good conscience”. As² I said above, I think laughter signifies mainly a reduction of tension, even when it happens in solitude. Or, in less mechanistic terms: it is a means toward community—which probably in some way accounts for the pleasure inseparable from it. From infancy on, smiling is intrinsically pleasurable, and laughter is just smiling taken to an extreme. Our biology must be such that from the first days when we learn how to smile we ‘instinctively’ know that it means a connection with another being—and these connections, be they manifested in whatever way, are *always* pleasurable. (The reason we're able to smile and laugh even when not in the company of another person (with whom to make a connection) is that our self-consciousness effectively provides us with this other person. In being aware of ourselves we're aware of an other. We smile with, and for, this other.)

–I can't enlarge on these ideas now. Have to go to a “Busta Rhymes” concert.

Ughh. After that experience, not even the Jupiter symphony can make me feel human again.

Tuesday, November 1

¹ From the female's perspective, of course, nature doesn't want him to move on.

² I added the following sentences when I was writing my book *The Humanist's Manifesto*, since I thought I was going to put these reflections in it.

Location of “concert”: the local watering-hole. About three hundred people. It “started” at 9, though Busta didn’t come out till 11:30. Highlight of the night: “the hip-hop violinist”, Miri Ben-Ari, 27-year-old Israeli classically trained beauty who at one point incorporated “Für Elise” into a riff. Busta came out with his minion Spiff or Spoofer or Spit or whatever and proceeded to disappoint his audience. –Unless they’d come there to see their hero spend half the time screaming hate and misogyny (and the other half screaming hate and misogyny to a beat). His hostility toward his fans was shocking. Anyone who didn’t raise his arms and sway them to the music—hell, anyone who didn’t spend the whole time dancing!—was singled out and mocked till he conformed. (Sandy and I refused to play along; I half-hoped I’d be picked on, just to see if my will was as strong as that of a mob and its coked-up leader screaming at me.) Afterwards I lashed out at Tim, the dingleberry who’d brought us there; couldn’t provoke him into an argument, though.

Wednesday, November 2

$2 + 3 = 5$. –Analytic or synthetic? Both options are tempting: synthetic, because I can see why Kant thought that the concept of 5 isn’t contained in the concept(s) of $2 + 3$; analytic, because what the equation says is really only $| + | = |$. From this perspective, it’s sort of a tautology.

I have to do a lot more reading before I think about this stuff.

2nd movement of B’s 8th.¹ Quintessentially classical in spirit, the more so b/c B had abandoned the classical spirit by the time he wrote it. The ticking of the metronome, the simplicity, the breezy rhythmic structuring of a rhythmless world. Return to Winckelmann’s Greece—not “shallow out of *profundity*” but out of the happiness of the noble savage. The noble savage whose savagery has decadently come to outweigh his nobility and so he turns back to his imagined arcadia, thus surpassing the classicism of the classicists even as—*because*—he knows it’s hopeless.

Being a leader is anticlimactic. (Like everything else.)

(Late at night. Forgive the sentimentality.—) *To my future love*: If you have read this journal, and if you have come to know me, you know what mood I am in now. Insomniac otherworldliness.... You know I cannot write as Joyce or as a poet, and you know I cannot express my love for you and my gratitude, but you know none of this matters anymore. If I am in your arms I have lost all ambitions and all regrets and especially all memories, and my self-love has died in your eyes. I am tired of living at the age of twenty-five and were it not for my dreams of you I would lose my ability to laugh. I love you, I love you not “more than life itself” but more than I long to *transcend* life itself, more than I long to sigh away into music, more than I love music. I love you and will love you and will die loving you more than the breath of life loved its first creation.

Thursday, November 3

It’s official: I’ve entered a new stage of my life. The change from my August self to my autumn self has been as sudden and radical as any in my past.

I don’t know what I meant by those thoughts above on the symphony. The second movement is just a frolic! That’s all. Nothing deep.

¹ As interpreted by Pierre Monteux and the Wiener Philharmoniker.

Sometimes I worry that as I mature I may lose my primeval wonder at the fact that people see me as an object in the world. This wonder has always been related to my introvertedness and hence my insecurities, so it isn't necessarily a good thing. But it's part of me, and it differentiates me from others, and it makes me more profound than others—or so I've always thought—and so as I lose my insecurities and thereby my solipsistic wonder I feel like I'm losing myself. I *want* to lose this wonder, but I *don't*. My hope is that I'll finally lose it when around others but I'll be able to hold onto it when around myself.

Friday, November 4

I don't even know what I want. *I don't know what I want!* I don't know if I want to give away my possessions and become a Buddhist monk, or if I want to walk over to my so-called friends' apartments and tell them I despise them and everyone, or if I want never again to be unkind, or maybe I want to blow my brains out, or I want to understand everything and die an instant later, or can it be I still want to love? [...] It would breed that delicious confusion that makes me remember I exist and is always incubating in my subconscious womb to explode periodically like warm semen spurting over your hand only to incubate some more in your testes and then spurt forth again like the messy confusion spilling around all over my mind and congealing in little stains on the written page and making me hate my existence my fucking existence like I hate fucking women with their smelly dishonesty and sloppy self-confusion and anal shopping-fixations and hideous shallowness which contrasts hatefully with my hideous selfish self-loving self-loathing which self-loves itself into sterile-smelling orgasm spraying sickish-soulless spirit-semen across the knuckles of my subconscious seediness seeping scary desires of rape and lust and murder into the sanctuary-of-moral(istic)-leprosy that is my self-consciousness such that super-egoistically I repress it too self-knowingly so that it does no good and stays on the surface beneath pretenses of goodness beneath pretenses of badness cultivated skillfully to seduce the sexual sex who self-delusively select scoundrels to have sex with as the most sinful scoundrel of all sits like Narcissus solitary before his semblance simpering sickeningly through sweetly syntaxed sentences spurted jerkily into daily spots of scholarish swill across swaths of spotless tabula rasas that are thus stained with the sour thoughts of a sullen selfish somber self who tells himself he's God's sole son the self-caused antichrist the sower of despair the Universal Solitude that sneaks up silently on unsuspecting humans in their moments of weaknesses and their final instants of existential instantiation (in this cemetery of existence) sapping their sagging spirits of sappy stupid enthusiasm the slag that settles at the lowest levels of the soul like sediment in a wineglass or settlements of squirming maggots on the underside of a squirrel's carcass yes enthusiasm is the symptom of the philosophically supine soul which refuses to scale the slopes of life's essence to see the summit of truth and sadness (because it lacks the spirit's spur of suffering) but instead survives at the subsistence level of "sacred happiness" and sleeps smugly in the sensuous atmosphere of skin-sucking sex-scheming sylph-dreaming milf-reaming cunt-screaming sweet-seeming swinish salivation and spittle-dribbling exhalations as the Christ-despiser sips from the chalice of sacred malice naked malice life-giving malice the *real* phallus the solace of the solid seeker of self-dissatisfaction the juice that sluices through the sewer of the psyche to stimulate the sexless sperm to spark the process of sexless (self-)creation which specializes in paralyzing the moralizing hypocrasizing sermonizing of Christ-utilizing life-despising self-stylizing 'sympathizers with celestial saintliness' who seem rather like 'sycophants with sovereign servility' and suggest to me a confusingly self-unaware cerebral impotence or something like a wetless feckless female who worships her own fecklessness in the name of the Spirit up there who dicks himself all over the world smearing his gospel into soft minds like mine deep in confusion and self-doubting hatred of all that obtains.¹

¹ An alternative ending is: "...wetless feckless female whose frigid field above her fissure lies fallow though fecund fetors float from far within her fraud-vagina like ("divine") flatus from her 'fairy-fragrant' anus fraught with flowing 'fairy-fragrant' feces like fluids filling her fleshy fracture fingered fuckishly till frenziedly a fountain spouts out about the mouth of the lout whose snout routs out rotted trout from out the mound plowed by the proud Roustabout up there who dicks himself all over the world smearing his gospel into soft minds like mine deep in confusion and self-doubting

Saturday, November 5 (3 a.m.)

The moments when you feel the pressure of lusty tenderness but you aren't in the mood to jerk off and yet you keep thinking of the girl whose image chokes your heart like a wrung sponge and you have to wriggle from its grip and claw out from beneath this damned anvil crushing you but you can't because the sexual release of whipping your cock to congestion has no relation to the required release of constipated tenderness, tenderness—tenderness.

Sunday, November 6

It's incredibly annoying that there are people with more talent than me. (That long stream of self-indulgence above is something I should be ashamed of for its puerile pleasure in pleasant sounds, paltry alliterations.)

But it's *horrifying* that we're all just little hamsters running in our wheels to project our shadows onto the cave wall. If we succeed and the image stays there awhile and other people see it, we're happy. That's all it takes, and that's all it is.

Tuesday, November 8

My first paper in grad school:

The (anti-)definition of art

In his paper "The Role of Theory in Aesthetics," Morris Weitz argues that philosophers of art have been chasing a chimera in their attempts to discover the necessary and sufficient conditions for calling something 'art.' Inspired by Wittgenstein's critique of the concept 'game'—according to which, no definition can be given of 'game' that applies to all and only things that are commonly called 'games'; rather, such things share a variety of "family resemblances"—Weitz argues that, apropos of defining art, philosophers can only list properties that *by and large* apply to artworks; none of them applies to *all* artworks. In his paper "Family Resemblances and Generalizations Concerning the Arts," Maurice Mandelbaum attempts to refute Weitz's conclusion by exploiting the parallel he (Weitz) draws between the concepts 'art' and 'game' (both of which, Weitz argues, are "open" rather than "closed"), namely by demonstrating that Wittgenstein's original analysis of 'game' was unclear, question-begging, and ultimately mistaken (and that, therefore, there *is* a set of necessary and sufficient conditions for calling something 'game,' and, by implication, (potentially) for calling something 'art'). If Mandelbaum is right, such theorists as Arthur Danto, Jerrold Levinson, George Dickie, and Richard Eldridge have been justified in continuing to strive for a single comprehensive definition of art; if he is wrong, these subsequent attempts have been doomed from the start. We shall argue that Mandelbaum is wrong.

hatred of all that obtains." 'Divine flatus' is an allusion to the term "divine afflatus", i.e., divine inspiration. Obviously one of the themes of the whole thing is the dichotomy between the 'high' and the 'low', and the interplay between them, and the hypocrisy of the human species (which denies and ignores the low). That's why I use so many religious words. By the way, after my roommate Will had read that passage he observed that all the 's' sounds suggest the serpent in the Garden of Eden, which I hadn't thought of.

Wittgenstein's doctrine of family resemblances may be stated as follows:¹ "one need not suppose that all instances of those entities to which we apply a common name do in fact possess any one feature in common. Instead, the use of a common name is grounded in the criss-crossing and overlapping of resembling features among otherwise heterogeneous objects and activities" (Neill, 194). In relation to the concept 'game,' such features might be, for example, the presence of rules, of competition, of more than one player, of 'fun,' of "absorbing non-practical interest" (Neill, 197). If this list were comprehensive, Wittgenstein would say that every game has one or more of these properties, but not necessarily all of them: some games may lack rules, others may not be fun, others may involve only one player. It may even be the case that the only 'game-ish' properties one game has are that it is organized by rules and that it is fun, while the only properties of another are that it contains an element of competition, that it involves more than one player, and that it is of absorbing non-practical interest (but is, perhaps, not properly called 'fun'). These two games have no game-ish properties in common (except the vague one that they are of non-practical interest), yet they fall under the same class—because the properties they have are conventionally associated with the concept of game.

To forestall an objection that Mandelbaum might raise, we should point out that although it is plausible to suppose that all games are indeed of absorbing non-practical interest, and that therefore this property might be taken as the defining one, it is in fact, at most, merely necessary. It is not sufficient, because games are not the only things that are of non-practical interest. (Art is, for example.) Wittgenstein's contention is that there is no necessary *and sufficient* condition for naming something 'game.'

Mandelbaum's main objection to Wittgenstein's theory is that, as an explanation of why one thing is called a game while another is not, it begs the question. Given that many activities are, e.g., fun and have rules and yet are not games, the "family resemblances" idea provides us with no criteria for determining whether to call something a game. Mandelbaum gives two examples (Neill, 195): (1) a person who appears to be playing the form of solitaire called "Canfield" is in fact 'reading fortunes' from the cards. The two activities are very similar (both in their "manifest" and "non-manifest" properties), but one is a game while the other is not. Why? They both, after all, have rules and can be construed as fun, and, moreover, they 'look' alike. Wittgenstein's theory offers no solution. Mandelbaum's second example is of the same kind as the first: a wrestling match is similar to a fight (in both its manifest and non-manifest properties²), but the activities belong to different classes. How shall we account for this?

There are two replies to this objection. Before outlining them, though, we should note that the similarity between the *manifest* characteristics of two activities, one of which is a game and the other is not, is irrelevant to the problem at hand. As Mandelbaum himself states, it is extremely likely that the only properties relevant to defining 'game' are not manifest—such properties as 'competitive' and so on. Therefore we can disregard the 'observable' (or 'sense-perceptory') parallels between, e.g., fighting and wrestling.

The first (and less fundamental) reply to Mandelbaum's objection is that Mandelbaum himself (or anyone who believes in the existence of necessary and sufficient conditions of 'game') is in the same dilemma as Wittgenstein. He too cannot unravel the quandary. For his solution could be only to enumerate the necessary and sufficient conditions of 'game,' which no theorist has yet succeeded in doing. The second reply is more substantive: Wittgenstein would deny the need to discover criteria by which activities that are similar to games can be distinguished from them. Indeed, the overall framework of his theory implicitly contains an explanation of why this *cannot be done*: such linguistic practices as naming objects and categorizing them operate through conventions, which tend to include an element of arbitrariness. One may, admittedly, doubt whether the rules of logic and mathematics are arbitrary, but it is at least plausible to suppose that the convention of calling a given activity a 'game' does not originate through logical necessity. Rather than insisting that the explanation of the inclusion (or exclusion) of something from the class 'game' be wholly philosophical, or 'analytical,' as Mandelbaum seems to do, one should adopt a more

¹ I am basically ignorant of the doctrine of the "cluster concept", but what I have read suggests it is very similar to Wittgenstein's idea. I'll ignore it in this paper.

² For example, fighting, like wrestling, can be understood as involving competitors and as being fun.

sociological/historical perspective. For example, to the question “Why is fortune-telling not a game?,” the following answer might be given: in the society in which fortune-telling originated, it was an extremely serious, non-competitive, non-‘game-ish’ activity, and so the label ‘game’ was naturally denied it. Since that time, societies into which it has been introduced have persisted in the convention of not calling it a game, largely because of tradition. Now that the social conditions that once led to its being taken seriously as a way of prophesizing have disappeared, fortune-telling is considered merely an amusing way of passing the time. Because Mandelbaum takes into account the latter fact without recognizing the former, he demands an ahistorical, philosophical answer to the question above—failing to see that if linguistic traditions did not have the (partial) autonomy from social conditions that they do, Western civilization today *would* call fortune-telling a game. Indeed, it is perfectly conceivable (though Mandelbaum apparently disagrees¹) that one day such expressions as “I’m playing fortune-telling” or “The game of fortune-telling is more fun than solitaire” will be permissible and common.²

Mandelbaum’s second example, invoking the parallels between wrestling and fighting, is different from the first in that our intuitions more strongly support the ‘category-distinction’ between the two activities than they do with regard to solitaire and fortune-telling. We all agree that fighting should not be called a game. “Why not?” Mandelbaum asks. The obvious answer is that its properties are not sufficiently game-ish. “But you’re begging the question!” says Mandelbaum. So we say in response, “More specifically, fighting is too serious, too intense, not really ‘competitive’—it does not involve ‘players’ *per se*—and not really ‘fun.’” But Mandelbaum retorts, rightly, “That answer is inadequate. What does ‘too serious,’ ‘too intense’ and so on *mean*? Your criteria are so vague that they themselves are question-begging. Moreover, one can think of games that are as serious as—if not more so than—fighting. For instance, Russian roulette is considered a game, though it is a life-and-death matter and is rarely fun for the players. And in this case you cannot rely on your historical analysis as an explanation of why it is (still) called a game in our society, because everyone still thinks it *should* be called a game.” Mandelbaum has unwittingly backed himself into a philosophical truth—precisely the one he argues against in his paper: there is never a complete ‘analytic’ explanation of why a given activity is called a game. Expressed differently, one can never *fully* explain what it means to call something a game. In other words, the concept ‘game’ is not determined by necessary and sufficient conditions—which, of course, is what we have been arguing all along. If someone asked what it meant to call a person a ‘bachelor,’ it would indeed be absurd to say (in the spirit of our answer to Mandelbaum’s question about the definition of ‘game’), “It means he has the properties of a bachelor,” because ‘bachelor’ is a closed concept (i.e., it can be exhaustively defined by invoking a list of properties). But in the case of open concepts, this type of answer is the best we can do. For instance, if I call someone ‘intelligent’ and am asked why (or rather, what it means to apply that word to him), I shall say, “Well, he has a quick mind, he’s creative, he’s witty, *and so on*.” In other words: “He has *enough* of the properties associated with the concept ‘intelligent’ to be called intelligent.” This kind of answer is not viciously circular as long as it is supplemented with a list of examples of such properties as are associated with the concept in question.

One may ask, though, how it is known that enough of the relevant properties are present. In fact, we may construe Mandelbaum’s questions above in this manner. “What justifies you,” he asks again, “in saying that wrestling is sufficiently game-ish while fighting is not? Granted, for the sake of argument, that there are ‘degrees’ of game-ishness, and that, from this perspective, the properties of fighting—while *somewhat* game-ish—are not ‘*sufficiently*’ game-ish. If you cannot say, however, *precisely* what it is about wrestling that justifies calling it a game, nor *precisely* what it is about fighting that precludes calling it a game, how do you know that wrestling should be called a game while fighting should not?” This question is at the heart of Mandelbaum’s challenge to Wittgenstein, and it is here where Wittgenstein finally fails to provide a satisfactory answer. In a situation in which our intuitions are clear about whether a given thing

¹ See Neill, 195.

² This fact itself testifies against the idea that ‘game’ is governed by necessary and sufficient conditions, because if it were, presumably it would not be possible for the same thing to be (commonly) called a game at one time and (commonly) not called a game at another.

should be classed as a game—as they are in this case—the only adequate answer to Mandelbaum’s question is that intuition itself is the criterion. That is, intuition is the factor which militates against our dubbing fighting a game, and which causes us to dub wrestling a game. –Or, expressed more clearly: the only reason we deny the label ‘game’ to fighting is—crudely speaking—that the alternative “just doesn’t sound right”; the reason we call wrestling a game is that it *does* “sound right.” We may try to justify the latter intuition (after the fact) by invoking the circumstances that wrestling has rules, that it is fun, that it is competitive, that it is spectatorial, but these criteria are inadequate. As we noted earlier, fighting too can be fun, spectatorial and competitive; it can even involve rules.¹ Thus, if we followed the method (of deciding whether something is a game) advocated by Mandelbaum—the method that works well vis-à-vis closed concepts like ‘bachelor’—of drawing up an extensive list of a given activity’s properties and comparing the list to a definition of ‘game’ in order to see how well the two ‘match up,’ there would be no way to guard against our making a mistake²—a mistake that would probably be *intuitively* obvious (if, for example, we observed or experienced firsthand the given activity and relied on our intuition to decide whether to call it a game).

It may be asked, however, why the society that invented wrestling chose to call it a game. After all, since it was an entirely new activity, its originators quite possibly did not have a “clear intuition” that it be called a game. Therefore they must have *analytically* (as opposed to intuitively) considered its properties and decided on that basis that it warranted being called a game. This suggests that ‘game’ is definable using necessary and sufficient conditions. –This objection, though, is feeble. For the sake of argument we shall accept its unrealistically ahistorical account: if wrestling was “conjured out of thin air,” its inventors did indeed possibly lack a clear intuition that it be categorized as a game. But there is no reason to suppose that they so categorized it only after comparing its properties with a necessary-and-sufficient definition of ‘game.’ Rather, they simply *stipulated* that it be called a game, on the basis of its properties’ status as being *reasonably* game-ish.³ Eventually (perhaps over the course of a generation or two) people became so accustomed to thinking of wrestling as a game (due to the convention of calling it such) that this classification sounded *intuitively obvious* to them, as it has ever since. –In this speculative history, no mention is made of necessary and sufficient conditions.

Two issues require clarification, namely, (1) what exactly it is that we are “intuitively” understanding in calling something a game, and (2) what the word ‘intuition’ itself means. Regarding the second, there is no clear answer. Various kinds of mental states may be taken as falling under the concept ‘intuition.’ For example, sense-perception has in the past been (misleadingly) called a form of intuition; so has the sudden, perceptibly ‘revelatory’ moment of insight that occurs when one, say, (finally) understands a mathematical proof. In the context of this essay, we mean by ‘intuition’ only the unproblematic, common-sensical kind of certainty involved in calling, e.g., poker a game, or croquet a game, or Russian roulette a game. In nearly all cases, the person who makes such a judgment simply ‘knows,’ somehow, that the activity is a game; he relies on no chain of logic, no analysis of properties. This instantaneous insight (which we cannot clarify further because psychologists do not understand it) is what we call intuition.

¹ The fights in the movie *Fight Club* had to follow a set of rules, yet surely they would not properly have been called games.

² In much the same way as (Frank Sibley notes that) reading a list of the properties of a painting may lead one (not having seen it) to decide mistakenly that the painting is, e.g., graceful—and which mistake one will instantly recognize upon actually viewing the painting. The difference between the two examples—between the concept of game and any aesthetic value—is that values are not condition-governed, while ‘game’ is. In other words, ‘game’ is comparable to ‘intelligent’: if enough properties are listed, eventually it will be impossible to deny that the thing under consideration is a game, even if one has not actually ‘experienced’ or ‘seen’ it (which is not true of values: no list of an artwork’s properties, however long, will justify beyond doubt the application to it (the artwork) of a given aesthetic quality). Still, the method of comparing the ‘list’ to a definition will not be foolproof (as it is not foolproof in the case of ‘intelligent’), because no definition is necessary and sufficient. One will, again, have to rely on the intuitive compatibility between the list and one’s understanding of ‘game.’

³ Perhaps, for example, wrestling had a lot in common with some other activity that was already called a game, and so to call wrestling a game was a natural extension of the concept.

The first question is more problematic. One's instinct may be to say (of something that one knows is conventionally thought of as a game),¹ "When I intuitively understand that this is a game, I understand simply that it has the properties of a game!" –Or, amended in light of the prior discussion, "I understand that it has enough of the properties conventionally associated with 'game' to be called a game." This answer, even if supplemented with a list of examples of properties associated with games, is not quite satisfactory, because, psychologically speaking, our intuitions are not 'directly connected' with this sort of conceptual analysis. They are not really intuitions of the logical compatibility of a given thing with the concept 'game.' Rather, they are intuitions that *society calls* this thing a game—that the relevant linguistic community to which one belongs calls this activity a game. In most cases, the person making this judgment is not self-consciously thinking that "I am calling this thing a game because society does so"; nevertheless, this relation between him and society is the causal mechanism not only of why he calls the thing a game but of why he '*instantaneously*' knows that it is a game. His intuition (or knowledge) was forged through experience in his linguistic community, through internalizing linguistic conventions; thus, it is an intuition of (or knowledge of) his linguistic community's convention, and not of any strict logical or analytic similarity, *per se*, between an object and a concept. Still, it may be asked why the convention has evolved; and the (philosophical) answer to this question has to be that the object has, through various historical processes, been determined as having enough properties in common with the concept 'game' to be judged a game. In more sophisticated language, one may say: of any given thing that the person (the 'judger') in question intuitively knows to be conventionally thought of as a game,² his judgment that it is a game means, "This thing is conventionally classed as a game by the linguistic community to which I belong; it has been classed as such because the set of its properties has, through whatever social mechanisms, been deemed as having enough in common with the set of properties conventionally associated with the concept 'game' (which set includes, among others, the properties *x*, *y*, and *z*³) to merit inclusion in the class 'game.'"⁴

It is time we explained the motivation behind restricting the foregoing ideas to things that convention dictates be called 'games.' –The reason is that the concept 'game' is used differently in different contexts (for example, metaphorically⁵ and 'stipulatedly') and that things which are in one context called games may in another not be (so that in order for them to continue to be called games, a new definition of 'game' must be stipulated—a definition that will apply only to this activity in this particular context).⁶ It is only to contexts in which the application of the concept is uncontroversial (i.e., obviously consistent with

¹ We'll explain in the next paragraph the reasons for inserting this caveat. –Incidentally, in this context 'knows' should be understood loosely. The knower may not know that he knows that the given thing is conventionally called a game, but his knowledge can be extrapolated from his behavior. It is a kind of 'unconscious' knowledge—which may at any moment become conscious, given the appropriate stimulus—similar to the unconscious knowledge we may be said to have at a given moment that the room we are in has four walls or that the computer we are typing on is a laptop.

² That is, he knows that, according to the linguistic conventions in which he was brought up, his judgment that it is a game is appropriate.

³ Appropriate properties may be substituted for the letters; the criterion for determining which properties are so substituted is that they be conventionally associated with games.

⁴ The question of whether this definition is viciously circular will be answered below, in the discussion of art.

⁵ An example of a metaphorical use of 'game' is the statement "Life is a game." There is, however, no simple criterion for deciding when the word is being used metaphorically as opposed to literally. The most reliable 'criterion' we have is our intuition: we intuitively see that "Life is a game" is a metaphor, without, however, being able to say exactly why it is. (We may give approximate explanations, but none of them will provide a wholly satisfactory way of determining, in all contexts, where the boundary is between metaphorical and literal uses of 'game.')

In limiting our definition above to contexts in which people intuitively understand that the word 'game' is used literally rather than metaphorically, we have taken account of this element of vagueness. [It seems that in this footnote I unwittingly "explained the motivation behind...etc."—but from the perspective of 'taking-account-of-metaphors'. In the remainder of the paragraph in the text I gave an explanation from the perspective of 'taking-account-of-stipulations'.]

⁶ Incidentally, the following discussion provides additional evidence against the idea that there can be necessary and sufficient conditions for calling something a game (because if the same activity can be a game in one context but not in another, it would seem that 'game' cannot be defined using necessary and sufficient conditions).

conventional usage) that our definition of game applies.¹ As an example of a controversial context,² let us look again at Russian roulette. This game consists of a person's placing a bullet into a revolver, spinning the cylinder, putting the revolver against his head and pulling the trigger. If he has witnesses, say, in a bar, who are perhaps gambling on the outcome, he is thought of as playing a game. If he is alone, though, suicidally depressed and not considering his activity to be at all 'game-ish'....one hesitates before saying that he is playing Russian roulette. That is, one has an intuition that the conventional use of 'game' is not entirely appropriate here. One may say, "*In a sense* he is playing Russian roulette, but *not really*. Not in the more obvious sense in which the guy in the bar was." If, in the end, after considering the matter, one decides to *stipulate* that the suicidal man's activity be called Russian roulette, our preceding definition of game is no longer useful (because, again, the ordinary use of 'game' is being stretched—and the person in the example can see this). A new definition must be invented, specifically for this context.³ It will be something like "an activity that does not have enough game-ish properties to be unproblematically (conventionally, intuitively) classed as a game but does have enough properties in common with a given conventional game [in this case, Russian roulette] to be called an instance of this game, and is thus itself a 'game' in a derivative, indirect way."⁴ What is being claimed is not that the activity under consideration is a game in the *conventional* (unproblematic) sense, but that it is a game *unconventionally* (i.e., 'not in the full, or intuitive, sense'), due to its having certain properties in common with a conventional game.

Let us proceed now on the assumption—or rather, presumption—that we have more or less refuted Mandelbaum's criticisms of Wittgenstein. In the remainder of this paper we shall argue that 'art,' like 'game,' is an open concept. Morris Weitz's aforementioned paper sets out several reasons for regarding 'art' in this way; the following passage provides an example:

I can illustrate this open character of "art" best by examples drawn from its sub-concepts. Consider questions like "Is Dos Passos' *U.S.A.* a novel?," "Is V. Woolf's *To the Lighthouse* a novel?" [...] On the traditional view, these are construed as factual problems to be answered yes or no in accordance with the presence or absence of defining properties. But certainly this is not how any of these questions is answered. Once it arises, as it has many times in the development of the novel from Richardson to Joyce [...], what is at stake is no factual analysis concerning necessary and sufficient properties but a decision as to whether the work under examination is similar in certain respects to other works, already called "novels," and consequently warrants the extension of the concept to cover the new case. (Neill, 188)

Weitz goes on to argue that sub-concepts of art (such as 'tragedy,' 'poetry,' 'painting,' and 'sculpture') are open in this way, and (therefore) that 'art' itself is. Intuitively this seems extremely plausible. However, neither the argument that art's sub-concepts are open, nor that (by inductively generalizing from that

¹ We should remark further that the definition does not apply if the speaker (or 'judge'), notwithstanding the conventionality of the context (i.e., of the game's being called a game in the conventional sense), actually intends that his use of the word 'game' to characterize the given game be understood unconventionally—e.g., metaphorically, or on the basis of some definition of 'game' that he has stipulated. In this case, it is self-evident that the speaker is not using 'game' as we have defined it. —Anyway, the reason we incorporated the first-person pronoun into the definition (and qualified the latter with the clause that preceded it in the text) was precisely to make it clear that 'game' was being understood conventionally.

² [On her copy of the paper, Ross said that a clearer term might be "borderline case".]

³ Of course, in a real-world situation it probably won't be explicitly formulated. It is merely a logical implication of how 'game' is being used in this particular context.

⁴ That is, it is considered a game not on the basis of the intrinsic game-ishness of its properties, but rather on the basis of their similarity to the properties of another activity whose properties are sufficiently game-ish for it to be an obvious example of a game. (As we have already explained, the "intrinsic game-ishness" of properties is judged intuitively, once the speaker has learned his language competently.)

argument) ‘art’ itself is open, is logically conclusive. Mandelbaum is right to deny the validity of Weitz’s conclusion, which is as follows:

What I am arguing, then, is that the very expansive, adventurous character of art, its ever-present changes and novel creations, makes it logically impossible to ensure any set of defining properties. We can, of course, choose to close the concept. But to do this with “art” or “tragedy” or “portraiture,” etc., is ludicrous since it forecloses on the very conditions of creativity in the arts. (Neill, 189)

As Mandelbaum states, “...the question of whether a particular concept is open or closed...is not identical with the question of whether future instances to which the very same concept is applied may or may not possess genuinely novel properties. In other words, Professor Weitz has not shown that every novelty in the instances to which we apply a term involves a stretching of the term’s connotation” (Neill, 200). Mandelbaum’s argument is borne out by the initial intuitive plausibility of both George Dickie’s and Jerrold Levinson’s definitions of art, which may be stated as follows:

(Dickie) “A work of art is an artifact of a kind created to be presented to an artworld public” (Neill, 222).

(Levinson) “ X is an artwork at $t = \text{df}$ X is an object of which it is true at t that some person or persons having the appropriate proprietary right over X , nonpassingly intends (or intended) X for regard-as-a-work-of-art—i.e., regard in any ways (or ways) in which artworks existing prior to t are or were correctly (or standardly) regarded” (Neill, 230).

These definitions (which, despite appearances, are not viciously circular¹) allow for the “adventurous” character of art, even though they invoke necessary and sufficient conditions.² Their greatest deficiency—and that of any conceivable ‘closed’ definition—is not that they preclude artistic creativity, but that they do not capture the vagueness of the word ‘art.’ Since they are intended precisely as accounts of how ‘art’ is ordinarily used, this inadequacy is fatal. Numerous thought-experiments illustrate it. For example, suppose two people are eating at a banquet in the dining hall of a palace. Lavish chandeliers hang from the ceiling. The following dialogue takes place:

“Those chandeliers are masterful works of art!”

“Yes, they are beautiful—but I wouldn’t consider them works of art, unless you mean it metaphorically.”

“Why not? Just look at the craftsmanship, the exquisite detail! Whoever designed them was obviously almost as creative and talented as the Greek sculptor Phidias!”

“Well, I wouldn’t go that far. But it doesn’t matter anyway. They were created not to be artistically appreciated, but to be mere practical adornments in a room whose purpose is purely practical.”

“That doesn’t matter, even if it’s true (which I doubt). If Andy Warhol’s Brillo boxes are art, then, for God’s sake, these chandeliers are!”

“You’re conflating beauty with art. The two are independent. Warhol’s works are art because that’s what they’re supposed to be. These chandeliers have the same function as wallpaper.”

“No, you’re wrong, and there’s no way you’re going to convince me otherwise.”

¹ The authors explain why in their papers.

² We must admit, however, that Weitz is right with regard to definitions that are not recursive. For example, Leo Tolstoy’s, Clive Bell’s, R. G. Collingwood’s, and Richard Eldridge’s definitions do “foreclose on the very conditions of creativity in the arts,” and are thus invalid. For they define art in terms of properties that are not present in all (commonly accepted) artworks, i.e., in terms (effectively) of what they (the theorists) think are the properties of good artworks. Only recursive (‘non-substantive’) definitions do not delimit the class ‘art’ in such a way that certain possibilities of creativity are ruled out.

Now, if Levinson's or Dickie's definition were true—if it were an accurate description of how 'art' is understood by competent speakers of English—this dialogue would probably never take place. And it would be obvious to the reader that, given the information he has in this example, the chandeliers ought not to be considered art. Neither of these circumstances, however, obtains. The dialogue is pretty reasonable, and the debate seems unresolvable. In other words, our intuition tells us that there is no apparent way to decide for or against the judgment that the chandeliers are art—which would of course not be the case if 'art' had a compact, closed definition.

Such examples could be multiplied indefinitely. This is because, as stated a moment ago, 'art' is a vague concept—i.e., it can be used appropriately in many dissimilar contexts. Indeed, it is *so* vague that its metaphorical (or "evaluative") use seems to 'blend into' its literal (or "descriptive") use. For instance, in the above example, by calling the chandeliers 'artworks' the first speaker is simply stating what is to him a fact: that they literally belong in the same category as Shakespeare's plays and Raphael's paintings and Warhol's pop art. On the other hand, by the term 'work of art,' the second speaker means only that they are impressive creations, not that they belong in, e.g., the Metropolitan Museum of Art. Thus, it is perfectly possible for people to use the same term ('work of art') in the same context yet understand by it different ideas, and thereby fall into mutual confusion. Clearly, if everyone understood 'art' to mean what Levinson or Dickie says it means, such confusion would not be possible (because people would agree on the appropriate application of the word in its descriptive, or literal, sense).

If this Wittgensteinian perspective has any validity, the question arises as to what properties are conventionally associated with art. Why is a sculpture considered art while a television is not? It is in answering this question that both traditional and contemporary theories of art are of use. For instance, some theories highlight the importance of self-expression; others focus on the role of 'representation' (in the sense that artworks are *about* something; this is Danto's approach); others invoke beauty; recursive definitions, which are probably the best (in that they are the most inclusive, and are therefore most consistent with ordinary usage), tend to involve intentionality and artworks' *origins*. All these properties, and many more, "criss-cross and overlap" throughout the diverse realm of art. —Still, this hypothesis, however true it may be, does not address Mandelbaum's objection to Wittgenstein, which we have answered as regards 'game' but not yet as regards 'art': namely, how is it that we so often know when to class something as art and when not to? Or, stated more loosely and ambiguously (and not quite correctly): what is the definition of art? We shall offer one modeled on that which we gave of game: "For someone to name something that is conventionally classed as an artwork¹ by the linguistic community to which he belongs 'an artwork' (on the basis of his instantaneous, commonsensical intuition or 'knowledge' that the given thing belongs in this category) is to say that this thing is conventionally classed as an artwork by the linguistic community to which he belongs, and that it is classed as such because the set of its properties has, through various social mechanisms, been determined as having enough in common with the set of properties conventionally associated with the concept 'art(work)' to merit inclusion in the class 'artwork.'" ² This definition, like Dickie's and Levinson's, is not viciously circular: it does not define an artwork as 'something having the properties of art,' but rather as 'something that (among other conditions) is *judged* to have the properties of art.' Being-judged is an essential part of it. Thus, the definition is not wholly uninformative, as it would be if it were viciously circular.

The case of transgressive, revolutionary art (such as Dada art in its early years) is to be handled in the way that we handled the case of the suicidal man 'playing' Russian roulette: namely, by *stipulating* that the revolutionary art be called art, on the basis of its relevant similarities to more conventional art. As you'll recall, in our first quotation from his paper, Morris Weitz argues that revolutionary art (such as *Finnegans*

¹ Or, if the given community is unaware of its existence, would be classed as such.

² See footnote [x + 4]. We should also point out that the converse of the definition is true: when a person 'unthinkingly' (on the basis of his 'instantaneous intuition' or knowledge) judges that a given object is not art, he is denying that the above definition applies to it. For instance, if I say of my telephone, in an 'automatic,' 'thoughtless' kind of way (without focusing my attention, e.g., on certain of its features I deem ugly and taking these as the reason for my judgment), "This is not art," I mean that the definition given above does not apply to it.

Wake) has been, in fact, handled in this way. When it is still so new that people in the relevant community are uncomfortable calling it art, it is art in a different way from that in which traditional art is. In other words, when it is labeled as art, the label has a (*slightly*) different meaning than when it is applied to traditional art: it means that the object to which it is applied is art *derivatively*, on the basis not of its properties' similarity to the conventional understanding of 'art' but rather of their similarity to properties of certain other objects, which (properties) have enough in common with the conventional understanding of art for *their* bearers to be 'direct' examples of art, 'intrinsic' and unproblematic instantiations of the idea. Eventually, of course, the community grows accustomed to thinking of the revolutionary art as art; it becomes 'conventional,' unproblematic art.

The very first historical examples of art—"ur-art," as Levinson calls them—do not pose a problem for our theory, because it is conditional. To object that it does not properly characterize the way the word 'art' was used in the beginning of history is pointless: we have already stated that the theory is not true under all conditions, but only under those described above. It is not hard, though, to give a speculative account of what happened in prehistoric communities: when the concept of art was first used, it denoted already-existing objects that were of a different character than others—namely, of (what we would call) an artistic character. Cave paintings, for example, had no practical purposes, as did most other objects; with the increasing sophistication of language, the word 'art' was invented to denote such objects that were irrelevant to the task of acquiring food but were interesting to look at and fun to make. This was, indeed, possibly how artworks were defined: they were objects that were pleasant to look at—of "absorbing non-practical interest"—which were also, perhaps, used in religious rituals. As language and culture developed, the category of art broadened, such that it could no longer be limited to religious objects or non-utilitarian objects. It was then that the definition we have given began to be more appropriate than a 'closed' definition like Clive Bell's, or even a closed *recursive* definition like George Dickie's.

Now, wherein lies the superiority of our definition over Levinson's?¹ Its relative virtues are (at least) threefold: (1) its conditionality—i.e., its appropriateness to only one kind of context (albeit the most common)—ensures that it more accurately reflects actual linguistic practice, given that the word 'art' is used in different ways in many contexts; (2) it bypasses the troublesome issues of (firstly) a proprietor's intentions² and their relation to the public's perception of the object to which they apply, and (secondly) the nature of artistic appreciation and what it means to regard a work of art "correctly"; (3) it does not have the unpleasant implication (as does Levinson's) that the public may be wrong in universally regarding a given object as an artwork:³ in other words, in denying that there is an 'objective truth' external to linguistic conventions of whether a given thing is an artwork, it avoids the counterintuitive essentialism to which Levinson's definition falls victim.

Let us provide an example of how our account is more satisfactory than Levinson's—and, by implication, any definition of art in terms of necessary and sufficient conditions. The following passage is taken from Levinson's paper "Defining Art Historically":

Given a proprietary-right condition, it is somewhat problematic whether curators, promoters, exhibitors can turn nonart objects of the past into art objects of the present as blithely as is usually allowed. Imagine an art museum having mounted for regard-as-a-work-of-art a strange ornate receptacle whose original purpose is unknown. The object comes from an ancient Mexican culture thought to have died out. However, a well-documented descendant of the tribe, armed with full knowledge of its customs and practices, appears and successfully demands the removal of the receptacle from public view (it is apparently a sacred ritual object, used for nocturnal royal baptisms, and not in any sense for appreciation). I maintain that the object in question does not just revert to being

¹ Dickie's definition has been criticized persuasively by other authors—see, e.g., Neill, 225—so we shall ignore it here.

² For example, it may in some cases be unclear who the proprietor is.

³ See Neill, 229 for Levinson's admission that his theory has this implication.

nonart—it never was art at all, because our present art establishment unknowingly lacked the right to make it such. This sort of case may be more prevalent than is generally imagined. (Neill, 229)

In other words, while the object was on display in the museum, everyone was wrong to regard it as a work of art. ‘Objectively’ speaking, it was not an artwork. Now, if one considers the matter closely, one will probably come to see an element of truth in Levinson’s account. From this perspective, it will be intuitively plausible that, in a sense, the object never really was art. On the other hand, one will also have to admit that, in another sense, the object *was* art: it was classed as such by the community, according to conventions, because it was relevantly similar to other such artifacts which had themselves been classed as art. To deny the label ‘artwork’ to this artifact while applying it to others would have been arbitrary and unjustifiable. Therefore it was art—and yet, as we noted, at the same time it was not. The only way out of this dilemma is to recognize that ‘art’ can be understood differently, depending on the context. Its definition changes according to its use. The definition we gave above is effectively how the community understood (or used) the word ‘art’ in calling the artifact an artwork before the tribe’s descendant had come forward; afterwards, ‘art’ was understood in a more essentialist way, so that Levinson’s definition was more appropriate than our own. From this example it is clear that in some contexts, ‘art’ may indeed be defined by necessary and sufficient conditions; however, in most cases such a definition is not useful. In fact, often¹ it is unclear in *what* sense the word is being used: the speaker himself may be confused, such that he does not really know what he means. If we were pressed, though, to give a generalization about the meaning of ‘art,’ we should say simply that it is governed by family resemblances.

The reader may wonder whether our account has implications for the question of what it means to *evaluate* an artwork—to apply aesthetic values to it, such as ‘good’ or ‘ugly’ or ‘beautiful.’ It seems probable that the only implication is that there is no “fact of the matter” as regards the application of an aesthetic quality to a given artwork (because the multitude of definitions of ‘art’ surely necessitates that there be many standards of artistic worth). However, this hypothesis can be established on independent grounds, and is in any case very complex, so we shall not argue for it here.

*

It plays the academic game passably well, don’t you think? –Except for the absence of a conclusion. ‘We deemed it unnecessary.’

By the way, one of the conclusions to draw from it is that the question ‘What is art?’, or ‘Is this particular thing a work of art?’, is not interesting. Of far more interest is the question of artistic values.

Spinoza was obviously right that mind and body are aspects of the same thing. (I’ve insisted on this for years. See ch. 3 of my senior thesis.) The question is, how is that statement to be interpreted? We’ll never have a wholly satisfying answer—the intuitive incongruence of the categories precludes that—but it’s likely we’ll one day have a ‘schematic’, ‘abstractly conceptual’ (though not concretely intuitive, i.e., wholly comprehensible) one.

Wednesday, November 9

A species whose individuals are hurtled into life, through no fault of their own. No choice in the matter. Nature chose you. You were selected for an eighty-some-odd-year life; now make the most of it. “Well, I still have fifty years to go. I guess I might as well *do* something, to pass the time....” You were allotted some literary talent? Fine, as time passes you might as well entertain yourself: write a little. Above

¹ As in our ‘dialogic’ example.

all, try to enjoy this world while it lasts. —Because in your last moments you’ll think....*What the hell was that?*

Thursday, November 10

The pills seem to be nothing more than an extreme version of coffee: they cause my hands to quiver, like I have Parkinson’s. And my heart beats like I’m sprinting.

It doesn’t matter. Destroying yourself is what youth is all about.

Friday, November 11

The best word to describe me is ‘uneven’. In all its connotations, that word is perfect.

For example: last night. At 7 I took a nap, having strained my body to its limits at the gym. Wasn’t really in the mood to drink, but at 8 I went to a German girl’s birthday party. Over the course of the night I drank about ten beers, had four or five jello shots, and I’d guzzled vodka before leaving my apartment (as I always do when I go out)—all on an empty stomach. Understandably, this extreme contempt for my body put me in a marvelous mood. We all went to a club; what followed can with justice be called an “orgy” (though, sadly, not literally). I had obscene fun. While dancing, every so often I’d look around at all of us and deflate with laughter, for two minutes. I laughed harder than I ever have. Seizures of laughter. But it all ended abruptly, from a single look. I was dancing with a girl I know, vainly pleased by her evident pleasure. I shouted some joke in her ear, to which she seemed to react favorably. But a moment later she walked over to talk to a friend of hers standing behind me, who, I think, had been doing some kind of striptease act with his scarf. It occurred to me that she’d probably been looking over my shoulder earlier, laughing at him rather than me. This was humiliating, but I shrugged it off. Went to the bathroom a minute later. There, I was ambushed by sadness. It was pretty strong, so I went outside to let it pass. Walked around the neighborhood. It was black and empty, except for cars, with lots of shadows. The symbolism wasn’t lost on me: I began to cry. Really cry. Despondently. I found it truly amazing and ascribed it to the maudlin influence of alcohol—the fountain of alcohol I’d drunk. Walked for a long time, sat behind bushes somewhere, sat in a big stone doorway, the crying coming and going. At last I returned to the club. Had trouble finding it; when I did, it was closed. But the door was open, so I walked in to get my coat, which I’d left on a table. Guys were cleaning up, sweeping the dance floor; they said I couldn’t come in. I told them why I was there and ignored their protests. But the coat was gone. One of the employees came over and ordered me to leave; we had a stimulating discussion, the upshot of which was that he pushed me towards the door, grabbing my arm. I told him to fuck off or something, or that I could find my own way to the door, and pushed his arm away. Unfortunately he was twice my size. He made the interesting remark “Don’t touch me” and then put me in a headlock, which it was futile to try to get out of. Shoved me outside. My drunkenness had dulled my capacity for rage, which was a blessing: otherwise I might have fought back. Found my way to the metro somehow, where the trains had of course stopped running. (It must have been about 2:30.) The schedule said they started at 4:15. So I lay on a bench, feeling appropriately sorry for myself. The air was freezing and I’d lost my coat. I thought awhile and started to cry again, the tears running down my cheeks from the outside corners of my eyes (since I was on my back). I thought it was funny that if any of my friends or my family had witnessed this scene they’d feel effusive pity, and that a good many girls might suddenly be interested in me—as Kanchana was that night when she and Lily came upon me throwing up in the shadows, and then I threw up again at the base of that old tree with Kanchana standing next to me stroking my back as I probed my throat with my middle finger, and for a moment she actually laid her head on my shoulder as a girl does on her boyfriend’s, while emitting an emotional

groan¹—but that because no one was watching me, this incident really wasn't happening and meant nothing. Which of course made me even sadder. At 4:15 the train didn't come. A woman told me it was because this was a holiday (Veterans Day?); the train wouldn't come until 5:00. That was welcome news, since it gave me a chance to be harassed by a random homeless guy who insisted on giving me his sweater because he could see I was frostbitten and he was wearing three layers. I refused—he insisted—I refused—he insisted—for ten minutes. He made me take it, threw it at me, but I gave it back. Soon I learned it wasn't just generosity on his part: he wanted seven dollars in exchange, for breakfast. I gave him five and walked away without the sweater. He followed me, and the surreality began again. At last the train came.

[...] Anyway, the point of all this is that I'm uneven.

Thoughts on coherentism (which the prof liked; otherwise I wouldn't have thought them interesting enough to be put here):

How can a coherentist know that coherence is the criterion for truth without first adopting a perspective outside the system, or the “web of belief”, from which to determine by what criteria the system ought to be judged? In other words, whenever a coherentist argues for coherentism, he is necessarily arguing from *outside* of coherentism. He offers his arguments as candidates for truth not solely on the basis of their internal coherence, nor on how well they cohere with his other beliefs—for then he would be begging the question—but on the basis partly of independent criteria such as inductive validity, logical force, and conclusions drawn from empirical observation. More generally, any argument that a coherentist proposes is (tacitly) supposed to be judged not merely by how well it fits into a web of belief, nor even by how mutually coherent its premises and conclusions are, but by many other factors as well. (What would it be like to judge an argument solely on the basis of the coherence of its internal and external relations??) What applies to individual arguments should apply to the system as a whole: i.e., the system is true not only because it is consistent etc. but also because it corresponds accurately with observations etc.

What is the *point* of coherentism? What is the point of denying the obvious relative importance of such “foundational” propositions as those of logic, and such foundational “deliverances” as sense-perceptions? Certainly sense-perceptions are judged true partly by how well they cohere with, e.g., scientific theories, but it seems wrongheaded to place them on a more or less equal plane with the latter. It is *not* the case that “they owe their epistemic status to their place in our evolving understanding of the world and our modes of access to it”, nor that “the justification for privileging perception derives [solely] from the relation of perceptual judgments to the rest of our theory of ourselves as cognitive agents interacting with a mind-independent world” (Steup, 163). This is so obvious that one wants to know what possible motive there could be for denying it.² Is coherentism's *raison d'être* merely the intractability of the regress problem? If so, then foundationalists would be well-advised to stop expending mental energy on refuting its perverse doctrines and instead to focus on

¹ That's females for ya. Be a charming, intelligent guy and they want nothing to do with you, but throw up in front of them and you've captured their hearts.

² [It's not much of an argument to say, “This is obvious.” But apparently what I was thinking was that perception is the ultimate court of appeal. Even in science, in almost every instant we're relying on sense-perceptions, both to test hypotheses and to construct hypotheses. Sense-experience is the crucible in which we *test ideas*, for we can't even judge the results of experiments without assuming the reliability of our perceptions in that moment. —Maybe that's one of the reasons the statement seemed so obvious to me. I suppose I also meant there's a kind of immediacy and certainty in sense-perceptions—not that the objects they present to us independently exist, but that *we are presented with* particular appearances—that is very different from scientific theories.]

showing how foundationalism¹ provides a solution to the regress problem, and thus to pull the rug out from beneath the coherentist's feet.

Saturday, November 12

Went to a concert with Sandy, Brandy and Jennifer. Mozart's 17th concerto, Beethoven's 7th symphony, and a collection of noise by some contemporary guy. Small orchestra, made smaller by the power of Beethoven's music. Unusual interpretation of Mozart: romantic, rubato. Second movement played more slowly than I've ever heard; the rests lasted fully five seconds each. It might not work well on a CD, but in the concert setting it was electrifying. I felt like I was listening to nirvana (the peace), a nirvana substantiated through passion. The first and third movements weren't as good: not crisp enough. Still, nothing could muffle the power of the music. (No one compares with Mozart for writing dialogues into melodies and harmonies; and of course the piano and the orchestra were having a conversation—a private conversation the audience was allowed to eavesdrop on.) The interpretation of the symphony was sensible: it made one recall Wagner's label "apotheosis of the dance". Unfortunately the trumpets upset the balance at critical moments—and at the end of the first movement the double basses weren't loud enough, nor was the second half-step descent accentuated enough.²

I'd forgotten how emotionally jarring the second movement is. Its first three minutes sound like the soundtrack to history.

I emerged from the experience unhappy. Maybe because I'd shared it with no one. Brandy and Jennifer are rocks when it comes to music—granite, not pumice—and Sandy was more entertained by my behavior. (Closing my eyes, moving my hands, etc.)

Sunday, November 13

I think I've been deceived in kowtowing to the received view that the longing for (biological) immortality is a human instinct, and in reducing the desire for existential meaning (and recognition) to the desire for immortality. In truth, I don't believe I want to live eternally, not even on an instinctual level. My real "passion" has always been (the "useless" one) to be (in Sartrean language) the in-itself and the for-itself at the same time. I've wanted to see myself as an object, a principle, a concept, an other—something I can pin down. I imagine myself from the other's perspective so that I may achieve this stasis. It's plausible that my desire for "recognition", or fame, or popularity, is derivative of the (oxymoronic) desire to be a frozen self-consciousness, because fame is nothing but a frozenness in being-respected. If everyone saw me as an '*admirable thing*', it would be easier for me to see myself as such (since self-perception depends largely on how others perceive one), and thus to calm a little my unrest (my striving, my always-evaluating-myself, which is, perhaps, coextensive with self-consciousness itself, to varying degrees in different people). If these desires exist, more or less, in the rest of mankind (which is probable: it's hard to believe that desires so fundamental—so fundamental as to be phenomenological analogues of biological instincts³—would exist in one mind but not in another), then the common positing of an instinct for immortality may be a confused interpretation of the desire for self-conscious stasis, or for being a for-itself-in-itself (because this would be a timelessness, and timelessness is a type of immortality). In other words, people in fact don't want to live for an infinite number of years; they want instead to live *outside* of 'years', outside of time. The obviousness of the universal desire to live immortally *after death*—through fame or

¹ [I didn't mean foundationalism in the sense of building up an edifice of knowledge on the basis of something absolutely certain, incorrigible. That sort of foundationalism is obsolete.]

² I neither know nor care what Beethoven's instructions are on the score. I love that bass line, and I want to be able to hear it.

³ I don't mean that in their content they somehow correspond to particular instincts, but that their power is comparable.

the continuation of one's genes or whatever—has added to the confusion, for it is an easy logical step to infer from the desire for this kind of immortality the existence of a more basic desire for *real* immortality, real (biological) never-dying, the impossibility of which is suggested as why we 'settle' for the other kind of immortality, the eternal 'living on in people's memories after I die'. What is overlooked is that the two kinds of immortality essentially have no relation to each other: neither is derived from the other. A person's tangible existence is a wholly different kind of thing from his existence in an other's mind, i.e., from his desire for recognition, i.e., from his desire to be remembered after he dies, i.e., from his desire for the kind of immortality that is supposedly grounded in a desire never to die. But this latter desire doesn't exist, as I've argued; thus, the former is actually a sublimation of the (incoherent) desire for a static self-consciousness, or a "self-conscious stasis". Now, what's interesting is the affinity of such a state with death. The only difference between the two is that a static self-consciousness would be a *life-in-death* (or a death-in-life). It would still be a death, though. This implies that the common postulate of a desire for immortality is simply a misinterpretation of the desire for (a type of) death. (Ironic!) It also suggests that Freud's postulate of a death-instinct and Sartre's postulate of a "useless passion" to be a for-itself-in-itself are grounded in the same psychological fact(s).

The sex instinct would probably be independent from a desire for death-in-life, which would corroborate Freud's intuition that humans are determined by Eros and Thanatos. Still, the more psychically accessible effects of these instincts (such as daily social interactions) would probably be determined by a merging of the two, given that the sex instinct seems to imply some of the same desires (such as for recognition) that grow out of the "death-in-life" instinct.

What I haven't explained is why we want only *positive* (self-)recognition, positive "stasis". In other words, the recognition-desire has more conceptual content than the for-itself-in-itself-desire, which makes me think the former isn't a sublimation of the latter.

(By the way, none of this runs counter to the fear of death. This fear is compatible with my ideas.)

That's all mythology, of course.

I subscribed to *Scientific American* online.—

Why do animals yawn, and why are yawns contagious? Scientists don't have a complete explanation. The only theory whose partial truth I can attest to is that yawning brings in extra oxygen: sometimes I can cut off a yawn by inhaling deeply and quickly.

Why is television addictive? An article in the February 2002 issue gives a series of convincing neurological explanations. I recommend you read it. It's scary. (But I'm really more interested in the fact that there is no 'place' in consciousness where the addiction *is*. It's weird.)

An article in the December 2005 issue argues that spacetime may have a fluidlike, granular structure. Another argues that gravity and three-dimensional space are, in a sense, illusions. They're somehow the products of quarks and gluons interacting on the boundary of a two-dimensional, gravityless universe. Another article proposes, on the basis of string theory, that the big bang didn't start from a singularity, and that the universe existed long before it. Indeed, it has possibly always existed. —The point is that I'm tired of reading.

No, the real point is that, even if cosmologists someday reach unanimity, the task of *explaining* will not even have begun. In fact, it will be more incomplete than it was in ancient Greece: then, at least, people still thought there *was* an explanation!

Monday, November 14

Today I felt like killing life. Self-revulsion. Little narcissistic thoughts. Anger at my brain for depriving me of serotonin and dopamine. (The supplements have become useless.)

I'm going to start searching actively for street drugs. A couple of my friends/acquaintances have told me they used to have contacts but don't anymore. In the meantime I'll drastically increase the

Paxil/Wellbutrin doses. I've also ordered something called "BrainQUICKEN", which, from all I've read, isn't as scammish a drug as its name would make you think. Anyway, it doesn't matter. I'm in the mood to experiment.

How absurd is this. I am a phenomenon of consciousness, a will-o'-the-wisp, an ignis fatuus, to which have been attached a body and recollections of experiences in order to trick me into believing that I'm...—I don't know—*something*—something substantial and metaphysically real—some kind of spiritual substance corporealized—a "**SELF**"—and I know this, I can intuitively *see* that Chris—the Chris who acts, that is; the one who thinks and does and so on, not the one who's nothing but an abstraction from experiences—Chris, writing right now, this active **I** who no longer cares about anything except falling in love—I am literally nothing but *looking-at-myself*, a mere fold in consciousness, a brain-produced, brain-controlled, invisible glint in its [i.e., the glint's] own eye.

I don't understand how any criticism of me can have force—or, more accurately, I don't understand what it would *mean* for a criticism to 'have force', or to be 'true'. I am who I am; to say that certain things I do are, for instance, 'weak' or 'petty', or that my personality isn't appealing, or that I'm not a 'strong' person, is ultimately nonsensical. The same is true of compliments. What does it mean to class a person or some aspect of him under some evaluative property? 'He's arrogant.' Okay... He thinks he's better than other people and sometimes acts like it. So what? What is really being said? The implication is that, insofar as he's arrogant, he's unpleasant or 'bad'. Arrogance is a flaw. But flaws or strengths are such only from an external viewpoint, an 'otherly' viewpoint. From the perspective of the subject, the interior, they have no significance. No meaning, in fact. I can think of people who might call me a jerk, or others who might call me admirable or brilliant. But from my own perspective, these words 'wash over' me. They can't stick, they can't mean anything; and to say they're 'true' would be an empty statement. This applies to everyone.

Thoughts like these are hard to pin down. All you can do is grope towards them.

Tuesday, November 15

Walking home tonight on the side of the road a car sped past me five inches away. I'd been about to step onto the road to avoid a puddle. Had the car driven by one second later, I'd be in a hospital right now. Maybe DOA. —And thus would I have ended. Thus would have ended this non-life.

The incident made me think about contingency. I think about it every day, but this time it was more intense. Well, intense isn't the word. Its emotional associations are inappropriate. In fact, immediately after the experience I was laughing, laughing at how tragic it would have been, and how funny, and how *perfect*. The perfect end to my life. Symbolically perfect, that is.

Back to oblivion, whence I came!

So it was all cerebral for a while, an academic meditation on how random life is and how worthless. Gradually it evolved into a mood. But even in this half-moody despair, I knew that if a friend suddenly appeared and we talked awhile I'd be refreshed and happy. It would take something as mundane as a short conversation for me to go from one extreme to the other. I was on the verge of happiness even as I was on the verge of suicide. And I felt this. I felt as if my progressively strengthening mood was just waiting for an object to latch onto, be it a pleasant one or an unpleasant. Since no pleasant object materialized, all this libido (in Jung's sense) finally poured out as tears. It was a peculiar experience. I kept trying to hold back the tears as they came, determined not to sink to this womanishness yet again; the combination of my willed refusal and the obstinacy of my tears made for a wonderfully intense bout of near-nervous-collapse. I recommend you try it sometime. In the midst of a crying-session, battle against yourself, your weakness. You'll feel like you're milking your despair for every last drop of *life* that lies within it. There's no question I was capable of killing myself in those moments. No question. I could see my hand holding a gun, raising it to my temple, pulling the trigger. And yet at the same time I knew I'd never do such a thing, for the obvious reason that it would hurt my parents. It would be a weak, selfish thing to do.

[...] Nor can I talk to the prescription-dispensing nurse, because she'd refer me to a therapist and would reduce my meds, when what I really need is more of them—or more of *something*. As for therapy, that's a last resort. It probably wouldn't accomplish anything.

I can't turn to my friends (?) for comfort either, because their attention spans are short. They'd give me a few words of advice and tire of the conversation.

How strange it is that I can sense pure happiness directly under the sadness! A trivial event could make me happy again.

I know that these problems are all “in my head”, that they're fabrications of a sick mind, but that does me no good. What it comes down to is that my brain is sadistic. Withholding the chemicals that make happiness possible! What meanness! What gratuitous malice!

That and the low self-esteem. Which comes and goes.

Wednesday, November 16

Wrote Sofia an email. We haven't corresponded in a long time, but she's the only one I could talk to. In the entire world, she's the only one. Everyone else would judge me, and I'm tired of being judged (mostly by myself). Sofia is that amazing rarity, that rarest of rarities: the loyal friend. The non-judgmental friend. The friend who can half-understand her friend. She's my Augusta.¹ In her answer to my first (merely friendly, non-revealing) email, she wrote something that improved my mood:

[...]

I have to tell you something. Few month ago I read the letter you wrote me when we were together in salzburg. do you remember you? the letter is one of the kindest letters I even got in my life. Even till up to now the letter is touching me and nearly i had to cry. it was a great time we spent together. I am happy to got to know you. It was my first semester in Salzburg and you made my life her more worth to be live.

People rarely remember that a lifetime of meaning can lie in a moment of “Hello...”

I'm taking advantage of my neutral mood to examine my psychology of the last few days. Purely out of intellectual curiosity.

Beginning around November 8th, the drugs stopped having nice effects. Instead, they left me with an ugly nervous feeling in my chest and frequent twitching in my limbs. So I stopped taking them. This was the same time I began to see that most of the people I'd thought were my friends were really no more than close acquaintances, excepting Sandy. The incident on November 11th didn't help matters. I found myself spending more time alone. I started thinking. (That was my downfall.) Philosophically, I'd been trying for a few weeks to wrap my mind around the possibility that solipsism is false. Solipsism is ridiculous, of course, but so is the opposite position. They're both equally ridiculous. The idea that other people are outside me, looking at me, hearing my words but not experiencing my mind, makes no sense. I am all that existence is: this ‘looking out’ at other people is the only existence. How can there be two existences, two worlds, looking at each other? How can there be other consciousnesses exactly like mine, as immediate for them as mine is for me, judging me, having the thoughts about me that I'm having about them? In other words, *where are they?* They don't exist in the world that *I* live in; therefore, they don't exist. Naturally I associated this abstract problem with the other intense aspect of my life: my social life. For the first time ever I really made an effort to see myself from the other's perspective: I looked in the mirror for long periods of time, trying to imagine myself outside of myself so I could decide what I'd think of this person; I imagined social situations from the other's perspective rather than mine; etc. One night as I was falling asleep—I was in that long ambiguous state between life and death—I thought about Wesleyan,

¹ And I'm her B—ob Southey. [See Byron and Augusta.]

about how I must have seemed to the people I knew. My mind rehearsed all the embarrassing things I'd done and understood how 'weak' I must have looked. [...] But now I saw a future desolate of relationships, desolate of a profession I could hold down, desolate of happiness, and a death when I'd survey the past and see a life lived only in a journal, a life crowded out by a journal, and I considered how contemptible these thoughts were too, and that I couldn't justify myself by invoking my creativity or whatnot and echoing the mantra "Artists are always depressed" because, first, I'm not an artist, and second, creativity is an accidental fact, which if I lacked would mean I'm nothing but a sad little self-obsessed man, and I thought about how little progress I'd made after all from my college years to now and how the falsity of solipsism means I'm merely a face among billions with nothing special about it and probably a good many things wrong with it and how I was 25 and my life had passed in a flash and when I died I would see that my life had passed in a flash and I'd return to the horror of the absence of horror and that I no longer cared a jot about being a great man because that too was contemptible and moreover false and I started to fall into confusion and suspension-of-the-will because I kept looking at myself from outside and felt like I was splitting apart into a part that smiled its way through the day and a part that judged this part from every angle and every person and although I kept screaming at it "Every judgment results from ignorance and no judgment is valid and knowledge is compassion!" I couldn't suppress the nagging doubt that this wasn't quite right and besides it didn't matter because people would keep judging me no matter how ignorant I knew they were and so when the car almost hit me I thought "Maybe that wouldn't have been a tragedy after all" and I kind of overflowed and would have come loose if my self-consciousness hadn't held me back.

That's sort of how I felt.

I wonder if you'll take my side by saying all the predictable things about how I'm not like this or that kind of person, I'm "different" or whatever. But that's crap. Philosophically, psychologically it's crap. You're judging people just like everyone else. "You're unusually intelligent, kind, sensitive, blah-blah." That's all irrelevant. I am who I am, and people are who they are, and that's all that can be said. Compliments and insults are false/meaningless, vague, ignorant *a posteriori* categories jammed down into the *a priori* fluidity of the mind. Hitler was just *that way*, not "bad"; he had been "determined" by the typical determinants, and the "free" choices he made had been determined by the second-order determinants, and the most you can say is that he should have been killed because it would have benefited mankind.*

But then you'll say, "So why do you care about being judged etc.?" Usually I don't.

*But where does that leave us? In a fairly untenable position. For if it's true, why should we refrain from doing certain (bad) things, etc.? I wrote about this months ago. 'We can't stop judging, but judging is pretty deluded. So what now?' Accept it and rise above it. Keep living—i.e., judging—but know "in the back of your mind" that what you're doing ultimately makes no sense. Live morally not because it's "right" but because it's the only way to live in harmony with others (which, after all, is why nature gave us the capacity for morality). Live morally because if you don't and you're discovered you'll feel shame.

[...]

Thursday, November 24

A week in San Francisco with twelve people. Good and bad, mostly good. (Frequent mood-swings.) Best American city. Bike-riding, Alcatraz, Redwood forest, Golden Gate Park, usw.

Friday, November 25

The pleasure principle is misleading. A person wants to have sex not really because he anticipates pleasure, but because he wants to see and feel his partner naked. The desire is "I want to be inside you!" (or "I want you inside me!"), not "I want the pleasure of being inside you!" Maybe you'll object that he

wants to be inside her precisely because of the pleasure he'll feel. And indeed, this is how he'd explain his desire to himself if he were asked about it. But this is only an 'after-the-fact' justification; it isn't the real reason, the psychological cause (and phenomenological meaning) of lust. Admittedly, once sex has begun, people keep doing it largely because it feels good and because their bodies anticipate the pleasure of orgasm. But these factors are irrelevant to the initiation of sex. The phenomenon of pornography corroborates this. People enjoy it because of their fascination with the naked body, with sex; after a few minutes of voyeurism, they masturbate to it not because they're aware of the pleasure they'll feel but simply because they want to be involved in the sex act they're witnessing. They're aroused by it. That's the only reason. They just—want to be involved, for no apparent reason (and certainly for no reason they're aware of).

Sunday, November 27

Besides, when *you* judge people you're convinced of your judgment, you write the person off as an idiot or a jerk or whatever, and "That's that!" So what do you mean when you say "Don't care what people think of you"? *You* care what you think of people. Are you saying that your opinion is the only one that matters, that they should care what you think of them but you shouldn't care what they think of you? — Because, of course, you do want them to care what you think of them. You know you're right in your judgments of them, so who's to say they're not right in their judgments of you? So you're being inconsistent. Either you admit that your judgments are not worth shit, or you admit that you should care what people think of you. It's one or the other. You know the option I've chosen—the true option: your judgments are not worth shit; *therefore*, don't care what people think of you. But don't care what you think of them either: i.e., don't make judgments with the seriousness you usually do. That's the only way to live honestly.

Second paper:

The (anti-)definition of knowledge

Upon surveying the contemporary epistemological scene, one is struck by how many debates involve disagreement about the definition of 'knowledge'. The internalism-externalism debate, for example, is made possible by conceptual ambiguity. Pure externalists claim that one need not have reasons (in the standard sense) for a belief in order for it to count as knowledge; what matters is that there be a certain kind of causal connection between the belief and the world.¹ Internalists, on the other hand, believe that the notion of knowledge implies that the believer has access to good reasons for his belief. Another example is the debate between contextualists and invariantists. Contextualists actually incorporate the ambiguity of 'knowledge' into their position: they claim that the standards of knowledge-attributions vary with the attributer's context. This means that the truth-conditions of such attributions change, which means, effectively, that their meaning changes as well. Invariantists, of course, deny this; knowledge has the same standards in all contexts. More generally, philosophers tend to bandy about the word 'knowledge' as if its meaning is unproblematic; a typical example is this sentence of John Hawthorne's: "Someone might know that his partner will never leave him and this may entail that she will never leave him for Mr. X".² What does 'know' mean here? No explanation is offered. In this paper I will attempt to remedy the situation by giving an original analysis of knowledge, the main conclusion of which will be that if the word 'knowledge', as used in ordinary contexts, is taken to its logical conclusion, it is meaningless, and hence unachievable. I will then apply my ideas to a few standard epistemological problems.

The definition of knowledge

¹ See Richard Feldman, "Justification is Internal," in *Contemporary Debates in Epistemology*, eds. Mattias Steup and Ernest Sosa (Malden, MA: Blackwell Publishing Ltd., 2005), 272, 273.

² John Hawthorne, "The Case for Closure," *ibid.*, 40.

The best method of defining a word is to observe how it is commonly used. ‘Knowledge’ is used in fairly specific ways, which should make the task of defining it straightforward. In the sense in which we are interested in it, only propositions that are believed (and perhaps facts as well) can be objects of knowledge. The propositions must, moreover, be true: I cannot know that p if p is false. The third condition is that the believer not have any doubt about the truth of the proposition in question. For if I doubt its truth, I can hardly be said to know its truth. So, my feeling *certain* is the third condition for attributing knowledge to me.¹ The fourth is internal justification. The following dialogue illustrates this. [*I deleted the dialogue because of its excessive length.*]

[...]

In short, the fourth condition of knowledge is that the knower have the ability to (truly and justifiably) attribute knowledge to himself, which requires (1) that he be aware of all the information relevant² to his belief, and (2) (by implication) that he base his belief on the right reasons. In other words, for knowledge to be justifiably attributed to him, he must be able to know that he knows. In this context, “be able to know” means that in the moment in which he knows that p, he has access to all the evidence, all the information, all the reasons relevant to his knowledge that p, such that if someone asked him “Do you *know* that p?”, he would be able to adduce everything in p’s favor and everything against it and explain how it is that he knows that p.

The reader may object, “What are your reasons for introducing this severe fourth condition of knowledge (viz., that the knower be able to justifiably attribute knowledge to himself)? You still have not argued for it.” Actually, I have. I noted in the dialogue above that people do not commonly attribute knowledge to infants and animals (except in a loose sense); the reason can only be that infants and animals cannot know that they have knowledge. If they could (i.e., if they were self-conscious), then surely there would be no reason not to attribute knowledge to them. Now, in order for a being to know it has knowledge that p, it must have access to all the facts relevant to its knowledge that p: it must know, for example, what were the direct causes of its belief that p, what justification there is for believing that p, and so on. –More generally, however, my argument for the fourth condition is simply that people use the word ‘knowledge’ in such a way that this fourth condition is implied. For instance, imagine this dialogue between Dick Cheney and Donald Rumsfeld:

Dick: “John knows that we manipulated the intelligence we used to justify the war in Iraq.”

Donald: “Actually, he doesn’t know it yet. He *thinks* we did, but he can’t prove it.”

Although Dick and Donald know that John’s belief is true, they refrain from attributing knowledge to him because they know he does not attribute knowledge to himself. The implication of this example is that, in order for someone to have knowledge, he must be able to say, justifiably, that he knows he has knowledge.

The reader may have noticed that the fourth condition is suspiciously similar to the third: a knower’s ability to ascribe knowledge to himself seems equivalent to his certainty that his belief is true. There is a subtle difference, however. As mentioned above, certainty is a purely subjective state, while justifiable self-ascription of knowledge is both subjective and objective. It is a unity of the two: it is subjective awareness of the objective validity of one’s judgment that one is in a state of knowledge. The fourth condition implies the third, but the third does not imply the fourth.

I will anticipate here the later discussion of internalism and externalism, because otherwise the reader might object that I have ignored externalism in my definition of knowledge. In truth, I have merely combined the two opposing positions: I have incorporated externalism into an internalist definition. “Which form of externalism?” asks the reader. “Not any form in particular,” I reply. The knower must simply know

¹ It is unclear why most epistemologists have not recognized this. For the concept of *certainly* has no place in their definitions of knowledge.

² Whether “relevant” should be understood narrowly or broadly need not concern us here. The point is that the knower must be aware of all the information that might conceivably bear on the belief in question (i.e., that he would need to know in order to make an informed and correct decision for or against the belief).

all “external” facts relevant to his knowledge that *p*: for example, that it is not accidental that he is right about its being the case that *p*.¹ It would be superfluous, however, to list all the conditions commonly invoked by externalists in order to describe what it is that the knower knows; the point is that he has perfect knowledge of the portion of reality that bears on his belief that *p*. Similarly, anyone who justifiably attributes knowledge to him must have the same complete knowledge that he has. This criterion of “omniscience” (with regard to a particular aspect of reality) is not arbitrary or absurd; it is implied by the meaning of the verb ‘to know’.

The meaninglessness of knowledge

Having outlined the definition of knowledge, I will now expound its implication—viz., that knowledge in the strictest sense is impossible for humans to achieve. The reason for this may not be evident: it is not that omniscience (in the limited form under consideration) is impossible—for, after all, this is not necessarily the case—but rather that it is in the nature of *homo sapiens* not to be able to know if/when omniscience has been achieved. This is due to the peculiar nature of consciousness. Humans, unlike other animals, are self-conscious: they are aware of themselves. In being self-aware, they are also necessarily aware of the externality of the world that confronts them. They are aware of it as an “other” thing, a thing to which they do not have the same direct, intuitive access that they have to their own consciousness. That is, they do not have (intuitive) access to the “interior” of this object, as they do to their (self-)consciousness. Because the world (i.e., reality²) is necessarily seen by self-consciousness as external to it, truth is seen as external—for truth is but a propositional expression of (a given aspect of) the world. This means that the negation of a given proposition is always conceivable. Even propositions about (self-)consciousness can conceivably be negated, because, although consciousness has intuitive access to the “interior” of itself (as it does not to that of the external world), it is also its own other. It observes itself, it is opposed to itself; therefore, it is “opposed to” (or outside of) any truth about itself, and thus any proposition. Now, to say that the negation of a proposition is always conceivable is to say that the person who asserts the proposition may be wrong, which is effectively to say that he may not be aware of all the facts relevant to the truth or falsity of the proposition. This is, moreover, intuitively compelling. We can never know whether we have grasped all the facts relevant to a given proposition, because, as already stated, facts are external to us; thus, we would have to step outside ourselves to determine (beyond doubt) whether we had understood a given aspect of reality. We would have to attain a God-like perspective, from which negation would be inconceivable.³ Because this is impossible—because, that is, negation is always conceivable—knowledge is impossible.

There is another argument for that conclusion, though it amounts to the same thing as the foregoing. Certainty, as we have seen, is a necessary condition for knowledge. In other words, *S* does not know that *p* unless *S* has no doubts that *p*. What does it mean to doubt that *p*? It means to be aware of the possibility that *p* is false. Now, we have seen that in the case of every proposition *p*, it is possible for *S* to be aware that *p* may be false, simply by imagining not-*p*. Whether *S* is *in fact* aware of this has no bearing on the question of whether *S* has knowledge, because the relevant condition for knowledge is that *S* can *justifiably* attribute knowledge to himself, not that *S* *does* attribute knowledge to himself. All that matters, then, is that *S* *can* conceive that not-*p*: this is enough to show that *S* cannot know that *p* (because imagining that not-*p* is equivalent to doubting that *p*, and doubt is incompatible with knowledge). In fact, complete certainty is, arguably, inconceivable, and hence meaningless. What would it be like not to be aware of the possibility that any proposition *p* can be false? All that is necessary for this awareness is that one understand the meaning of not-*p*; but what would it be like not to understand the meaning of not-*p*? That seems

¹ See Robert K. Shope, “Chapter 1: Conditions and Analyses of Knowing,” in *The Oxford Handbook of Epistemology*, ed. Paul K. Moser (New York: Oxford University Press, 2002), 35, <http://www.questia.com>.

² Or, as Wittgenstein defines it, “all that is the case”.

³ If God existed, he would not be able to think false thoughts. He would see reality—he would be reality—in its totality and nothing else; thus, negation would not exist for him.

unimaginable, meaningless; thus, complete certainty is meaningless, which means that knowledge itself is. –In short, it will always be possible to doubt that *p* (and an absence of doubt is meaningless); therefore, it will never be possible to know that *p*—and, moreover, knowledge that *p* is meaningless.

Maybe my definition of doubt seems too loose. It permits such statements as “I see a computer in front of me, but because I can conceive the truth of the proposition ‘I do not see a computer in front of me’, in a sense I doubt there is a computer in front of me—even though I believe there is.” It seems strange to believe a proposition but doubt it at the same time. Nevertheless, there is nothing paradoxical about this. I believe that the universe was created in a “big bang” but admit I may be wrong—which means, effectively, that my belief is subject to doubt. Similarly, it is possible to believe that I am writing on a computer and yet to doubt it, albeit in some nearly “empty” way. In any case, the fact that philosophers debate these sorts of questions—that they ask themselves, “Do I *know* there is a computer here?”, “Do I *know* I am not a brain in a vat?”—proves they have *some* kind of doubt—and, as we have seen, *all* kinds are incompatible with knowledge.

The question remains, however, why these epistemological problems—namely, the debates over skepticism, over internalism and externalism, over contextualism, over the proper definition of knowledge—have proven as recalcitrant as they have. Why has so little progress apparently been made by epistemologists in the last forty years? The answer is that they have been approaching the problems from the wrong angle. They have been searching for a (*single*) account of knowledge that can both preserve our knowledge of ordinary truths and explain the power of the skeptic’s intuitions. They have been trying to formulate a single definition of knowledge—and justification—that would provide a way around skepticism and Gettier-style problems while permitting people to retain their belief in ordinary, commonsensical knowledge. This project was doomed from the start. No definition can serve both purposes, for ‘knowledge’ is not used in the same way in the skeptic’s context (or, in general, the epistemologist’s context) as it is in the ordinary context. One has only to read Wittgenstein’s *On Certainty* to see that he would have predicted the theoretic floundering of the last few decades, for the simple reason that epistemologists have ignored his main insight: philosophical knowledge is meaningless. Unfortunately, he did not express his insight with precision. Although the concept of knowledge is, in a sense, meaningless, it is not *completely* meaningless. It is not gibberish. Its meaninglessness is analogous to that of my doubt that I am not a brain in a vat: this doubt is not fully conceptualizable, not *imaginable* in the way that my doubt about the origin of the universe is. Rather, it is merely an awareness of the abstract possibility that in some metaphysical world I am somehow a brain in a vat. Similarly, I cannot imagine what it would be like to have knowledge in the strict sense in which I defined it above; I can only abstractly conceive the possibility of not having doubts, of having direct access to metaphysical truth. Epistemologists have gone astray in thinking that literal knowledge (as opposed to “loose”, “metaphorical” knowledge; see below) is possible; their attempt to justify this conviction has led them into quagmires of casuistry.

Wittgenstein was wrong, however, to think that the origin of all this philosophical confusion was that philosophers had taken the word ‘knowledge’ out of its ordinary context and given it a new meaning (if he did in fact believe this). In reality, they had simply had the audacity to take the word seriously: they had tried to give it a consistent meaning that adhered to the ways in which ordinary people used it. This task was impossible, because ordinarily ‘knowledge’ is used in a loose sense—one might almost say a metaphorical sense. If you asked a normal intelligent person if he agreed with the definition of knowledge as “a true belief the truth of which one is certain, on the basis of his internal justification for the belief”, he would say, “Yes”, because that is how the word is used. But if you observed how he used the word in his daily interactions, you would see he understood both “certainty” and “internal justification” loosely. For instance, suppose you said, while indicating an object in the distance, “You know that’s a tree over there, right?” He might say, “Of course I know it! It’s tall, it has leaves, and it’s brown.” Upon approaching it, though, he sees it is a papier-mâché model of a tree. “I guess I didn’t know it was a tree after all,” he says. His judgment that he had known it was a tree was false, because, first, his belief was false, and second, his internal justification was not sufficient. This kind of outcome is conceivable in every scenario, which means that people never have knowledge (for they are never in a position to ascribe knowledge to themselves). It is conceivable even with regard to the statement that I know I have hands, because the division between me

and the objective world (or objective truth) ensures that my internal justification is not sufficient. (I may, for example, be deluded by an evil demon, à la Descartes.) Even the statement that I know I exist is subject to doubt, because I can imagine the possibility that in some metaphysical realm I do not “really” exist in the way I think I do. In other words, that I can imagine the truth of not-*p* (where *p* is the proposition in question) is sufficient to rule out certainty.

The different kinds of knowledge

It would be impracticable, however, to stop using the word ‘knowledge’ in social interactions. Thus, we are forced to posit two kinds of knowledge: that which is impossible and that which is presupposed in daily life. We may call the first kind “reflective knowledge”, or “absolute knowledge”, and the second “conventional knowledge”. The second is not knowledge *per se*, but, loosely speaking, it can be called such. To try to analyze in detail the standards according to which conventional knowledge-attributions are made would be difficult, because they vary between contexts. Broadly speaking, though, *S* has “conventional knowledge” that *p* if *S* is fairly certain that *p* and *S* has some sort of compelling internal justification—and, in some contexts, external justification (see below)—for believing that *p*. Examples of such knowledge would include my beliefs that the earth is approximately spherical, that I live in St. Louis, and that I will spend Christmas in Rhode Island. I “know” each of these statements. Notice that beliefs need not be true in order to count as (conventional) knowledge. Only in retrospect is the truth-criterion relevant: if I learn that the earth is not spherical, I will think, “Obviously my belief that the earth was spherical did not count as knowledge”; still, at the time, it did. Otherwise we are never justified in attributing knowledge to ourselves (since we are never in a position to decide, beyond doubt, that a given belief is true). The reader may find it problematic that the same belief can count as knowledge at one time but not at another—because people are inclined to think a belief is either true or false, and therefore that it either *is* knowledge or *isn't*—but this ambiguity in my account accurately reflects the ambiguity in the common use of the word ‘knowledge’. According to the precise definition of the word, the reader’s intuition is indeed correct; but according to the word’s conventional use, there is no “objective truth” about whether a given belief is “*actually*” known. Rather, it is known if someone believes it is known. Conventional knowledge exists only by convention, only in and through the ways in which the word ‘knowledge’ is conventionally used; therefore, it is as logically imprecise as convention. The essentialist definition of knowledge I gave above is the logically (and intuitively) valid, but unrealistic, extrapolation from convention; the non-essentialist definition is the logically (and intuitively) problematic, but realistic, extrapolation. It will collapse in logical paradoxes if examined too closely, but to examine it closely would be, effectively, to misunderstand it.

I should note that on the extreme end of the spectrum of forms of conventional knowledge—which spectrum ranges from the most lenient to the most stringent criteria for knowledge-attributions—is knowledge that satisfies Gettier requirements. “Goldman’s barn case” is a kind of Gettier example:

S is driving in the country and stops in front of a barn. Unbeknownst to *S*, *S* is looking at one of the few genuine barns in an area spawned with barn facsimiles. The facsimiles are so realistic that if *S* had stopped in front of any of them, *S* would have been tricked into thinking he was looking at a real barn. But by luck *S* has stopped in front of one of the few real barns left in the area. The standard intuition is that *S* does not know he is looking at a real barn, because he could easily have had the same belief while looking at a facsimile.¹

If the (potential) knowledge-attributer is aware of all the information, unlike *S*, he will not attribute knowledge to *S* because the truth of *S*’s belief is accidental. Only if *S* has all the relevant information will knowledge be attributed to him. This kind of knowledge falls under the concept “conventional knowledge” (despite the stringency of its conditions as compared with those of knowledge-attributions in more mundane contexts) because, like all conventional knowledge, it is merely an approximation of absolute knowledge,

¹ Berit Brogaard, “Can Virtue Reliabilism Explain the Value of Knowledge?”

such that neither S nor the attributer can ever be sure he has *all* the information. Even if S is aware of the Gettier conditions that the knowledge-attributer is aware of (and thus, according to the attributer, has knowledge), they both may be unaware of other (relevant) conditions that might conceivably exist, and which therefore vitiate S's knowledge. Hence, even knowledge that (from the attributer's perspective) satisfies "Gettier clauses" is fallible, like all conventional knowledge.

The distinctions I have made suggest solutions to several traditional epistemological problems—for example, the controversy surrounding Academic Skepticism (to use the terminology of Sextus Empiricus¹). Academic Sceptics claim we cannot have knowledge of "epistemically interesting" types of propositions, that is, propositions that are "generally thought to be known given what we ordinarily take knowledge to be".² According to the arguments I have proposed, skepticism cannot be refuted. People cannot have reflective (or absolute) knowledge. Perhaps the reader will retort that I am contradicting myself: "you say we cannot have knowledge, but clearly you think that that proposition itself can be known!" While I do think the proposition is true, I do not think it can be known for certain. So I am not contradicting myself. "So you accept skepticism? Does it not disturb you that all your beliefs may be false?—that you have no knowledge?" No, it doesn't disturb me in the least. I must admit that I have never been as terrified of skepticism as most philosophers are. That I do not have absolute knowledge vis-à-vis any of my beliefs seems to me like a purely scholastic problem. It does not mean, for example, that my beliefs are probably false. Skeptical possibilities (such as the "evil demon" and the "brain in a vat" hypotheses) are so ridiculous that I feel entitled to ignore them, even while knowing³ that they remain possibilities. Moreover, they are often patently delusional. For instance, to suggest that I may be a brain in a vat is effectively to suggest a self-contradiction. The I that I am is *right here*; the word 'I', as applied to myself, has no meaning outside of my immediately existing, immediately self-present self here in this world. It is absurd to say I am two beings at once—I am *this* self *and* a brain in a vat somewhere in the 'background'. Nevertheless, because I acknowledge the possibility that in some metaphysical world hidden from me self-contradictions may somehow be true, I cannot say that I *know* I am not a brain in a vat. —In short, skepticism is irrefutable, but, generally speaking, it should be ignored.

The internalism vs. externalism debate is another pseudo-problem. As we have seen, the two positions are united in the true definition of knowledge, such that the debate between them becomes moot. The internal justification that is a prerequisite for knowledge incorporates external justification: i.e., in order to know that p, one must have perfect knowledge of everything that directly relates to one's belief that p. Regarding conventional knowledge, we have seen that S's possession of internal justification is almost always a prerequisite for attributing knowledge to S; in many cases (such as Gettier contexts), the attributer requires also that S be externally justified. If asked, most people would probably say that external justification (such as that the truth of the belief in question is not accidental) is *always* necessary; however, in practice people often ignore this criterion when attributing knowledge to themselves and others. Because the nature of conventional knowledge varies between contexts (since people do not always use 'knowledge' in the same way, with the same criteria determining their attributions)—in other words, because there is no "truth of the matter" about whether a given person has knowledge; rather, he has knowledge simply if someone attributes it to him—we are forced to say that external justification is sometimes necessary and sometimes not. It depends on the context and on the knowledge-attributer.

My position may seem similar to contextualism; however, the parallels are superficial. A contextualist thinks that if the attributer is in a low-standards context, the person to whom knowledge has been attributed does indeed know that p; if, on the other hand, the attributer is in a high-standards context, the person does not necessarily know that p (even if the 'p' in question is the same proposition that the low-standards person knew). According to my position, neither person has knowledge in the strict sense, but in

¹ See Peter Elien, "Chapter 11: Skepticism," in *The Oxford Handbook of Epistemology*, ed. Paul K. Moser (New York: Oxford University Press, 2002), 337, <http://www.questia.com>.

² Ibid.

³ In this context (as in most others), I use 'knowledge' in the sense of 'conventional knowledge', not 'reflective knowledge'.

the low-standards context, the person does have conventional knowledge. The reason, however, is that we have done away with the truth criterion (except when the attributer has it in mind); if we had not, even in the low-standards context the person would not necessarily have knowledge. This is the flaw in contextualism: it forgets that truth is unaffected by a lowering of standards. That I lower the standards for my knowledge-attribution does not make it any more likely that the person to whom I am attributing knowledge has grasped truth. We may illustrate the point by taking an example from John Hawthorne's paper "The Case for Closure"¹: a newspaper prints the statement that Manchester United beat Coventry City. According to contextualism, a reader who does not consider the possibility that the statement is a misprint knows that Manchester United beat Coventry City, while a reader who does consider such a possibility does not know that Manchester United beat Coventry City (because he is unsure whether it is a misprint). As it turns out, the statement was a misprint; thus, the reader in the low-standards context could not have "known" that the statement was true, if knowledge implies the statement is in fact true (as a contextualist thinks it does). Nevertheless, a contextualist is committed to saying that he did know it; therefore, contextualism is false. The position I have outlined is more tenable, in that it denies that (in every context) p need be true in order for one to know that p . This does seem counterintuitive, but it adheres to conventional practice.

If my account is correct, where does it leave epistemologists? For one thing, it means that many of them have wasted the last forty years. Not all have, though. The foundationalism-coherentism debate is left intact, as is the empiricism-rationalism debate. These issues are unrelated to the definition of knowledge; they bear only on (an individual's or a community's) *understanding*. Understanding should be distinguished from knowledge (in both of its senses): it is a "system" or a "schema"—though not necessarily a well-organized, consistent one—that both *is* an interpretation and serves as a *framework* for interpretations of experience. It can be loosely defined as the collective body of "knowledge" of a given entity (whether individual or communal); however, it is not necessarily *true*. The areas of epistemology that are involved in analyzing the structure of understanding, but not in asking whether we *know* a given proposition, are left unharmed by my arguments.

"Still," the reader may ask, "are you saying we don't *know* that, e.g., $5 + 2 = 7$, or that trees generally have leaves, or that bachelors are unmarried adult males? If so, what do you mean?" Basically, the thrust of my arguments is that to ask such questions is misguided. To say we don't know that p , when p is something like " $5 + 2 = 7$ ", is largely meaningless. Nevertheless, the existence of these sorts of questions (and their stubborn resistance to being answered) shows that, in a sense, we do not, after all, *absolutely know, beyond any conceivable doubt*, that $5 + 2 = 7$.

It may help, in this context, if I make use of one last classification, one last category of knowledge. (I probably should have introduced it earlier, but—better late than never.) Aside from knowledge in the strictest sense ("absolute knowledge", or "reflective knowledge") and knowledge in the loosest sense ("conventional knowledge"), there is knowledge in the sense of 'My doubt that p is empty, meaningless, in that I cannot imagine what it would be like for p to be false'. We may call this "unconditional knowledge", since there are no conditions under which we can concretely imagine it is false. It can be subdivided into two classes: statements whose justification is *a priori*, and statements whose justification is *a posteriori*. Such propositions as "Grass turns green in the spring", "All cubes have twelve edges", and "I have hands" are unconditionally, and conventionally, known, though not absolutely known. (Unconditional knowledge may be seen as a subclass of conventional knowledge, since it too is but an approximation of absolute knowledge.) The criteria for unconditional knowledge-attributions are that both the attributer and the person to whom knowledge is attributed have internal justification and certainty so overwhelming that they cannot imagine "what it would be like" for the proposition in question to be false. If it were, their entire "*understanding*" would be thrown into confusion: their cognitive/conceptual framework for interpreting experience would collapse, and they would lose faith in all their former beliefs. Even a proposition like "President Bush went to New Orleans after Hurricane Katrina hit the city" is unconditionally known (by

¹ See *Contemporary Debates in Epistemology*, eds. Mattias Steup and Ernest Sosa (Malden, MA: Blackwell Publishing Ltd., 2005), 39.

me), because if it were false I would lose faith in the methods I use to interpret experience, the methods of collecting evidence and forming beliefs, and thus I would come to doubt nearly everything I had formerly known. Examples of propositions that are conventionally but not unconditionally known are “I will spend Christmas in Rhode Island”, “I will go to class on Thursday”, “The common belief that there are nine planets in the solar system is correct”, and “Geologists are right that the earth is about four billion years old”.

It may be asked, “Are statements that satisfy Gettier-clauses unconditionally known, or merely conventionally known?” This question is difficult to answer; however, it is also insignificant. It treats classification as an end in itself. If one’s goal is to attain insight into the nature of knowledge, there is no point in trying to decide whether statements that pass Gettier-standards satisfy the criteria on which unconditional knowledge-attributions are based. What matters is that these statements are not *absolutely* known, nor are they as fallible as the loosest kinds of conventional knowledge. The notions of conventional and unconditional knowledge are not—and need not be—defined with complete precision, in an attempt to make them somehow “correspond” to an objective reality; they are merely useful tools for conceptualizing knowledge-attributions.

Incidentally, it would not be futile for epistemologists to analyze—as they are apt to—how it is that people come to have unconditional knowledge (or even conventional knowledge) of certain beliefs; however, I think that this task might be more appropriate for psychologists than philosophers. Or maybe they could work together. I do not think, though, that the dialogue (between philosophers, psychologists, or whomever) should be framed in the dogmatic way it has been in recent decades; rather, it should be informed by an open-minded, “relativistic” attitude, grounded in recognition that knowledge-attributions do not, and should not, adhere to a single set of criteria (be they “internalist”, “externalist” or whatever). But regardless of the ways in which epistemology will proceed in the coming years, its practitioners have, for the past few decades, been misled by a lack of preciseness and a conflation of categories. In order to make progress they should start defining their terms more carefully, by observing how they’re used in ordinary contexts and making explicit all the implicit dimensions of such a concept as ‘knowledge’.

This paper has left some questions unanswered; its purpose, however, was only to sketch the framework of a way out of the confusion that defines the contemporary epistemological scene.

*

I should have followed more closely the guidelines of the assignment. But I don’t like writing papers that aren’t original contributions. Nor will I use contemporary jargon, if I can help it. I made a point of not mentioning Dretske’s “conclusive reasons” or Nozick’s “truth-tracking” or Sosa’s “virtue reliabilism” or blah blah.

Did you notice the Sartre I inserted in there? Uniting Sartre and Wittgenstein: that’s interesting.

Wednesday, November 30

You shouldn’t care what people think of you. Why? Because, presumably, their opinions usually aren’t “right”. (Or, at least, they “aren’t the whole story”.) For if they were, then surely you’d have a reason to care about them. At any rate, you’d be self-deluded and callous if you didn’t. Therefore, if the advice is to have any soundness, it assumes that judgments are generally ignorant and unperceptive. Including your own. So you’re being hypocritical in thinking that your judgments of people are right. (Obviously this isn’t a blanket condemnation of *all* judgments. Some are manifestly true. I’m questioning only the problematic ones, which tend to have an element of ‘good’ or ‘bad’.)

Or will you say that even if his opinion is right you shouldn’t care about it? –Because you’re free, because everyone has flaws, because you can’t spend your life worrying about what every passerby thinks of you. (That’s less a justification than a motivation. But it’s also a justification, albeit a weak one.) Everyone has flaws: that’s an acceptable argument. That and the other are sufficient to justify the advice.

Thursday, December 1

I'm tired of experimenting. Tired of taking Nietzsche's maxim to an extreme. It ain't worth it, even if it does bring life closer. For nearness to life is by no means a desirable experience. I took Ginseng pills this morning; they had no effect until the afternoon, when in the middle of class I suddenly lost my ability to talk. My tongue caught in the back of my mouth. It felt like if I said one more word I'd explode, either in tears or in a panic attack. Or I might just choke. A very surreal experience. And very scary. I thought about fleeing the room. Later, on the way to the gym, as I was walking in the night I hallucinated a writhing mass of translucent worm-like things—two sets of them, one in the foreground and one in the background. I could reach out and touch them. But as suddenly as they'd come they vanished. This got me to thinking: how far would these symptoms go? Would I hallucinate more and more and finally go blind? You laugh at the idea, but at the time, in my state of mind, it seemed eminently realistic. After all, I didn't know how Ginseng reacted with Wellbutrin and Paxil. Maybe blindness was a side-effect. I panicked, which is rare for me. Bothered by all sorts of ideas. Looked in the mirror a few inches away, examined my eyes: bloodshot. Lifted a lid and looked underneath to see the naked eyeball vulnerable, completely vulnerable, open to being plucked out. *Horri-fying*. I thought of the scene in *Kill Bill 2* when Uma plucks out the eye of her adversary, who flails and screams. I could see myself doing that. Reaching in there, yanking it out and squishing it between my toes; then going berserk. Kept looking at the mirror, fascinated. The loss of control, the loss of being-human, the becoming-an-animal. Felt strangely pulled to do the unthinkable as the sight of the animal overtook me. Something so different from what life has always been—so intense, *real*, I was riding a whirlpool down to oblivion. So close, my hand just waiting for the go-ahead.... So I backed away. Didn't trust myself.

Home, I sat on the rug, hands shaking. Thought, thought. How unreal it all is! Wouldn't the world stop existing if I did? Why did I worry about my parents? They wouldn't exist anymore! Everything was literally imaginary. Suicide as an experiment! Suicide from philosophical skepticism. Thoughts kept bouncing from epistemology to loneliness to unreality to epistemology. Tears came, from the drugs. Very severe. Intolerable. Hands pressed against forehead, forcing it in, trying to crack it like an eggshell. I couldn't stop these thoughts from coming! Thoughts like observing myself, knowing I'd write all this, knowing I'd look at it later disinterestedly, knowing I'd look fondly on this agony and smile but so sad now but *wanting* to be sad (or maybe not), relishing the reality of the experience yet wondering if it was real or an act, wondering if I was in fact relishing it or was this too only another act, thinking of the future reader, *lonely lonely* and thinking of all these people thinking how hard it must be to have a mind that is *never satisfied*, one fleeting thought after another, first-order second-order third-order, each an observation of the last order, wondering what is the explanation of tears (water leaking from the eye?!), hating my curiosity, thinking of Sandy's repudiation of our friendship due to one night when I was glum and acted so, the fragility of friendships. But mostly just *Get away from me, mind!* I was really fed up.

Enough with the drugs. My ordinary mental state is bliss compared to the drug frenzy.

[...]

Saturday, December 10

Some esoteric questions that don't want to be answered turn out to be pseudo-problems, arising either from the deceptive nature of language or from the solution's being available only from a perspective that's so obvious it's overlooked. I've probably mentioned in the past my confusion about how it's possible that I can find mankind at once so despicable and so lovable (and pitiable). Or how I can dislike a person one day and adore her the next day. "Those reactions must be totally irrational, nearly groundless, if I can

fluctuate from one to the other!” In a sense, of course, they are. But a rational justification can be invented for them (and that’s all I need). Namely, some of people’s traits are likable, or forgivable, and others aren’t. People are often ‘innocent’, ignorant only because of their innocence (i.e., lack of experience/intelligence), rarely have control over who they are—and then there are all the qualities that are positive in themselves. On the other hand, insofar as there’s such a thing as free will, people don’t try hard enough to be empathetic, kind, informed (whether interpersonally, politically, economically, artistically) and so on. And obviously they’re capable of the most barbarous sadism. And they’re just plain stupid.¹ So my love focuses on the first class of traits, my dislike on the other. That’s the explanation.

My faith in the power of reason is totally anachronistic, and even contradictory with myself. I’m the bastard child of a union between the Enlightenment and Existentialism—the Masculine and the Feminine.

Monday, December 12

My admiration of Bach consists primarily in the fact that he was the composer least susceptible to sentimentalism, yet, along with Mozart and Beethoven, most prone to passion.

But also, he operated by instinct to a greater degree even than Mozart. The prelude completed by Gounod and named “Ave Maria” testifies to this: its harmonies, which Bach composed, are so mathematically perfect that one of the most beautiful melodies in musical history—one of the most natural, most symmetrical, most logical—was latent in them. We have Gounod’s genius to thank for the melody, but we have Bach’s to thank for its substance.

In short, Bach was nature’s chosen vehicle for the musical expression of its physical principles.

Friday, December 16

Here’s another paper:

Holism in the Sciences

The debate between methodological individualism and holism has lasted well over a century, and a consensus will probably never be reached. The questions involved have, until recent decades, tended to be conflated: ontological claims have been equated with explanatory claims, which have been equated with semantic claims. In his book *Varieties of Social Explanation: An Introduction to the Philosophy of Social Science*,² Daniel Little distinguishes between three main questions: “What sorts of things is society composed of?”, “What do societal concepts mean?”, and “What method should be followed in explaining social phenomena?” The individualist gives the following respective answers: (1) society is simply an aggregate of individuals; (2) the meanings of such collectivist concepts as ‘state’ and ‘class’ can be reduced to concepts about (interactions between) individuals; and (3) social explanations can be—as J. W. N. Watkins puts it—“deduced from (a) principles governing the behavior of participating individuals and (b) descriptions of their situations”.³ The holist, on the other hand, answers, more or less, as follows: (1) society

¹ Their stupidity, though, provides fuel for both reactions. Since they don’t have control over it, it’s forgivable. It is in fact a wrong that nature has perpetrated, and as such can induce me to feel pity and compassion (for our poor, wronged species).

² (Boulder, CO: Westview Press, 1991), p. 183, <http://www.questia.com>.

³ J. W. N. Watkins, “Ideal Types and Historical Explanation,” in *The Philosophy of Social Explanation*, ed. Alan Ryan (New York: Oxford University Press, 1973), p. 88. Friedrich Hayek expresses the principle differently: “there is no other way toward an understanding of social phenomena but through our understanding of individual actions directed

is composed not only of individuals, but also of relations between individuals (to quote Louis Althusser); (2) the meanings of societal concepts are not reducible to individual-level concepts; and (3) social relations—or, ultimately, macroscopic tendencies—have explanatory primacy. Now, the same kind of answer need not be given to all three questions. An individualist’s ontology, for example, does not entail an individualist’s theory of meaning—because the meaning of a given concept (which is determined by the ways people use it) has nothing to do with insight into the true nature of the world (because neither does conventional linguistic practice)—nor does it entail an individualistic methodology—though I shall have to argue for this claim later, due to its complexity. Daniel Little argues convincingly against the individualist’s theory of meaning; in this paper I’ll answer the ontological and explanatory questions, defending the holist’s position (while qualifying it in minor respects).

Ontology

Here are two classic statements of methodological individualism, the first by Watkins, the second by Karl Popper:¹

....[T]he ultimate constituents of the social world are individual people who act more or less appropriately in the light of their dispositions and understanding of their situation. Every complex social situation or event is the result of a particular configuration of individuals, their dispositions, situations, beliefs, and physical resources and environment.

....[A]ll social phenomena, and especially the functioning of all social institutions, should always be understood as resulting from the decisions, actions, attitudes, etc. of human individuals, and...we should never be satisfied by an explanation in terms of so-called “collectives”...

The first point to be made is that Popper is not entitled to his conclusion. His methodological claim does not follow from his ontological one. This is because (assuming Popper’s ontology) it is possible to sum up the micro-level, atomistic facts of a given macrocosm and extrapolate tendencies that we then phrase in collectivist terms. In other words, we can legitimately abstract features of a collective without invoking the individuals who compose it. For instance, as a partial explanation of George W. Bush’s reelection in 2004 one might say, “His support among the Hispanic population was important”. “The Hispanic population” is a collective, yet the explanation offered is satisfactory. One can in this way abstract a plethora of features of any collective from the innumerable microstates that compose it, whether it be an economic class, a group of individuals with the same occupation, an ethnicity, or a social institution. “The bureaucracy of the State department is inefficient.” Even assuming an individualist ontology, this holistic claim is perfectly legitimate. Indeed, it would be absurd and otiose to say, instead, “The individuals from whom—or from whose acts—the concept of the ‘bureaucracy’ is abstracted operate in such a manner that it takes a needlessly long time for a directive by one of their superiors to be actualized.” To expunge references to collectives from explanations would be to make explanations far more verbose than they have to be.

Perhaps Popper would object to the latter example, since it is not an explanation *per se*. It is merely a description, and so his stricture does not, strictly speaking, apply to it. (This would be a sophistical objection, but I’ll ignore that.) Here is a better example: “The state typically adheres to the interests of the capitalist class, because this class wields far more economic power than any other, and economic power yields political sway.” It is hard to see how Popper’s social ontology is incompatible with that statement, even though it makes no reference to individuals. Indeed, it refers only to collectives and relations between them, both of which concepts (‘collective’ and ‘relation’) are deemed not to ‘really’ exist. Its concepts could

toward other people and guided by their expected behavior”. (Ibid., p. 121.) Both Watkins’ and Hayek’s statements amount to the idea that explanations must begin with the acts of individuals considered atomistically. They are then ‘added up’. (See below.)

¹ Quoted in Steven Lukes, “Methodological Individualism,” *ibid.*, p. 121.

be translated into individualistic ones—thus: “Politicians generally act according to the interests of their capitalist donors....”¹—but there seems little point in carrying out this reduction.

However, this whole discussion is confused (mirroring, in this respect, the historical debate between holism and individualism). If individuals and their actions were indeed the only socially relevant things that existed, then obviously social explanations would necessarily invoke only individuals and their actions. If there were no such things as relations, collectives and so on, theorists could not refer to them. But then there would be no debate between individualism and holism: all theories would, by necessity, be individualistic. This is not the case, however, so relations and collectives must in some sense exist. In some ‘abstract’ way, there clearly are such things as relations between people. Not even Popper would deny this. But what does it mean? This question cannot be answered in an intuitively satisfying way, although it has preoccupied philosophers for millennia. The medieval scholastics, for example, were divided into three positions: realism, according to which such ‘universals’ as relations exist outside the mind; conceptualism, according to which they are mind-made; and nominalism, according to which they do not exist at all. In his paper “On What There Is”, W. V. Quine respectively associates each of these with the modern doctrines of logicism, intuitionism, and formalism. The point is that none of these answers (to the question of what it means for relations to exist yet not to exist in the same way that material objects do) is relevant to the philosophy of social science. That is, it does not matter which of them is true: it will not change the opinion of either an individualist or a holist. Suppose it turns out that social relations do (metaphysically) exist outside the mind; the individualist will say, justifiably, “Well, they don’t *really* exist! They don’t exist in the way that people do!” On the other hand, if it turns out that relations do not exist at all (whatever that would mean), the holist will say, with justification, “Well, since we can coherently talk about them, obviously it isn’t senseless to say they exist. So I will stick to my original claim (viz., that social relations not only exist but determine the nature of social interactions).” Now, because these three ontological positions are exhaustive,² there is no relevant answer to the question. Therefore, to argue for or against the doctrine that social relations exist is misguided. It is based on a misunderstanding; whatever one’s position, nothing substantive is said.³ Thus, the ontological question itself is misguided.

That argument may have been too quick. I have another, though. Louis Althusser goes so far as to say that society is composed *only* of relations:⁴ “What constitutes society is the system of its social relations in which its individuals live, work and struggle”.⁵ Similarly, Karl Marx says (in the *Grundrisse*) that “society is not composed of individuals”. To a dogmatic individualist these statements must seem perverse, just as, to a dogmatic holist, it must seem outrageous to say that only individuals constitute society. However, with a sufficiently open mind, both doctrines are understandable. It is possible to shift from agreeing with one to agreeing with the other simply by experiencing what Thomas Kuhn might call a “gestalt switch”. From one perspective, Marx and Althusser are right; from another, Popper and Hayek are. One might even say that society is composed of traditions, or of norms, or of institutions, or of roles, or of whatever concepts can justifiably be abstracted from people’s modes of interaction; and one would be right. A societal ontology can include virtually whatever one wants it to include (within reason).

In any case, the ontological thesis of the individualist is vacuous. We have seen that he would agree with the holist that social relations abstractly exist; by arguing, then, that only people (and their actions, thoughts, etc.) exist, he is really arguing that people are the only concrete existents. He is saying, in effect, that the only things that concretely exist are things that concretely exist, namely people. He is stating a

¹ Incidentally, that translation presupposes social relations. It might be possible to express these relations in terms only of individuals’ behavior towards one another, but, again, no explanatory purpose would be served in doing so. Invoking relations is a legitimate and useful way of expressing—and explaining—human interactions. —But I’m getting ahead of myself.

² For universals either do not exist, exist only in the mind, or exist outside the mind. There are no other options.

³ To repeat: both sides accept that social relations exist but do not exist (in the ‘concrete’ way of material objects). The individualist merely emphasizes their non-existence, while the holist emphasizes their existence.

⁴ Louis Althusser, *Essays on Ideology* (London: Verso, 1984).

⁵ *Ibid.*, p. 85.

truism. No rational person, after all, would deny that “Every complex social situation or event is the result of a particular configuration of individuals, their dispositions, situations, beliefs, and physical resources and environment”. What follows from that? Nothing.

Methodology

The individualist’s methodology is more substantive than his ontology. Admittedly, at first glance it may seem equally truistic: to say, for example, that a theorist must look for the explanation of a bureaucracy’s inefficiency in the behavior of the individuals who compose it is, in a sense, to say not much at all. No holist would disagree with that statement. He would insist, however, that the bureaucrat’s behavior is itself explainable through more fundamental facts—facts rooted not in the bureaucrat’s psychology but in his location within a nexus of relations that extends through the whole of society. The individualist denies this—or, at most, qualifies his agreement by saying, perhaps, that these relations are explained by human psychology and people’s reactions “toward others....guided by their expected behavior”. The holist retorts, e.g., that psychology cannot account for the differences between societies and that the nature of people’s “reactions” depends on where they are located in the system of social relations. Then the individualist responds by invoking environmental conditions, etc., as an explanation of the differences between societies, and says that a person’s location in the system of social relations depends on his psychological characteristics and past actions, etc. And in this way the debate goes around in circles, beginning to seem uncomfortably similar to the “chicken or the egg” problem.

To find a way out, we must clarify wherein lies the confusion. This entails clarifying the disagreement. What does it really mean to say that the individualist’s perspective is atomistic? What does “atomism” mean? Hayek might say it means that “individual actions” are the fundamental level of analysis. But what does that mean? In itself, the principle that “there is no other way toward an understanding of social phenomena but through our understanding of individual actions directed toward other people and guided by their expected behavior” says nothing controversial. One can be a holist—a structuralist, a functionalist, a Marxist—yet subscribe to it, as far as it goes. It does not contradict the methodological injunction that relations, and the macroscopic structures they constitute, should be the focus of analysis, because the holist can consistently maintain both that a person’s behavior is causally influenced by the character of the social relations in which he is embedded¹ and that the properties of a given social phenomenon supervene on the actions of individuals. Indeed, to deny that they do so “supervene” would be ridiculous: it is obvious that if the behavior of a group of people changes,² the nature of the social phenomena that are related to it will change (and the latter will change only if the former does). This claim is essentially equivalent to Hayek’s idea that in order to understand a social phenomenon one must understand the actions in which it is instantiated (—or, at any rate, each idea implies the other); and neither idea implies that actions cannot be understood from a holistic perspective.

So we still do not know exactly what the individualist is saying. Let’s look at Watkins’ account of the theory: social explanations can be “deduced from (a) principles governing the behavior of participating individuals and (b) descriptions of their situations”. This statement is stronger than Hayek’s. A holist would not subscribe to it. It states that there is a set of principles (by which Watkins means *psychological* principles) that governs the behavior of all individuals, and that in order to understand a given social phenomenon the theorist must apply this set of principles to each relevant individual’s behavior, on the basis of a description of his situation. Now we finally know wherein consists the atomism of methodological individualism: social phenomena are explained by ‘summing up’ the psychological explanations, and the histories, of each relevant individual’s behavior. This interpretation is supported by Watkins’ frequent use in his aforementioned paper of the concept of a person’s “dispositions”. Dispositions (to act a certain way),

¹ I’ll explain below what that means.

² Or, to satisfy Popper et al: the behavior of the individuals from whom the notion of a ‘group’ is abstracted.

he seems to say, are what matter most.¹ Thus, methodological individualism, if it is to have any substance at all, is essentially a familiar form of reductionism: the reduction of sociology to psychology.²

Reductionism in most forms is not currently fashionable among scientists or philosophers. It isn't hard to see why: its program is unrealizable, due to practical and theoretic difficulties. Practically, the task of collecting enough data to explain, for example, the beating of a heart in terms of the movements of its molecules—or, more relevantly, a social phenomenon in terms of the psychology and the actions of all its participants—is impossible. But theoretically, most forms of reductionism are indefensible anyway, simply because when lower-level constituents combine to create a new entity, the latter has “emergent” properties that do not fit into the framework of the micro-level theory that describes the entity's constituents.

[...]

The situation is different on the level of social science. While the states of a given macrocosm still supervene on the behavior of individuals, the latter do not exist in the same kind of physical, deterministic network in which lower-level constituents exist in biological, chemical and physical entities. This is why methodological individualism is espoused only in relation to social systems: it is palpably false vis-à-vis deterministic systems, in which the interconnections between things are obvious. The existence of a psyche—that is, consciousness and will (free or otherwise)—in humans and animals somehow ‘softens’ environmental causality, so that it becomes mere *influence*. Thinkers are thus able to refer to the actions of “atomistic individuals”, which would be an absurd turn of phrase in the natural (i.e., deterministic) sciences.

Nevertheless, emergent phenomena abound in human communities (though less so in animal ones, since social relations are extremely rudimentary). Wherever there is a social structure—a hierarchy, a network of relations, a system of roles—there is emergence. This fact in itself implies the falsity of the individualist approach. One wonders why so many thinkers have overlooked it. Have they actually failed to see, for example, that the market economy has structural tendencies? Or that the behavior of social classes follows patterns? Or that a bureaucracy is, in a sense, more than the sum of the bureaucrats' activities? Obviously not. They have been misled, I think, by the irresistible, albeit shallow, logic of their methodology. For instance, upon reading the following statement from the economist Kenneth Arrow, one's first inclination is to think its ideas are self-evident:

A full characterization of each individual's behavior logically implies a knowledge of group behavior; there is nothing left out. The rejection of the organism approach to social problems has been a fairly complete, and to my mind salutary, rejection of mysticism.³

“Of course!” one thinks. “What could be more obvious?! Groups are nothing but people; once you understand the people, you understand the group!” It is strange, though, that none of these thinkers had the suspicion that this reasoning was too pat, too easy. It does suggest a useful methodological principle (on which, see below), but, as I have already noted, it does not rule out the existence of structural factors which, while supervening on people's behavior, constrain and guide their behavior as well. I think it is the invisibility of this dialectic between relations and agents that mystifies individualists and causes them to ridicule holism. My task, then, must be to elucidate it.

The methodological principle I referred to a moment ago is something we have already encountered: namely, the injunction to find concrete mechanisms whenever there is causation due to the emergent properties of a social group. The reason for this principle is that the emergent properties do not exist in some mysterious Platonic realm, but rather in the concrete mechanisms themselves. (Or, more accurately, they are extrapolations from the latter.) For example:

¹ Recall too that Adam Smith, another methodological individualist [*well, that's arguable*], grounded his system in the psychological postulate of a “propensity to truck and barter”.

² It is ironic that Popper, in one of his rational moments, praised Marx for helping to establish the autonomy of sociology from psychology. He seemed not to realize that, in his advocacy of methodological individualism, he was effectively fighting against this autonomy.

³ Alan Garfinkel, *Forms of Explanation* (New Haven: Yale University Press, 1981), p. 53.

Consider the proto-capitalist market, the ur-market of the early classical economists like Adam Smith. Its essential features are that it is a collection of small entrepreneurs in a competitive market, a homogeneous collection of traders engaged in competition with one another for resources or markets. The crucial fact about this situation is that it is unstable. In fact, as the degree of competition sharpens, the homogeneous situation becomes less and less stable. Many factors contribute to this situation.¹

Garfinkel proceeds to outline four such factors, one of which is the existence of economies of scale: “large-scale production is more efficient than small-scale; more automation can be used... Hence a small advantage tends to become bigger.” The phenomenon being explained, viz., the instability of an economy, is emergent, in that (1) it is a macro-state that is unintentionally produced as people pursue their own private ends, and (2) it cannot be derived from the sum of atomistic descriptions of each individual’s behavior. It is exclusively a relational fact: it exists ‘in’ the relational interstices between entrepreneurs. What matters, therefore, is not how this or that entrepreneur behaves, but how his behavior affects others. We want to know his behavior not for its own sake (as the individualist assumes), but for the sake of how it makes someone else behave; and we want to know this other person’s behavior only so that we can see how it bears on another’s behavior. And so on. The holist’s methodology, then, is a sort of negative methodology: he wants descriptions of the ‘positive’ or the ‘present’ (i.e., observable behavior) purely so he can understand the ‘negative’ or ‘absent’ (i.e., unobservable relations)—because, although it is the positive/present that concretely exists, it is the negative/absent that determines the dynamics of society. And this is because the negative determines the positive—or, less obscurely: relations ‘determine’ behavior. Thus, the individualist has it backwards: he adds up activities, when what must be ‘added up’ is how the activities *bear on one another*. He forgets that if social phenomena were mere sums of parts, mere aggregates—in the way that, for example, “taxonomic collectives” are,² or a herd of buffalo is—there would be no substantive relations between people, and so there would be no society.

To return to Garfinkel’s example: the question we are trying to answer is how emergent properties manifest themselves. It must be in concrete mechanisms, such as those that account for the frequent superiority of economies of scale to small-scale production. It is easy to imagine the specifics of how an economy organized around the latter could evolve to one organized around the former: an entrepreneur who had the benefit of economies of scale could lower his prices, thereby forcing his competitors either to follow suit or to go out of business. This process would gradually spread through the entire economy. The individualist might invoke psychology to explain why certain entrepreneurs were successful (as in a Social Darwinistic way), or he might note the importance of luck,³ or he might invoke rational choice theory or game theory; and from each person’s perspective, his account might (*possibly*) be correct. The problem is that it ignores the essential question, namely, *why is there a pattern?* If he answers, “The pattern is simply an aggregate of all these microstates” he is begging the question. The point is, what makes it possible that all these microstates can occur (in such a way that a pattern results)? Granted that, in each case, the more efficient entrepreneur will ‘drive out’ the less efficient; what is important is that whatever factors explain the possibility of this relation between entrepreneurs are the factors that explain the virtual *necessity* of the pattern. The individualist, if he is to be consistent with his methodology, cannot even ask the relevant

¹ Ibid., p. 120.

² Andrew Sayer, *Method in Social Science: A Realist Approach* (London: Hutchinson & Co., 1984), p. 109.

³ Garfinkel refers to a study by C. Jencks, the conclusion of which is that luck is more important than intelligence and education in explaining the economic success of particular individuals. Chance acquaintanceships, for example, or the range of jobs that happen to be available at a particular time, or various other accidents. Garfinkel’s point is that, from the individualistic perspective, luck is essential. The individualist’s “hyperspecific” focus precludes his explaining *patterns*, which are necessarily holistic.

question¹ (due to his hyperspecific focus, which prevents his seeing the phenomenon), much less answer it; the holist answers it by appeal to emergent properties, which manifest themselves in—one might almost say, *as*—the very microstates we are trying to explain. There is no other answer to the question that began this paragraph. Thus, an irreducible circularity characterizes society, between micro-level relations and emergent properties.² This circularity may be a philosophically obscure notion, but as a methodological postulate, it is necessary.

For further illustrations of the inadequacy of methodological individualism, I refer the reader to Garfinkel's book *Forms of Explanation*, which includes scores of arguments from a holistic perspective. The ideas set forth in this paper have been, admittedly, far from complete, consisting mostly of suggestions and hints, but I hope they have at least cast doubt on individualism—the only valid doctrines of which, I have argued, are the idea of supervenience, the injunction to look for concrete mechanisms, and the emphasis on “human nature” as setting the range of possible social organizations. (This emphasis, however, should not, as it were, be over-emphasized.)

*

Not very well-written, but most of its ideas are true. Still, I'm bothered by the unconceptualizability of the various “dialectics”.

Sunday, December 18

My second art paper: [I'm rewriting it, so I've included only the beginning here.]

The Solution to the Paradox of Horror

I have often wondered how it is that unpleasant emotions can be enjoyed. Sadness, anger, disgust, hatred, resentment, regret: they can all be “relished”, depending on the circumstances. In what sense are they unpleasant, and in what sense gratifying? What does it mean to call them such? Similarly, in the realm of art, tragedy and horror movies are enjoyed by mass audiences, despite the negative connotations of ‘pity’ and ‘fear’ (which are the characteristic emotional reactions they provoke). How is this paradox to be explained? I am basically ignorant of the literature on the subject, having read only Berys Gaut's paper “The Paradox of Horror” and a few pages of the excerpt from Noël Carroll's book *The Philosophy of Horror* in the anthology *Arguing about Art*, but I should like to offer a few ideas. I'll take it as axiomatic that the true theory must apply to both manifestations of the paradox (namely, (1) pleasure as derived from emotions whose objects are *real*, and (2) pleasure as derived from emotions with *fictional* objects). The reason is that the phenomenologies of the two manifestations are essentially the same: the (implicit) thought “I want this feeling to continue” is directed towards an emotion that one would normally not want to experience. Doubtless there are certain unique features of the art-manifestation that require a supplement to the explanation of the reality-manifestation; nevertheless, the overall framework of the theory will apply to both situations.

One of the reasons why the paradox has remained unresolved since Aristotle addressed it in his *Poetics* is that philosophers have misunderstood the nature of the problem. In being confused by the possibility of finding pleasure in pain, they have thought that the solution lay in an explanation of the *causes* of the pleasure. Thus, Aristotle invoked catharsis, Hume pointed to the importance of an engaging narrative structure, and Carroll describes the fascination attendant upon the violation of one's normal conceptual

¹ Namely, “What is it that makes all these microstates possible?”—or, more clearly, “What is the nature of this economic structure? (And why does it exist?)”

² As a Marxist, I would say there is a third circularity: between the economic base and the cultural superstructure. (It is an ‘asymmetric’ circle, however—if that term makes any sense.)

categories. (See below.) While these are plausible psychological explanations, they miss the point. The main question is not ‘What are the psychological causes of the pleasure?’; this question could easily be answered by an empirical investigation—a neurological and psychological investigation. The “paradox”, then, would really be no more than a reflection of the incompleteness of our scientific knowledge. The main question, instead, is ‘*What does it mean to feel pleasure in a painful emotion? Where is the pleasure? What are the criteria by which it can be pinpointed in the mind? How can pleasure and pain coexist in the very same mental phenomenon?*’ The main question is phenomenological rather than psychological, for the origin of the paradox lies in the paradoxical phenomenology of consciousness. Previous philosophers have been misled into asking a psychological question because the problem they were addressing is conceptually hard to grasp. The obscurity of the phenomenological intuition that piqued their curiosity (—the intuition, namely, that the pleasure is introspectively ‘ungraspable’, seemingly nonexistent) led them astray into formulating the wrong question. Admittedly, the psychological question is very interesting, and I’ll return to it below. In order to give a full solution to the paradox, however, I must first inquire into the phenomenology of pleasure and pain in general, so as to understand why *this particular* manifestation of pleasure (namely, the horror- and the tragedy-manifestation) is problematic.

Qualia

The unique nature of qualia is at the heart of the paradox. By ‘qualia’ are meant the phenomenal aspects of existence, such as headaches, tastes, colors and sounds.¹ They are unusual in that they are private to the person who experiences them: no one but I has access to my qualia. In order to clarify the status of pleasure and pain as qualia, we shall first have to inquire into the processes through which qualia are named.

One’s instinct may be to think that a sensation is given a name—or *could* be given a name—through a private act of ostension: one directs one’s attention to a sensation and makes a sound as one does so, with the intention that from now on this sound will be the name of that sensation. For example, I press my hands together while saying “pilb”, thus naming this sensation ‘pilb’. So, in the future, whenever I press my hands together I say, “I feel pilb”. Eventually, perhaps, this terminology becomes so popular that my word is universally accepted as having a definite meaning, comparable to ‘itch’ or ‘burn’. This hypothetical account, however, is flawed. The problem is that no matter how often I use my new word, it will never acquire a meaning. It will never develop conceptual content; it will remain an empty, meaningless sound that I arbitrarily say whenever I do a certain action. This is intuitively obvious. The question is, *why?* Why does my word fail while other words like ‘warm’ and ‘dry’ succeed? They both name sensations, after all. What have I done wrong?

The answer may emerge if we look at another example. Suppose I define color-names through private acts of ostension. Whenever I see a shade of color that seems to be the same shade I earlier named ‘dolph’, I say, “This is dolph”. And I do that for a variety of colors. By the end, what have I accomplished? Nothing. I have done something totally senseless. None of my names has conceptual content; they are all empty sounds, and will necessarily remain so. All I have done is make a random sound while telling myself inwardly that the color I am looking at reminds me of the color I looked at a moment ago. The difference between my artificial names and real names like ‘brown’ and ‘red’ is that the rules which govern my use of the latter are imposed on me; I do not create them, as I do with regard to my invented names. My belief that a given splotch of color should be called ‘red’ instead of ‘brown’ is almost entirely involuntary: it is determined through intuition (my intuitive response upon seeing the color), and I cannot consciously ‘guide’ my intuition. The essential fact here is that I come to associate various shades of color with one another during the process of learning color-names: the name ‘red’ applies to a given range of colors, as does ‘brown’ and so on.² How far each range extends is out of my control (except in rare ‘stipulatory’ cases involving unclear boundaries between the extensions of color-names). This is necessarily not true of such

¹ It is controversial which features of experience satisfy this definition, but for our purposes, anything that is ‘felt’ (or seen or heard, etc.) is a quale.

² The impreciseness of the boundaries between color-categories is irrelevant to my discussion.

artificial names as ‘dolp’, the extension of which is subject to my whim. If I can choose what the denotation of a word will be—i.e., if I can guide myself in determining how to apply the word, and there are no restrictions on how I so guide myself—the word is meaningless. Its use is not rule-governed. (If a word has a meaning, its use is necessarily rule-governed, because the word’s meaning determines the word’s application.) But since there is implicit in the concept of red a negation of the concepts of brown and grey and green and so on (which, again, is due to the fact that ‘red’ picks out a range of colors from which are excluded the colors associated with other names), the use of it is governed by a rule, and so it’s a meaningful word.¹ This is how it’s possible for the statement ‘That object is red’ to be informative, rather than just a rephrasing of ‘That object has the color that it has’. For, in saying the color is red, I’m bringing it into a relation with a *class* of colors—which I’m *not* doing by saying it is “dolp” (while concentrating on my memory of a prior act of ostension).

In other words, the point of applying a name, a universal, like ‘red’, to a quale is not to record the fact that this quale is similar to another that one has in the past called ‘red’; it is to *abstract* the element that this quale has in common with a range of other qualia. It is an act of *violence*, as a private act of ostension is not. In the latter case, the repeated use of a name betokens a passive act of recognition that a given quale strikes one as exactly similar to another; in the former case, the purpose of naming is to *introduce* a common element in qualia which may, after all, be very different from one another. (For example, brown has a wide variety of shades. When I name two different shades ‘brown’, I am both recognizing that they are similar and forcing them into the same category despite their differences.) To speak in Hegelian language, the significance of my using a (universal) name is that I introduce an element of mediation into an unmediated situation: I relate two or more unmediated items² with one another, thus changing their essences (for me) from unmediated brute data into mediated concrete instances of a concept. *This* is the function of naming;—to introduce mediation into unmediation, thus eliminating the unmediated, i.e., assimilating it to the human mode of experience, by applying human-invented categories to it (which, pragmatically speaking, allows humans to *act* on it—to appropriate it and use it for their own benefit). For example, if we did not name qualia we would find it very hard to perceive similarities and differences between them: we would be aware only of a chaotic array of sounds, sights, tastes, smells and feelings. Our recognition of any ordering properties they had (i.e., their similarities and differences) would be muddled and half-conscious. (See the next paragraph but one.) –Private ostensive definitions can accomplish none of this. They are a pointless, passive recording of brute data.

We can see now that in our earlier example, ‘pilb’ differed from, say, ‘headache’ in many ways. Or rather: the meaning of its difference is expressible in many ways, for instance by saying that its use was not governed by a rule, or that ‘pilb’ applied only to a single specific quale (located in a specific part of the body) rather than to a range of qualia, or that conceptually implicit in ‘pilb’ was no negation of other types of qualia, or that the use of it did not introduce mediation into an unmediated quale, or that designating a sensation by ‘pilb’ did not bring the sensation into a conceptual relation with other sensations.

[....]

*

I suppose it’s intolerably dense. (*I* certainly can’t stand reading it.) But it’s fairly original at least. (It stumbled on ideas Wittgenstein had grappled with in his *Investigations*.³)

Monday, December 19

¹ [The first clause in that sentence may seem unnecessary, in that it really doesn’t say anything that the clause in the parenthesis doesn’t say also, but I included it because I wanted to tie Saussure’s idea into all this.]

² That is, items (in this case, qualia) which are simply given to me, as brute data.

³ I haven’t read that book in years, so I wasn’t plagiarizing.

The second movement of the Pastoral symphony. The passage from measures 86 to 90.¹ It makes me think of Matthew 26: 36-46 and 75—not of the words but of the situation. The mortality of beauty. The sorrow of love, and the long sighs; yet the serenity. But only if my headphones are of good quality: I'm pressing them hard against my ears, the volume on maximum; my teeth are clenched because I've never encountered anything quite so painful as this music. Repeating it ten times, twenty times. Crying, of course. The violins descending in broken thirds, the violas sympathizing with them, and the flutes and oboes agreeing pithily, and then the gentle pluck of the bass after its silence, conscious that the resonance of its contribution consists in its laconic authority; but the oboes and flutes are swept up in the current and, satisfied no longer with passive assent, converse together lyrically, the violins too murmuring trills, sweet and light; the bassoons and clarinets are aroused to song, exhorting their companions with their poetry, and as the bass is carried away by this love for all that is, all is submerged in a purple cloud of harmony. A melody would disrupt the balance; harmony is everything, and there are no individuals.

Berlioz has some ideas on the third movement I hadn't thought of:

The poet [Beethoven] now brings us in the midst of a *Joyful gathering of peasants*.² The dancing and laughter are restrained at first; the oboe plays a cheerful refrain accompanied by a bassoon that can only manage to produce two notes. Beethoven's intention was probably to suggest in this way an old German peasant, sitting on a cask with a decrepit old instrument, from which all he can draw are the two principal notes of the key of F, the dominant and the tonic. Every time the oboe plays its naïve and jolly tune like a girl in her Sunday clothes, the old bassoon blows his two notes. When the melody modulates to a different key the bassoon falls silent and quietly counts his rests, until the original key returns and he is able to interject again unruffled his F, C and F. This burlesque effect is wonderfully apt but the public seems to miss it almost completely.

Now that I've read this, whenever I hear that part of the movement I won't be able to suppress laughter.

An addendum to the first paragraph above: I hope you can get your hands on a copy of Monteux's recording in 1970, '71 (Decca), so you can hear what is to me the most moving single second in the whole second movement, namely when the oboe plays its three notes in the second half of measure 88. The notes that pierce through the collective fog of the harmony. Derivatively, the following three groups of three notes each. And in measures 86 and 87, the three trills in the violins with the octaval leaps. The contribution of these leaps, once the listener has picked them out, to the beauty of the passage is a compelling argument for the Shaker principle that simplicity is a gift.

Tuesday, December 20

The "educated elite" (monkeys who know big words) are easily blinded by the glitter of a thinker's aura. They attribute more to him than is there. If Nietzsche's ideas are distilled into their essence, divested of their decorative eloquence, they become no more than *interesting perspectives*—and there become fewer of them.³ If Wittgenstein's unusual personality is ignored as the irrelevance it is, his mystique dissipates and his thoughts are shorn of much substance. [...] G. E. Moore, of course, was barely a thinker at all. In the last three centuries, the only famous thinkers (outside the natural sciences) of whom the spectacle hasn't outweighed the substance are Leibniz, Hume, Kant, Hegel (possibly), Marx (possibly), and Frege. [And Chomsky!]

¹ Again, Pierre Monteux's interpretation.

² This is Beethoven's title of the movement.

³ His style of writing doesn't lend itself to a disinterested pursuit of truth.

Suppose I say, “Marx makes pygmies of the rest of us”. If you’re intelligent and have a sense of humor, you’ll react with something like a chuckle and a nod of agreement. But if Marx himself says, “I make pygmies of you people”, you’ll object violently, throw at him (self-defensive) aspersions like “deluded!” and “vain!”. What is the explanation of the inconsistency? It would seem, after all, that in both cases you’re being devalued. Why should you accept the first but not the second? A possible reason: because in the first case I’m including myself in the class of pygmies, you half-consciously sense that I don’t mean what I’m saying. I’m saying it only jokingly, so you can agree with it with a good conscience. In fact, in nearly all such situations, the judgment has an air of the comic about it, even if it is said in sincerity. If I say, “We aren’t very impressive compared to Marx”, you may agree, but your agreement is little more than a shallow tribute to his name. It has no implications; it is not thought about, it is not taken seriously. Only when I am noticeably depressed do others take my judgment wholly seriously. And in that case, they argue against it. Similarly, if Marx says, “You people are inferior”, you think he means it, so you argue against it. Anything but admit that you’re inferior!

On the other hand, inferiority is bearable as long as you aren’t the only one who’s inferior. When saying the above statement I’m positing a communal bond between myself and my listeners; this bond, perhaps, is what disposes you to agree with me. It may even allow you to feel, without pain, a deep conviction that you’re inferior to Marx—because you know that I consider myself inferior to him as well. Community is what you value most, not abstract superiority over another. (This latter desire may arise only in an era—such as the last five to ten thousand years, but especially in advanced civilizations—in which the health of the community is not, by necessity, the (*incomparably*) overriding concern of the individual. The community, by its mere existence and his participation in it, used to provide all the emotional security a person needed, such that he did not have to prove himself better than or equal to others in order to feel good about himself; when the community began to deteriorate (in the Neolithic age), the individual began to seek his former security in *competition*—paradoxically. The paradox is superficial, though. Before I explain why, I must clarify a few things. (What I’ll call) communal security (i.e., the psychological state, not the material one) can be analytically divided into two factors: (1) the intrinsically satisfying social interactions, which consisted of a *closeness* to people, an emotional closeness, an ‘openness’ with everyone, an unadulterated pleasure in social happenings (which was possible because there were no such things as ulterior motives or social niceties, no reasons to dissemble, no reasons not to trust (life was too simple)—and maybe no one even *knew how* not to trust). It was the satisfaction inherent in the desire/need to be with others (and, of course, in the actual *being with* them). (2) Holistically united with it—i.e., an implicit component of it¹—was self-respect. Without self-respect, communal life would not have been very enjoyable; but it was precisely this communal life that was (broadly speaking²) the necessary and sufficient condition for self-respect. The latter had two manifestations: during a particular social interaction, the individual’s pleasure was fused with his self-respect; in solitude he was not riven by self-doubts, but was instead (on a fundamental psychological level, despite whatever momentary concerns of daily life might have been bothering him) content with himself, his half-conscious knowledge of his self-worth. This second manifestation of self-respect was derivative of the first, and of (1) above: it was a comparatively abstract

¹ Which, however, can, for the purposes of analysis, be distinguished from it.

² Ignoring exceptional cases like emotionally debilitating intra-/inter-tribal disputes. Even if disputes were common, they weren’t usually as psychologically damaging as they are nowadays, because people were less sensitive back then. They weren’t adept at questioning themselves, at being dissatisfied with themselves. This is because, as I said above, life was pretty simple (there were fewer contexts in which one could question oneself). Also, the fact that life was relatively nasty, brutish and short meant that most mental energy was expended in securing the means of existence, not in evaluating oneself. But more relevantly to the present argument, the universal perception of essential equality between (the human value of) each tribe-member ensured that another’s (temporary) harsh opinions of one did not generally make one feel insecure or ‘less valuable’. The subtle gradations in worth between individuals that we civilized people are constantly (half-consciously) aware of and adjusting our behavior to did not exist back then. (See the next paragraph.) Communal life was essentially an interaction between equals—in fact, individuals were barely individuated from each other (as we individuate nowadays, such as through personality-traits)—and so self-respect was not fragile.

residue of (—or one’s half-conscious knowledge of—) one’s favorable reaction to the other (or Other, i.e., all others) and his favorable reaction to oneself (which reactions were, as we have seen, inextricably united with (the first manifestation of) self-respect, such that it was a component in them and they were a component in it).

(Security achieved through competition, on the other hand, was weaker, more fragile, and less satisfying than communal security. It necessitated that one prove oneself equal to or better than others in order to gain their respect, and thus in order to feel ‘secure’¹. The pleasure of social interactions, of communal life, was no longer spontaneous and unmediated; no longer was it the case that the individual (was) spontaneously loved and needed (by) other people. Instead, the pleasure deriving from a given interaction was mediated by the individual’s (half-conscious) concern with whether the person to whom he was talking was equal to or better (i.e., ‘more impressive’, more respected/respectable) than him. If he was approximately equal (or even a little inferior), the other man felt both the intrinsic satisfaction of interacting and the self-respect that is, on the whole, fused with it; if this other man sensed that the person to whom he was talking was superior, or felt himself superior, his satisfaction was marred by, first, the perception that he had to work hard to be impressive, and second, his relatively high self-consciousness (and consciousness of his own inferiority). (Obviously the “first” and “second” are closely related.)² The difference between competition- and community-security can be stated like this: the latter is (and is derived from) an immediate, intrinsic pleasure in social interactions. It is a pleasure in *one’s own reaction to the other*. Its immediacy (intrinsic-ness) is made possible by the fact that there are no underlying mutual evaluations going on; everyone is equal, so there is no need to impress people, no need to worry about the impression one is making. The nature of the other’s reaction is already known; there is no uncertainty; therefore, the inherent pleasure of interacting can be enjoyed. By contrast, competition(-derived)-security³ is a kind of negative satisfaction. First, equality must be established—*relaxation, comfort, unconcern-with-being-judged* must be established; *then*, the inherent pleasure of interacting is allowed free reign. But, again, it is no longer really inherent—or rather, its inherentness is overpowered by the need to establish equality first (i.e., to negate self-consciousness). In situations in which there is no equality, various forms of self-consciousness drown out the inherent satisfaction of interacting.⁴—In other words, this kind of security is initially a function of the other’s reaction to oneself, and secondarily of one’s reaction to the other; the communal kind is a function solely of one’s reaction to the other (because the other’s reaction is a given). The first kind is conditional, the second is not.⁵

¹ To repeat: security can be loosely equated with self-respect. The two aren’t identical—the latter is usually taken to denote a specific mental state, with fairly specific intentional content, while the former is more like a vague well-being—but they’re closely interwoven. (Self-respect is sometimes thought of as precisely the “vague well-being” that I have said is called security, but due to the narrower *strict* connotations of the word ‘self-respect’, it is advisable to distinguish the two so as not to get confused.)

² The flip side is that if he perceived the person to whom he was talking as significantly inferior, he gained little enjoyment from the interaction. It should be noted that in both cases—i.e., with the superior interlocutor and the inferior one—satisfaction is a function of the strength of the communal bond. In both cases, equality is lacking, so there is little satisfaction. Self-consciousness (in two different forms) interferes with the communal bond, with equality.

³ A better expression is: security in a competitively organized society. The expression in the text is misleading, for reasons I won’t go into.

⁴ A less ambiguous way of saying it is: the “inherent” satisfaction does not exist except when there is equality (or mitigated self-consciousness, or whatever you want to call it). But then it ceases to be inherent, properly speaking. Besides, my reason for originally using the word ‘inherent’ is that interactions ‘*in themselves*’, *ceteris paribus*, are satisfying.

⁵ The first does allow for one possibility that the second doesn’t: one can contemplate with an abstract intellectual pleasure that a given person (or many people) think well of one. With communal security this does not happen. It would be absurd: the (meager) pleasure of such contemplation makes no sense except against a backdrop of self-doubt, or potential self-doubt, which exists very rarely where there is communal security.

(In short, there is no paradox. Competition is a means toward community¹—the only possible means in an age in which the processes of production have undermined the immediateness, the homogeneity, of the community. The individual will do anything to regain this homogeneity in some form, even if it means furthering its destruction *on the level of appearance*. Competition appears to fragment the community, but for the individual its purpose is to raise him to equality with everyone else—i.e., to reinstate the community.) So if you're in a community, Karl Marx's "abstract superiority" over you does not affect you.

What all this means is that our resistance to (or resentment of) a person's belief that he is better than us is a function not so much of our desire to be equal to or better than him, but of his sundering the communal bond between himself and us. More accurately, we do want to be respected by him—we do want to be equal—but not for the sake (merely) of being respected by him, nor even fundamentally for the sake of self-respect. It is instead for the sake of being in a community with him. This is an end in itself. There is nothing higher, nothing to which it is a means (unless you want to say, "It is a means to the emotional pleasure from which it is inseparable", but then you're missing the point. Pleasure, or satisfaction, in whatever form, is always implicitly the goal—of everything. The question is "What is the surest way of attaining emotional satisfaction?" Community.). The weird thing is that the satisfaction derived from a communal bond is direct: communal bond \supset satisfaction. If A, then B. There is no 'inner' mediary in consciousness, no phenomenologically detectable element that mediates between the bond and the satisfaction. Self-respect, for example, is not *felt*, nor even thought about (except rarely). The connection between the A and the B, it seems, is magical. Just like the connection between the pretty girl and the desire to have sex with her, and the TV-watching and the compulsion to keep watching. [See the later entries on Saul Kripke's book *Wittgenstein on Rules and Private Language*.]

Thursday, December 29

Reading Saul Kripke's *Naming and Necessity*. Excellent book. His method is similar to mine: intuitive. He criticizes the Frege-Russell view of names, according to which "a proper name is a definite description abbreviated or disguised". For example, 'Walter Scott' literally is nothing but an abbreviation of some such description as 'the man who wrote *Waverley*' or 'the Scottish author who lived in such-and-such a place at such-and-such time and wrote the following books...'. It does not "rigidly designate" an individual (i.e., designate the same individual in all possible worlds²); instead, it is synonymous with a description of the individual (in *this* world). The motivation behind the theory is the need to explain how names can refer to anything. On J. S. Mill's view, names have no descriptive content (they are empty, meaningless)—so it is a mystery how anyone can ever know to whom or what a name refers (except in cases of ostension). Frege and Russell solve the problem by arguing that names do have descriptive content.

Now, this theory is the kind of rubbish I'd expect from Russell, but not Frege. I'm disappointed in him.³ Its philosophical problems are insuperable (e.g., What is the 'true' description of a given individual? How can we know what it is? How can that notion even make any sense? The "cluster concept" idea (viz., that what is associated with a name is not a single description but a family of descriptions) is, as Kripke

¹ Ultimately, of course, it is a means toward [psychological] security, or satisfaction. But we have seen that a person's security—if 'security' is taken in the weakest possible sense, namely as self-respect—presupposes *at least* his equality, and that his *satisfaction* (insofar as the word can be thought of as denoting something more positive and 'forceful' than "mere" self-respect) presupposes that he does not see himself as extremely superior. So the goal of "competition" must be equality. Community. (Sorry for the confusion. I've been treating the goals of security and satisfaction as synonymous, but that wasn't quite right: 'security' can be understood in a weak sense, a negative sense (viz., the absence of self-doubt), while satisfaction can't. In its negative sense, security is compatible with seeing oneself as extremely superior; satisfaction is not. *Positive* security, i.e., satisfaction, is man's goal.)

² For example, the "possible world" in which Walter Scott did not write *Waverley*, or in which he decided not to become an author at all, etc.

³ Actually, I suspect that Frege's version was better than Russell's.

argues, inadequate.), but its denial of common sense is a good enough reason to reject it. How warped must a man's mind be for him to think that a name has a *meaning*, that a name fixes its referent by way of the description(s) of which it is literally an "*abbreviation*"?!¹ Like many of Russell's dogmas, this is nothing but a denial of common sense. And Kripke's book is nothing but a defense—an ingenious defense—(and elaboration) of common sense. Which is why it is valuable. (Philosophers, after all, are defined by their lack of common sense.)

Returning to the paper I wrote above: most forms of explanatory reduction are motivated by the fact that a given phenomenon is ontologically reducible to a collection of microstates. Cells are composed of molecules, organisms of cells (and whatever else), societies of individuals and their behavior. From this is inferred that "the phenomena of the first kind [e.g., cellular] are explainable from the theory of the second kind [e.g., molecular]" (Garfinkel, 49). This kind of reduction—inferred from ontology—is false; I argued against it above. Another type of reductionism is: 'Everything in society, "in the last analysis", "is just" economics', or 'Human behavior "is just" an expression of primitive drives', etc. (Garfinkel, 49). This is always simplistic: it places an undue emphasis on one causal factor among many. A third kind of reductionism is unique: mental [or rather, *conscious*] states are physical states. This is an ontological claim, and it is wrong (or, at least, stated too simplistically -- categorically). It implies, or seems to imply, that consciousness is somehow an illusion, a complete illusion. All mental states are 'in fact' physical. They're just particular arrangements of, and relations between, molecules, cells, electrons, etc. This is stupid. The mere fact that there is a debate—that reductionists understand their opponents' position well enough to argue against it—shows that there is some kind of a difference between the body and consciousness. Besides, language presupposes the difference. The sentence "I feel"—or even "There is a feeling"—logically implies a mental state, i.e., something more than a chain of causation between cells.

Nevertheless, in another sense, mental states [I meant states of consciousness] *are* reducible to physical states. But not in the way that physicalists think, nor as a whole is to its parts. (Like a cell is to molecular processes.) –Before proceeding, we have to clarify a few things. A mental state is an emergent phenomenon, like a cell, a molecule, an atom, an organism. It is caused by processes on the cellular level: millions of interactions among neurons result, *as a holistic totality*, in a given mental state. The latter *is* the holistic totality of these processes. (See below.) It is all of them 'taken together', as one, in much the same way as a cell is the totality of its underlying processes. But there is a difference between the two: each microstate is a part of the cell—i.e., the cell is a whole which can be ontologically reduced to its parts and their interrelations—whereas each neural microstate is *not* a "part" of the mental state. The latter cannot be ontologically reduced to "its" parts, to *any* "parts", as can all other emergent phenomena in nature (and even society). The only thing it can be "reduced to" is the holistic totality of interactions among the participating neurons—but this is not really a reduction. The only reason it seems to be is that by "holistic totality [(which is (or results in?) an emergent phenomenon)] of neural interactions" we tacitly understand not "holistic totality" but "*aggregative* totality", the *sum* of neural interactions. We think, "A mental state is just all these neural processes put together", i.e., "summed up". We may even think we *don't* mean "summed up", even as the image we have before our minds is of a bunch of neurons interacting with each other—i.e., an *aggregate* of neurons. We cannot avoid this way of looking at the issue (of 'picturing' it), because, (1) since we know that mental states *supervene* on neural microstates, we half-consciously think each microstate is an essential *part* of the mental state,² and (2)—more importantly—we naturally assume a dichotomy between the mental and the physical, the subjective and the objective, the inner and the outer: when we hear the phrase "holistic totality of neural interactions" we think of the "other side" of the mental phenomenon, the objective side, which, we think, cannot be identical with the subjective. It must be something physical, some physical fact distinguishable from the mental state. But it is not. The latter just *is* the emergent neural phenomenon. It is the inner and the outer. The only sense in which there is an

¹ Another kind of description theory admits that names aren't disguised descriptions, but maintains nonetheless that they fix their referents by way of the latter's descriptions.

² Just as an electron is part of an atom, an atom is part of a molecule, a molecule is part of a cell...

objective fact, a physical state distinguishable from the mental one, is that the mental *supervenes* on physical microstates to which we have no immediate subjective access. It is caused by millions of microstates, microprocesses, interacting. But it *is* the *totality* of these processes, the phenomenon that ‘emerges’ from their interactions—as a cell is the phenomenon that emerges from the interactions among the microstates on which it supervenes. The fact that cells and mental states are profoundly different is due to the cell’s being *composed of* physical processes, not just *supervenient on* them. That is, even from the ontological perspective of the cell (i.e., considering it as a single thing, a unitary, concrete, causally efficacious datum), it contains [*extended*] *parts*, which can be analytically distinguished. The mental state does not. Consciousness isn’t divided into parts in that way. This also accounts for the (deterministic-)causal impotence of the mental state: since it lacks [extended] parts, there are no micro-level mechanisms through which it can act and react against physical bodies.¹

Maybe you wonder how quantitative changes can lead to a qualitative one. How is it that, given enough neural interactions, suddenly a phenomenon is produced that is not properly called physical [in the ordinary sense] (though it is, nonetheless, the holistic totality of these physical interactions)? It would be well to remember that a similar feat of ontological magic occurs whenever there is an emergent phenomenon possessing some kind of causal power. When a sufficient number of molecules get together in a sufficiently cooperative way, a cell is the result. A new entity, an ontologically distinct thing—a qualitatively different thing from its parts. This magic is *constantly* occurring in nature and society, *everywhere*. While it takes different forms—for example, an emergent fact in society is not an ontologically distinct, ‘real’ or ‘concrete’ thing, though it does possess (non-deterministic) (‘top-down’) causal powers and is in that sense somewhat mysterious—it is more or less as conceptually problematic as the emergence of a not-properly-physical fact from a group of physical facts. –Still, it is clear that the emergence of mind from brain is a little different than the emergence of, e.g., a cell from molecules. In fact, with the exception of mental states, all deterministic emergent phenomena in nature exist in the same Spinozistic mode (physical—physical) as their constituents.² Again, what the problem comes down to is the partless nature of mental states. This is their central paradox, from which derive all others (such as the impossibility of defining or describing them [as, e.g., colored, two centimeters long, located at particular spatiotemporal coordinates, etc.]). I can’t even begin to explain it—primarily because I don’t know what there is to explain. (“Why are mental states partless?” How would one go about answering that question? “How is it *possible* that they can be partless?” What does that question mean? “What does it mean for them to be partless?” Just look inside your consciousness. While that is not an explanation, there is no other.)

[...]

The mental state is a new thing, a ‘concrete’ (though not really physical), real thing. In all *other* cases, the newness of the thing consists in its possession of causal powers not possessed by the microstates that give rise to it; in *this* case [i.e., that of the mental], the newness consists in the thing’s [e.g., the thought’s] not having [deterministic] causal powers. Regarding all other deterministic emergent phenomena, an “ontological relativism” obtains (as I argued in my paper): they can be analyzed either from the perspective of their parts or from the perspective of themselves (the whole); in the former case they are not ontologically real, while in the latter they are. Ontological relativism does not apply to mental states, though, because they do not have parts³—because, that is, they have no causal efficacy. They are *not* “from one perspective” nothing but neural interactions to which we have no access while “from another perspective” they are the states we experience. They are, instead, just what they are: the states we experience. The only sense in which there can be something remotely like an ontological reduction is that they are *caused by*, and *supervene on*, physical processes—but, of course, this is not an ontological

¹ Actually, I think the defining property of a physical object is precisely its deterministic-causal efficacy. (On the other hand, I’m not sure that the latter idea can be defined without invoking the idea of a physical object, in which case my definition is circular.)

² Lest there be confusion: mental states are, in this context, as deterministic as all other emergent phenomena, in that they result from, or are ‘expressions’ of, deterministic physical processes.

³ [I should have said *extension*.]

reduction. When I say, “They are the holistic totalities of neural processes” it may seem like I am reducing them to something physical, but I’m not: the holistic totality is not physical [in the usual sense, which refers to extension and so on], though the *aggregative* totality is.

[...]

On the basis of these ideas, one can see that the problem of epiphenomenalism isn’t much of one. [Wrong!] While mental states are not the direct causes of anything—the deterministic causes—they are essential in order for there to *be* “direct causes”. Without corresponding mental states (intentions, feelings), many physical acts would not occur. I don’t know the exact biological relationship between the two (because no one does), but the point is that, since mental states *are* emergent neural states, and neural activities are the direct causes of actions, there is obviously some intimate and necessary connection between mental states and the causes of actions.

(I don’t feel like going further into it now.)

The fourth kind of reductionism is the troublesome one: psychology is supposed to be reducible to biology. This is unlike the first and third kinds in that it has nothing to do with ontology. First of all, the mental can be, in a way, distinct from the physical yet be explanatorily reducible to it. Second, this [viz., the idea of psychology’s being ‘reducible to’ biology] is also not a reduction of the whole to its parts: neural activities, whether taken as a holistic [emergent] system or not, are not “a part” of the mental. I suspect this type of reductionism is true in some sense, but that for most phenomena psychology can provide ‘parallel’, and adequate, explanations. Not always, but usually. Still, it should ideally be supplemented with biology—because, although the mental is not ontologically identical with physical things, it is caused by them and supervenes on them.

Friday, December 30

Arthur Rubinstein is to Chopin as Glenn Gould is to Bach. They both have an uncanny way of lingering on certain notes (sacrificing the tempo) and whisking through certain passages. And so the music fills with flair.

Sometimes I repent of giving mankind something as valuable as this journal. It’s like buying an exquisite porcelain doll for a child you know will break it.

I was writing in the living room when my brother came in to play the piano. He really is a bad piano player, though no one ever tells him so. But I was in an ugly mood, and his playing made it worse, so I said, “Terry, you can’t play for shit. Give it up.” He said, “Yes I can!”, to which I replied, “And stop deluding yourself, too.” “Shut up”, he mumbled—after which, for the first time ever, he actually tried to play well (and succeeded, comparatively speaking). Clearly, then, he was hurt. He also became mellow—a rare occurrence!—and a half-hour later I heard him complaining to Dad that I make just as many mistakes when I play as he does. The point is that all this made me feel a little ashamed. (Or maybe not *ashamed*; maybe I just felt bad for him and wished I hadn’t opened my mouth.) I thought, “Obviously I was a jerk when I said that. —But if I was a jerk, then there is, after all, substance to the claim that a given person is a jerk. But what *kind* of substance? I suppose it just means that he treats people badly, which itself is a bad thing, and so, to that extent, he’s a bad person. But everything gets muddled when the word ‘bad’ comes into the mix. The situation can’t be saved by substituting the word ‘unpleasant’. The mere judgment that he is unpleasant, while true, does not have the force of ‘bad’, the universal(istic) and absolutist implications of it; to say that a person is unpleasant is not really to condemn him, not in any effective way. But the thrust of the word ‘jerk’ is condemnation, absolute unequivocal condemnation, not something relative and feeble like ‘unpleasant’. So it seems that the word ‘jerk’, insofar as it’s condemnatory, is meaningless, and insofar as it’s meaningful, is not truly condemnatory. Still, no one wants to be a jerk, because he thinks it reflects negatively on his human worth. Can this impression be given a rational justification? It would seem not. Or maybe the point is that if he acts in a jerkish way even as he knows he is doing so (and knows he shouldn’t

be doing so), he must have a lack of self-control—and this, according to mankind’s basic conceptions of what it means to be a worthy person, does reflect badly on him (because a lack of self-control is universally thought of as a powerful indictment of your value as a human being—of your freedom, your autonomy, your self-determination—more so than a mere acting-unpleasantly is, or even a mere not-being-sensitive-to-a-person’s-feelings). But this isn’t a satisfactory justification either, partly because it presupposes what is dubious at best: that the jerk wants to act differently but can’t. In the end, we just have an intuition that to treat people badly reflects badly on the treater. We should follow our intuition and leave it at that.” (All those thoughts took the form of non-propositional intuitions, so they went through my mind quickly. Too quickly for elaboration.)

What moves you?— People taking simple pleasure in simple things, unconcerned with their motives and with implications. Thoughts of simple pleasures are the most beautiful thoughts.

January 1, 2006

“Quinn Hepworth” wrote this to Marilyn vos Savant:

In reply to a question about whether mental illness ever causes a notable good deed (the way it sometimes causes destructive behavior), you wrote: “Mental illness has something in common with an unhappy childhood. On rare occasions you can blame it, the vast majority of the time you should not, and it never deserves credit for the things you stand up and do right.” First, if mental illness comes from an unhappy childhood, most people would be suffering from one malady or another! And second, Winston Churchill suffered from depression, yet wasn’t he a great man? Please re-think both of your statements.

Whoever Quinn Hepworth is, he or she should be put in a lab and studied, like a rat. The reason I’m drawing attention to this little creature is not to point out that the fact that *A* has something in common with *B* does not imply that *A* is caused by *B*. Rather, I want to understand how it is possible to make this mistake. I have to assume that if this “Quinn” creature sat down to think, it would agree that it had made a logical fallacy. I suppose the reason it did is that it was thinking quickly and carelessly; but the mistake itself is telling. The masses have a tendency to confuse *similarity* with *causation* (and also *correlation* with causation). If *A* is similar to *B*, the instinct is to assume a causal link. This is closely related to the assumption that two things that are similar in appearance are similar in essence. (What is the exact relation between the two beliefs? I don’t know.) The latter mistake, by the way, is a necessary (though not sufficient) condition for the primitive ideas of animism and many other mass ideologies.

On pages 144-155 of the 1980 edition, Kripke argues forcefully against mind-brain identity theorists—who, in this day and age, are materialists. I’ll give a very condensed summary of his account (skipping much of it) so I can show why it isn’t damaging to my own resolution of the mind-brain problem.— Earlier, Kripke argued that, if $A = B$, their identity is necessary, because identity statements are between objects rather than just their names (as some theorists think¹), so that to say that Cicero is Tully is to say that the man referred to by ‘Cicero’ is the man referred to by ‘Tully’, which means, effectively, *this man is this man*, which is a necessary truth. So, if, for example, heat is identical with the movement of molecules, heat is *necessarily* identical with the movement of molecules. The identity statement is saying that the phenomenon referred to by ‘heat’ and that referred to by ‘the movement of molecules’ are one and

¹ I.e., some theorists think that the statement “Cicero is Tully” says only that ‘Cicero’ and ‘Tully’ are names of the same man, rather than that the *man designated by* ‘Cicero’ is the man designated by ‘Tully’ (in other words: this particular man is this particular man). [Surely, however, a statement like “Cicero is Tully” can be interpreted in both ways, in Kripke’s way and in his interlocutors’ way.]

the same—and obviously a given phenomenon must be identical to itself. The explanation of the fact that the identity of heat and molecular motion seems to be contingent—in that it was empirically discovered, and could conceivably have been otherwise—is that, in making this judgment, we implicitly conflate ‘heat’ with the *feeling* of heat’. The feeling of heat is indeed not identical with the movement of molecules; in another possible world, a being could have a sensation identical to our heat-sensation even when not in the presence of molecular motion, in which case the sensation is not caused by heat (i.e., molecular motion). Therefore, it seems to us, mistakenly, that the identity of heat and molecular motion is contingent. The identity theorist, aware of the common intuition that mental states are not identical to physical states—and that, if they are, the identity is a contingent relation—and, moreover, recognizing, with Kripke, that identity claims applying to objects denoted by rigid designators are, if true, *necessarily* true, understands that if his own identity-claim is correct, it must be *necessarily* correct, and thus that the common intuition (of the *contingency* of mind-brain identity) has to be explained away. He might be tempted to do this by saying there is an analogy between the mind/brain identity and the heat/molecular-motion identity: we think of the latter as contingent, despite its necessity, because we conflate heat with the *perception* of heat; similarly, we think the mind-brain identity is contingent despite its necessity because we conflate mental states with our...perceptions of them? But he sees immediately that there’s a problem. The analogy does not hold up. Mental states just *are* our perceptions of them, while heat is not our perception of heat. The distinction between heat and our perception of it was essential to the explanation (and explaining-away) of our belief that the equation of heat with molecular motion is contingent; since there is no distinction between mental states and our perceptions of them, the identity theorist cannot explain away our troublesome dualistic intuitions by invoking such a distinction. Therefore, it seems that there is a mind-body dualism after all.

My position is neither dualistic nor monistic (properly speaking), but it has affinities with both. Mental states are emergent neural states, and emergent neural states [of the relevant type¹] are not “physical” [as, say, a protein molecule’s interaction with a cell is]. So there is a kind of mind-brain identity here; but it is immune to Kripke’s criticisms. For, in order for it to be true, our common Cartesian intuitions need not be explained away. It acknowledges their truth: neural processes ‘in themselves’—i.e., considered as an *aggregate* of chemical releases and action potentials, an atomistic aggregate—are not mental states. This is as far as the intuitions go. They have no implications regarding the idea that the *emergent state* of neural processes is the mental state. There is no common intuition that this emergent state can be only contingently identical with a mental state—largely because no one has any idea how to conceptualize the “emergent state” of a neural system. Nevertheless, there *is* such a state (there *must* be); and it is none other than our mental experience—our mental states—which, of course, themselves cannot really be conceptualized, which is yet another argument for my ideas. (Emergent state: unconceptualizable. Mental state: unconceptualizable. ∴ It’s possible that mental state = emergent state.)

Damn it, man, it would be refreshing to be *wrong* for once!

By the way, as I sped through that Kripke summary I felt like Will Hunting in the scene with the projector, talking to mediocrities like Rouse and Horst and everyone else who spends his academic life immersed in other people’s ideas: “Do you have any idea how *easy* this shit is for me? It’s a *fucking joke!*” That’s the kind of thing they’re impressed with, that regurgitation. ‘You can start doing original work, if you’re lucky, when you’re studying for your doctorate. But not before.’ Fucking nihilists. If you display a firm grasp of someone else’s philosophy, you’ve earned their respect. But as soon as you venture into uncharted territory, where there are no famous names by which they can get their bearings, no theoretic landmarks, they decide you’re lost and abandon you. Rouse’s favorite page in my senior thesis was the summary of McInerney’s summary of Husserl. Why? Because it was the only thing he could relate to.

By the way, in that long entry above I not only put forward a new theory but explained the appeal of old ones (like materialism). That’s what you have to do, if you want to be thorough.

¹ [There are, after all, different kinds of neural states/processes, some of which are involved in “mental life”, some of which are not.]

Monday, January 2

It may be that a version of Kripke's criticisms applies to my ideas. We think that, if an identity relation happens to hold between a particular neural state and, say, the sensation of pain, it is contingent. It could have been otherwise.¹ Let's grant for the moment that, for the reasons given by Kripke, this intuition of contingency is problematic for the identity theorist. Is it also problematic for me? Yes and no. No, insofar as by "neural state" we do not understand "*emergent* neural state" (which is the relevant concept in my account) but rather a mere aggregate of physical states. If you ask a hypothetical person, "Is the identity of pain with an *emergent* neural state contingent?", he will be less quick in his answer (than he was in the case of etc.). He will ask, "Well, what do you mean by 'emergent neural state'?" You answer, "That's precisely the question. If I told you its meaning (more specifically, the phenomenon it refers to)—which I don't know any more than you do—that would be to beg the question against my original question. So you just have to answer the question based on your intuitions, as you did when I asked, 'Is the identity of pain with a (mere) *neural state* contingent?'" Then he'll say, "But I don't *have* any intuitions about *emergent* neural states!" "Okay, then obviously you find it neither contingent nor necessary that pain be identical with a particular emergent neural state." And so Kripke's objections don't bear on my ideas.

On the other hand, they do. For an emergent neural state is, after all, a neural state. What applies to the latter should apply to the former. The word 'emergent' just gets us flustered. —But then again, the reason it does so is that it seems to mitigate the physicalistic overtones of "neural state". In other words, it isn't the neural state as such that can be only contingently identified with pain; it is its *materialistic* aspect. But since I have done away with its exclusively materialistic aspect, there is no reason to think that its identification with pain is merely contingent. —Aaaaaah, fuck it. My original intention was to say: "In any case, I disagree with Kripke's criticisms of materialism". Unfortunately I'm having a hard time pinning down my intuition that he's overlooking something.

Another possible objection hit me as I was reading an online article about the concept of emergence. "The theory of mind called functionalism based its argument for the irreducibility of psychological and sociological categories on the fact that there are too many different physical ways that functional predicates could be instantiated for them to be reduced to single physical predicates. This makes it impossible to formulate what are called 'bridge laws', i.e., logical identities between entities in the reduced and reducing domains." I'm not sure how to interpret the first sentence (or, for that matter, the second one). But the point is, it made me wonder whether the possibility that mental states are "multiply realizable" in physical systems means that a given mental state cannot be *identical* with a neural state. Actually, forget about "possibility". That word is ambiguous. Let's suppose there is an actual case of a creature made of silicon chips that has pain-sensations exactly like our own. Does this mean that our sensations cannot be identical with (emergent) neural states, or that the creature's sensations are not identical with silicon states? No. There is no *a priori* reason to think that processes occurring in two different kinds of substances cannot create—and *be*—the same type of non-physical emergent state (precisely because it is non-physical²). At most, the thought-experiment shows that I should distinguish between "type" and "token": a given type of mental state is identical not with emergent *neural* states but rather with emergent *physical* states 'of a certain kind',³ while the particular instance of this type that occurs in humans is identical with an emergent neural

¹ And not only in the epistemological sense of 'possibility', i.e., the sense in which our former ignorance of the relation between mind and brain left open, *to us*, the possibility that mental states are not the same thing as brain states. Unfortunately I'm not clear on the nature of metaphysical possibility. What does it mean to say, metaphysically speaking, "It could have been otherwise"? See Kripke's book.

² Are you still going to insist it is incoherent to say that a physical process (*emergently*) is (and, considered as a mere aggregate, *creates*) a 'non-physical' state? Well, the microstates in a cell not only (as an aggregate) *create* the cell but also (as a holistic totality) *are* the cell. Emergence is magical.

³ I.e., not just any physical system can create mental states. It has to have special properties, such as those possessed by neural systems.

state (because neural systems are the proper kind of physical system). –But I’m attributing too much importance to an outlandish functionalist thought-experiment.

Tuesday, January 3

Skimming through a book that skims over the philosophy of mind: Jaegwon Kim’s *Philosophy of Mind* (1998).

My version of “emergentism” is different from other versions, judging by Kim’s descriptions.

I admit that emergentism, or holism in any form, has counterintuitive elements. Downward causation, which holism is surely committed to, is paradoxical. Unconceptualizable, even. But to have an *a priori* conviction that all modes of interaction between things in the world are susceptible of conceptual explanation is nothing but a prejudice.

[...] Functionalism in general, by the way, is something of an embarrassment to philosophy. Not as much as behaviorism is, but nearly. Putnam, Armstrong, Lewis: your place is in the classroom, not the study.

I won’t even argue against it. It’ll die out someday.

“Why,” you ask, “why—*why*—do you write and write? Can you really think that someday your thoughts will be picked up and made much of? Do you really think you’re bestowing a great blessing on mankind?” I write only for myself. I don’t much care whether people read. Life has given me nothing but writing and music.

A long time ago I asked why the world is structured in “binary oppositions”—or, as I said, “dualities”. Man/woman, mental/physical, light/dark, right/left, up/down, ugly/beautiful, stupid/smart, good/bad, sun/moon, heaven/earth, cause/effect, appearance/essence, inner/outer, existence/nonexistence, truth/falsity.... I never answered the question (or so my unerring memory tells me). The first thing is to separate the accidental from the necessary. The sun/moon opposition is accidental; there could have been two moons. As for the *necessary*—I get the impression that rationality is somehow closely connected with the number 2. It’s hard to say why. It just seems as if the ability, for example, to distinguish physical objects clearly, or to think clearly, is related to 2 and not to 1 or 3 or any other number. (Yes, I’m being serious.) Also, it seems like the series of natural numbers should be understood as an endlessly repeated repetition of 2 (or rather, a repeated application of the conceptual foundations of the number ‘2’).¹ –Let’s clarify a few things. An animal’s consciousness is analogous to the number 1. It is an undifferentiated unity: physical objects are not seen as separate things; instead, consciousness simply focuses on...one thing, then another, then another, then another, without being [explicitly] aware of any differences between them (without, that is, being aware that it is focused on different things). Human consciousness is analogous to 2. It recognizes difference—it *is* (a) difference; it is a difference between itself²—and 2 is nothing but an implication and a presupposition of difference. (2 logically follows from difference, and difference logically follows from 2.) I’m not sure what the relation is between the two concepts, nor even exactly what they (*a*) mean (since neither can be defined in a non-question-begging way) and (*b*) *are* (because the same is true of the word

¹ I’m almost certain I didn’t read any of the following ideas in the book on mathematics (of which I read only a fraction), but if I did, I’m not *consciously* plagiarizing.

² To speak more clearly: since ‘difference’ is an abstract idea, it can be only *presupposed* by consciousness; it cannot *be* consciousness. But since consciousness is self-consciousness, and self-consciousness is a difference between itself and itself, one can say that, in another sense, consciousness *is* a difference.

‘concept’ itself), but I don’t care.¹ The point is that, even before language arose eons ago, the notions of difference and 2 were ‘implicit’ in human consciousness—which means that (a) the sequence of real numbers was implicit (because it is essentially a repetition of the pure idea of difference: 2 is a single difference from 1, 3 is two differences from 1 and one from 2, etc.²); (b) logic was implicit (because, like mathematics, it is an elaboration of (the implications of) difference—as in the law of non-contradiction); and (c) it was inevitable that mankind would organize its language around differences.³ But not only its language; its *conceptual system*. The organization of concepts is necessarily dualistic, because, although there can be differences between three and four and five things, the notion of ‘dualism’ is implicit in the concept ‘difference’—is part of its meaning. Three and four and five are not. So, since the totality of concepts is necessarily organized around differences between them (otherwise there couldn’t be *different concepts*), it is natural that many concepts will be “opposites”. In other words: consciousness sees the world according to differences; ‘difference’ is a fundamentally dualistic concept; therefore, the simplest, most natural—not to mention most practically useful—way of interpreting reality is through dualisms.

But not only that. The world itself—in itself—seems to be structured dualistically. Assuming, of course, that causes and effects, inner and outer, male and female, positive and negative electric charges, and other fundamental dualisms that apply to nature really do exist ‘out there’.

All this explains the dialectic as well—even the “synthesis” part (which obtains only sometimes), which can be seen as man’s reaction against his all-too-hasty initial instinctive leap from one extreme to the other. (That isn’t a thorough explanation, though.)

[Written years later: All I really had to do to explain the ubiquity of binary oppositions was to note that differentiation is negation. The more negation, the more differentiation, i.e. content. Opposites are mutually negating, so it’s natural for humans to structure their understanding of the world around the principle of oppositeness. Of p vs. not-p. That amounts to the maximum degree of differentiation, which entails the maximum degree of content.]

When I gave my vague definition of rationality in my thesis and earlier in this journal, I instinctively understood the foregoing. Rationality is an instinctual, intuitive recognition of the law of non-contradiction (which, as I said above, seems to be the foundation of mathematics and logic) and its implications.

Thursday, January 5

At dinner I got us into speculations about what the coming hundreds of millennia would bring. Few people think about it. It upsets me. Dark ages are coming. Dark ages that will put the Middle Ages to shame. Why don’t people open their eyes? Think of the suffering that is to come.... Suffering that will put to shame all the suffering man has ever known. There will be pockets of resistance, pockets in which people cling desperately to old traditions like music and poetry and love. But the world will be an abyss.

If only love had the powers ascribed to it! If only it were a thing that could be pointed to! I would carry around my love on my shoulders, like a hunk of amber mined from deep in the earth.

¹ [If you think I’m being too quick with all this, you should know that I thought about the questions asked in that sentence for over an hour before ending it with “I don’t care” (because I wasn’t making any headway). In general, you should know that despite the quickness of my style, it takes me hours to write a paragraph like the one above.]

² You’ll say I’m begging the question by formulating the issue in this way. (3 is two differences from 1....) But that’s unavoidable. The structures of thought “beg the question” against themselves and each other. They are a holistic totality; none of them can be explained without invoking the others (which can’t be explained without invoking the original explananda).

³ See Saussure. Linguistic meaning is not possible without differentiation. The more differentiation there is between two words, the more meaningful they are.

Friday, January 6

I read David Lewis's article "An Argument for the Identity Theory" (1966). It didn't change my opinion of him. He makes the mistake of trying to *define* (types of) experiences, such as pain. "The definitive characteristic of any experience as such is its causal role." Sorry, you're wrong. Experiences don't have (non-circular) definitive characteristics. Read the paper I wrote. The definitive characteristic of pain is that it hurts, not that it causes certain kinds of behavior, etc. His argument, as he summarizes it, is: "The definitive characteristic of any (sort of) experience as such is its causal role, its syndrome of most typical causes and effects. But we materialists believe that these causal roles which belong by analytic necessity to experiences belong in fact to certain physical states. Since those physical states possess the definitive characteristics of experience, they must be the experiences." What a boring doctrine.

I can't find a copy of Kripke's *Wittgenstein on Rules and Private Language*, but Ruth Millikan writes this about it:

Kripke places a great deal of emphasis on the failure to find anything that "justifies" my proceeding as I do when I follow a rule, and he seems to think of a "justification" as something that must be, by its very nature, open to or within consciousness. Similarly: "Even now as I write, I feel confident that there must be something *in my mind*—a meaning I attach to the 'plus' sign¹—that *instructs* me what I ought to do in all future cases. And "The idea that we lack 'direct' access to the facts whether we mean plus or quus² is bizarre in any case. Do I not know, directly, and with a fair degree of certainty, that I mean plus?" Indeed, many passages in Kripke's essay suggest that what bothers him the most is not that nothing seems to determine what rule I am following, but that nothing *before my mind* determines it. The feeling is conveyed that Kripke finds the real blow to be that the intentionality involved in rule-following does not reside *within* consciousness. If *that* is what Kripke takes to be the root "Wittgenstein paradox", then all will agree that Wittgenstein made no attempt to give a "straight solution" to it. Nor will I.

Wise of you, since there is no solution. This is exactly the kind of thing I've been writing about for months. The difference is that I have mentioned it not in the context of rule-following but in the context of girl-kissing, girl-fucking, TV-watching, feeling shame, being drunk, communally bonding, and what have you. It is also related to what I wrote in my second art paper. Trying to characterize the phenomenology of mental states by means of everyday concepts and the principles of ratiocination is abortive. —Here's how intentional consciousness works: you just *do* stuff, without having motives and explanations of your acts before your mind; it is said that you "intend" these acts solely because their fulfillment in a given case does not surprise you. You 'accept' them and 'go along with' them. That's what it means to "intend" something (such as getting a glass of water). There is not some sort of deeply explanatory 'content' in your consciousness as you get up out of your chair to get a glass of water: you just *do* it, and your consciousness *accepts* it. (I.e., you don't have thoughts that object to it. Your thoughts just take it as a *given* that you're getting water right now.) Rule-following, as in arithmetic, functions the same way, since it involves an intentional consciousness. There is no "justification" before your mind, no genuine understanding of the meaning/logical foundations of your act. You just *do* it. Similarly with feelings. Even feelings like the strong desire to keep watching TV once it is on. While these are not, strictly speaking, cases of actually "doing" something, the peculiar character of each feeling is experienced in a way comparable to the experience of rule-following: you know what it is you're feeling (doing)—namely, *this*—and yet you don't know. You can't get *underneath* it, as it were. You can't reproduce the experience in concepts, by putting

¹ Kripke is discussing what it means to follow the rule of addition.

² "Quus" is a made-up mathematical operation.

concepts into certain relations with each other. Because the required concepts do not exist. Because there is really nothing for them to be concepts *of*. Consciousness is empty. Yet it isn't. —“Aye, there's the rub!”

Thursday, January 12

Extension of the December 20th entry.— Since antiquity, people have valued freedom. Slaves have always wanted to be free, subjugated nations have always wanted to cast off their yoke. Why? A desire this universal, this ahistorical, must have a universal and ahistorical cause. Rousseau might have said it has to do with *amour-de-soi*, which, under the barbaric conditions of civilization, becomes *amour-propre*. Self-respect, or self-regard, gives birth to a refusal to be downtrodden; vanity, or selfishness (?), sharpens this refusal. The idea has merit, but I think it just formulates the question in a different way: why should oppression signify an affront to self-regard or vanity? “Because it means that someone else, or some other entity, has control over you.” But what's so bad about *that*? Or rather, what is the explanation of its badness?

Here's how I interpret the desire for freedom: as a manifestation of the desire for community. Oppression, generally speaking, occurs only in an age in which the community (the “Community”) has already lost its primordial homogeneity; people are already in the *amour-propre* frame of mind, more or less. They want respect from others, they try to earn it; they don't take it for granted, as their ancestors did. I.e., there is already an other—an Other, and lots of little others (within the community as well as outside it). In desiring respect, or recognition, the individual is pining after his lost community: he wants to be an equal among equals, a lover among lovers (though a *slight* differentiation in worth is permissible, as long as he's on the upper end of the scale). Along comes an Oppressor. The oppressors bring to the community a schism between the masters and the slaves. There are, in fact, two communities, living either side by side or together. In the mind of the trampled one, the oppressors become lumped together as an Oppressor, a vague superior thing that looks down on its subjects and constantly mocks their ambitions for equality. And each time an oppressor is met, his glance is a taunt. The confinement to physically unpleasant roles like servant and slave, or to physically unpleasant regions of the country, and to poverty, just heightens the oppressed one's consciousness of his subservience. (Doubtless, if the conditions are bad enough, a separate explanation of the desire for freedom is the desire simply not to be physically miserable. This will often take precedence over the psychological cause, the burdensome knowledge of another's excessive pride and his disdain for the subaltern.¹) —Actually, this kind of psychology may be specifically a symptom of colonization (the ‘black vs. white’ thing, which makes possible the inferiority complex of the colonized people); oppression in general just fosters resentment and envy (and frustration and humiliation, etc.), rather than an inferiority complex *per se*. But even without an inferiority complex, resentment is still resentment of *inequality*. The conquered one's pride (self-respect; *amour-de-soi* and *amour-propre*) is wounded. Because all he wants—whether he knows it or not—is to be in a community of approximate equals, of people each of whose otherhood has the same approximate weight, so that no one—and least of all *him*—is looked down upon. Resentment and envy are two of nature's ways of making the individual feel the absence of community—lament it—and of making him do something to remedy it. They are self-preservation instincts. They keep him firmly in the fold of the community. Certain bonds are broken—that is, certain forms of otherhood are established—....so the individual is tortured. In wanting “freedom”, he wants respect (from self and other); in wanting respect, he wants community. His perception of a lack of respect is nothing but the absence of togetherness as intuitively (“instinctively”) interpreted from the individual's (Individual's) perspective. The individual's problem is the flip side of the community's

¹ While I'm on the subject of exceptions: you might think that the fury of a rebellion, or the lust for violence of a frustrated people, signifies the *opposite* of a “desire for community”. But you have to distinguish the appearance from the essence. The same underlying psychological fact can have different effects when it interacts with different conditions. Frustration and humiliation, as such, must presuppose a longing for equality/community. Besides, a violent uprising, while destructive of the (already nonexistent) “community” with the overlords, forges powerful bonds between the uprisers, and so corroborates my ideas.

problem; the Rousseauian motive is the flip side of *nature's* motive, viz. the restoration of the community. To preempt your objection: the reason why the schism in the community doesn't cause the *oppressor* to try to heal it (as, according to my ideas, it should, and as it does the oppressed) is that he already has his community, his superior community. The inferior, subjugated one doesn't concern him; it is beneath him, so he doesn't trouble himself about its opinions of him. (Except, of course, for the purposes of policing and so on.)

Yes, there are many inadequacies in that.

"I want to be free!" That is, "I want to be in thrall!"

[...]

Tuesday, January 17

Think about the poignancy of this situation. In a civilization where communities have been shredded by technology, millions of young people find ways to construct artificial communities by using this very technology. They spend hours every day interacting electronically. They become virtual zombies, obsessed with the tenuous human connections they've made in cyberspace. —This is what communities have been reduced to.

Sunday, January 22

Taking Analytic philosophy, Metaphysics, and Formal Logic. Reading articles for the first two that will go down in history as forgotten. Examples: "A Puzzle about Ontology" by Thomas Hofweber, "A Defense of Presentism" by Ned Markosian. Ontology isn't a substantive discipline, and the debate between presentism and eternalism is silly.

I'm also reading Lyotard's book *The Postmodern Condition: A Report on Knowledge*. I find it totally unconvincing—and ambiguous and, in most parts, empty. The dichotomy between narrative and scientific knowledge is simple-minded. It arises from Lyotard's habit of calling them "language-games": narration is one language-game, while science is another. If they're different language-games, then they must be *essentially* different, right? Wrong. As Andrew Sayer says, different "problematics" or "paradigms" have a lot more in common than relativists think. Similar standards apply to them; they can be involved in a dialogue, since they share common ground. (They all aim at truth; they all presuppose logic and arrive at their conclusions through (some form of) argumentation; etc.) Anyway, I don't know what Lyotard is arguing for. He just vomits verbiage.

Monday, January 23

I recommend Gogol's "Diary of a Madman". Comedy and tragedy are united seamlessly: the more comical it becomes, the more tragic. Reminiscent of *Don Quixote*, except more moving. A civil servant who has been ground into dirt for decades, treated as a nobody, his sole purpose in life to sharpen His Excellency's quills and copy out documents—becomes obsessed with His Excellency's daughter. He starts having conversations with her dog, to find out more about her. The more debased he is, the more his humanity rebels: he has been so degraded that he comes to believe he is King Ferdinand VIII of Spain, waiting for the deputation that will take him to his new kingdom. Instead it takes him to an insane asylum (which he thinks is Spain)—after he has finally, in his own eyes, regained his dignity by behaving like a king with the clerks at his office. His delusion has even given him the courage to declare his love to the

girl. (Courage required delusion, because of the delusive trappings of society.) But in the asylum they manage to strip him even of his life-saving insanity: he cries out that he is a miserable wretch, that he longs for his mother in his old peasant hut. “Give me a troika with horses swift as the whirlwind! Climb up, driver, and let the bells ring! Soar away, horses, and carry me from this world!” But after this piteous speech, the last sentence of the story is the comical non sequitur, “And did you know that the Dhey of Algiers has a wart right under his nose?” The man is obsessed with little things like that, little flaws in appearance, little gradations in rank, because that’s what his society is obsessed with. And that’s the tragedy of it. He has been made incapable of seeing his humanity, even as he screams inwardly that he is a man!

You see, appearance is everything. Social status determines all. It takes a change in his self-perceived status for the man to finally put an end (in his own eyes) to his dehumanization. That’s the only way people know how to, in this world. There’s no such thing as humanizing yourself, because the only way to do so is to play the game of social rank, which is a dehumanizing game. You can’t break out of the framework; the charade has become the cast of your mind. So even if you’re a king, you’re still dehumanized.

And obviously the dog is symbolic.

What a masterful story! Totally free of bathos—totally lighthearted—but infinitely tragic. It forces the reader to rely on his imagination, to imagine the real situation behind the character who writes such silly journal-entries. At forty-two years of age he goes insane. Think of all the pain behind that! We’re forced to *imagine* the pain, though, which makes it more effective.

Speaking of charades, I just read “The Death of Ivan Ilych”. Old Tolstoy was no lover of rituals. Detested niceties. Evidently thought that “death is terrifying because it is the one event in life which is real”. The two short stories I read today are thematically similar: normal life is dehumanizing, etc. In the first, the protagonist was driven to insanity by all the alienation; in the second, he was driven to agony—until the very end, when he glimpsed heaven. Unfortunately it’s an unrealistic ending—or, at any rate, the happiness glimpsed is not a Truth but a momentary illusion produced by unusual neurological processes.

The situation depicted at the end is frightening. As you know, all my thinking and striving are but a preparation for those final moments: I’ve always been terrified of having regrets at the end of my life.

Tuesday, January 24

“The Overcoat” is weird. I ought to read it again more carefully.

Wednesday, January 25

What is a community? In its strictest sense, it is a mutual desire for one another, a desire to be with one another. A psychological need for one another. Everyone in a community belongs in that community.

Hegel defined self-consciousness as desire for desire. While I don’t subscribe to that definition, I think that “implicit” in self-consciousness is this desire for desire. What does “implicit” mean? Only that everything you do is oriented toward this desire in some sense. It is a kind of presupposition behind all your actions. It is coextensive with self-consciousness: just as (to quote Sartre) you can be non-thetically self-conscious, so you can have a non-thetic desire for desire. And you do have this non-thetic desire at all times, in that if you reflect on it you will be immediately aware of it. Even if you think you aren’t, you are on a more basic level, because desire-for-desire is the structure of human consciousness. It isn’t the *definition*—which is simply consciousness-of-(it)self—but, inasmuch as self-consciousness necessarily reaches out for another self-consciousness, it is the structure of self-consciousness (even though, from another perspective, “self-consciousness” is itself the structure of self-consciousness).

Thus, a community is the fulfillment of self-consciousness. But this fulfillment is also its negation, because if one’s desire for desire has been satisfied, one no longer has the desire. The more acute the desire

is, the more ‘full’ self-consciousness is; hence, if the desire ceases to be the restless demon that it is in civilized conditions, then self-consciousness, in some sense, diminishes. –But this discussion is ambiguous. Since man emerged from the primeval swamp, he has obviously remained self-conscious even in his communities. The latter haven’t negated his self-consciousness; they have ‘negated’ only its manifestation under conditions of extreme individualism. The desire for desire has persisted even as, in a way, it has been satisfied. (People continue to want recognition/love even if they already have it.) If the community were *really* going to be complete—if, that is, even the *potential* for its deterioration were to be negated—then self-consciousness would have to be negated. But that can’t happen once man has become man. The most that happens is that ‘individualistic self-consciousness’—in which the individual is extremely aware of his existence as a separate individual, which entails that the implicit nature of self-consciousness becomes more explicit (e.g., the individual develops a pathological fixation on his desire for desire)—is superseded¹ in favor of a more secure, serene, stable, communal, less-selfconscious self-consciousness. Even in specific social interactions, the pleasure is proportionate to the reduction in (one’s fixation on) self-consciousness. The reduction is a ‘relief’, as it were—because, to put it Kojèveanly, the desire for desire is being satisfied.

So, man is most fully man in a community, when the desire that defines him is being satisfied. [...] How is the desire for freedom related to all this? The hatred of oppression, or the dislike of working at certain jobs, or, in general, the not-being-able-to-do-what-you-want: how are these related to the foregoing? The first is a different phenomenon from the second two, although, to the extent that oppression consists in a restriction of movement, it can be analyzed similarly.

I’m having trouble answering the question. The reason is that I don’t even know what it means to want freedom. I don’t know how to conceptualize the desire. Again, this is because the desire has no “justification” in consciousness—no real *presence* in consciousness, aside from the empty thought that ‘I want to do what I choose’. Even in concrete situations, such as when I don’t want to go to the restaurant and wait tables, my desire is just *given*, just *there*; it has no meaning or explanation in consciousness. This, of course, has to do with what Kripke talks about. (I still haven’t read his book.)

The weird thing is that most of my phenomenological analyses are of mental states that are in more or less the same situation as this desire for freedom. Somehow I’m able to attribute phenomenological meaning to certain states but not to others. Why? And what does that mean? Are my explanations purely imaginary? I don’t think so. But then you’d think there would be explanations of all these other phenomena (like rule-following and whatnot)—and yet there aren’t. So mental states have to be divided into two classes: those that are phenomenologically explicable—at least, partially so—and those that aren’t. But why would there be these two classes? *How could* there be? It doesn’t make sense.

On the other hand, even those things to which I’ve applied phenomenology are, *in the moment*, just as ‘*sui generis*’ as the other seemingly inexplicable facts. They always just appear out of nowhere, and we act in accordance with them. So maybe what it comes down to is that my imaginative powers have been equal to the task only on certain occasions and not on others. In other words, it must be possible to apply at least a limited phenomenological analysis/explanation to all states of consciousness, even though on another level the conscious facts are also explainable by biology and underlying psychological factors. Of course, the phenomenological factors are themselves “underlying”, in that we are hardly ever aware of them despite their continuous existence; but they’re underlying in a more accessible way than biological and psychoanalytical factors are.

And yet, given that consciousness is an emergent neural state, biology and phenomenology must overlap. *More* than overlap. The latter must be just a ‘part’ of the former, or a translation of part of it. This would sort of explain how phenomenological factors that we aren’t explicitly aware of can determine our acts (because biology determines our acts even though we aren’t aware of it). It would also, obviously, make possible the reconciliation of biology and phenomenology.

¹ Or, more accurately: is not allowed to emerge.

There's something very confused about all my ruminations on biology vs. psychoanalysis vs. phenomenology. Maybe Trina was right after all. (I'm sure she was.) Still, there are problems in fitting all the theories together.

Reading Heidegger's *Introduction to Metaphysics*. He thinks that the fundamental philosophical question is "Why is there something rather than nothing?" Says that philosophizing is always ultimately addressing this question. The question preliminary to it is "What is the nature of being?" Before I read any more I'll say that my initial answer to this second one, which a moment later I realized to be inadequate, was that "to be" is essentially *to manifest oneself to another* (whether in consciousness or through causation, or in whatever other way). Then I decided that the question—both questions—are futile and unanswerable.

Thursday, January 26

The structure of Western musical harmonies—their tonality, their modes, the tonic-subdominant-dominant structure, with all the hundreds of rules it involves—is not a mere "social construction". It came into existence through historical processes, but it obviously has a universal physical/mathematical basis. [...] Be that as it may, tonality is grounded in the nature of the physical world. Pythagoras's experiments established that. What I want to understand is *how*. More specifically, why does a transition from a certain tone to another have the character of a "resolution"? How is this possible? The physics of sound must provide an explanation, in terms of frequencies and wavelengths and harmonics and whatnot. But what is the basis of the explanation? What does it say about the world? Moreover, why do certain modes sound gloomy, others cheerful? Etc.

Phenomenological psychology is deluded.

Friday, January 27

So is Heideggerianism. I just looked that word up in the dictionary; it is defined as "a systematic elaboration of empty thoughts; a puerile philosophy related to the question of what 'Being' means; see Kaufmann: 'Heidegger is always on his way towards a point from which one day it will be possible to ask a question'". Heidegger, the Nazi¹ who thought that the unfolding of Being is somehow tied to the historical development of Germany, was as empty a thinker as Moore.

By the way, my answer to his preliminary question was similar to one of his own. He says that an essential part of being is appearance. "The essence of being is *physis* [i.e., emergence and subsequent endurance, or "standing-there"]. Appearing is the power that emerges. Appearing makes manifest. Already we know then that being, appearing, causes to emerge from concealment." And he talks about the necessity that in order for something to be, it must limit itself. Being *is* this self-limiting, in a way. (He says that "being *is*" a dozen different things.) All of his ideas, incidentally, are borrowed from the Greeks. And he never answers his original question. And he is far more skilled than Kierkegaard at repeating himself.

Maybe I should give you an update on my living situation. I have a new roommate, an American named Charles, thirty years old. I have furniture now too—a bed and desk, though no chairs. Charles is a nice guy, though a sleazebag (a self-proclaimed "man-whore") in love with himself—which makes him popular with the ladies, despite his chubbiness and dull face. (In the last week two girls have spent the night.) He's a former philosophy major, now a film buff who's pursuing a career as an independent filmmaker. He's one of those people who, in intellectual conversations, can never admit he's wrong. I'm working out at the gym often, determined to complete my transformation into an underwear model.

¹ He even sported a Hitler mustache.

If what I wrote above has an ounce of a foundation in reality, it sort of explains the communal nature of women: on the whole, they're more self-conscious than men, which means their desire for desire is stronger, which means they naturally bond with one another fairly easily—and yet are more sensitive than men, and are thus more vindictive. ('Sensitive' means that their desire for desire—which I prefer to call desire for recognition,¹ since Kojève's explanation of the term makes it seem to revolve around competition, which isn't necessarily the case for the *Sache selbst*²—is not easily satisfied (or that if it is, it is easily disappointed as well). This leads to vindictiveness/cruelty because....I don't know....but probably because revenge establishes equality again. If a woman thinks she has been injured she'll brood and brood on it; she'll want to return the injury because that will enable her to stop dwelling on it, i.e., on her perceived inferiority, her selfconsciousness-from-the-perspective-of-the-other. She won't be aware of this motive, but it does underlie her behavior.)

By the way, the last three sentences explain why unrequited lovers sometimes kill their beloved.

The pleasure of television is somehow related to the pleasure of community. The phenomenology is similar. But not identical. There isn't the same recognition ('interaction'), so television isn't as satisfying. It can be more *entertaining*, though, for unrelated reasons (having to do with plot-structure and so on). – The central paradox in all this stuff, which we have to accept and move beyond, is that conscious states feel different from each other and yet they don't, because, in a sense, there is really nothing to feel (except in the case of physiological sensations). Wittgenstein emphasized the latter fact at the expense of the former; Sartre and other phenomenologists emphasized the former at the expense of the latter.

Saturday, January 28

Let me give you an example of a conscious state that, viewed from one angle, has no content, but from another angle does. I tell someone, "I resent what you did to me"; my consciousness in the moment of the assertion does not provide a "justification" of it, in that it does not elaborate on the meaning of the sentence. If you look into my consciousness, you won't see what I mean by 'resentment'. It is just a word I say, a word I am accustomed to and therefore do not find problematic. But if you look at the matter closely, you will see that 'beneath' my consciousness, as it were—right on the edge of it, hovering between consciousness and unconsciousness, as a kind of logical and phenomenological presupposition of my judgment—is my perception that my self-worth has been slighted, that I have, in a sense, been devalued, that (perhaps) something has been attributed to me that was beneath me, or that something has been done

¹ I use 'recognition' rather than 'respect' because the latter is too unobtrusive. 'Respect' suggests a specific state of mind in the one who respects, and a specific kind of behavior; 'recognition' is more general, and can obtain even if there is, strictly speaking, not much respect *per se*. But of course, respect is ultimately desired, since it is really a variation on recognition. (There is recognition, for example, when someone laughs at a joke one has made; but this can't really be called respect.)

² I say "not necessarily" because I don't *know* if it is. It may, after all, be that, on the deepest psychological level, *community* is desired, *equality* (as I wrote above), but that in civilized conditions this desire takes the form of the will to power (the desire for desire, the desire to be another's self-ideal), because the differentiation among people, which has been 'absorbed' in everyone's psyches, ensures that the ideal of (living in) a pure community can't even take shape in the psyche, and that ('therefore') the nearest approximation to the phenomenology of consciousness-in-conditions-of-a-pure-community is the phenomenology of knowing (or intuitively feeling) that one is, more or less, the self-ideal of another. (This is an approximation in that it causes/is a state of mind that) is similar to the lack of reflection-on-oneself-from-the-perspective-of-the-other (i.e., a certain kind of acute self-consciousness) characteristic of a self that lives in a pure community.) The point is that the phrase "desire for desire" is more ambiguous than "desire for recognition", since it can be interpreted in two distinct ways—a competitive ("I am your self-ideal, i.e., I am better than you") and a non-competitive ("You desire me, i.e., you desire to be with me")—while the latter has only one meaning, which however has a broad range of manifestations, from being-equal-with-another to being-superior-to-another; and therefore the latter is more useful than the former.

to me that betokens a lack of respect for me. In all likelihood I am not actually thinking these thoughts (or even intuiting them non-verbally) when I make the statement; nevertheless, they are there, somehow. And they are what justify my statement.

Let's look at addition, the rule-following process that messed Kripke up so much. When I perform the operation $29+47$ on a piece of paper, what is "justifying" my act? In what does my rule-following consist? (Those questions are equivalent because my act is ultimately justified by my following a rule.) The second question seems misguided. My rule-following is just my carrying-out the act, combined with the certainty that attends it—the involuntariness of the popping-into-my-mind of 16 and the necessity of carrying the 1 and of combining 1 and 2 into 3 and 3 and 4 into 7, and thus arriving at 76. The intentionality of the rule-following is the involuntary (and full-of-certainty) coming-into-my-mind of the numbers and of what I have to do with them. So the rule-following consists in the nature of my intentionality. —But that's not quite right. Rather, the nature of my intentionality *indicates* that I am following a rule, and it is what immediately justifies my act. The rule-following itself is nothing but the acting in accordance with rules I have been taught, (solely) *because* I have been taught them. (One can determine when a rule is being followed—and which rule—by looking at the causal and intentional history of the relevant individual, to see if he was taught a given rule and is acting on its basis (because he has 'internalized' it).) So what's the big deal?

Sunday, January 29

Another example: why do I constantly seek knowledge? The answer I'm looking for has nothing to do with neurology or depth psychology. The question isn't just idle curiosity about the ultimate (and possibly introspectively inaccessible) causes of my behavior; it is an *imperative* question, something that presses on me and demands an answer if I am to reject the possibility that I am a machine. As a human being, everything I do is (supposed to be) subject to my will. I do it because I want to, because there is either a reason or a cause for it—an *introspectively accessible* reason or cause. If there is no such explanation—if I don't know why I do it—the implication is not merely that I don't have complete control over my acts. The really disturbing implication is that I am not a fully substantial self. I become a bare fact of *supervenience*: a surface phenomenon, comparable to the play of light on waves determined by currents beneath them. The really *substantial* intentionality of my acts is suddenly relegated to an unconscious realm; my own intentionality is nothing but an awareness that I am acting in a certain way, and perhaps an empty desire to act in this way. The desire has no real content; it is just an inexplicable desire to act thusly. So you see, phenomenological psychology is nothing less than the attempt to give man a measure of dignity (of selfhood), or rather to prevent him from losing it.

Having said that, I'll say that the attempt cannot be successful. It is destined to fall halfway short of its goal, because our ordinary consciousness almost never has the phenomenological content that is being sought. The content is right on the edge of it, if indeed it exists at all: it has to be drawn painstakingly into the light. If it exists, it only half-exists. It is not wholly conscious, nor is it wholly unconscious. —To be clearer: while it is still conceivable that all acts are phenomenologically explainable, the explanation is not an articulation of what is present in ordinary consciousness. It is an attributing to ordinary consciousness of explanatory factors that are absent from it—absent but, presumably, implicated in it, as 'unexpressed potentials'. The only way to decide whether the proffered explanation is the correct one is to determine whether it has intuitive force. If it does, then the phenomenologist concludes that he has expressed a given 'potential'—or rather an actuality that normally exists in the form of a potential (in that we are unaware of it). Still, phenomenology cannot save the substantiality of the self (in fact, it is the prime mover in stripping bare the illusion); all it can do is meet the self halfway. 'You exist, but you are not what you think you are.'

To return to the question: why do I seek knowledge?I don't know.

The reason we aren't usually bothered by these sorts of questions is that the ways in which we choose to act are gratifying—or, in the case of rule-following, we simply *know* that what we are doing is

right (as in arithmetic, or in speaking a language)—and this is enough of a reason for us. This kind of ‘self-evident’ reason is satisfactory. But if you think about it, the introspective absence of a reason why a given act is gratifying (or why you want to carry it out), or why a given instance of rule-following feels obviously correct (obviously the right way to follow the rule), is a terrible violation of rationality. It isn’t just a conundrum; it’s a *rape*. It means there is nothing that ‘grounds’ our intentions/acts. When the thought occurs to me that I feel like looking at porn, nothing ‘underlies’ my desire; I just....feel like looking at porn. When I add up numbers according to the rules of addition, I do not know what these rules are. I know only that, say, $7+9=16$, or $3+5=8$, or whatever. Nothing *grounds* my act, nothing justifies it in the sense that I can look at a list of criteria to make sure I have done the operation correctly. There are no criteria involved when I feel like jerking off, no items I can check off to determine that I really do want to jerk off, and *why* I do, and *what it means* that I do.

This is all very elusive.

Monday, January 30

In other words, we just *do* things, without having a delineable ‘understanding’ of them. Our understanding is somehow not located in consciousness (even though it also, somehow, is) but rather in the brain—which only means that it isn’t ‘understanding’ in the conventional sense. We understand words, numbers and acts on something like a behavioral level only—and this is testified to by the facts that, for example, we can’t say what numbers are, and that we can rarely sense ‘contents’ in consciousness. In fact, ontology in general (and much of metaphysics) exists only because philosophers, as people, have an irresistible temptation to attribute a kind of ‘substance’ to everything—to relations, numbers, concepts, properties, etc. Humans are always seduced into thinking in terms of ‘correspondence’: a concept corresponds to something real. Understanding corresponds to a conscious state, numerals correspond to ‘entities’ or ‘facts’, propositions correspond to facts, the concept of the self corresponds to something real.¹ This just means we (are tempted to) attribute substance to everything—to the self, to the eyes (their pupils), to shadows, to bodies of water. (See the thoughts I wrote in Norway, when I was on the ship on the lake.) So platonism never dies, and nominalism, while seemingly obvious on one level, is hard to accept on another. And so the controversy never ends—because we are pitting two primitive intuitions against each other, intuitions that cannot be argued away. The platonist intuition is grounded ultimately in the intuition of the self’s substantiality, which is both fictive and true (self-consciousness can be interpreted as a substance, in something like Aristotle’s sense (*parousia*; see Heidegger, chapter 2), while it also is an emptiness, a negation, a self-difference), whereas the nominalist intuition is grounded in the insight that, after all, nothing in our experience *does* correspond to the disputed concepts. (We have no experience of an abstract entity called ‘dog’.) Yet nominalism is unattractive because concepts are more than just empty words; they have some kind of *content*, they seem to *denote* something, some abstract thing (and to *be* this thing).² But this thing cannot be pinpointed. Neither a rule nor a concept nor any kind of understanding has a denotable reality. And yet it does: consciousness has a half-determinate, half-indeterminate conception of it; it is this conception that platonists reify, confusedly. Insofar as consciousness understands something, it ascribes a certain substantiality, a determinateness, a ‘*right there*’-ness to its understanding and to the concept understood (—‘understanding’ itself is thought of as a denotable event or process in the mind, especially when the word is introspectively contemplated³); platonists seize on this conviction of

¹ Clearly the internalization of language has contributed to this state of affairs (since declarative sentences purport to refer, and many concepts refer to concrete objects).

² For example, the concept ‘dog’ is supposed to denote some abstract prototype of a dog, but at the same time, it *is* (supposed to be) this prototype. [NB: When I wrote all this I didn’t have a thorough understanding of the ontologies I was discussing. But I succeeded in communicating a few insights, in my obscure way.]

³ Of course, this is also when it becomes most clear that understanding really *isn’t* (usually) a perceptible event—or, to be clearer, doesn’t *coincide with* such an event. (But if for the purposes of clarity I have to alter the word ‘is’ to the

substantiveness and turn the latter into a mind-independent thing. That is, the concept itself is turned into a mind-independent thing.

—And all because consciousness misinterprets itself (i.e., the self).¹ It is in fact a necessary misinterpretation, since human experience and knowledge would be impossible without the constant ‘background presence’ of a substantial self that organizes and assimilates all the impressions (or: whose existence *permits* the organization and assimilation (into a self-centered unity) of impressions). Without such a self, communities could not take the form they do (as collections of more-or-less distinguishable individuals), which means that *homo sapiens* could not have persevered (because its specifically human communities were what allowed it to triumph over other animals). (Of course, it wouldn’t even have *existed* in its present form.) So you see, platonism and many other philosophical mistakes are made virtually inevitable by the nature of the natural selective mechanisms through which man triumphed.

Tuesday, January 31

I’m finally reading Kripke’s book. As before, I have the impression that Kripke may be the only contemporary philosopher worthy of the name. (He also vindicates me: again and again he emphasizes the importance of intuition.) But I’m having a hard time agreeing with his arguments. Some. Like his idea that there is no way to tell whether I mean plus or quus by the ‘+’ sign. Surely my reason for saying I don’t mean quus is that, when I’ve done addition, I’ve never had a particular large number in mind (Kripke uses ‘57’) beyond which all sums add up to ‘5’. Had I meant quus all along, I would have told myself when doing an addition problem that ‘because the numbers in this problem are less than 57, I can ignore the rule that the sum of numbers higher than 57 is always 5’. That I have no memory of having given myself such instructions is why I think that my present act accords with my past intentions. (As Kripke says, the unreliability of memory is not the issue here. We’re assuming that memory is reliable.) Do I *know* it accords with them? What does ‘know’ mean? In its (largely) meaningless sense, no, I don’t know it. But in its meaningful (less rigorous) sense(s), I do ‘know’ it. I know that, in adding 57+68 to get 125, I am following the same rule (called ‘addition’) that I’ve always followed when confronted with a plus sign. My criterion (my reason) for ascribing knowledge to myself is that my memory tells me my past intentions never involved reference to a quus function, or to any other function that isn’t addition. Similarly, I know I don’t mean quus *right now*, as I carry out this addition problem, through the fact that nowhere in my consciousness is there reference to a quus function, as there is to a plus function. So, in a sense, there *is* a ‘fact of the matter’ about what I mean (contrary to Kripke). But in another sense there isn’t: strictly speaking, this fact is nothing but a vague, paradoxically indeterminate ‘(non-)presence’ in my consciousness. I am aware of carrying out the problem in an ‘additive’ way, but I am not really aware of the additive function itself. I just do the problem automatically. It could almost be called a fact of *behavior* rather than of *consciousness*, though this would be misleading (and unhelpful vis-à-vis Wittgenstein’s skeptical paradox—as Kripke argues).

On the other hand, it seems true that if “whatever seems right to me *is* right”, we can’t properly talk about ‘right’. But is it the case that whatever seems right to me is right? In terms of what my intentions are, one would think “Yes”. How can I think I’m doing addition when I’m actually doing “quaddition”, or

words ‘coincide with’, what then can actual *understanding* be? That is, if the concept of understanding necessarily does not denote an event or process, but instead a more *abstract* kind of fact, what can it be? Nothing. Nothing in reality corresponds to understanding—although, of course, *something* does. But this something is nothing. It isn’t really there.)

¹ Actually, this shouldn’t be interpreted as a foundational cause. The mind is holistic: the self’s self-misinterpretation presupposes other facts (like the existence of the “deep structure” of language in our neurology) which themselves presuppose the misinterpretation. Nevertheless, the latter can be (misleadingly) treated as fundamental in that it existed, to an extent, even before language was explicit, and also because the illusion of the self is what permits the organization of an individual’s experience(s) (i.e., what makes the experience possible in its specifically human form). Etc.

multiplication or whatever? How can I be deceived about my own intentions like that? “You may be on a drug”, Kripke says. “Or you may be having some kind of psychotic episode.” I’m not sure I agree with that. It doesn’t seem at all possible that I’m undergoing a delusional experience right now. I think that if I were undergoing one, I wouldn’t have the kind of certainty I have right now. This clear-headed, rational, self-conscious mode of consciousness is surely different from the consciousness I’d experience during a delusional episode. But how do I know that? I don’t *know* it. But I can’t non-emptily doubt it. —So where does that leave us? It appears to mean that whatever seems right to me is right. But that can’t be right.

Grrrr.

Maybe these confusions—which I can’t see any way around—merely confirm my idea that there both is a fact and isn’t a fact about whether I mean addition. There is: i.e., I can see unproblematically that I’m right (that I’m doing addition). There isn’t: i.e., the impossibility of having any criterion for thinking I’m right other than my own feeling of certainty means that we can’t talk about ‘right’ here, which means that there isn’t really a ‘fact’ to be examined here. But that’s freaking weird. But it also makes sense, and fits into everything I’ve been saying for years.

“The basic point is that I follow rules ‘blindly’, without any justification for the choice I make” (p. 81). This is true in a sense, but misleading. In the cases Kripke has been discussing, we *have* no choice in the matter. We don’t make an arbitrary, unjustified choice; we are *forced* to act a certain way. Because we can’t even conceive of an alternative, we’re certain that we’re right in our rule-following. A rule, as Wittgenstein says, must guide us; so if whatever *seems* right to us *is* right—if, that is, the only criterion is our feeling of certainty—it would appear that we aren’t following a rule (because it appears that we aren’t being guided). But he overlooks that we *are* being guided. Not, indeed, in the choice we make; rather, in the range of possible choices that are laid out for us. And there is *no* range: when we see a plus sign, we have no choice in the matter of how to interpret it (unless, of course, we self-consciously stipulate that it will not mean addition—but in this case we know we are flouting the rule). Thus, we are being guided. Which means we are following a rule. This is why we can speak of ‘right’ here, why there is a fact of the matter. Our rule-following is right because it has been imposed on us, outside of our will; it *seems* right to us precisely because we feel that we lack a choice—i.e., because we know that, in a different sense of ‘seems’, whatever ‘seems’ right to us is *not* (necessarily) right.

“To think one is obeying a rule is not to obey a rule. Hence it is not possible to obey a rule ‘privately’; otherwise thinking one was obeying a rule would be the same thing as obeying it.” The first sentence is true on one understanding but not on another. If my obeying is not forced on me, then my thinking that I am obeying is indeed not obeying. But if it *is* forced on me—if I am ‘guided’ into obeying it, in an *a priori*-esque way—then I am *necessarily* obeying a rule, and so I *think* I am and cannot be wrong (because I know that I am being forced to act in this way).

Hence, it is possible to obey a rule privately (if I understand that word correctly)—namely, if the rule is *a priori*.

But since Wittgenstein was skeptical of the *a priori* (—a lot of this paradoxical stuff is motivated by familiar empiricist qualms about *a priori* certainty), he was blind to the above arguments.

Wednesday, February 1

Still, it does seem that “no mental state of mine guarantees my correct behavior” (p. 95). And yet, my ‘mental state’ when doing $11+34=45$ —that is, my consciousness of carrying out the problem and checking it—is surely such that I know I am following the right rule, and following the rule rightly.

Grrrr.

Maybe, again, this just has to do with the half-meaninglessness of knowledge. For it also seems (contrary to Wittgenstein) that no amount of communal agreement that I have done the calculation correctly *guarantees* that I have done it correctly. After all, if we’re using Kripke’s skeptical framework, it may be

that the whole community has gone insane, like me: they think I'm following the right rule even though I'm not. In fact, it seems like *nothing* can “guarantee” my correct behavior.

While my arguments may be flawed (I keep questioning them as I read), there's one thing that surely ensures the falseness of Wittgenstein's skeptical problem. The problem has *some* content, but not enough to justify his conclusions. Consider: “We cannot say that we all respond as we do to ‘68+57’ *because* we all grasp the concept of addition in the same way, that we share common responses to particular addition problems *because* we share a common concept of addition. For Wittgenstein, an ‘explanation’ of this kind ignores his treatment of the skeptical paradox and its solution. There is no objective fact—that we all mean addition by ‘+’, or even that a given individual does—that explains our agreement in particular cases.” Now, as a thinker I am peculiarly amenable to holding paradoxical beliefs; but *this* one, even *I* consider to be preposterous. We *can* say what the first sentence denies; and we *can't* say what the third sentence affirms. There *is* a fact. The only element of truth in Wittgenstein's ideas is that this fact does not have the form we commonly assume it to have. We grasp the concept of addition, but not as a ‘substantive’, ‘concrete’ datum in consciousness. Our understanding is not something that can be, in a way, ‘pointed to’ or ‘observed’ (as we're inclined to think); it does not concretely manifest itself in consciousness. And yet, since it is, after all, ‘*understanding*’, it *does* manifest itself in consciousness. Otherwise it couldn't be called ‘understanding’. *This* is the paradox—this contradiction between the presence and the absence of understanding in consciousness. It is misleading to say that the paradox (*my* paradox, anyway) is the absence of a *fact*. For there *is* a ‘fact’, in a way, which makes it true that we all grasp the concept of addition in the same way.

My paradox, which is extremely broad and resists clear formulation, is the ultimate reason for the endless superfluous debates over presentism and eternalism, and actualism and possibilism, and endurantism and perdurantism, and almost all metaphysics. Almost all *philosophy*. And much of psychology (especially psychoanalysis and phenomenology).

A week or two ago I “got high” with Charles and a friend. It was really the first time ever. We watched *Irreversible* at the same time. Which was, uh, memorable. (That movie is *fucked up*.)

(2 a.m.) Permit me my evil hour.— How is it that a 25-year-old can feel like a 75-year-old? Even as he also feels like a 25-year-old. Meandering through life....a Eugene O'Neill without the dramatic talent.... I doubt I'll ever fall in love. It's *humans* I have to deal with, after all.

You think about this world and you have to laugh, because you have nothing to do with it. You had no part in creating the universe. What *right*—what *right* did the universe have to create me? To violate my individuality like that? To steal from me self-determination? It is beyond disrespectful, beyond presumptuous: it is immoral. To conjure me out of the darkness:—*I did not give my permission!* But it sits up there, out there, laughing at me, at what it did to me, laughing at the little trick it pulled. Nero's sadism was child's play, crude and embarrassing; Nero was no Universe. What fascinating sadism.... To create a being and give it just enough insight so that it knows it is worth nothing, it will die and be forgotten, but not enough to understand *why*; and to make this being so that it is obsessed with an unattainable happiness, and an unattainable togetherness, with stifling distaste for the universal isolation in which it must live.

I could be angry. I could be full of anger, like I've been so many times. But it has been months, maybe years, since I've been angry. I don't have the spirit for it anymore. Life has won.

Thursday, February 2

I learn from the *New York Times* that Einstein was a music-lover. I think that instinctively I already knew this. Somehow it was necessary that he love music. He was a skilled violinist, and Mozart was his favorite composer. He saw the mathematical beauty of the universe reflected in Mozart's music.

We would have gotten along famously.

I've been trying to explain behavior solely in terms of degrees of self-consciousness (e.g., the lessening and heightening of it), but I know that won't do. This is upsetting, though; self-consciousness is the only easily observable and fairly conceptualizable phenomenon of consciousness. If it is inadequate to explain behavior—if other phenomenological factors must be introduced—I run into the paradoxes I've been discussing. For example: if lust can't be adequately described as, say, a desire to merge one's self(-consciousness) with the other, what other elements are present in its phenomenology? I.e., what is the phenomenological (as opposed to neurological) cause of the desire for sex in a given case? (The two questions are the same. To ask about the content of a mental state and the explanation of a desire/intention that 'inheres' in it (or an action to which the desire led) is the same.)

...There's something confused about my whole framework. But it's hard to know what.

Friday, February 3

Maybe this has something to do with it: much of the "content" of an intentional state is unconscious. In other words, at this moment, most of my conscious mental state is unconscious. That seems like a contradiction, right? But it's true. By definition I am aware of my consciousness, but *in* my consciousness are facts I am not aware of. Desires, conflicts, etc. It is misleading for psychoanalysts to say that these are unconscious; *in a sense* they are, but not in the sense that they are wholly *outside* of consciousness. This is evidenced by the fact that if somehow you become aware of a desire that, according to psychoanalysis (which ultimately means according to phenomenological analysis), had been influencing your behavior for a while—and if you really think about this desire, if you grasp it in intuition—you will think, "My God, of course! That's been obvious all along! It was in my consciousness all along. I just wasn't aware of it." Paradoxical but true. Theoretically, then, it is possible to come up with a 'meaning' of conscious states simply through self-analysis, by intuiting their phenomenological (psychoanalytical) foundations. [...]

Saturday, February 4

Reading a biography of Freud. Learned that his emphasis on the sex-instinct has been misinterpreted. He writes: "[Sexuality should be] divorced from its too-close connection with the genitals, and [seen] as a more comprehensive bodily function, having pleasure as its goal and only secondarily coming to serve the ends of reproduction. ...the sexual impulses are regarded as including all of those affectionate and friendly impulses to which usage applies the exceedingly ambiguous word 'love'."

I think this is right. All affectionate impulses are surely related to sexual ones (or, as Freud might say, *are* sexual ones, in the broader sense of 'sexual'). But they are also related to the recognition-urge, because the paradigm for recognition is communal interaction (i.e., communal 'affection'), of the kind that existed in certain regions a hundred thousand years ago. In November I interpreted the recognition-instinct as a "death-in-life"-instinct (an in-itself-for-itself instinct), but I think that was wrong. There is no such instinct. The misinterpretation is due to the fact that in our post-prehistorical times (but in particular the alienated era of capitalism) people objectify themselves in acutely individualistic, self-conscious ways—i.e., they are extremely focused on the other and on themselves (or, better: on themselves from the perspective of an observing other)—such that, to inquiring minds, it seems as if people have an instinct to be an object, a 'frozen' object (which is nonetheless conscious). After all, they're fixated on objecthood, otherness; so a psychologist living in this time will think that human consciousness has an inherent tendency to overcome itself, to turn itself into a permanent *thing*. In truth, the alienated kind of consciousness, the insecure, isolated kind, characteristic especially of capitalism but more generally of historical man, does have a "tendency" (or desire) to overcome itself, but not in the direction of permanent thinghood; rather, in that of community-hood. The modern other-fixation is just the wound of the loveless psyche. The too-self-

conscious psyche. (Self-consciousness, in this peculiar form, is itself the wound. Or, if the wound is seen, from another angle, as the deterioration of the community, then self-consciousness is its *symptom*. As well as its presupposition.¹) Its being a compulsive partial-otherness-to-itself does not signify a *desire* to be a *complete* otherness-to-itself. What the psyche desires is a lowering of the boundaries between self and other. This is what the sexual instinct amounts to, and what the recognition-urge amounts to, and therefore what the (metaphorical) ‘immortality’-urge amounts to² (a *biological* immortality-urge doesn’t exist). All these instincts are essentially the same. They are grounded in the same psychological tendencies.

I think that the pleasure I get from writing and reading and thinking is related to all this. It really does seem like a sublimation. When I was happy with Sangeetha I had no desire to read or write; only when she returned to India did I return to my journal and books. –Then again, love can be an *inspiration* for creation—usually artistic creation. A lovelorn person might turn to creation as a substitute-gratification; a happily passionate lover might turn to it for the same reason—say, if he happens to be away from his lover and is obsessing over her. Writing might provide him with something vaguely similar to the pleasure of her company, or the pleasure of community in general (the pleasure of talking about her). –The phenomenon can also be formulated in terms of energy-levels: creation can be an outlet for the excessive psychic energy associated with passionate love. [...]

The problem is that when you start talking about energy you’ve jumped to a different level of explanation, closer to the biological level. This isn’t allowed. Whatever paradigm you start in, you have to stay in.

Sunday, February 5

Watching Dane Cook, I see that stand-up comedy is less about the humor than the charisma. This is true of all forms of comedy, whether at parties, with your friends, on talk shows, wherever. That is, the audience’s reaction is largely a function of the delivery, not the intrinsically humorous content of what is said. Much of the time, what it comes down to is the sex appeal of the comedian (which is another way of saying his charisma). Listen to the women screaming at Dane: most of them would gladly sleep with him. And so they can’t stop laughing, because laughter is both a sign of being drawn to someone and a drawing-oneself to him (as well as, on a weaker level, a drawing-him to oneself). Thus it makes sense that the delivery is often more important than—or at least, as important as—the content: laughter means a heightening of community,³ which is largely a function of personal magnetism.

[...]

The existentialist emphasis on “anguish over the inevitability of death” as a cause of man’s malaise is mistaken. Most people feel little anguish at the thought of death. As for the ones who do: they misinterpret their anguish. While the thought of death no doubt disturbs them, perhaps even to the point of obsession,

¹ There is a circular relationship: the community’s disintegration leads to insecure self-consciousness, while the latter reinforces the community’s disintegration.

² See my entry on its derivation from the desire for recognition.

³ Not always. And that’s simplistic anyway. But the ‘unexpectedness’ factor in laughter (in humor), and the ‘inappropriateness’ factor, are related to the increase in community. Being ‘taken off guard’ interrupts one’s composure, one’s self-consciousness—it ‘lowers one’s defenses’, or “the boundaries between self and other”—and thus bolsters community. Said differently: it diverts a portion of psychic energy from self-control (self-censoring, self-observing, self-monitoring) to contemplation of something else than self, and to (half-conscious) appreciation of the other’s company, and by so doing reduces psychic tension. This is the essence of an increase in community. “Psychic tension” is just bottled-up energy. The higher the self-consciousness, the higher the tension (and vice versa). For to the extent that energy is denied an ‘external’ outlet, consciousness must become more fixated on itself so as to give the energy *some* kind of outlet. Because it has to go somewhere; it can’t stay *totally* bottled up. And yet, in a sense, it is being bottled up if it’s devoted to self-consciousness—at least more so than if it were devoted to attraction-to-another.

their fixation on it is just a symptom of their fixation on themselves. This is the real problem. This is the real source of their anguish. A person thoroughly integrated in a community is not preoccupied with death. At most, he occasionally contemplates it and becomes sad for a moment. But his communal activities ensure that he is mentally healthy, confident and happy.

Likewise, the emphasis on man's knowledge of the absurdity of existence, and of its contingency, is misguided. This knowledge is not what causes modern-day neuroses or any other psychological ailments. A preoccupation with what may, indeed, be an "objective truth" of absurdity and contingency is symptomatic of a deeper sickness: the loss of community. Goethe was right that too-deep thinking betokens a kind of sickness. It is the *dwelling* on absurdity, not the absurdity itself, that is the problem. The healthy psyche does not 'dwell' on *anything*, least of all itself or its absurd conditions of existence.

Sex can't be completely assimilated to "affection" (or, affection can't be assimilated to sex). I have no desire to have sex with my male friends. Different chemicals and reactions, surely, are involved in lust than are involved in friendship. Nevertheless, sex and love are, in a sense, just friendship taken to an extreme. The motives for them are the same: recognition, togetherness. (*These*, not sex, should be seen as the framework for human behavior, the overarching goals/orientations within which behavior takes place. Freud's formulation is misleading, even if sex is understood broadly.) It just so happens that these goals are paradigmatically achieved in different ways for the different sexes. In the throes of lust one doesn't desire merely the partner's body; one desires also his consciousness (his recognition, togetherness). If the body were all that mattered, life-size sex-dolls would be far more popular than they are.

Now, I'm not saying that everyone *consciously* wants to be integrated in a community. I, for example, don't. Last night I saw the movie *π*; the main character certainly preferred solitude to society. But then again, he was tortured. And at the end, after he'd given himself a lobotomy, he preferred society, and was finally happy. And I too, on a somewhat less accessible level than my immediate consciousness, would *much* rather be integrated in a community than be alone. With few exceptions, artists and thinkers who live in relative solitude are unhappy. Even if they don't live in solitude they're unhappy, because they're narcissistic (fixated on themselves, schizoid, etc.). Even more tellingly, when they create they almost always have in mind a potential audience. Obviously, then, their consciousness is oriented toward the community. What they want is togetherness; their problem is that their aptitudes force them to try to achieve it in different ways than normal people do. Hence, they are conflicted. One part of them, the most universal part, the species part, desires love and community and whatnot; another 'part' shuns it, probably considers it contemptible ("The masses! Ugh!"), because a third 'part' of them is organized in such a way that togetherness is difficult for them. The reaction of the second 'part' is explainable as a community-oriented (other-oriented) reaction to the fact of their enforced solitude. It is something like an identity-reinforcing (self-protecting) defense mechanism. Such a mechanism must be other-oriented because the wound it is intended to heal is precisely the lack of recognition from the other. But the 'other' in question now (in the defense mechanism) has to be the artist himself, because the *other* other, the community, has rejected him (which is of course what caused the problem in the first place). The artist must become his own community, his own other. Understandably this substitution is unsatisfying—he cannot be an other for himself in the way that the *real* other is—so he remains unhappy. Finally he cuts off his ear and kills himself.

So you see, when man, phylogenetically speaking, became his own other—when he became fully self-conscious—it may have been in reaction to the deterioration of the community. His self-consciousness was the psyche's attempt to heal itself, by giving itself the recognition, the togetherness, it had formerly received from the community. On the other hand, self-consciousness was also the wound itself, for the wound was precisely the separation of the individual from the community, i.e., his becoming self-conscious. (How very Hegelian of the psyche!)

If this is true phylogenetically, it must also be true ontogenetically. The child comes to full self-consciousness only upon confrontation with the other—with, for example, the lack of constant loving attention from the mother. The self is formed partly to compensate for the absence of togetherness, to give *itself* togetherness, to be a surrogate mother to itself, a surrogate other. Presumably in Paleolithic times the

process of self-(consciousness-)creation in the child ended at an earlier stage than it does now, such that his sense of selfhood was vaguer, less defined, than it is now.

So, in a sense, the conventional wisdom is true that people's basic desire is to return to the womb. Oneness. Union with the mother. It's like the story from the *Symposium*, the hermaphrodite story. Sort of. But not really.

Monday, February 6

It occurs to me that I don't know what I'm trying to explain.

Tuesday, February 7

The feeling of having a lot of energy is almost always pleasurable. Does the pleasure consist in the "release" of the energy? I don't think so; *having* the energy, while it does impel towards discharge, is itself enjoyable. The 'potential' energy, not yet released but 'bubbling up' inside, is a source of pleasure. A nearly universal characteristic of this state is that the psyche desires interpersonal interaction; it is through such interaction that the energy is to be released. There is no compulsive self-consciousness, no fixation on being an object—on wanting to but dreading to (see R. D. Laing, and me); there is only an irresistible impulsion toward togetherness. Now, a state that gives such great pleasure is surely, in a sense, a 'goal' of the psyche. And the more this state occurs, the 'healthier' is the psyche in which it occurs. But an appeal to pleasure here isn't even necessary; it's obvious that such a psyche—such an energetic, not-compulsively-self-conscious, community-oriented psyche—is fairly healthy and happy, well-adjusted. Why is it obvious? Because each of us knows from introspection that in such states one feels no psychological conflicts, no burdens; one is 'light': selfhood does not weigh down on one. So from introspection we know that the main goal is to escape a preoccupation with selfhood. D.h.: to escape selfhood itself (because selfhood is defined as a preoccupation with itself, an awareness of awareness).

I think the theoretic divorce between psychic and bodily energy is mistaken. The two go hand-in-hand; they increase and decrease together.

God *damn*; Liszt's piano version of *Erkönig*—I haven't heard Schubert's original—is awesome. Especially the part about a minute-and-a-half into it when it goes major and treble. The melody. What a melody! And Liszt's transcription of the *Trout*. Superb. Wonderfully playful.

(I make all these references to specific classical pieces because I want you to listen to them. Seriously, that's the reason. Also, I have a strong urge to release my pent-up appreciation, and since I don't know anyone who sympathizes with it I have to express it here.)

I think Freud's mechanistic framework is wrong. The emphasis on instincts, on "discharge", on opposing "forces" (id and superego). Humans do have instincts, but they don't operate as Freud thought.

Wednesday, February 8

darkness

partygoing downtown in the club rousing
termites from anthill lairs crawling
backwards through space and time driving
uphill through space and time thumping

wildly wildly rumping to death beating
 death pulsing oozing crud of spirit bumping
 against sides of wet sweat fat-plowed hardly sticking
 to sticky palms of sweat-smearred soul-thudding
 sound beating like a meat mallet your pounding
 head to pulp inside out from soul to body crushing
 bodies in a slimy mass of slippery groping
 under and over and outer and in her quivering
 lips soaked with fat-perspiring
 blood-condensing hip-grinding mouth-salivating
 movement wrecking you in throes of deadening
 ecstasy through screams of banshee-worshipping
 dancers who scream like raping
 raping in thuds of hollow violence killing
 killing in the dark of drunken nausea ripping
 knife-like through the mass of teeming
 congealed shots of liquor

I eat the sweet meat of your deep treat as you beat me; then I lick your teat as we weep, in heat.

The Blessed

I wake up happily beside your back,
 Its naked shoulderblades as near as dusk.
 They sway ever so lightly as you breathe—
 A motion imperceptible did I
 Not know so well the rhythms of your body.
 You're sleeping; I can hear the whisk of breath
 From out your nose—the quiet rush of warmth
 Warming your upper lip (perhaps a bead
 Of moisture lingers there)—it sounds just like
 The sighing of a distant breeze! So quiet....
 To think that sound could be so quiet, and yet
 Be heard! Or is it my imagination?
 Perhaps I am so rapt that I imagine....
 Your hair is knotted on the pillow, tangled
 In piles tickling my lips, which kiss
 The strands in bunches (since their counterparts
 Upon your face—though longing to be kissed—
 Are turned away and inaccessible).
 Clichéd it is, but....I inhale your hair.
 It is a kind of secret, guilty pleasure,
 Which I permit myself occasionally.
 And then I touch your back, a timid finger
 Afraid to mar the skin, which looks as if
 It's made of fairy-tales solidified.
 How can there be such symmetry in life?
 —Except....yes, I see an auburn fleck
 On one side of your back, right near your neck.

It's almost hidden by the hair; to touch
 It I must move the tousled mass aside
 —Though slowly, carefully. You mustn't wake.
 Who knows what dreams are passing underneath
 Your darting eyes (for surely they are darting,
 Bird-like, as I have seen them do before)?
 Oh, how I'd like to see your face right now!
 A glimpse only....perhaps of just the dimple
 That bunches up the right side of your face
 (It's deeper than the other, prettier).
 Or maybe just your lips—or your eyes,
 Those sapphires that I sometimes dream about.
 But I must lie here restlessly, in rapt
 Anticipation of the moment when
 You'll wake. To look into your droopy eyes,
 To be the being they see first, as sleep
 Still clings to them.... Your sluggish smile will be
 The answer to my expectant grin. And then
 Together we will sit outside, beneath
 The dogwood tree, and watch the setting sun.

Thursday, February 9

A Garden

This is a vision.— I am sitting on the rug
 In my bedroom, my back against a pillow propped
 Against the bed (the maroon comforter),
 Shoes off, shirt off (except a t-shirt), legs extended
 Far off into forgetfulness, laptop on lap.
 My laptop!—(What a name! “Laptop”. Suitably
 Poetical.)—‘What would I do without thee, dearest?!
 “How do I love thee? Let me count the ways....” No;
 That were—I mean, would be—to make this poem (so-called)
 Excessively didactic (though I fear the damage
 Is done already). Even so, I love you, laptop.
 —Where was I?— Here I sit (or rather, *lie*: my grade
 Of incline is closer to forty-five degrees
 Than ninety), with my blaring headphones safely snug
 Against my grateful ears (they're being damaged, but
 They don't object); Beethoven is shouting—pounding
 His silver hammer like a Nietzschean against
 The anvil of Platonic Beauty, so that sparks
 May fly—into my willing mind, or soul, or brain,
 Or what-have-you. It's a symphony—the sixth,
 To which I'm partial. (Debussy once asked why this
 One in particular is so beloved by all;
 His answer....had something to do with the idea
 That man and nature are divided by a gulf
 Unbridgeable, and that the wonder which man feels

For something so mysterious and charming is
 Communicated in this symphony. I think
 That this is sheer bullshit. “Mystery”? And “gulfs”?
 And metaphysical “wonder”? No! Philosophy
 Has no place in the Kingdom of the Musical;
 It is a trespasser—and it had best beware
 Lest it be instantly revealed as a fraud,
 A charlatan, a loathsome brute, when placed beside
 The comely maiden, the Cinderella that is music.)
 My mood is not....the other one, the offspring of
 The *Marche Funèbre*; it is the radiant sister of
 The cisalpine sunrise, or of Venice at dusk.
 This solitude is far from loneliness; I *crave*
 It, more than poets crave love—than Byron craved freedom.
 To sit here on this rug—this drab and threadbare rug—
 With music in my mind and freedom in my thoughts,
 Is something more than paradise. —“Paradise”?!
 I pity those poor souls in Paradise, if it
 Be not a room, a rug, a bed, a pen, and music!

I’m reading Erich Fromm’s massive *Anatomy of Human Destructiveness*.

Friday, February 10

The Death Leap of Alfred Kubin

Bullet-rigid, headless as a bolt of lightning,
 lock-kneed, jointless like a solitary stick,
 he dives in—voluntarily horribly
 stricken with death-fever life-lustfully,
 arrowed-armed as a spear reaching for its prey.
 His hairless body a naked chisel he drills
 for the open gash,
 a miner brandishing his pickaxe
 deep in Mother Earth.

Night

The wind throttles the tree, tears its dead branches,
 Bangs my broken window;
 A woman fights it, tears stuck on her face.

Saturday, February 11

Salvation

Before I met you
 in the transcendent meadow

where grass grew tall and concealed us
 I noticed often
 while looking under rocks
 and peering through overgrown vines
 That things were empty
 beneath their shiny shells
 with colors calculated to deceive
 And threats were empty
 because their promised poison
 was less potent than observation
 And there was no flight
 that weak and injured insects
 could hope to use as an escape
 From broken wings
 destroyed in daily life
 through constant unrelenting probing
 Of broken souls
 and broken buds of life
 with nothing of value left to offer
 So I began
 in this state of fatigue
 and tired disillusionment
 To doubt my searching
 which had led me nowhere
 except to thoughts I longed to forget
 And closed my eyes
 to stop the inquisition
 and kill obscure hope of truth
 In loneliness
 in this withered desert
 where I had lived and grown old
 But then I met you
 in the eternal meadow
 where grass grew tall and concealed us
 And I was saved.

Sunday, February 12

I'm surprised—though not really—that I've never encountered among scholars the insight that, in his chapter on "The Body" in *Being and Nothingness*, Sartre's thoughts sometimes mirror Wittgenstein's. Like on pp. 454 and 455.

On pp. 729 and 733 Sartre makes similar points to the one I made on the 3rd about "unconscious" thoughts being present in consciousness in some way, though we don't have "knowledge" of them (Sartre's terminology). He doesn't think the dichotomy between consciousness and knowledge is problematic. I should read his Introduction, where he establishes the distinction. (To me it's inexplicable, though it obviously exists. It reminds me of our never having explicit awareness of all our physical sensations at a given time, despite the fact that, inasmuch as they are sensations, we *do* have some vague awareness of them. But not until we focus our attention on them do they become genuine objects of "knowledge" for us, i.e., of "explicit awareness".)

Monday, February 13

Epiphany time: my mental 'illness' is nothing but lack of sleep. I need nine hours of sleep. If I get nine hours of sleep I'm a different person. I slept nine hours last night and now I feel like a cannonball. Bouncing around the rooms. But how fucking sad is it that all these years I've been sad mostly because I haven't had enough sleep!! And how stupid is it that I've never taken sleep seriously! Oh well. I'm too happy to have regrets.

Tuesday, February 14

Went to a yoga class. It's a weekly thing.

Wednesday, February 15

within and without the sacred spheres, the millennial lightning storms rained down on us dashing brain into asphalt sheening the sidewalks like sweat on the forehead of Michelle Kwan outside her shimmering brain oily pussy-like (for I indeed do want to fuck) upon the ice radiating shards into the air sounding the empty gale at the center of the empty wail which is a whale in whom I am the Jonah drowning in nothingness the void that is my self my high self flying away into the dusk of my firefly dust-eyes sailing away into the dusk of my life lord god I write in my sublime state of yearning for thy perfection which however I am experiencing now in my trippy state of mind nirvana-like if you keep your eyes semi-closed better than yoga surreal like time goes so slowly like an eternity in a moment so many thoughts passing through my mind like conflict between the self and consciousness I am being forced back to the past that night when I wept suicidely but I'm not unhappy I delight in life except I would appreciate sleep now while listening to Indian music

Sunday, February 19

I wrote that while high as a kite on pot. Closed my eyes and just listened to my unconscious flow, with a few interruptions to savor it. Suurrrreeeeeeaaaallllll....

Reading Frege's *Foundations of Arithmetic*.

Thoughtless

I see her without closing my eyes,
 she sits right there in front of me,
 her eyes reaching for my fingertips,
 her tiny smile hugging me.
 Neither of us talks, though we want to:
 words would be dangerous.
 I cannot bring myself to smile,
 though hers is unwavering
 and tries to reassure me.
 She is barefoot, as so often;
 her unbroken skin is barely pale.
 The tear in the knee of her jeans

makes me think of wet grass
 and the day I met her there
 a long time ago.
 Her eyes drop, the smile fades;
 she leaves me.

Rachmaninov's Moment Musical No. 5 put me in the mood. (There are subtle hints that she was killed, maybe in a car accident.)

the
 lady
 who stole my
 autonomy
 from me heartlessly
 did not have the kindness
 to tell me that she would leave
 when I could not live without her—
 when her absence would cut life from me.
 She *knew* it—she *knew* it—she *must* have known!
 Could she not feel it cutting her up
 inside, *inside*, inside herself?
 I will not forgive you, love!
 Never! You have killed me!
 And yet she was all—
 her memory
 is all I—
 she was
 the—

Friday, February 24

I'm in that phase of What's the point of thinking? that hits me periodically. I haven't thought for a long time. Just having a good time going through the motions and meeting people and getting drunk (like tonite and yesternite and tomorrow and Tuesday—Fat Tuesday). I don't know what to think about. Want to write poetry but can't. Been thinking about a girl named Maria, a student who came to my office-hours and we had a good time and I saw her later at lunch and we've been emailing and her paper (on Van Gogh's *Stairway at Auvers*) was the best I've read in both semesters and she studies history and art and we have a lot in common—like beauty: she has it and I love it—and I'm trying to stifle my hopes. (After meeting her for the first time I sang all across the parking lot "Maria! Maria! I just met a girl named Mariiiiiia!")

There's the same lack as always but I'm happier (=more confident) than usual.

But if there's no "instinctual", unconscious yearning for eternal life (as there is, say, for community), why have religions always attracted people by the promise of eternal life? Well, for one thing, the eternal life in question isn't just a continuation of what we experience on Earth. Most people wouldn't want to live forever if it meant more of the same (suffering, ennui and so on). What they want is eternal *oneness*: perfect communion with God, or with Being, or with Seventy Virgins. So the power of the promise of eternal life is actually another piece of evidence for the Marxist hypothesis (of community etc.).

In any case, insofar as people do want to live eternally just for the sake of living eternally, their desire is only a *reasoned*—a poorly reasoned—reaction to their indubitably instinctual fear of death. This *fear* is ingrained, but the desire it provokes is not. It exists on the level of shallow reason. People think

momentarily, “Wouldn’t it be great if I could live forever?”....and then forget this thought and go about their daily activities. The desire has no manifestation in the unconscious. Properly speaking, it isn’t even a ‘real’ desire; it’s just a passing whim. Fear of death doesn’t entail or presuppose the wish to live forever.

In fact, the tragedy and comedy is that neither of these options, which are exhaustive, is desired. People want neither death (though they may think they do) nor eternal life. It’s Scylla and Charybdis.

Sunday, February 26

you
 I love
 sun-harnessed
 power of life
 glowing tides of tears
 moon-begotten through you
 star-yearning astronomer
 drifting buoyant through galaxies
 distant star-beaded light necklaces
 enwreathing invisibly your white neck
 radiating sun-kisses through space
 reaching from your unbounded eyes
 outside temporal vacuums
 inside concrete worlds
 where bland life happens
 which I reject
 just because
 I love
 you

The psychological state portrayed in *Notes from Underground*, and in Sartre’s chapter on bad faith, and in *No Exit*, and in numerous entries from this journal—the state of insincere sincerity, in short—seems to be a modern phenomenon. In all of history, the first unambiguous reference to it that I know of is in *Rameau’s Nephew* (if my memory doth not greatly err). In no ancient writings that I know of is self-consciousness taken to this extreme, this extreme of doubting whether experiences can ever be sincere—and whether this word ‘sincerity’ indeed has any meaning. As far as I know, Sartre fails to appreciate the historically conditioned character of bad faith. Or would he say it has always existed ‘unconsciously’, or half-consciously, but that earlier writers were not perceptive enough to diagnose it? This may be true. In a sense, it must be: the intrinsic nature of consciousness has not undergone radical changes since Cro-Magnon man. But the reason the phenomenon was not noticed until recently is that it was not a problem until recently. It did not pose a threat to mental well-being until recently.

—To speak more clearly: the condition that Sartre analyzes in his pages on the waiter and the coquette has always been implicit in consciousness. Consciousness has always been more or less the way Sartre describes it. It transcends itself, it is not what it is and it is what it is not; it continuously anticipates the immediate future (in “protention”; see my senior thesis), and consciousness-of-the-immediate-future is the way in which consciousness prereflectively experiences (the fact of) *possibility*. Implicit in awareness of possibility is negation of the real; implicit in negation of the real is awareness of its transience or non-inevitability (or non-absoluteness)—i.e., protention, which is implicit in self-consciousness. So implicit in self-consciousness is awareness of possibility, of the fact that whatever is being experienced not only can

but *will (immediately)*, in a sense, be otherwise¹—and thus *is* otherwise, because included in this very moment is anticipation of the next, i.e., implicit awareness of the absolute transience of this experience. For an experience necessarily exists in a given moment—it itself is a part of the moment—and a moment is necessarily ‘passing’ or ‘dying’ the instant it appears—and so the experience is ‘passing’ along with the moment, which means that, in order for it to persist for a certain length of time, it must in a sense be *willed* to persist. Otherwise it will vanish the moment it appears. In this willing consists the insincerity of ‘sincerity’. Said differently: insofar as consciousness ignores its own transience, its own possibility-governed character, its own *freedom*—that is, insofar as it ignores the fact that it *wills* every experience, and instead treats experiences as *happening to* it—it is being a little insincere, is existing in “bad faith”.

All this, however, is rarely an object of knowledge. The subject is ignorant of it, and so the subject cannot be blamed for it (as Sartre seems to blame him, in using, for example, the value-laden term ‘bad faith’). —Be that as it may, as an *object of knowledge* this phenomenon is historically conditioned. In itself (as coextensive with consciousness) it is not blameworthy or ‘sick’ or a symptom of narcissism or any other illness; it becomes such only when it becomes an object of knowledge. Only the (mildly or severely) sick individual—the narcissist (or, more generally, the person who is excessively aware of himself)—is aware of the insincerity of his consciousness, which he understands as *necessary*, as something he cannot overcome. (This kind of psychological acumen is almost always a symptom of sickness.) That this person has become more and more common with the onset of modernity is a clear sign of the sickness of the times. If mankind ever evolves to a healthier era, the phenomenon that Sartre analyzed will probably again cease to be an object of common knowledge (except maybe in an academic—i.e., not intensely *experiential*—way, when people, say, read Sartre’s books), though it will still be a condition of consciousness. Fewer people will be (as) bothered (as I am) by their “bad faith”, because, in being well-integrated in their communities, they won’t be impelled to probe themselves compulsively.

Tuesday, February 28

Jackhammer

come in said the voice huskily
 come in here where it’s dark
 so I went in the dark
 with cold trepidation
 legs hot and stiff
 I’s shut widely
 tremor her
 her fur
 spur
 her
 her
 hurt
 spurt

¹ Even if, in another way, it won’t. The point isn’t that in every moment, the experience in the next moment will literally be qualitatively different; rather, the moment’s transience—its never being wholly and simply present but always consisting partly of an *anticipation* (of the next moment)—which is synonymous with the perpetual fact of possibility, means that the experience of this moment is never wholly and simply just what it is, but that it exists in a kind of limbo, in which the possibility of its negation is always half-consciously present in consciousness. The moment is constantly having to be posited; a new moment is always coming into existence. So the next moment (which exists right now, in the midst of the current one) will be a different moment from the current one, which means that the nature of the experience of this moment is not necessary, not permanent, but conditional and temporary.

in the dark
 make it hurt
 make it hurt *hurt*
 in herrrrrrrrrr

Sartre's phenomenological analyses in *Being and Nothingness*, while brilliant, necessarily fail. They try to capture in concepts the whole content of mental states, which is impossible because all types of consciousness have an unconceptualizable element. Concepts can characterize them *to an extent*, but not completely. For example, shame is more than just "the attitude by which I recognize the Other as the subject through whom I get my object-ness", and arrogance is more than just "the attitude by which I apprehend myself as the free object by which the Other gets his being-other" (p. 386). Even in context—i.e., together with everything else Sartre writes—these descriptions are inadequate. The words have an ambiguity that the attitude itself lacks. I can cognize them in ways that don't imply the full content of the attitudes they're meant to express. This is essentially the problem I mentioned, e.g., on February 2nd: the content of these states isn't exhausted in analyses that invoke only subtleties in the concept of self-consciousness; they have also an 'emotional' *force* (or, better: a primitive, conceptually irreducible character), which isn't strictly implied by, or deducible from, mere descriptions of the way one cognizes oneself or the Other. Precisely because there's really 'nothing in it' to be deduced! –Said differently, states like shame and arrogance are susceptible of more than one kind of phenomenological description. I might, for instance, say that shame includes a perception of inferiority which, strictly speaking, isn't 'deducible from' (or 'contained in') any half-conscious perception I have that "the Other is the subject through whom I get my object-ness". In themselves, these words don't necessarily have a negative connotation—which shame does. The perception of self-inferiority in shame is "sui generis": I just... 'look down on myself', whatever that means. I just... perceive the Other as superior, whatever that means. It can't mean only what Sartre says it does, because of the ambiguity of his descriptions (which is the ambiguity of *all* descriptions). (I don't mean 'obscurity', by the way; I mean that, even when his obscure sentences are understood, there remains an ambiguity.) In other words: in order to understand Sartre's sentences, the reader has to bring to them what he already intuitively knows of the mental state under discussion. A reader unfamiliar with shame—a Martian, say, who understood our language—would not fully understand it on the basis of Sartre's descriptions.

Still, they have an element of truth.

Thursday, March 2

Last night I acted in a short movie Charles made here in the apartment with a girl and a friend of his. It was a mini-movie set, complete with lights and a sound-boom-thing and a white umbrella-thing to soften the light. I was the sicko who stalked her and stabbed her to death in the bathtub. The actress: 19-year-old Erin, a bimbo Charles has fucked more than once (who likes to strut around bare-breasted). He's told me anecdotes about her, like how during that time of month when blood comes out of her vagina unless it's absorbed by a wad of cotton stuffed in there she refused to let him bang her, so he just played little games like pulling on her tampon by the string.

No pleasure like sitting here listening to Liszt's *Au bord d'une source* and *Liebesbotschaft* and *Die Loreley* and *Les jeux d'eaux à la Villa d'Este*. Unless it were to listen with Maria next to me.

One thing is needful.— The only way to stay alive for an entire lifetime is—not to live. Most people have an unconscious understanding of this, so they watch television.

Blindly living

The drone drums on outside in the day—far away,
 in the bright wilderness of the day,
 I can hear buzzing and talking and mechanical sounds,
 like every day, every other day.
 Outside this night is a bath of warmth, a freeness, quick-paced,
 and lots of light. I can feel it—almost.
 There's nothing I can't hear.
 Tied up in here I hear running dogs sniffing and growling
 (I imagine they are playing together),
 children running and leaves falling from trees
 which feel rough and scarred and old.
 Fast people with fast voices conscious of fast time pass me
 because they are late probably for appointments.
 I can feel things like stares and self-conscious ends of stares,
 for they are rude, but I feel the pity not ending,
 for pity is not rude and is allowed (death is polite).
 Starers see me my windowless face and close their windows,

but pity glows from the shutters which I see and they do not.

Tap-scrape-tap, I hear my cane test the sidewalk
 scraping past cracks. Tapping heels of shoes and saying
 Sorry I'm Sorry, and the turning around and saying quickly
 It's Okay (what a friendly voice!....).
 Swarms of voices, friendly voices all around, helpful
 and kind
 and soft with good intentions, waiting gratefully
 for gratitude.
 —Yes, they are more grateful than I, far more
 (So cruel are you, society, so miserly!),
 and so I repay them smilingly (because we play games even at night!)
 and give them what is expected. I must. We all must.
 And so they....leave....and I watch them go....

Every day. Every day.
 All you people, you kind people with faces and eyes,
 you fake people, you ethereal threads of sound with colorless flesh,
 you ungrateful frivolous people: every day you live
 amidst the unliving!
 I do not live, I *crawl!*
 I am locked in wakeful sleep—a crawling contradiction!
 I want to see! I want to see this famed “sunset”;
 I want to see this woman who smells pleasant;
 I want to see this stump that trips me and lands me on the grass
 (blades of grass between my teeth),
 so I can count its rings and see how old it is.
 But the world is blind to me, all its facets black,
 and I must stumble on without end.
 Every day.

Friday, March 3

Apparently John Searle thinks that “mental phenomena are caused by neurophysiological processes in the brain and are themselves features of the brain....: ‘mental events and processes are as much part of our biological natural history as digestion, mitosis, meiosis, or enzyme secretion.’” “Mental phenomena are realized in the structure of the brain.The feeling of thirst is localized in the hypothalamus and visual experiences are right there in the brain where the firing of a vast number of neurons at literally millions of synapses have brought them about.” Moron. If consciousness is in the brain, point to it. Show me where it is. “But at least you can’t deny that it’s located somewhere in the *head!* It’s intuitively self-evident that consciousness is in the head, as opposed to outside the head. And if it’s in the head, then surely it’s in the brain (because the brain is the part of the head that controls thinking). So it must be in the brain.” No. It’s a mistake to apply the concept of location to consciousness, or to anything else non-physical. Consciousness isn’t located anywhere. Not even ‘in the head’. “But that’s absurd!” It seems absurd because we’re in the habit (actually, more than habit—I’m not a Humean—; we’re in the *conceptual compulsion*) of thinking that everything has a location, even concepts. (Hence Platonism. Hence “Goddammit, *what are* concepts?! *Where* are they? They have to be *somewhere*, goddammit!”) And also because it’s intuitively obvious that consciousness is right there behind the eyes. Yet, strictly speaking, it isn’t. It doesn’t have a particular location. It’s an emergent neural phenomenon many of whose features are outside our conceptual scheme.

Applying certain concepts to it gets us into insoluble paradoxes. This makes sense, since language wasn't designed for philosophy; it was designed for practical use, for use in the exoteric world. —Admittedly, my Wittgensteinian ideas are unsatisfying, because it'll always seem obvious that consciousness is 'in the head'; still, they're right.

Another testament to the fact that Saul Kripke and I are practically the only philosophers left: the debate over the meaning of self-continuity. The main problem (which I struggled with in my senior thesis) is that it's impossible to distinguish selves from one another. There isn't a criterion; every self is exactly the same as every other, except that it's separated from them. (This is just a brute datum of experience.) Hence it's meaningless to say that *this* self is the same as the one two hours ago. (One of) the reason(s) it doesn't seem meaningless is that there's a continuity linking this consciousness to the one two hours ago (as I said in my thesis). This temporal continuity is made possible by protention and retention, i.e., by the fact that the previous 'moment' and the following 'moment' are both somehow phenomenologically present in *this* 'moment'. (This is also what "temporal continuity" *means*.) In my thesis—if my memory doth not greatly err—I went so far as to say that continuity of consciousness (expressed propositionally) is the *meaning* of the judgment "It was I who had that experience back then". That was wrong. Such continuity—or rather, the memory of such continuity—is merely a reason for affirming the judgment. The judgment itself means only that "this (self-)consciousness was the one back then, temporally displaced". But this is truistic. Inasmuch as consciousness is always consciousness, every consciousness is going to be every other one "displaced" (temporally or spatially or whatever). But then—because the judgment is a truism—it doesn't succeed in distinguishing between people, which is what it purports to do. The absence of a criterion for distinguishing between consciousnesses—between 'mine' and 'someone else's', which means: between *me* and *someone else* (because the self is self-consciousness)—makes the judgment meaningless. It *seems* to have meaning, but if you look closer, the meaning evaporates.

Still: "Obviously that was me two hours ago and not you!" In order for that statement both to have meaning and to be true, we must interpret it differently than we did above. It has to be understood as a confused way of saying some or all of the following: that that consciousness existed in this body, that I remember the experience I had two hours ago, that the general 'tenor' of that consciousness—i.e., the thoughts it was prone to, etc.—was the same as the tenor of this one, that the personality-traits possessed by the 'consciousness-body' (the *whole* 'me') then are essentially the same as those now, etc. In some circumstances, certain of these will be absent (e.g., memory), but because the rest are present the judgment will still be affirmed. For example, if I say "I was the person who smashed his face on the road when he was eight", the sentence will be considered true even if, say, my personality has completely changed since then, because that consciousness will have been in 'this' body (insofar as that eight-year-old body would evolve into this one), and because I remember the experience. If I didn't remember it...actually, the statement would probably still be considered true. So I guess that when long spans of time are under consideration (and maybe even short spans), physical continuity is the most important criterion.¹ ('Physical continuity' doesn't mean that the body's properties haven't changed. It means that during the process of change, the part of the body which is, at any given time, thought to be the 'most important' one—i.e., the 'main' part—i.e., 'the body'—remains intact at that time,² all the way up to the present.)

When someone says, on the other hand, "I wasn't the same person back then; I wasn't the person I am now", he usually means that his personality was different. So, strictly speaking, he *was* the same *self*—i.e., he has memories of the experiences back then, his current body directly evolved from the earlier one, etc.; he merely has different characteristics now. (Of course, we've seen that, in the *strictest* sense, it's meaningless to posit an identity between two selves.)

I've thought of objections to the foregoing, but....me-no-likey objections.

¹ In the case of very short time spans, my half-conscious memory of the temporal continuity of my consciousness becomes important.

² [In other words, if, for example, I lose my hand in an accident, the requisite bodily continuity still exists because the 'main part' of my body remains intact. But the whole discussion above is simplistic.]

You can't deny that Chomsky is (always) right: intellectuals have a duty to dredge up the truth about politics. A duty to fight the Establishment. For they have access, time, money and intelligence. 'Either you're complicit or you're a hero': that should be the motto of every intellectual.

Obviously I don't live up to my standards.

—I would, though, if I thought there were a publication that would print something I wrote. But institutions, as a rule, don't speak truth to power.

Where the Stoics went wrong.— Nothing encourages stoicism like *never being wrong*.

"*What is truth?*"— The only way a philosopher can be a philosopher is to live in ignorance [of society]. Otherwise his humanity will rebel.

(↑) I saw *Lord of War*. Not a great movie, but a little disturbing. "Lights a fire under your ass." If only documenting crimes weren't so tedious and dehumanizing!

Seriously: although, in a sense, an intellectual can be said to have a moral obligation to do as Chomsky does, doing so will prevent him from cultivating himself in 'beautiful' ways. What he does will be noble, but it will also be, kind of, a neglect of his creativity. It will turn him into little more than a data-spitting robot. He may indeed delve into theory as a result of his investigations, but to the extent that he does so he becomes less "moral". —Well, that isn't necessarily true. Theories can be of practical use. But usually they aren't.

And let it not be said that the intellectual who accepts his moral obligation needn't devote *all* his time to exposing crimes or remedying them. If we're assuming morality, then morality is absolute. If a certain act is moral, then it's *right*—not because it's right but because it's good. Morality must be founded on compassion, but whatever is compassionate is *right*, and not just 'good' or 'better'. An alternative isn't 'worse' but *wrong*. (In the moral world, everything is necessarily black and white. Otherwise there are no moral imperatives, which means it's permissible in every situation to invoke "extenuating circumstances" as an explanation of one's not acting morally.) Therefore, someone who has access and resources is acting wrongly in every moment that he doesn't contribute to the alleviation of suffering.

Ehhhh, that's simplistic. But there's a kernel of truth in it.

She nettles my bristling vanity, but I settle for whistling "Inanity!"

Saturday, March 4

The foundation of morality, in the broadest sense, is the imperative to improve life. The desire to improve life is an integral part of what distinguishes humans from animals: humans, in being self-conscious, are conscious of suffering, of death, and thus are constantly trying to make their lot more bearable. Morality is the 'imperative' to make *other people's* lives more bearable. (It makes no sense to say that a person who fails to make his own life happy is being immoral. One can act morally only in relation to others.) And yes, it's an imperative; otherwise it's nothing. A mere 'suggestion', which has no force. So on this construal, artists like Mozart—who provide people with a happiness than which no other can be deeper—are acting morally by creating art. Anyone who creates anything that can be construed as improving life can be called "moral". Of course, this position quickly degenerates into relativism ('What makes me happy makes you unhappy.'). and it doesn't take account of people's motives or of ambiguities in the notion of "improving life"—but morality is ultimately an incoherent idea anyway. It can be easily applied only in the most clear-cut situations, like those involving atrocities and the imperative to fight against them.

But does this mean that everyone in a position to fight against them, however indirectly, must do so? Yes. Insofar as he doesn't, he isn't being moral.

I hate reading the machine-written research papers that pass for philosophy nowadays. It's like they've been stenciled in from the same universal cookie-cutter template. It's like they've been written by intelligent undergraduates. —“It is a commonplace that ‘world-talk’ plays an important role in modern philosophical discourse. Philosophers have proposed analyses of modality, counterfactuals, propositions, and more in terms of possible worlds, and philosophical arguments are conducted on the basis of such analyses. But are there any possible worlds? And, if there are, are they adequate for the tasks to which philosophers have put them? These are crucial questions for the worlds theorist. In this paper, I am (primarily) concerned with the second. In particular, my concern is to address the question of the relevance of possible worlds to modal truth—where the modality under consideration is *metaphysical* modality.” –In other words: “General introductory sentence. More specific introductory sentence elaborating on an idea in the first introductory sentence. Hint at the question this paper is supposed to answer. Embellishment on the hint....”

By the way, this huge controversy over “possible worlds” and “genuine modal realism” and all the David Lewis-spawned shit in metaphysics makes me think the masses are right about philosophy.

Sunday, March 5

To Ilan Halimi

processions of stains of tortures of Jews
 marching single-file the rank and file
 of bitterest hate human-stained
human-fabricated hate
 past the wide judgment-eye
 glaring all the time
 and all the while
 hideous
 death-throes
 throw
 death to
 history
 and all kindness
 maimed mutilated
 marching armies across
 envy-sown battlefields
 soaked with bloodlusting sadism
 ripping apart Innocence's corpse
 as Love's wide judgment-eye looks on and cries

Maria has a boyfriend. Luckily I hadn't allowed myself to hope.

The young man sitting on his once-white
 bedsheets which were now as almost-brown
 as three-day-old slush in the gutter in the street
 clung to his computer like he was still in the
 womb floating with his stubby hands pressed
 tightly against his tumid head because there was
 outside a certain malformed beast called reality

which screamed like nails scraped down
 a wall of glass leaving long white cuts shrilly
 at him to come and join the crowd before it died.

Thursday, March 9

Why are people horrified at the thought of mankind's extinction? Their fear has no rational basis. It isn't as if life is an unbelievably good thing, so good a thing that it would be terrible for potential future people not to experience it. Life sucks. We'd be doing those future people a *favor* if we killed the human race. What's so terrible about nothingness? It's better than this fucking shit we have going on here. Bertie Russell said that one of the three principles by which he had lived his life was "unbearable pity for the suffering of humanity". But someone who really felt that kind of pity—and who, moreover, prided himself on his ability to reason logically—would be most consistent if he advocated extermination of the species. Think of the billions of potential future people who would be spared pain! If extermination could be carried out in a physically painless way, one can argue it would be a good thing. Besides, the species is going to die out anyway, and when that happens, everything that came earlier will effectively not have happened. So we might as well get it over with!

Friday, March 10

I've been reading stuff on the mind-body problem. The more I read, the more convinced I am that (an elaboration of) my solution is the only sensible one. It avoids the identity theory's problem of "How can a *public* brain state be identical with a *private* mental state?"¹—as well as all other problems, except for a few inevitable paradoxes (which aren't peculiar to my solution; they're inherent in the nature of consciousness). In fact, in one fell swoop it bypasses most of the last sixty years of discussion, as being irrelevant. Once you've understood it, for example, most of the papers in the anthology *Modern Materialism: Readings on Mind-Body Identity* (ed. John O'Connor) suddenly become academic exercises with no bearing on reality.

Maybe you think it's hubristic of me to think I've laid the framework of an answer to a problem that's been around since Descartes. But I have so little respect for "philosophers" and mankind in general that it doesn't surprise me at all that finding an [approximate] answer to this "most difficult of questions" would be anticlimactic. *Everything* is anticlimactic; why should this be any different? Besides, my solution is so hard to grasp conceptually that for it to be *the* solution would make sense—because if the solution were as simple as most thinkers have thought (—thus, for example: 'Mental states are physical states. Period. Simple as that.'), why would the problem have been around as long as it has? Obviously the problem has something to do with the fact that concepts (like 'mental' versus 'physical'²) are not wholly adequate for describing consciousness (i.e., consciousness cannot be adequately described)—the recognition of which fact is integral to my solution.

I mean, for Christ's sake: you have Richard Rorty saying that sensations actually don't exist, and that the only reason we think they do is that to eliminate talk about them from our language would be "impractical"—and so, in short, sensations are really nothing but physical [not 'qualitative'] processes—

¹ In my theory, the brain state isn't public. The '*aggregate*' of the neural activities is, but their emergent result isn't. (The aggregate is the exclusively physical side of the activity, so it's public; the emergent result is the mental side—which is also, however, physical, in some strange incomprehensible way—and the mental is private.)

² And, even more pertinently: the *single* concept of 'mental versus physical'.

and then you have me putting forward a theory so nuanced¹ (yet elegant and systematic)—and to understand which requires such powers of intuition—that I won't even describe it here. Who do you think is right?

Still, as I said above, there are unresolved issues. Like: since there are different kinds of emergence (at least, there seem to be), and since emergence in general is a very strange thing, it would be good to have a fuller account of it than I've given.

Sunday, March 12

The cry of impotence

If a tenth of the time I spend thinking of death
I spent thinking of life, I would be full of life.
If I thought to myself how little eternity means
and believed it,
I could live eternity every moment.
And I wouldn't have to write like a wailing infant,
nor pretend to be weak because weakness was fun.
This damn sickness of having to need "perfection"
or prettiness because nothing matters
and everything changes
and everything dies
would no longer infect me
and I could live like someone in 18th century Vienna
when the most unpleasant thing was horseshit on the street.
Just to not wonder why I so long for eternity and fullness
and have been birthmarked with this senseless yearning
for something outside the bounds of sense.

I wish life were easier.

I was sitting on the couch, looking at the ceiling with my head resting on the cushion, making the squinchy bizarre faces I make to myself whenever I feel good, and I suddenly realized: "What freedom! I can make these faces whenever I want to! I can manipulate my face in any way I want! And I can jump up and move my body however I want! And right now there's a mass of cells in my head! Life is *awesome!*" Weird epiphany.

Monday, March 13

Reading Schiller's essay *On Naïve and Sentimental Poetry*. Also, Vasari's *Lives of the Painters, Sculptors and Architects*.

Met with one of my students, a Marine who's being deployed to Iraq for the third time. Asked him about his experiences and impressions. He was in Fallujah; said he was in charge of a machine gun but had knifed people to death also. Enjoys it—the adrenaline—despite having lost many of his friends.

¹ So nuanced that it can account for the appeal of all other theories—or at least 'make room for it'. (On the other hand, it's also the only one that isn't totally stupid. Like behaviorism, functionalism, physicalism, dualism, and Searle's "biological naturalism".)

A piece of advice

Despite the past, despite the pain,
 Despite life's driving you insane,
 Live full, live deep, be gay and merry
 —But still, 'round women, I advise: be wary.

The meaning of life

Whene'er you think that "life ain't fair!"
 (Whilst tearing your hair in great despair),
 Reflect, ere reaching for your gun:
 If life were "fair," it wouldn't be fun!

Dear God

It's said you're full of love for us
 And wish us all the best;
 —Okay, supposing it is true,
 I have just one request.

To help us humans have good lives,
 Please *break religion's spell*;
 In other words, please kill yourself!
 —And send yourself to hell!

The fruit of life

They taste so good, these ripe grapes!
 And their texture—softly ribbed, fleshy.
 But my favorite is the stalk that grows between them,
 Which when you squeeze leaks sweet juice
 —Well, it's tasteless, and smells like bleach,
 But I like to lick it anyway.

I love Robert Browning's short poems. They're passionate but restrained, simple in sentiments but rich in imagery. Their language is neither flowery nor prosaic:

Meeting at Night

The gray sea and the long black land;
 And the yellow half-moon large and low;
 And the startled little waves that leap
 In fiery ringlets from their sleep,
 As I gain the cove with pushing prow,
 And quench its speed i' the slushy sand.
 Then a mile of warm sea-scented beach;

Three fields to cross till a farm appears;
 A tap at the pane, the quick sharp scratch
 And blue spurt of a lighted match,
 And a voice less loud, through its joys and fears,
 Than the two hearts beating each to each!

I wish I could write like that!

Wednesday, March 15

Reading Stephen Barker's *Philosophy of Mathematics*, an excellent introduction to the subject. Provides a broad historical perspective. I might even call it a thrilling read. (History is thrilling no matter what it's a history of.)

Also rereading parts of Putnam's *Philosophy of Mathematics*. And Max Black's *The Nature of Mathematics*. To prepare for a paper I want to write on ontology.

I was watching a sitcom. The episode was about a fat man who kept eating more and more despite the pleadings of his friends, who couldn't understand why he insisted on risking his health. What made it even stranger is that he was lonely and obviously would have appreciated a girlfriend, but the more he ate, the less attractive he became to women. So he was just shooting himself in the foot. Eventually they realized that this was the whole point: women rejected him, so he had unconsciously 'decided' to justify this rejection, to give them a *reason* to reject him—a reason *he* had chosen. By gorging himself, then, he was making a virtue of necessity: he was choosing to be rejected, which made the rejection bearable. 'If they don't want me, well, fuck 'em! I don't *want* them to want me! I'm happy with who I am.'¹ But he was unaware of all this unconscious reasoning; as far as he knew, he just wanted to eat a lot. But his unconscious motivation revealed itself in the virulence with which he rejected his friends' attempts to look out for his welfare: he found it disloyal of them not to accept him as he was. He explicitly told them that. "Why can't you accept me as I am?!" (This ejaculation, of course, can be construed as an inadvertent revelation of his real motives—an accidental 'slipping-out' of the emotional pain behind his gluttony. All he wants is acceptance, though he doesn't know it. His determination to eat is a way to hide his pain to himself and others—hide it behind a mask of pride.)

As always, I want to understand how this is possible. How can the unconscious have this kind of intentionality? Assuming the explanation is true—and it seems plausible—how can the unconscious display this sort of Hegelian "cunning of reason", by which it achieves its ends through actions of whose meaning the actor is unaware? If I could only understand this I'd be very receptive to psychoanalysis!

Thursday, March 16

At lunch I saw a flyer advertising an event tonight having something to do with dating and sex. I thought 'Okay, what the hell' and went to it. Maybe I'd meet somebody. Turns out it was a meeting for members of some weird underground cult that does nothing but preach about how inferior we all are to

¹ Alternatively, he was just depressed, and through some unconscious mechanism this led directly to his over-eating as a way of coping, rather than a way of 'rebellling'—of finding unconscious comfort by *choosing* his situation. That is, maybe the element of choice is irrelevant; maybe there's some direct connection between over-eating and depression. This seems likely, at least in many people: you always hear of people eating loads of ice cream and cake and junkfood when they're depressed (though *I've* never had the urge to do so). But this may be due to their energylessness—their lack of energy to cook real meals—and if so, it isn't related to the case at hand, because the fat man had plenty of energy—enough to support righteous indignation at his friends for wanting him to change his unhealthy ways.

some guy named “Jesus Christ”. I felt like Indiana Jones in that scene in *The Temple of Doom* when he observes the ritual of the Thugee cult—the zombies intoning meaningless sounds as a human is sacrificed into the fire pit. “No one’s seen anything like this for a hundred years!” That’s what I was thinking.

It began innocently enough. I walked into the large room, which was absurdly empty (evidently the cult isn’t very popular), and stood there wondering what I’d got myself into. I didn’t yet know it was a Christian Conference, but I could tell I was about to be underwhelmed. Some girl involved with the show came up to me and started a conversation. Quite pleasant. We were both friendly; I was starting to think that maybe this wouldn’t be so bad after all—when, in answer to my question about what all the musical instruments on the stage were for, she said, “We’re going to start out with some worship music.” A single thought flashed through my mind: ‘Uh-oh’. “Worship music?” I asked. “Well, no....” she said, “just some music.” Hmm. A few minutes later another guy came over and introduced himself—very friendly again—and then two other guys—very friendly. I was getting suspicious. After I’d heard a few references to the Church, my suspicions were confirmed. “So...this is sort of a religious thing?” I asked. “Yes!”, with an amused smile. Then it took off. I was told all about this little group that goes around spreading the Word, and I was told to go to Bible study tomorrow at noon, and there’s a fancy dinner tomorrow night, and etc. Then the pastor came over and we talked. Finally the production began—with half an hour of songs and prayers about how unworthy we are of God’s love. It was a sing-along; we stood up and clapped along and sang to the lyrics on the video screen in front of us. (It was a Powerpoint presentation.) Guitar, synthesizer, bongo drums, accompanists with microphones. Ugh. Those songs lasted forever! Each was at least eight minutes long. And there were only about two verses to each song, so we sang each verse about ten times. Audience-members were closing their eyes, raising their hands to the heavens—and keeping them suspended in air for minutes at a time; it was strange—bowing their heads and saying “In Jesus name! In Jesus name!” as the rest of us kept the melody going. Twenty-five minutes into it I got to thinking that it wouldn’t be so hard after all to come to believe in this stuff if it was regularly pounded into you like this. Still, I could see that they meant well, and that they were good people. ‘These are the *good* Christians,’ I thought, ‘the ones it’s easy to forget about.’ –That was a rather naïve opinion, as I came to realize.

It all stayed innocent and somewhat charming for a while longer. There was a mimed drama that portrayed Jesus (dressed in white with a red paper-heart stuck on his chest and paper hearts taped to his palms that you could see when he raised his arms in that expansive ‘I love all of you’ way) saving four tormented souls (dressed in black with masks on their faces;—I didn’t catch the symbolism)—by slapping hearts onto their chests, which caused them to jump up and down with glee and whisk their masks off and dance around the stage. ‘At least their intentions are good,’ I thought again.

Then it was time for the entrée. Our guest speaker was going to talk about sex and love in our sinful society—“Is true love still possible?” etc. (I’ll spare you the suspense: yes.) Skilled speechifier that he was, he started off with jokes to lighten the mood. Here’s a sample: There were two brooms in a closet. They were getting married. So there was a bride broom and a groom broom. (That drew laughs.) They went to a party shortly before their wedding; the groom broom made some remark that I’ve forgotten (it had something to do with asking his betrothed if he could “whisk her away”), to which the bride broom responded with “Are you kidding?! We haven’t even swept together yet!” Har-har. That provoked the universally accepted reaction to bad-pun jokes: a collective good-natured “Awwwhhh!” (like: “Oh *man* that was bad, ha ha, but it was funny too, ha ha”), a few chuckles, and a lot of turning-the-heads-to-neighbors-and-shaking-the-heads while smiling;—“Aww, that mischievous ol’ guest speaker with his bad-pun jokes!”

Okay; now it was time to get down to business. The speech began poignantly: he described his near-suicide in college, after his fiancée had broken up with him. For a week he’d planned it out, down to the last detail; but one night in a park, while he was trying to make the final decision for or against death, God spoke to him. That was his rebirth, etc. Now he was a marriage counselor and a preacher (or pastor or reverend or one of those things). The rest of his speech was about the greatness of love—and abstinence until marriage—and the sinfulness of flesh-pleasures—and the inadequacy of evolution (“We’re all descended from muck, just by chance?! That doesn’t account for *love*! Science can’t account for love!”)—and the sinfulness of society. It turns out that the cause of all the world’s ills is sex before marriage. The speaker himself had had sex with his fiancée before she’d dumped him; *this* was the reason for his suicidal

pain. Satan had possessed him, and the result was despair. (Lust, you may know, is the work of Satan. Love is the work of God.) We have to love Jesus. If we love Jesus with our heart and soul, etc. etc. And besides, if we abstain from sex until marriage we'll enjoy it a lot more when it finally happens. (He emphasized this pragmatic concern quite a bit.) "Is love temporal or eternal?" Well, according to him, lust is temporal, but love is eternal. And the precondition for love is that women save their "precious jewel" for marriage. The speaker threw out all sorts of statistics that drew oohs and ahhs from the audience—like, for the last five years, 100 Japanese young people have killed themselves every day (often during big internet "suicide parties"), and 80% of people who have sex before marriage end up divorcing, and one out of five women are sexually abused in childhood, and one out of five pastors are addicted to pornography.

An hour of this. This palaver. By the end I couldn't stop thinking about *Inherit the Wind*, which I'd seen the previous night. All these people sitting here absorbing this stuff and nodding and shaking their heads—this stuff that was becoming more ignorant and bigoted by the minute—these people had been so kind and pleasant just two hours ago, but now they were haters of evolution, of science, of gays, of the irreligious. They would have denied that, but obviously missionary zeal was not foreign to them. And what else is missionary zeal but intolerance of dissent? That's clearly the motivation behind it most of the time—the desire to impose oneself on the other. In the 1920s these people would have lived in Heavenly Hillsboro and happily thrown the free-thinking heretic into jail. All because of their infinite love, their eternal love. It was all right there below the surface. This absolute faith in their own rightness.... And yet they were so agreeable as conversationalists, and I could see they were fundamentally kind! This is the paradox that's always disturbed me. The intermixture of good and bad, a mixture so perfect that there's really no distinguishing between the good and the bad. The bad exists in the good and vice versa.

Equally frightening: I can sense the rudiments of hateful missionary zeal within myself. As I walked home tonight, feeling so corrupted—almost *physiologically* corrupted—that I could think of little else but the Mozart I'd be listening to in a moment, I could tell I had the potential for atheistic fanaticism. I knew that the only reason I'd never succumb to fanaticism is that I'm *aware* of my fanaticism. My self-consciousness is all that prevents me from sliding into the pit of disguised jihadism.

Also, the obvious insight once again occurred to me that historically the role of "confessors" has been to function as therapists in an age that didn't recognize psychology. Conversely, therapists are just confessors for the modern age. *Talking* about problems (like guilt; hence "Have you sinned recently, my child?")¹ in itself somehow relieves their burden. (Clearly by establishing a community with the listener. But this isn't really an explanation.)

Hollow

In cemeteries I have a way
of being content,
and sitting on the grass against a gravestone
finding the melancholy peaceful.
Not feeling so would seem sacrilegious.
Sitting in the shade of the junipers,
I think of the squirrel looking at me
as he holds his partially eaten acorn.

¹ One reason Christianity has been psychologically powerful is that it first burdens people with guilt and then gives them the means to overcome it. It *separates* them from the community (with God, etc.) only to draw them more closely into it. (Guilt is just a form of isolation, of self-fixation.) That is, it creates a community by promising that only through this community can one reach the *ideal, eternal* community—by transcending one's original guilt ("sin"), which is essentially one's original *individuality* or *isolation*. For sin is just the stain of original separateness. The stain of *personality*, of concrete, bodily existence. Salvation means overcoming the particularities of concrete existence.

At parties I have a way
of being unhappy,
and in my can of beer is a half-emptiness.
The cluttered noise around me is strangely measured,
like a row of gravestones in a park.
I sip my beer and contemplate
the woman staring across from me,
and smile at her
hollowly.

For each person there is a particular era into which he ought to have been born—and it's rarely the one in which he lives. His talents are most suited for a single culture and a single time, and his weaknesses will be most noticeable in a different culture and time. So, somewhere in time there's a culture that will make possible the perfect compromise between his talents and his weaknesses, a culture that will best allow the flowering of his talents while hiding the extent of his weaknesses. For example, had I lived in the 19th century I would have been a terrible poet, much worse even than Oscar Wilde. My innate sentimentalism would have been given free rein, and my difficulties with rhyme and rhythm would have convinced me to give up any poetic ambitions. But my aptitudes are well-adapted to the 21st century: rather than being a terrible poet, I'm an *average* one. So it's conceivable that people might someday consider me a better poet than Oscar Wilde, which is absurd. In the romantic style he surpassed what I could have done, and in the free verse style....who knows what he might have been capable of?

N.B.: I'm irritated that I used not to want to write free verse. I valued only the traditional stuff, which effectively prevented me from writing poetry during those many dark nights in Korea and in college, when I was most in need of poetry's therapeutic effect. Not only would I have enjoyed myself more, but I probably would have written a lot of readable poems.

Saturday, March 18

The Rossini in the sky

In the sunlight poking its fingers through the blinds in my room
I think I hear murmurs of a *valse brillante*, Chopin-style;
(I'm listening to that piece now, so it comes to mind—
Ah, what a welcoming way to wake up each morning!)
Or maybe it's a duet, or a fugue, or a symphony....
I'm curious now and anyway want to hear the music outside,
So I raise myself (this necessitates that I pause the other music—
It's Mozart's Sunshine Concerto now, No. 17—but I trust
The substitution will be worth it)
And I pull the little string with the little plastic cone on its end
And the blinds magically raise themselves.
The sunlight withdraws its fingers and steps into my room
Uninhibited, body and soul.
It's blinding.
There's no subtlety here; it's clearly a fanfare I'm listening to.
Pure joy in the cloudlessness of the sky (which is immeasurably blue).
It's Beethoven's Fifth, fourth movement: "Wake up! Wake up!
Wake up while there is such a day to be seized!"
I smile and throw on my clothes and step outside,

Body and soul.

It's uncanny how true the conventional wisdom is: the longer you live, the less you care about achieving perfection. Life somehow kills the desire—kills desire in general.

There are certain combinations of talents that are not suitable for life. We experimental people are proofs of nature's failure as an architect.

Dear PETA.— If nature can experiment on humans, why can't humans experiment on nature?

Monday, March 20

Schiller's insistence on the necessity of uniting "simplicity" and "sentimentality" in order to achieve a "beautiful humanity" reminds me of Jung's idea that a healthy psyche makes use of all its faculties. (Also: Goethe's ideal, and the Greeks' ideal, and Nietzsche's *Übermensch* (sort of), etc.) Well-roundedness is the meaning of both ideas. Simplicity = immediate experience, "spontaneous activity", an unreflective harmony among all the faculties—a harmony in which "the whole object possesses one", such that one doesn't dwell on one's subjectivity; sentimentality = reflectiveness, romanticism, a division between the faculties, a self-conscious love of feeling, a dwelling in the realm of the ideal. Both individuals and historical epochs are dominated by one or the other of these tendencies. Taken to extremes, both are unhealthy (because they stunt humanity). Schiller's essay revolves around the idea of 'poetry as a metaphor for life': the different kinds of poetry are correlated with different kinds of life.

I think the explanation of the general, though only approximate, truth of the suggestion that each historical era is dominated by one or the other tendency is that social organizations can be (crudely) classed into two kinds: those that encourage the individual to be integrated in the community, and those that encourage him to feel separated from it—to feel his own separate identity. In the first case, generally speaking, his personality will be primarily active: his self-consciousness (his reflective side) will be overpowered by his urge for action, for experience, for being at the center of communal life. He will, in all likelihood, see nature mainly as an extension of human society, or vice versa (because, due to the lack of a duality between him and his community, he won't have the psychological motive, or ability, to posit a duality between society and nature); thus, his religion will probably be animistic or polytheistic (though it needn't be). Examples of such a society are Greece in the Archaic and Classical periods,¹ India at the time of the Vedas, the society that produced the earlier books of the Old Testament, the society in which the Koran was written,² and the society in which *Beowulf* was written. And of course all prehistoric cultures. On the other hand, there are cultures in which individuals don't feel very integrated in the community; the result is self-consciousness, insecurity (often), nostalgia for simpler times, a clearer distinction between nature and mankind, a fondness for wallowing in one's subjectivity, etc. Examples are Rome during and after the demise of the Republic, Greece in the age after Alexander, China during the T'ang dynasty (see the poetry of Li Po), Europe and America during the last three or four hundred years (or more). Mankind will surely return to the simpler age eventually, but not until the current civilization has destroyed itself.

I'm reading a bunch of books on ontology and the philosophy of math. *Wittgenstein's Philosophy of Mathematics*, by Klenk, *Abstract Particulars*, by Campbell, *Number: The Language of Science* (a history of mathematics), by Dantzig, *Universals: An Opinionated Introduction*, by Armstrong, *Realism in Mathematics*, by Gaddy, *Frege and the Philosophy of Mathematics*, by Resnik, *Essays in Ontology*, by Allaire et al, et cetera.

¹ But even at the time of Euripides and Socrates, Athens was evolving away from simplicity and into sentimentality.

² Communal integration doesn't imply the absence of war.

Saturday, March 25

I recommend Dantzig's book. To quote Albert Einstein, "This is beyond doubt the most interesting book on the evolution of mathematics that has ever fallen into my hands." What's more, the author has that precious quality lacking in so many scholarly authors: wit. Here's an example (the second paragraph):

It is significant that we owe the first explicit formulation of the *principle of recurrence* to the genius of Blaise Pascal, a contemporary and friend of Fermat. Pascal stated the principle in a tract called *The Arithmetic Triangle* which appeared in 1654. Yet it was later discovered that the gist of this tract was contained in the correspondence between Pascal and Fermat regarding a problem in gambling, and the same correspondence which is now regarded as the nucleus from which developed the theory of probabilities.

It surely is a fitting subject for mystic contemplation that the principle of reasoning by recurrence, which is so basic in pure mathematics, and the theory of probabilities, which is the basis of all inductive sciences, were both conceived while devising a scheme for the division of stakes in an unfinished match of two gamblers.

That reference to mysticism ties into the author's earlier ridicule of it.

Most of Wittgenstein's ideas on mathematics are perverse. But that's obvious and I won't waste time arguing for it. Instead I'll mention a criticism of his theory of meaning that's bothered me since I first read *Philosophical Investigations* years ago: to say that the meaning of a sentence is its use, or that it's the rules that govern when it can be used, or that it's its "assertability conditions", or that it's the role it plays in a language-game, is very imprecise. What does it mean? How can the sentence's *meaning* be any of these? It may be intimately related to them, but it can't *be* them. The meaning of 'The house is on fire' is not the fact that this sentence serves as a warning not to approach the house. That wouldn't even make sense. Its meaning, rather, is its truth conditions: that the house be on fire. If someone asks me "What do you mean?" I'll say "I mean the house is on fire!" Cf. Tarski's example: "'Snow is white' is true iff snow is white." Why? Because the statement that snow is white is what the sentence *means*. Admittedly, in my commentary on the *PI* I somewhat misleadingly insisted that the meaning of a sentence is the 'intention' that invests it with—meaning; but I did so because of my intuitive awareness that the intention (i.e., the thought) is 'of' the truth conditions. In other words, it's only because I was unaware of the Fregean terminology that I didn't express my correct intuition more felicitously. (Of course, this analysis of meaning applies only to a certain kind of statement. The meaning of performative utterances is not 'their' truth conditions, precisely because they don't have any. —On the other hand, maybe I shouldn't adopt the fashionable Austinian view just because it's fashionable. No doubt the function of performative utterances isn't to state a fact; still, their meaning is what they assert, and what they assert is a fact. If I say in a moment of passion "I love you!", my statement's purpose (i.e., its "role") isn't to communicate a fact. It's to express a feeling, or something like that. Nevertheless, the sentence's *meaning* is the fact stated—i.e., the sentence's truth conditions. The role or function must be distinguished from the meaning.)

Sunday, March 26

I'm grateful to Jay for drawing my attention to the Swingle Singers, an a capella group that sings classical music, from Bach to Debussy. They're amazing. E.g. their version of Clair de lune. (Seriously: angels.) But the Largo from Bach's fifth piano concerto, with the translucent, vulnerable voice of the female lead, lonely and resigned but so beautiful.... How can one not cry listening to this? It's just so penetratingly sad I can't help closing the door to my room and crying a little.

In the entry on January 30th I was also arguing against Frege's conception of a "third realm". Or rather, I was trying to explain its intuitive irresistibility. (To argue against it would be stupid, because it's an inevitable product of the structure of the human mind and language. Besides, there's no *reason* to argue against it; it serves essential logical purposes, though it's also basically a myth. A necessary one.) My talk about the "substantiveness" of concepts and the like—i.e., their 'abstract entity'-ness—can be translated into talk about their objectivity, their 'third realm'-ness. Thus: there's the physical world, there's the mental world, and there's the world of propositions, numbers, concepts, and so forth. The latter is objective but not physical. 'Objective but not physical' has no clear meaning, though; it's an inexplicable paradox, which is why I consider it a myth and argued against it¹ (albeit in a sympathetic, non-argumentative way) on the 30th. In other words, numbers and concepts etc. are themselves myths, in that our half-conscious intuition of their ontological status is mistaken. We use them as if they're *fixed, objective, substantial* somehow, when really they can't even be conceptualized. They exist yet don't exist; they're in consciousness yet they aren't; they have well-defined meanings and yet are indefinable. But it would be senseless to deny on this basis the existence of "universals" like red and justice and triangle and pain. These things (which are vaguely similar to names) can be used to describe or denote a large number of things in spacetime. We use them in a 'universal' way, so there's no point in denying universals. We simply have to be careful how we interpret their ontological status.

Though I haven't known it, the theme running through many of my philosophical reflections since the beginning of my senior year has been the attempt to carve out a position between the *Tractatus* and the *PI*. Both extremes have insights but go too far; a position must be found that incorporates the good and leaves out the bad. (Apparently Wittgenstein thought that the only conceivable alternative to his later work was his earlier work, but that can't be right.)

The psychological problems of middle-class Americans—their narcissism, their TV-obsession, their celebrity-obsessions, their apathy—come down to this: the demise of illusions. Like religion. Religion's corpse is already half-decomposed. And there's no more faith in science, nor faith in great men ("genius"), nor faith in democracy, nor faith in prophetic social visions. Nobody believes in the illusion of eternity anymore: nothing lasts, everything changes all the time. Marx diagnosed the disease in 1848: capitalism has destroyed every object of worship but the cash-nexus. Which no one really worships anyway. They just think they do. (*They* worship it, but their *psyche* doesn't.)

Nietzsche was wrong: his *Götzen* hadn't *dämmerunged*. He still had his own private *Götze*: genius. The myth of the *Übermensch* sustained him. But that myth is not tenable, so there's nothing to anchor us.

...I've never been a fan of Quine. He has little of value to say. Penelope Maddy calls him, amusingly, "the master". An example of his masterly thinking is his "stunningly simple counter-argument" to the belief in universals: "We want to say that Ted and Ed are white dogs. [Do we? Okay, sure.] This is supposed to commit us to the universal 'whiteness'. But for 'Ted and Ed are white dogs' to be true, all that is required is that there be a white dog named 'Ted' and a white dog named 'Ed'; no 'whiteness' or even 'dogness' is necessary. [Therefore there's no reason to believe in universals.]" —Now, this, my friend, is why you're right in turning up your nose at philosophy. This less-than-thinking.

Honestly, it enrages me. It's bad enough that intelligent people spend years thinking about this *meaningless academic shit*; but when they're also as confused as this "stunningly simple counter-argument" shows them to be, and yet are totally unaware of their confusion—are in fact proud of their clear thinking, smug in their ivory towers—they deserve to be hauled out into the square and stoned. "No 'whiteness' or even 'dogness' is necessary." Brilliant. Except that you just referred to their whiteness and their dogness. You said they're white dogs. So I guess whiteness and dogness are necessary after all.

¹ I'm not a "fictionalist", though. From what I've read of it (very little), fictionalism is stupid. 'Statements about numbers and necessity and possibility and the like are merely useful fictions.' Huh? That reminds me of instrumentalism, 'than which nothing could be stupider'.

Universals are nothing but a certain kind of concept. If the *concept* “subsists”, then the *universal* does. And no one’s going to deny that the concept ‘dog’ “subsists”; therefore, there’s a universal.

I sympathize with Carnap’s belief that ontology is mostly empty. But I disagree with his reasons. (The “linguistic frameworks” idea.) I also, by the way, disagree with his conventionalism. Of all the idiotic ideas I’ve encountered—!

Another thing: deflationary theories of truth are stupid. ‘There’s no need to rely on the notion of correspondence. To say that a proposition is true is redundant. The proposition that snow is white is true iff snow is white. That’s all there is to it.’ Okaaayyyy.... But snow is white “iff” *snow is white!* The statement *corresponds to* a fact! The question that has to be answered is *what makes a proposition true?* The correspondence theorist isn’t denying that the property of ‘being true’ is, in a sense, redundant; but it’s redundant only because every proposition implicitly asserts its own truth. By denying the substantiveness of the question ‘What does it mean for a proposition to be true?’, you’re denying the substantiveness of the question whether {insert proposition here}. In other words, you’re refusing to answer the very question that started all the trouble in the first place.

Tuesday, March 28

Trapped behind bars

At times when the light is on in my bedroom
and the night outside is blue and I look
through my barred window at the blue night,
I see strips of infinity across the sky.
And between them I can see my cloudy profile
repeated and distorted again and again
from the horizon to the apex,
like in the distorting mirrors at amusement parks.
It’s almost unrecognizable, but because I want
to see it I see it.
It’s there, stamped into the blue clouds in front of the moon.
(I want to *blot out* the moon, that serene patch!)
And I try to engrave that distant image of myself
into my mind, before I go to sleep every night,
but I never can.
And I realize how frightening it is to be alone.

Thursday, March 30

I miss Jim. He’s always reminded me of Jon Stewart. And Dane Cook. The same charisma, the same style of humor. The kind of guy who somehow makes the rest of look like we live in black-and-white, while he has color. I wonder if he has HIV. That would make sense, since it’s usually the best people who suffer the worst misfortunes.

I’ve often envied Teiresias. Except for the fact that the poor guy was the victim of a female: he said that women enjoy sex nine times more than men, so Hera blinded him. (*What the fuck? Isn’t enjoying sex nine times more than men good?*) But to be both a man and a woman—to see what it’s like to be a member of the second sex—that would almost be worth blindness.

“To play with fools, O what a fool was I!”

[...] I know that most intelligent people are aware of mankind's idiocy/dishonesty but are able to shrug it off. I'm not, unfortunately. Or rather: my constant shrugging-off is only on the surface.

Since I rarely tell you about the little daily incidents that drive me to this journal-venting you probably think etc. In this case it's because for the last few days I've been sending pleasant little emails to girls on the 'Yahoo personals' website, which I joined out of boredom, but only a single one has responded. Even though each of them can see from my profile that I have a dozen things in common with her, and my pictures are, in all honesty, pretty good. *Their* profiles, of course, are all full of "Are you the one? I want to meet a kind, intelligent man! Email me if you want to know more!" Arrgh.

The one is named Lauren; we have everything in common. But we'll see.

The formula for sexual tension: male confidence + female openness to it.

Friday, April 7

[...]

Sometimes religion and music belong together. And without them one is lost. [See Mozart's *Ave verum corpus*.]

*Ave verum corpus natum de Maria Virgine,
Vere passum immolatum in cruce pro homine,
Cuius latus perforatum unda fluxit et sanguine,
Esto nobis praegustatum in mortis examine.*

My only paper of the semester. The product of a week-and-a-half of intellectual distress:

Abstract

In this paper I argue that much of ontology is confused. I criticize the notion of 'abstract object' (or 'abstract entity') while yet explaining its theoretic appeal. This leads me to reject both realism and nominalism, and, more fundamentally, to argue that ontological questions tend to be "pseudo-questions". Along the way I discuss both the phenomenology of consciousness and Saul Kripke's interpretation of Wittgenstein, because they bear on my arguments. This paper is unusual in that it also embodies 'programmatic' intentions—namely, to unite the analytic tradition with the Continental, or, in other words, *intellectual cleanliness* with *ambition*. The result is necessarily (in an essay of this length) little more than an outline, but it may nonetheless be a useful corrective to the über-specialization that obtains in contemporary philosophy.

A Refutation of Ontology

Ontological questions have a venerable history, having been in circulation among philosophers for 2400 years. Nevertheless, in this paper I shall argue that many of them are pseudo-questions. More specifically, the question whether abstract entities exist—whether there are 'in reality' such objects as numbers, relations, properties and propositions—is based on confusions. Surely this claim ought to be uncontroversial. When a philosophical problem is actively debated for nearly one thousand consecutive years, refusing to be resolved despite the best efforts of the best minds, the possibility that it has been incorrectly formulated ought to be considered a probability. Ontologists should thus change their focus from attempting to answer the question directly to trying to explain in what sense it may be an illusion.

Of course, there is not just *one* question. There are many. Indeed, upon glancing over the contemporary ontological literature, one is struck that there may be an *infinite* number of questions.

Literally: there seems not to be a limit to the number of questions that can be posed, nor the number of ways they can each be dealt with. New problems are constantly being brought to light, and each proposed solution is merely fertile ground for the sprouting of new problems. The more that ontology progresses, the less it does. Any disinterested observer who read all the books, all the journal articles, all their rejoinders, all the rejoinders to the rejoinders, might well decide that the participants had given up the attempt to find answers and had resolved, consciously or unconsciously, just to continue writing for the sake of writing.

Obviously there's something wrong. Ontological theorizing ought not to be so technical that only a few specialists can understand it, nor should answers to its questions appear farther away the closer one gets to them. Wittgenstein once wrote that the purpose of philosophy is to show the fly the way out of the fly-bottle. With regard to ontology, I agree. In this paper I'll try to explain the source of all the confusion, thus, hopefully, freeing the fly. Or at least uncorking the bottle.

An overview of ontology

I find myself already confronted with a dilemma. I have to provide some background for the reader, but the relevant 'background' is the whole of ontology. Which is a large subject. So I'll have to compromise: I'll try to give the reader a sense of the issues at stake, but I won't be able to touch on *all* the issues.

A good place to start is David Armstrong's formulation of what he calls the "Problem of Universals": What distinguishes the classes of tokens that mark off a type from the classes that do not?¹ (A token is an instance of a type. For example, a single banana is an instance of the type 'banana'.) This is an ontological question because whatever it is that distinguishes things from each other must obviously *exist*, and it must also be the fundamental organizing principle of our experience. So in asking for an account of it, we're asking for an account of arguably the fundamental class of existents, the class that structures our experience.

Each traditional answer to this question falls under one of two categories: nominalism or realism.² Penelope Maddy characterizes the realist position as follows:

We all agree that there are many red things—red roses, red houses, red sunsets—but the ancient question is whether or not there is also, over and above this lot of particular red things, a further thing they share, namely, redness. Such an additional thing—redness—would be a universal. The most basic difference between particulars and universals is that a universal can be present ('realized', 'instantiated', 'exemplified') in more than one place at a time, while a particular cannot.³

Thus, properties and relations are universals, in that the same property or relation can be shared by many particular objects. Now, this ontology suggests the *substance-attribute* theory of Locke and (arguably) Aristotle: particulars are substances, while the universals that are exemplified by particulars are attributes of the substances.⁴ For instance, Aristotle called an individual thing, together with its properties, a substance.⁵ But this begs a question: what is it that distinguishes a given substance (i.e., a particular) from another? Why is this banana different from that one, if they both instantiate the same universals? Clearly a particularizing element is needed; this is what Locke called the "substratum". So, a substance is a substratum plus the universals it instantiates. But what is a substratum? It must be a "bare particular", a particular without properties, because whatever properties it has can be ontologically distinguished from it.⁶ But the idea of a propertyless particular is very strange. Moreover, if substrata have no properties then

¹ David Armstrong, *Universals: An Opinionated Introduction* (London: Westview Press, 1989), p. 13.

² For the moment I'll ignore conceptualism. I'll explain why later.

³ Penelope Maddy, *Realism in Mathematics* (New York: Oxford University Press, 1990), p. 11.

⁴ As Armstrong notes (op. cit., p. 62), this theory would have to be extended to account for relations.

⁵ See Armstrong, op. cit., p. 60.

⁶ Keith Campbell, *Abstract Particulars* (Oxford: Basil Blackwood, 1990), p. 7.

they are indistinguishable from one another. But in that case, how can there be more than one of them? What is it that distinguishes them? By definition there is nothing that fulfills this role (because they lack properties); therefore, there can be only one substratum. But this is absurd, because it entails that there is only one concrete particular in the whole world.

The substance-attribute theory is subject to many similarly devastating criticisms,¹ but since my purpose at the moment is only to provide a context for my later discussion I'll pass over the others.

Historically, the British Empiricist tradition reacted against Locke's substance-attribute theory by adopting a *bundle theory*, according to which a particular is identified with the bundle of its properties.² The idea of the substratum is rejected as unnecessary and paradoxical. Berkeley's phenomenalism had affinities with a bundle theory (though Berkeley was a nominalist), but Bertrand Russell put forward the most famous version. He suggested that properties are universals, and particulars are bundles of "compresent" properties. This means that no two particulars can be composed of the same properties, for if they were, they would necessarily be the same particular. The bundle theory, therefore, is committed to Leibniz's principle of the Identity of Indiscernibles, viz. that if two things have the same properties then they are the same thing. This principle, however, does not seem to be true. There are various counter-examples to it: for instance, Nietzsche's suggestion that the world exists in a cycle of eternal recurrence, in which everything that has happened will happen again an infinite number of times. This may not be true, but it is at least possible. Since it implies that Leibniz's principle is false, the bundle theory must be false as well.³

Let's look at versions of nominalism. Keith Campbell describes the main thesis of nominalism as follows:

There are only concrete particular objects—rabbits and foxes, chairs and tables, and so forth. These objects fall into groups resembling one another more or less closely. Such objects have in common their membership of sundry classes, but no genuinely common universal element. In a medieval version, all that rabbits have in common is that they are described using the same *common name* 'rabbit'—hence the label 'nominalism' for this group of doctrines.*To have a property* reduces to belonging to appropriate classes or glorying in appropriate descriptions. *To be a property* is to be an open class of concrete particulars.⁴

One might with justice say that the unifying thread among nominalist theories is their denial of abstract entities (in particular, universals).⁵ Class Nominalism ("the view that for a thing to be of a certain type is nothing more than for it to be a member of a certain class"⁶) and Predicate Nominalism (the view that for a thing to be of a certain type is for it to be named by a certain predicate) have been effectively criticized by Armstrong,⁷ but it would be worthwhile for us to look at one or two other versions. Let's start with Resemblance Nominalism.

This theory reduces membership in a class (e.g., the class of bananas) to certain relations of resemblance between the members. These resemblance-relations are not reduced to relations between properties possessed by the individuals; instead, they are primitive. They are just brute facts about the

¹ See *ibid.*, pp. 7 – 16.

² Armstrong, *op. cit.*, p. 61.

³ See *ibid.*, pp. 70 – 74 for more problems with Russell's bundle theory.

⁴ Campbell, *op. cit.*, p. 17.

⁵ This isn't entirely true, though. Nelson Goodman's nominalism, for example, differs from the traditional kind in that it countenances abstract entities (because he thinks that these can be construed as 'individuals'). See his article "A World of Individuals" in *Philosophy of Mathematics*, ed. Putnam and Benacerraf (Englewood Cliffs, New Jersey: Prentice-Hall, 1964), pp. 197 – 210.

⁶ Armstrong, *op. cit.*, p. 8.

⁷ See his *Universals and Scientific Realism* (Cambridge: Cambridge University Press, 1978), chapters 2 and 4.

individuals.¹ In H. H. Price's version of the theory, yellow things, for example, are called yellow because they sufficiently resemble "a small group of standard objects or exemplars" of yellowness²—what is often called the "paradigm group". This paradigm group might be a particular banana, a particular patch of color, and the paint on a particular wall. Other objects are called yellow if they resemble the paradigm objects at least as closely as the latter resemble each other. Properties, or the individuals' instantiation of universals, need not be invoked to explain these resemblances.

While this theory, if fleshed out, may initially seem attractive, it is not. In denying properties, it foregoes a very useful explanatory tool. The positing of properties is necessary in order to explain, for example, causal relations. "Things act in virtue of their properties."³ Indeed, from what I've gathered while reading about this theory, it actually denies *relations* as well (as indeed it must, if it denies universals and does not replace them with tropes). But I fail to see how a theory that must invoke the relation of resemblance can coherently deny the existence of relations. —In any case, this form of nominalism is refuted by common sense.

Trope theory is a more promising form. A trope is a particular instance of a property or relation. The red of a particular apple—the color that one can actually *see*, as opposed to the concept of the color, or its universal—is a trope; the specific relation of similarity between two particular apples is also a trope. Tropes have often been called abstract particulars, because each exists in a particular spatiotemporal location and yet can be brought before the mind only through a process of abstraction from other localized properties.⁴ A concrete particular is nothing but a collection of these properties. It is a complete group of compresent tropes.⁵ On this scheme, there is no substratum mysteriously lurking behind appearances, no problematic instantiation of universals (because there *are* no universals), and no reason for the theorist to implausibly deny properties.

Of course, I am again, of necessity, oversimplifying. There are many kinds of trope theory: some retain primitive particulars, others retain universals, others reduce both particulars and universals to collections of tropes. This latter kind, though, is the 'classic' version of trope theory, and it is probably still the most popular. G. F. Stout, Donald Williams and Keith Campbell are well-known advocates of it; they favor it largely because of the theoretic economy introduced by its one-category ontology. This enables them, for example, to analyse the statement "All bananas are yellow" analogously to the Resemblance Nominalist's analysis: the statement means that the yellow trope of each banana sufficiently resembles the yellow trope of every other banana for all the bananas to belong in the same class. Williams and Campbell take this resemblance-relation to be primitive (unanalysable), but they avoid the problems that beset the Resemblance Nominalist because they are willing to invoke properties (since properties are tropes), as he wasn't.

Nevertheless, there are problems with trope theory. For one thing, it seems odd to say that collections of compresent properties are capable of independent existence, in the way that we commonly think of concrete particulars as independently existing. For a banana to be *nothing but* a bunch of properties somehow bundled together offends our common sense intuitions. Properties just aren't 'substantial' enough. They need to inhere in something. To get around this difficulty—i.e., to add a little spatiotemporal 'heft' to properties—a trope theorist might try to ascribe shape, size and duration to tropes, but, as Armstrong notes, these are themselves properties and "therefore ought to be tropes themselves alongside other property tropes".⁶ Besides, this *ad hoc* solution would still not answer the question of what it is that the properties inhere in. This question, of course, is *necessarily* unanswerable—or unaskable—within the framework of Williams' and Campbell's trope theory, because their ontology recognizes only one category.

¹ *Universals: An Opinionated Introduction*, p. 15.

² *Ibid.*, p. 47.

³ *Ibid.*, p. 50.

⁴ I think the term 'abstract particular' is misleading, though, since it can be construed as naming *abstract entities* that are particulars rather than universals. See below for examples of this kind of 'abstract particular'.

⁵ Campbell, *op. cit.*, p. 21.

⁶ Armstrong, *op. cit.*, p. 115.

Maybe they would reply in quasi-Berkeleyan fashion: there is no need to posit an underlying substance or substratum, because no matter how deeply we analyse any concrete particular, all we ever encounter are properties. Even on the subatomic level, we encounter only mass, velocity, electric charge, etc.; subatomic particles are essentially composites of these properties, just as bananas are composites of their properties. Moreover, we have already seen the problems with a substance-attribute view. Hence, it is better to deny substance altogether. –These replies are not obviously flawed. What they show, though, is not that trope theory is unequivocally good, but simply that it may be the lesser of two evils. In other words, we seem to be stuck with a ‘Scylla or Charybdis’-situation. And that’s a sure sign that something’s wrong.

I’ll pass over the other problems with trope theory and proceed to the philosophy of mathematics. The realist position is described by Penelope Maddy as follows: “mathematics is the scientific study of objectively existing mathematical entities just as physics is the study of physical entities. The statements of mathematics are true or false depending on the properties of those entities, independent of our ability, or lack thereof, to determine which.”¹ The analogy with realism about universals is clear: as universals are supposed to be abstract entities that have being independently of the mind,² so are numbers. It may be asked whether numbers are universals or ‘abstract particulars’ not capable of multiple instantiation. This question is not easily answered. If numbers are defined as sets (as they often have been)—so that, for example, the number 0 is the set of all empty sets—then they are particulars, because sets are not multiply instantiable.³ On the other hand, it certainly seems as if, e.g., the number 2 can be instantiated an indefinite number of times. (There are two pencils in front of me, I have two brothers, etc.) Rather than attempting to answer the question here, let’s just acknowledge that it’s a difficult one and move on.⁴ For our purposes, it’s enough to note that a realist believes that numbers are independently existing abstract entities.

Gottlob Frege was a famous mathematical realist, who extended some of his ideas to language in general. He suggested that numbers, concepts (or “functions”, as he called them) and propositions (or “thoughts”) all exist in a “third realm”:

[Frege] thought that these entities [viz., thought contents, numbers and functions] are non-spatial, non-temporal, causally inert, and independent for their existence and natures from any person’s thinking them or thinking about them. Frege proposed a picturesque metaphor of thought contents as existing in a “third realm”. This “realm” counted as “third” because it was comparable to but different from the realm of physical objects and the realm of mental entities. ...Entities in the other realms depended for determinate identities on functions (concepts) in the third realm. Since logic was committed to this realm, and since all sciences contained logic, all sciences were committed to and were partly about elements of this realm.⁵

Not all realists have subscribed to this doctrine of a third realm, for it is considered extremely platonistic and somewhat implausible. A common objection to it is that our ability to interact with the third realm—i.e., to have thoughts of numbers or propositions—is inexplicable, since the realm is causally inert and outside our experience. Frege’s late paper “*Der Gedanke*” did not do much to clear up the issue:

Thoughts are not wholly unactual, but their actuality is quite different from the actuality of things. And their action is brought about by a performance of a thinker; without this they would be inactive, at least as far as we can see. And yet the thinker does not create them

¹ Maddy, *op. cit.*, p. 21.

² Cf. Quine, “On What There Is”, in Putnam and Benacerraf, *op. cit.*, p. 192.

³ A set is determined by its elements: i.e., two sets are identical if and only if they have the same elements. Thus, a specific set cannot be instantiated by another entity.

⁴ Its difficulty should in itself make us suspicious of it, and thus of the meaningfulness of the categories ‘universal’ and ‘particular’. But more on this later.

⁵ Tyler Burge, “Frege on Knowing the Third Realm”, *Mind*, Vol. 101, No. 404, p. 634.

but must take them as they are. They can be true without being grasped by a thinker; and they are not wholly unactual even then, at least if they could be grasped and so brought into action.¹

This all seemed very obscure to many philosophers, even some realists. I have to agree with Frege, though. While the details of his formulation may have been flawed, it seems obvious to me that any kind of realism about abstract entities is committed to the doctrine of a third realm, since abstract entities can be neither physical nor mental. If they were mental, they would be merely thoughts in a person's mind, which would mean that any statement about numbers or concepts or propositions would be a statement about the 'intuitions' or 'ideas' passing through a given person's mind at a given moment. To quote Frege: "If the number two were an idea, then it would have straight away to be private to me only. Another man's idea is, *ex vi termini*, another idea. We should then have, it might be, many millions of twos on our hands."² This is clearly absurd. Therefore, if we allow that the concept of two exists, it exists in a third realm. Similarly with all universals and propositions.³ Exactly what this theory *means*, though, is a question that will have to be postponed until later in the paper.

Historically, realism in the philosophy of mathematics was associated with logicism, viz., the attempt to reduce mathematics to logic. More specifically: "according to [Frege's version of] the logicist thesis, the laws of arithmetic and the rest of the mathematics of number are related to those of logic in the same way as the theorems of geometry are related to its axioms."⁴ Logicism and realism do not necessarily stand or fall together, though—which is good for realism, because logicism is generally thought to have failed. Still, realism faces difficulties. The objections that can be raised against it are similar to those that can be raised against Frege's "third realm". How should we understand the statement that numbers, or mathematical structures, exist independently of us? How do we acquire knowledge of them? Paul Benacerraf introduced the 'causal inertness' argument against realism (paraphrased by Maddy):

What makes ' $2 + 2 = 4$ ' true is the nature of the abstract entities 2 and 4 and the operation plus; for me to know that ' $2 + 2 = 4$ ', those entities must play an appropriate causal role in the generation of my belief. But how can entities that don't even inhabit the physical universe take part in any causal interaction whatsoever? Surely to be abstract is to be causally inert. Thus, if Platonism [or realism] is true, we can have no mathematical knowledge. Assuming that we do have such knowledge, Platonism must be false.⁵

This argument applies also to realism about *any* kind of abstract entity, not just numbers. All abstract entities are causally inert, since they do not exist in spacetime. Hence, it would seem that if we adopt the realist's point of view, propositions, for example, can play no role in our acceptance of them. But this is absurd, so realism must be wrong. There must be a better account of numbers, propositions and concepts than to say that they are mind-independent abstract entities.

Nominalist theories about numbers are of course analogous to such theories about properties and relations. But if numbers are not abstract entities, what can they be? The most widely accepted nominalist position has been formalism, which Quine describes as follows:

¹ Gottlob Frege, "Thoughts", in G. Frege, *Collected Papers on Mathematics, Logic, and Philosophy* (Oxford: Basil Blackwell, 1984); 351-72.

² Frege, *The Foundations of Arithmetic*, trans. J. L. Austin (New York: Harper & Brothers, 1953), p. 37.

³ I haven't read much about Fodor's representational theory of mind, but insofar as it identifies concepts with mental representations, it surely falls victim to Frege's criticism quoted above. See Eric Margolis and Stephen Laurence, "Concepts", *Stanford Encyclopedia of Philosophy* (Spring 2006 Edition), Edward N. Zalta (ed.), URL = <<http://plato.stanford.edu/archives/spr2006/entries/concepts/>>.

⁴ Stephen Barker, *Philosophy of Mathematics* (Eaglewood Cliffs, New Jersey: Prentice-Hall, 1964), p. 80.

⁵ Maddy, *op. cit.*, p. 37.

The formalist keeps classical mathematics as a play of insignificant notations. This play of notations can still be of utility—whatever utility it has already shown itself to have as a crutch for physicists and engineers. But utility need not imply significance, in any literal linguistic sense. Nor need the marked success of mathematicians in spinning out theorems, and in finding objective bases for agreement with one another’s results, imply significance. For an adequate basis for agreement among mathematicians can be found simply in the rules which govern the manipulation of the notations—these syntactical rules being, unlike the notations themselves, quite significant and intelligible.¹

Thus, not only are numbers not abstract entities; strictly speaking, “such questions as ‘What do the laws of number mean?’, ‘How do we know whether they are true?’, and ‘Do numbers exist?’ all evaporate and cannot even be asked, if the view of mathematical systems as nothing but formalized systems is adhered to. The formulas of such a formalized system do not mean anything, they are neither true nor false, they embody no knowledge and no claims about the existence of anything.”² But this is odd, to say the least. For one thing, it apparently implies that numbers are just *numerals*, i.e., the marks we make on paper. But that can’t be right; when we speak of the series of natural numbers, we aren’t talking about a series of notations we just made with a pen. We’re talking about something else, something more ‘abstract’. Moreover, it seems manifestly false to say that numerals are meaningless. Nor is it clear how mathematics could be as scientifically useful as it is if it were nothing but a “play of insignificant notations”.

Intuitionism is the third major school of mathematical philosophy. It is associated with the ontological theory of conceptualism, which states that abstract entities exist but are mind-made. In medieval times, this position was a popular attempt to deal with the problem of universals, but its support has dwindled since then. I haven’t talked about it because it isn’t very influential anymore—and also because, frankly, I have never really understood its analysis of universals. (For instance, I have often read that conceptualism holds that concepts exist only in the mind. But then how they are to be distinguished from subjective ideas and impressions is a mystery.) Be that as it may, intuitionism, which was developed originally by Brouwer, was inspired by Kant’s transcendental idealism. Its association with conceptualism derives from its Kantian thesis that “mathematical objects such as numbers and sets are abstract entities brought into being by thinking”.³ That is, the *intuition of counting* is supposed to be the source of numbers and sets. The process of doing mathematics is a process of creation rather than discovery: the mathematician, guided by certain logical constraints, *creates* mathematical truths.

This doctrine has dramatic methodological consequences. For instance, it has led to the intuitionists’ rejection of the law of excluded middle: a mathematical statement is not true or false independently of its proof or disproof; it is true if and only if it has been proven. Statements that have not hitherto been proven, such as Goldbach’s conjecture,⁴ are therefore neither true nor false. Also, intuitionists reject impredicative definitions, as well as Cantor’s important theory of transfinite numbers (because it relies on the intuitively ungraspable idea that an infinite number of mathematical steps has been completed)—and, indeed, much of classical mathematics is thrown out. It is not surprising, then, that the mathematical community has almost universally rejected intuitionism.⁵

The view that numbers are properties of external things was effectively criticized by Frege in his *Foundations of Arithmetic*,⁶ and I shall not repeat his criticisms here. The view that numbers are sets or classes has been useful in the philosophy of mathematics, but as we have seen, it conflicts with certain of our intuitions. Sets and numbers just do not seem intuitively identical. (Even analytically—i.e., by

¹ Putnam and Benacerraf, op. cit., p. 193.

² Stephen Barker, op. cit., p. 98.

³ Ibid., p. 72.

⁴ Namely, that every even number can be expressed as the sum of two prime numbers.

⁵ Cf. Ernst Snapper, “The Three Crises in Mathematics: Logicism, Intuitionism, and Formalism”, *Mathematics Magazine*, Vol. 52, No. 4, p. 211.

⁶ See §21 – §25.

comparing a list of their respective properties—numbers and sets can be distinguished from each other. For example, the set of all sets with two members—which is supposed to be the definition of 2—lacks certain properties that the number 2 has, and vice versa. 2 may be *extensionally* equivalent to this set, but intensionally it is not.)—In short, no matter what definition of number is offered, nor in what philosophical framework (the realist, the nominalist or the conceptualist)—and no matter what the nature of mathematical activity is held to consist in (whether in the discovery of abstract truths or in their *creation* or in the manipulation of meaningless symbols)—it seems subject to effective criticism.¹

I have yet to touch on the problems surrounding the nature of propositions. Above I stated, somewhat offhandedly, that if concepts exist then they must be abstract entities, and hence must exist in a third realm. I would say the same thing about propositions, on the basis of the argument I took from Frege. But there is another argument that appears to establish the mind-independence of propositions:

The proposition that there are rocks does not entail the existence of any beings that have or are capable of having mental states. It entails this neither in a strictly or broadly logical sense. That is, it is possible in the broadest sense for ‘there are rocks’ to be true in the absence of all mental states. But now, if this proposition is possibly true in the absence of mental states, then it possibly exists in the absence of all mental states, and so is mind-independent. This is an easy argument for the mind-independence of at least some propositions.²

“This argument seems to rule out any kind of conceptualism about propositions.” It is such an easy argument that many philosophers have been convinced there is something wrong with it; however, their attempts to invalidate it have not, as far as I know, been successful. Other philosophers have accepted it but have been so averse to platonism that they have thus been led to deny the existence of propositions. This position is not very plausible, though. As Matthew McGrath points out, it seems *obvious* that “beliefs have sharable objects which bear truth values”—i.e., propositions. ‘Snow is white’ must express a proposition because it has a truth-value, and only propositions have truth-values. So there would seem to be such abstract entities as propositions. On the other hand, the belief in abstract entities is, as we have seen, not free of difficulties. The Benacerrafian argument cited above is but one such difficulty.

In short, ontologists are in a muddle.

An attempt to think outside the box

I was at pains in the foregoing to ignore common sense—which is generally what one has to do when doing ontology. Contemporary philosophers, unconsciously aware of this, have made an art of ignoring common sense. They are also singularly bad at ‘thinking outside the box’. Let’s see if we can do any better.

The peculiar nature of abstract objects (or “entities”) is at the root of many problems. These objects seem both unavoidable and inexplicable. Our first task, then, should be to explicate them. A good place to start is Saul Kripke’s interpretation of Wittgenstein, as expounded in *Wittgenstein on Rules and Private Language*. My conclusion, briefly stated, will be that the confusion about abstract objects is an inevitable product of the paradoxical nature of ‘understanding’, which itself is grounded in the paradoxical nature of consciousness.

¹ There are a few theories I have not considered, among them conventionalism and fictionalism. But as I warned at the outset, I did not intend to give a thorough analysis of every ontological position. My purpose in this first section is to provide only a background.

² Matthew McGrath, “Propositions”, *Stanford Encyclopedia of Philosophy* (Spring 2006 Edition), Edward N. Zalta (ed.), URL = <<http://plato.stanford.edu/archives/spr2006/entries/propositions/>>.

I'll ignore the question of whether Kripke's interpretation of Wittgenstein is accurate. I happen to think that he gives Wittgenstein too much credit in attributing to him an overarching, coherent plan for the *Philosophical Investigations*¹—which has always seemed to me little more than a record of confused (albeit occasionally brilliant) gropings around thoughts whose main unifying thread is that they are intended to undermine the apparently natural and obvious world-view expressed by the *Tractatus* and hidden behind the incoherent prejudices of common sense²—but this is irrelevant. I am concerned only with the insights into what it means to 'understand' something.

Kripke's book is divided into two parts. In the first part he analyses what it is to understand and to 'mean' words and sentences. He concludes that there is no "fact of the matter" about what such understanding or meaning consists in. My knowledge of how I am supposed to carry out an operation like ' $68 + 57 = _$ '—i.e., my understanding of its meaning—is not a denotable fact, introspectively or extrospectively accessible; it is *sui generis*. It cannot be reduced to some such fact as my behavior or the nature of my intentions; it exists neither in my consciousness nor outside it. This is paradoxical because its existence seems obviously inferable from my behavior: I am said to understand the proposition above because I know how to complete it, namely by writing '125' after the '=' sign. So, *obviously* I understand it! But then, where *is* my understanding? It is nowhere. Therefore, there can be no understanding (or, said differently, "there can be no such thing as meaning anything by any word"³).

But this is absurd. The paradox must be resolved. Kripke undertakes its resolution in the second part of his book. Since he has effectively shown that language is impossible given our common understanding of meaning, he must revise our understanding in order to account for the meaningfulness of language. Now, common sense takes the meaning of a sentence to be the truth conditions of the proposition expressed by that sentence. For example, because 'Snow is white' is true if and only if snow is white, the meaning of 'Snow is white' must *be* precisely that snow is white!—i.e., the truth conditions of the proposition. Indeed, it seems as if this Fregean/Tractarian account of meaning scarcely needs to be argued for, it's so obvious. Nevertheless, it must be wrong, because it is what got us into all the trouble in the first place. Our conclusion that assertions are meaningless was based on two premises: "facts, or truth conditions, are of the essence of meaningful assertion",⁴ and there are no facts about what is asserted (or understood). In order to reject the conclusion, we must reject one of the premises. We cannot reject the second, because Kripke's arguments have established it; therefore we must reject the first. This means that the truth conditional analysis of meaning is mistaken. Kripke replaces it with an analysis based on "assertability conditions": an utterance has meaning if and only if it has been uttered under the right circumstances, or in the right "language game". Truth conditions have nothing to do with meaning. Given this new theory of meaning, we can answer the skeptic as follows: "In a sense, you're right that there is no fact about a person in virtue of which he means one thing rather than another by a given utterance. But in another sense, made possible by our new theory of meaning, you're wrong. A person means, say, addition if and only if the community to which he belongs judges that he is following the rules for addition correctly. His use of language is always subject to correction by the community. Communal linguistic practice is what determines the meaning of any utterance, in that the meaning is whatever the community agrees on."

—That's the book in a nutshell. I disagree with much of it, and I'll explain why shortly. But first I have to embellish a few points. The question whether a given statement has meaning or is understood correctly is closely related to the issue of rule-following, because to participate in language is to follow rules (syntactical, semantic, etc.). When I write the equation ' $68 + 57 = 125$ ', I am following mathematical

¹ In fact, I think that philosophers in general give Wittgenstein too much credit. He wasn't some sort of semi-divine thinker with a mystical insight into truth. If the *Philosophical Investigations* doesn't prove that, the *Remarks on the Foundations of Mathematics* does.

² To clarify my opinion of common sense: there's the good kind and the bad kind. The good kind, which philosophers no longer heed, militates against intellectual perversity. The bad kind is mankind's common stock of wisdom. I.e., it's a collection of idiocies.

³ Saul Kripke, *Wittgenstein on Rules and Private Language*, (Oxford: Basil Blackwood, 1982), p. 55.

⁴ *Ibid.*, p. 77.

rules, in particular the rule of addition. The skeptic's argument can be restated in this way: rule-following presupposes that there are ways to check whether the rule is being followed correctly. There must be criteria relevant to determining what counts as 'following the rule correctly'; otherwise the notion of following a rule does not make sense (because if there are no criteria then the rule can be 'followed' in whatever way one wants to follow it, which of course would mean that one is not following the rule). As Wittgenstein says, "To think one is obeying a rule is not to obey a rule. Hence it is not possible to obey a rule 'privately'; otherwise thinking one was obeying the rule would be the same thing as obeying it" (*Philosophical Investigations*, §202). The skeptic, however, says that there are no criteria relevant to determining whether I have done an addition problem the right way, or whether I have understood a proposition the right way. I just go ahead and do the problem, automatically and blindly, following only my own sense of certainty. The same is true when, for example, I say that a given patch of color is green. I am not following any criteria; I am simply, as it were, doing what I feel like doing, while feeling sure, somehow, that I'm doing the right thing. Here again Wittgenstein says that "whatever is going to seem right to me is right. And that only means that here we can't talk about 'right'" (§258)—i.e., that we can't talk about following a rule. There is no "fact of the matter" about wherein my rule-following consists. This means we can't talk about speaking a language, which means we can't talk about *understanding* a language, or about the language's having any meaning. Thus we arrive at the skeptic's conclusion via an alternative route. (The solution to the paradox, of course, is that it is not possible to follow a rule privately. The criterion for rule-following is communal agreement that the rule has been followed correctly.)

Let me return to the phenomenological aspect of the paradox. This is the most direct and intuitively disturbing way to approach it, because it assaults our most deeply held beliefs and intuitions about what the activities of consciousness consist in. To quote Kripke:

This, then, is the skeptical paradox. When I respond in one way rather than another to such a problem as '68 + 57', I can have no justification for one response rather than another.there is no fact about me that distinguishes between my meaning a definite function by 'plus' (which determines my responses in new cases) and my meaning nothing at all.

Sometimes when I have contemplated the situation, I have had something of an eerie feeling. Even now as I write, I feel confident that there is something in my mind—the meaning I attach to the 'plus' sign—that *instructs* me what I ought to do in all future cases. I do not *predict* what I *will* do....but instruct myself what I ought to do to conform to the meaning.But when I concentrate on what is now in my mind, what instructions can be found there? How can I be said to be acting on the basis of these instructions in the future?What can there be in my mind that I make use of when I act in the future? It seems that the entire idea of meaning vanishes into thin air.¹

The point behind all this is that it's possible—indeed, necessary—that in the very same moment I have perfect understanding of what I'm doing (viz., adding) and yet I *don't*. My understanding is both fully conscious and *not* conscious, in that it cannot be 'pointed to' in my mind. I just—*act*, seemingly without justification, yet with absolute certainty that I'm justified.

Where I disagree with Kripke is in his argument about "quaddition". This is his main argument in support of the skeptical paradox, but it seems to me neither necessary nor convincing. The *quus* function is an artificial mathematical function that Kripke invents for the sake of argument. This is how he defines it:

$$\begin{aligned} x \text{ quus } y &= x + y, \text{ if } x, y < 57 \\ &= 5, \text{ otherwise} \end{aligned}$$

¹ *Ibid.*, pp. 21, 22.

In other words, if x and y are both less than 57, the '+' sign is to be interpreted as we normally interpret it, namely as denoting the additive function. But if x or y is greater than 57, then the '+' sign changes its meaning: it now means that the outcome of the operation is 5.

Kripke argues that there is no way for me to know whether I mean plus or quus when confronted with a mathematical equation in which the '+' sign occurs. This applies to both the past and the present: I cannot know what I meant in the past nor what I mean right now. Perhaps I have meant quaddition all along. The point here is not that memory is unreliable; this has nothing to do with the paradox. Even if I have perfect memory of my past intentions and actions, I cannot be certain that I have always understood plus by '+'. Kripke asks, "What is the fact about my past usage that refutes the possibility that I meant quus rather than plus?"¹ Moreover, what is the fact about my *present* usage that refutes the possibility that I mean quus? There is none, he says. I may mean quus even without knowing it!

Now, I may just be obtuse (this is indeed a possibility), but I don't see what all the fuss is about. The 'quus' possibility is refuted by the fact that at no time when writing out the equation, for example, ' $13 + 25 = 38$ ' do I think to myself "Because 13 and 25 are both less than 57, I have to interpret '+' as meaning plus". I'd have to *think* this in order for quus to be a possibility. Because I have never thought about quus, as I have thought about plus (many times), I have never meant quus. Kripke doesn't even consider this answer to his skeptical question, despite its unbelievable obviousness. This leads me to think I may be misinterpreting him. But I can't see how: nothing I've read in the text justifies a more charitable interpretation. So I suppose this was simply a bizarre lapse in his thinking.

I also disagree with the argument that we cannot be said to be following a rule when doing, say, an addition problem privately, or when judging that a given patch of color is blue, because I think there *is* a criterion in these cases. Kripke writes that "the basic point [is] that I follow rules 'blindly', without any justification for the choice I make".² Also: "The entire point of the skeptical argument is that ultimately we reach a level where we act without any reason in terms of which we can justify our action. We act unhesitatingly but *blindly*."³ This blindness is supposed to imply that private rule-following is impossible. And, in a sense, Kripke is right: we *do* act blindly, or 'automatically'. But this by no means entails that we lack justification for our action. The reason it seems to is that Wittgenstein and Kripke formulate the issue in terms of *choice*: we are said to *choose* blindly. And a blind choice, of course, is an arbitrary and unjustifiable one. But the fact of the matter is that when using language (be it mathematical or any other kind) we do not choose how we act. Our action is *forced* on us. It simply 'comes' to us that $2 + 2 = 4$ and that a given spot of color is red and that a given sensation is called 'pain' and that the right grammatical form of a given sentence is so-and-so. The criterion for our rule-following is that we *cannot act any other way*—i.e., that we are *unable to choose* what seems right to us. Because we can't even conceive of an alternative, we're certain that we're right in our rule-following.

In other words, while Wittgenstein is right that a rule necessarily guides us, he is wrong to think that when we act 'privately' we are not being guided. We *are*, though not in the 'choice' we make; rather, in the range of possible choices that is laid out for us. And there *is* no range: when we see a plus sign, we have no choice in the matter of how to interpret it (unless, of course, we self-consciously stipulate that it will not mean addition—but in this case we know we are flouting the rule). This is why we can speak of 'right' here, why there is, in a sense, a fact of the matter. We know we are following a rule because we sense that whatever seems right to us will *not* necessarily be right. It has to be *forced* on us first. The feeling of rightness has to be involuntary.

Thought-experiments have been proposed to show the untenability of any kind of 'inner feeling' as a criterion. A common strategy is to say that, for all we know, we are "under the influence of some insane frenzy, or a bout of LSD",⁴ and thus misinterpret our own consciousness. But there is something odd about this argument. I'll pass over the fact that we should be suspicious of any argument in support of a

¹ Ibid., p. 9.

² Ibid., p. 81, footnote 70.

³ Ibid., p. 87.

⁴ Ibid., p. 9.

Wittgensteinian idea that Wittgenstein himself would have considered ridiculous.¹ Instead, I'll point out that anyone who has actually been insane or under the influence of LSD or marijuana or any other mind-altering drug will know that his consciousness during these episodes is radically different from his ordinary consciousness. It's so different that, practically speaking, it is *not* a possibility that when we experience the 'lucid', 'objective', 'rational', 'clear-headed' state of mind that is called ordinary we are actually experiencing some sort of insane frenzy. Hence this argument is not persuasive. It does remind me, however, that I should be careful in how I formulate my ideas. Instead of invoking only the feeling of 'involuntarily being guided', which, after all, can exist in some strange way even when one is under the influence of a drug, I should adduce also the 'lucidity' with which this feeling coexists in the ordinary, non-drug-stuporous consciousness.

In any case, we have to distinguish between following a rule and *correctly* following the rule we *think* we're following. I may have made a mistake in a calculation even though I feel sure I haven't, but I am nonetheless justified in believing that I was following a rule while doing the calculation, because I did not say to myself something like, "Okay, $93 \div 75$? Ehh, what the hell, let's say 6." In that case I would not have been following a rule. But because the calculation 'guided' me, albeit incorrectly—and my consciousness was not of the drug-stuporous kind—I was following some sort of rule. Still, it may be objected that we need a criterion for *correct* rule-following; Kripke argues that communal approval (of an individual's linguistic practice) can be the only such criterion. The individual himself cannot privately check whether he has followed a rule correctly (even though, as we have seen, he *can* 'check' whether his actions were rule-governed). –But why not? Indeed, that statement has very odd implications. Consider:

[The following are] rough assertability conditions for such a sentence as "Jones means addition by 'plus'." *Jones* is entitled, subject to correction by others, provisionally to say, "I mean addition by 'plus'," whenever he has the feeling of confidence—"now I can go on!"—that he can give 'correct' responses in new cases; and *he* is entitled, again provisionally and subject to correction by others, to judge a new response to be 'correct' simply because it is the response he is inclined to give.²

In other words, if I say that $2 + 3 = 5$, I have to patiently wait for you to decide whether that's right. My certainty is only provisional. Suppose you're busy doing something else; the longer you keep me waiting, the more unbearable will be my doubt that I've carried out the operation the right way. Finally you come over and look at the equation and say, "Yes, that's right", and I heave a sigh of relief—because, according to Kripke, I was not entitled to judge that I had given the right answer until you agreed with me. –And that's just weird.³

On the other hand, there *is* something compelling in the objection that one's own private certainty is not enough to establish that one has followed a rule correctly. The reason, of course, is that people have been known to be wrong from time to time. So we find ourselves torn between two intuitions: the intuition that certainty *is* a sufficient criterion for correctness in cases like $2 + 3 = 5$, and the intuition that certainty is *not* sufficient in other cases. Said differently: in some cases it is acceptable to say, "I just *know*!" in answer to the question "How do I know I'm right?", while in others it is not. The question naturally arises, then, "Where is the boundary between these two categories?" There does not seem to be a clear boundary, however, which should lead us to think that this whole formulation of the problem is wrong.

I'll try approaching it from a different angle. I have already noted my disagreement with the quus argument. This means that I *can* know I don't mean the quus function. I mean the plus function. But what

¹ He did not have much sympathy for these kinds of skeptical thought-experiments, involving 'possibilities' that we're insane or drugged-up or dreaming or aliens on another planet or what have you.

² *Ibid.*, p. 90.

³ It is also, ironically, not very Wittgensteinian. Wittgenstein would ask "What would it be like to doubt that $2 + 3 = 5$?" Since a substantive doubt is inconceivable here, he would disagree with Kripke that one's feeling of confidence is provisional. Therefore, Kripke's whole interpretation of Wittgenstein must be flawed in some way.

is this? The skeptic is right that there are no instructions in my head with which the plus function can be equated; there is, rather, simply an awareness that $2 + 3 = 5$, and $7 + 8 = 15$, etc. But this absence of instructions that can justify my belief that $2 + 3 = 5$ does not mean there is no such thing as addition, nor that I have no understanding of it. If we reformulate the mathematical proposition we can get a clearer understanding of it: ' $2 + 3 = 5$ ' is a restatement of $|| + || = || ||$. It is, in a way, a tautology, in that it equates $|| || ||$ with $|| || ||$. The reason there are no instructions in my head is that the plus function is too 'primitive' to admit of being analysed into a list of instructions. The same is true of multiplication, division and subtraction. It may indeed take a while to find the solution of, e.g., $210 \div 39$, but this does not mean that the division function *itself* is some kind of complicated 'composite', some list of instructions. My understanding of it is unanalysable because the function cannot really be reduced to anything.

So, strictly speaking, the criterion for the correctness of one's claim that $2 + 3 = 5$ is not one's certainty; it is that ' $2 + 3 = 5$ ' can be analysed into ' $|| + || = || ||$ ', which is self-evident. It would not make sense to seek a criterion for the correctness of *that* proposition (i.e., a criterion for the truth of the judgment that one is correctly following the rule of addition).¹ Therefore, private rule-following is possible.

To clarify all this: because I have rejected the quus argument, I can reject Kripke's rejection (on page 13) of the suggestion that the main skeptical question (the question that leads to the repudiation of private rule-following) can be reformulated as "How do I know that $68 + 57$ is 125?" Since I have reformulated it this way, I can re-reformulate it as the question of what justifies my certainty. And the justification is that the proposition can be restated in a form that is even more self-evident than the form that relies on Arabic numerals (namely, the ' $|| + || ||$ ' form). At this point we have to stop inquiring further—by asking, for example, why the new proposition is self-evident. It just is. (As Wittgenstein said (*PI*, §1), explanations must come to an end somewhere.)

But what about statements in which a sensation or a spot of color is named? What criterion do we have for their correctness? In the case of the private individual, there is none. To justify them, he can invoke only their self-evidence. Ultimately he'll have to stand trial before the tribunal of communal judgment. But surely it speaks in favor of the possibility of private rule-following that 99.9% of the time, the community will agree with him. (There may be some slight doubt with regard to borderline cases, in which, say, one person considers a spot to be red while another considers it pink, but in these cases the correctness of the rule-following is not in question. Indeed, it is not obvious that there *is* a 'correct answer' here. This fact may be of significance, but I don't think its significance bears on the question of whether rules can be followed privately.)²

These issues and related ones could be dissected for many pages, but I have already strayed too far from the subject of this paper. I think that, in the end, Kripke's book is incoherent, but I'll pass over its other problems³ and get to the main point: the rejection of the truth conditional analysis of meaning is wrong. For one thing, we have seen it to be unnecessary: there *is* a fact about what I mean by a given utterance such as $2 + 3 = 5$. For another, it defies common sense. If I say, "The house is on fire", I mean that the house is on fire. I.e., my meaning is the relevant truth conditions. Nevertheless, as I said above, I agree with a *version* of Kripke's skeptical paradox, a watered-down version. While I think that sentences

¹ Admittedly, one could explain the proposition's truth by lining up both sides of the equation in a one-to-one correspondence (which, of course, is what we have already implicitly done by equating the two sides). But then there is no 'criterion' for the truth of the statement that they have a one-to-one correspondence. It's just self-evidently true. So at some point we have to stop looking for a criterion other than 'self-evidence'.

² For an alternative and, I think, more plausible interpretation of Wittgenstein's private language argument, see Norman Malcolm's paper "Wittgenstein's *Philosophical Investigations*", in Harold Morick ed., *Wittgenstein and the Problem of Other Minds* (New York: McGraw Hill Book Company, 1967), pp. 45 – 81.

³ There are many. For instance, Kripke cannot account for communal agreement in rule-following. If there is no fact about what addition is, why do we do addition problems in the same way? Consider (p. 97): "We cannot say that we all respond as we do to ' $68+57$ ' because we all grasp the concept of addition in the same way, that we share common responses to particular addition problems because we share a common concept of addition.There is no objective fact—that we all mean addition by '+', or even that a given individual does—that explains our agreement in particular cases." Aside from being fairly preposterous, this position leaves it a mystery as to why we would agree.

have meanings (viz., the truth conditions of the propositions they express¹), our understanding of them is an obscure phenomenon, conscious yet unconscious. Understanding can be neither a sensation in consciousness—nor a *fact* in consciousness, because *where is the fact?*²—nor merely behavioral. To make the point in a catchy aphoristic style reminiscent of Wittgenstein: while we understand sentences, we don't understand our understanding. It is *sui generis*, a half-nonexistent—half-behavioral and half-conscious—state. Any person with an iota of introspective skill should see this. Moreover, I can appeal directly to “the master” himself: in a number of sections in the *Philosophical Investigations* he grapples with the question of what understanding could possibly be. His not finding an answer corroborates my idea.

As it happens, I think that this ‘paradox’ is merely a manifestation of a much broader paradox grounded in the nature of consciousness. I won't delve into it deeply, but I will say that its essence is the fact—articulated first by Fichte³ (or maybe Kant), then Hegel,⁴ then Kierkegaard,⁵ then Marx,⁶ then Sartre⁷ and the existentialists—that human consciousness is a self-negation, a self-difference, a relation to itself. Human consciousness is self-consciousness, i.e., consciousness of consciousness, and is, moreover, always focused on an object (whether the object be itself or something else), which means it is always transcending itself, which means it is never just *itself*. It is never simply identical to itself; it is, rather, in continuous contradiction with itself. Thus, it is both a frenzied activity, a ‘fullness’, and an emptiness, a nothingness.⁸ This paradoxical nature is the origin of the fact that consciousness *itself* (and not merely understanding, as I argued above) is not ‘locatable’, not denotable or ‘able-to-be-pointed-to’, but rather a mysterious non-present presence. A substanceless substance.

Now, abstract objects share this quality. Intuition interprets them as ‘substantive’ in some way, though at the same time it denies them substance. Any concept is an example. The concept of ‘2’: when contemplating it, one cannot help feeling as if there's *something there*, some ‘abstract content’ that does

¹ Maybe the reader will adopt the Austinian view and argue that performative utterances must be distinguished from constative ones. The ‘truth conditions’-analysis of meaning, he'll say, is not appropriate for performative statements, only (perhaps) for constative ones. He'll say that the meaning of the former is the *role* they play in social interactions. The meaning of “I love you!”, uttered in a moment of passion, is not the sentence's truth conditions, but its role, or its function (viz., to express an emotion). This view hearkens to Wittgenstein's theory that meaning is *use* (or “assertability conditions”, or the statement's role in a language-game, or whatever). But I've always found these ideas confused. While Austin's distinction is useful, to say that a sentence's *meaning* is something like a “role” in a “language-game” makes no sense. The meaning of “I love you!” cannot be stated as “Expression of emotion!” Rather, the meaning is the truth conditions—namely that *I love you*. Thus, a statement's role is different from its meaning. – Still, one might object that the speaker's purpose is not to state the proposition which is expressed by the sentence ‘in itself’ (together with the context in which it is spoken—because context is relevant to a proposition's meaning. See the footnote in which I mention the “problem of egocentricity”), but rather to perform an act. “I now pronounce you man and wife”, said at a wedding, can indeed be understood as stating a proposition with a given truth-value, but that is not its role in the language-game. –But I don't deny this. I am concerned not with the *speaker's purpose* but with the meanings of declarative sentences in abstraction from the language-game in which they are spoken; that is, the meanings of the sentences ‘in themselves’. Since declarative sentences posit truth conditions by virtue of their form, their meanings must be directly related to these truth conditions.

² And yet, of course, it *is* a fact in consciousness. It must be, because by definition it is a conscious state.

³ See his *Wissenschaftslehre*.

⁴ See, for example, *The Phenomenology of Spirit*.

⁵ See Section A in the first chapter of *The Sickness unto Death*.

⁶ See *The Economic and Philosophical Manuscripts*, specifically “A Critique of the Hegelian Dialectic and Philosophy as a Whole”.

⁷ See *Being and Nothingness*.

⁸ Its nature is at once infinite and yet ‘self-limiting’. The Ancient Greeks, who defined being as a kind of self-limiting, would therefore have considered self-consciousness to be the being *par excellence*. Their term “*parousia*”, which is usually misleadingly translated as “substance” but signifies rather a “self-enclosedness”, a “standing presence”, and which they understood as the essence of being, would apply to self-consciousness. And yet self-consciousness is also an emptiness. Hence the paradox. Cf. Martin Heidegger, *An Introduction to Metaphysics* (New Haven: Yale University Press, 1959), p. 61.

not quite let itself be grasped. Say the word to yourself several times and examine your consciousness as you do so. If you have a knack for introspection, you'll notice that you feel as if you can almost 'reach out and touch' the concept, as if you can point to it. "It's *right there!*" 'Dog', or 'dogness', has the same unsettling, elusive, half-concrete half-illusory feel. So does the proposition "The dog is running". If you contemplate that sentence, reflect on the 'eternal', 'objective' yet strangely ungraspable nature of its propositional content—you'll be nonplussed.

Since the platonic "third realm" is necessarily the home of these abstract objects, it is closely related to the paradox I am discussing. But before I elaborate on that, I should dispose of traditional arguments in support of the claim that there are no abstract objects.¹

Carnap considered such questions as "Are there numbers?", "Are there relations?", and "Are there properties?" to be pseudo-questions.² I agree, though not with his reasons. He divided ontological questions into two categories: internal and external. By "internal" he meant *internal to a given linguistic framework*. An example of this kind of question would be "Is there a number x such that $x + 13 = 13$?" This is substantive and answerable, because it presupposes the linguistic framework of numbers and asks whether there is something within this framework that satisfies certain criteria. On the other hand, there are questions that effectively call into question entire linguistic frameworks, though they seem to be about the existence of entities. The three questions asked above are examples. They are not substantive, because while they are supposed to be questions of fact—"Are there *really* numbers?"—they in fact merely call for a decision, namely, the decision whether to adopt a given linguistic framework. So they are trivial: "Yes, there are numbers if you adopt that framework, because—you've adopted the framework of numbers! If you choose not to, then there are *not* numbers." In other words, all questions are necessarily internal to certain linguistic frameworks; but ontologists think they are asking *external* questions, and so their questions do not have the meanings they are thought to have.³

My disagreement with this account stems from my skepticism about the idea of linguistic frameworks. First of all, I don't think they're explanatorily necessary. We need not posit a specific "framework" for speaking about, say, properties, because in any language, talk about properties is unavoidable. Surely no separate "framework" need be introduced in order to speak about properties, because in nearly every sentence, some kind of property is spoken of. Moreover, what would count as 'inside' and 'outside' a given framework? How would one know when one had stepped outside the 'properties' framework, or stepped back inside it? What *is* a framework? Thirdly, the implication is odd that a decision can be made about whether to adopt a certain framework. One cannot just choose to reject numbers, in the sense of *not even recognizing that people talk about them*. If one understands what someone means by '2', then one has already 'decided' to adopt the numbers framework. But of course no decision is involved here; acceptance of numbers (in this not-necessarily-abstract-object sense) is natural and necessary. Fourthly, I think that certain ontological questions *are* substantive—or, at any rate, there is at least one such question: "Do physical objects exist?" That is, "Do the objects we perceive exist independently of us, or are they merely 'in our minds'?" Carnap's theory is not nuanced enough to allow that some ontological questions are substantive while others are not. Lastly, the association of Carnap's theory with his conventionalism makes me suspicious of it, since I find conventionalism a very implausible doctrine. It may be that the two theories are logically separable, but—anyway, I'm suspicious.

My own argument is simply that it makes no sense to reject abstract objects on the basis of traditional nominalistic arguments. Such a rejection reminds me of Richard Rorty's asinine denial of sensations, and his argument that we think they exist only because "elimination [in language] of the referring use of 'sensation' would be in the highest degree *impractical*."⁴ Behaviorism and nominalism: two extremely confused and tellingly similar doctrines. Penelope Maddy quotes with approval this

¹ I say "traditional" because, as will be seen, I think the conclusion is true *in a sense*.

² See his article "Empiricism, Semantics and Ontology", in Putnam and Benacerraf, op. cit., pp. 233 – 248.

³ Cf. Thomas Hofweber, "A Puzzle about Ontology", pp. 24, 25.

⁴ Richard Rorty, "Mind-Body Identity, Privacy, and Categories", in *Modern Materialism: Readings on Mind-Body Identity*, John O' Connor ed. (New York: Harcourt, Brace & World, Inc., 1969), p. 153.

“stunningly simple counter-argument” to the belief in universals, taken from Quine: “We want to say that Ted and Ed are white dogs. This is supposed to commit us to the universal ‘whiteness’. But for ‘Ted and Ed are white dogs’ to be true, all that is required is that there be a white dog named ‘Ted’ and a white dog named ‘Ed’; no ‘whiteness’ or even ‘dogness’ is necessary. [Therefore we need not invoke universals.]”¹ Maybe I’m confused, but it seems to me that Quine and Maddy have overlooked the fact that they just used the concepts ‘whiteness’ and ‘dogness’, namely by saying that Ted and Ed are white dogs. ‘White’ and ‘dog’ are concepts; one does not suddenly change their essence by adding ‘-ness’ at the end. With or without the suffix, we’re dealing with concepts, which means we’re dealing with things that are neither physical nor mental. I have already explained why concepts cannot be mental entities; if the reader would ask why they cannot be physical, I would—not know how to respond. I might note that Frege considered the view that they are physical to be so obviously wrong that he didn’t even mention it. Or I might note that the dog I see in front of me is not the same thing as the concept (or, if the reader is allergic to that term, the ‘word’) I apply to him, viz., ‘dog’. This word can apply to many objects, many particular dogs; therefore it is a “universal”, and an abstract object. A universal is nothing but a word, or a concept, that ranges over many entities;² and surely it will not be denied that there are such words. ‘Red’, ‘dog’, ‘number’, ‘large’, etc. To be horrified by the “prodigiously teeming Platonic Heaven”³ to which this acceptance of universals apparently leads is a rather strange reaction, because it is effectively a horror at the existence of words. And where would philosophers be without words?! (Maybe in Diogenes’s barrel, since they certainly couldn’t earn a living.)

I’ll consider shortly the problems that nominalism is supposed to resolve. For now, I merely want to point out how unjustifiable it is to deny abstract objects on the basis of arguments like the foregoing: in doing so, one is really denying words, because words are concepts⁴ and concepts are abstract objects (because they can be neither mental nor physical).

So: to say there are words and to say there is a third realm are essentially the same thing. But what does this mean? It means that concepts and propositions—or, in general, the “senses” of sentences (to quote Frege)—are objective but not physical. (They cannot be subjective, as Frege argued.) Their objectivity is what makes communication possible. But what is this objectivity? This question has two answers: the platonic and the phenomenological. The platonic, however, is not really an answer, but a restating of the question. The platonist is content to define abstract objects negatively, as *not* physical and *not* mental. He cannot say what they are *positively*, because humans can have no conception of something that exists outside space and time. Therefore the platonist says that concepts exist in a third realm and leaves it at that, without telling us what that means. The phenomenological answer, on the other hand, is the truly explanatory one: the objectivity of propositions (and concepts) is in a position analogous to that of understanding. As understanding is phenomenologically both present and absent, so is the objective meaning of propositions. In order for them to *have* a meaning, of course, it must be accessible, in some way, in consciousness, because otherwise people could not communicate (they would not know the meanings of utterances), and language would have no purpose.⁵ Nor does it make much sense to say that words have a meaning outside consciousness—outside of how they are interpreted by consciousness. Whatever meaning they have must somehow be in consciousness. Moreover, it must be in the consciousness of every person who competently uses the language, because, since objective meanings (rather than subjective ideas associated with them) are what make communication possible, anyone who communicates

¹ Maddy, *op. cit.*, p. 13.

² I’ll address the question of uninstantiated universals later.

³ Goodman, *op. cit.*, in Putnam and Benacerraf, *op. cit.*, p. 200.

⁴ To be precise: words ‘incorporate’ concepts. In Saussurean terminology, a word is a union of the signified and the signifier, or the concept and the “sound-image”. See Saussure’s *Cours de linguistique générale*.

⁵ Kripke and Chomsky and others have demolished the behaviorist analysis of meaning in terms of “dispositions” and whatnot. Meaning must be accessible *in consciousness* for it to be meaning. [That’s debatable. Chomsky, who understands the importance of unconscious cognitive structures, would likely disagree with it.]

must have access to these meanings. Now, we have seen that a proposition's meaning is its truth conditions.¹ Hence, an awareness of the truth conditions is what is half-present when someone understands a proposition.² This awareness is *all that exists* of the ("abstract") truth conditions, i.e., the objective meaning, i.e., the abstract object. The meaning "in itself"—whatever that phrase means—does not exist, because whatever exists exists in spacetime. Therefore, the "third realm", and abstract objects, and concepts, and propositions, and words, are all myths, albeit necessary ones.

I am inclined to think that the phenomenological impetus behind platonism is the obscure nature of understanding (i.e., of linguistic and propositional meaning³). This obscurity is especially noticeable with regard to isolated concepts. As I noted above, when I say 'tree' slowly while concentrating on the mental state that accompanies the act, I am tempted to believe that the word has more abstract content than I can phenomenologically grasp. It has an objective conceptual content, of which my understanding (of the word) is but a shadow. Its *full* content lies somewhere else, somewhere outside of me, in some eternal Paradise of logical forms. It isn't hard to believe that Plato and Frege and other realists were led to posit a third realm partly by virtue of some unconscious mechanism relating to the peculiar phenomenology involved in understanding concepts and sentences.

Be that as it may, their hypothesis was not only psychologically natural but epistemologically necessary, in that it is a presupposition of the belief in words, which are themselves a necessary condition for highly evolved communication. Without the belief that 'tree', no matter how often it is used, is always the same word, language would have no consistency; it would be so variable as to be useless. It could not even be learned in the first place. Any given sound-image, such as 'tree', must develop a fixed significance in consciousness for it to be of use; this significance is what leads people to posit a thing called 'the word's meaning', which is nothing but the abstract object, or the concept, which the sound-image is supposed to designate. In other words, *everyone*, even the dumbest person on the street, as well as nominalists, implicitly believes in a reification called 'abstract objects', because everyone believes in words and words incorporate such objects. Strictly speaking, however, words do not exist, because (1) all existents are in spacetime, as words are not (though the sound-images are), and (2) no single 'significant sound-image' (such as this particular meaningful mark: 'tree') is ever used twice. Each meaningful sound-image is unique; no two are ever the same, even 'tree' and 'tree'. They look and sound the same, and we interpret them as having the same significance, but they cannot be called instantiations of a single word because the notion of an abstract object is impenetrably obscure.

What I have said about words applies also to propositions. Whenever we utter a proposition we are positing its objectivity, its truth, its abstractness. This is because language necessarily *refers* [or represents]: a proposition posits a reference (viz., its truth conditions), and since the reference is always 'fixed' (unchanging), it must be abstract. (After all, nothing concretely existing is ever *fixed*. Things change in every instant, whether through movement, through destruction, through birth, or whatnot.) This referential [or representational] character is also why we are psychologically incapable of interpreting concepts as

¹ The 'truth conditions' analysis in itself does not provide a satisfactory account of interrogative statements or imperatives. But I think it could be extended to do so. For truth conditions give a kind of 'picture' (in a sense similar to that in which the early Wittgenstein used it in his theory of meaning); and I think that a 'picture'-oriented theory of meaning could potentially do justice to imperatives and interrogatives. I also think it could elucidate the problems of synonymy ('How is synonymy possible? What does it mean?').

² Lest I be misunderstood: it isn't that a person only half-understands any given proposition; rather, his *complete* understanding is unanalyzable. It is neither perceptible (in the manner of sensations) nor spatially qualified. It is just mysteriously *there*. Thus, I say in this paper, somewhat misleadingly, that it "half-exists".

³ Many philosophers think that linguistic meaning should be differentiated from propositional meaning. This is because of what Russell called "the problem of egocentricity". (See his paper "Mr. Strawson on Referring".) The sentence "It is raining now" has the same linguistic meaning no matter where it is uttered, but if I say it in St. Louis and then say it in New York, its propositional content seems to change (for it may be true in St. Louis and false in New York). While this argument seems powerful, there are others that undercut it. I cannot discuss them now, though; suffice it to say that a declarative sentence's linguistic meaning is not unrelated to truth conditions.

mere ‘names’, or empty ‘classes’ devoid of conceptual content: in referring, language is saturated with an objective character.

So, the way we (necessarily) use language entails that there are abstract objects, but there are not, so our use of language is deluded. In other words, to believe that communication is possible we must ‘half-consciously’ believe in abstract objects—because otherwise, so it seems, all we have are ideas “private to me only. Another man’s idea is, *ex vi termini*, another idea. We should then have, it might be, many millions of twos on our hands.” If humans are to understand each other, a *universal sense* must inhere in a given word or sentence. When using words we automatically interpret this sense as being an abstract object, but in reality it is merely the fixed significance attached to a given type of sound-image in the minds of people who speak the same language. Evidently the human mind is such that this sort of universal consistency in understanding is not only possible but necessary. Thus, there is only *one* concept ‘2’ because every person’s immediate intuition of that sound-image is qualitatively the same (both between people and between times in one person’s life)—and, moreover, the ‘meaningful sound-image’¹ has a referential character, as do all words (though not in as intuitively obvious a way as propositions do)—and therefore the sound-image is inevitably taken to denote a given abstract entity. Epistemologically speaking, though, we need not invoke abstract entities in order to account for communication²; it is enough that humans have consistently similar understandings of each ‘type’ of sound-image (such as the type ‘tree’).

In short, both nominalism and realism have elements of truth. Nominalists point out that if concepts do not exist in spacetime they do not really exist. Realists, on the other hand, realize that to deny the existence of concepts is a flagrant violation of common sense, since people use concepts all the time. So, they are right to emphasize (unknowingly) the elusive phenomenological abstractness/objectiveness of words and sentences—but they are wrong to turn it into a mind-independent thing. And yet their doing so is perfectly natural, since in everyday life we half-consciously believe³ in abstract objects, due to the referential character (and ultimately the ‘truth conditions’ analysis) of language. Indeed, the reader will notice that, given my ideas, I cannot help contradicting myself at every turn: in using ‘meaningful sound-images’ (like the ones on this page) I cannot help ‘assuming’ that each is an instantiation of a *word*, which I have argued is an illusion. But insofar as one uses language, one falls victim to this illusion.

Therefore, such questions as “Are there properties?” are misguided. They have two answers: the trivially true and the trivially false. That is, there are properties insofar as we talk about them and can intuitively see that their existence is self-evident. But if we then ask, “Do they *really* exist, though? Are there *abstract objects*?”, it is unclear what is meant. Since the only conception we have of real, mind-independent existence is spatiotemporal, yet abstract objects are by definition not in spacetime, the answer to this second question must be that their existence is trivially false. Or else that the question is absurd and empty. Platonists, admittedly, think that abstract objects are explanatorily necessary, but we have seen that this is wrong. It is enough that our linguistic understanding is so similar, or ‘fixed’, across time and between people as to entail that we half-consciously posit abstract objects.

One of the advantages of my theory is that it avoids the ‘causal inertness’ problem of abstract objects—by getting rid of them. (At the same time, it explains their philosophical appeal.) So Benacerraf’s argument has no relevance anymore.

Incidentally, it is interesting to speculate on the broader significance of my suggestions. While I cannot go into details here, I might point out that humans’ self-understanding is afflicted by the same delusions that characterize their understanding of language. To invoke Fichte, Hegel, Kierkegaard, Marx, Sartre and other phenomenologists again: not only is it the case that the human mode of consciousness is self-consciousness; the self *itself* is self-consciousness. It is just immediate consciousness of consciousness;

¹ I’ll keep calling such sound-images ‘words’, since my intention is not to reform language. But the reader should keep in mind the ways in which I have qualified the use of ‘word’, as well as ‘concept’ and so on.

² As I said above, however, we do have to invoke a half-conscious belief in abstract entities in order to account for people’s unreflective *understanding* of language.

³ This ‘half-conscious belief’, while paradoxical-sounding, is analogous to our half-conscious understanding of any word or sentence.

there is no other ‘substance’ to it, though we intuitively think there is. Wittgenstein thought that an experience of the self is not included in human experience—he thought that the self was merely the “boundary” of experience—but this is only another example of his sloppy thinking. In truth, the self is *necessarily* included in our experience, because it is what organizes experience into a cohesive whole ‘belonging’ to one person. Without the illusion of a substantival self, human experience would have a vastly different form than it has. Complex societies would be impossible, complex communication would be impossible, and we would exist at the level of the higher animals. In other words, our mode of experience and knowledge would not be possible without the continuous ‘background presence’ of a substantival self that organizes and assimilates all the impressions (or rather: whose existence is a *necessary condition* for the organization and assimilation (into a self-centered unity) of impressions). Communities could not take the form they do (as collections of more-or-less distinguishable individuals), which means that *homo sapiens* could not have persevered (because its specifically human communities were what allowed it to triumph over other animals). But this substantival self—this “spiritual substance”—is a myth. There *is* a self, in a way, but it is not what we think it is. It is substanceless; it is consciousness reflected back on itself.

In short, platonism and many other philosophical mistakes are in fact virtually inevitable by the nature of the natural selective tricks through which it was possible for man to triumph over other animals. –Nature *tricked* man into triumphing. That’s what it comes down to.

Conclusion

Let’s apply our ideas to some of the problems outlined in the first section above. We have seen that the existence of concepts and propositions is both trivially true and trivially false (or, if not false, then the question is empty). This means that the existence of *universals* is true and false as well, because universals are a certain kind of concept. –Actually, it is not entirely clear which concepts are to be called ‘universals’. Bertrand Russell thought that “substantives, adjectives, prepositions and verbs stand for universals”.¹ I don’t know whether most philosophers (realists, anyway) agree with this statement, but it seems sensible. However, we saw above that it isn’t clear whether numbers should be called universals or particulars. Arguments can be conceived for and against both sides. Frankly, I think that this debate is rather sterile. I have a similarly low opinion of the debate about “uninstantiated universals”: “Is a universal necessarily instantiated by at least one particular, or can uninstantiated universals exist?” I suppose, however, that for the sake of thoroughness I should address these subjects.

First, numbers. In his paper “On What There Is”, Quine says that the word ‘existence’ does not have spatiotemporal connotations.² The cube root of 27 exists, though it is not in spacetime. I will not deny this. What I’ll deny is that it makes sense not to distinguish between this kind of existence and spatiotemporal existence. As we saw above, it is trivially true that numbers exist, since we use them all the time. But the statement that the cube root of 27 *abstractly* exists has no definite meaning. The number 3 is just an ‘internalization’ of $\left| \left| \left| \right. \right. \right|$, so to speak. –Of course, stated like that, the proposition is refuted by Frege’s argument. This is (one of the reasons) why the myth of abstract objects is necessary. For communication to be possible we have to posit common objects, fixed abstract objects that we can talk about. Still, when someone talks about 3 he does not have an abstract object in mind; he is merely ‘half-consciously’ aware—or has a ‘half-understanding’ (see my version of Kripke’s paradox³)—of some inscrutable, unconceptualizable internalization of $\left| \left| \left| \right. \right. \right|$. This is all that anyone ever ‘has in mind’ when talking about 3, or any other number. So the myth of the third realm is necessary on one level but

¹ Russell, *The Problems of Philosophy* (New York: Oxford University Press, 1952), p. 93.

² Putnam and Benacerraf, op. cit., p. 184.

³ It entails that *all* understanding is a “half-understanding”, a half-existence, like consciousness itself. (This makes sense, because consciousness, while temporally qualified, is not spatially qualified.)

unnecessary on another: to talk about numbers we need it, but to *explain* our talk about numbers, we do not.¹

Thus we see that both mathematical realism and nominalism are false. Nor do I have much sympathy with intuitionism, conventionalism, or Wittgenstein's philosophy of mathematics (such as it is). I don't know much about fictionalism, but I doubt it's right. ("Numbers are useful fictions"? How could that be true? What does it even mean?) I do have other positive ideas, but it would take me too far afield to develop them.

As for the question of whether numbers are particulars or universals, it is, to an extent, moot. It presupposes, of course, that numbers are abstract objects, which we have seen is not true (because, in the sense that is meant, there *are* no "numbers"). Nevertheless, insofar as we are generally forced to believe in abstract numbers, the question can be asked, as it can be asked of properties and relations. Unfortunately it cannot be answered. Our intuition vacillates: it is first drawn to "particulars!", then to "universals!", and then back again. Clearly this is because, for example—in support of the "particulars!" hypothesis—| | | is a definite, exact (number of) thing(s) (unlike, say, red, which has many different shades, and is considered a universal); while, in support of the "universals!" hypothesis, the number 3 can be manifested an indefinite number of times in collections of objects. Since there is no decisive argument for either position, and the debate itself seems merely academic (I cannot think of any explanatory purpose it serves), I propose that the question be ignored.

This is not, by the way, a cowardly side-stepping of the issue. It is a tacit recognition of the fact that the universal/particular dichotomy is not a fundamental truth grounded in the nature of reality itself—a truth comparable to, say, the law of cause and effect. Rather, it is a philosophical fabrication, an artificial construction devised to facilitate clarity in ontological discussions. There is no *a priori* reason to think that every concept is necessarily *either* a particular *or* a universal, such that in different contexts it cannot be used sometimes as a particular and sometimes as a universal. When the dichotomy is more of a hindrance than a help, it should be ignored.

The question of uninstantiated universals is another pointless one. It strikes me as a terminological dispute. For example, in Armstrong's discussion of it² (as in most of his other discussions in the book cited), he does not give the reader a reason to care. There is no broad perspective on its implications, no sense that the question has *meaning*. This is, indeed, the fatal flaw in much contemporary philosophical literature. Philosophers get so bogged down in casuistries that they can't see the broader picture: their assumptions must be false if they result (as they usually do) in apparently unresolvable deadlock between opposing positions. In this case, the false assumption is realism. Because abstract objects do not exist, the category of 'universals' is merely a heuristic device, an aid to our understanding of how we use language. It is therefore a non-question whether there are uninstantiated universals.

A more interesting question is how to characterize concrete particulars. We looked at the substance-attribute view, the bundle theory, Resemblance Nominalism and trope theory, but all were seen to have flaws. When thinking about them in detail it is easy to get lost in minutiae and lose sight of the larger question, so we would do well to remember it: "What distinguishes the classes of tokens that mark off a type from the classes that do not?" When the question is formulated succinctly like this, the answer is obvious: "properties and relations". Nominalists contested this answer because of the difficulties that realism encounters. I have argued, however, that properties and relations are not abstract objects, even when formulated in 'universal' terms (such as 'red', as opposed to *this particular trope* of red). We naturally *interpret* them as abstract objects—e.g., there is a *concept* 'red', a *concept* 'small'—and in order to talk about them we necessarily 'act' as if they are abstract objects, but to *explain* our talk about them we need not invoke such objects. Psychology and neurology and similar disciplines can provide adequate explanations of our behavior in these contexts; we need not bring in ontology. We should *explain away* the

¹ (I know these thoughts are difficult; I'm trying hard to express them clearly. But it may be that what Wittgenstein said with regard to his *Tractatus* applies also to this paper: "This book will perhaps only be understood by those who have themselves already thought the thoughts which are expressed in it—or similar thoughts.")

² Armstrong, *op. cit.*, pp. 75 – 82.

controversial ontological presuppositions of the ways we talk, as I have tried to do in this paper. We should not argue about ontology *on its own level*, because, by and large, it is composed of pseudo-questions, which arise from deep confusions in how we interpret the world and use language.

Thus, there are tropes of properties and relations, but there are also general terms that range over a wide variety of tropes. We use these terms as concepts, but to explain our use we need only invoke ‘internalizations’ of rules for applying certain sound-images to concrete particulars—rules learned primarily in childhood. (And, as I argued above, contrary to Kripke’s Wittgenstein, we can follow these rules privately.) Regarding the question of whether we need to invoke substances as bearers of properties, I would suggest that we follow scientific realism (as being the view that best explains all the evidence and does the least damage to common sense): let’s rely on the explanations that science gives us of the nature of matter and of differentiation between natural classes.

In this paper I have not discussed the philosophy of modality, nor the ontology of time, nor various other issues—nor (obviously) have I given a completely satisfactory account of even the problems outlined in the first section—but, as an excuse, I would plead exhaustion. I think that my suggestions could be extended to these other topics as well, but that task will have to be left for another time.

*

By the end I didn’t care anymore, so I barely proofread it. Which means there may be minor inconsistencies. [The problems I discussed are rooted in the very nature of human consciousness and reason, so, despite my insights, the exposition wasn’t satisfactory.]

I made an effort to play the academic game by pretending to be erudite.

By the way, here’s my rough 20-minute outline of the other paper I was thinking of writing:

In my paper I’ll examine the controversy between endurantism and perdurantism. My thesis will be that the issue has been framed unclearly: in one sense, it is true that objects are their spatiotemporal “worms”,¹ but in another sense it isn’t. Generally, when a person refers to an object he isn’t referring to its entire lifespan; he is referring to its present manifestation. (When I talk about Pavarotti I have in mind the *present* Pavarotti, not the past and the future.) So perdurantism begs the question: while objects can be construed as their complete temporal extensions, such a construal is not enlightening. The question is, what makes a given object in this moment the same object in the next, despite whatever changes it may have undergone? To say that ‘strictly speaking, the object is its past, present and future; each temporal stage is just a *part* of it’ says nothing. It just reformulates the problem into the question of what connects *this* instantaneous temporal sliver of the object with the following and the past temporal slivers. Endurantism and perdurantism are both silent on this issue.

My critical task will consist in an elaboration of the foregoing; my constructive task will be to answer the question that both sides of the controversy inexplicably leave unanswered. (It’s inexplicable because originally their whole *raison d’être* was to answer that question!)² I’m not sure how I’ll do that, but it will probably involve a return to the thoughts of the great philosophers of the past.

¹ [Seriously, that’s the technical terminology. Perdurantism is often called “worm theory”. That name in itself refutes it.]

² [Actually, it isn’t inexplicable. Schopenhauer would have no trouble explaining it: the perdurantist solution is attractive on a *verbal* level. ‘Each temporal stage is just a *part* of the total object, the total worm! As spatial parts are unproblematic, so are temporal parts.’ Since most academics can’t get below the level of words, many have accepted this position. –To be honest, I think the problem is neither substantive nor interesting, which is why I didn’t write my paper on it.]

Tuesday, April 11

Reading R. D. Laing's *The Divided Self*. Brilliant book. He has the intuitive powers of a genius.

Here's something funny: when I sleep I tuck my hands under my chin, like a fetus. I've seen pictures of myself as an infant—a cute little infant sleeping in his crib with his tiny hands curled up under his chin. The child is father to the man. (I am the child of that child I used to be.)

I was talking to Peter, a philosophy grad student who also happens to be as fat and ugly as a hippopotamus. But he's fairly intelligent. He was telling me about the metaphysics paper he's writing for our class, shouting and heaving and spluttering in his excitement (as usual). It was something about mereological sums and unrestricted mereological composition and Socrates and how because of unrestricted mereological composition the name 'Socrates' could theoretically denote Socrates *plus* any object—say, a turnip. So when saying 'Socrates' we may actually be saying 'Socrates and this turnip'. –I was used to all this jabber from the metaphysics class, so I just looked at him with an expression of concentration and intense interest, nodding periodically, saying "Ah, I see!", "That's interesting!", while thinking 'Wow, look at him go! –Can't you see I don't give a shit?' Nothing unusual in any of this; it's what I hear and do all the time in class. But then, at the end: "And so, of course, the funny line [in his paper] will be that 'People would be surprised to know that all this time they've been referring to Socrates plus a turnip! And Xanthippe most of all [would be surprised]!' Hahaha!" Yes, he laughed. So I laughed with him. "Heh-heh! That's pretty funny!" I smiled as best I could.

The point is that, outside of philosophy, this guy has a good sense of humor. He's hilarious sometimes. But now here he was all full of glee at the thought of the 'joke' he was going to include in a paper. All contemporary philosophers have that same trait—at least, the ones who have a sense of humor. They may be funny in other contexts, but suddenly in philosophy they can't distinguish funny from nerdy. [...]

My personality has schizoid characteristics, though they're mild. You want an example? Okay. I live in a fantasy world. z.B.: I often think I don't want my philosophical writings published just because if philosophers notice them and critique them, they'll be brought down to earth. Even if they become famous, they will have been made earthly. Picked apart, masticated and digested into little brown turds. I won't have the heart to defend them, because that would be to admit that they're just as real as everything else—as ordinary and flawed. Dissection is always disgusting. (Cf. Wittgenstein's reaction to a philosophical discussion about the *Tractatus*: "Stop! What I wrote was a *poem*! I didn't mean for people like you to pick it apart!") I couldn't stand to see something I wrote published in a scholarly journal.

This is why I've always striven for "greatness", and why I can't fully accept its demise. Greatness, or immortality, is my fantasy world—the thing that keeps me interested in life, even as I recognize its incoherence. In short: I live in the schizophrenic's schism between fantasy and reality.

Anyway, just read the book and then read this journal (November 3rd, November 18th, December 1st,¹ and every other day) and you'll see hundreds of parallels. Like this:

If the patient contrasts his own inner emptiness, worthlessness, coldness, desolation, dryness, with the abundance, worth, warmth, companionship that he may yet believe to be elsewhere (a belief which often grows to fantastically idealized proportions, uncorrected as it is by direct experience), there is evoked a welter of conflicting emotions, from a desperate *longing* and yearning for what others have and he lacks, to frantic *envy* and hatred of all that is theirs and not his, or a desire to destroy all the goodness, freshness, richness

¹ The pills brought out what was latent.

in the world. These feelings may, in turn, be offset by counter-attitudes of disdain, contempt, disgust, or indifference. ...This emptiness, this sense of inner lack of richness, substantiality and value, if it overweighs his illusory omnipotence, is a powerful prompter to make 'contact' with reality. The soul or self thus desolate and arid longs to be refreshed and fertilized, but longs not simply for a relationship between separable beings, but to be completely drenched and suffused by the other.

Remember my freshman year, with Rebecca? Remember the entry in which I waxed eloquent over love and my need for oneness and used the word '*aufgehoben*'? (That's all I remember about it.) On the other hand, the parallels shouldn't be overemphasized. In a lot of ways I'm normal. The Zoloff helps, too.

Laing has also given a possible explanation of why I so hate doing practical things—why I postpone paying bills until the day before they're due, and why I hate looking for jobs online, and why I hate thinking about money, and why I hate doing coursework. These things aren't just *annoying*; I sometimes have almost a *physical aversion* to them. The thought of them can really depress me. The explanation is in fact rather obvious: they're a violation of my freedom. They're "reality impinging on" me, my self, my autonomy. The schizoid self prizes its freedom, its isolation from reality, above all else. Only through this freedom does it feel relatively secure. [That's stupidly oversimplified.]

Friday, April 14

The chapter on self-consciousness is amazingly insightful. And bold. Laing doesn't have the self-doubt of the academic; he marches on confidently, not wasting time on trivial scholarly conventions. Has some of Freud's improvisational skill, the knack for experimentation.

Summerjob interview. Canvassing for environmentalism. Must have made a good impression, since she wants me to be a field manager. (Some sort of director.) I'll start in May.

I'm 25. The macrocosmos is my clam.

"The sense of identity requires the existence of another by whom one is known, and a conjunction of this other person's recognition of one's self with self-recognition." Very suggestive.

All I want, all I've been looking for, is an Archimedes' point in the psyche.

While Laing's ideas are brilliant, he leaves it a mystery as to how it all works. He describes what goes on in the schizoid self, but not *how* it goes on. No underlying mechanisms, no exact chains of cause and effect. The reason is that he *can't*: these things aren't explicable in his humanistic, phenomenological framework. We have to bring in biology, I think.

Tuesday, April 18

Immersing myself in info on global warming to prepare for summer job. (GW is going to be the focus of MoPIRG's efforts this summer.) Starting with the EPA website and its hundreds of links to governmental and scientific documents. (Also, SciAm's website.) Example: the *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2004* is very useful. *Time* just published a special report on global warming, so I'm reading that. Within a month I hope to be an amateur expert.

Terror. Global warming is *the* problem of the 21st century. I don't see how I can, in good conscience, become a professor of philosophy when life on Earth is being destroyed.

Sterile

The crust of wasted semen on the carpet
 full of dust and weeks of dryness
 and particles of toilet paper, wasted,
 scrapes against the bottom of my foot.
 A tuft of old carpet, unvacuumed, stiff and upright
 with a coating of wasted sperm no longer squirming
 hopefully towards an egg.
 Frozen there and dead and motionless.
 Once so slimy, sticky, sweet and optimistic;
 then sopped up and dropped into the toilet, and flushed
 into the sewer,
 or smeared across the carpet carelessly
 (What care I for the thrashings of potential life, my child?)
 and left to petrify on the filthy carpet.
 Crusted and forgotten; futile thrashings forgotten.

Spring, *je t'aime!! Je t'adore!!*

I've finally taken a close look at the arguments for and against ANWR drilling—looked at a lot of websites, read a lot of testimony by scientists, read up on the history of the oil fields in Prudhoe Bay and their impact on the environment, read about the “2000 acre” myth that oil-advocates trumpet—and I've decided: against.

The more I read, the more invested I am in environmentalism. I've always been an “environmentalist”, obviously, but in name only. Now I can foresee a day when it'll be an essential part of my identity. Environmentalism is the new Revolutionary Marxism. Anything approximating a ‘good society’ can be achieved only via environmentalism. Energy efficiency; beneficial technological development; the fight to preserve global-warming-endangered species, and human health, and the environment, and sea-level cities like Venice; social movements like feminism, democracy, anti-racism, anti-terrorism;—they all tie into environmentalism, which ties into Marxism (prescriptively and descriptively). I can't sit on the sidelines anymore.

Yes, I'm still appalled by the contingency of everything, by the fact that the future of civilization is being decided by a few prejudiced, ignorant men in Washington, D.C. who care only about making a buck—and I still don't care ultimately one way or the other, since I know that life is senseless and tragic and transient and nothing can ever change that—but somehow, above or beneath all this negativity, I feel driven to work for a positive goal.

One just has to ‘bracket’ all the absurdity. Don't dwell on the fact that a 5-4 vote in the Supreme Court can determine the election of a president and thus *directly* the fate of millions of people and *indirectly* the fate of civilization. Don't dwell on the fact that if a person named Clinton hadn't stuck his dick in Monica's mouth, the nation might have elected Gore. Take the perpetually optimistic “tree-hugging” activists as your role-models; don't let the likes of Ted Stevens ruin your day.

I wonder if propositions just *are* the truth-conditions (understood in the mode of “abstraction”, as opposed to the *concrete instantiation* of the truth-conditions) of an utterance. So, to speak of a proposition's truth-conditions is misleading. “The dog is running” is an utterance; {*dog-running*} is the proposition. (If it just *is* the truth-conditions, it can't be expressed. It can only be *shown*. (Cf. Frege.) So in ‘expressing’ the proposition I have to write something like “{*dog-running*}”.) If I remember rightly, Frege thought that the *sense* of a proposition is what is “shown”, while the proposition itself can be *said*. If my ideas are right, that's wrong. The proposition is what is shown. And the *proposition* is the sense of an utterance; there's no other mysterious ‘sense’ distinguishable from the proposition. This revision, which was implicit in my paper, might allow a dissolving of the paradoxes involved in “egocentricity”. (E.g., what does it mean for the propositional content of a particular sentence to vary according to where the sentence is spoken?)

Thursday, April 20

Hour-long presentation on my paper in Metaphysics. Amazingly, it wasn't a catastrophe. (I think that my having done many many pushups right before it played a part in that.) I probably could have explained myself better (judging by the questions they posed), but—whatever. I learned long ago that people don't understand my ideas; this doesn't bother me anymore. I'll let posterity interpret me. "History will judge!", to quote the man I'd like to put a bullet through the head of.

To be or not to be?

The pulsing of the sun determines life
 Amongst us earthlings; we're beholden to
 A trillion nuclear explosions. Flares
 Upon the solar rim determine cloud-
 Movements and weather patterns and daily life
 Here on the earth. Millions of miles away
 Our future is decided, *predecided*,
 Concocted in a boiling brew of atoms.
 —One knows not how one should react to this.
 Is horror most appropriate? Or awe?
 Or wonder? Or is fear more sensible?
 Or maybe suicide is suitable,
 Since life in such conditions is for naught.
 A "floating" Earth—embedded in a viscid
 Cosmos—which travels on a curved straight line
 Around a (literal) space-coagulation
 Unendingly—or, *billions* of times—
 Is quite indifferent to the destiny
 Of helpless little lice inhabiting
 Its many tufts of hair—which they call "forests",
 And which, stupidly, they shave away,
 Thus leaving only a bare scalp with scars
 All intersecting, grey, ugly;—and yet,
 At least, they give the lice the means to keep
 Proliferating parasitically
 (Because of some bizarre connection between
 Such scars and liceal regeneration).
 And so, in short, the black enormity
 Of crimes perpetrated by space and time
 On us poor lice, together with our crimes
 Against ourselves as well as gentle Earth,
 Lead one to think that....—no, just to despair!
 There is no point in thought, nor action! We
 Can only sit in immobility,
 Thoughtless, despairing immobility,
 And wait in trepidation for the end.
 —Right?No; I disagree. I choose to live
 In wonder, and in awe all full of love.
 Yes, love! That thing poeticized to death,

Yet utterly deserving of the praise.
 Forget about the horror! Think, Chris, of Lauren,
 Your “soul-twin”—or the Vietnamese angel
 You talked to yesterday, while your heart
 Grew wings! Think of when she bent over,
 And her....—well, yes, it was a pretty sight.
 (That’s all that need be said.) I wonder when
 I’ll see her next. Tomorrow? Saturday?
 I wonder if she’s interested in me.
 And when will Lauren come to St. Louis?
 I wonder.... Ah well. Earth, keep orbiting!
 You have permission to ignore me. But
 My fellow lice, *you* do not! I want
 Your love, because I love you—stupidly,
 It’s true, and mindlessly, instinctively,
 And blindly, but....well, after all, I’m just
 A louse! You can’t expect *too* much from me!
 Blind love is all you’re gonna get. Blind love
 And blinder wonder. —So say your prayers and love
 Your neighbors, and live Christ-like lives (—Good luck!),
 And love your cosmic insignificance
 Because it means you’re just a visitor,
 A tourist without responsibilities!
 And Lauren: I’ll see you soon, I hope, and when
 I do I’ll let you tear apart this poem.
 (Your critical sense is more refined than mine.)

I’m not a pervert, I swear!

Should this journal chance to fall
 Into my mother’s hands,
 I’d tell her: ‘Mom, I’m still your “doll”
 Who liked to draw with crayons!
 Ignore these vulgar words: they’re all
 Just ways for me to—dance!’

Sunday, April 23

Reading Searle’s *Mind, Language, and Society*. [For those readers who are sensible enough to ignore contemporary philosophy: John Searle is very famous.] I just started it, but I think I’m gonna like it. First of all, it seems like Searle has common sense. (I.e., he’s a realist, a correspondence theorist, etc.¹) Even more importantly, he has ambition. In this little book he sets out to explain “the structural features of mind, language, and society, and then show how they all fit together. My aim, then, is to make a modest contribution to the Enlightenment vision.” I wish he hadn’t used the word ‘modest’, though.

¹ He rightly makes the Wittgensteinian point that these positions are not so much “common sense” as necessary background assumptions to most human behavior, but, as you should know by now, I use the term primarily for its *ad hominem* value. (It’s fun to accuse people of not having common sense.)

Most of his arguments against anti-realism were expressed in this journal four years ago, though with more pizzazz.

The book I skimmed through on March 3rd was right, and so was I: biological naturalism is confused. “Consciousness is a higher-level feature of the brain in the same way that digestion is a higher-level feature of the stomach, or liquidity a higher-level feature of the system of molecules that constitute[s] our blood.” No. Digestion is the totality of processes that take place in the digestive system, and liquidity is a physical property of a system (namely, the mode of interaction between its molecular constituents). Neither is comparable to the other, nor to consciousness.

Searle’s argument against epiphenomenalism is stupid too. I agree with his conclusion (consciousness is not epiphenomenal) but not with his reasons. My own reasons are more subtle.

Many of Searle’s arguments, by the way, are very philosophically naïve.

He agrees with me that the mind-body problem is related to the inadequacy of our conceptual apparatus, but he doesn’t really explain how or why, as I did above. He just says, “The solution is to shift the categories around so we recognize that consciousness is at one and the same time completely material and irreducibly mental. And that means we should simply abandon the traditional categories of ‘mental’ and ‘material’ as they have been used in the Cartesian tradition.” But he doesn’t explain what he means in the first sentence! He just leaves it at “completely material and irreducibly mental”! Very enlightening.

I’m also reading Boswell’s *Life of Johnson*.

I was wrong. Searle’s book is totally uninteresting.

Thursday, April 27

Reading the anthology *Theories of History*, edited by Patrick Gardiner. It goes from Vico to Watkins. Also, William Dray’s *Philosophy of History*, and an anthology he edited called *Philosophical Analysis and History*.

Free will. A problem even more intractable than the mind-body problem. I haven’t read my senior thesis in years, but from what I recall, I still agree with the main tenets of its solution. Free will is a psychologically (phenomenologically) necessary illusion, fabricated in the deterministic workings of the brain. Since brains are a part of physical nature, this commits me to the view (ignoring quantum mechanics) that if a being with perfect, God-like knowledge of the nature and movements of every single particle (or string or whatever) had existed at the dawn of the universe, it could have predicted that I would type these words right now. Pure determinism (again, ignoring quantum mechanics) is committed to that view. You may find it unattractive, but the alternative is far less attractive. For many reasons. First of all, the idea of free will is incredibly obscure, paradoxical, almost meaningless; so it is philosophically *far* more tempting to deny free will’s reality, and to treat our vague intuition of “self-control” as an illusion. Admittedly, it would be mistaken to say, without further qualification, that the illusion is *totally false*. For, in any given moment, we do ‘anticipate’ or ‘expect’ any given action of ours, and we often *consciously decide* on a certain course of action. So in this sense we do control ourselves. It can be argued, moreover, that our intuition of free will extends no further than this;—that it has no implications with respect to an underlying deterministic causation of our intentions. In other words, in this limited sense, free will is actually compatible with an underlying physical determinism. What I am denying is the “metaphysical” truth of free will. Our decisions and actions are not “metaphysically” free, whatever that’s supposed to mean, because they are the direct outcomes of deterministic neural processes. Or rather, our consciousness itself *is* (some of) these neural processes (as I said in my thesis)—but considered as emergent phenomena rather than aggregates of physical states. To say that it’s ‘*substantively*’ free, then, doesn’t make sense, because neural processes cannot be “free”.

Secondly, my solution fits nicely into my evolving worldview. Thirdly, it is more theoretically economical than any alternative, especially one that (like Kant’s) brings in religion. Fourthly, it does little damage to common sense and scientific realism.

But what about quantum mechanics? How does that fit in? Me not know.

In my epistemology paper I should have said, with Kierkegaard, that experience itself is immediately certain, no matter what experience it is. Uncertainty comes into play only when language does, because that's when mediation does, and mediation brings doubt. So my experience of typing on a computer is immediate and certain, but if I say, "I am typing on a computer", doubt is introduced. The reason is that no concepts are directly involved in the experience itself. The experience is just a *doing*, or a *feeling*. It has no room for doubt. Doubt becomes conceivable only through language, because language relates immediately present things to things that aren't present. It abstracts from the given; it goes beyond "sensuous certainty".

Hegel's shadow still looms large over us.

Saturday, April 29

I can't read my poems after I read Samuel Johnson's.

I have much marveled at Boswell's use of a common colloquialism of ours, to wit, the substitution of 'pretty' for 'quite' or 'somewhat', as in "Johnson used to be a pretty frequent visitor at the house of Mr. Richardson". Is it not queer that such a sentence should have been produced in the 18th century?

The Caterpillar

I saw a caterpillar today. In the parking lot.
 I had a plastic bag of garbage in my hand—trash
 From my apartment. Carried it at arm's length, from the smell.
 It *overflowed* with stench and waste, degrading human waste—
 Like cardboard cartons for frozen food, and decaying plastic plates,
 And partially eaten store-bought apple pie (now feeding fungi),
 And empty cereal boxes (Frosted Flakes, Cheerios),
 And plastic forks and spoons and cups and cartons of skim milk.
 All rotten, curdled, fly-encrusted. So I approached the dumpster.
 While deftly dodging stationary cars (which wasn't easy:
 I had to run while carrying this huge and bulging bag,
 Arms quivering with the strain), I looked down at the crunching gravel,
 Just for a second, and saw a tiny spot of green—light green.
 But not just "green", drab green; it looked almost iridescent,
 A little neon light that flashed my mind back to the coral
 Reef off Australia's coast, where I had scuba-dived one time.
 I dropped the bag. Knelt down to get a closer look. It looked
 So isolated there, atop a mound of pebbles! Squirming,
 Its head high in the air, blindly squirming helplessly
 —Yet hopefully. It hoped for help, apparently. So I
 Lent it my index finger, which it gratefully accepted.
 The pile of trash beside me beckoned with its pungency,
 But I ignored it; the half-inch turquoise avatar of trust
 And steady confidence worming its way across my skin
 Was more deserving of attention. For it made me think....
 I sat upon the grass—it was quiet all around;
 Not even cars passed on the street—and watched the caterpillar
 Contract, expand, contract, expand, so *slowly—patiently—*
 Across my hand. "I could end you," I whispered, "but I won't...."

I placed it on a blade of grass. I had to go to class.
 The trash, and its unsavory scent, still beckoned me, so
 I did my duty. My dumpsterial duty. –But the blade
 Of grass I'd favored quivered as the caterpillar crawled....
 And so I left them, quivering in quiet harmony.

Well the sun gets weary and the sun goes down, ever since the watermelon.
 “Buckets of Rain” = good song. (Dylan) And “Most of the Time”.

I'm even better now than I ever was at entertaining myself by myself. And I'm not talking about masturbation. Nay, 'tis instead so-called *spiritual* passing-the-time methods to which I refer (though verily I do still appreciate the delights of porn). Porn! I enter your immortal shrine in a spirit of penitence for my wayward non-sexual profligacies, and I do castrate myself—I mean, prostrate myself before thine altar! With a Zossiman fervor and a Zossiman stench wafting from my unwashed genitals, I kiss thy feet, immortal god of Porn!

I'm trying to evaluate Hempel's influential “deductive-nomological” model of scientific explanation. Since I'm in an altruistic mood I'll give the reader some background. According to Alan Donagan,

the cardinal tenet of the Hempelian theory is that all scientific explanations have a common form. A scientific explanation must be such that what is explained may be logically deduced from it; a weaker connexion¹ would invalidate it. There are two kinds of scientific explanation, differentiated by the kinds of thing they explain. The first of these is the explanation of individual happenings: a landslide, say, or a political murder, or a victory in battle. Explanations of this kind have two components: (1) statements of other prior or simultaneous happenings, and (2) general laws established by empirical evidence. General laws admit no exceptions.The second kind of explanation is of general laws. Explanations of this kind consist solely of general laws other than those which are explained. In both kinds of explanation, and especially in the second, the logical derivation of what is explained from its explanation may require dexterity and even deep insight. (Gardiner, 428)

Okay, no more altruism. You should read Michael Scriven's paper “Truisms as the Grounds for Historical Explanations”. He criticizes deductivism. I agree with him that universal laws are often unnecessary in explanations and indeed unavailable. (Especially in history.) But I accept Donagan's defense of deductivism: “If it is supposed that an explanation need not logically entail what it explains, but may be consistent with several other possibilities, then it will fail to explain why one or other of these possibilities was not realized, i.e. it will fail to explain why what it purports to explain should have happened rather than something else.” Scriven thinks, with Andrew Sayer, that induction (or “abduction”) is all that is needed in certain explanations. I think that, while Hempel's version of deductivism should be thrown out, *some* version is necessary. No doubt scientists arrive at their hypotheses through induction, but in order for explanations to entail their explananda—i.e., to *explain* them—they must be formulable so as to *entail* them!—i.e., so as to *deductively imply* them! Scriven's examples rule out only the deductive-nomological model, not the deductive model.

Consider Cortes's third expedition to California, after the first two had failed. What explains his decision to try a third time? Plausibly, the facts that he was greedy and that he was confident of success if *he* led the expedition this time. But our intuitive provisional acceptance of this hypothesis is based on the tacit premise that, with respect to certain people, greed and confidence of success are sufficient motives for undertaking dangerous expeditions for plunder. Thus, the fact is deducible from the following premises:

¹ Oh Alan, you silly Brit! Spelling ‘connection’ with an ‘x’!

(1) the premise I just stated; (2) Cortes was one of these people; and (3) Cortes was greedy and confident of success in this particular expedition. These three premises entail his setting out for California. No doubt a thorough explanation might involve a few more premises, but the point is that it would also involve deduction. Typically we ignore some of the premises because of their triviality (which, however, is not *emptiness*); still, logically speaking, they're necessary.

Another example. I accidentally knock my knee against the desk and spill an ink-bottle onto the carpet, thus staining it. What's the explanation for the stain? Stated with *some* thoroughness, it is: (1) if ink of a certain quality is spilled onto a carpet of a certain quality, a stain will result; (2) my knee's knocking the desk caused the ink to spill onto the carpet; (3) the ink and the carpet in question were of the right quality. This explanation entails that a stain resulted. Ordinarily, though, we would invoke only the second premise, because the others are assumed.

Note that—contrary to Hempel and Popper—predictive success doesn't play an essential role in explanations. At most, one can say that "*If* such and such conditions are fulfilled, such and such an outcome will necessarily result". There's no reason to demand that we be able to *categorically* foresee a given event (as opposed to hypothetically), because our ability to perceive the occurrence of all the requisite conditions prior to the occurrence of the event does not bear on our understanding of the event. Theoretically we can understand it perfectly well and yet not be able to predict its occurrence (perhaps because of the complexity of the environment, or because of free will,¹ etc.).

Note also that this form of deductivism has little bearing on the methodology of the social sciences (because the premises necessary to complete any given deduction are usually implicit anyway). Nor does it invalidate their scientific pretensions (if adherence to deductivism is the sole criterion for assigning the label 'scientific'). At most, it encourages social scientists to make explicit the tacit premises involved in particularly complex cases. This might, moreover, stimulate them to look for explanations of these taken-for-granted premises.

Note also that the foregoing ideas provide yet more support for my conviction that the answers to philosophical questions about the methodology of *any* field rarely have an impact on the methodology of that field.

Note also how pretentious I sound when I write "note also".

Last night

My head lay stiffly on my insomnia-soaked pillow
and my eyes bored into the ceiling which I could
see because the moon was awake too.
I looked up as always and thought about sheep
climbing fences and bleating with the strain
or grazing on ancient Scottish farmland swamped
in a soupy fog, like that day my family and I stood
on Hadrian's ruined wall (now just Roman stones
strewn unlawfully about) as sheep roamed nearby.
I hopped over from England to Scotland and back
and shouted, "I'm in England! I'm in Scotland!"
I was not tired then as I was now, nor did I
have to look at the obnoxious monotony of a ceiling.
In the skeletal silver light I heard soft voices outside
on the grass beneath my window.

¹ As Scriven says, we might not know a man is capable of murder until he commits murder. So although we knew he had a motive for murder prior to the event, and we can give a good explanation of it afterwards, we couldn't predict it because we didn't know whether he was "capable" of it. His free will got in the way of any predictions.

Murmurings of a female and a male together.
 I leaned closer into the sound but could not distinguish
 words or even him from her.
 I raised myself and went to the window
 into the moonlight and the whisperings below
 and saw two silhouettes looking at one another.
 It was quiet as they kissed and I could hear nothing.
 And moments later I was asleep on my pillow.

Tuesday, May 2

Plekhanov's essay *The Role of the Individual in History* isn't terribly impressive, but it communicates a few insights. (Mostly in its second half.) *The Materialist Conception of History* is a good overview of the subject. Most of its ideas are obvious, though not always expressed well. (Sartre wouldn't like the deterministic phrasing.) It leaves all the interesting and tough questions unanswered—and mostly unasked. But it's just a short pamphlet, so you shouldn't expect much.

A soft, green heart

This artichoke heart
 hemmed in by layers
 of barbed defenses
 which you pick off
 and throw away
 so nonchalantly
 tastes delicious.

Friday, May 5

This is the happiest time of my life. What with the spring, my freedom, my confidence, my daily working-out, the protein shakes, my Japanese friend Masa who lives right below me, and my intellectual curiosity and confidence.

[...]

Yes, one might say that love is the meaning of life. Love, recognition, respect. It's more important than the satisfaction of mechanical "instincts". It isn't the whole story, of course, but it's the background. The Prologue in Heaven.

A bothersome fact: neither Nothingness nor Somethingness makes sense. It so happens that Somethingness exists rather than Nothingness, but it is no more comprehensible than the latter.

I tried to read Raymond Aron's *Introduction to the Philosophy of History* (Aron was a famous French philosopher in the days of Sartre) but didn't get very far. It reminded me of the scene in *Anna Karenina* when the slick young doctor comes to the family, examines the patient, talks for twenty minutes about the diagnosis and prognosis and possible remedies, and when he's gone they all ask each other, "What did he say? I don't know. He talked for twenty minutes without really saying anything." That doctor is Mr. Raymond. How can a person write for three hundred pages without *saying* anything?

Monday, May 8

Reading *Climate Change: Five Years after Kyoto*, a collection of papers. Also, *Global Environmental Outlook* (a U.N. report), *Alternative Energy: Facts, Statistics, and Issues*, by Paula Bernstein, *America's Environmental Report Card*, by Blatt, and *From Resource Scarcity to Ecological Security: Exploring New Limits to Growth*. The National Resources Defense Council's website is another good resource. So is the Sierra Club's.

Also reading Albert Schweitzer's *Out of My Life and Thought*.

His interpretation of Bach reminds me of Glenn Gould's. "Whereas down to the middle of the nineteenth century Bach, curiously enough, was generally played staccato, players have since that date gone to the other extreme of rendering him with a monotonous legato. That is how I learned to play him from Widor in 1893. But as time went on, it occurred to me that Bach calls for phrasing which is full of life. He thinks as a violinist. His notes are to be connected with each other and at the same time separated from each other in the way which is natural to the bow of a violin. To play well one of Bach's piano compositions means to render it as it would be performed by a string quartette." This is pure Gould. (heh-heh)

Tuesday, May 9

Schweitzer strikes me as a very simple man, albeit intelligent. He was lucky enough not to have a personality full of contradictions, nor prone to torment, but constant and certain of its convictions. Lifelong steadiness and self-sacrifice are achievable if one has a placid character, a primeval gentleness stronger than any restlessness. Schweitzer wasn't a great thinker, but a few chapters in his book—especially the Epilogue—are inspiring. The ethical ideals they articulate are obvious and not new, but the mode of expression is fairly poetic. And its repetitiveness is strangely effective.

The world does not consist of happenings only; it contains life as well, and to the life in the world, so far as it comes within my reach, I have to be in a relation which is not only passive but active. By placing myself in the service of that which lives I reach an activity, exerted, upon the world which has meaning and purpose.

The idea of Reverence for Life offers itself as the realistic answer of the realistic question of how man and the world are related to each other. Of the world man knows only that everything which exists is, like himself, a manifestation of the Will-to-Live. With this world he stands in a relation of passivity and activity. On the one hand he is subordinate to the course of events which is given in this totality of life; on the other hand he is capable of affecting the life which comes within his reach by hampering or promoting it, by destroying or maintaining it.

As a being in an active relation to the world he comes into a spiritual relation with it by not living for himself alone, but feeling himself one with all life that comes within his reach. He will feel all that life's experiences as his own, he will give it all the help that he possibly can, and will feel all the saving and promotion of life that he has been able to effect as the deepest happiness that can ever fall to his lot.

Reverence for Life contains in itself resignation, an affirmative attitude toward the world, and ethics—the three essential elements in a philosophy of life, as mutually interrelated results of thinking.

Objection is made to this ethic that it sets too high a value on natural life. To this it can retort that the mistake made by all previous systems of ethics has been the failure to

recognize that life as such is the mysterious value with which they have to deal. All spiritual life meets us within natural life. Reverence for Life, therefore, is applied to natural life and spiritual life alike. In the parable of Jesus, the shepherd saves not merely the soul of the lost sheep but the whole animal. The stronger the reverence for natural life, the stronger grows also that for spiritual life.

The critic can cavil with all this—he can protest, with Nietzsche, that life is not will-to-life but will-to-power—but the universal validity of the sentiments remains. (This accounts for their ancient origins, in the Vedic texts.) And the validity is not only philosophical; more importantly, it is grounded in psychology. The reason Reverence for Life makes possible great happiness is that it fits perfectly into the communal orientation of the psyche. It is this that matters most in life; this is the ultimate end of our strivings. The satisfaction of the communal urge. Most psychic disorders or conflicts are, at bottom, explicable in terms of the frustration of this urge.

How miraculous it is! Not only has nature potentially given us the ability to understand its deepest truths in their formal aspect (mathematics); it has also programmed us so that our greatest happiness lies in affirming nature's own works.

("The miraculous" is simply that which isn't explainable in terms of the conventional categories of thought. Life is miraculous because it can't be subsumed under any concepts or theories or methods of theorizing 'without remainder'—without an intuitive remainder, which can't be grasped conceptually. This magical, obscure feeling we have that there is *something* about life THAT is incomprehensible—as there is something about the existence of matter that is equally mysterious—this feeling is the origin of the Miraculous.)

I don't understand the popular belief that religion encourages the feeling of wonder. If I thought there were a God, I would *lose* my wonder. I'd think, "Oh well, an intelligent being designed all this, so it isn't that amazing after all." God *himself* would remain something of a mystery, but not an exciting one. His status as an intelligent being would deprive him of mystery. He would just be *me*, on a grander scale; my awe of him would be little more than glorified respect. Moreover, knowing that someone else understood the universe—that he had *created* the universe—would sap my wonder of grandeur. It would no longer implicitly glorify me, because I would know that I was inferior to someone. (Part of the excitement of feeling wonder is that it half-consciously places the wonderer on a pedestal in his own mind, as someone capable of a rarefied intellectual emotion. If he knows that his object of wonder has been *intentionally designed*, there is not an implicit contrast between him and an inferior brute force called 'chance', and so he cannot implicitly respect himself by virtue of this contrast.) My place in the cosmos would be demoted to that of a little being who was too insignificant to understand his Master: my awe would amount to the plea, "Tell me, please, Excellency, how you did all this! I'm exceedingly curious and very impressed."—But, in general, everything would cease to be miraculous: it would be explainable in terms of reason and intelligence and other such mundane concepts.

....I'm reading Charles's *Norton Anthology of Modern Poetry*. I wish I'd read it earlier: Charles is moving out, so I won't have access to it for long. I'm also reading Michael Meyer's long book *Poetry: An Introduction*. (It's unfortunate I don't really like reading poetry.)

Christ, it's depressing to read about the government's environmental and energy policies. I can't stand it.

Wednesday, May 10

I'm surprisingly optimistic about the prospects for more enlightened environmental policies. It's getting harder and harder for Congress to persist in its obstructionism. Even the conservatives are starting to see the light. Even major corporations are pressing them for changes, and making changes on their own.

The Bush administration represents the last hurrah of massively backward conservatism. (For a few decades, at least.) [Typical leftist over-optimism.]

By the way: unquestionably the worst administration in history, at the worst possible time.

But as Ted Kennedy said, the situation can only get better from here. We're on the cusp of an age of progressivism.

(I want to remind the reader—just so he never forgets what a *fucking moron* Bill Frist is—that three weeks ago Frist proposed a \$100 rebate to all American families as compensation for the high price of gasoline. I'm serious. He thought it was a great idea. —A hundred years from now, people reading this paragraph will be like “Is that *true*??!” And don't forget his role in the Terri Schiavo comedy. Nor his comment on Stephanopoulos's talk show that HIV can be transmitted through tears. He's a medical doctor.)

I wish gas prices were \$5 or \$6 per gallon. *That* would spark change.

This is something to keep in mind: “Never doubt that a small group of thoughtful, committed citizens can change the world. Indeed, it's the only thing that ever has.” (Margaret Mead)

The Prophet

I opened my ears and heard the past
sobbing
and the people in the past
sobbing
and I closed my eyes and saw the future
screaming
and the people in the future
screaming
and the bloody bodies slickly dying in heaps
and the suffocating
and the sobbing

Reading *Residence on Earth*, a collection of poems by Pablo Neruda. And Rainer Maria Rilke's *Letters to a Young Poet*. (And of course all the books I mentioned above. I don't jump from one book to another after having read only a dozen pages.)

I could have used this little book six years ago. It might have brought some comfort. As it is, I'm too old for it to speak directly to me. I no longer need consolation; I've assimilated all of Rilke's insights—and filtered out his exaggerations—on my own.

The last sentence of this quotation is very beautiful:

Do not observe yourself too much. Do not draw too hasty conclusions from what happens to you; let it simply happen to you. Otherwise you will too easily look with reproach (that is, morally) upon your past, which naturally has its share in all that you are now meeting. But that part of the errors, desires and longings of your boyhood which is working in you is not what you remember and condemn. The unusual conditions of a lonely and helpless childhood are so difficult, so complicated, open to so many influences and at the same time so disengaged from all real connections with life that, where a vice enters into it, one may not without more ado simply call it vice. One must be so careful with names anyway; it is so often on the *name* of a misdeed that a life goes to pieces, not the nameless and personal action itself, which was perhaps a perfectly definite necessity of life and would have been absorbed by it without effort.

Thursday, May 11

The midnight-aura

In the liquid sugar of this fantasia
 I sing my dripping heart into the air
 onto the frost-paned crystal that hovers and kisses me
 its crisp threads weaving slowly web-like around me
 round my molten-glass breath warm-blown
 through chandeliers of lavender whispers
 whispered
 like a melting icicle
 into the silent shivers of me
 whence I sing
 with the heart of Chopin beating in my outstretched
 hand
 hotly

Reading Charles Bukowski's collection of poems called *The Flash of Lightning Behind the Mountain*. Very easy to read, of course, but not very impressive. To compare Neruda and Bukowski would be a little like comparing Nietzsche and Baudrillard. They aren't even in the same galaxy.

"I have a foolproof way to become famous! I'll write lots of little meditations in ordinary prose but then make it look like poetry by putting only a few words on each line! People will say it's revolutionary!" He was right.

It's easier to criticize poems like mine than Bukowski's, because....there's nothing to criticize in the latter. They're so unambitious, so formless, so disdainful of literary canons and ideals, so whatever-they-want-to-be, that there's no place for criticism to get a foothold. It's like when you're trying to scoop up that last little pea on your dinner-plate; it keeps rolling away, refusing to be pinned down. Poetry that aims only for irony and cynicism and humor and moments of nonchalant profundity, all in the easiness of prose—casual, too street-smart to be overly concerned about anything, least of all standards of criticism (and so any criticism "misses the point!")—this poetry, while entertaining and even valuable in some ways (as social commentary, as symptomatic of a certain state of mind, as pushing the boundaries of literature), isn't particularly impressive or interesting.

Neruda, on the other hand, reminds me of Marquez. And Jean Toomer. The same hauntingness, nostalgia, the surreality and the exquisite use of language. Inimitable imagery. The images are so unusual, so startling, that to really appreciate the poems you'd have to read them at the pace of a child learning a language. Just to absorb the images.

The long poem "Spain in Our Hearts", written after the civil war, is beyond words.

Friday, May 12

An illustration

In six hours I'll be having
 dinner
 with the Asian chick,
 charming
 her pants off,
 speaking my filtered
 cock
 between mouthfuls of fish.

Her smile
 will be as unwavering as
 my desire, which will be
 as unwavering
 as my erection.
 Maybe I'll
 mention
 my adventure with
 malaria in Sapa,
 a stupid
 overreactive
 episode
 which will not fail to garner
 applause.
 (Every time a female laughs
 is
 another notch in your belt.)
 Or maybe I'll talk
 about
 how much rice I had to eat
 in Korea,
 rice twice, thrice,
 a day,
 for a year,
 and she'll laugh laugh ha ha.
 Meanwhile I'll eat my
 fish.

I wonder
 what Vietnamese pussy tastes
 like.

See?

I must admit I like Bukowski's poem "nice guy". Not necessarily because I see myself reflected in it (though I do); mostly just because it's true. It's deeply, profoundly, unequivocally true.

Quietly

close the shades
 narrow the sunbeams
 still the hum of life

Saturday, May 13

It's encouraging that someone who knows more about poetry than I do agrees with me. Here's an excerpt from Lauren's last email:

I can't stand Bukowski. He's a horrible man and I don't like 99.9% of his writing. Anyone that would try to turn raping a woman into a work of art disgusts me. I bought "The

Bukowski Reader" a few summers ago and it was such a waste of money. Not to "diss" your roommate [who likes Bukowski], but I've found that most of the people that read Bukowski are desperately trying to cultivate that indie pseudo-intellectual/pseudo-communist/pseudo-slacker image. "I'm cool and different, I listen to bad music that no one knows about and read Hunter S. Thompson and Bukowski." I love love love love Pablo Neruda. His love poems are....breathtaking. Sigh. I don't like My Big Fat Greek Wedding either. I thought it was sort of insipid. I much prefer romantic comedies that appeal to my brain just as much as my heart...though I will admit that teen date movies amuse me.

We continue to have everything in common.

She's right about my (ex-)roommate, by the way.

Insofar as—or, *if*—there is an innate psychological basis for the inequality in artistic production between the sexes, I think it has to do with the peculiar self-centeredness, the individualistic nature, of men. The somewhat condescending attitude they naturally take towards women—their instinctual comparative self-confidence and self-sufficiency—allows them to be productive during months and years of loneliness, to take advantage of whatever psychic ailments they may have. Men who personify masculinity are too focused on themselves from the perspective of *themselves*—too immersed in their would-be manliness, in their worldly ambitions and sexual desires, their self-certainty—to be great artists, while women who personify femininity are too focused on themselves from the perspective of the *other* (i.e., too insecure, self-doubting, invested in their appearance and eager for approval). The former lack the element of self-consciousness, of insecurity and unrest, which is necessary for the production of great art (—art is created in sustained solitude, which necessarily brings unhappiness and a kind of self-doubt), while the latter lack the element of self-confidence, the innate predilection towards *self-assertion*, the sense of self-worth (however vague and riddled with doubts it may be in certain men, like the past version of me), which would allow them not only to tolerate but to make productive use of sustained solitude. Artists must have both feminine and masculine traits; but it seems that men have the feminine trait(s) more often than women have the masculine trait(s), which would (partially) explain the relative abundance of male artists and philosophers. (In the last century, though, women have become more self-confident/self-sufficient than they used to be, so there have been more female artists than in the past.)

Obviously there are other necessary conditions. (Education, intelligence, opportunities, etc.)

 kinetically frozen stone (white heat) eons-old
 and doomed trees gasping.
 raucous neon saffron-gash boiling,
 liquid petrification (Earth's candle, volcanic wick) oozing
 up from under into
 down feather-pillows of smoke
 sweeping the complacent forests,
 bleeding scattered life.

“Shaggy sheep clouds” is (according to the *Post*) the villagers' name for the smoke-billows.

Reading parts of *Problems of Literary Evaluation*, an anthology.

Wednesday, May 17

First day of work yesterday. 1 to 11. Ten to twelve hours every day. Five hours of door-knocking; the rest of the time is spent traveling to and fro, eating lunch together, role-playing, drawing out the turf, etc. Awesome coworkers. Today was supposed to be my first paid day, but I forgot to bring two forms of ID to the office, which was required for tax purposes and whatnot. I only had my license. So I was told I couldn't go canvassing, unless I went back home and got my SS card and came back, within one hour. So I ran the five blocks to the metro station, took the fifteen-minute trip, ran to my apartment, searched everywhere....only to find that the card had been in my backpack the whole time. I'd had it with me in the office! “Sheesh.” By now it was too late to get back there, so *tomorrow* will be my first day. [...]

Thursday, May 18

First paid day. I raised \$130, which I'm told is good for a first day. This is by far the best job I've ever had—largely because of the coworkers, but also because meeting forty to a hundred people a day is fun. There are plenty of jerks, but there are quite a few supporters too. And every so often you'll meet someone who's really friendly and you can have a short conversation with. Even the jerks I don't mind, because they can be amusing and I've grown a thick skin in the last year or two. Some of them yell “Go away!” or “I'm not interested!” or “I really could[n't] care less!”, or think of more creative ways to say “no”, but it's very easy not to care. I'm also good at giving the canvasser-spiel conversationally rather than robotically.

I'm reading various papers in various volumes of the journal *Marxist Perspectives*. (William Styron called it “the most impressive journal of intellectual opinion to have appeared on the scene in years”, and he was right.)

Sunday, May 21

Friday wasn't great. A lot of apartment complexes, which are difficult. (More doors, fewer people, more assholes.) Only \$100. Yesterday I spent nine hours at Six Flags with Nguyen and five friends.

Ah, I feel like a worthlessness. Dust-particles on the computer screen heralding two millennia in the future. I hate all this shit, having to live. I just want to sleep, or drown. Fuck it all. Jobs, relationships.

Poetry is masturbation beautified.
 What is it like to have sex with a beautiful girl?

Saturday, May 27

I raised \$690 yesterday, thanks largely to a guy who gave me \$500. He lived in a mansion, so when he asked me for a suggestion I said “500 dollars?”. His hesitation lasted about one second. I should have asked for \$1000. –What a character this guy was! Big and boisterous, constantly talking. Gave me his email address and insisted I come to the huge party he’s hosting this summer (every summer), the pool party with all his rich buddies and girlfriends.

Usually I’m incapable of being polite to people who are rude. Sometimes they make me so angry that I longingly imagine vandalizing their house. Spray-painting it or something. This job can get discouraging once in a while. Every day is *no no no no no no no no no no no no yes no no no no yes no no no no no no no....* Most staffers last about three days. It’s unfortunate, because a lot of them are great people I’d like to work with. Today a sweet and sexy girl named Katie quit.

On the whole, though, I think the job is quite easy. The only problems are the St. Louis heat and the fatigue that attends an 11-hour day.

the community

apathy-baked blisters
 popping open
 in the leaden heat of tradition-drenched climates
 across the canvas of American suburbia,
 neighborhood-wide blisters
 that ooze “no”s and “*I don’t care*”s and
 such polluted cynicism.
 knocking on doors and opening pores
 that seep fetid
 selfishness—*smellable*
 selfishness
 in the curled snarls
 on the fat and aging faces, gargoyles
 twisted into the woodwork.
 splintered faces—blistering.

I can’t decide on the significance of the repudiation of femininity by both sexes. Men repudiate it wholeheartedly [as regards themselves], while women do so half-heartedly. They’re caught between the desire to be as autonomous, rational, dominating and self-confident as men, and the desire to be cared for, protected, loved and spoiled by a man. They always have been; the only difference between the past and modernity is that the desire to be man-like is more socially accepted and pronounced now than it used to be. It used to be more unconscious than it’s become. This makes sense, because capitalism has intensified the competition-element of civilization, and masculinity has always been identified with competitiveness and individualism. So, in a sense, capitalism epitomizes masculinity—even though, in other (more ideological, less purely economic) senses, modern culture is more effeminate than ancient culture. But the masculine, atomistic, rationalistic¹ mentality derived from the economic sphere necessarily permeates all other spheres, and so everyone partially succumbs to it (even more so because it resonates with people’s

¹ ‘Masculine’ doesn’t imply ‘rationalistic’ and ‘atomistic’, but these traits are more naturally masculine than feminine. [See my later writings on sex and gender.]

transhistoric psychological needs, in particular their need for recognition and respect. Of course, it couldn't become culturally predominant in the first place if it didn't so resonate.). Including women. Hence, modern women are even more ambivalent toward femininity than pre-modern women were. But there was always this ambivalence—at least, since the dawn of civilization. See my thoughts of December 20th.

It would be interesting to trace the accidental parallels between, on the one hand, the biological predispositions of the sexes and, on the other, the structures of societies. Certain ideologies and social structures can be called more masculine (or feminine) than others. But I don't know how theoretically fruitful it would be to draw such parallels.

By the way, I think that people tend to overestimate the historical differences between “East” and “West”. And to underestimate the differences between Eastern cultures and between Western cultures.

Pascal's question—“Why do I exist *now* and *here* rather than at a different time and place?”—is puzzling precisely because it's unanswerable. This can be seen clearly if you ask the same question of, say, a dog or a plant. Why does this particular plant exist now and here? “Well.... It just *does!* There's no *reason*. The seed just happened to produce this plant rather than another.” Same with people.

Still, there's something unsatisfying about that. The question is meaningless, but not *completely* meaningless. For example, it surely was possible that my parents' first son would be not me but someone else (say, if a different sperm had reached the egg). Let's suppose for the sake of argument that this other son would have had a personality nearly identical to mine. So if you compare the actual world to this possible world, my parents can't distinguish between the actual me and the other possible son. He could have been me, or I could have been him, without their being any the wiser. In fact, for all they know, I *am* him, and not myself! For *I* might not have existed even as someone with an identical personality did (‘in my place’).

But this is all very weird. As I've said before.

Eternity

In the village hut,
 Below the scalding metal roof
 Below the crushing Laotian sun,
 In the dark,
 A blood-drained woman lies, leather-skinned,
 Legs spread apart,
 Dying, shrieking soundlessly, frozen
 To her stillborn son in her arms.

But the waning day has no remorse,
 And the coming night is empty
 And not soothing,
 And nothing—nothing changes.

On the fresh-tarred street,
 Sprawled in the gutter beside the curb
 With frozen mud in his hair,
 Fingers rigid,
 Lies a starved, bloodless man, homeless
 Formerly,
 Now nothing but something unpleasant
 Which must be taken care of.

But the waning day has no remorse,
 And the coming night is empty

And not soothing,
And nothing—nothing changes.

In the Adriatic,
Rusting, rotting like the hull
Of a submerged titanic ship,
In the dark,
A ruined palace of a city sleeps,
Unconscious
Of the irony, its famed canals
And piazzas home to memoryless creatures.

But the waning day has no remorse,
And the coming night is empty
And not soothing,
And nothing—nothing changes.

Monday, May 29

Reading short stories in the anthology by Ann Charters.
Here's an uplifting one I wrote today:

The Joy of Life in 2006

It was a joyous day when I finally moved into my new house. I had lived in that rotten old apartment for years, and it had long since kept me day and night in depression. It was dark, first of all, windowless except for one in the living room (which was more like a closet for a television than a room to live in). And even that window had a nauseating yellowish tint, probably because of the pollution from all the cars on the highway below. That highway, by the way, had made me miserable when I'd first moved in, but I'd become used to it. The noise no longer bothered me—at least, not on a conscious level. I wouldn't be surprised if the monotonous roaring had somehow *unconsciously* poisoned me. But I don't know about that. All I know is that that damned apartment was gloomy, and I had to get out of there. So when I realized that I'd finally saved up enough money to buy this new house I felt almost reborn.

This house wasn't what you'd call a mansion, but it was inhabitable. It was out in the suburbs, in a pleasant neighborhood with pleasant people—and nowhere near a highway! The people were very friendly, helping me carry in my furniture (what little there was) and advising me where to put it. This one little girl was adorable, running around the house and shouting, "Over here! Put it over here! And that desk should go in that corner below the window, because the light will make it look nice! You need light if you're gonna write there, right?!" I obeyed all her orders, not so much because I thought them sensible as because I couldn't imagine *not* obeying them.

Anyway, I was proud of my little house, and pleased with its location, and I thought that all was well. "At last!" I thought, "at last I can be happy and content! No more constant tiredness and messiness and apathy just because I live in a gloomy old hell-hole!" This house was what a woman might call "cute". The kitchen, for example, reminded me of those toy kitchen-sets for children. It was essentially an adult version of those, with its small blue cabinets and pink counters (—yes, *pink*; but I was okay with that) and diminutive table in the middle of the room. The living room had a comfortable couch and large windows facing east, so sunlight flooded the room in the morning. Every morning I would sit on the couch, sip my coffee and listen to Mozart laughing from the stereo. (Mozart was my only connection with high culture.)

During the honeymoon period, my mental health returned. I also made friends with a number of dogs in the neighborhood. (The only problem with that was that I had to wash my hands after I touched

them. That sweaty-dog-smell is quite terrible.) And, as I said, I liked the children, who played frisbee in my backyard—I always joined them—and street-hockey when cars weren't driving past. I regained my native optimism and began looking to the future, making plans. I was ambitious and confident I could rise high in the company I worked for, since I was becoming an expert at manipulating office-politics. I even started to fancy myself a budding politician. Maybe I could do some good for the world, “work for the common weal”! The thought was seductive. But most importantly, I wanted to fall in love and find a wife. I was already thirty-four years old, and I figured it was time I made something of myself.

But then things started to go wrong. The house wasn't as ideal as I'd thought. When it rained, leaks developed in the ceilings. There was even one above my bed! I woke up one night in a puddle of water! (That was unnerving. Only after smelling it was I reassured it wasn't my fault.) The leaks wouldn't go away, no matter what I did to fix them. Another problem was the peeling paint on the outside of the house and even in one or two rooms. It was unsightly. Soon I learned that the house was infested with termites. (The real estate agent had been smart enough not to tell me that.) And when the weather got cooler, most of the rooms became drafty. In short, complications piled on complications.

One unpleasant incident turned the neighborhood against me. (These suburban neighborhoods, by the way, are all cotton candy on the outside and bitter licorice on the inside.) I was slumped over in my kitchen chair one day, brooding on my recent failure to be promoted to office manager—which I had thought was a sure thing—when a baseball crashed through the window and landed on the floor in front of my feet. It very nearly gave me a heart attack. I heard giggling outside, so I ran to the window in a fury. Cindy, the little girl who had helped me move in and whom I genuinely liked most of the time, was holding a bat while sporting a guilty smile. Her friends all pointed at her laughingly and said, “It was her! It was her! She aimed right for your window!” “I did not!” she shouted back. It didn't matter; I was furious and had been in a bad mood already, so I cursed at her. Called her a name I don't care to repeat here. Then I said I was keeping the ball and told her to get the hell out of my yard. So she did. But not before making it clear, with her eyes, that I had suddenly become her implacable enemy. And that I was soon to be her *parents'* implacable enemy as well. And thus the whole neighborhood's. Though I apologized afterwards, none of them ever looked at me the same way again. And so I felt like I no longer belonged there. I had violated suburbia's sacred code of *saccharinity*, and was ever after an outcast.

All these troubles dampened my enthusiasm about my 'new' life (which was by now several months old). I grew sick of it all. I couldn't stand this house anymore—those pink Formica counters were *awful*; the kitchen table was far too small; the wintry weather was inescapable even in the warmest rooms of the house; I had neither the energy nor the money to restore whatever architectural integrity this one-story mockery of a house had once had—and I felt like an outsider in my neighborhood. (Not just because of that one incident. I had discovered that my neighbors were boring people, who watched TV too often and had nothing interesting to talk about.) On the whole, though, it was mostly my crappy house that made me increasingly miserable.

Seriously, after six or eight months of living in that cramped house I felt myself losing my ambition again, all my lofty hopes of what I'd accomplish in life. There's something about one's living situation—even in its purely physical aspect—that influences what kind of person one is. My personality was growing as constricted as my house. And I was lonely, and none of the women I spent the nights with could cure me.

One day, as I was seeking solace in a bookstore, I came across a book called *Walden*, by Henry David Thoreau. On a whim I bought it. Read it that night. A lot of it was over my head, but it inspired me. “Simplicity!” Yes, simplicity! That would make life so much easier! “Our life is frittered away by detail.” Yes! I had been bogged down so long in such deadening concerns as how best to kill off termites and whom to hire to paint the house and repair the leaks and how to reconcile myself with my dreadful neighbors that I was unknowingly frittering away my life, and before I knew it I'd be five years older! I realized I had to break out of this cycle. I had to save myself, before I became one of *them*. (My neighbors, that is.) I had to follow Henry's lead and break with my lifestyle, at least for a short while. But how? *How?* That was the only problem.

I couldn't build a cabin in the middle of a forest, because, first of all, I wasn't an architect, and secondly, where would that get me? I'd have to quit my job and sell my house, and then when I decided to rejoin society I'd have nothing to do and nowhere to go. And no money. So that was out of the question. But I really did need a break from the constant daily hassles and stresses and the tedium of life. I could no longer stand the sight of my house—nor, for that matter, the thought of having to go to work everyday, nor the incessant polite conversations that were the price of admittance to society. I needed a vacation. A long vacation.

But my boss wouldn't give me one. So I was apparently trapped. I thought and thought, but no solution to my "existential anguish" presented itself. In the end, therefore, I was compelled to remain in that damned house. I dealt with the termites and the leaks, and I accepted the neighbors for what they were—namely, sources of amusement, people to make fun of and occasionally complain to about my job—and I even got married, hoping this would calm the restlessness that still asserted itself periodically. It did, for a while, but not for long. Neither did having children. (That just made it worse.) And now here I am, fifty years old, still living in this damned house.

*

I don't have the endurance to write anything that takes longer than a few hours. I'm too lazy. And I never feel inspired anymore.

Once in a while I read a blog entry or a letter to the editor by Richard Dawkins, the great crusader against stupidity. He takes it upon himself to try to use rational argumentation to convince Christians that they're wrong. Daniel Dennett did the same thing in a book he recently published—which he wrote specifically to be read by Christians—that attempted to debunk Christianity by speculating on its genealogical history, à la Nietzsche. (Or so I've heard.) I would suggest to these two men that they give it up. Let history deal with Christians; philosophers will get nowhere with them. How can you argue with people the premise of whose belief-system (insofar as they really believe it) is that evidence counts for nothing and blind devotion is the highest virtue? The 'blindness' part is absolutely essential to Christianity; not because one has to be blind in order to believe in it, but because faith is supposed to be an act of "infinite trust", based not on logic but on a *leap of love*. The more one *argues* for Christianity (in the mode of science or philosophy), the less one understands it. This is why people who always fall back on the stock answer (to rational queries) "God works in mysterious ways" are right to answer so. The spirit of their religion demands that they not take part in philosophical cerebration, lest they disrespect their god, who demands blind obedience. At the core of Christ's teaching is the precept, "Have faith in me for the *sole reason* that it is for your own good"—though this may be expressed in loftier-sounding ways (for example, by saying that since God loves you, you should love him back). In other words, being a Christian means, by definition, suspending rational thought (such as the search for evidence)—which indeed helps explain why not a single verse in the Gospels praises intelligence. (Intelligence is dangerous to Christianity! This belief-system is intended only for people who need comfort, i.e., for the "meek".) The impossibility of fulfilling the Christian project has made inevitable the many philosophical and 'scientific' defenses of it that have been proposed over the centuries. (The only philosopher who really understood it was Kierkegaard. Hence his never arguing for it, except from an anti-scientific perspective.)

This is predictably ironic, by the way. An atheist understands Christ's teachings better than most Christians.

Certain episodes in the Gospels are as beautiful as anything in literature. The woman caught in adultery, in John, ch. 8. That scene is immortal. If we had no other record of Jesus but those eleven lines, he would be nearly as compelling and enigmatic a figure as he is now.

Reading the anthology *Wittgenstein and the Problem of Other Minds*.

Thursday, June 1

I'm meeting Lauren tomorrow. (Getting the day off work. I'll have to make it up on Saturday.) She's quite excited. Unfortunately I no longer know what 'excitement' means, but I'm looking forward to seeing her. (I'm tired of writing emails every day, though.) Her latest idea is that we read the same book at the same time so we can talk about it in our emails. We've decided on *Zen and the Art of Motorcycle Maintenance*.

One of the advantages of this job is that it gives you insight into the fanaticism of greed. You meet the scum of the earth, especially in the wealthy neighborhoods. Today I canvassed such a neighborhood: mansion after mansion. Ninety percent of the residents were misers. One old man seemed interested in donating, so he took out his wallet and looked through it. I glimpsed a few twenty dollar bills and a hundred dollar bill. But when I suggested he give "30 to 60 dollars, or whatever you can afford", he said "No, I can't give that much. But I can write a \$10 check." So he went into the house, climbed the stairs to the second floor—a slow process—came down again a few minutes later, went into another room, and emerged a minute later to ask who he should make it out to. I said MoPIRG. He was hard of hearing, so I repeated it and spelled it. About five times, because he couldn't remember the P-I-R-G part. At last he finished it, so I thanked him and left, muttering "Fucking ass". Still, he was one of the generous ones. The rest were not only miserly but obnoxious. (I did meet one woman who gave me \$100. She was a wonderful person, friendly and supportive. She even had the common decency to remark on my soaking hair and clothes, due to the thunderstorm.) So I lost my politeness. One woman answered the door and interrupted me with "The climate goes in cycles! You should read up on the science." (That's a common response. Self-proclaimed scientists often tell me that.) This time, instead of letting it go, I said, "You should watch Al Gore's new movie." She scowled. "I wouldn't waste my time! And this is a private street. You can't be soliciting here." "I'm not soliciting." "Yes you are." "No I'm not." (Apparently she didn't know what 'soliciting' means. The Supreme Court has ruled that political canvassing of this sort is not 'soliciting'.) Then she waved her hand, as if dismissing me. So I mimicked her scowl and waved my hand back, in disgust. She slammed the door.

My 18-year-old coworker had a terrible night. She reported, for example, that a rich old shylock had said, in reference to her "ignorance" of "science", "Do your fucking homework!" Which, together with the rest of her night, had made her cry.

Well, at least the two directors of the office, 24 and 23 years old (Erin and Jackson), are amazing people—*inspiring*—and my other coworkers are good too.

Friday, June 2

I ought to have made clear in my ontology paper that there are two senses of 'blind rule-following' that have to be distinguished. After reading Norman Malcolm's paper I can see that Kripke confuses the two,¹ and that Wittgenstein's point is consistent with my own position. On the one hand, if we privately denote a given sensation by, say, "lidge", and tell ourselves that we're feeling "lidge" whenever we think we feel this sensation, we're applying our name *blindly*. We think we're following a rule, but we're not, because whatever we think is the correct way to apply the name will *be* the correct way, and that means our act is not rule-governed. We can do whatever we want, and nothing can show us to be incorrect except our own feeling that we've applied the name incorrectly. On the other hand, we use a *real* rule like addition blindly inasmuch as we use it 'by compulsion', i.e. without having any choice in the matter and without having any conscious justification for our use except that we feel it *must* be this way. The difference between the two cases is that in the former, choice is everything—there is no *involuntariness*, no *compulsion* to our application of the name—while in the latter there is no choice whatever in our application of the rule.

¹ Actually, I saw this a few months ago, but then I forgot.

Kripke confuses the two senses of ‘blindness’, and thus thinks that the second method of rule-following is as unjustifiable as the first. (To express it without the ‘blindness’ metaphor: in the first example, the reason that whatever seems right to us will ‘be’ right is that there is no way for us to check whether we have used the name “lidge” correctly; in the second example, the reason is that the nature of the ‘seeming’ is itself the means by which we can ‘check’ our application of the rule. The involuntariness of the seeming tells us that we’re following a rule we’ve internalized, while the criterion of one-to-one correspondence tells us that we’re following the specific rule of *addition correctly*. I discussed all this in the paper.)

Also: Kripke doesn’t appreciate that Wittgenstein holds the sensible opinion that certain statements and beliefs are incorrigible (as is evidenced by Kripke’s invoking the LSD thought-experiment). If I say, “I’m in pain”, and I mean it, I can’t possibly be wrong. Being wrong here would make no sense; we can have no conception of error in such a case. Therefore, a person uttering such an avowal can ‘know’ that he is “following a rule” correctly (i.e., that he is using ‘pain’ in the right way) without relying on the testimony of someone observing his behavior (as Kripke would have it). The problem, though, is: which utterances are incorrigible and which aren’t? Surely there isn’t a clear boundary. –But this is all related to my thoughts on knowledge and certainty. Maybe it goes back, somehow, to the meaninglessness of certain forms of doubt. Or maybe there *is* a clear boundary between corrigible and incorrigible statements (i.e., statements with respect to which doubt can be substantive and those with respect to which it can *not* be substantive).

Damn it, there’s *something* about the problem of certainty (and its derivatives) that is misguided. I don’t think I’ve ever quite put my finger on it, because I keep returning to these questions.

I met Lauren today, at the Forest Park art museum. Her parents were with her—very nice people—but after the greetings we split up. Toured the museum, then walked around the park. Perfect weather. Fountains, lakes, rivers, ducks, picnickers, small woodsy areas, couples lying on their blankets together in the shade, the Shakespeare festival (*Julius Caesar* hip-hoppified; Caesar was a pimp); we sat on the grass near a lake with canoers. After a minute of hesitation I kissed her, which she wanted and was expecting, and we kissed awhile. She was wearing a lovely summer dress, beige with flowers woven in. I’d forgotten how fun kissing is. Then we lay there and talked, and then we met her parents again and parted. She’s pretty (not beautiful), and laughs and talks well.

It was a strange experience to kiss. I’d gotten into the habit of assuming I’d never kiss anyone again.

Saturday, June 3

Wittgenstein:

A doctor asks: “How is he feeling?” The nurse says: “He is groaning.” A report on his behavior. But need there be any question for them whether the groaning is really genuine, is really the expression of anything? Might they not, for example, draw the conclusion “If he groans, we must give him more analgesic”—without suppressing a middle term? Isn’t the point the service to which they put the description of behavior?

That reminds me of what I wrote above: “The weird thing is that the satisfaction derived from a communal bond is direct: communal bond \supset satisfaction. If A, then B. There is no ‘inner’ mediary in consciousness, no phenomenologically detectable element that mediates between the bond and the satisfaction[, that *explains* the satisfaction].” In Wittgenstein’s example, it never occurs to the doctor or nurse that groans signify pain. Their reaction is ‘conditioned’, sort of; they don’t rationalize or justify (even to themselves, even inwardly) their giving the patient analgesic. They just do it automatically. Pavlovian dog-ly (though not *quite* to that extreme). Obviously both the satisfaction and the decision to administer more analgesic can be explained *neurologically*, but that’s beside the point. The point is that *phenomenologically*, neither the doctor nor the person in a communal bond is aware of the reason for his reaction. His reaction just

‘happens’, ‘comes naturally’. (The doctor’s inclination toward the decision to give more analgesic is almost as involuntary as the person-in-the-other-example’s satisfaction.) In both cases, there is no middle term in their consciousness, although logic says that this middle term is necessary and implicit. But for it to be *phenomenologically* implicit, as opposed to explicit, doesn’t make much sense. (It’s the paradox of “half-consciousness” that I’ve described.) —The reason all this is interesting is that it does violence to our intuition that we have a self (which is the foundation of our intuition that we have free will and that our actions and mental states necessarily ‘pass through’ the self), for the “implicit” middle term is what relates the consequent to the self. (In the first example, the middle term would be something having to do with the communal bond’s effect on one’s self-consciousness or self-respect; in the second example, it would make clear the connection between groaning and pain, thereby relating the doctor’s decision to use more anesthesia to the *patient’s* self. But this relating, if the doctor actually reflected on it, would also relate his decision to *his own* self, namely by filling in the logical gap(s) in his course of action (in his own mind), thus reinstating his (specious) autonomy, his (illusory) self-determining self.) This may not be exactly why Wittgenstein found it interesting, but it’s the real reason.

I wish I could explain myself better.

Sunday, June 4

(A return to something I’ve written about before.—) If people didn’t have names, it’s possible they wouldn’t have a very secure sense of themselves, of their identity. Names help cohere personalities into a unity despite all their contradictions. Despite the fact that I’m an inordinately complex person, I will always remain *Chris*, and will thus always be *one person*. *Chris* has hundreds of contradictory traits; *he possesses them*. He is at their core, their center; and when his sense of himself starts to become a little slippery he can reassure himself that he will at least always be *Chris*. If he didn’t have a name, then, he would have a less sure sense of himself, and would thus have a less sure sense of his status as an *individual separate from others*. I wouldn’t be surprised if the invention of names coincided roughly with the beginning of the Neolithic age, because civilization is characterized by heightened self-consciousness and diminished group solidarity (caused by changes in the social structure that accompanied the Neolithic revolution).

Thursday, June 8

A couple days ago when I was canvassing in Rock Hill a woman with a flabby pockmarked face got into an argument with me. “Do you have a permit to solicit?” she demanded. Once I saw I wouldn’t get any money from her I ended the conversation, but then she must have called the cops, because ten minutes later two of them showed up. One on a motorcycle, one in a car. The first one wanted to see my permit, which I didn’t have because we hadn’t received them yet. I told him we’d called City Hall and they’d given us permission to canvass, but he said I had to get a permit and come back the next day. I started to argue with him. Something about cops always infuriates me, and I can barely prevent myself from being as much of a dick as they are. “Go back to your car and leave!” he said. So I walked towards it, and they left. And I resumed door-knocking. Two hours later he came back to the neighborhood, spotted me and threw a hissy-fit. “Hey you! I told you to leave! Do you think I talk just to hear myself?! Do you think I’m stupid?! Because I’m beginning to think you’re stupid! Go back to your car immediately and leave or you’ll go to jail!” I didn’t say a word but walked slowly to the car as he followed me on his motorcycle, calling for backup. When it arrived he left, and my new friend followed me in his car to make sure I left the neighborhood. But I was feeling a strange lack of respect for authority, so I drove slowly around the neighborhood in a circle (or a square), back and forth, with the cop following me. Once he caught on to the game he flashed his lights and did the siren thing, so I pulled over and waited for the tongue-lashing. But it never came. After sitting there a minute he suddenly peeled out and drove past me and out to the highway and out of my life. I could have stayed in the neighborhood but decided that might not be the best idea and

instead went to a different one, where I continued canvassing. (It was all to no avail. Only one person donated that day.)

I was tempted to tempt the coppers even more than I did so I could experience a night in jail just to see what it's like, but I figured it would have been more trouble than it was worth.

One's immediate, intuitive, ineffable sense of self is a social and psychological construct. So is one's *discursive* sense of oneself, one's self-description(s). But (self-)consciousness itself is a biological phenomenon, which doesn't involve idiosyncratic 'psychological' facts (though it coexists with them in consciousness). Admittedly, it's originally created in social interactions during early childhood (primarily with one's parents); still, once infancy is over—once consciousness has, to some degree, become aware of itself—self-consciousness has no need of one's *psychological sense of self* in order to exist. In real human beings, the latter is indeed an important part of consciousness—for instance, the 'flavor' of my consciousness is a disinterestedness, a perpetual observing even in the midst of acting, a certain light-heartedness, and (this applies to everyone) a half-consciousness of the inner contours of my face as well as an ever-present expectation of how I'll act and a lingering memory of how I just acted, etc.—but self-consciousness, which is the core of one's (sense of one)self, is just a bare fact which is, as such, the same in everyone. (Obviously by 'self-consciousness', in this context and most others, I don't mean consciousness of one's identity or "sense of oneself" or one's past or whatever, but simply consciousness of consciousness, consciousness of existence, which is the kernel of *empirical* human consciousness, i.e., any given person's experience (of consciousness)¹ in any given moment. This pure self-consciousness is an abstraction from real empirical consciousness.)

So in *Zen and the Art of Motorcycle Maintenance*, Pirsig's current self is different from Phaedrus, 'his' earlier one (which of course isn't 'his', but simply existed in 'his' body), because Phaedrus had different memories, a different intuitive sense of himself (which was largely conditioned by—and even immediately involved—his memories), and discursively identified himself (and his goals in life, etc.) in different ways than Pirsig does. Pirsig has no recollection of being Phaedrus. He has only occasional memory-fragments that have survived the shock therapy. As far as Pirsig knows, that is the extent of the psychological continuity between him and Phaedrus. Now, because a person's self is, for him and for others, not just the bare fact of (self-)consciousness but a fusion of 'characterological' intuitions (which, as I said a few days ago, coalesce around a *name*), Pirsig *is* a different person than Phaedrus. From an 'objective' viewpoint they may share a number of traits and inhabit the same body, but this doesn't mean they're the same person, because in a concrete human being (as opposed to the abstract idea of one) the "self" is primarily the (self's) "*sense of self*", even if the self's kernel is consciousness of consciousness, and as such is the same in everyone. "Sense of self" can't be precisely defined because it's intuitive and ineffable. Of course, one might think that, as a mere "*sense*" (composed of memories and so on), it cannot really be *active*, the '*I*' that *acts*, and thus violates one of the criteria I chose in my senior thesis for identifying the 'true' self. But its necessary activeness is provided by self-consciousness, which, as I have said, is the 'center' of the empirical self (*viz.*, a person's full and active intuition of himself). Because the self as a whole includes this psychological self-perception, Pirsig and Phaedrus are different people even though they share the same body and some of the same traits, as well as—necessarily—the same "bare fact" of self-consciousness.

(When I wrote above that the essence of the self includes both self-consciousness and one's inner awareness of one's face, I was confusedly anticipating these ideas.)

This is all verifiable not only through intuition but also common sense. When a philosopher asks himself, "Who am I? *What* am I?" and is tempted to respond, "Well, I'm just *me!*", he is corroborating my ideas. The only way he knows how to answer the question is to invoke his consciousness of himself. This is what the circularity of his answer signifies. It doesn't mean that the answer is utterly trivial, as he's inclined to think (since he has been trained to think that circular answers are uninformative). Instead, the significance of his being able only to point to his self-consciousness by way of an answer ("I am myself")

¹ That parenthesis is a redundancy.

is that he has unwittingly shown that self-consciousness *is* the self. He thinks he isn't answering the question by saying "I am I", but in fact he has given the only possible answer. "I am 'my' self-consciousness." *That's* what he has said, though he doesn't know it. But by "me" or "myself" or "I" he doesn't mean self-consciousness as I've defined it, an abstraction; he means his full, empirical self-perception, his full self-intuition at any given moment. This has been shaped over his lifetime; it's related to his perception of his body, to his memories, his habits of thought, etc. The only reason it makes sense to say that it is *himself*, i.e., an active, self-present being, is that consciousness of consciousness lies at the heart of it, and consciousness of consciousness is really the only 'act-ive' (self-present) thing in the psyche. In normal people, this full and active self-perception is so integrated with itself that it's very hard for them to abstract, in thought, the element of pure self-consciousness from the rest—which is why they can't give a coherent answer to the question "What is the self?". In some people, though, self-consciousness more or less splits from the other components in the self-perception, and looks on them as a foreign object. It sees them as a second self, a false one. It can't split entirely, however, because then in its full empirical existence it would be *nothing but* consciousness of consciousness, which is absurd. Consciousness always has other thoughts, or 'awarenesses', passing through it. So the self-consciousness that has split from the properly *psychological* self-perception with which in most people it is fused associates itself with other traits/intuitions, with a *new* self-perception, such as an unnatural contemplativeness, an emptiness, a loneliness (it feels like it has lost its content, as if it is now just a husk, observing the *other* self, the *non-active* self (which, ironically, is in a sense much more active than the "active" self, the self that feels it is the *real* self)). But then it may come to think that this new, emptier self is itself false,¹ a mere 'act', and it will dissociate itself from it. This will result in even more emptiness and uncertainty, more alienation. The self will realize that the process of self-splitting can never end. It will probably lose all sense of self-identity and self-continuity, since, even though it tries to dissociate itself from everything that has content, it cannot do so completely (—as an empirical phenomenon it necessarily has *some* content; it can't be just self-consciousness and nothing else); and so it's thrown between all kinds of 'contents', identifying itself now with one and now with the other—now with emptiness, now with love, now with an idyllic childhood, now with old age. —Of course, "self-consciousness" itself (in the 'abstracted' sense) isn't doing this identifying, since self-consciousness is nothing but consciousness of consciousness and as such cannot "identify" with anything except itself; but this just reinforces my point that self-consciousness necessarily empirically 'includes', or coexists with, some thought or other² that isn't itself—in this case, precisely the thought that it doesn't own any of the thoughts that pass through it or any of the actions that it 'approves' but looks on as alien. 'It' might think, for example, that "None of these thoughts I'm having is really *mine*. I go from one to the other—from wanting to rape a girl to wanting to die for her sake—but none of them belongs to me. Not even *that* thought belongs to me!" The once-full and -robust (sense of) self has been virtually reduced to its core, self-consciousness. The psychological, identity-constituting intuitions and self-perceptions that the robust self included have been repudiated; virtually all that's left of the self is self-consciousness. (This makes sense in the context of my ideas. The self has been reduced—as much as is empirically possible—to its core, which as I've said is self-consciousness. Since one's perception of having an identity doesn't come from bare self-consciousness but rather from the sense of having a consistent psychology—and since one's psychology has been repudiated as foreign, as not belonging to the self—this loss of any anchor for the (sense of) self besides self-consciousness itself results in a loss of identity, a constant self-doubt and inferiority complex.)

¹ Obviously, it's a "new" self in a different way than Pirsig is a "new" self relative to Phaedrus. Pirsig and Phaedrus are quite literally two different selves; on the other hand, the self that feels itself split is *one* self, albeit one that is aware of psychological divisions within itself. (In other words, it doesn't fully identify itself with certain of 'its' psychological aspects, even though it recognizes that these aspects are also somehow intimately related to it. There's an intimacy but also an alienation, neither of which is understood. Hence the identity crisis.)

² Actually, there are many. Most of them, however, are half-conscious—half-conscious perceptions of oneself, which make up much of the "(sense of one)self" I referred to earlier. Their status as half-conscious helps explain the remarkable vagueness of the empirical (sense of one)self.

(Charles took R. D. Laing's book from me over a month ago, but clearly it made an impression on me. I'm extending his account by annexing to it my own metaphysics of the self, thus giving it a philosophical foundation.)

Saturday, June 10

They pulled me crushed and bleeding from the mines; the shock of the open air killed me.

The Storm

The earth is black. Sky-waterfalls have drowned
 The day, so that it's night already. Night...
 Cascading roars self-tumble down the night,
 The rolling echoes of cloud-timpani
 Careering through the dark, like massive mold-
 Besotted logs that thunder down a hill
 Unstoppably. They quake the earth. It shakes.
 Its shivers, friendless in the deluge, are
 Illumined by the sky's electric rage:—
 The lightning-bullets penetrate the mud!
 They splash the night a bluish glare and then
 Are gone, as if to prove that ghosts exist.
 The sudden frozen sky-dividing flare,
 Night's guillotine—scaffold-skeletal—
 Is echoed in the boom that cracks, ruptures
 The caul of Chaos, all birth-bloody and hideous.
 A branch smashes a window somewhere near,
 Wind-torn from its old socket in a tree—
 Or maybe lightning-severed. The telephone-line
 Outside explodes in sparks, thus cutting off
 Communication and reducing life
 To huddled silence dimly candle-lit.
 Cowering in the corner, far from windows,
 And cringing when the cannons overhead
 Let loose their rounds. There is no sleep tonight.

Taking into account the narrative in his book, we colloquially say that Robert Pirsig was a certain way in the early part of his life—intense, obsessive, depressive, irascible, always hovering on the fringes of sanity, etc.—and very different in the latter part of his life, after his shock therapy. Pirsig, however, would say that he wasn't just "different"; that earlier person wasn't even *him*. It was someone totally different, as different as, say, I am from Nietzsche, except that the earlier person existed in Pirsig's body and some of his memories have carried over into Pirsig himself. If pressed, he would admit that there's a more intimate relation between him and Phaedrus than there is between Nietzsche and me, but he would still maintain that they were two different people. And he'd be right. *We'd* be right too, though. From the outside, we see obvious continuities between Phaedrus and Pirsig, between their personalities, their experiences, and their physical existences. The two of them constitute, in a sense, one person, whose peculiar psychological history has split him up, *'for himself'*, into two people. This paradox of two contradictory reports' (Pirsig's and ours) both being true is due to the ambiguity of the concept 'person'. The concept 'self' is less ambiguous, which is why we're more willing to admit that Pirsig and Phaedrus

are (or 'have') indeed two different selves.¹ We recognize that 'self' is purely an inner phenomenon, a phenomenon of the consciousness of a given person, and as such is not essentially related to 'accidental', 'external' physical or psychological continuities—continuities obvious to outsiders but less so to the person himself. The self is an intuitive, phenomenological construct, while the person is largely a behavioral, physical construct. Still, due to the ambiguity of 'person'—like 'self', its usage is related to a person's *inner* experience of himself, though less so—we can also appreciate the truth of Pirsig's belief that Phaedrus is a different person. He *is* and he *isn't*.

I should note that there are physical criteria relevant to the proper use of 'self' also, though they come into play only in exceptional circumstances. If I remember being Julius Caesar I might say that he and I are the same person, and have the same (sense of) self (in that 'my' self is a continuation of 'his', as it's a continuation of my self at the age of 15); you'll say I'm wrong, because there's no spatial or temporal continuity between us, and so my self can't possibly be a 'continuation' of his. In this case my consciousness isn't what matters most, even though we're talking about my sense of self. External physical facts prove me wrong.

Suppose Ed Norton's character in *Primal Fear* really did have the personality disorder he pretended to have. His two personalities would correspond to two selves, because they correspond to two totally different consciousnesses. One could also with justice say they were two *people*. And yet one could say they were two aspects of the same person, a person who had such-and-such a kind of brain and such-and-such a kind of personality disorder. Both uses of the word 'person' might sound a little odd, a little artificial, but that's because the various conceptual undertones of 'person' pull the word in both directions. Some of its undertones pull it toward the 'two people' hypothesis, while others pull it toward the 'one person' hypothesis. There's none of this ambiguity when it comes to 'self', though. In my thesis I thought there was, but, as I recall (vaguely), I approached the problem then from the wrong direction. I was blinkered by my obsession with the self as being bare self-consciousness and my understanding that, as such, it's the same in everyone. Since the self is in fact one's *sense* of self, one's psychological intuitions of one's boundaries (which intuitions—to repeat—are centered around self-consciousness (without which there would be only a selfless 'bundle' of perceptions, as in animals) but always embellish it, so that it never exists in its pure form), there *are* differences between my self and your self, and between the two selves of Ed Norton's character. It *isn't* a total mystery what it means to say that the two selves of that person are

¹ The grammatical conflict between 'are' and 'have' is a product of the conceptual differences between 'person' and 'self'. 'Person' is a broader concept, comprising not only my intuition that *I am I* but also 'external' facts like physical and psychological continuity. 'Self', on the other hand, takes account only of my sense that *I am I*. 'Objective' or 'external' continuities have nothing to do with it. As a person, I *have* a self (I am 'broader' and more 'objective' than my (sense of) self); as a (sense of) self, I *am* a (sense of) self. 'Person' is more behavioral, i.e., more from-the-perspective-of-the-other; 'self' is more phenomenological, i.e., more from-the-perspective-of-oneself. I experience you as a person; you experience yourself as a self (though you also partly assimilate my experience of you as a person, i.e., as an object for other people—which explains Pirsig's admitting that there's a more intimate connection between him and Phaedrus than there is between Nietzsche and me. As far as his immediate intuition of himself goes, there isn't, but insofar as he sees himself from an external perspective he can see that there is.). In my senior thesis I explained the 'are/have' ambiguity by saying that self-consciousness, the essence of the self, is molded through experience in such a way that the 'self' of which it is 'consciousness' includes the body, memories, etc.; and therefore, from the perspective of this broad empirical sense of myself I say that I (viz., my empirical totality) *have* a self, by which I'm referring (whether self-consciously or half-consciously) to the purer essence of myself, my consciousness of consciousness, while when I say that I *am* a self I'm speaking (again, whether I know it or not) from the perspective of this purer self-consciousness, rather than from the perspective of my total empirical existence (as I was in the first case). But no, this is wrong. At the moment I wrote it, in the intensity of introspection, it may have been an apt description of what I was doing, but ordinarily people don't distinguish, even half-consciously, between meanings of the word 'self'. Still, my suggestion was a confused grasping of the truth. As a *person* I'm *broader*, more 'external', than my inner sense of self is; as a *self* I'm *narrower*, more *subjective*, than my personhood is. —Incidentally, this footnote illuminates the point I'm making in the text too.

different from one another, because, while their analytical essence is identical, their full empirical reality is not.

Since I don't have the thesis in front of me I haven't been able to put myself into the confused state of mind I was in when I wrote the chapter on the self, so I may have missed the point of the confusion.

Pirsig's philosophical investigations leave a lot to be desired. (The classical-romantic dichotomy, for example, is simplistic, though it does highlight certain contrasts in ways of thinking.) But the book isn't a philosophical treatise, so I guess that's forgivable. Actually, I don't know what it is. A collection of an amateur philosopher's amateurish attempts to philosophize, interspersed with descriptions of a father-son relationship. Not a novel, not an essay; sort of both.

quiet soft body
lying on the wet red ground,
smashed car next to it

throbbing heart sinking
beneath purple-layered breaths,
evaporating

warm exhalations,
pleasant and reassuring,
from the computer

Tuesday, June 13

I was wrong: our intuitions about the self do sometimes pull us in opposing directions. If I'm confronted with irrefutable evidence that I did a certain action but don't remember doing it, I might not think 'I' was the one who did it. I won't feel a sense of ownership. Yet I'll have to accept that I was the one who did it. —This may just reflect the vagueness of 'person', though, as opposed to 'self'. I was, in a sense, the person who did it, but that person didn't necessarily have this same *self*. But what does that mean? Obviously, for all intents and purposes, he *did* have the same "(sense of) self" (assuming I don't have a personality disorder)—with the exception that I don't remember being him.

These problems aren't really substantive [...].

cool sweat of the cupped palm warm
soul undulating

Friday, June 16

Last night I fell asleep wondering what part of the psyche the "imp of the perverse" lives in. Why does he exist? What's the fascination with horror, with tragedy, with mayhem and torture? I tried to answer this question in the second paper I wrote for my Philosophy of Art class, but since I'm still in the process of rewriting it I haven't found a solution. (I haven't looked at the revision in months.) Freud might have

said something about the id and so on, but that isn't really an explanation, even if humans do have "instincts" for violence etc. What's needed is an explanation that relates the explanandum to the *self*. Something relating it to the phenomenology of consciousness (because that's the level we exist on; that's the form of explanation we intuitively want, a form involving our *consciousness*), for example by saying it's "pleasurable". But the whole point is that it *isn't*, so an alternative explanation is needed.

One of the reasons for, or symptoms of, the psychological subordination of women is that they're constantly being thrust back onto their bodies. They can't escape the body. They simply have *more* of it than men, literally and figuratively. Literally: breasts and hips, etc. Figuratively: menstruation, pregnancy, menopause, the necessity of beautifying themselves, etc. (It's a "necessity" because that's how they attract mates. Men, on the other hand, operate under the necessity of being confident and dominating, because that's how *they* attract mates. The gender roles, in these broad senses, are a result of biological facts and tendencies, though their cultural manifestations vary.) Since women identify with their bodies more than men do, they are *objects* more than men are. I don't mean that term in only the popular sense, the "sex object" sense; I mean it in the sense of 'women "look at" themselves more obsessively than men look at themselves'. They live in objecthood (i.e., self-consciousness), partly self-inflicted, to a greater extent than men do. This is probably one reason they have a greater need for community—for love, emotional relationships—than men do.

It's unfortunate that this kind of honesty about women is called misogyny, because then everyone is misogynistic. For everyone understands these truths on some level, consciously or half-consciously. Feminists think that "gender stereotypes" of this kind are historical creations rather than biological ones, but actually *their* label of "misogyny" is the historical creation. Every society in history has manifested some variation of these archetypal gender roles, but only in recent times has it occurred to people to label them misogynistic. For thousands of years they were simply common sense. Admittedly, the common sense generally went too far in the "misogynistic" direction, but its archetypal content, shorn of culturally produced prejudices, was correct. *Necessarily* so, because, after all, it was archetypal!

Sunday, June 18

If you're in the mood for Bach, I recommend the Organ Sonata in C (first movement, I think). I don't know the number, but it's the really cheerful one. The one that goes "bup-bup-bup-baaa, dadadaa...."

I wrote a story about canvassing. Every word of it is accurate, except for a couple descriptions of me.

A Day in the Life

"I'm not interested."

"Okay. But are you with us on the issue?"

"I don't know."

"Well, why don't I give you this pamphlet here. We have a website too, and you can donate online if you change your mind."

"Uh-huh."

"Thanks. Have a good day!"

John walked down the steps, toward the sidewalk, as the door closed behind him. The air was heavy, and sweat ran down his temples to his chin and soaked his hair. Casually he wiped his face; he looked at his hand and chuckled. "Well, at least it's not hot," he muttered ironically. "Where to next?" He squinted at the address of the next house (he'd lost his glasses a few days earlier) and wrote it down on the paper on his clipboard. "Onward, men!" he said to himself. "Onnnwarrd, Chrissstian so-o-o-o-ldiers...." (He'd forgotten the melody but remembered those three words from Sunday school fifteen years ago.) The

next house was another mansion, like the last four. He was in a rich part of town, which was also rumored to be politically liberal. Most of the houses were in the Greek Revival style, with large porches, columns in the Ionic or Corinthian mode (the Doric was too plain), elaborate balustrades along the staircases and decorative cornices completing the roofs. This particular house was at the end of a long brick walkway, which was reminiscent of the red carpets laid out for royalty and celebrities.

A large man answered the door. "Can I help you?" he said.

"Hi! My name is John; I'm with MoPIRG, the statewide environmental group, and right now we're focusing on global warming." The man kept staring at him, so he went on. "Scientists say that 2005 was the hottest year on record, and here in Missouri, global warming means more air pollution and more severe heat waves. The Bush administration is refusing to act, but we really need to get serious about cutting pollution from cars and power—"

"What's your point?"

"Well, the point is that we can lead the way in this effort if we keep building a lot of public support—and that's why I'm here. This is our Statement of Support; it outlines our work." He handed the man his clipboard. "Actually, the best way for you to support the effort is to become a member of MoPIRG, which you can do either through our monthly giving program or—"

"No."

"Well, you could also give us a one-time contribution, of whatever you can afford. We suggest 50 to 100 dollars. 75% of our money goes directly to—"

"No, I don't have any money. Thanks." He closed the door. John stood there, nodded his head and laughed. "Another devoted citizen." He turned around and left.

At the next house a woman answered the door. "Hi! How are you?" John said. No answer. "My name is John, and I'm with MoPIRG. We're the statewide environmental group, and right now we're fighting against global warming."

She waved her hand dismissively. "Don't give me that global warming shit! The climate goes in cycles."

"I see.... Well, here's a pamphlet you can look through, about our organization. Thanks." He walked away, not in the mood for real politeness. His soaking hair and sticky clothes were bothering him. He looked up at the sky and saw grey clouds collecting, and remembered he didn't have an umbrella.

No one was home at the next three houses, but at the fourth an old man was sitting on the porch. His house was less massive than the others, but it was stately. Instead of columns it had pilasters projecting from the wall, and there was no intricate ornamentation anywhere.

John waved as he approached the porch. "Hello, sir! How are you?" No answer. "My name is John, and I'm with MoPIRG, the statewide environmental group...." This time he was allowed to get through his entire speech: the man just sat there in his rocking chair, rocking back and forth, listening with half an ear. At the end he stood up and took out his wallet. "Let's see what I have...." he murmured. "Great!" said John. "Thanks so much for your support! We suggest 30 to 60 dollars for the one-time contribution...." He caught a glimpse of the cash inside the wallet: several twenties and a hundred. But the man looked up abruptly: "No, I can't afford that much. I'll write you a \$10 check." "Actually, the minimum for membership is \$15. Members receive email updates on our campaign...." But the man was already inside the house (to get his checkbook), and was ignoring him.

John followed him in as he waited for the check. Like nearly everyone else in the city, the man owned a dog. A frantically barking dog, jumping around to greet the newcomer. But at least this one was playful and not mean. John rubbed its stomach and petted its head as it gazed affectionately at his face, licking his hand.

The man was disabled and used a cane, so he moved slowly. First he trudged up the steps to the second floor, where he remained a minute or two. Then he trudged down and walked back into the kitchen, where he stayed for a short time. "What's going on?" thought John. "Who should I make the check out to?" called the man. "MoPIRG! M-o-p-i-r-g." Silence. "Who?" "MoPIRG! M-o-p-i-r-g." Silence. The man appeared, carrying his checkbook. "Who did you say I should make it out to?" "MoPIRG." "MoPRIG?" "MoPIRG." "How do you spell that?" "M-o-p-i-r-g." "M....o....p....what?" "I....r....g." "I....r....g." "Yep." He

handed over the check. “Thanks,” said John. He patted the dog affectionately one last time, while cursing the old man under his breath.

Outside, the drizzle had started. But the heat wasn’t letting up. Emerging from the cool house, John found it unbearable. And his mood was worsening. “Fucking miser. How is it *possible* to be so greedy? Writing a \$10 check!” He wasn’t feeling self-righteous yet; he was just discouraged. He had thought this neighborhood would be better than the middle-class neighborhoods, which typically gave him about \$140 a night. Instead it was worse.

As he labored under the humidity he reflected that the so-called “emotional satisfaction” that’s supposed to come from jobs like this isn’t all it’s reputed to be. He rarely felt particularly righteous or proud or optimistic. Especially not optimistic. He had simply settled into the rut of a routine. In the beginning he had been excited, having immersed himself in literature on global warming. He’d been excited and terrified, and his excitement had been fed by his terror. The thought of millions of human deaths due to rising ocean levels, a possible Ice Age in Europe and the spread of disease was horrible, but almost equally terrible to him was the probable loss of such “immortal” cities as Venice, London, Lisbon and Shanghai, as well as the loss of the world’s coral reefs and millions of animal species. He had snorkeled once in the waters of the Great Barrier Reef, and the memory of that future ghost town haunted him. He remembered the turquoise water, the sunbeams slicing through it to become spectral shards illuminating the fish (iridescent), the anemone swaying in the current, the neon coral themselves. His head underwater, he’d heard a constant muffled swishing and munching sound, probably the fish munching on vegetation. It had mesmerized him. But he had also seen masses of blanched, dead coral, killed by the rising temperature of the water. Apparently much of the reef had already died.

So he was very dedicated to environmentalism. This job was going to be his first serious foray into activism, and he was looking forward to it. Though he had no illusions about how much of a “difference” he was going to make—twenty-five years had turned him into a stoic, if not a cynic—at least he’d be doing something community-oriented for a change. And he could finally sleep at night, with a good conscience. No more incessant solipsistic intellectualizing.

After four weeks he still liked his coworkers and thought the job was more enjoyable than any he’d ever had, but his initial passion was gone. He no longer read about the science of global warming, because such detailed knowledge wasn’t necessary for the job. He no longer read much about related political events, because his two directors kept their staff apprised of relevant developments during their announcements each day. He no longer felt the inspiration to *fight* and *fight without end*, because his routine was stultifying, as routines always are. His went something like this: *wake up at 10:00; go to work at 12:00; draw the daily maps and do administrative stuff until 2:00; participate in ‘announcements’ and leave with his group at 2:30; drive to the Neighborhood-of-the-Day and have lunch until 3:30; canvass from 4:00 till 9:00; drive back to the office, count up all the money and take care of administrative stuff; go home at 12:00, after drinks with his coworkers; go to bed at 1:30.* That was his routine. It was better than a lot of others he’d had in the past, but still, it was a routine, and as such it bred an awareness that he was a mere cog. A person with no real effect on anything, an expendable individual.

But that was okay. The routine itself made it okay, by encouraging him to ignore it. He just “minded his business” and got through the day, content that at least he was making a token effort to improve the world.

Later that day he found himself, with a sigh of relief, in a more middle-class area. With a couple of exceptions, all the wealthy folk, snug in their architecturally manifested vanity (as he saw it), had refused to donate any money. They had put him in a foul mood, and, with the rain, it had become a failed day. The storm had dwindled to a drizzle, and the heat and humidity were no longer intense, but he was drenched and feeling distinctly misanthropic. Not one person had so much as remarked on his soaking clothes; many had simply shut the door in his face upon learning he was from an environmental group. One conversation in particular had him still fuming:

A woman had answered the door. “Yes?” she said.

“Hi! My name is John.” He forced himself to smile pleasantly. “I’m with MoPIRG, the statewide environmental group, and right now we’re focused on global warming. Scientists say that 2005 was the hottest year on record, and here in—”

“How can they know that?”

“Well, I’m sure they have ways. I don’t know their exact methods, though.”

“Global warming doesn’t exist. The climate goes in cycles. You should read up on the science.”

“You should watch Al Gore’s new movie.”

She scowled. “I wouldn’t waste my time! Al Gore is a liar. He thinks he invented the internet! By the way, this is a private street. You can’t be soliciting here.”

“I’m not soliciting.”

“Yes you are.”

“No I’m not. The Supreme Court has said that political canvassing isn’t solici—”

“I don’t care what the Supreme Court has said. You can’t be here.”

“Umm, *yes*, I *can*.”

She scowled again and waved her hand as if shooing him away; so he scowled back and made a gesture of disgust, after which she slammed the door. Together with all the events of that day, the exchange left him in a murderous mood.

As he walked around knocking on the doors in this new neighborhood, keeping his clipboard carefully protected from the rain and periodically running his hands through his hair so it didn’t plaster to his head, he wondered what it was like to be that woman whose time was too precious for her to watch one movie. What was it like to be willfully close-minded? He really did want to understand how it was possible to be like that. That woman felt certain she was justified in her attitudes, that her beliefs were indubitably correct, that the young man she had just talked to was insolent and ignorant and pernicious (as a “liberal”)—and yet she was wrong. *He* was right; *she* was wrong. *She* was the ignorant one. There was no question. So, what was it like to feel certain of oneself when one was totally in error? He couldn’t fathom it. But it fascinated him—and infuriated him.

While occupied in these thoughts he managed to raise forty dollars. One old lady launched into a diatribe against Bush, which he could only listen to while smiling and nodding in agreement. He also met a friendly young woman who looked with horror at his sopping hair and offered him a towel. “You poor thing! Here, dry your hair with this!” He handed it back to her gratefully. “I’m sorry,” she said, “I wish I had money to give you—you’re out here in this weather!—but I just lost my job and I have a newborn baby, so I really can’t afford it.” “Don’t worry!” he said happily. “The towel was enough. I really appreciate it!” A few minutes later the rain stopped, as if on cue. The sun came out for the remainder of the evening and his clothes began to dry.

Gradually his mood improved. The cool night air felt good on his wet skin after the heat of the afternoon. He looked at the sheet on the back of his clipboard, adding up the numbers. “Ninety dollars. Not so bad. And there’s still an hour left.” The many rejections didn’t faze him anymore; he returned to his cheerful ironic self-comments, interspersed with snatches of tunes he sang to pass the time. He’d forgotten his former rage.

He went to the house of a woman who had donated in the past. Her husband answered the door. “Hi! My name is John; I’m with MoPIRG. Is Martha home?”

“No.”

“Oh. I just wanted to thank her for her contributions in the past. Also, we’re going around the neighborhoods asking past members to donate to our campaign this summer, on global warming.”

“Well, she isn’t home. But I’ll tell her you stopped by.”

“Great! Thanks. Actually, maybe you could give her this pamphlet. It has some information on the issue.”

“Okay.”

“You don’t know when she’ll be back, do you?”

“No.”

“Well, do you think I could stop by again later?”

“I’d rather you didn’t.”

“Ah. Okay. See ya.”

He left. About five minutes later, though, he saw her car pull up in the driveway. He ran over to talk to her before she entered the house.

“I think I just sent in a check recently,” she said. Her arms were full of grocery bags, but she smiled and stood there patiently.

“Really? That’s weird; they should have told me that. –I’m sorry, I’m keeping you outside! You can go in and unload all that stuff. I could help…”

“Well, I may be wrong. I’ll go look at my checkbook. Come on in.” John followed her, though he suspected her husband wouldn’t be pleased. He was right.

“I thought I told you not to come back!” the man said after seeing him behind Martha.

“Sorry,” John said, “but I just saw your wife drive up, so I thought I’d run over and talk to her.” He walked into the hallway and waited. Martha set down the bags on the kitchen table and rummaged through her purse.

“I told him not to come back,” the man said to her. Then he caught sight of the cat and frantically ran towards it, since it was moving in the direction of the door. “Don’t let the cat out! Don’t let the cat— Close the door!” But it was closed already. So he went back to the kitchen. “I told him not to come back. You don’t listen very well, do you?” he shouted over his wife’s head. John ignored him. “Don’t give him any money. MoPIRG is a waste of an organization. Please, just leave! Leave!” he called again. John waited for an indication from Martha, but she was silent. Her head was turned away, turned down toward her purse. She seemed embarrassed and ashamed, so John excused himself. “Yes, I think I sent a check recently,” she said quietly. Her husband chimed in, “Go! Please, leave!”

Outside, John stood still in puzzlement. “That was odd.” But he laughed and walked on.

The last house. Finally! It was a decent-sized middle-class home, with a large white porch and a swing-set visible in the backyard. As he knocked on the screen door he heard kids laughing and running around inside. It sounded like two girls. Their mother came to the door.

“Hello!” she said. “Are you with MoPIRG?”

“Yeah.”

“Great! We’ve given money to you in the past. We were just recently thinking of joining up for the monthly program you have.”

“Really? That would be terrific! Monthly members are the—”

“Honey!” she called. “Come down!”

“So anyway,” John said, “this summer we’re focused on global warming.”

“Oh it’s terrible isn’t it! We just saw Al Gore’s movie. Terrifying. But very good.”

“I’ve heard a lot of good things about it. Haven’t seen it though.”

“It makes Gore look like some sort of heroic figure, fighting against all odds. Which he probably is. Honey!” she yelled again. “What are you doing?”

“Coming, coming!” It was from the second floor. “Just playing with the kids.” A portly, laughing man appeared, with a young girl by his side. Adorable, smiling.

“Hello!” John said to her, waving. “What’s your name?”

“Rachel,” she said shyly.

“MoPIRG!” interrupted the man. “We love you guys! We were just talking about joining your monthly program. We saw Al Gore’s movie a few nights ago.”

“I’m gonna finish cooking,” his wife told him.

“Okay. Let’s go outside.” Rachel ran back into the living room while her father joined John outside. “Christ!” he sighed. “They’re a handful.”

“You have two daughters?” The younger one was peeking around the corner of the doorway, smiling mischievously. Suddenly she burst into a sprint towards the living room.

“Yeah.”

“I wish I had kids. I like children.”

“You want ‘em?”

“Sure! I’ve always wanted daughters.”

“Of course you have. You know why?”

“Why?”

“Cause you don’t have any.” The man sank into a chair and laughed. “By the way, my name’s Tom. So did she say how much she wanted to give?”

“No, she didn’t.”

The man leapt up and yelled through the screen door, “Hey!!” No answer. “Come on inside. My wife’s cooking spaghetti.”

“I smell it. I forgot how hungry I was.” They stepped inside and walked to the kitchen, past the living room. The two girls were on the floor together, giggling. “Sorry to invade your home like this,” John said.

“Nonsense!” said the woman, who was stirring a pan of meatballs. “I love showing off my cooking.”

“Stay and have dinner if you want! We’ll be eating soon.”

John laughed. “I’d love to—haven’t had good food in months. But my boss might not be so pleased.”

“So how much did you want to join for?” the man asked his wife. “Ten a month?”

“Yup.”

“Great. Where do I sign?”

John explained all the details. After he’d had time to gather his thoughts he felt compelled to vent his gratitude. “It’s so refreshing to meet people like you! Supportive people. This neighborhood isn’t very liberal, you know.”

“Oh, I know. We got a lot of Bush fanatics around here.”

They chatted awhile, commiserating over the state of politics. John was struck that they treated him like an old friend, repeatedly inviting him to stay for dinner and not at all embarrassed by the chaos of the household. (The living room was littered with half-naked Barbie dolls; the girls were screeching and chasing each other in disregard of their father’s good-natured shouts; their mother was haphazardly setting the table and plopping spaghetti onto each plate.) ‘If only everyone were like them!’ he thought. ‘Friendliness is so rare!’ At length he left, thanking them profusely. They had nudged him into his old love of mankind.

He walked to the car parked several blocks away. The neighborhood was mostly quiet, except for the sounds from the house he’d just left and the rustling of leaves in the breeze. It was a strong breeze. Clouds above blew by impatiently; the moon was visible in the spaces between them. It was nearly full. He couldn’t see any stars, but he decided that was because the streetlights were too bright. The stars were up there all the same, hidden somewhere in the dark. He tried to imagine the distance between them and the earth, knowing it was impossible but enjoying the challenge anyway. It felt sort of ‘mind-stretching’, as if he were stepping outside himself and into the night.

He remembered the woman who had so enraged him, and the old man who had written the \$10 check and the younger man who had pleaded with him to leave his house. John smiled, no longer upset. The question occurred to him again: How was it possible? How were *they* possible? But it no longer was colored with bitterness, nor even mild resentment. There was only pity. He understood they were not ‘bad’ people, nor stupid, but only victims of some accident or other that had toppled them into a ditch, a mental rut. They had long ago become victims of *routine*. Their attitudes and thoughts and personalities had been routinized, to the extent that they could no longer evaluate old situations in new ways or adjust old ways to new situations. They lived their routines and had lost the ability to really question them, and the desire. ‘Money is precious’; ‘privacy is sacred’; ‘time is money’; etc. Their ‘certainty’ was just the lazy certainty of routine. They were casualties of modern life.

He looked back fondly at the last house and decided, then and there, that that would not happen to him.

*

Probably you think I'm exaggerating. "Casualties of modern life"? But a person's character can be revealed by a single act.

The Reunion

your hand,
 tiny, entwined
 in mine, our fingerprint-
 grooves all fitting together, is
 lovely.

Apparently that form of poetry is called a "cinquain".

Death

I killed
 the chickadee
 with a stone, even though
 it was pretty....and with its death,
 I died.

Tuesday, June 20

Today, while walking around zombie-like in the heat and conservatism of Kirkwood, I realized that I'd enjoy myself more if I composed "epigrams" while walking. So I thought of a few: [I deleted some]

If ever you think that your attitude towards mankind isn't jaundiced enough, try canvassing. That'll give you all the jaundice you could possibly want.

The most dangerous kind of amnesia.— The faster that society evolves, the shorter is its collective memory.

"Why is absent-mindedness perceived as endearing?" Because it makes the perceiver feel superior.

I've almost finished reading Pirsig's book. The philosophical parts are pretty stupid. Embarrassing, even. I could point to dozens of inadequacies. For instance, its extremely un-Marxist ideas. And its vagueness. And its ignorance of the history of philosophy. And its self-congratulation. ("Phaedrus was unbelievably original!" "No one had ever thought of this before!" "He was certain his ideas were revolutionary!" "He kept finding parallels of his own thoughts in Plato's writings!" "His insanity was due to his heroic rejection of his culture's *mythos*!" "Quality! Quality! Yay for Quality! Quality is like the Hindu's *dharma*, and the Buddhist's *One*, and the Greek's *aretê*! It unites Eastern and Western thought! It's earth-shaking!" "Phaedrus was a madman!"—i.e., a really cool genius! Actually, Phaedrus was an imbecile.) People who love this book are just in love with the idea that they've learned a little philosophy. They'd never read real philosophers, though, because they're "boring".

This should be the book's title: *Zen and the Art of Motorcycle Maintenance; or, Philosophy for the Masses*. (Zen = philosophy; Motorcycle Maintenance = the masses.)

One guy I talked to today said (after I'd suggested he give \$10), "I'd be glad to do that if I wanted to, but I don't want to." He was smiling and thought he was being friendly—not trying to be funny. He

didn't see how idiotic his statement was. An old woman who listened to me for a minute or two turned down my request for money by saying, "I have to leave town at 10:00 tomorrow, and I don't have a minute to spare." "Even ten dollars....?" I said. "Nope." A bunch of people said, "I won't give you any money, but I really support what you're doing!" One guy interrupted my speech with "You can't be soliciting here." So I frowned and made a gesture of contempt and walked away; he shouted at my back, "Don't wave at me!"

Psychologically/phenomenologically, how can the obsession with private property be explained? What is it about walking on someone's lawn that makes him angry at you? It's just *grass*, for God's sake! Maybe it's something about your not appreciating a thing he's spent a long time making pretty. "Have the courtesy to admire my lawn! That's why I've taken such good care of it, after all—so that people will admire it, not walk on it!"

[Or rather: "It's *mine*. You're showing disrespect towards me by walking all over it."]

Saturday, June 24

On Phaedrus's experience of Quality.— If Enlightenment is something you attain while lying half-conscious in a pool of your own piss after prolonged sleep-deprivation.....I think I'll pass.

Cosmic insects.— Yesterday as I was walking through a suburban neighborhood I heard a chorus of cicadas. It started off slow and quiet, then crescendoed to an almost deafening roar while quickening its tempo, and finally sank to a whimper and stopped. It was an unintelligible noise, insistent and annoying, but brief. —Suddenly I realized that the furious sounds of man's own history must seem like the cicadas' chorus to Earth.

Amusing encounters with mediocrity.— "...and this summer we're focusing on global warming," I say. "Awwhh!" she says. "There's no such thing as global warming! In 1988 *Newsweek* had a cover that said, 'Is a new ice age upon us?' Trust me: global warming doesn't exist. Just believe me." Or the old man who says, "Global warming is *shit!* It's a fad!", whereupon I walk away, as he yells at my back, "And stop that! Stop promoting the idea of global warming!" Quite amusing.

Rudolf Schramm as the prototype of the contemporary conservative American.— "A rowdy, loudmouthed and extremely confused little mannikin whose life-motto came from *Rameau's Nephew*: 'I would rather be an impudent windbag than nothing at all.'"

On Pascal.— "Men are so necessarily mad, that not to be mad would amount to another form of madness." Hypocrisy is but ignorance of this maxim. So is contemporary Christianity—though original Christianity was but a profound acceptance of it.

I'm reading Howard Zinn's *A People's History of the United States*, Cornel West's self-edited anthology *The Cornel West Reader*, and Julius Sensat, Jr.'s *Habermas and Marxism*.

I have the feeling that Cornel West's personality is as overwrought as his writing. (Style reveals personality.) But at least he means well. —On the other hand, the road to literary hell is paved with good intentions. "My painful quest for wisdom is an endless journey that tries to delve into the darkness of my soul to create a more mature and compassionate person." "I am primarily a dramatist of philosophic notions and historical narratives that partake of blood-drenched battles on a tear-soaked terrain in which our lives and deaths are at stake." "The distinctive mark of modernity is to pursue the treacherous trek of dialogue, to wager on the fecund yet potentially poisonous fruits of fallible inquiry, which require communicative action, risk-ridden conversation, even intimate relation." —Not *terrible*, but not great. His rhymes and alliterations and parallelisms are too self-conscious; his imagery is too grandiloquent; his inflated self-

esteem is too noticeable, though he makes feeble attempts to hide it. The best writers are those who, like West, have the talent and perhaps inclination for semi-persuasive bombast but, *unlike him*, are able to curtail it.

....Well, he ain't as bad as all that, I guess. He's actually pretty good in his academic pieces, where he has less of an opportunity to wax lyrical. But the *substance* of his writings doesn't seem very interesting or original.

I just had a thought: maybe the first principle of literary criticism, implicit in most (if not all) other principles, is that the work in question not show signs of self-consciousness. As in daily life, the imperative is to project confidence, sureness of purpose; the cardinal sin—in both realms—is to hint at premeditation, hesitancy, to show signs of 'trying too hard' or being too preoccupied with self-observation. Whatever it is, it must appear *natural*, *unconscious* (or at least not *self-conscious*), *spontaneous*, virtually *inevitable* in its progression from one moment to the next. Whether it's social interaction or literature, it should seem *sincere*. (Again, that's a quality opposed to self-consciousness.) Hence the injunction against, for example, literary sentimentalism, i.e., forced and unconvincing emotionalism, i.e., self-conscious, non-spontaneous emotionalism. Cheap literary effects like facile alliterations and parallelisms betoken a lack of involvement on the part of the author in the content of his writing, which means an over-involvement in himself and the effect he's creating on the reader. Every reader indeed knows that every author is concerned with his effect on his audience, but the point is that the reader doesn't want to be reminded of that, because then he'll wonder why *he* should immerse himself in the text if the *author*, of all people, didn't! If it seems like the author didn't believe in what he was writing—wasn't *totally convinced* of it in *every moment*, and instead focused unduly on something external like style—the reader will find himself detached from the work, uninspired by it. Only if the *author* was persuaded will the *reader* be persuaded too.

Granted, some great works have self-consciousness and self-detachment woven into them (*The Unbearable Lightness of Being* comes to mind), but in these cases their self-consciousness is integral to their content and themes. It's part of their content, essential to it, rather than being an encumbrance that distracts from it. (The less essential it is, the more it's a flaw. A case could be made that the self-conscious digressions in Kundera's book are flaws, if indeed they interrupt the book's flow and its themes.)

Of course there are other important principles too, like simple 'readability' (rhythm, stylistic consistency, felicitous syntax), but to an extent these can probably be related to the principle that all hints of self-consciousness be avoided.

And surely these general principles are common to every culture of any sophistication. —Why, I don't know.

Friday, June 30

Yesterday I wrote a poem while canvassing, to rejuvenate myself after two hours of "Go away!"

Fighting against global warming

As I talk to this person
 full of sincerity and urgency
 (human connectedness is urgent)
 her eyes leak deserts of starch
 onto my soft words
 and in them
 I see
 a deserted future....
 Human kindness has been milked dry.

How to tell when you're getting tired of being single.—When every girl you talk to for two minutes stays fixed in your mind for half an hour afterwards, you know you're ready for a relationship.

I had a long debate with Jackson about the merits and demerits of postmodernism. Specifically cultural relativism. Relativism in science, etc. He was pro, I was con. Very lively discussion. Jackson's awesome. One of the best people I've known, brilliant and funny and likable. We have a lot in common (absent-mindedness, easygoingness, intellectualness, senses of humor), with the exception of his overflowing charisma. He reminds me of Jim, but without the occasional assholeishness. And with a passion for social justice.

For a while I've been puzzled by the modern woman's apparent self-ambivalence. Her enjoyment of (half-consciously) semi-subordinating herself in relationships with men, of decorating herself and being a decoration herself, of following men and wanting to be with men who dominate, of having children and spending most of her time with them—and yet her complaints about being the second sex, about having to decorate and beautify herself, about not being able to have a career unhampered by child-bearing. In short, she's torn between the love of being an object [or rather, being half-passive] and the hatred of being an object—the love and the hatred of being unequal. She wants to care for and to be cared for, yet she envies the male's *carte blanche* to be aggressive in all areas of life. I've wondered, “Can it really be that women have an innate half-desire to be male? A natural ‘penis-envy’? Are they really conflicted between a masculine and a feminine self-ideal? Is Adler's ‘masculine protest’ natural in women or just a modern confusion? Is it indeed a *masculine* protest, or is it a *human* one, which has for some reason become associated with men?” I was confused, though. I hadn't questioned my assumptions.

The modern self-ambivalence of women—their ambivalence about their social roles, and even about their biological position vis-à-vis men—is not transhistorical. Nor is it anything like penis-envy or an unconscious desire to be male. It's the psychological result of the deterioration of the community, the fragmentation of social life, caused in part by (and manifested in) the rise of the nuclear family. For hundreds of thousands of years there was no “nuclear family”, at least in the form it's taken in the last thousand years (and especially the last few hundred). There were strong communal ties, whether structured along lines of kinship or in other ways, and both men and women played important parts in communal life. Women were indeed comparatively confined to the homestead—caring for children, etc.—but they also were involved in food-gathering, in agriculture, in the political life of the community (such as it was). And the “homestead” wasn't what it's become, a single house shut in and shut off from the neighborhood; it was the community itself, the whole area where everyone lived (as opposed to the wilderness where men hunted). All activities took place in the context of an open community—there were no doors to be closed on neighbors, no walls—and everyone shared his or her belongings, and children were raised communally, and loneliness was unusual (perhaps almost impossible). Then, all of sudden, in a mere five thousand years—or really five *hundred* years—economic life becomes fragmented, the nuclear family becomes the basis of the social fabric, men take over politics and most of the economy, and women are confined increasingly to limited roles in the household. These roles aren't “spiritually fulfilling” because of their isolation from the community. (It's a cruel twist of irony that the female sex is the one that most craves emotional connections and care!) So women become much more attached to their male partners than they used to be, because their partners are their closest remaining ties to communal affection. And what was innately a slight difference in needs and abilities between the sexes becomes a chasm, and women become increasingly subordinate to men in almost all spheres and increasingly reliant on their husbands (and children) for their emotional well-being. Thus they develop a cloistered outlook on life and an inferiority complex vis-à-vis men. Is it any surprise then that when political liberalism arrives on the scene, women finally come out and say they want a bigger role in the community? They want careers, they want respect, they want to participate in society. This isn't a “masculine” protest; it's a human one, grounded in the human need for community [or recognition]. It happens to look masculine because of the way gender roles have been structured. After some years women find that careers aren't as satisfying as they'd hoped—which is predictable, since job-relationships have become as fractured and schizophrenic as relationships outside

of jobs—so they re-embrace their traditional roles at a man’s side and in the home (hence the contemporary reaction against feminism). But this isn’t satisfying. So they’re caught between two undesirable options.¹ Real happiness won’t be possible until the social structure is revolutionized—until, that is, communities become the norm again.

Civilization and the Jews.— Monotheism is the predominant form of religion today. Aside from Zoroastrianism, which died out long ago, Judaism is the oldest form of monotheism. Christianity was conceived by Jews, and Islam was inspired by the prophets of the Old Testament. So the hegemonic modern moralities and belief-systems were created or inspired by Jews. With respect to intellectual life, three Jews did more than anyone else to carve modernity: Marx, Freud and Einstein. We’re still living in their shadows. —Someone should write a book called *The Creative Genius of Jewry*.

Sunday, July 2

I got four books at the library today: *Women’s Mysteries*, by Downing, *Analytical Marxism: A Critique*, by Roberts, *Female Sexuality*, edited by Bassin, and *Psychoanalytic Versions of the Human Condition*, edited by Marcus and Rosenberg. I love going to the library. I get excited seeing all those books everywhere, thousands and thousands of books. Why? I think because they represent *freedom*. I can be totally *myself* in a library; I can immerse myself in an object, without having to worry about playing a part in society. My heart leaps to my throat as I look at all the books, read their titles and imagine the content between their covers. And I can stay there for hours, for as long as I want, without worrying about responsibilities.

—Or, as Winnicott might say, I can “play”. “Cultural experiences are in direct continuity with play, the play of those who have not yet heard of games.” I like this way of conceptualizing it. Play is light-hearted, enjoyable, free and creative. Play is freedom, freedom *to* and freedom *from*—from responsibilities, from burdensome and external norms, from anything ‘external’ and constraining. Play is an assimilation of experience to the self (its desires, its sense of itself), and of the self to experience. It’s a sympathetic appropriation of experience—a molding of experience into one’s own idiosyncratic framework for experience, for interpreting life (not discursively but *actively*, through “praxis”). This is what it means to enjoy oneself, and what it means to be free. Freedom is an interiorizing of the exterior, and an exteriorizing of the interior. This is what infants are doing when they play—this adapting of the world to themselves and vice versa, as they freely explore their environment—and it involves smiles and laughter because no external obstacles are getting in the way of their activity, their free self-expression. Their desire is being fulfilled; there’s no division between them and their environment, no source of frustration—no ‘blockage’ or ‘deprivation’ obstructing their spontaneous self-assertion. (Incidentally, this mechanistic language—this talk of “frustration” and “blockage” and “tension”—suggests Freudianism, with its talk of instincts and the id and the pleasure principle vs. reality. The main flaw in many of Freud’s ideas may simply have been the unfortunate terminology in which they were expressed—the scientific framework in which they were formulated. Taken out of this framework and reformulated accordingly, they may be true.) As for the *cognitive* significance of infantile play, see Piaget.

I want to make one more point: these reflections suggest the association I made above between freedom and community. But now *play* has been added into the mix. Psychological freedom (or the phenomenological feeling of freedom—*positive* freedom) signifies a lack of separation between the self

¹ In all this doubt about what lifestyles they want and what kind of people they want to be, and all this universal loneliness (afflicting both sexes), and all the modern collisions of ideologies and new scientific discoveries, is it any wonder that women misinterpret themselves? Some of them think they want to be (or *are*) totally “equal” to men, equally “aggressive” and “autonomous”, equally career-driven, but generally these are exaggerations that shouldn’t be taken at face-value. These truly *masculine* protests are confusions, predictable in an age of extreme freedom and despair. Every social group is experiencing identity-crises.

and its environment—a lack of an *experienced* separation, that is.¹ (Logically and epistemologically there's always a dualism between the self and its environment, but this dualism need not always be experienced, or 'felt', in consciousness.) Since play is an expression of freedom, it's also an expression of "community"—i.e., of the self's perception of harmony or sympathy between itself and its environment. Thus, 'freedom is play is community', or 'community is freedom is play', or what have you. They all imply each other. And cultural experiences are just sophisticated manifestations of infantile play. They proceed from the same motives and have largely the same psychological and cognitive functions. Artists and thinkers, and people who appreciate their work, are literally adult infants. To an extent, though, we *all* are.

This human need to assimilate experience to the (cognitive and emotional structures of the) self has other manifestations too. For instance, think about how frustrating it is when you hear a familiar tune but can't remember where you heard it first, or you can't remember its name or who wrote it. Or when you see a familiar face but can't think of the name that goes with it. "It's right on the tip of my tongue! Damn it!" The power of your frustration shows how powerful is your need to *order* the world. Play, freedom and community signify a temporarily perfect ordering of your world, a harmony between the self and its environment.

Obviously all this ties into Marxian anthropology (the young Marx's emphasis on our need to humanize nature and on our self-creation through labor,² etc.). It also reminds me of Nietzsche's will to power.

So, it may *look* like someone is being very serious and academic and doing something that's totally the opposite of playing (say, reading a book on philosophy), but actually his activity is essentially similar to the child's playing with toys.

These thoughts may hold the key to the common observation that highly endowed people tend to act like children in some respects. For example: me. I'm very silly, unpractical, absent-minded, good-natured, emotional, self-absorbed, but very intelligent and creative. I'm like the child that loves to explore its world and 'play' with new objects and ideas. Artists and thinkers have a greater capacity and need for play than other adults—because, presumably, in some respects they've evolved out of childhood less than others have. (I wonder why. Probably both nature and nurture.)

I should make a revision: there are two forms of play, namely the kind that signifies an already-achieved harmony with the environment (in which case the play is really nothing more than a wallowing in this harmony, this freedom), and the kind that signifies an attempt to achieve this harmony. —Or maybe both kinds presuppose a certain degree of harmony or freedom, but the second kind (an example of which is the philosopher's struggle to sort through ideas) is an attempt to achieve harmony on a higher level. It couldn't take place if there weren't already some freedom, some 'sympathy' between the player and his environment (a sympathy that gives him the freedom to play in the first place), but in another sense he still hasn't psychologically, or cognitively, assimilated his environment, so he 'plays' with ways of assimilating it. Like I'm doing right now. This kind of play seems different from the kind that presupposes 'superfluity', like when children play cops and robbers. In the latter case there is no struggle to assimilate the environment; there's only the enjoyment of an already-accomplished assimilation. Both forms of play are enjoyable, but in different ways: the first is more serious, more urgent, less purely pleasurable. Art, on the other hand, generally seems to have more in common with the second kind. (This explains why I think of art as more 'fun' and 'free' than philosophy, even though it can also be very difficult.)

¹ "Separation" as in frustration, confusion, alienation, boredom, self-consciousness, stress, etc.

² Through "labor", or praxis—which often takes the form of play—we accommodate ourselves to [and *create*] our environment and thus achieve freedom/community and thereby self-creation (for we effectively create the conditions of the self's equilibrium with itself and its environment). But the self-creation of course enters on other levels as well, such as in the fact that through labor we learn about ourselves, and we transform the environment in such a way that gradually it transforms us as well (and so on *ad infinitum*).

I'm very happy sitting here reading this book on psychology while listening to Beethoven's 4th. (I think the reason why the music adds to the enjoyment is partly that it makes the situation more *my own*, more familiar to me, as mine. I.e., it adds a further element of play, of assimilation.)

By the way, unpleasant emotions, from anger to hatred to boredom, imply a conflict between the environment and the self, a lack of assimilation of the first to the second (to its desires, expectations, categories of understanding); this accounts for their unpleasantness. The pleasant emotions are essentially forms of play—or at least are usually *manifested* in play.

Play is the psychological goal of humans. A person is mentally healthy to the degree that he's capable of play.

Tuesday, July 4

In the natural sciences it's possible to reach a single true explanation of a given phenomenon. The physical world theoretically admits of one complete explanation, and there are ways to tell when this explanation has, beyond reasonable doubt, been reached. The social sciences (including psychology) are different. Theories will always and necessarily continue to evolve, because they can't be stated with mathematical precision and they can't be tested by an *experimentum crucis*. Social scientific theorizing involves finding *more adequate* ways of conceptualizing phenomena, rather than finding the *only true* way of conceptualizing them (which is what natural science aims for). Adequacy is determined by the criteria I listed in my senior thesis, namely intuitive plausibility, success in prediction, breadth of explanatory power, consistency with widely accepted scientific theories as well as the "web of belief" in general, etc.

On the other hand, it does seem like the implicit goal of the social sciences is to find *the truth* vis-à-vis a given phenomenon—the correct way to conceptualize it. Or maybe the position I took in my thesis is better: theories aim for the *best* explanation rather than the *correct* one. Many theories might be correct, as far as they go, but theoretically there's only one *best* one, one that succeeds better than all others at satisfying the criteria for adequacy. If the phenomena under consideration have any sort of complexity and breadth this ideal theory will never be attained, but it remains the implicit goal of theorizing. (In the natural sciences, the goal of *correspondence with reality* is more easily conceptualizable—even *directly observable*—than it is in the social sciences. Concepts and theories are, in this case, ostensibly just linguistic expressions of actual 'observable' facts in the physical world. When concepts and conceptual relations have been found that correspond to physical facts, there's nothing more for theorists to do. Since physical facts aren't what the social sciences are supposed to explain, but rather nebulous causal links mediated by nebulous psychological states, these sciences have much more room for conceptual vagueness, for manipulation and evolution of concepts, for degrees of theoretic accuracy, etc.)

The problem with the social sciences is that their subject-matter is ultimately buried in the human brain, deep in the subconscious and the inner workings of the psyche. All the social interactions they study work their causal magic through the deepest layers of the psyche. [...]

Aufschwung

Schumann,
like Icarus,
flew too close to the sun;
his sanity melted and he
died young.

A Perfect Night

This night
would be perfect

if it weren't hot, muggy,
buggy, noisy, and I weren't so
tired.

The Omen

I see
skulls in the sky,
in the clouds, staring down
grimly at our future, our past
future.

I'm tempted to agree with Laing's belief that deception (self- and other-) is the main cause of psychological illness. After all, for hundreds of thousands of years there was no such thing as deception—there couldn't be; life was too simple and communal—but then suddenly in eight thousand years it became an essential part of life. That's bound to have psychological effects. Having to conceal things from people isn't healthy: it sets up divisions in the community, fosters a sense of isolation that can lead to loneliness; it militates against the possibility of naïve 'play' with the other and with oneself, that carefree acceptance, trust and love that is essential to happiness. And it leads to self-deception, which posits divisions in the self. (By acquiring the ability to deceive the other, you've laid the foundations for the ability to deceive yourself. You just have to do to yourself what you've done to the other.)

I like Heinz Kohut's self psychology. It melds nicely with my own views. Here's a useful comparison between Kohut's and Freud's basic premises (Freud's first):

The infant is born with the innate propensity for incestuous lustfulness, pleasure seeking and murderous wishes as primary and basic, and these are from the beginning on a collision course with the culture and society (represented by the caregivers) into which the human infant has to be civilized.This taming, controlling and proper channeling of the drives occurs against the infant's and child's will and selfish interests. The results are at best an acquisition of a thin veneer of civilization that can, and frequently does, easily peel off, laying bare the original lustfulness and bestiality beneath.To restate it in theoretical terms: the human infant born as a "bundle of drives" evokes the caregiver's efforts at curbing, controlling and channeling these drives. This leads inevitably to conflicts between the drives and the representatives of culture. Conflict is thus built into the mental apparatus from the very outset and culminates in the prototypically conflict-ridden Oedipus complex. From then on this conflict pervades every human activity in health and disease.

The human infant arrives into this world preadapted—we might now say "hard-wired"—for the capacity to elicit the needed responses from its surroundings. Hence the infant's primary need is for connection and for response.To express this in theoretical terms, the infant is born, with all of its biological givens, into a "self-selfobject matrix" in which an empathically responsive milieu will provide physically, nutritionally, and emotionally what it needs for its prolonged development. The infant is thus a social being to begin with, reaching out actively to a harmonious and receptive rather than to an antagonistic and coercively civilizing environment. So there is no built-in primary pathogenic conflict in the human psyche. However, conflict is inevitable because the milieu can never respond perfectly to the needs of a budding self. Hence, there will always be conflict. Such conflict becomes pathogenic or pathological, however, only if, in response to empathic failures of the selfobject milieu, the development and consolidation of the self is thwarted.

Kohut's vision is more compelling than Freud's, not to mention more uplifting. Here are more of his insights:

Viewed from a broad perspective, man's functioning should be seen as aiming in two directions. I identify these by speaking of *Guilty Man* if the aim is directed toward the activity of his drives and of *Tragic Man* if the aims are toward the fulfillment of the self.... Guilty Man lives within the pleasure principle; he attempts to satisfy his pleasure-seeking drives, to lessen the tensions that arise in his erogenous zones. The fact that man, not only because of environmental pressure, but especially as the result of inner conflict, is often unable to achieve his goals in this area, prompted me to designate him Guilty Man when he is seen in this context.... Tragic Man, on the other hand, seeks to express the pattern of his nuclear self; his endeavors lie beyond the pleasure principle. Here, too, the undeniable fact that man's failures overshadow his successes prompted me to designate this aspect of man negatively as Tragic Man rather than "self-expressive" or "creative man".

Freud's is a conception of man as endowed with either a well functioning or malfunctioning psychic apparatus—of man spurred on by his drives and shackled by castration anxiety and guilt. It is a concept that does adequate justice to the problems of the structural neuroses, and, *in the broad arena of societal and historical development, encompasses the conflicts of Guilty Man.*

Classical theory cannot illuminate the essence of fractured, enfeebled, discontinuous human existence: it cannot explain the essence of the schizophrenic fragmentation, the struggle of the patient who suffers from a narcissistic personality disorder to reassemble himself, the despair—the guiltless despair, I stress—of those who in late middle age discover that the basic pattern of their self as laid down in their nuclear ambitions and ideals has not been realized. Dynamic-structural metapsychology does not do justice to these problems of man, cannot encompass the problem of Tragic Man.

I have a new roommate. Vikram, 23. Good guy.

Thursday, July 6

Why are sports fun? *Where* [in mental space] are they fun?

Imagine how healthy our culture would be if clothing were optional! There wouldn't be any mass fetishizing of sex; people would have fewer insecurities, especially about their bodies; we would all naturally feel closer to each other than we do now.

Whoever wrote the Book of Genesis was both wiser and more confused than he thought: self-consciousness is heightened by the dictate to cover one's natural physical state. (The Biblical fable confused the cause and effect.¹)

Melanie Klein's theories don't grab me. Though there's probably a kernel of truth in all psychoanalytic systems, hers seems far-fetched at times. And I don't know what to make of Wilfred Bion's. It's just strange.

Sunday, July 9

¹ (Obviously it's more complicated than just "cause and effect".)

As a thinker, Jon Elster seems as boring and shallow as his friends the game theorists.

I went to a PIRG camping retreat this weekend with a few coworkers and dozens of canvassers from the region. Fun.

Another long debate with Jackson. Going round in circles, as with most debates, but exciting and thought-provoking.

I'm reading Elizabeth Lloyd Mayer's 1985 paper "Everybody Must Be Just Like Me': Observations on Female Castration Anxiety" (in the *Female Sexuality* anthology). After three pages I'm already struck by its ingeniousness and originality. So much so that I'm going to quote it at length.

Emily, a bright little girl of 20 months, for the first time commented on the matter of sexual differences to her mother with the following series of remarks. "Mummy," she began, "Mummy has a bottom....and Mummy, Daddy has a bottom....and Mummy, Emily has a bottom." Emily's mother assented to each of these observations and Emily thoughtfully continued, "and Mummy has a vulva....and Emily has a vulva....but Mummy, Daddy has something *funny* in his vulva!"

Emily, like Freud's prototypical little Hans, has made a simple assumption about the nature of genitals: "everyone is and must be like me." But unlike Freud's little Hans, this assumption has led her to believe that everyone has and must have a vulva. (Emily is a child of the 1980s; she has been taught a word which explicitly denotes her external genitalia.) Emily's new observation is that Daddy has something funny *besides*—and, she imagines, *inside*, although more of that later.

A number of female patients have reiterated to me a view of men in which certain stereotypic features recur: men, these women assert, are emotionally closed, unable to be receptive or empathic, and without access to inner feelings or inner sensations. The absolutism of these characterizations, their repetitiveness, their frequency, and the stubborn determination with which they are retained, have struck me as requiring explanation. As I have investigated such women's characterizations of men, I have been impressed that certain themes recur. In brief: these women are determined to believe that men are lacking something crucial; they associate the missing something with what are explicitly described as "feminine" capacities; these women are at some level deeply anxious about their own capacities to be feminine; and they ultimately report versions of a fantasy that the capacity to be *genitally open* is a capacity that can be endangered, can be lost, and indeed *has* been quite literally lost by the male sex. Their characterizations of men as emotionally closed appear to represent derivatives of an unconscious conviction that men have actually been closed over genitally, and that men therefore represent the frightening possibility that such a thing could really happen *to a woman*. While the defensive functions of such material have been frequently pointed out in the psychoanalytic literature (i.e., "something's wrong with *him*, not with *me*; *he's* the one who's missing something!"), I believe that there may be additional ways of understanding such material that could contribute to our comprehension of female psychology.

The remarks of little Emily may prove illuminating in pursuing this line of thought. I believe that we can observe in her reflections a phase of female psychosexual development that invites further investigation, particularly in its clinical implications. I would like to suggest that, given the egocentric nature of small children, the vicissitudes of the girl's later development will rest on her early conviction that boys as well as girls have female genitals, much as we are accustomed to assuming the importance to the boy of his early conviction that everyone has a penis. Thus, according to Emily, Daddy *must* have a vulva for his penis to be *in*. Certainly it has been widely demonstrated that the little girl's first perception of a penis leads her to wonder at her lack. Relatively unemphasized

has been her response to noting that the boy does *not* have what she has, a vulva, a parting between the labia with the potential for an opening and for something inside. But, I suggest, this first awareness of the possibility of being without a vulva may contribute to the development of a true female castration anxiety. As such, it would have decisive influence on the course of female development and would affect also the ways in which girls perceive boys (and women perceive men). It would constitute an observation that must be worked over repeatedly as solutions to each phase of psychosexual conflict are attained by the girl.

It is my impression that such a female castration anxiety may be observed clinically, and that it is distinct from the female castration complex as that complex has been widely described in the psychoanalytic literature. I suggest that *castration anxiety* in men or in women, is anxiety over losing that genital which is actually possessed. It bears a particular relationship to oedipal conflicts and is given great force by perception of the opposite sex as lacking one's valued genital. The *castration complex*, on the other hand, has traditionally referred to the girl's fantasy of having had a penis that was lost. Such a definition of the castration complex implies an essentially phallogocentric experience and resolution of female castration complex. Though important, I believe it describes only one dimension of how girls may experience and cope with those concerns. So, for purposes of clarity in this paper, I will refer to that set of fantasies as the *phallic castration complex*. I will use the term female castration anxiety to refer to anxiety, in girls or in women, over the fantasied loss of *female* genitals. Clinical manifestations of female castration anxiety and the phallic castration complex may merge, but I believe that the phenomena themselves have distinct origins, follow distinguishable developmental lines, bear a complicated relationship to each other, and are certainly not exclusive of each other....

Note Mayer's powers of intuition as well as her skill at exposition—her ability to get to the point. I'm excited to read the rest of this paper. [*Um, you can see from this excerpt how unscientific psychoanalysis is. It's mostly a lot of untestable guessing and, frequently, attributing more significance to little childhood experiences than they probably have.*]

Apparently just before she died she finished writing a book called *Extraordinary Knowing: Science, Skepticism, and the Inexplicable Powers of the Human Mind*. A random website describes it thusly: "She became interested in coincidence in 1991 when she was searching for a stolen family possession, according to published reports. On a dare, Professor Mayer sought the aid of a self-described psychic who lived 800 miles away. The man was able to tell her precisely where to find the missing object. Professor Mayer began more than a decade of research seeking a scientific explanation for what had occurred. She began working with Robert G. Jahn, a science and engineering professor at Princeton University, who published an article exploring similar territory in 2001. In their view, the unconscious mind absorbs bits of information that rise into awareness, producing the phenomenon commonly called clairvoyance. At the same time, the unconscious may be able to alter the physical world." I wanted to order the book immediately, but it won't be available until February!

As I read about the psyche I despair of ever reaching anything like understanding. It's too complex. And, moreover, psychoanalysis is just plain *hard*: it relies on intuition/introspection/empathy like no other discipline [except phenomenology, surely].

Monday, July 10

Question and answer.— A: "It's amazing how *boring* people are! How can they live with themselves?!" B: "It's precisely *because* they're boring that they're able to live with themselves."

A definition.— "I'm not some dirty, naked savage! I'm *civilized!*" I.e., "My mind has been colonized in such a way that I have to cover myself in shame!"

In all humility.— Far be it from me to criticize nature’s genius in creating man, but, still, I must admit....“the painting would have been better painted had the painter taken more pains.”

Tuesday, July 11

Skimming through the book *Women’s Mysteries*, I’m struck by how right I was that women are largely defined by their bodies. Their monthly blood-letting, their ambivalence about the vagina, their ambivalence about motherhood and children and menstruation and breasts and the penis and everything else. They’re so dark to themselves! I could pick hundreds of passages from the book that seem to point to the centrality of women’s genitals in determining their outlook on life. For example:

In a female ritual context menstruation means more than the beginning of reproductive capacity; it means initiation into shared sisterhood with all who bleed. I know women who have sought to create menstrual rituals together. They save their blood and pour it onto the earth. They break the taboo against this blood by doing this not alone but in each other’s company. They tell each other their stories of first bleeding. They welcome one another into the circle of women, knowing many were not welcomed when that blood first flowed. They tell one another the stories of the humiliation of the blood....

....From a series of letters written to me over the course of years I have culled these reflections:

“I write today as I bleed. The first day and the heaviest flow. I write feeling my weightedness, the drag of my uterus. Feeling my wound, my incapacity. All the changes in my body—my voice flattened, my belly swollen, my clumsiness, a flood of dreams I cannot bring back to consciousness.

“How difficult it is to stay in the body. I get up, get to the bathroom, reach into my vagina for the menstrual sponge—a bloody mess! Squeeze the blood into a cup. It splatters everywhere.

“Can I write this to you? Am I so crazy I don’t even know it? Today I feel such self-doubt.

“The knowledge of taboo returns. The blood is not to be touched, let alone saved.

“Even what we value of menstruation—are our bodies there? We value the rhythmic cycle, the feelings, the dreams, the bond. We talk and interpret. Analyze dreams. Theorize. Baroque elaborations. Virginal fluffy clouds. Ascending out of the blood, the mess, the ache, the wound.

“Even this writing. How difficult for me to stay with my body. My feelings of vulnerability. My tears that I had hoped were past, falling again. Fears and doubts.

“Here I am. The ache in my lower spine is sensual, as is the openness of my vulva, my blood slipping in my vagina.

“A wound not to be healed—but attended to—felt, touched, smelled, seen. Received.”

Merida’s words remind me of how our monthly periods open us to our vulnerability, our tears, our doubts, our fears, to a sense of wounds as not to be fixed but attended to. She encourages us to honor our dreams, the dreams we have that prepare us for our bleeding, the dreams that accompany our bleeding, the dreams that warn us we may cease to bleed....

Because we are wounded creatures, we tend to fear being further wounded, to fear otherness, to fear dependency, and to misconstrue interdependence as domination. Because the differences between another and myself may seem to be so great as to be well-nigh intolerable, in seeking to establish a relationship I may try to make that other more like myself. Because we can't tolerate the heterogeneity, we may seek to dominate or destroy the otherness of the other. Thus heterosexual encounters often come to be contaminated by patterns of dominance and submission—even when we may all want something quite different.

I suppose it's foolish of me to point to all this, since by doing so I'm arguing with the imbecilic masses rather than the few intelligent people in the world. But, men: imagine what it's like to be so wedded to one's body! We men hardly ever really think about our bodies, unless we're thinking in passing "I wish I were more muscular/thin", or "I'm proud of how muscular/thin I am". Thus, it's more natural for us to be self-confident, to be "rational" or "intellectual": the body doesn't constantly press itself on us, so we're able to focus on the body of the other—and on things other than the body. The other, by contrast, is constantly reminded of her own body (and thus of *herself*), through the looks of men, the jiggling of her breasts (probably not as trivial a factor as it sounds), the menstruation cycle, her primordial fascination with it (her body, that is), etc. On top of that, her psychosexual development is more complex and potentially traumatic than men's (read Mayer's paper and others). Therefore her relationship to herself and the opposite sex is more complicated and ambivalent than it is for men, and she tends to be more self-conscious and insecure. ("Insecure" = preoccupied with how the other perceives you, and with the question of your place in the community.)

People

People are like
ostriches,
long necks with little heads stuck
in the sand.
Very good at hiding
and
running away.
Not so good at having
brains.

Idiocy

The miser
said
he would not donate money
because
apparently he is in favor
of pollution
and
hates
democracy
(not to mention mankind).

Thursday, July 13

Thoughts.— Compared to emotions, thoughts are mere epiphenomena. I talked to an Eastern European mother and daughter tonight—14- or 15-year-old daughter—sweet and pretty as the mist after the rain—and afterwards I forgot how to think the thoughts I'd been thinking earlier, about women and their weaknesses. I just wanted to brighten up the rainy night in their apartment, ask about their experiences and make them laugh.

Friday, July 14

Excerpts from an informative passage from Roberts' book (pp. 68 ff.):

....According to the positivist conception of science—explicitly avowed by Acton; implicitly conceded by Cohen—technological determinism will qualify as a genuine scientific theory only if empirically testable and predictive hypotheses can be deduced from its core propositions. Should there be some internal, necessary relationship between forces [of production] and relations [of production], then there can be no external, explanatory relationship—at least, of the required kind. Marxism's analytical critics had argued that the general theory of history was therefore unscientific. The forces, relations and superstructure could not be independently identified; the fundamental concepts in Marx's theory of history were logically related in a way that precluded any causal relationship. Other positivist critics of Marxism—most prominently, Popper—further argued that the theory tended to circularity in another, closely related, sense: what appeared to be bold empirical hypotheses not infrequently turned out to be mere tautologies. Consider the claim that, if the existing relations of production have become fetters on technological development, then this will bring about an 'epoch of social revolution'. This is a bold and testable conjecture only if the antecedent condition (the 'fettering' of the productive forces) is identifiable independently of the consequent 'social revolution'. Presented with this claim, the positivist social scientist will be unable to test it until he is told what level of 'fettering' will be sufficient to bring about a social revolution. But, or so their Anglophone critics claimed, Marxists simply denied that there was fettering in the required sense unless and until social revolution actually occurred. In the 1940s and 1950s, Marxism's critics argued that the general theory of history was either demonstrably false or vacuously tautologous.

....[Miller, however, disagrees.] If scientific positivism is conceded, he argues, then Marx's theory of history would be indefensible. But it should not be conceded.Circularity—understood as the identification of 'internal' relationships between the central explanatory concepts within a scientific research programme—is not a problem at all: 'it is typical of the most interesting scientific theories that phenomena which are connected by way of explanation are also connected, to some extent, by definition'.

Miller develops this point through a discussion of Darwin's theory of evolution.If this 'massive Ism' had suffered the indignity of being hauled up before Ryle's 'court of law', then it too would have been convicted of non-scientificity. Consider the central proposition of the theory of evolution: 'when the selective advantages of the traits associated with new genetic material are great enough in the population, it comes to pervade the gene pool; if enough new traits accumulate a new species emerges'. But this is pure tautology: 'in these principles, "enough" in the antecedents means enough to produce the changes described in the consequents'—for example, 'enough' new traits have

accumulated to produce a new species if, and only if, a new species is produced. Compare this, then, with Marx's claim that if the fettering of technological development by the relations of production is severe enough, then there will follow an 'epoch of social revolution'—this is tautologous: fettering is severe enough if, and only if, revolution occurs. Miller makes no bones about the fact that the core propositions of his 'mode of production' theory are also transparently tautologous: 'basic change in economic structure occurs when the mode of production gives rise to conflicts severe enough to produce such change'. As Darwin's theory of evolution, so too Karl Marx's theory of revolution.

Why have positivist philosophers of science displayed such an uncompromising hostility to the common practice of research scientists in both the natural and social sciences? The answer is, in part, that they have tended indiscriminately and universally to appeal to a particular model of the nature of scientific practice. On this view, the business of science is to make *predictions*, and to test these predictions through rigorous empirical research aimed at the confirmation or disconfirmation of a particular hypothesis. Science predicts, then tests. But, just as Darwin's theory does not enable us to predict the emergence of a new species, Marx's theory of history does not enable us to specify in advance the conditions under which a social revolution will actually materialise. Only after the event, as it were, does Darwin's theory connect the emergence of a new species with a process of genetic mutation, or Marx's theory of history connect social revolution with the fettering of the productive forces. Yet, while these theories are not *predictive*, they are clearly *explanatory*. It would be absurd to suppose that a general theory of history of the kind developed by Marx could or should be able to produce predictive empirical laws of the form 'when social conflict reaches degree X, there follows the revolutionary transition to a higher mode of production'. But while Marx's theory cannot make predictions, it seeks to explain epochal social transformations. It tells us *why* social transitions occur—due to contradictions between the forces and relations—and it tells us *how* they are achieved—through the medium of class conflict.

I'm not sure I agree with the parallel drawn between Darwin and Marx, but it's thought-provoking. The Marxist theory of history, as stated in the famous Preface, is inadequate (though not for the reasons Popper thinks), but since it's suggestive it must be substantive.

I'm amazed at the extent of our culture's cult of secrecy in matters of the body. Even in *this* age, people find it terrible to speak of women's bodies! Menstruation is unmentionable, except maybe in intimate circles of liberal-minded people. What dishonesty! How can women not see that "anatomy [or biology] is", more or less, "destiny"?! Freud exaggerated it, but his view has a kernel of truth. I can use one of their own "against" them:

Having wombs reminds us of how much we are part of the ever-ongoing cycle of generations, how much we are used by nature as simply the instrument of her self-continuation. Having wombs reminds us of how much human activity is creative, generative.Having wombs reminds us of the womb which gave us birth and also, inevitably, of the womb-tomb to which we will return.

[Conception] is followed by the mystery of *gestation*—the slow growing within our body of another life. This for me was an even greater mystery, the most powerful experience I've known of my body knowing how to perform a miracle about which "I" didn't have a clue—and the experience of coming to feel that the real "I" was precisely the knowing body. The excitement of feeling the changes month by month. The changes in my body's contours and responses. The experience of feeling the new little creature within grow and move and assert its presence. The strange sense of an intimacy of connection to

this other who was also still partly myself. The mystery of knowing that I, too, had begun as a being living within my mother's body.

....Sometimes the child within feels like an invader. Sometimes it feels as though one's body is betraying one, that more radically than ever before it feels "not-me". And sometimes things go radically wrong—and then there can come a terrible feeling of unworthiness and failure. We're "supposed" to know how to do this and to do it easily and well. This sense of failure may then expand and seem to apply to all of our lives, initiating a crisis of depression and self-denigration and despair. How vulnerable our bodies make us.

The first meaning breasts have for us is nurturance. We received it (or didn't receive it) from our own mothers, and then if we become mothers ourselves, find ourselves expected to play the role of nurture-giver in our turn. Those of us who actually breast-feed our babies (as I did) may receive deep delight from doing so. The closeness of holding the child so recently within our bodies at our breast, feeling the liquid flow from our bodies into theirs, symbolizes that the connection remains. I remember the bliss of feeling the child become satiated, utterly content, and then falling asleep with my nipple still in its mouth—and my own empathic drowsiness. I knew I wasn't supposed to bring my babies into my bed, to let them lie curled against my own recumbent body for those middle-of-the-night feedings, but I couldn't always resist. It was too delicious, too beautiful. I remember, too, the sweetness of their smiles of grateful pleasure when in response to their cries I'd begin to open my blouse, and their eyes so loving fixed on mine as they sucked away.

Even as I write this, more than thirty years since I last nursed a child, I feel the tightening of my nipples, the responding pulse in my vagina. There's a kind of female eroticism around breasts, a from-within not a looking-at eroticism, that is as compelling as any I know. A lover sucking at my breasts has great power to arouse me sexually, to fill me with delight in being touched there and with longing to be touched below and entered—but powerful as that lover's touch may be, it does not stir me as deeply as my babies' sucking.

A being with a body like that and a biological role like that—how could her self-conception not be fundamentally oriented around her body, more so than it is in men? And her biologically ordained semi-passiveness (see especially the second and third paragraphs, but don't forget about menstruation and the other changes during puberty)—her *felt knowledge* of it, of her otherness-to-herself, more profound than the man's otherness-to-himself—how could this not influence her attitudes toward herself and toward the other sex, the more 'autonomous' and less biologically 'passive' sex?

Sunday, July 16

I got some books from the library. First of all, I'm rereading Margaret Mead's *Coming of Age in Samoa*, since I never finished it. I also took out her *Sex and Temperament*, Leopold Pospisil's *The Kapauku Papuans of West New Guinea*, H. G. Barnett's *Being a Palauan*, Winnicott's *Playing and Reality*, Kohut's *Self Psychology and the Humanities*, and two anthologies: *Foundations of Social Inequality*, edited by Gary Feinman and T. Price, and *Man Before History*, edited by Creighton Gabel.

One of the things that impressed me when I first read Mead's book is that young children take care of the youngest children. Six-, seven-, eight-year-olds are responsible for two-, three-, four-year-olds. This fact, together with the apparent 'healthiness' of the society, suggests that psychoanalysts have tended to

overestimate the infant's need for properly *maternal care*.¹ (Also, modern Western children raised in households of gay men seem to become well-functioning adults.) Young (female) children do the housework as well:

As soon as the girls are strong enough to carry heavy loads, it pays the family to shift the responsibility for the little children to the younger girls and the adolescent girls are released from baby-tending. It may be said with some justice that the worst period of their lives is over. Never again will they be so incessantly at the beck and call of their elders, never again so tyrannised over by two-year-old tyrants. All the irritating, detailed routine of housekeeping, which in our civilization is accused of warping the souls and souring the tempers of grown women, is here performed by children under fourteen years of age. A fire or a pipe to be kindled, a call for a drink, a lamp to be lit, the baby's cry, the errand of the capricious adult—these haunt them from morning until night. With the introduction of several months a year of government schools these children are being taken out of their homes for most of the day. This brings about a complete disintegration of the native households which have no precedents for a manner of life where mothers have to stay at home and take care of their children and adults have to perform small routine tasks and run errands.

Men and women share duties in the household and on the plantations.

W. R. D. Fairbairn's ideas, which are exceedingly complex, seem sensible. Some of them are quite suggestive. For instance, Grotstein writes in his paper on Fairbairn that "[the infant] does not operate primarily from the pleasure principle but defaults into using the pleasure principle when object relations are realized to be untenable". Possibly a half-truth, but suggestive. Here are others:

....An intrinsic part of the schizoid personality is a withdrawal from untrustworthy interpersonal relationships, which are then taken into the patient's internal world where they constitute internalized "object relationships".

In other words, the infant needs a "satisfying person" on the outside. Failing that, he introjects the image of that person into his internal world as an unsatisfying object. This unsatisfying object, in turn, is identified with an unconscious aspect of the ego. Thus, the internalized object is treated as if it is indistinguishable from the ego itself. This unsatisfying object is then split and divide into a rejecting object and an exciting object. Along with this, the unconscious object splits and becomes an antilibidinal ego, which is identified with the rejecting object, and the libidinal ego, which is identified with the exciting object.

I shall go into Fairbairn's endopsychic structure shortly, but for now I should like to discuss his view of internalizations and identifications. One of the most evocative of Fairbairn's conclusions, and one that has paradoxically remained largely unnoticed, is his concept of internalization and identification. Unlike virtually every other theoretician, Fairbairn states that only bad objects are internalized; good objects do not have to be because they are satisfying. Thus, from Fairbairn's point of view, all identifications can be thought of as actually or potentially pathological. I think Fairbairn would have exempted trial identifications, that is, identifications that were transitory and not permanent. Freud himself hinted at this when he said that the shadow of the object falls on the ego. If we follow that metaphor to its conclusion, we see that the ego must conform to the shadow of its object, thereby restricting its own agenda in favor of the object's. The infant introjects the badness of the object because the object is needed, and its badness in the external object is all the more threatening. On the inside of the self it can be controlled, albeit in phantasy.

¹ Until the infants are weaned, though, mothers are mainly responsible for their care.

What does the infant or, for that matter, the normal person of any age do with good objects or the goodness of the object? Fairbairn states that the goodness of the object does not have to be internalized. He does not explain this fully, but one inference is that the goodness of the object produces good experiences that allow the infant to grow properly. An analogy would be that infant must take in the milk from the breast, but not the breast itself unless the breast is felt to be bad and therefore must be taken in.

An offshoot of Fairbairn's ideas of introjection and identification is his concept of the moral defense, or the defense of the superego. The infant takes in the badness of the parent, as mentioned above, in order to control it within and also to restore the external object to a suitable state. In other words, the infant takes over (that is, takes over the responsibility for—by identifying with) the parent's badness in order to "cure" the parent, that is, to "launder" the parent's image so as to have a fictively reconstructed parent that is serviceable for the infant's needs.

Fairbairn believed that the objects that were taken into the internal world, along with the dissociated egos that joined each of the objects, constituted "endopsychic structures" that, in turn, related to each other as unconscious dynamic structures....

Why, for instance, do people who are raped or severely traumatized feel guilty and/or ashamed, especially when they are innocent in the first place? Fairbairn's answer to this paradox is unique. One who is overcome by trauma feels "broken" by the abuser and retroactively (as well as retrospectively) reconstructs a belief about oneself that one is inhabited by bad objects with *whom one is identified!* Shame emerges from the retroactive and retrospective emergence of the sense of being unprotected by good objects and laden with bad ones with whom one is in identification.

[And again:] The relationship between these endopsychic structures helps us understand why, for instance, children who are abused or molested have such a difficult time discussing it with others, including therapists. The sense of shame is enormous. They believe they are identified with bad objects, retrospectively. Yet another aspect of this situation is that many of these children may take on the so-called martyr defense. That is, they may introjectively identify with what is felt to be the bad or cruel external object, experience self-abuse, act the loser, avoid success, and carry out other forms of self-punitive behavior, but in such a passive-aggressive way that one quickly realizes that their guilt has a projectively provocative effect on their caretaking objects. Often behind this unconscious action is narrative is the hope to "bust" their parents, that is, to bring them to the public at large by virtue of the suffering victim's agony.

I'm tired of reading to no end. There's no point anymore, this attempt to find truth in a world that doesn't care. I don't know where I'm headed in life.

Tuesday, July 18

Thoughts thought in the heat:

A woman who puts on high heels has already subordinated herself to men. (It's self-objectification.)

If *I'm* this bored—after only 25 years—imagine how bored the *universe* must be! Supernovae may be the universe's attempts to amuse itself.

A dangerous temptation for people like me is to treat non-conformism as an end in itself. It isn't. It's just a means.

If there is a God, he's a nihilist.

I was talking to my roommate about philosophy—he likes broaching the subject (or that may be my influence on him)—and although our conversations are never nearly as satisfying as those I have with Jackson, who's the only über-charismatic guy I've known who's also philosophically informed, they are engaging—and without knowing it I said that the reason consciousness is indefinable is that it's too *immediate*, i.e. lacks properties, i.e. can't be related to anything else. That isn't completely true, though. Or maybe it is. Consciousness has *negative* properties, and can be *positively* described *indirectly* (e.g., “It is implicit in the concept of experience”) and *metaphorically* (“It is transparent”), but it has no genuine properties *per se*.

I don't know why I wrote all that. It's identical to what I wrote months ago.

Sunday, July 23

The storm that hit St. Louis on Wednesday is being touted as the worst disaster in the city's history. Three hundred thousand people (including me) are still without power. It's global warming's fault, I tell you. I was in Ladue, town of misers, when it happened. It was strange: ominous clouds appeared out of nowhere and then the temperature dropped thirty degrees in five minutes, and then the wind started. Ninety miles per hour. I took shelter in someone's yard under a tree-canopy till the rain got bad; then I hid in a shed. The lightning was spectacular! So was the destruction of yards. “God's wrath is upon you, Ladue!” I shouted. “Damn Ladoosiers!”

The penultimate chapter in Mead's book is excellent. (All the chapters are.) It's both a summary and an explanation of the differences between the Samoan and American cultures. Why are Samoan adolescents so well-adjusted while Americans are tormented?

The Samoan background which makes growing up so easy, so simple a matter, is the general casualness of the whole society. For Samoa is a place where no one plays for very high stakes, no one pays very heavy prices, no one suffers for his convictions or fights to the death for special ends. Disagreements between parent and child are settled by the child's moving across the street, between a man and his village by the man's removal to the next village, between a husband and his wife's seducer by a few fine mats.Love and hate, jealousy and revenge, sorrow and bereavement, are all matters of weeks. From the first months of its life, when the child is handed carelessly from one woman's hands to another's, the lesson is learned of not caring for one person greatly, not setting high hopes on any one relationship.So, high up in our list of explanations we must place the lack of deep feeling which the Samoans have conventionalized until it is the very framework of all their attitudes toward life.

And next there is the most striking way in which all isolated primitive civilizations and many modern ones differ from our own, in the number of choices which are permitted to each individual. Our children grow up to find a world of choices dazzling their unaccustomed eyes....

....Little Samoan children pass apparently unharmed through experiences which often have grave effects on individual development in our civilization. Our life histories are filled with the later difficulties which can be traced back to some early, highly charged experience with sex or with birth or death. And yet Samoan children are familiarized at an early age and without disaster, with all three.

....The organization of a Samoan household eliminates at one stroke, in almost all cases, many of the special situations which are believed to be productive of undesirable emotional sets. The youngest, the oldest, and the only child, hardly ever occur because of the large number of children in a household, all of whom receive the same treatment....

The close relationship between parent and child, which has such a decisive influence upon so many in our civilization that submission to the parent or defiance of the parent may become the dominating pattern of a lifetime, is not found in Samoa. Children reared in households where there are a half dozen adult women to care for them and dry their tears, and a half dozen adult males, all of whom represent constituted authority, do not distinguish their parents as sharply as our children do.... It is interesting to note that a larger family community....seems to ensure the child against the development of the crippling attitudes which have been labelled Oedipus complexes, Electra complexes, and so on.

The third element in the Samoan pattern of lack of personal relationships and lack of specialized affection, is the case of friendship. Here, most of all, individuals are placed in categories and the response is to the category....[and] considerations of congeniality, of like-mindedness, are all ironed out in favor of regimented associations.

Drawing the threads of this particular discussion together, we may say that one striking difference between Samoan society and our own is the lack of specialization of feeling, and particularly of sex feeling, among the Samoans. To this difference is undoubtedly due a part of the lack of difficulty of marital adjustments in a marriage of convenience, and the lack of frigidity or psychic impotence. This lack of specialization of feeling must be attributed to the large heterogeneous household, the segregation of the sexes before adolescence, and the regimentation of friendship—chiefly along relationship lines....

The next great difference between Samoa and our own culture which may be credited with a lower production of maladjusted individuals is the difference in the attitudes towards sex and the education of the children in matters pertaining to birth and death. None of the facts of sex or of birth are regarded as unfit for children, no child has to conceal its knowledge for fear of punishment or ponder painfully over little-understood occurrences.Furthermore, the Samoan child who participates intimately in the lives of a host of relatives has many and varied experiences upon which to base its emotional attitudes....

Mead also notes the absence of a rigid dichotomy between work and play. You should read the whole chapter.

Roberts' book raises interesting questions, but they're too difficult for me to discuss.

At the library I got Marcuse's *One-Dimensional Man* and a compilation of George Herbert Mead's writings called *Mind, Self, and Society*.

Monday, July 24

Still no fucking power. Those fuckers at AmerenUE restored electricity in Ladue and U. City and the other wealthy neighborhoods within two days, but in the poor areas it's been a week and we've still got nothing. (What could be more predictable?)

The two worst inventions in history were the nuclear bomb and human beings. Of the two, though, the second is far more destructive.

R. P. Dore's article "Function and Cause" (in *The Philosophy of Social Explanation*) is, on the whole, very good. I think I agree with his critique of functionalism. What we need are *causal* explanations.

Functional explanations are useful primarily insofar as they enumerate some causes of the *persistence* of institutions, as opposed to their *origin*. (See the article on the distinction.)

The old debate over the separation between sociology and psychology seems sterile. Sociology has to borrow a lot from psychology, but since its subject-matter is interaction among *groups* of people—whereas psychology is concerned with the individual—it isn't "reducible" to psychology.

Tuesday, July 25

Good day. Proof, written earlier:

Ode to Clayton.— Clayton, city of angels, neighborhood of nice old people: you make my heart sing! You make everything *groooooovy!*

"*You gotta feel the groove, man!*"— Sex is like jazz. Like improvising. First of all, the rhythm has to consume you. It has to flow out to your consciousness from deep instinctual reservoirs, unthinkingly. Syncopation is acceptable only as long as you continue to feel the beat and master it. Secondly, you have to know the art of crescendoes and diminuendos in excitement, of building the tempo and slowing it and letting the suspense develop its own momentum. It builds nearly to a climax and then sinks, then falls to a whisper and builds again. Several false climaxes, several real ones, until the eruption near the end. Thirdly, you need a sensitive touch. You have to know when pianissimo is called for and when mezzo-piano; your sensitivity has to send shivers through the listener. Pain and dissonance are good as long as you know how to resolve them, caress them away in a single breath *à la* Mozart. Most importantly, though, you have to lose yourself in the music. Let go of everything; sacrifice yourself and *become* the music. She'll love you for it, trust me.

Sheer misery.— Now that I have self-confidence, my worst experiences are when I fall in love with a sweet-looking girl I talk to or pass in the street. A girl who looks slightly naïve but intelligent, passionate but self-possessed, sexy but self-respecting. Wearing a skirt or shorts—or pants, it doesn't matter; it's all in her face and the way she carries herself. The level-headed girl whose beauty suggests there's something poetic in her personality.... In all seriousness, such encounters really are painful for me.

For humans, there is something absolutely fundamental about *rhythm*. It's manifested everywhere. In biology, in sex, in music, in dance, in play, in infancy. (Piaget's studies attest to the significance of rhythm for the young child.) There's something profound in that, though I don't know what.

Wednesday, July 26

One of the good things about this job is that it always gives me time to write:

Outward harmony, inner war, between the sexes.— My relationships with women are just now starting to become healthy, because only now is my self-confidence *in relation* to them.

The naysayer speaks.— "I don't respect people unless they admit their inferiority to me."

The Culture of Neuroticism.— When you sit on the border between someone's lawn and the sidewalk and he tells you to get off his property, the reason for his remark is clearly that your presence makes him insecure in some way. But what does "insecure" mean? It's just a word, an empty word that doesn't capture the concrete fact behind it. I think his insecurity is phenomenologically comparable to a form of mild obsessive-compulsiveness. The kind I used to have, which made me, for example, place a

dollar bill right side up when I saw it tossed carelessly onto a table, or adjust books so that their edges were parallel to the edge of the desk they'd been placed on. Your presence on the man's lawn just—*bugs* him, as the crumpled dollar bill bugged me. It's a nagging at the edge of his consciousness. As such, it means he lacks a certain carefreeness, a casualness—a togetherness-oriented outlook on life. In a sense, in that moment he's fixated on himself (through that which is his, his property), on the separation between the two of you, like I was fixated on myself in the years of my obsessive-compulsiveness. In fact, the latter was an *expression of* my self-consciousness, as well as an unconscious reaction to it. (That may seem weird, because there's no apparent connection between self-consciousness and obsessive-compulsiveness, but pathologies work in mysterious ways.) Likewise, the man's neurotic 'psychic tick'—his fixation on his private property—is an expression of and reaction to his habit of thinking [...]

Thursday, July 27

Day of shit. No money in Rich Prick Land. I had an encounter with obnoxiousness personified. (Interestingly, obnoxiousness takes the form of a wrinkled old geezer.) More or less verbatim as follows:
[...]

One-Dimensional Man is irritating. Sloppy thinking, and it's hard to know what's being said. Frigging Continental philosophers write arguments that aren't arguments. Still, Marcuse manages to communicate insights once in a while.

The greatest country in history.— Americans fetishize all seven of the deadly sins. Greed: look at Enron and the rest of corporate America and politics. Sloth: television is no longer just the masses' opiate; it is *reality*. Gluttony: Americans are fatter than any people in history. Vanity: women have become nothing but creatures of their bodies, and the cult of appearance is corrupting men too. (The obsession with “working out”.) Lust: pop culture revolves around sex. Envy: movies, magazines, individualistic ideologies all encourage interpersonal comparisons and dissatisfaction. Pride: Americans as such are at least as arrogant as Romans were in their day. —No wonder Christians have their persecution-complex! They can see that their religion has become irrelevant.

Sunday, July 30

In her book *Sex and Temperament*, Mead describes three tribes in New Guinea whose gender-relationships she thinks challenge Western preconceptions. Amongst the Arapesh, both men and women are maternal, gentle, etc; amongst the Mundugumor, the sexes are aggressive and masculine; amongst the Tchambuli, the men are comparatively passive and “feminine”. I've skimmed only parts of the book, mostly in the section on the Tchambuli people because it's potentially the one most damaging to my beloved prejudices. (When it comes to innate predispositions, I'm more committed to ideas on the *relative* roles of men and women rather than to ideas on *absolute behavioral patterns*.) Her account is fairly compelling, but its cogency seems diminished by articles I've read that criticize her methodology. But it's too complicated (and probably hopeless) a task to determine where the truth lies, so—that's that.

Still, it must count for something (in my favor) that the men in this supposedly role-reversed society were neurotic and mentally unhealthy, as she admits.

In dubious company.— The Marquis de Sade would have approved of my “free-spiritedness”, which tips its hat to him as its great forerunner. (Guillaume Apollinaire called de Sade “the freest spirit that has yet existed”.)

the tiredness in the sadness

in the happiness in the love....
such is my life

Howard Zinn's book is excellent. It's a dreary record of injustice and inhumanity, as any true history must be. It ought to be required reading for all politicians, who, out of ignorance of history and the conditions of society, invariably repeat the mistakes of the past. [Nope, this is psychologism and idealism. Institutions are the main problem, not ignorance.]

Leopold Pospisil's analysis of the Kapauku, with their "primitive capitalism" and secularism, is fascinating. The people recognize a mind-body dualism and are apparently even more individualistic than Americans.

Today I got Richard Rorty's *Philosophy and the Mirror of Nature*, John Murphy's *Pragmatism: From Pierce to Davidson*, William Gorton's *Karl Popper and the Social Sciences*, Howard Marshall's *The Great Economists: A History of Economic Thought*, Ernesto Screpanti and Stefano Zamagni's *An Outline of the History of Economic Thought*, *The Great Gatsby*, and *Hitler's Secret Conversations 1941-1944*.

Rorty, ch. 1: "I hope I have said enough to have incited the suspicion that our so-called intuition about what is mental may be merely our readiness to fall in with a specifically philosophical language-game. This is, in fact, the view I want to defend. I think that this so-called intuition is no more than the ability to command a certain technical vocabulary—one which has no use outside of philosophy books and which links up with no issues in daily life, empirical science, morals, or religion." My *intuition* of the difference between body and mind is merely an *ability*?? How can an intuition be the same thing as an ability? The first is a specific event, the second a descriptive extrapolation, something like a disposition. (This is of course one of the problems with behaviorism. Mental *events* are not behavioral *dispositions*.) Granted that Rorty expressed himself badly, his position still doesn't make sense. When I intuit the body/mind dichotomy, I'm not using concepts. Indeed, that's the distinguishing mark of an intuition: it isn't discursive. Furthermore, is it likely that people in the Kapauku tribe are "commanding a certain technical [philosophical] vocabulary" when they intuit the mind-body dualism? (Pospisil notes that they're a very unphilosophical tribe, almost exclusively concerned with amassing wealth.) It may—*possibly*—be true that in some cultures the dualism is unintuitable because of primitive social conditions and a corresponding unsubtlety of thought (John Searle remarks that in a certain African language it's impossible to communicate the mind-body problem—which, incidentally, doesn't imply that the people can't *intuit* [or at least 'vaguely understand'] the distinction), but given the sophistication of our culture, the mind-body division is most definitely intuitable outside philosophical language-games, and most definitely links up with issues in daily life, science, morals and religion.

The next sentence in the quoted passage is this: "In later sections of this chapter I shall sketch a historical account of how this technical vocabulary emerged, but before doing so, I shall beat some neighboring bushes." Apparently he wants to beat some neighboring bushes—neighboring, I suppose, the desk where he's writing, or the house he lives in. While I do find it a childish activity to hit bushes—what, is he *angry* at them?—and I consider it an irrelevant piece of information in the context of the passage, I freely acknowledge his right to beat bushes and I hope he has fun doing so.

Rorty is right that it's somewhat arbitrary to class intentions and phenomenal states together as "the mental". They share only negative properties, such as 'of a different intuitive and ontological character than the body'. They're different species of emergent neural phenomena; a conceptually more precise language wouldn't classify them both as "mental" and leave it at that.

....I hate reading philosophy. It's frustrating to indulge the attempts of intellectual midgets to muddle helplessly through simple problems.

Rorty on the ontological dualism implicit in the mind-body problem (specifically on the question of why we think of the phenomenal as immaterial, to which he gives the answer "because we think of pains as *universals* (and universals are immaterial)"):

As long as feeling painful is a property of a person or of brain-fibers, there seems no reason for the epistemic difference between reports of how things feel and reports of anything else to produce an ontological gap. But as soon as there is an ontological gap, we are no longer talking about states or properties but about distinct particulars, distinct subjects of predication. The neo-dualist who identifies a pain with how it feels to be in pain is hypostatizing a property—painfulness—into a special sort of particular, a particular of that special sort whose *esse* is *percipi* and whose reality is exhausted in our initial acquaintance with it. The neo-dualist is no longer talking about how people feel but about feelings as little self-subsistent entities, floating free of people in the way in which universals float free of the instantiations. He has, in fact, modeled pains on universals. It is no wonder, then, that he can “intuit” that pains can exist separately from the body, for this intuition is simply the intuition that universals can exist independently of particulars. That special sort of subject of predication whose appearance *is* its reality—phenomenal pain—turns out to be simply the painfulness of the pain abstracted from the person having the pain. It is, in short, the universal *painfulness* itself. To put it oxymoronicly, mental particulars, unlike mental states of people, turn out to be universals.

This is the sort of sophistical trash that passes for philosophy.

In a passage on the Greek image of the Eye of the Mind as a metaphor for knowledge—“knowledge [is interpreted] as *looking* at something”—Rorty says he doesn’t know how the image originated nor why it caught on. He doesn’t even offer a suggestion. Being Richard Rorty, he’s content to admit it’s a mystery to him. In a book whose main purpose is to criticize the “mirror” image of philosophy—i.e., representationalism, the correspondence theory of truth—this is quite a lacuna. I’m a nice guy, though, so I’ll do Rorty’s thinking for him. He should have been struck by the parallel between Plato’s metaphor and Wittgenstein’s picture theory of meaning. And then he should have realized that the essence of both is *correspondence* (both a picture and sight are *of* something). And then he should have noted that language has a referential [or representational], self-transcending character,¹ that every statement (even an imperative) posits a state of affairs²—that it’s a *picture* of a state of affairs.³ And then he should have noted that knowledge itself is always *of* something, that it implies correspondence with something external to it. And finally he should have seen that the ocular metaphor is the best possible one, related as it is to pictures (of states of affairs), to representations of an external world and thus to knowledge and the correspondence theory of truth. At this point he should have stopped writing his book.

I get the feeling that Rorty is succumbing—or is going to succumb later in the book—to the common mistake made by readers of Kuhn and postmodernists in general, that because certain modern ideas are products of “gestalt switches” that occurred between the sixteenth and twentieth centuries, they have only relative validity. This conclusion doesn’t follow from the premise, unless you add the further premise that no revolutionary idea that partly *bypasses* previous questions rather than directly answering them can be true outside the culture in which it arises. But this is absurd. It implies, for example, that general relativity, if true, is true only in Western culture. (Alternatively, it implies that general relativity *can’t* be true, for the simple reason that it resulted from a gestalt switch.) In any case, the rejection of an old “vocabulary” and adoption of a new one whose categorial framework is, *to an extent*, incommensurable

¹ Suggestive remark: in this respect it’s similar to consciousness.

² The order “Go over there!” posits the state of *you being over there*.

³ This is the implicit ideal, at least. The more ‘abstract’ a statement is, the harder it is to see its pictorial element. This indeed accounts for the difficulty of such abstract disciplines as philosophy and economics: the mind finds it harder to grasp the logically implicit “pictures”. This is also why the correspondence theory of truth seems to break down in such realms. It remains the logically necessary ideal, though. We’re forced to orient our theoretic efforts towards it. (See the first chapter of my senior thesis.)

with the old one¹ and thus leads to totally different questions may after all signify a more adequate conceptualization of the subject-matter and thus an advance towards truth. The whole point of philosophy is to find the subtlest, most fine-grained conceptualizations of phenomena so that our “representations” of them can have the most explanatory power. This is also, of course, the goal towards which Rorty and all postmodernists are (despite themselves) looking: they want to *represent* their subject-matter in the truest way possible.

The farthest I’m willing to go down the road of relativism is to say that there are *degrees* of truth. But I’ve been saying this all along (see my thesis), and anyway it isn’t relativistic. It’s simply a recognition of the fact that languages are rough-hewn out of the raw material of experience—i.e., that they evolve in usefulness and thus truth. The implicit goal of linguistic and theoretic evolution remains correspondence with that towards which the given utterance transcends itself.

Ultimately I have to agree with Rorty that “‘sensation’ and ‘brain process’ are just two ways of talking about the same thing”—which isn’t a *third* thing (in addition to mind and body), since ‘sensation’ is just an emergent aspect of bodily processes—but his claim doesn’t make sense except on the basis of my arguments. For he doesn’t suggest any way to conceptualize it. He simply says, “It would be better at this point to abandon argument and fall back on sarcasm, asking rhetorical questions like ‘What is this mental-physical contrast anyway? Whoever said that anything one mentioned had to fall into one or other of two (or half-a-dozen) ontological realms?’” (That isn’t sarcasm, by the way.) He does admit that that tactic seems disingenuous, since “it seems obvious that ‘the physical’ has somehow triumphed”, but in the end he leaves it at that. His final argument is that “if knowledge is not a matter of accuracy of representation, in any but the most trivial and unproblematic sense, then we need no inner mirror, and there is thus no mystery concerning the relation of that mirror [viz., the mind] to our grosser parts [viz., the body]”. Oh-so-cleverly he thus connects the mind-body problem with epistemology, which is conveniently the subject of the next part of his book. (He also has cleverly obscured the fact that his solution to the mind-body problem is the prosaic materialistic one, namely by arbitrarily and inexplicably declaring that we have to drop the “whole cluster of images” inherited from the seventeenth century. If we just “*drop the images*”, the problem will be solved!²)

Schubert is incredible: his pieces change keys more often than those of any other composer. He’s an ancestor of the atonalists. The difference between him and them (aside from the obvious) is that his concern throughout was to make *music*, while theirs was to make a *statement*, a *theoretic revolution*. He let

¹ I say “to an extent” because, as Andrew Sayers says, there is always *some* continuity between two given “vocabularies”, *some* way of arguing between them. This is because, insofar as people follow the most basic rules of logic (which they have to if they speak a language), their methods of finding truth are essentially similar. Newtonians can argue against relativists; Western scientists can demonstrate to Papuans that the latter’s explanatory myths (of, say, an eclipse) are incorrect. (Insofar as people use language, i.e., are “rational”, they must accept and utilize evidence in support of beliefs. And the scientist’s evidence—his whole *framework*, in fact—is more compelling than the Papuan’s, for many reasons I won’t go into. If despite overwhelming evidence the Papuan persists in his mythical beliefs, he is to that extent irrational. (An example of a ‘framework-neutral’ criterion for deciding between theories is predictive ability. Even Papuans want to be able to predict phenomena, like eclipses and weather-patterns. To the extent that the scientist is better able to predict these things, his theories are better than the Papuan’s.))

² He’s right that in a sufficiently different language and conceptual framework the problem wouldn’t arise, but it doesn’t make sense to assume that *therefore* the problem is a verbal illusion. For it may be that our language and conceptual system are subtler and more faithful to differences in the *Sachen selbst* than the other language is. For example, the Greek idea that sensation belongs to the body rather than the mind is indeed an interesting alternative to our Cartesian intuitions, but it’s probable that philosophical argument would conclude that our intuitions are more faithful to differences in the ‘raw material’—differences that are merely “potential” (for us) until they’re made “actual” in our awareness. How else would our intuitions, our “whole cluster of images”, have persisted for centuries if they didn’t correspond to distinctions in the raw material of experience? —Anyway, all this is academic, because my solution to the mind-body problem accommodates both the Greek and the Cartesian intuitions. It explains in what sense mental phenomena are physical and in what sense they aren’t.

his instincts guide him; the atonalists were guided by their self-consciousness. Hence they're less interesting. (And their music, of course, is ugly.)

Monday, July 31

I left my job on Friday. Couldn't tolerate the misers anymore. I raised about \$5000 over the summer.

Rorty: "I shall try to back up the claim (common to Wittgenstein and Dewey) that to think of knowledge which presents a 'problem', and about which we ought to have a 'theory', is a product of viewing knowledge as an assemblage of representations—a view of knowledge which, I have been arguing, was a product of the seventeenth century. The moral to be drawn is that if this way of thinking is optional, then so is epistemology, and so is philosophy as it has understood itself since the middle of the last century." It's optional? Granted. There is indeed such a thing as history, congratulations on the discovery. But it's a non sequitur to go from "optional" to "wrong". (I'm not necessarily defending the self-conception of philosophers. I'm attacking Rorty's postmodernist, fallacy-ridden method.)

The crucial premise of [my] argument is that we understand knowledge when we understand the social justification of belief, and thus have no need to view it as accuracy of representation. Once conversation replaces confrontation, the notion of the mind as Mirror of Nature can be discarded. Then the notion of philosophy as the discipline which looks for privileged representations among those constituting the Mirror becomes unintelligible. A thoroughgoing holism has no place for the notion of philosophy as "conceptual", as "apodictic", as picking out the "foundations" of the rest of knowledge, as explaining which representations are "purely given" or "purely conceptual", as presenting a "canonical notation" rather than an empirical discovery, or as isolating "trans-framework heuristic categories". If we see knowledge as a matter of conversation and of social practice, rather than as an attempt to mirror nature, we will not be likely to envisage a metapractice which will be the critique of all possible forms of social practice. So holism produces, as Quine has argued in detail and Sellars has said in passing, a conception of philosophy which has nothing to do with the quest for certainty.

As you know, I agree with him that the quest for certainty, for foundations of knowledge, should be abandoned. I think, though, that, like the later Wittgenstein, he sets up a false dichotomy between an implausible realism and an anti-representationalist pragmatism. There's a path midway between the early and the late Wittgenstein. The notion of truth as correspondence is implicit in all theorizing, but our philosophical *self-understanding* can incorporate the fact that the social sciences are less exclusively 'representational' or 'mirror-like' than the natural sciences, in that the reality they purport to describe, lacking a physical aspect, doesn't clearly and directly confront us. We have more freedom to *create* in the social sciences; we can't constantly test our theories in the crucible of physical nature. Still, in the end even our self-understanding has to make room for 'truth-as-correspondence', because, after all, we are trying to describe an external reality, albeit an invisible one. (It asserts its presence in the form of logical (and inductive) persuasiveness, of regularities in human behavior, of indirect empirical evidence for theories, etc.)

I skimmed Gorton's book. It didn't cure me of my Popper-disdain. I have yet to be impressed by any of his ideas.

Notes on the two economics books:

Mercantilism. The surplus or the deficit on the balance of trade between countries is what makes the exchange rate vary. But rather than worry about the exchange rate, the state should encourage exports and discourage imports. The excess of sales over purchases is thought to be the sole origin of profit (for

nations as well as individuals), so the goal of maintaining a favorable balance of trade should guide the state's economic endeavors. Therefore, protectionism! High import duties and no export duties. The mercantilists also wanted population to increase so there would be a sufficient labor supply for the expanding industries. They formulated the first quantity theory of money: the higher the gold in circulation, the higher the prices. Later on they modified the theory to state that the increase in money supply stimulates economic activity (i.e., *output* increases). There are two reasons for this: (a) incomes and consumption increase with the increase in money supply; (b) the interest rate lowers at the same time (because "when money is plentiful it is more easy to find some to borrow"), thereby reducing the price of credit and thus the cost of financing investments, which encourages economic expansion. The mercantilist theory of value relied on utility rather than the costs of production. It can be summarized as follows: "First, the natural value of goods is imply represented by their market price. Second, the forces of supply and demand determine the market price. Finally, the use value is the main factor on which the market price depends."

Tuesday, August 1

Sorry to be repetitive, but I can't help it: Rorty refutes himself. The methods he uses contradict his conclusions. Like any theorist, he makes use of rational argumentation, logic, induction and so on to adjudicate between competing positions. He necessarily approaches his material from a "common ground"; the problem is that he's arguing for the impossibility of a common ground. Even someone arguing for a paradigm-shift, as he's doing, adopts a meta-level perspective outside the two competing paradigms. To quote Scheffler (who's commenting on Kuhn): "the comparative evaluation of rival paradigms is quite plausibly conceived of as a deliberative process occurring at a second level of discourse....regulated, to some degree at least, by shared standards appropriate to second-order discussion". Rorty himself "deliberates"—necessarily—"at a second level of discourse". This is the trap into which every relativist, every deconstructionist falls. Even anti-correspondence theorists and anti-representationalists fall into the trap of self-contradiction, though less obviously than Rortyan pragmatists. (In the latter case the contradiction is between the form of argument and the content of the theory; in the former case it's between the form of *language* and the content of the theory. Language implies correspondence and representation (reference).)

I just got a CD of Beethoven's early piano trios. I can't believe I hadn't heard them before. I pity my past self. "You silly, silly guy, past version of me! What were you *thinking?*"

Oh great, here we go with the "winner writes history" argument for relativism: "We are the heirs of three hundred years of rhetoric about the importance of distinguishing sharply between science and religion, science and politics, science and art, science and philosophy, and so on. This rhetoric has formed the culture of Europe. It made us what we are today. We are fortunate that no little perplexity within epistemology, or within the historiography of science, is enough to defeat it. But to proclaim our loyalty to these distinctions is not to say that there are 'objective' and 'rational' standards for adopting them. Galileo, so to speak, won the argument, and we all stand on the common ground of the 'grid' of relevance and irrelevance which 'modern philosophy' developed as a consequence of that victory. But what could show that the Bellarmine-Galileo issue 'differs in kind' from the issue between, say, Kerensky and Lenin, or that between the Royal Academy (*circa* 1910) and Bloomsbury?" Good question. Maybe the fact that certain practices, called "scientific", give us the technical ability to manipulate nature, to predict events, and can be evaluated for truth by standards shared by thinking men across cultures and paradigms, while other practices, called "political", are concerned mainly with the power-relations between individuals in society.

'Power-relations are reality itself! There's nothing outside power-relations! (—except for that sentence)' Foucault and Rorty, sitting in a tree, k-i-s-s-i-n-g, first comes love, then comes marriage, then comes Rorty's mental miscarriage.

Rorty talks a lot about hermeneutics (as a supplement to epistemology, etc.). Here's what I think of the debate between hermeneutics and positivism (or, more generally, Anglo-American philosophies of science): any explanation, be it of nature or society or individuals' actions, looks for causes. It isn't complete

until it's stated in a deductive form, no matter whether the subject is psychology, sociology, history or physics.¹ (The form needn't always be "nomological".) Hermeneutics, whatever the hell it's supposed to be, can be divided into two classes, or uses: those in which it contributes to causal explanations (as in history or certain anthropological contexts), and those in which it's used for translation just for the sake of translation. (Translating a text or a verbal utterance.) Thus, it doesn't conflict with scientific explanation. It supplements it. In fact, it's a necessary explanatory tool in the human sciences because acts are oriented around *meanings*, in contrast with events in the natural world. In social contexts, understanding meanings is part of understanding causes. So, in its explanatory uses, hermeneutics is a tool for arriving at possible causes, which are then placed in a deductive argument. (Deduction, incidentally, doesn't in itself ignore the fact of human freedom. Whether *reasons* or *causes* are invoked in a "causal" explanation, the deductive model allows for human freedom because *laws* needn't play a role in it—and laws are what really deny subjectivity, in that they're universal.)

William Petty. He abandoned the subjective theory of value, replacing it with the concept of "natural value", viz., the costs of production. The prices of commodities tend to adjust to the natural value by means of small oscillations. The costs of production are the utilization of land and labor, but labor (embodied labor) is by far the most important. "[Petty's] search for a unit of measure to translate the value of land into labor is interesting, because in the process he managed to define the natural price of labor. In fact, that unit of measurement consisted of the average daily amount of food necessary to sustain a worker. [Anticipation of Marx.] But Petty did not explain how and why wages tended to adjust to the subsistence level..." He anticipated the classical economists with his concepts of rent and of surplus (which he interpreted as a product of labor, since it was obtained only by the application of human energy).

John Locke, as you know, used Petty's labor theory of value to justify private property. (Individuals have a right to their labor and to the products of their labor, etc.) *Dudley North* anticipated liberalism in his idea that "harmony of interests is derived solely from the fact that nobody is able to look after the interests of an individual better than the individual himself, so that if individuals are left free, they will prosper. On the other hand, any measure that interferes with the individual's attempts to pursue private goals hinders the achievement of the public interest. [Therefore,] the best policy is no policy, no laws to regulate trade, none to regulate the interest rate, nor to control the money supply." *Richard Cantillon* borrowed Petty's theory of value but clarified the distinction between "intrinsic value", which depends on production conditions, and "market price", which depends on the forces of supply and demand. "His explanation of the adjustment of the latter to the former was based on the hypothesis that the market price is fixed by the seller and dynamically modified on the basis of his estimate of the demand."

François Quesnay and the physiocrats. "Three points in particular are worth underlining: (a) the new, revolutionary concepts of productive and unproductive labor, which were introduced in connection with a new concept of wealth (a concept by which the real source of wealth is the *net product* obtained by applying labor to land); (b) the idea of interdependence among the various productive processes and the related idea of macroeconomic equilibrium; (c) the representation of the economic exchanges as a circular flow of money and goods among the various economic sectors." Agriculture is the only real source of wealth. Society is divided into three classes: farmers, the productive class; manufacturers, the "sterile" class (so called because the value of their output is equal to the overall value of the inputs); and landlords, the "distributive" class (—by the expenditure of their rents, they get the circulation process of money started). Because the circular flow of wealth throughout the economy has its own logic and equilibrium, *laissez-faire* is the best political policy.

Ferdinando Galiani. Value depends on the utility and scarcity of goods; it derives from the choices of economic subjects. "Value is an idea of proportion between the possession of one thing and that of another in the mind of a man." Since utility and scarcity depend on the needs of individuals, "the same good has different utilities for an individual according to the quantity of it that he has already consumed.

¹ Restating it in a deductive form will often seem trivial, but it's necessary for completeness because at least one *general* premise is always implicit in the argument.

The more of the good consumed, the lower the utility will be, up to the point of becoming zero.” This is a theory of diminishing ‘final’ utility, anticipating the marginalists. Other Italian economists (Beccaria, Verri, Ortes) anticipated Malthus and Bentham, and even Smith (in his criticisms of the physiocrats).

David Hume. Because of the price–specie-flow mechanism, a surplus on the balance of trade doesn’t produce permanent benefits, since it automatically activates a re-equilibrating process. “The inflow of gold generated by the trade surplus causes prices in the country to rise, while it decreases those of the competing countries in deficit. Owing to the consequent changes in competitiveness, the trade balances gradually adjust. The free trade implications of this theory are obvious.” Hume recognized that the mercantilists were partly right in at least one of their theories: although prices rise (in a ‘transmission’ process from sector to sector) with an increase in the money supply, output also increases in the short term, because as expenditure incrementally rises with prices, production and employment expand.

Hume also attacked on two fronts, and succeeded in both. First, he denied that the volume of international trade was fixed [as the mercantilists had thought], and therefore that one country could increase its wealth only at the expense of another. Rather, he maintained that an increase in the wealth of one country—to the extent that it was an increase in real wealth, namely in the level of output—would lead, through imports, to a parallel increase in outputs in other countries. Second, he denied that the rate of interest would necessarily vary inversely with the money supply. Instead, he observed that it was the increase in economic activity itself that, by increasing the real capital stock of a country, would cause a decrease in the rate of profit and, as a consequence, a decrease in the rate of interest.

Hume’s four fundamental arguments—the price–species-flow mechanism, the quantity theory of money, the theory of the growth of the volume of international trade, and the explanation of the diminution of interest as a real phenomenon—were to be accepted *en bloc* by English and European thought, and were to form the pillars (even if in revised and corrected versions) of nineteenth-century free-trade theories.

James Steuart. The quantity theory of money is wrong; what matters is the velocity of circulation, which, “by means of variations of the amount of money hoarded, continually changes in such a way that the quantity of money in circulation is always adequate for the needs of trade”. Laissez-faire is *not* the way to go, because demand for goods isn’t always sufficient to guarantee full employment. Furthermore, the introduction of machinery can create unemployment, in that “the reabsorption of the work-force into other sectors doesn’t occur immediately.” It’s the government’s job to ensure reabsorption, just as the government should encourage exports to bring about full employment.

The following are discarded notes I’ve written over the last couple of years. Most of them are from my stay in D.C.

Quid pro quo.-- I allow you your stupidity and conformism; it’s only fair that you allow me my delusions of grandeur.

Music as superior to words.-- After I’ve been writing for hours, sitting in an empty silence, listening to music feels like a return to myself. The words lose significance; they become mere relics of an alien intellectualism, a shadow of real experience. They’re *frozen, lifeless*. Abstract. Purely symbolic. As such, they lie. (A truth long recognized, of course, but worth recalling.) Life is movement, unrest; for thoughts to be crystallized in the written (and spoken) word is for them to be betrayed. The essential element of *consciousness*--of *intuition*--is absent in the word; what is present is something ‘given’, something ‘universal’: a meaning fixed by convention, agreed-on by everyone, callous toward one’s idiosyncrasies. Music, on the other hand, respects the individual. As I already stated, time is of its essence, as it is of the

self. It flows from happiness to anger to sadness to fear to love, and that with all the indeterminacy of consciousness itself. --But why does it have this quality of manifesting emotions? What connection do *sounds* have with *feelings*? As far as I can tell, the only connection is that in childhood, humans learn to associate particular vocal modulations with certain emotions. For whatever reason, our vocal cords are affected by our state of mind: sorrow changes the quality of our voice, as does excitement, as does anger... An art, therefore, that consists of manipulating sounds produces in the listener involuntary associations with emotions. This also explains why a given musical passage can rarely be definitely associated with only one emotion--why there's always a slight ambiguity (unless the passage is *sung*). The reason is that the timbre of the human voice is different from that of the notes played on an instrument.

Hmmm...-- And yet, that explanation is woefully inadequate. The relation between the sound of crying and a minor key is unclear. Both produce associations with sadness in the listener--but the parallels end there. Why do we tend to associate a minor key with sorrow and a major key with happiness?

I suspect that this question, too, can be answered only with the help of physics and biology.

Words as superior to music.--

Darthusianism.-- I've never been satisfied with Darwinism. Natural selection as the mechanism of evolution? Scarcity of resources as the engine that drives nature forward? 'In a given environment', so the theory goes, 'there are enough resources to support the existence of only a certain number of animals. Population always tends to be higher than the given resources will support, so some individuals are destined to lose the struggle for sustenance. The weak ones starve or are killed; the better-equipped ones prevail. Thus, the DNA of the former dies out, while that of the latter endures. Sometimes the fight is between different species--such that the weaker is eventually killed off--and sometimes between members of the same species, when there's been a random mutation in the DNA of a small number of them. If the mutation allows for a better adaptation to the environment, the mutants may eventually succeed in wiping out the normal ones, which effectively changes the genetic code of the species and is an example of evolution. Over the course of millions of years, these slight genetic variations accumulate, and new species are born.' That's the theory. Now let's attack it.-- (1) Environments are rarely 'closed'. If certain animals aren't successfully competing for resources, there seems no reason why they can't migrate to another area and find their food there. (2) More fundamentally: why should we take Malthusianism seriously? Is there sufficient evidence across a wide spectrum of species to justify the conclusion that parents produce more offspring than can survive? Doubtless, insofar as offspring sometimes prematurely die, that hypothesis is true. But do they die because there aren't resources to support them? Surely that occurs only in exceptional circumstances. Nature tends to be bountiful. (3) It's hard to believe that a DNA mutation in one or a small number of individuals would--even after millions of years--result in their descendants' killing off everyone else in the species. For it to accomplish that feat, it would indeed have to be quite an impressive mutation. Moreover, the mutant allele would probably have to be dominant; if it were recessive, there's a good chance it wouldn't appear in the offspring's phenotype, and would thus have a fairly insignificant cumulative effect. (4) I'm skeptical that evolutionary advances as awesome as the move from *Australopithecus afarensis* to *Homo sapiens* could have resulted from random genetic variation. With hindsight, one is tempted to attribute the advance to some kind of teleology. I realize that 'hindsight' is distorting--that there are many evolutionary failures for every success--but, still, something tells me that random variation is a facile explanation.

Unfortunately I haven't anything to offer in its stead.

Faust without Mephistopheles.-- That philosophy constantly revisits old themes and thus seems--*seems*--never to progress proves only that people in all ages must rediscover for themselves the same thoughts that occupied individuals in previous times. It does not prove, e.g., the richness of the Greek philosophical mind and the paucity of cultures that followed it. --"All of Western philosophy is merely a footnote to Plato and Aristotle." That well-known quotation (paraphrased) is intended to denigrate the achievements of later

thinkers relative to those of Plato and Aristotle. I interpret it differently. Setting aside its hyperbole, I find that it does equal honor to subsequent thinkers as it does to the two Greeks. Philosophers who followed them refused to accept their ideas, their answers, and did not hesitate to begin from the beginning as many times as was necessary--knowing that their own answers would one day be questioned--that at times they would question them themselves--that they were not 'final'--but having to seek them anyway because it was in their *nature* to seek--because the process of asking-and-answering-and-asking was its own end--because their creed was "To strive, to seek, to find, and not to yield!"--not to yield even to their *own* answers. The spirit of history does not rest when knowledge has been attained; neither should the spirit of man.

And thus he will forever ask himself the same questions, long after he has found adequate answers. --Why? Because he can.

Who am I?-- Are we our *acts* or our *potential*? Marxian anthropology would have us be only our acts; common sense would, surely, have us be also our thoughts and the acts that we're *capable* of committing but rarely/never do. In a certain sense, this question is merely verbal: we can define the self however we want--as its acts or its potential or its thoughts or a combination of them. The question is ambiguous, also.

Two kinds of alienation.-- There can be no doubt: inasmuch as the word 'genius' has meaning, David Foster Wallace is a genius. But, as a literary reviewer once titled an article criticizing the novelist Thomas Wolfe, "genius is not enough". Wallace's writings reek of *machinery*--of our heartless technological age. They will never be timeless classics. Only *human* works can be classics;--only works that can be enjoyed outside the social context in which they were created. Poststructuralist literary theory is right to emphasize that the meaning of a text is, to a degree, culturally specific, that it may vary between cultures (and readers), that what Aeschylus meant to an ancient Athenian is different from what he means to an American--indeed, that there is no 'true' meaning to *any* text--but what defines a literary classic is that its 'language', while conceived in a specific social milieu, resonates in all others as well. It does this by describing conflicts that humans, as humans, can understand. If the forms of alienation it depicts exist in only one society--if they are caused, for example, solely by an unprecedented growth in technology--the text will eventually cease to be of all but historical interest. I fear that Wallace's genius will suffer this fate.

Even the author may be unable to decide between multiple meanings. But more importantly, it doesn't matter what meaning he 'decides' on: language is a collective process, and as such it is susceptible to as many meanings as the community can give it. There is no single 'privileged' meaning--not even the one that the author consciously intends.

The thinker's most difficult thought.-- Being human is more important than knowing truth. Expressing oneself nobly is better than expressing oneself scientifically. Having breadth and depth while being 'ignorant' is better than having knowledge while being stunted.

Ideally, however, one should achieve both humanity *and* knowledge--because the latter is an extension of the former.

The meaning of music.-- Individualism has no place in music. To the extent that the boundaries of one's self persist as one experiences this art, music has failed in its purpose. Unless one's self-consciousness is overcome, one does not know the power of music. Dionysus is its symbol, as Nietzsche perceived. The merging of self-with-object is its culmination.

That is impossible, of course. In Sartrean language, the "For-itself" cannot merge with the "In-itself". Consciousness cannot become its object (in the relevant sense). Hence, the goal of music is an illusion--a negation of reality--an *escape*. Music is Escape. From what? From the self,¹ i.e., self-consciousness. Self-consciousness is inseparable from time (as I'll argue later). Therefore, music is escape

¹ See section ____.

from the self and time. How does it (attempt to) achieve this escape? Ironically, it is one of the few art forms that relies wholly on time in order to manifest itself. The others are drama, dance, and the purely verbal arts. (Sculptures, paintings and so on are ‘given’, in one moment; there is no ‘development’ as one experiences them.) Drama and dance are more closely involved with the visual sense than with the auditory sense. [...] Music is thus in its own category as an art form. That it is the only one whose purpose is complete loss-of-self¹ is due to its having no relation to the visual sense. Sight posits a division between the subject and the object; there is no such division in sound--or rather, *logically* there is, but *phenomenologically* (i.e., in consciousness) there is not. The self assimilates the sound as *part* of itself, while it does *not* assimilate the *seen* as part of itself. Now, the self can ‘lose itself’ only in a *part* of itself; it cannot lose itself in an object that it sees as divided from it. For example, it cannot lose itself in a photograph or in a poem, while it *can* in emotions, in thoughts, in physical sensations--and in music. --So we understand how it is *possible* for one to lose oneself in music; how is this actually supposed to come about? Clearly by one’s listening to a (relatively) *continuous* stream of sound, which is why a musical piece never has long periods of silence.² Ideally, all of one’s thoughts are focused on the stream of sound, such that one no longer has ‘room’ in his consciousness to be aware of himself. Strictly speaking, in a fully developed human being this lack of self-consciousness is impossible, but it can be approximated. ‘Beautiful’ and ‘thrilling’ pieces of music are most successful at coaxing a listener into this nirvana-like state.

I never plagiarize.-- Despite my seeming erudition, I really haven’t read much. If my thoughts sometimes coincide with those of another thinker, unless I’ve cited him it’s an accident.

All truths are ‘fixed’ or timeless. “What does that mean?” It means they don’t vary with time; what’s true today is true always. If it’s true that the sun is shining today, then tomorrow it’s true that yesterday’s thought “The sun is shining” was true. Similarly, if the meaning of ‘truth’ changes as history evolves, such that what was once true is no longer so, then it’s *always* true that truth changes--that it isn’t fixed. (You can thank the paradox of self-reference for the truth of that self-contradictory statement.) The first example illustrates the reason *why* truth is fixed: sentences refer beyond themselves, such that they involve some kind of a reference [or representation]--and the reference is, in a way, a *part* of the thought that the sentence expresses, so that the thought ‘The sun is shining today’ has two different meanings if spoken on two different days (i.e., it isn’t the same thought). I’m using the word ‘thought’ in the sense that Frege did. But what sense was that? This is an issue of some difficulty. He says that the same thought can be expressed in different ways. For example, “Ice is less dense than water” expresses the same thought as “Ice is not as dense as water” and “Water is denser than ice”. All three mean the same thing, and have the same sense. The question is, how? What is ‘sense’? What is a thought? What makes a thought different from another? Before answering these questions, it may be useful to explicate an entity more fundamental than a thought--namely, a concept. After all, thoughts are, among other things, a combination of concepts; to understand the former, then, we must understand the latter.

Before continuing I must make a terminological distinction. To prevent confusion between Frege’s conception of ‘thought’ and the common one, I’ll capitalize the word when I’m referring to Frege’s idea. This device is, no doubt, rather comical, but it’s the best one I can think of. The term ‘proposition’, for instance, as a substitution for (Frege’s) ‘thought’ will not do: ‘proposition’ refers to the meaning of a sentence, while ‘thought’ refers to the *sense* of a sentence. The difference between ‘sense’ and ‘meaning’ is subtle but important, as is evident from the fact that, e.g., the two sentences ‘The morning star is a body illuminated by the sun’ and ‘The evening star is a body illuminated by the sun’ may be thought of as meaning the same thing, viz., that the planet Venus is illuminated by the sun--and therefore the propositions they express may be considered one and the same--while their senses are said by Frege to be different. I.e.,

¹ There is *partial* loss-of-self in the others--particularly in drama--but nothing comparable to that in music. One cannot get ‘drunk’ on them, as one can on music.

² If it does, it isn’t music. Example: John Cage’s ‘piece’ “Tactic”, which is four minutes and thirty-three seconds of silence.

‘proposition’ is used in a more general sense than ‘Thought’.

To return to the argument.-- I’m not using ‘concept’ in Frege’s sense (as described in his article “On Concept and Object”). As I understand it, its extension is far more inclusive. For example, nouns, verbs, adjectives, and adverbs are all concepts. But that statement is ambiguous. To clarify it I’ll borrow Saussure’s distinction between the signifier, the sign, and the signified.¹ Morphemes, words, and sentences are signs signifiers:² “sound-images” which, in themselves, have no meaning, but acquire meaning by being associated with a signified. By ‘sound-image’ Saussure doesn’t mean “the material sound [or the written mark], a purely physical thing, but [rather] the psychological imprint of the sound, the impression that it makes on our senses” (Saussure, 66). This is a bad way of expressing his idea. What is the psychological imprint supposed to be? One’s recognition of the signifier? Or of the signifier *as such*? Or perhaps some kind of an intuition that one has? Moreover, how can such an imprint be a signifier? Does Saussure mean that the experience of recognizing the “physical thing” is itself the signifier? No. Clearly he means that the physical thing itself is the signifier, but only by virtue of its relation to consciousness. In itself it is a meaningless physical phenomenon; to the interpreting consciousness, however, it signifies something. By calling the sound/written marks ‘meaningless’ I’m using the term in a different sense than when I call the *sound-image*³ meaningless. The sound in itself is merely a series of vibrations; the sound-image is the vibrations as consciousness experiences them. The subtle difference in degrees of meaning between the two is illustrated by the fact that the sound cannot potentially signify anything; the sound-image, though--*any* sound-image (in fact, *anything* as it ‘impresses’ itself on consciousness) *can*. The sound-image of someone tapping his fingers on a table can potentially be a signifier, even though in itself it is meaningless. --The objection may be raised that this ‘revision’⁴ of Saussure’s position implies that when a person thinks a sentence without saying it, he isn’t thinking a sentence, because (as I’ve defined them) no signifiers/signs are coming into play. The answer to this criticism is that the ‘internal images’, the ‘conscious residues’ of the signifiers, which pass through the mind of the thinker, themselves function as signifiers.⁵ This is intuitively obvious and need hardly be argued for. The residues can be called ‘derivative signifiers’.⁶

The sign is a union of the signifier (sfr.) and the signified (sfd.). The latter is the concept that the former signifies, or ‘means’. It isn’t the *reference* of the concept (if the concept indeed has a reference; see below). But what does ‘union’ mean in this context? According to William B. McGregor, the linguistic sign is composed of a “structural link”, an “indissoluble link”, between the concept and the sound-image (McGregor, 1997). While this doesn’t *define* the union, it at least *characterizes* it. The union is so close that when a signifier is spoken, it instantly conjures the associated concept. For example, I find it impossible to separate the sound ‘tree’ from the concept ‘tree’: as soon as I utter the word--even if I make an effort to ignore the concept and concentrate only on the sound(-image)--I’m aware of some kind of a conceptual overtone. The link is effectively indissoluble: to dissolve it is beyond my power. (Clearly the reason is grounded in biology: neural mechanisms ‘fix’ the two components together.) On the other hand, in the case of this particular word the indissolubility operates in only one direction: I can think the concept ‘tree’ without uttering or imagining the sound-image, simply by ‘calling to mind’ an ‘intuition’ of a tree. Likewise with ‘table’, ‘grass’, ‘paper’, and most other nouns. Somehow I can make myself aware of the concept

¹ The following discussion isn’t meant to be a comprehensive analysis of the ‘sign’. My intention is to clarify it only to the extent that is necessary for a basic understanding of words and sentences.

² The “...or signifiers” seems to imply that I intend ‘sign’ and ‘signifier’ to be synonymous, which Saussure would contest: he thinks that a sign is a union of the signifier and the signified. Now, while I don’t believe that ‘sign’ and ‘signifier’ are synonymous (--and in that respect my “...or signifiers” is, admittedly, misleading--), I do believe that the connection between them is closer than that between sign and signified. I’ll explain why later.

³ I understand that word to refer to both the acoustic and the written signifiers, whether or not Saussure did. For the sake of brevity, though, I’ll generally discuss only the acoustic version. (Incidentally, the vagueness of my definition of ‘sound-image’ is not damaging to my present argument(s).)

⁴ I put that word in scare-quotes because it really isn’t a revision.

⁵ The vagueness of ‘internal images’ is not a flaw in that argument: the objection has already presupposed their existence, and therefore to answer it I need not define them.

⁶ Later I’ll inquire into the nature of such ‘intuitions’ or ‘images’ in consciousness.

without at the same time being aware of the word. I call this kind of awareness ‘intuition’. --Admittedly, *all* (intentional) awareness can be called an intuition--an intuition of the world, of experience, of a particular object, of a sensation, of an idea, etc. However, I’ll use the word in a narrower sense, closely related to that of ‘imagination’ or ‘inner perception’, in Brentano’s sense. I should note that the existence of intuitions is not in question; their *nature* is, though. I’ll examine it later. For the moment we’ll take it for granted.

To resume.-- We’ve seen that in some cases, at least, the union inherent in the linguistic sign is indissoluble only from the side of the sfr.; the sfd. can be separated (in thought) from the sfr. What this amounts to is that it can be separated from the sign (because the sign is a *union* of the sfr. and the sfd.).¹ The sfr., on the other hand, *cannot* be separated from the sign, because it cannot be separated (in thought) from the sfd.;² conversely, the sign cannot be separated from the sfr., because without its (the sign’s) physical components (*viz.*, the sounds/written marks, or the sound-image) there would be nothing that could signify anything--whereas in this respect the sign *can* be separated from the sfd., because if it were somehow deprived of its sfd. its physical manifestation would persist.

Having established that the concept (the sfd.) is not always inseparable from the sign, two questions arise: under what circumstances is it separable, and--even more fundamentally--what *is* it? I’ll address the second question first. It may be useful to begin with a simple concept like ‘tree’, which we know can be studied in abstraction from its sign (possibly unlike other more complicated concepts). I wrote above that, with the use of intuition, I can “think the concept ‘tree’” without representing it in a sign. What does that mean? First of all, what is an intuition? “An ‘inner perception’.” What is that? “An immediate cognition or apprehension, as opposed to a process of reasoning.” What is an “immediate cognition”? “Something similar to a use of the imagination.” What does that mean? “A kind of pseudo-visualization.” What is that? --Etc., etc. Obviously, neither the concept ‘intuition’ nor a particular intuition can be defined or described in the way that, e.g., the concept ‘house’ can be defined or a particular house can be described.

[...] Why is this? It’s true not only of ‘intuition’, but of *every* kind of mental occurrence. For example, the same problems arise when I try to define ‘pain’ or describe a particular pain. Similarly in the case of happiness, sadness, anger, physical pleasure, a physical sensation (such as touch or taste), the state of drunkenness, and so on. None of these can be adequately defined or described. In his book *A Moveable Feast*, Ernest Hemingway tried to describe the experience of eating an oyster:

As I ate the oysters with their strong taste of the sea and their faint metallic taste that the cold white wine washed away, leaving only the sea taste and the succulent texture, and as I drank their cold liquid from each shell and washed it down with the crisp taste of the wine, I lost the empty feeling and began to be happy and to make plans.

It’s poetic and moving, but intuitively one can see that it doesn’t quite grasp the essence of the experience. “Strong taste of the sea”, “faint metallic taste”, “succulent texture”, “crisp taste of the wine”--one has the impression that all these attempts are not ‘direct’ but *oblique*, merely approximations. They *glance off* the sensation; they sketch its *boundaries* but can’t reproduce it, as the image of a house can be ‘reproduced’ by a masterful word-painter. In other words, due to the paucity of adjectives that apply literally to the sensation of taste (sweet, salty, bitter, sour, spicy, and a few variants), Hemingway is compelled to use metaphors and analogies: his description, like most descriptions of mental events, has the form of ‘It’s *like* this, it’s *like* that’. ‘The taste is *like* the sea, *like* metal, *like* something crisp.’ To *literally* describe it as ‘metallic’ or ‘crisp’ makes no sense: these words refer to solid objects, which taste isn’t. However, even a literal adjective like ‘sweet’ or ‘salty’ is inadequate, though for a different reason: in its inability to communicate the immediacy of the sensation, it is necessarily construed as being extremely vague and therefore unable to

¹ This possibility of separation is also evident from the fact that the same sfd. can be ‘included in’/‘referred to by’ different signs. For example, ‘less dense than’ and ‘not as dense as’ signify the same concept. I’ll return to this issue. --As for the paradoxical dichotomy ‘included in’/‘referred to by’, it is implied by the current argument in the text. The linguistic sign both *incorporates* and *refers to* the sfd.

² The sfd. can be separated from *it*, but *it* can’t be separated from the sfd.

justice to the idiosyncrasy of the experience. This is, ultimately, the reason for the imperfection of every characterization of a mental state;--not so much the vagueness of the descriptive term (e.g., ‘inner perception’, ‘hurt’, ‘cold’)

Briefly stated, a thought is a postulation of certain relations between its conceptual components. A sentence, on the other hand, is a ‘grammatically correct’ expression of the thought. In the above examples, the concepts ‘ice’, ‘dense’ and ‘water’ are related to each other in a definite way, which is expressed, however, in *three* ways. The concept ‘dense’ is subsumed under (or, is a part of) the concept ‘not as dense as’, ‘less dense than’, and--when the order of the nouns is reversed--‘denser than’. What makes a combination of words a concept?

All truths are necessarily ‘fixed’. Their linguistic expression--in declarative sentences--has an atemporal form, because sentences are structured in such a way that they negate temporality. In referring beyond themselves--in being “signifiers” of a “signified”¹ (unlike, for example, music, which refers only to itself)--they cut across time: the signified is atemporal, because the relations between the words² are.

The thinker has no choice but to accept that language has this power over him. It forces him to presuppose the existence of fixed truths. Thus, in the ‘third epoch of the thinker’ he will continue to theorize as if his only goal is to understand the world (in the act of theorizing this will be his goal), but when he steps back and reflects on his single-minded pursuit of knowledge he will understand that in most contexts it is probably, to an extent, futile--that many of the ideas he arrives at will one day be superseded--that in these contexts³ there is possibly no such thing as “objective truth” (even in contexts in which poststructuralists operate--and thereby contradict themselves), and that if there *is* he can never be certain that he has reached it--that the *real* purpose of his philosophizing, the only one which is not possibly an illusion, is self-affirmation through self-cultivation. This realization will necessitate that he live in constant uncertainty, but eventually he will come to be *grateful* for his doubt, for his ‘hovering’: he will recognize that if he achieved his goal of knowledge, life would be rendered *infinitely banal*. His uncertainty is a blessing. It allows him to be cheerful--and to luxuriate in wonder.

[...]

Political correctness is the religious fundamentalism of liberals. It’s a disguised nihilism, an explicit relativism--a relativism that *struts*, proud of itself, of its shallow respect for cultures and minorities purely by virtue of their status as non-hegemonic--a respect based on a *lack* of understanding. It thinks that to refrain from “judging” is equivalent to showing respect.

It seems to me that America is undergoing--or is on the verge of undergoing--a crisis, which reaches into every nook and cranny of the society. (1) The educational system is obsolete. It doesn’t prepare students for competition in a global economy; its all-important propagandistic functions (to “manufacture consent” and so on) are increasingly ineffective, as apathy and cynicism take hold of young people, who, as a result, tend to spend more time watching TV and playing video games than studying; grade inflation is rampant (especially in universities); physical conditions in public schools are deteriorating, largely because devoting resources to the military is politically more feasible than vastly increasing educational funding. These problems will not be solved within the next few decades, due to political pettiness/deadlock and to the immensity of the task of reform. (2) Partly because of the insolubility of the educational problem, America’s jobs will continue to be outsourced to countries with a more capable and cheap workforce.

As the years go by, this draining effect will begin to have momentous economic consequences: masses of people will be thrown out of work--not cyclically (i.e., from business cycles), as has usually been

¹ I’ll delve into these concepts later. I don’t mean them in exactly the same way that Ferdinand de Saussure did.

² In Saussurean terminology, the “syntagmatic” relations.

³ Later I’ll attempt to provide a list of them.

the case in the past (during recessions and depressions), but structurally (i.e., from changes in the economy's structure, such as the mismatch between the needs of employers and the skills of the workforce). This will have a ripple effect through the economy, such that businesses will start to go bankrupt from an insufficient demand for their products, which will itself have a ripple effect, until finally a severe recession occurs.

When you read the writings of feminists¹ you can't help being startled by how confused some women are about themselves. [...] First of all, there's the opposition between two broad species of feminism, summed up by Julia Kristeva in this excerpt from an interview (Courtivron, 1980): "There are two extremes in [women's] writing experiences: the first tends to valorize phallic dominance, associated with the privileged father-daughter relationship, which gives rise to the tendency toward mastery, science, philosophy, professorships, etc. This virilization of woman makes of her, ideally, a typical militant who can, in fact, become a veritable striking force in the social revolution (just as it was in the USSR, and just as it is today in China)... On the other hand, we flee everything considered 'phallic' to find refuge in the valorization of a silent underwater body, thus abdicating any entry into history." Thus, many American feminists proclaim that women are just as rational as men and can do anything that men can do (provided, of course, that the social order is revolutionized). French feminists, on the other hand--e.g., Irigaray and Cixous--believe that rationality and logic are phallogocentric, that women are naturally less rational than men--or that in order to 'realize' themselves they cannot stay confined within the "phallogocentric" masculine mode of being and thinking and writing. They must "write their body". Says Cixous: "More so than men, who are coaxed toward social success, toward sublimation, women are body".

Intellectual quixotisms.-- I half-admire the tenacity of militant feminists and preachers of political correctness. Every step of the way, they're arguing against common sense. It's an uphill battle--yet they never quit! They trudge on, inventing new 'arguments'--or (what is more common) simply repeating their beliefs again and again, as if that will make them true--impervious to reality. Don Quixote lived in a fantasy world but was thereby rendered strangely 'heroic' (in a perverse, comical way); these postmodernists are the new Don Quixotes.

The explanation for their stubbornness is that knowing truth is not their goal. If it were, they would take the time to analyze their opponents' arguments and respond to them honestly rather than write them off as "phallogocentric" or "logocentric" or "Eurocentric".² Their goal is to eradicate inequality. Equality is their highest value. It is the be-all and end-all of postmodernism. (It is, indeed, the source of postmodernist nihilism. If values, cultures, philosophies, and individuals are 'equal'--i.e., they're 'merely' social constructs, (which is supposed to mean that) none has more 'validity' than any other--nihilism cannot be avoided.) In my discussion of Marxism I'll explain the social mechanisms through which the pursuit of political, social, economic, and philosophical equality has emerged as, arguably, the main cultural phenomenon of the entire world (certainly of the West, and soon of the 'East' and everywhere else). Here I would like to inquire into the *psychological* causes.³

The origin of the holy fool.-- The crusade against evolution, in backward places like Kansas and the Bible Belt, is shockingly dishonest. This whole vehement defense of God is based on people's misunderstanding of themselves. I know it's futile to argue against them--after all, they're conservative Christians, i.e., prejudiced animals who consider rationality dangerous--and so I won't expend energy on pointing out that, for example, God can surely take care of himself--that he doesn't need an army of ants to defend him--but

¹ By 'feminists' I never mean women who fight against their political and economic oppression. That kind of feminism is old news--and it's so obviously sensible and worthwhile that very little can be said about it in a book like this.

² This is their formula for creating an argument: add the suffix '-centric' to any given term, apply it to an opponent's ideas, and--presto!--you've refuted them.

³ The two spheres (social and psychological) are not completely independent, in that each influences the other, but at a level of abstraction they can, without distortion, be treated as such--provided that their interrelationships are clarified as well.

nonetheless, I'd like to explain to them that they really couldn't care less about "God". (Many of the more intelligent ones already know this; they're simply taking advantage of mass stupidity to gain money and power.) They don't know who or what he is; they don't know what doctrine they "believe in"; they don't know *why* they believe in it; they don't understand how incompatible it is with their entire lifestyle. In most cases, the only reason they're "Christian" is that during childhood they absorbed certain religious tenets--in a process akin to osmosis--and, since their "minds" subsequently ossified, couldn't (didn't try to) challenge them. There was no reason for them to do so--or, more correctly, no *cause*¹ that provoked them. From the very beginning they were sunk in the mire of routine; since then, they've come to believe that their routine is the best (and so they try to impose it on everyone else, as a way of self-validation). Why do they believe this? Because of the desire for recognition. I've said enough about this already. No one wants to think that his lifestyle/belief-system is wrong, because it would reflect badly on him. The difference between the conservative Christian and, for example, the enlightened philosopher is that the latter, despite his opinion that his way of life is the best,² recognizes the value of diversity, the fact that different lifestyles are appropriate to different people, and the fallibility of his beliefs. In other words, he's more *reasonable*. (The 'laws of reason' are *good*, despite what postmodernist pseudo-intellectuals would have you believe.)

So, what it comes down to, I suppose, is not that the anti-science, anti-gay, anti-abortion, etc. movement is *dishonest*; rather (like most mass movements of cruelty), it originates in *irrationality*, in an inability to question and revise one's beliefs. Dishonesty presupposes an awareness of truth (of the fact that one is lying), which most social conservatives do *not* have--because, again, their minds are governed by necessity rather than freedom.

A definition of stupidity-- A lack of intellectual freedom rooted in a deficiency in the capacity for using logic.

Maybe you'll say that in my fight against religion, pro-lifers, anti-gay marriage activists and so on (read: in my desire to stomp out prejudice and superstition), I'm "imposing" my ideas on others, and that therefore I'm guilty of precisely what I accuse conservatives of. To this charge I can answer only: Yes, I'm guilty, but in a fundamentally different way than *you* are. My fight is based on the motto "Live and let live!"; yours is based on the motto "My way or none at all!"

-people want to 'beat you down'. they don't want you to rise above them. competition...

-'distance' = respect

-why hasn't it been answered satisfactorily?

-temporarily abstracting from abstruse philosophical skepticism

-can't write elegantly when discussing the self in depth. (why?) anyone who *does* isn't discussing the self in depth. (--twist professors' criticisms of Hegel into criticisms of *them*)

-thinking of yourself as a great human being feels weird b/c you're looking at yourself from the outside? or b/c you're placing yourself decisively *in the world*, when automatically you feel outside of it? --b/c you're treating yourself as a thing?--something finished? or b/c you don't *feel* great?

DUMMETT

- sense can only be shown, not stated. significance?
 - Davidson: a theory of truth *is* a theory of meaning. that seems to make sense
 - you grasp the thought if you know what would determine it as true?? -(b/c) the thought expressed by a sentence is the thought that the truth-conditions are fulfilled? --every sentence posits its own truth, yes, but the thought is what’s communicated, not that it’s true!
 - you express a belief *by means of* a sentence: i.e., the belief, in an ‘intuitive’ form, is prior to the sentence
 - the choice between explaining thought in terms of language or language in terms of thought seems misguided: they both explain each other
-
- why do people want to destroy what they don’t understand?
 - why does it look feminine to cross one’s legs? (*what is it* about crossing legs that looks feminine?)
 - what makes someone good-looking?
 - the concept ‘intuition’ is also the reference. that’s unique
 - by definition, social conservatives have no historical perspective
 - why does the adjective ‘literally’ apply to the sensation? what makes it literal?
 - two kinds of good humor: Nietzschean and Fodorean.
 - why are there so few words that describe perceptions and ‘inner’ experiences?
 - “Alice believes that the morning star is a body illuminated by the sun. The morning star=the evening star. Therefore, Alice believes that the evening star is a body illuminated by the sun.” in a way (the objective referential way), yes. in another way (the subjective referential way), no. (?)
 - ‘I promise I’ll go tomorrow’: neither true nor false. implications?
 - even Austin is presupposing the truth/reality dichotomy: he’s describing the way things are
 - my synthesis: language as action and creation rather than revelation of truth--but, by embracing creation, the philosopher is embracing truth. this is all similar to the early Marx. ...tension between static truth and dynamic truth (or truth as dynamism); two kinds of truth, but knowledge of the second (dynamic) made possible by knowledge of the first (static). so static is still ‘fundamental’--although dynamic is fundamental in a different way
 - performatives don’t refer
 - meaning of a segment of a proposition derives from its context in the proposition. in some cases this is more true than in others. or rather, some concepts have easily identifiable meanings outside of sentences, but even *these* meanings ‘change’ somewhat in a sentence: they become parts of a single object referred to by the sentence
 - is the sign the physical thing or the conscious impression? maybe the primary/derivative dichotomy is reversed
 - I tend to hypostatize society;--it has a spirit
 - torment in knowing that acting well doesn’t necessarily reflect well on you
 - it’s good I live nowadays, when thought is fragmented, there are no great movements, I can ponder freely

and not feel the need to conform to anything (because there's nothing to conform to). it's a bad age and a good age for a thinker

- 'it's true that ahistorical theories cannot be true'; 'it's ahistorically true that ahistorical truth doesn't exist'. 'it's true' can go before every proposition without changing the proposition. therefore Foucault is a moron

- give a concrete example of relations between all the elements of a society

- misleading metaphor (see the last sentence): "It is easy to see that this representation of the structure of every society as an edifice containing a base (infrastructure) on which are erected the two 'floors' of the superstructure, is a metaphor, to be quite precise, a spatial metaphor: the metaphor of a topography [*topique*]. Like every metaphor, this metaphor suggests something, makes something visible. What? Precisely this: that the upper floors could not 'stay up' (in the air) alone, if they did not rest precisely on their base."

- *no class can hold State power over a long period without at the same time exercising its hegemony over and in the State Ideological Apparatuses.* [Duh! Althusser is of little interest.]

- it is not their real conditions of existence, their real world, that 'men' 'represent to themselves' in ideology, but above all it is their relation to those conditions of existence which is represented to them there.

- "ideology = an imaginary relation to real relations"

- we are subjects = the elementary ideological effect

- ... the (scientific) knowledge of the mechanism of this recognition. Now it is this *knowledge* that we have to reach, if you will, while speaking in ideology, and from within ideology we have to outline a discourse which tries to break with ideology, in order to dare to be the beginning of a scientific (i.e. subjectless) discourse on ideology.

- "ideology exists only by constituting concrete subjects as subjects"

- any ideology as believed in by the masses is false consciousness. but even true systems of thought are ideologies, inasmuch as they 'constitute' subjectivities. ideology is a blanket term with two main classes

- "ideology does not invariably constitute persons; it can also de-constitute them. For example, the laws of *coverture* precluded women from personhood on entry into marriage. It is more pertinent to claim that ideologies function to differentiate persons from not-persons (for example, children, married women, slaves and aliens). These remarks raise the traditional philosophical problem of whether subjects require bodies and, indeed, what 'bodies' are."

- Althusser's formulation seems to imply that any experience/practice that constructs subjecthood is an ideology. obviously absurd. must distinguish between types of subject- (or self-?) constructing things

- "A major problem with Therborn's account of class ideologies is that he does not adequately explain *why* he chooses certain ideologies as functionally necessary". which ideologies are necessary?

- mechanisms of functional evolution, e.g. in the Marxist idea of revolution

- "for Therborn the creation of subjectivity actually involves two processes: of subjecting the subject to a particular definition of his role, and of qualifying him for his role. The reproduction of any social organization requires some basic correspondence between subjection and qualification. However, there is an inherent possibility of conflict between the two. For instance, 'new kinds of qualification may be required and provided, new skills that clash with the traditional forms of subjection'"

- "the difficulty with Therborn's account here is that he does not provide a convincing theoretical discussion of alter-ideologies. They are seen as logically an inevitable consequence of positional ideologies which produce differences, but there is no sociological account of how they are maintained and have effects in social struggles."

- "There are two reasons why we believe that ideological variation increases with the development of late capitalism: (1) 'dull compulsion' in everyday life is adequate for the subordination of the worker; and (2) there is no economic requirement for a dominant ideology. In short, capitalism can 'tolerate' contingency far better than any other mode of production."

- "Perhaps the mode of production ought to be regarded as establishing certain broad parameters which set the limits of ideological variation. In early capitalism, for example, the relations of production require certain legal supports in terms of private property and stability of economic contracts, but these may be guaranteed by a variety of legal systems. At the level of the social formation, ideology can be studied only,

following Weber, in terms of certain historically specific, preexisting ideologies which may or may not contribute to the growth of capitalist culture (the Protestant Ethic thesis). Ideology does not simply incorporate classes; it is, rather, a 'resource' of collective action. For example, as Marx noted, the bourgeoisie, having mobilized individualism against feudalism, finds 'civil liberties' employed by oppositional groups against capitalist domination. Individualism can thus be regarded as a resource of political struggle. Furthermore, as we argued earlier, ideology, in the form of individualism, may be effective in actually forming the specific shape of capitalist society. It does not, however, *necessarily* have that function."

-“There is no general theory which can specify the functions and content of ideology for different societies.”
 “It is not evident, in any case, that societies require the level of ideological support implied by Therborn. As Foucault argues, the individuation, construction and discipline of individuals can be secured by regulatory practices and institutions (panopticism) which do not require subjective consciousness on the part of individual persons.”

-“...on the relationship of the implicit functionalism of subjectivities to the contingent qualities of ideology, on the precise role of the economy, and on the mechanisms of the overdetermination of non-class ideologies by class.”

-“AHT conclude that ‘late capitalism operates largely without ideology’ and, leaning upon Max Weber's economic sociology and an expression of Marx, that ‘the coherence of capitalist societies is produced by the “dull compulsion of economic relations””

-“Social classes do have different and conflicting ideologies but are, nevertheless, bound together by the network of objective social relations.”

-Marx didn't think that the dominant bourgeois ideology was believed in by the proletariat. the cohering of capitalist society had nothing to do with a dominant ideology that commanded assent from subordinate classes. (on the other hand, there's a quotation that suggests the opposite)

-we will not abolish private property until the end; it will be abolished gradually, as happened in the transition from feudalism to capitalism

-the best way one can defend one's morality and political ideals is by saying that they're closer to most people's basic intuitions of what is good than alternatives are

-“Thought, we might say, is at once cognitive and creative: in the act of understanding its real conditions, an oppressed group or class has begun in that very moment to fashion the forms of consciousness which will contribute to changing them. And this is why no simple ‘reflection’ model of consciousness will really do. ‘Thought and existence’, Lukács writes, ‘are not identical in the sense that they “correspond” to each other, or “reflect” each other, that they “run parallel” to each other or “coincide” with each other (all expressions that conceal a rigid duality). Their identity is that they are aspects of one and the same real historical and dialectical process.’ The cognition of the revolutionary proletariat, for Lukács, is part of the situation it cognizes, and alters that situation at a stroke. If this logic is pressed to an extreme, then it would seem that we never simply know some ‘thing’, since our act of knowing is has already transformed it into something else. The model tacitly underlying this doctrine is that of self-knowledge; for to know myself is no longer to be the self that I was a moment before I knew it. It would seem, in any case, that this whole conception of consciousness as essentially active, practical and dynamic, which Lukács owes to the work of Hegel, will force us to revise any too simplistic notion of false consciousness as some lag, gap or disjunction between the way things are and the way we know them.” --paradoxical

-you change the object in the act of contemplation. (right?) how can performative be reconciled with constative?

-eagleton: “ideology, like social class itself, is an inherently *relational* phenomenon; it expresses less the way a class lives its conditions of existence than the way it lives them *in relation to the lived experience of other classes.*”

-relation between ideological and political domination?

-poor feminists. no matter what they do, they're defining themselves in relation to men. if they embrace traditional ways of thinking/writing, they embrace “masculinity”; if they try alternative ways, it's because they don't want to be men. there's no way out! --seriously: what's the solution to their dilemma?

- cixous criticizes classic representations of women while reproducing them in her own obscure way
- even feminists *reason* in their writings. (they try not to, and it comes out in the quality of their arguments, but they do) it's virtually impossible not to. is rationality phallogocentric? if so, then women are inevitably phallogocentric
- some things are culturally fabricated. like the taboo against female masturbation. feminists confuse the biological with the cultural
- generalization: "Her speech, even when 'theoretical' or political, is never simple or linear or 'objectified', generalized: she draws her story into history."
- one gets the impression that the imperative of "writing one's self" is nothing but an excuse to ignore objective standards of quality
- "[woman] writes in white ink", i.e., milk
- descriptivism: properties pick out the bearers of names. absurd
- sense determines reference? whaaaa? *definition* determines reference, but sense (intension) isn't definition. (and the definition doesn't 'express' the sense either)
- I have to agree with Dummett that Fregean sense can only be shown. it's a mode of presentation!--not a 'hidden' description or definition. (it can't be 'decomposed' into a definition) but then how does it determine reference?
- I refuse to believe that philosophy has to be technical and boring, or even completely precise. precision is exalted because no one has imagination or ambition nowadays
- the significance of the death of religion. what does the non-necessity of religion imply as regards the psyche? (explore the death of religion from every side. is religion socially necessary, etc.)
- why do adults automatically talk in a different tone of voice to infants than to fellow adults?
- why don't we remember anything from the early stages of childhood?
- with some people I'm incredibly personable, with others not. explain!
- why are men attracted to innocence?
- gender attitudes = archetypes!
- why do young children 'withdraw' from strangers? (archetype. but why and how? -essential to survival to be able to distinguish between friend and foe)
- why are people who aren't one-sided often more mentally healthy than people who are? the search for meaning? what does that mean?
- why is the sense of meaninglessness the "general neurosis" of the age? we're alienated from our archetypal nature? life isn't 'spiritual' enough?
- a lack of self-esteem as a lack of psychic energy. when I have more energy, I'm more self-confident.
- principles of entropy and the conservation of energy in the psyche
- the nature of the social mask we all wear. its origin, relation to the psyche, consequences on the psyche
- psychic balance is the purpose of life? (the universal human, etc.)
- "the direction of the psyche towards its goal of wholeness is itself archetypal, that is, it is an aim that is an *a priori* human disposition, and *the archetype of wholeness is the archetype of the Self.*"
- Jung's inductive reasoning isn't convincing. maybe the belief in God is common not because of an archetype but because of a lack of scientific knowledge, or because of tradition. Freud's ideas are also an explanation (though an implausible one)
- why are dreams of falling so common?
- individuation. the natural desire to integrate the conscious and unconscious (so as to establish a psychic equilibrium)
- meaninglessness as a separation between Self and ego ([or?] as an insufficiency of psychic energy in the conscious, and a concentration of it in the unconscious)
- distinction between form and content appropriate to all archetypes
- "another strange reaction": how does *love* result from being validated? an emotion from an intellectual satisfaction?
- our perception of cuteness is both a source and a product of love
- people say the Koran preaches compassion and mercy--and they think they're respecting it by saying that.

it's conditional and partial respect. if it didn't preach those things, they wouldn't respect it; and they respect it only inasmuch as it preaches those things. I.e., they respect it only to the extent that it's compatible with the modern world

-people think you have to believe in God to experience wonder. why?

-why does everyone interpret sighing as meaning that you're tired or something's wrong?

-what is resentment?

-I feel lazy and 'cowardly' when I write art: I'm escaping from the harder task, viz. to understand the world

-the antichrist, sec. 57: "The fact that a man is publicly useful, that he is a wheel, a function, is evidence of a natural predisposition; it is not *society*, but the only sort of happiness that the majority are capable of, that makes them intelligent machines. To the mediocre mediocrity is a form of happiness; they have a natural instinct for mastering one thing, for specialization."

-why do women get angry when you say "oh, is it that time of month again?" in response to their mood swings? surely because you're impugning their independence, their rationality, their self-control, and thereby their self-worth. but they're unaware of this motivation. their anger is purely spontaneous. how can such a motivation be the cause if they're unaware of it? more generally, how can effects have 'psychological' causes if we're unaware of them? what are the mechanisms through which they (unconsciously) influence us?

-therborn... subjection-qualification: does ideology really 'qualify' people for their social positions? qualification involves an acquisition of skills, which seems to be unrelated to ideology; or rather, ideologies provide the intellectual basis/justification for modes of education, but the education itself isn't ideology, and therefore ideology isn't what 'qualifies' people for their professional etc. roles. it's indirectly related

-subjectivity: "acting as a particular subject in a particular context". "forms of human subjectivity are constituted by intersections of the psychic and social, and may be seen as the outer, more conscious, and more socially changeable aspects of the person" --therborn

-significance of the correlation of intelligence with personality traits and interest in the interests of the opposite sex? see Readings on the psychology of women, ch. 6.

-little boys build things, girls play with dolls. extremely significant! is the doll-fixation simply a foreshadowing of the maternal instinct? or is it a reflection of girls' apparently greater need to be affirmed through interpersonal relationships than boys?

-why different classes have different ideologies. (b/c: different conditions of life, etc.)

-things we STILL don't understand: why do I care about my friends? why do I like reading (or writing or playing sports or whatever)? why is gossiping fun? etc.

-"every totality is incomplete; therefore a 'totalizing' system like Marxism is invalid." refute. (at any given moment, society is a totality. it's everything that exists and falls under the rubric of 'social'; the definition of society may be ambiguous, but that's unrelated to this particular criticism)

-lust isn't for the sake of pleasure, as everyone thinks...

-difference between intelligent people and e.g. Jehovah's Witnesses: the minds of the former have evolved to a more 'self-decentered', 'objective' point than those of the latter. see Piaget. their perspective is broader, etc.

-maybe some analytic truths are a priori and others are a posteriori

On the other hand, how can 'There is a brown table in front of me' be wrong if I see the table? If by 'table' I mean a mind-independent object, then the possibility I'm wrong is obvious. But surely that's not what I mean! I just mean *that thing I see*. Can I be wrong that I'm seeing *something*? No, that's absurd! Can I be wrong that it's a table--an object that has all the features people associate with tables (aside from mind-independence)? How *could* I? I know what a table is! Can I be using 'brown' incorrectly? Can the table 'really' be *green*? How could I be wrong? "What would it be like" for someone to correct me? And yet it seems strange to say that my judgment is infallible. If I said 'The table is beige', someone might say that I was misunderstanding 'beige' and show me what beige really looks like. In that case I'd be wrong. But I'm so certain of what 'brown' is that I consider my judgment infallible--even though, in a sense, it isn't... Witt. was right that there's something misguided about these kinds of questions.

What makes self-deception possible is that thoughts are often indeterminate. Their content, that is. Their form is always indeterminate. But their content is *usually* not a single differentiated meaning, a “proposition” (or question or whatever). [...] This is how consciousness can seem opaque, even as, in another sense, it can’t be (because whatever I’m conscious of, I’m conscious of). It can be the case that I don’t really know what I’m thinking, or that a given state of consciousness seems empty even though, obviously, it can’t be (because consciousness is never “empty”). The indeterminate form also has a role in these paradoxes: it is presupposed by the content’s indeterminacy (because whatever has a form must, presumably, have *some* kind of content), [...]

(from my journal--august 27) In a way it’s *obvious* that we know things about our material surroundings--“that (when we see them for ourselves) there are cookies in a jar, zebras in the zoo, people in the room, and cars on the street”. We *know* these things, period. But from the philosophical perspective we don’t: there could be a Cartesian “evil demon” deceiving us. Both alternatives are equally obvious--equally *true*, in fact--when you examine them from within their respective ‘perspectives’--the perspectives that produce them--just as both are equally doubtful when you look at them from the opposing perspective. From the philosophical standpoint, ordinary knowledge is dubious; from the ordinary standpoint, the skeptical position that ordinary knowledge is dubious is itself ridiculous, because the reasons that cause the skeptic to doubt ordinary knowledge are fanciful and have no force in comparison with the overwhelming power of ordinary knowledge. ‘There is a bed in my room’: in one sense I know that’s true--I *know* it: I’m ‘immediately’ certain that my belief is justified and true--yet in another sense I know that I *don’t* know it. (Do I *know* that I don’t know it, or do I merely *believe* I don’t know it?) This contradiction boils down to the conflict between my animal and my rational ‘experience-processing-capacities’. They can’t be reconciled

I have yet to touch on modality. This is another thorny issue, which revolves around the question “What is it by virtue of which modal claims are true or false?” When I say, “It’s possible that there are black swans”, what does that mean, and how can I know if it’s true? Similarly, what is necessity, and how can we judge the truth of claims of necessity?

As far as I can tell, variants of realism are the dominant positions in the philosophy of modality. What they have in common is that they assume the existence of possible worlds—though they analyze the meaning of ‘existence’ differently. According to David Lewis’s “genuine modal realism”, for example, modal claims are analyzable in terms of concrete possible worlds to which *our* world has no spatiotemporal access. For instance, the statement that black swans possibly exist entails that there is a real world—a “maximal spatiotemporal region”¹—in which swans are black. The *actual* world, the one in which we live, has no spatiotemporal connection to this possible world, but the latter is nonetheless ‘actual’ for the beings that exist there. In other words, “every way the world can be is a way some world is; and modal statements are to be construed as quantifications over these worlds.”²

On the other hand, there is the view that Lewis calls “ersatz modal realism”: possible worlds are “certain *abstract* objects that somehow manage to be complete representations of different ways the world could be. These abstract objects then count as the ‘worlds’ for the purposes of modal analysis.”³

[from the paper on the paradox of horror] I should embellish on a suggestion I made a moment ago, because it is relevant to the paradox I’m discussing. I noted that without a language one would have trouble differentiating qualia. This would be especially true of physiological sensations, such as warmth, softness and dryness. It may seem counterintuitive, but in the absence of a language one could literally not learn to

¹ Alexander Rosenberg, “Is Lewis’s ‘Genuine Modal Realism’ Magical Too?”, *Mind: New Series*, Vol. 98, No. 391, p. 411.

² Tony Roy, “Worlds and Modality”, *The Philosophical Review*, Vol. 102, No. 3, p. 336.

³ *Ibid.*

distinguish the different properties of a sensation such as pressing one's hands together—the properties, namely, of smoothness, softness, warmth, dryness and so on. (Or, at most, as I said, one would have only a muddled, half-conscious comprehension of the differences between them—between, for example, warmth and softness.) The important thing to understand here is that the distinction I made between the unmediated and the mediated color-qualia is manifested here, in the fact that sensations can be divided into two categories: the unmediated and the mediated. Feelings like (*a particular instance of*) a headache, or (of) grabbing one's foot, or (of) placing a hand on one's chest, are unmediated: they are just *given*; we do not rely on language in order to be aware of them. In other words, rather than being 'universals', they are 'concrete particulars'. Each instance of them is a complete, 'self-enclosed' sensation in and of itself, such that no act of abstraction is necessary in order to concentrate on it. On the other hand, a particular instance of a feeling like coldness, wetness, or hardness is—to borrow a term from trope theory—an 'abstract particular'. This is an appropriate name because, although such a sensation can indeed be construed as a 'concrete particular' (in that it has a particular location in spacetime), in order to pick it out, one must *abstract* it from the unmediated sensation in which it exists.¹ It's true that we commonly think of these abstractions as sensations in their own right—which explains our use of such expressions as 'the sensation of warmth' and 'the sensation of pain'—but this should not obscure the fact that their status as sensations (or as qualia) is categorially different from the status of a sensation like that of pressing hands together. *This* is the kind of sensation that could be denoted (though futilely, as we have seen) by a private act of ostension—the *only* kind of sensation that could, because in order clearly to pick out the other kind, an act of conceptual abstraction is necessary.

This issue of mediated versus unmediated qualia is complicated, though. *All* qualia—even the 'mediated' abstractions like warmth—are in a sense unmediated, in that they exist outside of language. The act of naming them cannot in itself bring them into existence. What it can do, in the case of some, is give us a clearer perception of them, by helping us focus our attention on them in opposition to a 'broader' quale in which they are included (as warmth is included in the feeling of pressing one's hands together). But when I describe this criterion for determining which qualia are to be called 'mediated', I am not suggesting that by saying, "I feel wetness in my hand" when I pour water on it, I will thereby make clearer my perception of the wetness. Rather, I mean that in the absence of *any* (public²) *language at all*, one will have a less clear sense of the difference between, say, wetness and softness than if one spoke a language—which is to say that one's perception of wetness will not be as clearly defined as it would have been had one spoken a language. Once a language has been internalized, it doesn't matter much (with regard to the nature of one's experience of a quale) whether one actually makes the effort to name, or to 'pick out', a given quale when one is experiencing it, as in "I am experiencing wetness now".

An air of ambiguity surrounds unmediated qualia as well, because, after all, they become mediated (i.e., brought into relation with other qualia) as soon as they are named or described. Nevertheless, our learning a language does not really have an effect on our perception of them—i.e., it does not make us more clearly aware of them—so I call them 'unmediated'. They are unproblematically 'given' to us in themselves (outside of language), clearly and absolutely, as mediated qualia are not. Said differently: they are not phenomenologically included in a more basic, more 'brute' sensation than they themselves.

Let's look at a few examples. Is an itch a mediated or an unmediated sensation? Clearly unmediated, because it isn't merely a part of another sensation. It's always isolated and wholly concrete, like a headache. No act of abstraction is involved when one concentrates on it. The feeling of tiredness is a similar example. Likewise, any sensation to refer to which one must start out by saying "the sensation of..." (as in, "the sensation of punching someone") is unmediated. The fact that a description of an action is necessary in order to refer to the feeling is a sure sign that a feeling *as a whole* is being referred to—because such a description is incapable of denoting only *part* of a sensation (that is, an abstraction from it).

On the other hand, there are borderline cases, in which a quale whose name would lead one to think that it (the quale) would be an abstraction from another quale seems to have a full-fledged independent-

¹ Again, to speak in Hegelian jargon: one must introduce mediation into an unmediated datum of perception.

² See four paragraphs below.

quale status. For instance, suppose I burn my hand on the stove. Because in its less extreme manifestations, the feeling of heat is merely an abstraction from a ‘broader’, more basic sensation (such as that of placing one’s hand on a warm radiator), one might be tempted to say that in this case too, the hotness is just an element in a broader sensation. But this wouldn’t be right, of course. It is possible for a sensation whose name typically denotes a mediated sensation to be so predominant or overpowering that it effectively becomes ‘unmediated’; i.e., it ceases to be a part of another sensation. This is what happens when I suffer a severe burn, [...]

Before I end these preliminary remarks, I ought to explain how it is that humans acquire words, specifically qualia-names. If the answer is not ‘through private ostensive definitions’, then what is it? Obviously, ‘through publicly correctable uses of words that we, as children, learn from adults’. We observe how adults use words like ‘pain’ and ‘hot’, and we mimic them. If we use them in the wrong circumstances—if our behavior seems incongruous with our verbal expression—we are corrected. If we say, “This hurts!” while happily eating ice-cream, someone corrects us: “No, say ‘This tastes good’.” Being guided by an external authority is essential, because it’s the only way we can develop our own *internal* guide. Our internal guide, however—once it comes into existence (i.e., after we have learned to use a language properly)—does not operate ‘after the fact’, as does the external one; it guides us *before* we speak. It determines what words we use when confronted with a given quale; it automatically ‘presents’ the words to us, as it were, in intuition, such that we have no choice in the matter. Our prior internalization of the external authority’s behavior (or instructions) is such that the appropriate words in a given context occur to us involuntarily. Thus, our ‘following a rule’ consists precisely in our lack of choice as to which verbal expressions seem right to us.

[from an earlier draft] The reason why the paradox in question has remained unresolved since Aristotle addressed it in his *Poetics* is that the conventional ways of talking about feelings are misconceived. Such words as ‘pleasure’, ‘pain’, ‘satisfaction’ and ‘enjoyment’ (and their corresponding adjectives) are not only vague but deceiving. They are distinguished from words that name particular emotions (such as ‘anxiety’, ‘anger’, ‘fear’), which, while vague, are not really deceiving. The difference between the two classes is that the terms in the former are more general than those in the latter: they are used to characterize a huge variety of mental states, while the latter apply to a comparatively narrow range.¹ For example, sadness (a word that belongs to the second class) is said to be painful, but so is anger. Likewise, joy is pleasurable, but so is the feeling that corresponds to malice. The generality of the words in the first category is deceptive in that it posits unities among the most diverse phenomena. More specifically, each word is supposed to name a single quality that inheres in every phenomenon to which the word applies. Philosophers are thus led to look for the common quality, and when they cannot find it they declare that a paradox has been discovered.

For instance, in attempting to account for the pleasure that can accompany sadness, they analyze the state of sadness to try to find wherein it is similar to something like happiness. They may, perhaps, introspect when they happen to be in a sad mood (or they may ‘imaginatively reproduce’ it, abstractly conceiving its essential features), or they may undertake a conceptual analysis of emotions in general. In either case, they assume that the meaning of ‘pleasant’ is fairly unproblematic. “A given thing is pleasant insofar as one desires that it continue”, they might say. Or maybe they would say, “A mental state is pleasant if and only if (loosely speaking) it feels good”. The problem is, there is no way to define pleasure *except* by “speaking loosely”. Because ‘pleasure’ is used in such a way that it denotes inner sensations, an intuitively satisfactory definition would ‘reproduce’ in concepts the inner sensations deemed pleasurable. The point of a definition of a noun, after all, is to portray in concepts the thing to which the noun refers: ‘bachelor’, for example, is defined as ‘unmarried adult male’. The definition ‘picks out’ the denoted: it allows a person to *point to* the referent, by stating the criteria by which the referent is distinguishable. Thus,

¹ Such words as ‘emotion’, ‘feeling’ and ‘thought’ are as vague and deceptive as those in the first class, but I omit them from this discussion because their deceptiveness is of an irrelevant kind. Only words conceptually related to ‘pleasure’ and ‘pain’ play a role in the resolution of the paradox.

a complete definition of ‘pleasure’ would set forth a series of criteria that would make possible in all contexts an unambiguous decision as to whether a given state was pleasurable or not; the criteria would be “internal” because ‘pleasure’ denotes an internal state. (The same applies to ‘pain’ and its offshoots.) No such definition exists, though. Nor is it possible. *Emotions* cannot be conclusively defined either. That is, no (nontrivial) set of necessary and sufficient conditions can be stated that allows one to determine whether a given state qualifies as ‘anger’ or ‘sadness’ or ‘envy’. The difference between pleasure and pain, on the one hand, and emotions on the other, is that while the latter have properties,¹ and can thus be given partial definitions,² the former do not. There is literally not a single nontrivial property that can be pointed to

[...] The point is that we have no clear idea what pleasure is, except that we recognize it when we feel it.

—Or do we? In fact, the crux of the problem is that we don’t. We cannot tell whether sadness “*really is*” pleasant sometimes, or whether fear provoked by horror movies “*really is*” pleasant. —Or rather, we cannot tell *in what sense* it is (which amounts, more or less, to the same thing). That’s why there is a paradox. We are conflicted: these emotions are pleasurable “in a way”, but also painful. The solution lies in the fact that when we think of ourselves as “enjoying” “unpleasant” emotions, we understand ‘pleasure’ not in the (indefinable) sense of some kind of intrinsically positive feeling, unmixed with pain, but rather as I defined it above, namely as a mental event the continuation of which is desired for its own sake. We want the feeling to continue even though we do not think it is completely, “intrinsically” pleasurable. The reason for our desire (in the absence of an unambiguously positive feeling)—in other words, the solution to the paradox I’m dissecting—is simply *emotional inertia*. This is intuitively verifiable. What is also verifiable is that *during every occurrence* of a negative emotion, one wants it (“in a way”) to continue. For example, when I’m in a self-pitying mood, or when I feel sad for whatever reason, or bitter or angry, I want the mood to continue *just because I’m already in that mood*. Even if, say, my parents died, and I were at their funeral, I would, in a sense, want to persist in that state of sorrow. So would everyone else. This probably seems counterintuitive, though. “Are you crazy?!” objects the reader. “It’s absurd! Nobody but a masochist would want to stay sad if his parents had died! Just look at the movie *High Fidelity*: after the woman’s father has died, when she is in the car with Rob, she turns to him and says in desperation, ‘*I want to feel anything but this, Rob.*’ And then she asks permission to have sex with him, just so she can feel something else.” Nevertheless, I maintain that she partly enjoyed her sorrow, though only because she was already experiencing it.

In order to de-perversify my ideas, I must borrow a few from Berys Gaut. According to the “evaluative theory of the emotions”, emotions are not mere “phenomenologically characterized feelings”, distinguishable from thoughts; rather, they are cognitive, “essentially incorporating evaluations” (Neill, 302). “Thus to fear something involves evaluating it as threatening, to be angry with someone involves evaluating his actions as wrong...”. Now, this theory is true in most circumstances, but not all. It is possible for an emotion to exist and yet for there to be no corresponding evaluation. For example, I sometimes find myself suddenly feeling exuberant for no apparent reason. No particular thought is involved; I just feel, inexplicably, joyful. My bodily sensations are suddenly very pleasant. It may be objected that my implicit evaluation is some vague thought like “I love life!”; but this objection is trivial. The point is that my emotion has no definite object. Similarly, I am sometimes depressed even though I don’t know why. Still, in most circumstances the theory is true: emotions are essentially united with evaluations of a given object. Gaut proceeds to argue that “one emotion is to be individuated from another in terms of the evaluations involved, rather than by the particular features of the physiological state or of the associated bodily sensations, for

¹ For example, a particular instance of anger may involve a restless feeling in the chest and a desire to punch someone.

² Such a “definition” might, perhaps, describe the feelings coextensive with a given instance of anger, without saying that these feelings are coextensive with *all* instances of anger. (That is, they are merely an example. The point is that other examples of anger will be *similar* to this.) Incidentally, shortly I’ll provide a partial, inadequate definition of pleasure, the existence of which will not, however, contradict the point made here, because the inadequacy of the definition will consist in its reliance on external criteria, while the inadequacy of a definition of any emotion consists in its ability to provide an exhaustive list of all *internal* criteria.

there is no pattern of physiological changes or set of sensations peculiar to each emotion....” (Neill, 302). Therefore, the painfulness of an emotion is a function of the negative evaluations it incorporates, not of the “intrinsically painful” nature of the bodily sensations. Given the limit I have set on the applicability of the first doctrine, this second doctrine has a limit as well. And even in those emotional states that include negative evaluations, the bodily sensations are sometimes also intrinsically unpleasant. Nevertheless, generally speaking, the theory seems true.

Evaluations have degrees of strength: some are very negative, others less so. For example, if a college student has failed a course, the thought that is united with his emotion will be fairly negative but (probably) not acutely so; if one’s parents have died, the thought *will* be acutely negative. This will make the emotion extremely unpleasant. In the former case, if the student is palpably depressed and reflects on the depression, it will seem strangely pleasurable: in that moment, he will not really want it to end immediately and suddenly, to change from sadness to happiness in a short span of time. The evaluation, though, insofar as it can be considered in abstraction from the (holistic) emotion, will be unambiguously painful. It is the evaluation that accounts for the overall painfulness of the situation; the “inertia” of the emotion is what accounts for the pleasure. The death of one’s parents, or one’s spouse, will (presumably) result in severely negative thoughts, such that one will not even want to think them. Even though, upon insightful reflection, one will detect a hint of satisfaction in the emotion, the painfulness of the thoughts will so overpower the satisfaction that one will, like Rob’s girlfriend, want to feel *anything else*.

As I have already remarked, these ideas apply to all negative emotions. It is strange, then, that people acknowledge only that such emotions are *sometimes* pleasurable, in “atypical” situations. How can this be explained, if there is always a slight degree of pleasure?¹ The answer is that people are not typically self-aware. Rarely do they reflect on their feelings. In the powerful immediacy of an emotion, they are consumed by its object—its “unpleasant” object. They are not reflectively abstracting from themselves, ‘stepping back’ in order to observe exactly how it is that they feel. Thus, the atypical nature of the situations in which negative emotions have an element of pleasure consists precisely in the fact that the person feeling the emotion is reflecting on it.²

Philosophers, in short—or, at any rate, a few of them—have been misled by language into looking for a single determinate *internal* property, a property of the *sensations*, shared by such feelings as joy and pity. There is, strictly speaking, no such property. But there are two reasons for this, the first of which is the one I had in mind at the end of the second paragraph of this paper: (1) the sensations generally associated, for example, with joy and pity have no similarities,³ and (2) feelings *do not have* properties in the first place. As we have seen, they are “irreducibly holistic”, un-denotable by criteria: isolated (or even analytically isolatable) properties ‘in’ them cannot be described or pointed to. This is extremely paradoxical, because it means that reason #1, which presupposes the possibility of similarities—i.e., of similarities *among properties*—contradicts reason #2. (Or at least it *seems* to contradict it.) Even more disturbing, it is intuitively obvious that there are such things as similarities between feelings: for example, between my joyful sensations yesterday and my joyful sensations today. Or between the sensations associated with ecstasy and those associated with happiness. They are similar. But we cannot explain how, because feelings have no properties. They just—*are*. They are ineffable. The only way we can know whether a feeling is similar to another is by introspecting and

that’s ambiguous: we should be speaking not of isolated ‘properties’ (which, as we have seen,

¹ By the way, I’ll conclude my discussion of the ambiguity of ‘pleasure’ momentarily—the discussion I interrupted when putting forward my solution to the paradox.

² This raises the question whether it is possible to feel pleasure without being aware of it. However, I have no intention of getting stuck in the mire of this issue. I think that it is indeed possible, just as it is possible (as Gaut notes) to be deceived about the contents of one’s belief that *x*. In fact, the notion of self-deception seems as philosophically problematic as that of ‘un(self-consciously)felt pleasure’.

³ Except, perhaps, in exceptional circumstances, such as when a Christian with a mystical temperament is so overwhelmed by his pity for humanity that he experiences something like joy.

feelings never have; they are “irreducibly holistic”) but rather of similarities. The only (relevant) property these emotions share is an external one, i.e., one that has to do with their (psychological) *effects*, and is defined through behavioral notions: viz., they provoke the desire that they continue. –Maybe it will be objected that desire is itself internal, even if it is preeminently a behavioral notion (a reason for *acting* a certain way)—and so philosophers have not really been misled, as I have said. I might reply by saying that the desire is from a perspective external to the feeling: it is not really a part of the feeling, but is projected onto it. At any rate, I don’t insist on this. Maybe philosophers have not, after all, been *wholly* misled; this has no significance for my arguments. Regarding the question of what it means to divide pleasure into two categories (as I have done)—viz., ‘positive pleasure’, an intrinsically good feeling, such as joy, and ‘negative pleasure’, i.e., the pleasure of inertia—I have no answer. It is and will remain a complete mystery what the phenomenological meaning, or essence, is of both kinds of pleasure. They (and pain) are *sui generis*. Ineffable.

Incidentally, I have a suggestion as to what the psychological explanation of inertial pleasure is. In *The Ego and the Id*, Freud writes that “unpleasurable sensations impel towards change, towards discharge, and that is why we interpret unpleasure as implying a heightening and pleasure a lowering of energetic cathexis”. When one is psychically immobilized by a compelling mood, the mood’s ‘energy’ (or the neurological chemicals, or the relevant electrical current in the brain, or whatever) is effectively insisting that it have time to ‘spend’ itself. One does not really want to advance suddenly into a different, happier mood because there is still a quantum of unspent energy—a quantum of the peculiar type of energy associated with this particular mood. –That’s only a suggestion, though.

As I noted at the beginning, I must supplement my theory to account for the pleasures of tragedy and horror. These art forms have narrative structures, characters and so on; the enjoyment we derive is related to these features. As Noël Carroll argues, in the case of horror there is an element of fascination: monsters (and, I might add, gruesome spectacles) violate our normal conceptual schemes—they “transgress our categories of thought”¹ (Neill, 287)—and thus fascinate us. And fascination is, for whatever reason, enjoyable. On the other hand, monsters are disgusting, and so we are also repelled by them (and hence by the horror genre). The suspense in these movies is another reason for our enjoyment: we crave the plot’s eventual resolution (and also our *anticipation* of its resolution), as well as the eventual revelation of whatever horrifying being is causing all the mayhem (for movies often delay revealing both the monster and the *explanation* of the monster). Again, what the phenomenological and the psychological meanings are of our enjoyment of suspense is a mystery (though the second meaning is theoretically discoverable²). In any case, the paradox of tragedy is explicable along similar lines. That is, the experience of spectating has painful and pleasurable aspects, but the pleasurable outweigh the painful.

This kind of explanation is clearly adequate up to a point: tragedy and horror are obviously painful in some respects and enjoyable in others; the claims of the latter must trump those of the former. But it is not thoroughly satisfying.³ Gaut’s theory is based on the idea that people can actually *enjoy* being scared, disgusted, sad and so on. In other words, Carroll thinks their enjoyment is *in spite of* their disgust and fear; Gaut thinks it is (often) *because* of their disgust and fear. He does not explain how this is possible, though. His solution is merely the following: no emotional-types are intrinsically unpleasant (rather, the unpleasantness of an emotion is a function of the negative evaluations it incorporates); therefore, the emotions associated with tragedy and horror are not *necessarily*, in all people and at all times, unpleasant (because people need not always be thinking negative evaluations when watching tragedy or horror); therefore, there is no paradox of tragedy and horror. The problem is that Gaut leaves it to empirical psychology to explain why certain people enjoy fear and others do not (i.e., why certain people do not attach

¹ Gore doesn’t really transgress categories of thought, but it does grate against our normal ways of experiencing the world. Therefore it is fascinating.

² If Freud’s ideas have any validity, the psychological meaning might have something to do with our anticipation of the discharge of psychic energy that occurs at the plot’s climax, i.e., at the moment of “recognition” (in Aristotelian language).

³ It’s kind of boring, too.

negative evaluations to fear while others do). But this begs the question, in a way. If negative emotions are almost always experienced as painful (as Gaut thinks), why, and how, are they *occasionally* experienced as pleasant? Gaut does not give an answer. He says only that, somehow, in atypical situations, people do not attach negative evaluations to fear. My solution is better: *everyone always* has a slight enjoyment of fear and disgust and sadness; some people, though—i.e., those who dislike horror and/or tragedy—(1) direct more attention to the corresponding negative evaluations (and less to the interest in the plot, or the ‘thrill’ of having one’s conceptual categories violated) than others do, and (2) are less susceptible to the pleasures of emotional inertia (partly, indeed, because they focus intensely on the negative evaluations, and partly, perhaps, because their physiological sensations are unusually disagreeable¹)—and therefore these art-forms are not universally beloved.

In short, my theory incorporates aspects of Carroll’s and Gaut’s, while adding other ideas that satisfy the requirement (the “axiom”) I mentioned in the beginning—namely, that the true solution explain how it is that negative emotions with *real* objects are pleasurable.

*

That last stuff was from the original version of my paper on horror. You can see why I took it out. It’s confused, wrong, badly written.

Here’s the crappy ghost story I started and will never finish:

Fathers and Sons

The gray sepulchers lie exposed beneath the encroaching tenebrious sky. Mounds of earth are etched against the swirling mountainous clouds. Hoary redwoods stand fearless against the threatened tempest as their fatidic leaves shiver in the blustering wind. Dustclouds rise and wreath in the electric air above impassive gravestones. The ghosts of bodies buried below shriek and writhe in a macabre dance on their eternal tombs. Distant rumblings tell of future horrors...

I push open the gate with a hand that grasps a rusted iron spike projecting from the top. A bar in the latticework shakes loose and rattles to the ground. I look around to see if anyone is watching or has heard the squeal of the hinges—or the bang of the gate slamming against the metal fence. But I am alone; none would venture out on this night. A thick layer of forest insulates me from civilization, and the terrors brewing in the sky have tripled the remoteness of my solitude. I pick up the shovel, trembling, and step onto the dirt hallowed by rotting flesh. Gray marble eyes lodged in the ground stare at me unblinkingly, accusingly. The gate clatters behind me, endued by the wind with a will of its own—certain that evil is afoot.

It is a moonless night. The only light out here is the dim reflection from streetlamps on the undersides of clouds. Without my flashlight I would be blind. I shine it in front of me; its weak yellow beam (the batteries must be dying) lands on a small tombstone engraved with no name. Time has corroded it off: all that remain are pits and stains. Somewhere down below is an anonymous decomposing skeleton. For an instant I’m overcome by a perverse, wild desire to laugh—uncontrollably, hysterically—at the absurdity of this deformed stone sticking up out of the earth as a solemn reminder of the final resting-place of a forgotten piece of worm-pabulum, whose loved ones are surely dead and forgotten as well. But I suppress the wild urge. As soon as I do, though, I am conscious again of the fear. The throat-constricting, limb-freezing fear. It has been with me (in various forms) since I left the house. I was able to ignore it as I walked through the streets, where the lights from houses and the people on the sidewalks kept my

¹ It is probably superfluous to remind the reader of an implication of my having qualified the evaluative theory of the emotions: we can desire the continuation of a disagreeable emotion even if both the evaluation *and the physiological sensation* are inherently unpleasant. This may seem paradoxical. However, the paradox is mitigated by the fact that physiological sensations dubbed ‘emotional’ are almost never *unambiguously*, ‘truly’ painful. Their painfulness (when it exists) is always fairly tolerable.

imagination at bay. As I reached the outskirts of the town I felt it creeping from my heart—which beat a little faster—to my throat. In the dark of the forest, with the lonely cries and the crackings underfoot, it turned nearly to panic...

Wednesday, August 2

Adam Smith. The circle of economic growth: a greater division of labor leads to an enlargement of the markets, which leads to an increase in labor productivity, which leads to a greater division of labor. Capital is divided into *fixed capital* (machinery, buildings, etc.) and *circulating capital* (which is used to buy raw materials and pay for labor). The *wages fund* is the part of circulating capital that pays the workers. The bourgeois class has a high propensity to save, since it wants to increase productive capital. Consequently, “the higher the proportion of the national income going to profits, the higher the growth in the wealth of the nation. The general interest of the nation, therefore, coincides with that of the bourgeois class.”

A good doesn't have value unless it was produced by human labor. And the value of a good is *measured* by the quantity of labor it exchanges for. Under capitalist conditions, in which “capitalists and landlords take part in the division of the product, the exchange value of a good must be such as to allow the payment of a profit and a rent besides a wage. This implies that the quantity of labor the good can pay for must be greater than that employed to produce it. In a capitalist society, therefore, embodied labor isn't a good measure of the exchange value of goods.” A commodity's price is the sum of the incomes paid to produce it, namely wages, profits and rent. There's a difference, however, between the market price and the natural price: the former is the real price of a good at a given moment, and depends on the forces of supply and demand; the latter is what would allow for the payment of workers, capitalists and landowners at normal rates of remuneration. It is, “as it were, the central price, to which the prices of all commodities are continually gravitating” because of competition. (High demand = high market price; excess supply = low market price.) Competition (under certain ideal conditions) continually drives the market towards equilibrium. There's a tension in Smith's work between 'objectivist' and 'subjectivist' orientations—roughly, the macroeconomic and the microeconomic sides of his work. For example, an explanation of wage differentials is the “agreeableness or disagreeableness” of the work: the more disagreeable, the higher the wage will be. On the other hand, another explanation is the high or the low cost of training: the higher the cost, the higher the wage. The first is a subjective, the second an objective determinant. Neoclassical economists seized on the subjective, microeconomic aspects of Smith's thought, while Ricardians and Marxists were more interested in the objective, macroeconomic aspects.

Jean-Baptiste Say formulated Say's Law: a general glut is impossible because supply creates its own demand. “Say first restricted himself to observing that the value of the aggregate production is necessarily equal to the aggregate value of the distributed incomes. This is an accountancy identity that nobody would object to. As incomes are purchasing power, it is also possible to say that the produced goods always create the purchasing power corresponding to their value. From here to say that the production always creates its own demand may seem a small step. In fact it is enormous. One must add that incomes are entirely and immediately spent.”

This is by far the best time of my life. I'm always happy, always wanting to have fun. Talkative, confident, fun-loving yet mature. Always feeling silly and totally forgetful of past woes. [...]

Method in the social sciences.— First formulate a question. An example would be “Why are there higher proportions of blacks than whites in poor inner city neighborhoods?” Then, using your intuitive skills of induction, list categories of possible causes—but be sure to distinguish between causes of the phenomenon's *origin* and of its *perpetuation*. In fact, you should divide your question into two: “How did the phenomenon originate?” and “Why has it persisted?” [...]

Thus, one's intuitive understanding of society is essential for inductively arriving at general

hypotheses. The question of why induction actually *works* is indeed puzzling, since it isn't based on logic, but psychologically it's explicable: in the course of life we 'internalize'—or become 'unconsciously accustomed to'—or acquire the ability to automatically intuit—causal connections between phenomena, by learning how people behave under certain conditions, by noticing regularities in their behavior, by learning which factors and institutions have the greatest causal power in given conditions, etc. Induction isn't 'magical'; it's a semi-creative, discursively manifested processing of past encounters between a person and his environment, and of theories he may have unconsciously assimilated during the process of his education, and so forth.

With the help of empirical data you should choose specific causes that you think are the most important. Unlike natural scientists you won't be able to state precisely the relations and interactions between them, or between them and the events you're explaining, because human behavior doesn't conform to laws¹—and certainly not mathematically formalizable laws. Human interaction isn't deterministic; the existence of freedom (i.e., of a psyche complex enough to be self-conscious) will always vitiate any attempt to formalize social causes and formulate social laws (except in uninformative, truistic ways). So the best you can hope for is an *approximation* of the true, complete explanation.² Be as precise as possible, but know that absolute precision is impossible.

It isn't necessary to write your final argument in a deductive form, because the implicit premises are almost always trivial. Just use a lot of evidence and remember to anticipate objections and argue against opposing theories. In the end you'll simply have to appeal to the reader's own inductive abilities, because in social science it's rarely possible to test hypotheses empirically.³

There's another kind of theory in social science, a more general and abstract theory. When a thinker asks "How does the economy work?" or "What direction is society headed in?" or "Are there general 'laws' that explain historical evolution?", he is asking this kind of question. The difference between the two kinds isn't absolute, but the distinction is useful. In one case you start out with general ideas, educated guesses that guide you in your research and eventually lead to more concrete hypotheses; in the other case you don't want to descend to concrete facts except insofar as they help you arrive at abstract theories. Your *goal* is the abstract theory, the theory that applies to more than one specific set of circumstances. After you've stated it, of course, you should apply it to specific phenomena to test its explanatory power—and indeed, in the process of refining it there's a constant interplay between the concrete and the abstract, as you focus your attention first on one and then on the other—but ultimately your goal is a general theory that provides a framework for more detailed and concrete ones.

¹ [I think that when I drew a logical connection between the two clauses in that sentence my reasoning was like this: the natural scientist's ability to give a precise explanation of, say, the orbits of planets is based on his ability to use general laws (like Einstein's equations) in his deductive or mathematical explanations. I suppose the connection between laws and explanatory "preciseness"—by which I mean articulation of all the relevant causal steps, all the mechanisms—is that laws apply only to deterministic phenomena, and only with respect to deterministic phenomena is explanatory preciseness (thoroughness) possible. Since the subject-matter of the social sciences isn't deterministic, i.e., isn't subject to laws, complete theoretic preciseness is impossible.]

² Only natural science (an incredibly sophisticated and probably unattainable natural science) could give the complete deterministic explanation of a social phenomenon. —Yes, I said "deterministic", despite what I said above about freedom. For there are two levels to human behavior: the biological and the psychological/phenomenological (by which I mean also the sociological, anthropological and so on). The former is the deterministic aspect, the latter the 'meaning-full' aspect. In principle, biology and chemistry can give a complete explanation of human behavior—and they are the only disciplines that can; the human sciences can but approximate, because of freedom. The *brain* is ultimately where causal interactions between 'social forces' take place and so determine the individual's behavior, and thus society's. (The reason for the "thus" is that society supervenes on individuals, even though the latter are influenced by holistic forces.)

³ In certain cases, such as some psychological or economic explanations, you'll have to presuppose a broader theoretic framework. To be thorough you might want to defend this framework, but usually you can get by with defending your ideas just in the context of the particular phenomenon you're discussing. Keep in mind, though, that your decision not to defend the framework will make it easier for people to attack your position (if they think, for example, that in other contexts the "framework" is inadequate).

It's hard to describe a general path to this kind of theory. Different thinkers proceed in different ways. A common theme is that they have to rely, through intuition, on induction. Yet even this isn't equally true of them all. An economist might, as J. S. Mill advises, abstract important features from economic life (be they regularities or mere similarities or whatever) and then deduce implications or induce presuppositions. Induction can play a role in both steps or only in one or the other. A psychoanalyst, on the other hand, might use nothing but induction: he induces causes of behavior partly on the basis of its similarities to other behavior of which he already has an explanation, or he notices that a particular form of behavior is common and, drawing intuitively on his general conception of human nature, induces an explanation. The test of his theories is how well they fit together logically, how fruitful they are and how much predictive power they have, how consistent they are with commonly agreed-upon behavioral facts or probabilities, how simple or unnecessarily complex they are, how well they fit with natural science and anthropological discoveries. Throughout all this, intuition plays a major role, but it can always be backed up with arguments.

As for Milton Friedman's famous argument that scientists should and do base their theories on unrealistic assumptions—"Truly important and significant hypotheses will be found to have 'assumptions' that are wildly inaccurate descriptive representations of reality, and, in general, the more significant the theory, the more unrealistic the assumptions (in this sense)"—it's wrong. So is its corollary: "The only legitimate way to criticize an economic theory is to point out that its predictions are at variance with the facts". In his article "'Unreal assumptions in economic theory: the F-twist untwisted', Alan Musgrave explains why. I wrote an outline of the article for my social science course:

- I. Criticism of Friedman: he is unclear about the status of assumptions in theories.
 - A. There are three different kinds: negligibility assumptions, domain assumptions, and heuristic assumptions.
- II. Negligibility assumptions.
 - A. A scientist declares that a given factor that might be expected to influence the phenomenon he's investigating has in fact a negligible effect.
 1. Example: Galileo assumed that air resistance has no detectable effect on bodies falling through short distances.
 - B. Friedman is right that a theory containing a negligibility assumption can be evaluated only by testing its consequences. [I disagree.]
 - C. He is wrong that a good hypothesis must have descriptively false negligibility assumptions—or, as he puts it, "the more significant the theory, the more unrealistic the assumptions". For negligibility assumptions need not be false.
 - D. Thus, he is wrong to conclude that theories do not even *aim* to be accurate descriptions of reality (a view called instrumentalism).
- III. Domain assumptions.
 - A. These are used to specify the domain of applicability of a theory.
 1. The same wording is used to express a negligibility assumption as a domain assumption. Example: "assume the government has a balanced budget" may mean either that an actual budget imbalance has a negligible effect on the phenomenon in question or that it has a *significant* effect, and that the given hypothesis is therefore valid only if there's no imbalance. In this latter case, the assumption restricts the theory's domain.
 - B. The presence of a domain assumption, in making a theory less realistic, makes it less testable.
 - C. Therefore, concerning domain assumptions, Friedman's statement that "the more significant the theory, the more unrealistic the assumptions" is wrong. On the contrary, the theory is significant if it's more widely applicable.
- IV. Heuristic assumptions.
 - A. These are ways of simplifying the exposition of a theory.

1. Example: when Newton wanted to discover what his theory predicted about the solar system, “he first neglected interplanetary gravitational forces by ‘assuming’ that there was only one planet orbiting the sun”. This was a heuristic assumption.

B. Friedman’s central thesis is wrong in this case too.

When an economist “abstract[s] important features from economic life”, he’s basically making negligibility assumptions: the things he’s abstracting from are negligible,¹ at least at this point in the exposition of his theory. (In this respect he’s also making heuristic assumptions—provided, that is, that he intends to explain the phenomena abstracted from later on, once he’s laid the foundation of his theory.) Marx’s use of abstraction signifies a combination of negligibility and heuristic assumptions.

Malicious well-wishers

“Climb

to heaven!”
we’re told daily
by people who would
rather see us in hell
(because it would prove them right).

Thursday, August 3

Contemporary journalists and editors are gutless wonders. They’re “yellow” than William Randolph Hearst himself.

Bought CDs of John Field’s Nocturnes and his 4th and 6th Piano Concertos. I think this culture could use a little more John Field and a little less Dr. Dre.

Funny story: “Field spent a season in Paris in 1832-33; there he received much acclaim, but also some criticism from the young Turks of the piano, whose style was more aggressive or more brilliant than his own flexible, lyrical approach. (After hearing one of Liszt’s assaults on the keyboard for the first time Field asked his neighbor, ‘Does he bite?’)”

David Ricardo. He was the first to formulate the doctrine of comparative advantage, or at least to bring it to relative maturity. (If one country is more efficient than another at producing both wine and cloth, both countries will nonetheless reap advantages if they each produce only the good they’re most efficient at producing. So one produces wine, the other cloth.) Whereas Smith was preoccupied with the problems of production, Ricardo was more concerned with distribution. How are the payments to land, labor and capital determined?

As capital accumulated, the demand for labor would increase, bringing with it an inevitable rise in money wages. This increase in the market price of labor would lead in turn, just as Smith had suggested, to a rise in the population, with an eventual expansion in the labor force. But here Smith and Ricardo parted company. For where Smith had seen the rise in the supply of labor acting as a restraint on higher wages, Ricardo saw the expansion of the total population as impinging on the means of subsistence. Just as Malthus had pictured the growth of the population as leading to an ever rising cost of living, thus worsening the

¹ To be clearer: they’re ‘*comparatively*’ negligible. They may actually be important, but they’re not as important as the features he’s picking out for analysis.

standard of living for the majority of population, so also did Ricardo fear the effects of this expansion in population.

Wages would not be restored to their previous lower levels by the increase in the size of the labor force. Why not? Because the added numbers made necessary a permanent rise in the cost of living. Since the natural level of wages was geared to this cost of living, a rise in that cost would inevitably produce a rise in the natural level of wages. As the natural rate of wages was thereby increased, the rate of profits would inevitably decline. The time would eventually come when the rate of profit would decline to the point where no further accumulation of capital would take place. When this happened, all economic growth would cease and the stationary state would emerge.

The capitalist would not benefit from this process because his rate of profits declined steadily as the process continued. The worker would not benefit in the long run either, although he might benefit for indeterminate periods as the market price for his services soared above the natural subsistence wage. In the long run, wages would settle to the subsistence level. It was the third class, the landlords, who really benefited. As the demand for the means of subsistence rose, increased cultivation of both and intensive and extensive nature became necessary. The more fertile lands were increasingly capable of yielding a surplus paid to the landlord in the form of rent.

In capsule form this is the essence of Ricardo's famous theory of rent. Note its dependence on the Malthusian principle of population. If higher wages did not produce an expansion in population faster than the means of subsistence were able to be increased, the entire picture would change....

Rent is the result not of fertility itself (as Malthus thought) but "of the fertility of one piece of land when compared with others also under cultivation".

Value is determined by the amount of labor in a product. (Capital is merely stored-up labor.) Ricardo thus rejected Smith's labor-command theory of value in favor of his "labor-jelly" theory. Specifically, value is determined by the amount of labor expended on the "final unit of the commodity"—i.e., the labor under the most difficult, least efficient conditions of production.

I'll finish Ricardo later.

Friday, August 4

From a book of reminiscences: "*Tolstoy says, 'Tchaikovsky's dead'—and two huge tears rolled down his great cheeks.*" (My italics.) I just listened to the Sixth Symphony. Without exaggeration, it's the most devastating piece I've ever heard. (Even on my miserable little headphones.) When I first heard it years ago I didn't like it, and it's taken me awhile to get used to it, but now that I have I love it. The first movement in particular affects me. The passage in the middle that starts with the epic crescendo on the timpani and continues on to the furious trombones and/or tubas—*dum duuuuum, dadaaaa!*—that passage is colossal. Paralyzing. I want to buy a stereo-system just to listen to it! It sounds like the end of the world. And then the romantic melody with the glissando in the strings, after the world has ended.... And finally the plucked diatonic descent under the cadence in the brass and woodwinds, capacious as joy in sorrow....

The end of the last movement is quite shattering too. The dead pulses in the double bass, and the dark stabbings of life's last flickers, and the final four heartbeats, and then death. Those pulses sound like time, the tickings of mortality—death calling you...."*bump bump, bump bump, bump bump...*" The two lines in the music, the underworld tickings and the descending melody, are death and life, inevitability and the final hopeless succumbing to it. Those ticks really do sound like inevitability. They just keep going, undisturbed by the drama playing out above them, patiently waiting to claim their own.

In his personality, Tchaikovsky reminds me of myself between 14 and 24/25.

Went to a party with Vikram and former coworkers. Got drunk and took one gigantic hit of pot that

messed me up for quite a while. It would have been great at the *end* of the night, but since it was at the beginning it ruined everything. I was just *swimming* for a while; lost all my quick-wittedness and energy. I've reached the stage of life where I have more fun sober than drunk. I feel so *natural* all the time now that alcohol just interferes with it, makes me dull.

MoPIRG had something to do with this, I think. Aggressively talking to thousands of people who want to slam the door in your face gives you a “devil-may-care” attitude with everyone else.

Good. Every year from now on I'll celebrate this day, my liberation from the alcoholic's philosophy of life—of using alcohol as an escape. I no longer need an escape.

Saturday, August 5

I've never seen Noam Chomsky lose a debate. Foucault, W. F. Buckley, Richard Perle....he trounces them all. Even when being talked over, ignored, not allowed to get a word in, as in the “debate” with Buckley, he wins. —Buckley, the arch-stereotype, the self-parody of the smug British intellectual. [Actually he was American; he only affected a British accent.] Unbearable to listen to, impossible to watch. Rude, overbearing, astronomically pretentious, smirky and smarmy.¹ Speaks through his nose. And ignores the facts. Chomsky, on the other hand—soft-spoken, courteous, willing to listen and engage with arguments, unbelievably knowledgeable.

When are debates useful? Almost never. They get sucked into a Battle of the Egos, because at least one of the participants is always either easily riled or a pompous dick. Mindful of his image over his argument. The single exception seems to be Chomsky.

Mead reminds me of both Wittgenstein and Sartre,² though obviously he's very different from them. His approach to psychology and sociology is congenial to mine, for example in its emphasis on holism and in its conceptualization of the self. He insists—again and again and again; he's Kierkegaardian in his repetitiveness—that the “vocal gesture” evokes the same responses in the person making it as it does in the other, i.e., that both individuals understand it in the same way. This is what I said about words in my paper on ontology. Through repeated interactions their meanings are fixed in consciousness(es), so that everyone comes to understand a word like ‘tree’ the same way, *exactly* the same way. They may attach different associations to it, when explicitly reflecting, say, on the images it conjures in their mind, but the word itself is just the word itself and is understood as such. (In my class presentation on my paper, the infant thinkers I was talking to made an uproar about that idea. “People understand words differently! Nobody understands a word exactly as another person understands it!” You see, their minds have been saturated by relativistic ideologies, by multiculturalism and pop-anthropology and ideological schisms and late-capitalist skepticism, so they refuse to recognize commonalities between people, unaware that if everyone understood words differently, communication would be impossible.³) Actually, I think Mead's meaning is a little different from mine, and I'm not sure he's right. —But this is all out of context, so I'll shut up.

Songs like “Most of the Time” are good for me because of the vicarious hurt they give. Eyes

¹ At one point he actually gave a sly wink to the camera, pleased with his witty remark. What a clown. Putting on a show.

² “When one is running to get away from someone who is chasing him, he is entirely occupied in this action, and his experience may be swallowed up in the objects about him, so that he has, at the time being, no consciousness of self at all.” Pure Sartre. Mead relies a lot on phenomenological descriptions.

³ “How do you account for misunderstandings?” The words themselves, in their immediacy, are not misunderstood—*cannot be* misunderstood, because otherwise the fluid communication we engage in wouldn't be possible. Instead, the misunderstandings arise when people try to translate utterances into their ‘equivalents’, or try to state their presuppositions and implications. This is when the element of *choice*, of *interpretation*, enters. The speaker, for example, may have left unexpressed the logical or emotional connections between his sentences, thus exposing himself to misinterpretation.

leaking, face red, I can almost feel like I know the sweetness of the pain of loss. Remembering, say, being happy with someone who still means something to me, or being sad with someone who still means something to me. I can almost feel like I know how that feels. Just to get away from the lightness of life and pretend to actually care about something, someone, for a moment, no matter how depressed that might make me—that's good.

Went to a party, didn't get drunk but didn't have fun. Feel a peculiar anger against the world.—

The candle is flickering because it's getting dark, and people are flickering with it, away into the rabid black night, swallowed and hopefully digested; rage drips from my skin and I try to stomp it out but can't, it's there in the sheen on the black tar and trails me home, a stench of burning flesh hovering over it; the calluses on my eyes have blinded me so I rely on instinct to find my way back, but everywhere I turn I slip on puddles of rage; meanwhile I think of Sylvia Plath and Anne Sexton and Hart Crane and Kurt Cobain and suddenly my fist clenches with fingernails digging in, and I raise the gun and blow my brains out.

Sunday, August 6

Nassau Senior is most famous for his capitalist apologetics: profit is a reward for “abstinence” on the part of the capitalist, namely the abstinence involved in his postponing pleasure for the sake of investment.¹ (The authors call this theory the “mother of all the neoclassical theories of capital”.) He also anticipated the principle of marginal utility. *Samuel Bailey* criticized Ricardo's cost-of-production theory of value; he thought that “the value of a good is nothing more than the valuation given to it by economic agents, and that, as a consequence, ‘value’ only denotes an effect in the mind”. *Hermann Heinrich Gossen* shared Bailey's preoccupation with utility:

He formulated two laws that still today form the basis of the neoclassical theory of consumer behavior. The first law establishes the principle of decreasing marginal utility: the pleasure obtained from a good decreases as the amount consumed increases until, eventually, satiety is reached. The second law is more important. It states that the individual will choose to demand the various goods in such proportions that the satisfactions they give him are equal at the moment at which he stops consuming them; or, rather, that the individual will continue to exchange two goods until the values of the last units he possesses of them become equal.Gossen had in mind what today is known as the theorem of equality of the weighted marginal utilities.

There were many other forerunners of neoclassical theory.

John Stuart Mill. His goal being mainly to clarify and modernize established theory, he wasn't extremely original. He agreed with Ricardo's theory of rent (viz., that rent is due to differences in fertility). He accepted Malthus's population theory and considered the law of diminishing returns “the most important proposition in political economy”. He also adopted Senior's “abstinence” theory of profit, while at the same time recognizing that profit is due to the surplus produced by labor. As for wages: he held a “wages-fund” theory, according to which capitalists, through their abstinence, stockpile money for wages. In fact, “capital itself is nothing else but the wages fund set aside in preceding periods in order to sustain the workers who

¹ See Marx's footnote in *Capital*: ‘...In the “Letters on the Factory Act,” [Senior] makes the whole net gains including “profit” and “interest,” and even “something more,” depend upon a single unpaid hour's work of the labourer. [See the section in *Capital* called ‘Senior's “Last Hour”’.] One year previously, in his “Outlines of Political Economy,” written for the instruction of Oxford students and cultivated Philistines, he had also “discovered, in opposition to Ricardo's determination of value by labour, that profit is derived from the labour of the capitalist, and interest from his asceticism,” in other words, from his “abstinence.” The dodge was an old one, but the word “abstinence” was new....’

produce the means of production”. Since the size of the wages fund is at any given moment predetermined by the amount of capital accumulated for wage payments, the level of wages depends on the number of workers employed: the more there are, the less will their average wage be. This idea has quite a few implications that I won’t go into. (Mill eventually decided he was wrong.) He held a cost-of-production theory of value. And he believed in Say’s Law. And he agreed with his colleagues that the ultimate future of the economy lay in stagnation, because “As the population increased, the cost of the means of subsistence would gradually rise. With this rise would come the need for higher real wages and such rises could be achieved only at the expense of profits. As the rate of profits declined, a point would come when further new investment would be unprofitable and at this point progress would cease.” I’m tired of writing these short summaries.

Children who like to point to things and say, “What’s this called? What’s that called?” Verbally inclined minds. But the principle is operative in all children. Higher mental capacities (human, linguistic) emerging vis-à-vis lower mental capacities (animal, pictorial-reflexive). Need to assimilate, get comfortable, ‘accustomed to the situation’, to feel free and in control, able to ‘play’ with the situation, to be uninhibited by something external to the self—‘in opposition’ to the self, because foreign and strange—and the self arises through “verbal gestures” in society (gestures that force the speaker to respond to himself as the listener responds to him, because they both hear the same thing, the same sounds, in the same way; and so the speaker necessarily experiences himself (*originally* through these so-called gestures, later also through introspection) as an other, thus allowing for his sense of self) and is therefore a fundamentally linguistic affair, in its very essence and origin, and so it makes sense that the child’s need to assimilate the environment would manifest itself through language. In any case, there’s no other way to ‘take up into the self’ a foreign object than by naming it—except maybe by simply encountering it again and again, or by studying it or destroying it—or, I suppose, by *doing* something with it, *using* it—so I guess there *are* quite a few other ways—but naming it is the easiest and most efficient. Thinkers, by the way, are evidently the people who most desire to assimilate the world, attain power over it, impose themselves on it by remaking it in thought. This isn’t necessarily praiseworthy; all it means is that they feel confused more often than other people, and so have to do a little extra work to reach the desired state of play, or harmony with the environment. (As I said earlier, serious thought can itself be considered a form of play, but it’s really only *half-play*. *Half-freedom*. Phenomenologically, it may be comparable to the child’s consciousness when he says “What’s that called?”, except that it’s both more unpleasant and more satisfying, because more creative. Like play (which is always creative), there’s an element of ‘for-its-own-sake’, an element of pleasure; unlike play, there’s an element of restlessness and displeasure, which one wants to conquer in order to reach the state of harmony- or equilibrium-with-the-environment that is implicit in play.)

Monday, August 7

I’m skipping ahead to the marginalists. Later I’ll pick up where I left off.

The neoclassical system. “One characteristic of the new system was the disappearance of interest in economic growth, the great theme of the economic theories of Smith, Ricardo, Marx, and all the classical economists. Attention, instead, was focused on the problem of the allocation of *given* resources.The central argument of the theoretical research in this period was the study of a static equilibrium system.” The revolutionary aspect of the system lay not in the argument that the prices of goods are determined by utility (since this idea had been formulated much earlier), but in the principle that “human behavior is exclusively reducible to rational calculation aimed at the maximization of utility”. Marginalists considered this principle universally valid. (That is, they were vulgar Benthamite utilitarians.) Since the economic agents had to be capable of making rational decisions to maximize utility and profit, the collective agents—social classes and political groups—that the mercantilists and classical economists had placed at the center of their systems disappeared in favor of decision-making units like households and firms. (Marginalism, therefore, served useful ideological purposes, in that it deflected attention from class conflict.) Also, economic laws

attained the status of natural laws, comparable to laws in physics, universally valid because of the eternal nature of the problem posed by neoclassicism, viz., that of scarcity. “Thus, while individualistic reductionism had led to the elimination of social classes, the anti-historicist reduction led to the elimination of social relations—which obviously meant that the study of their change also lost importance.” Adding yet another idiocy into the mix, marginalists substituted a subjective theory of value for an objective one; they argued that all values are individual and subjective.

The principle of subjectivity implies that a value is such because somebody has chosen it as an end; whereas the principle of individuality postulates that there must be a particular individual to which that end can be attributed. In the opposite conception, that of objective value, values exist independently of individual choices. The individual can accept or reject values but he is not able to establish their cogency. An important consequence of the neoclassical approach in regard to the question of value is that the theory of the distribution of income becomes a special case of the theory of value, a problem of determining the prices of the services of the productive factors rather than of sharing out income among the social classes.

Lastly, the neoclassical *method* is distinctive. It’s based on the “substitution principle”: “in the theory of consumption, the substitutability of one basket of goods for another is assumed; in the theory of production, the substitutability of one combination of factors for another. The analysis is carried out in terms of the alternative possibilities among which the subjects, both consumers and producers, can choose. And the objective is the same: to search for the conditions under which the optimal alternative is chosen.”

Another way to conceptualize marginalism is to say that it adopted the opposite perspective of Ricardo vis-à-vis the Smithian theoretic dualism: whereas Ricardo had tried to free the macroeconomic element in Smith from the microeconomic, the marginalists tried to do the opposite. “Their revolution consisted in this: they freed microeconomics, understood as a theory of rational individual choices, from classical macroeconomics.”

William Stanley Jevons. One of the three founders of marginalism; mentally retarded. Possibly his most impressive work was in his studies of business cycles, which he attributed to solar disturbances (sunspots). “Two explanations of this interrelation were deemed possible. Either the sunspots produced alternating waves of optimism and pessimism in businessmen, thus leading them to overexpand and overinvest, with a subsequent period of retrenchment and caution to follow, or the sunspots caused variations in agricultural productivity, which in turn produced repercussions in the industrial sector.” This fruitful hypothesis has unfortunately proven difficult to test.

He was a fanatical laissez-fairean, believing that all conflicts of interest between capitalist and worker could be resolved through competition (!). “Competition would cause capital to be remunerated at the market rate of interest, while the worker would receive ‘only the value that he has produced’”. Hence, the natural state of a market economy is social harmony. Problem solved. (Obviously he “criticized the Ricardian theory of the inverse relationship between profits and wages as ‘radically fallacious’, wishing in this way to demolish the theoretical foundation of class struggle”.) Not surprisingly, his idols were Malthus, Say, Senior, and Bastiat.

He finally solved the problem of value that had baffled economists since William Petty, namely by taking the bold step of ignoring it. He simply equated value with price, thus throwing the issue out the window. And then he stated categorically that “value depends entirely upon utility”. He made much of the principle of marginal utility in explaining the behavior of individual consumers, and he also tried to use it in an explanation of exchange on the market. Unfortunately he didn’t explain how prices are determined, instead taking them for granted. He used his concept of the increasing marginal *disutility* of labor to explain how the amount of production of any good is determined: “Labour will be carried on until the increment of utility from any of the employments just balances the increment of pain.” Okayyyyyy....? Soooooo....? (I gotta admit, I’ve never quite understood the significance of the concepts of marginal utility and disutility. They seem either truistic or wrong.)

Mead's concept of the generalized other is fruitful. "The organized community or social group which gives to the individual his unity of self may be called 'the generalized other'. The attitude of the generalized other is the attitude of the whole community." "It is in the form of the generalized other that the social process influences the behavior of the individuals involved in it and carrying it on, i.e., that the community exercises control over the conduct of its individual members; for it is in this form that the social process or community enters as a determining factor into the individual's thinking." The ideological mechanism of *interpellation* that Althusser talks about operates by means of the generalized other: you're molded into a subject—in both senses of the word—by being directly "addressed" by representatives of the generalized other, such as TV, politicians, movies and advertising campaigns. The power that these forces exert over our subjectivities would be impossible if we didn't unconsciously interpret them as spokes-things of the community, the generalized other. (I should make it clear that this "other" isn't the actual concrete aggregate of people in the community; it's the community as an abstract 'presence' in an individual's consciousness. It's the Eye that implicitly looks at you whenever you're experiencing the self. Its existence is a necessary condition for your adherence to morals and mores. And, in a way, it's you yourself. (*You* are the "abstract Other" I've talked about in past entries;—or, rather, this Other is one 'side' of you, implicit in your self-consciousness.) The confusing thing is that, although the generalized other is fundamentally nothing but a phenomenological construction out of your self-consciousness, 'derivatively' it can be understood as the community made into a single abstract 'actor' that confronts you and judges you, an actor with more or less well-defined attitudes. —This is all quite confusing. I doubt, though, that sorting it out would be a profitable activity.)

I wonder if the source, or meaning, of charisma is our perception that the charismatic person best represents the attitudes of the generalized other. Since we want recognition from this other, it stands to reason that we'll want recognition from the charismatic person. While I'm sure this has something to do with it, it obviously begs the question: what is it about self-confidence etc. that makes a person seem to represent the generalized other?

If I really thought about this problem I'm sure I could find an answer, but I ain't in the mood.

"In abstract thought the individual takes the attitude of the generalized other toward himself, without reference to its expression in any particular other individuals; and in concrete thought he takes that attitude insofar as it is expressed in the attitudes toward his behavior of those other individuals with whom he is involved in the given social situation or act. But only by taking the attitude of the generalized other toward himself, in one or another of these ways, can he think; for only thus can thinking—or the internalized conversation of gestures which constitutes thinking—occur."

....Actually, I think that, once again, Mead's idea is a little different from mine. Or maybe he's just confused, like me. In some passages he sees the generalized other as the social group itself, with its attitudes and behavioral patterns; at other times he seems to interpret it as our *internalization* of the social group. This internalization, moreover, has two aspects: the personality-traits and structures that are formed in us, and the phenomenological half-perception of a general, abstract other.

Of course, it goes without saying that from an analytical point of view Mead's theories leave a lot to be desired.

But I'm impressed with his discussion of play and games. He approaches these activities (which he distinguishes) from a perspective I hadn't thought of, namely by considering their contributions to the formation of selfhood. According to Mead, play means successively adopting concrete individual roles (the mother, the policeman, the Indian); since selfhood results from and implies one's taking the role of the other—the generalized other—toward oneself, play is a first step toward selfhood. Games are a second step. In games, the child has to learn rules, he has to continually take the attitudes and roles of the people he's with (so as to interact, and to understand what's going on); his role-taking is now more abstract and general than it was during play, and his sense of self is correspondingly more advanced. (He adopts roles in other parts of his life too, but focusing on games is useful for the purposes of illustration. By "adopting roles", Mead means that the individual understands himself and his "gestures" in the same way that the other person does. —Read the book if you care.)

I read an article about a middle-aged Lebanese man who had lost his wife, daughter and granddaughter in an Israeli airstrike. “Mr. Samra had been sitting with friends elsewhere. He raced to the building and frantically began to dig. He found his 5-year-old daughter, Sally, torn apart. Her torso and an arm lay separate from her legs. Another daughter, Noor, 8, was moving under the rubble. His granddaughter Lynn, not yet 2, had part of her face smashed. His wife, Alia Waabi, had died immediately.” After reading an article like that you have three options on how to live the rest of your life: you can accept that these things occur but detach yourself from them; you can spend every day until you die in rage and despair, from a too-deep knowledge that John Donne’s 17th Meditation expresses timeless truth; or you can emotionally detach yourself from the knowledge but devote every waking hour to fighting against war. When you remember that the article pointed out that the demolished building was the main office for the city’s emergency workers, and that it was targeted because a single Hezbollah official was suspected of living there, you’ll probably be tempted to choose the second option—with the emphasis on *rage*, though. Still, the only option you can choose with a good conscience is the third.

Ehud Olmert is a monster. The problem with him and most people in power is that they’re bureaucrats. Bureaucrats and technocrats. Living in their bureaucratic bubble, they forget their responsibilities and let their egos seduce them into neglecting their duties or actively overseeing crimes against humanity. Like the European monarchs in the 18th century, they see politics and war as games—extremely serious games, involving clever maneuvers for the sake of power and respect. One could draw parallels with chess. The world of these people really is nothing but a stage, and they are among the most dehumanized individuals on the planet.

Tuesday, August 8

Compared to most music from the 1980s, Paul Simon’s *Graceland* has aged remarkably well. It’s always been one of my favorite albums. In this skeptical age, its insouciance plays well.

Léon Walras. While he was one of the originators of the concept of marginal utility, he’s most famous for his theory of the general economic equilibrium. Given his assumption of perfect competition, the theory is simply common sense, i.e., a collection of trivialities.

An economy is in a *Walrasian competitive equilibrium* when there is a set of prices such that: (1) in each market the demand equals the supply; (2) each agent is able to buy and sell exactly what he planned to; (3) all the firms and consumers are able to exchange precisely those quantities of goods which maximize, respectively, profits and utilities.

....The markets must be interrelated so as to make the choices of all the economic subjects compatible. A subject who is unable to achieve the goal of maximizing his satisfaction (or welfare) will have excess demands for some goods and excess supplies for others. By means of exchange, the individual will use the excess supplies to eliminate the excess demands. A state of general economic equilibrium is one in which the prices are such as to allow all individuals to maximize simultaneously their own objectives, with excess demand vanishing.

The model of price-formation underlying Walras’s theory of exchange is one of competitive bargaining. According to this model, markets are conceptualized as *auctions*, in which there are, on the one hand, stockbrokers and, on the other, the auctioneers. [The auctioneer shouts prices; if at the shouted price there’s excess demand, he’ll lower the price, and if there’s excess supply he’ll raise the price, until supply and demand are in equilibrium.] Let us now turn to the ‘Sisyphus entrepreneur’. Walras considered that a firm is in equilibrium when the profit is reduced to zero owing to the competition among

entrepreneurs.... “In a state of equilibrium in production, entrepreneurs make neither profit nor loss”, writes Walras. Profit depends on exceptional circumstances; from a theoretical point of view it must simply be ignored.

Profit, the *raison d'être* of capitalism, should be ignored. —What would Marx have thought of these economists! ‘Business cycles are due to sunspots, social harmony is the natural state of the market, economic laws are eternal, profits should be ignored!’

I’m glad I Am *Not* a Walras.

These sentences got me thinking about methodology again: “Menger [supported] methodological individualism, the view that all propositions about the behavior of collective agents must be reducible to propositions about the behavior of their individual components. [According to] *holism*, the collective terms of social science represent social entities which are absolutely emergent with respect to their individual components. The classical economists and Marx, according to this point of view, were supporters of methodological holism: they believed that it is impossible to understand the operation of the economic system on the grounds of a theory of the behavior of single agents, and this would explain their use of the category of social class.” While I still find it hard to conceptualize emergence, I remain convinced that it’s necessary. How else can you explain business cycles? (Surely it’s significant that neoclassical theory, far from explaining business cycles, doesn’t even address them! —The only time it does, in the sunspot “theory”, it has to look for a cause *outside* the system, a cause that acts ‘individualistically’ on each businessman.) Anyhow, philosophical qualms should be less important than explanatory success; and Marx’s holistic theories are far more fruitful and predictively accurate than marginalism.

Carl Menger. He explained both supply and demand in terms of marginal utility. While Jevons and Walras had focused on demand, Menger wanted to show that production and demand were two sides of the same problem, both explicable through the concept of utility.

With his theories of *imputation* and *opportunity cost*, Menger resolved costs into utility. His starting-point was a classification of goods according to their distance from final consumption: the “higher-order goods”, or the “factors of production”, derive their utility from the goods of the “first order” (consumer goods) they contribute to produce. This indirect utility can be *imputed* to each productive factor by taking into account the marginal contribution it makes to the production process. In this way the actual cost sustained to produce a certain good becomes an *opportunity cost*, namely the cost represented by the sacrifice of utility of those other goods that could have been obtained from the resources actually used to produce the good in question. The production costs are evaluated no longer in absolute but in relative terms, i.e. in terms of sacrificed alternatives.

[Menger’s theory also explains the formation and distribution of income, since] what is a cost for the firm is an income for the owners of the productive factors. Wages, profits, and rents depend, ultimately, on the demand and the prices of the consumer goods and are therefore determined by utility. In this way the distribution of income ceases to be a separate chapter in economic theory, as it was in the classical approach, and just becomes a section of the chapter dealing with theory of prices.

Answer me this: how is it possible for a thinker to spend his entire life mulling on methodology? Doesn’t he ever want to branch out into *substance*? People like Popper and Rorty—not so much *thinkers* as *slowly hardening pieces of clay*. ‘Hurry up and mold it before it gets dry! It can’t change its shape afterwards!’ Even *philosophy* as a lifelong pursuit is too narrow! I have to go from psychology to economics to history to anthropology to poetry just to stay interested.

By the age of thirty I’ll have surpassed Nietzsche in the number of fruitful thoughts I’ve had. [That’s probably a little too ambitious, Chris.] This isn’t a *goal* of mine, something I think about in my spare time—‘I’m almost there! Just a few more thoughts to go!’—(in fact, I hadn’t thought of it before now); it’s simply

a consequence of the roving character of my mind. 'Live rovingly or die!' is my mind's motto. I've given up competition in favor of curiosity.

Mead's doctrine of the "I" and the "me" is obscure. It doesn't seem very valuable.

the sempiternal monumental feet of his half-jointed bloodstream continue to choke my frozen atmosphere of lovely-bridled death inside the strain of happiness on a star shooting towards Mercury and dripping hail all across the icy pathways of space and time dreadfully empty and cold into my dampened soul which hovers faithlessly in the air underneath God's epic feet winged and spritely having sex too far deeply into the moon of the darkness of my eyes and pupils undilated into the flower-like languor of time and eternity stretched out from here to there and in the center of black holes there are worms itching my testicles growing sac-like into elephants dragging the trunks of giant penises through the sterile dirt in rivulets into psyches of marginalism crying out for salvation from homo economicus travestied masterfully by runts in theoretic-pigsties rutting with themselves begging to be slaughtered for their bacon how unfertile though they are as willow-down floating down the breeze above the stream into my open mouth with flies buzzing nearby around the sunflower dotted with the foul stench of sunflower seeds strewn about stamping on the ground killed by moles burrowing blindly poor moles swallowed snakewonder jiltedthroats poisonedapples jampacked gulletfrenzy

(mostly stream of my consciousness, little forethought)

New Life

Life had a simplicity before I met you,
 darling,
 a simplicity I loathed yet
 loved.
 Life could be counted on
 to give me Cheerios in the morning and
 insomnia at night,
 to take me to class day in and day out,
 to be full of highway-noise and simple wallpaper,
 big smiles and pleasant pleasantries and sameness.
 Life was the hours of idleness, the
 cockroach on the wall,
 the cut while shaving in a fogged-up mirror,
 the daily muscle-fatigue in the gym
 for the sake of girls who never cared.
 Life was a pleasant blur, and I was a tin man.
 Now everything has changed.

I love you.

Wednesday, August 9

The Banality of Evil? What a discovery, Hannah. Welcome to the modern world. –Well, almost. You still have one foot in the Middle Ages, since you think "evil" exists.

At the library I got Joseph Smith's *The United States and Latin America: A History of American Diplomacy, 1776 – 2000*, A. H. Johnson's *Whitehead's Theory of Reality*, selections from Kierkegaard's journals, and volume one of Foucault's *History of Sexuality*. I was going to get books by analytic philosophers until I realized that mutual masturbation doesn't interest me right now.

Quine, Rorty, Davidson, Dennett, Sellars, Putnam, Armstrong, Searle, Lewis, *et hoc genus omne* = malleable minds that have been successfully processed through the “Ph.D. mills”.

I bought the stereo-system I mentioned. For twenty dollars, it’s awesome.

“Toward the beginning of the eighteenth century, there emerged a political, economic, and technical incitement to talk about sex. And not so much in the form of a general theory of sexuality as in the form of analysis, stocktaking, classification, and specification, of quantitative or causal studies. This need to take sex ‘into account’, to pronounce a discourse on sex....” It had never occurred to me that the phrase ‘take into account’ comes from the economic meaning of ‘accounting’, but obviously it does. Marxism corroborated yet again!

Vikram’s sister is married and has two children, a boy (two and a half years) and a girl. The girl likes to play chess and the boy watches her sometimes, so he knows what the pieces are. As his mother was bathing him one day he pointed to his penis and said, “Mom, look, I have a bishop!”

It occurs to me that young children think of similarities between objects as identities. They have a hard time distinguishing the two. “Daddy’s vulva has something funny in it!” “Mom, I have a bishop!” This makes sense; at that age their understanding of the difference between self and other is similarly immature. Their cognitive abilities evolve at the same pace as their psychological/emotional knowledge. Another interesting fact is that most adults exhibit a comparable naïveté regarding the distinction between similarity and identity, and correlation and causation. They do have more discernment than the child, but only up to a point.

Thursday, August 10

Whitehead’s was a silly and pointless philosophy. Or so it seems from Johnson’s terrible book.

with a single glance
into my stunned, frozen eyes,
or a light caress,
she gently plucks the worn strings
of this tired violin-soul

drifting tufts of wheat
through shy gusts of evening wind
along the cool beach....
as the waves lap at my feet
I hear tufts of air passing

computer-powered
I sit here robotically
day in and day out,
airplanes roaring overhead
as Field’s nocturnes console me....

death-defying love
enveloping one’s little
space upon this earth,
all-consuming blessedness—

that is what I'll never have

the Adagio,
 a waltz wailed by violins
 in loving despair—
 I could dance this dance of death
 in terrible ecstasy

smiling at the child
 giggling pink life-bubbles
 naively to me;
 they all pop and pass me by,
 but I am happy for her

Tanka. "Danke, tanka!"

Saturday, August 12

Foucault's book is interesting but not excellent. The theme running through it is opposition to a "straw man" argument, namely that for the last few centuries sex has been repressed, mainly for the sake of preventing society's labor capacity from "dissipating itself in pleasurable pursuits". What a crude functionalist position! *Obviously* it's a simplification, desperately in need of elaboration and supplementation. But Foucault's book itself contains plenty of simplistic hypotheses. Moreover, he constantly finds himself compelled to admit, without saying so, that the "repressive hypothesis" is partly, if not wholly, true. For instance, he repeatedly acknowledges that after the sixteenth century, sexual prohibitions were severe, and propriety demanded that one maintain a certain silence about sex, and so on. More importantly, "the multiplication of discourses concerning sex" which took place in "the field of exercise of power itself"—the "institutional incitement to speak about it, and to do so more and more; [the] determination on the part of the agencies of power to hear it spoken about, and to cause *it* to speak through explicit articulation and endlessly accumulated detail" (he discusses at length the significance of the confessional, and of the new theoretic discourses concerning women's sexuality, childhood onanism, population control, sexual perversities like homosexuality and sodomy, etc. etc.)—this "steady proliferation of discourses", which demanded that individuals and families monitor themselves, discipline themselves, divert their sexual energies into normal reproductive functions, surely fostered a tremendous anxiety about sexuality. Whether the anxiety was caused by enforced silence/censorship/prohibitions (which Foucault denies) or by excessive "multiplication of discourses" (which Foucault affirms) seems less important than the fact that there *was* this anxiety, this "repression" (which he seems to deny). (Anyway, the anxiety was obviously caused by *both* the silence/prohibitions and the discourses. The two went hand-in-hand: had there not been so many discourses there wouldn't have been so many prohibitions, and vice versa.) No doubt Foucault is mostly right in his history of the "*scientia sexualis*" that overtook Europe with the onset of capitalism; but, if anything, his history *supports* the "repressive hypothesis"—or the "anxiety hypothesis", as I'd prefer to call it, since the word 'repression' has overtones of silence.

Still, there has been and still is a shroud of silence concerning sex, despite what Foucault says in the last pages of his book. The "proliferation of discourses" doesn't negate the fact that it ain't *easy* to get sex—that most people (especially women) are still uncomfortable talking about it, that women tend to consider it a shameful secret (whence—partly—their insecurities), that coquettish sexual games which lead nowhere are ubiquitous in our civilization. There's far more sexual frustration and anxiety in the West than in the remaining primitive societies (not to mention extinct prehistoric societies). As for Foucault's idea

that “sex” is simply a historical fabrication, an “imaginary element” that’s subordinate to sexuality and power-relations: it’s perverse. “The theory [that there is such a thing as sex] performed a certain number of functions that made it indispensable. First, the notion of ‘sex’ made it possible to group together, in an artificial unity, anatomical elements, biological functions, conducts, sensations, and pleasures, and it enabled one to make use of this fictitious unity as a causal principle, an omnipresent meaning, a secret to be discovered everywhere: sex was thus able to function as a unique signifier and as a universal signified.” (Yes, there we go again with the poststructuralist obsession with signifier/signified.) First of all, I fail to see how the unity thus constructed is “artificial”, and in any case, Foucault hasn’t argued for his claim. Second, this passage hints at the favorite—fallacy-saturated—method of postmodernists, which runs through Foucault’s book as a whole: to argue that because a certain position has a history and serves some function or other, it isn’t true. This conclusion is never stated explicitly, since it’s absurd, but the methods and rhetorical devices peculiar to postmodernists tend to get their force from the implicit appeal to that argument. Foucault, Rorty, Derrida and all the others seem to think that by focusing attention on the process of philosophical creation—the vagaries and vicissitudes of it—and on a philosophy’s uses to a given power-structure, they can invalidate the philosophy itself. That just ain’t so. At most, it encourages the philosophy’s defenders to be extra-rigorous in their defense.

At the MoPIRG party last night I read part of Barbara Ehrenreich’s book *Nickel and Dimed*, which is a record of her experiences in the lower class. For months she was an undercover investigator of conditions at low-paying jobs (waitressing, Wal-Marting, cleaning-ladying); she wanted to see what life is like for the “other half”. Turns out, it sucks. It really, really sucks. The book is eye-opening; you should read it. Be prepared to get angry, though.

Increasingly I fail to see the point of most endeavors in the social sciences and humanities, especially history and philosophy. Rarely do they have practical effects; they’re just attempts to allay curiosity. People sitting in their ivory towers, theorizing for no apparent reason.... How idle theory is! On the other hand, why should practical applications be the be-all and end-all of human pursuits? Can’t intellectual stimulation be considered respectable for its own sake? “No, for the sake of self-cultivation!” you’ll say, quoting me. Fine. But then ultimately we aren’t theorizing for the sake of *truth*, as (during the activity itself) we think we are. So there’s self-delusion.

I could continue, but that would be—pointless.

Alfred Marshall. “The method of partial-equilibrium analysis was his great invention and personal contribution to economics.” It involves confining the analysis to a particular commodity produced by the average firm in an industry small enough to leave the rest of the economy unaffected by changes in output. (I.e., the prices of other commodities are assumed to be constant.) Walras and Marshall differed in how they conceptualized perfect competition (the notion of which, by the way, is attributed originally to *Cournot*).

In the Walrasian conceptualization, the agent in perfect competition is a price-taker: he considers the prices as given and not capable of being directly influenced by his own behavior. Marshall, on the other hand, believed that a perfectly competitive market is one in which a large number of agents operate; each has objectives which conflict with those of the others, and will try to pursue them without entering into coalitions or blocs and without using special bargaining powers. Marshall’s ‘perfect competition’ does not presuppose that each agent takes the prices of goods as given, nor that the firms are identical (even though they must be ‘similar’). The small differences among firms play, in Marshall’s system, the same role as that of the genetic variations in Darwinian theory.

Marshall is the guy who made famous the demand and supply “scissors”. In the very short-run, price is set by the level of demand because supply is perfectly inelastic. In the long run, though, value comes close to the cost of production, as the classical school thought, because supply approaches perfect elasticity.

Marshall recognized that there were forces acting to increase the size of firms. They were of two kinds: internal economies and external economies. The former include efficiencies associated with large-scale production, mass advertising and so on. The latter result from the expansion of the relevant industry or from economies experienced by supplying industries. He attributed business cycles to the mismanagement of money and credit. He thought they were exceptional; the normal state of the economy approximates equilibrium. He believed in the quantity theory of money. All in all, his importance is that he systematized and popularized neoclassical thought—and communicated a few important insights in the process.

Arthur Pigou. Marshall's student. He was a welfare economist, which means that he acknowledged, with Marshall, the existence of market failures and thought that governmental intervention could correct them. Interpersonal comparisons of utility, he thought, are possible, and he based his theories on this Benthamite assumption. He distinguished between the private costs and the social costs of the production and sale of a commodity: the former are those borne by the producer, the latter those borne by the society. The problem is that social costs are sometimes greater than private costs. (For example, smoke from a factory is a social cost.) Whenever this is the case, the government should intervene. Taxes and subsidies are desirable if they encourage industries with increasing returns to become larger and discourage industries with decreasing returns from becoming larger. However, since Pigou thought (with Say) that savings are all channeled automatically into investment, he warned against taxes that might threaten savings, such as property, estate, and progressive income taxes. Redistributions of income are also risky, in that they might diminish incentives for investment and thus hamper economic growth. In general, "the output of the economy is maximized when private net product and social net product are equal, and costs are best allocated when marginal private cost equals marginal social cost". (Whatever that means.)

Sunday, August 13

Going home for a week.

Mellow. Looked at pics of Rachel McAdams online and now have a crush on her. That damn tender mood where you want to do nothing but sit with a girl while listening to music. (Paul Simon's "Homeless" is playing right now.) It's amazing how hard it is to meet people in this world.

Another thing: I love the female voice. Love it love it love it. "Of all the arrows in Cupid's quiver...."

Monday, August 14

I finished *The Great Gatsby*. *C'est un roman magnifique*. One of my favorites. A masterpiece that's also a page-turner! Who'd have thought! I want to write about it like I did with Marquez's book, but I'm tired after the trip home and then to Bob and Betty's. I think I'll read critical essays and then write my own.

2046 succeeds in expressing "Casta Diva" cinematically. I want to express it in writing. I want to write a story that evokes a casta-divan mood.

Detachment

Drippingly rain cuts the dirt
darkening it dissolving it
running it off into the splashed streets
sadly beneath absurd rubber tires
and the sky is white with the passed storm
and I am white with detachment

The Lento from Dvořák's "Spring" quartet.

Sublimity

To think that all this pain is for the sake
Of nothing but a succulent vagina!
How I do flatter those ugly little things!
And why?! These poems, these feelings, these white thoughts!
I'd feel ashamed were't not that—women want *cocks*!

Memory

The purple trails of my sluggish tears,
streaks to my chin,
red-faced bursts of burnt flowers in my eyes—
my lemon-stung eyes cry for you, darling.
Acid visions blurring; love-stained spring dresses twirling,
hair-twined daisies spinning, air perfumed with feminine laughter
fresh as the dew-scented sun.
The warm coconut-milk of your feet spills gently
onto the trampled daisies, which drink it up like flowers.
I want to see you, darling, once more, before you
leave—but you have left. I left your funeral
because I heard you talking to me, quietly like
the drumming rain. And in the shade
I saw you, a raspberry I wanted to pick,
to ingest and live warmly forever in your eyes
—they were blue like sapphire-berries and I
loved them.
(More lavender bursts of memory.)
Picnicking under apple trees,
pears redolent of lovemaking in apple-strewn meadows,
lips and lips kissing earth-ground blanket
naked as the clear sky,
flushed with cheeks breathless in their hot love
and desire ripe as female breasts.
Soft and comfortable your lap like a bed of honeysuckle.
No rain, no sorrow, no regret was there...
no tears and there was no time.

The 4th movement of Mahler's 5th symphony. And Schumann's Romance Op. 28 No. 2.

Wednesday, August 16

Anti-Comte.— Polytheism is more civilized than monotheism. Egypt, Rome, Greece and the other polytheistic civilizations never fought wars for the sake of religion, as Christians, Muslims and Jews have. Instead they fought for the more sensible motive of acquiring territory and wealth. They lacked the moralistic fanaticism of the Judaic tradition, probably because (a) it's hard to associate a single morality with a heterogeneous community of gods and (b) these gods, perpetually misbehaving, aren't great role-models, as are Allah and YHWH and Jesus Christ. They're reflections of humanity and its weaknesses, and

so to fight for the sake of spreading their creeds would be senseless. Polytheism is therefore more humanistic, rational, life-affirming and—ironically—peaceful than monotheism.

3:00 a.m. While lying in bed waiting for sleep (usually if I try to compose a short poem I fall asleep faster) I wondered what I was going to do with my life. Teach philosophy?? I've never been able to see my interest in philosophy going beyond the level of a hobby. To adopt a career teaching it seems impossible. And then suddenly I had an epiphany: I'll study politics. Something related to politics. Maybe international relations. I'll finish my UMSL degree and then put philosophy behind me. Living a life of philosophy would be idiotic: philosophy's dead and the world is in crisis. I can't revolve around myself. I have to try to make the world an easier place to live in. Fighting conservatism would be more satisfying than teaching philosophy. Besides, studying international relations (or whatever) would give me a broad array of possible career-paths. And it would give me opportunities to actually *take part* in the world.

The book on Latin America had a hand in this.

Thursday, August 17

Also, it'll give me an excuse to read economics, history, sociology and politics. It'll be a way to organize and justify my empirical interests. I'll always read philosophy, literature and psychology for their own sake—and write them too—and transmit whatever insights I have to posterity, but it's harder to justify economics and political history as hobbies, since they're preeminently practical. If I'm going to study them I want to have an immediate and practical pay-off.

In other words, having a career in international relations would be not only spiritually but intellectually satisfying, for two reasons: it would help me impose order on my interests, and it would allow me to indulge my interests without a bad conscience. For example, suddenly I'm motivated to do what I've wanted to but haven't been able to justify to myself: finish reading Howard Zinn's book. And totally immerse myself in history.

Sunday, August 20

Reading *The Affluent Society*.

Wednesday, August 23

Reading *Necessary Truth: A Book of Readings* on the *a priori* and the analytic-synthetic distinction. I might write my thesis on this stuff.

I ought to have written a book by now. Any kind of book. I'm 25!

Here's my dilemma: on one hand, I'm interested in pure theory (in all areas) but deplore its practical irrelevance; on the other hand, I'd like to work for concrete solutions to real problems but deplore the corresponding lack of intellectual stimulation.

I'm taking Ethical Theory (text: *Moral Discourse & Practice*, edited by Darwall, Gibbard and Railton), Philosophy of Language (supplementary text: *Philosophy of Language: a contemporary introduction*, by William Lycan), and Philosophy of Science (*Philosophy of Natural Science*, by Hempel, and the anthology *Scientific Inquiry*, edited by Robert Klee). I'm TAing two classes.

I will say this about Moore: he's easy to read. Also, the hyperbole in my statement "G. E. Moore, of course, was barely a thinker at all" was a little *too* hyperbolic. He had a certain meek originality, a weak forcefulness of thought.

I'm worried that my journal will be destroyed in the nuclear war.

Sunday, August 27

At Jason's party last night I drank too much, got a little sick. Around 3:00, he, his roommate and I went to some creepy guy's apartment and snorted coke. Four or five lines each. It felt like an extreme version of Ritalin and I wasn't entirely a fan. Made me jittery, sobered me up right away and gave me more self-confidence/carefreeness. But coming down from it wasn't pleasant; it took a few hours, during which I was very hungry but not at all, very tired but not at all, and had that annoying jittery feeling in my chest. I doubt I'll do coke again. Drugs aren't worth it—except insofar as they teach you to appreciate being happy and healthy after they wear off.

Courtship is such a ludicrous hassle. I'm courting a Chinese girl named Lin I met two days ago. Lovely sweet girl. Our conversations are fun and all, but there's no getting away from the constant game of manipulation. Even when I'm being perfectly natural and myself, I'm being manipulative. I always have to anticipate her reactions, judge how best to make a good impression, generalize from experience with other girls, make her think I like her but not too much, be diplomatic but not too much....

Here's one of the many parallels between Marxism and Meadism: "Human society, we have insisted, does not merely stamp the pattern of its organized social behavior upon any one of its individual members, so that this pattern becomes likewise the pattern of the individual's self; it also, at the same time, gives him a mind, as the means or ability of consciously conversing with himself in terms of the social attitudes which constitute the structure of his self and which embody the pattern of human society's organized behavior as reflected in that structure. And his mind enables him in turn to stamp the pattern of his further developing self (further developing through his mental activity) upon the structure or organization of human society, and thus in a degree to reconstruct and modify in terms of his self the general pattern of social or group behavior in terms of which his self was originally constituted." (*Mind, Self, and Society*, p. 263) Social being determines consciousness more than vice versa, but there is nonetheless a dialectical interaction. (If you'll ask, with Hume, how there can be a causal relationship between things that are logically implied in each other—namely, social being and consciousness—I'll answer, first, that that's a misleading way of framing the issue, and second, that Marx's claim can be made more convincing by being made more precise. The character of one's social activities influences the character of one's 'inner life' (thoughts and emotions). If, for example, there's a social hierarchy in one's society—say, a caste system, as in India—one will internalize this system and come to interpret the world and organize one's life along hierarchical lines. Only with a supreme effort can one mentally rebel against the system, and even in that case one has already been decisively influenced by it (and will, moreover, surely never be rid of certain prejudices). It's true that thoughts etc. are logically implied in activities, but since activities are not *merely* thoughts—they're also physical forms of life, unconscious internalizations of the environment, responses to the other, and so on—they can causally influence mental life in the long run, more than vice versa. This isn't just a terminological dispute, by the way. Social being is a broader concept than consciousness: it includes societal activities, structures, institutions and patterns, and, to an extent, the ways they react upon the individual's psyche. Therefore, if social being can be structured differently than in capitalism, consciousness can be different than it is in capitalism—and with a different consciousness will follow different ways of 'being social', which will themselves further influence consciousness, etc. *ad infinitum*.)

Gone are the days when a thinker could write a book that would have an impact on society.
Unfortunately I still crave fame.

Wednesday, August 30

In the last week my historical consciousness has become stronger than ever and I feel like I've lost my ideals. I can't get myself to do anything, because I know how transient and meager it would be. I've lost my curiosity too. You could say I'm in a kind of despair.

(A person who wants greatness won't settle for anything less, and sometimes ends up doing nothing.)

I'm leaning towards philosophy again. I thrive on ideas, not on empirical (political or economic) research.

I plan to read a shitload about the philosophy of language this semester so that my final paper can be of some value.

Monday, September 4

Got Searle's anthology *The Philosophy of Language*, A. P. Martinich's anthology of the same name, Juan Roederer's *The Physics and Psychophysics of Music: An Introduction*, Peter Isard's *Globalization and the International Financial System: What's Wrong and What Can Be Done*, and Downing Thomas's *Music and the Origins of Language* (a study of Enlightenment thought). (I actually wrote 'Doubting Thomas' first, without knowing it.)

I'm finally writing a book that will sum up all my 'wisdom.' This time I won't quit. I'm going to get this thing published.

Tuesday, September 12

The unfortunate thing is that I can never stand to reread anything I've written.

Wednesday, November 8

I think I might actually end up being *somewhat proud* of this book!

[Deleted entry.]

Sunday, February 18

Wow, I was about to complain about people again, having forgotten that my last entry had been the same kind of thing. Damn. But it's true: I can't stand ordinary life. Ordinary people are fine in small doses, but if you live with them it sucks. There's nothing *to* them. They're fucking robots. If only I could meet a girl I could read poetry with!—or read my poetry to, or discuss philosophy with, or just sympathize with.

Monday, February 19

Fuck this shit. Fuck the world, fuck life, fuck ambitions. Fuck everything and everyone. Fuck friends too, friends are shits, little fucking dishonest selfish shits. Fuck television, fuck the internet, I'm

sick of fucking relying on email to stay interested in life, I'm sick of fucking jerking off every night to porn, [...]. Fuck drugs, fuck hopes, fuck writing, fuck poems, fuck Yahoo Personals and the bitches who use it, fuck philosophy above all, fuck this whole goddamned world and every piece of shit in it. Except music. Music is the one thing I've never cursed and never will curse, I couldn't fucking live without music.

The older I get, the harder it is for me to cope with the fact that there are rapes, murders, tortures going on somewhere every minute of every day. And starvation, disease, suffering of all kinds. Sometimes I just sit here and imagine it. And I can't do anything about it. Except—donate money. I'm going to start doing that more (more than my measly MoPIRG donations). I'm starting with the 'sponsoring a child' thing—in Uganda, a little girl named Sylvia.

It's terrible to be powerless as the likes of George Bush rule the world.

Saturday, February 24

Heavenly love

Ribbons of eroding moss sinking from the sky
 down upon white lily-petals of cloud,
 snowy ferns rainbow-flowing,
 rain-feathers brushing my warm cheek to your blushing
 lips.
 Rushing, snow-melting streams of woman's body
 meet my open soul, drench my open heart,
 pool in my palms (cupped openly) from which I sip
 as breathing wintry air.
 Your soul-puddle ripples in my hands.
 I drink you, drink your liquid hair, your liquid eyes,
 your snowy breasts and moss-soft skin,
 and slowly together we dissipate skyward—
 earth-memories evaporating.

Eternal streams of stars engulf the night, swallow
 the world; there we hover blackly, stilly.
 There we hover.

Monday, February 26

Reading P. F. Strawson's book *The Bounds of Sense: An Essay on Kant's Critique of Pure Reason*. (The only course I'm taking this semester is on Kant. Also I'm writing a thesis on the mind-body problem; my advisor is a douchebag Gen-Xer functionalist with idiotic scorn for Kant named Gualtiero Piccinini—I can't stand him with his academic smugness, so I inserted a few jabs at his functionalist "lack of common sense" and his idols Dennett and Armstrong *et hoc genus omne* in the rough draft I gave him four days ago. The result was that he wrote this:

I've read your paper. I'm sorry to say that it is not what you were supposed to do. The reason why I asked you to write an outline is precisely to avoid this kind of situation.

The main problem is, I do not detect any significant original contribution made by your paper. It reads as a very basic, and not entirely competent, discussion of emergence and the mind-body problem, with a few (mostly unsupported) opinions expressed here and there. You like to refer to "this age of philosophical shallowness", but this piece is considerably shallower than the work of the authors you criticize.

You said you were going to criticize the O'Connor model of emergence on the grounds of an elaboration of Kim's arguments. That seemed like an entirely worthwhile and feasible project. Now you say that you are no longer interested in that, but you haven't replaced that with a different project. You have simply resorted to expressing your opinions about a wide range of subjects, without offering any in-depth discussions or arguments.

Before we discuss how to proceed, perhaps I should ask you again whether you actually want to write a real philosophy M.A. thesis. If not, we shouldn't waste each other's time. If yes, we need to go back to searching for a suitable project. If you still want to work on emergence, we can talk about whether there is anything salvageable in this paper.

Best,
Gualtierio

So then I wrote this:

Yeah, I had a feeling you wouldn't like it, since you seem to have functionalist sympathies. Unfortunately you appear to have read it quite uncritically - perhaps just skimmed it - given that you've written off the whole thing without paying any attention to its arguments. Admittedly, the arguments can be rather dense at times, such that if one doesn't pore over them it may seem as if nothing is being expressed at all; nevertheless, that's wrong.

Actually, it's mind-boggling to me that you think there are no arguments in the paper. Did you even read it? The whole point of having a thesis advisor is presumably to work with someone who will critically examine one's arguments and suggest improvements; instead, you sweepingly throw them all aside - ad hominemly label them "opinions", as if that itself constitutes a philosophical argument - and triumphantly declare that I have to start all over again - without giving any indication whatsoever that you have engaged with the paper or adhered to the "principle of charity" that academics always preach to their students but rarely respect themselves.

Perhaps you take too personally my contempt for the contemporary verbose perverseness that passes for philosophy. So I'll reassure you that I fully respect you and your fellow academics. You're doing your thing as best you know how. But what I dislike is the smugness that is manifested in the injunction to "do it my way or not at all!" - to be as tedious and unproductive as other philosophers these days. It strikes me as unfair that you should penalize me for being 'existentially committed' to philosophy (and hence writing in a somewhat personal and dense style) rather than treating it as a verbal game, like most people do. My writings are more intuitive than discursive, which is probably why professors have trouble understanding them. (And yes, *that* is what is at issue here, much as you may deny it.)

On the other hand, I suppose you're right, insofar as you're the voice of the system (which demands that one play the academic game, go through the right channels and so on): it does seem as if no "committee" would approve of my paper. It isn't tedious enough or derivative

enough. (Its original topic, which you so loved, was totally derivative: it consisted of applying some other thinker's arguments to another person's paper. How would *that* permit of originality and creativity on my part? It would be just a meaningless little game that neither contributed to knowledge nor assuaged my philosophical curiosity.)

Well, I guess I'm fighting a losing battle here. You're right: I do have to write a piece of derivative crap in order to complete this Master's program. I tried that and it didn't work, but now that I appreciate your narrow-mindedness I'll try it again. So....back to the drawing-board, I guess. This time I'll make a supreme effort to adhere to my original topic, i.e., to be as uninteresting as possible. I won't fail you this time, I promise. I'll have an outline within a week.

Best,
Chris

That was fun.) So far it isn't bad—quite illuminating at times—but some of Strawson's criticisms of Kant are asinine. It enrages me when he makes objections I disagree with, when he casually dismisses whole portions of the *Critique*. There are problems—'incoherencies'—involved in the idea of the noumenon, but Strawson attacks other things that, as far as I can see, don't deserve to be attacked. Anyway, there isn't the slightest possibility I'll read the whole book. Skipping ahead, I see that most of it consists of belabored masturbation.

By the way, I wrote my book and sent queries to agents and no one has responded, so now I'm hoping to build up credentials by being published in journals. For three weeks I've been submitting poems to magazines across the country.

Also reading volume one of H. J. Paton's commentary on *Kant's Metaphysic of Experience*. Excellent.

Sometimes I think that *stupidity* is the main source of the world's ills. Mere stupidity. Hitler was *stupid*, because prejudice is stupid. Obsession with making endless amounts of money is just plain senseless. Fanaticism is foolish, no critical thinker can be a fanatic. Radical thinkers like Marx are fond of saying it isn't the people themselves but the *system* that is at fault; however, if the people weren't morons, the system couldn't manipulate them in the ways it does. Most conformism is made possible by a lack of critical thought.

That interpretation is simplistic, though.

But just to illustrate the level of stupidity that is overtaking the world (as if it needed illustrating): there's a new gameshow on Fox (where else??) called "Are you smarter than a fifth-grader?", in which middle-aged contestants have to answer questions like "What is a pronoun?"—Ugh, am I really a citizen of this country??

Tuesday, February 27

You're curious about the paper, aren't you? Okay, here it is, as far as I got before the bureaucrat nixed the project. [I've edited it a little and added a pat conclusion.]

Emergentism, a Partial Solution to the Mind-Body Problem

The mind-body problem—which Jaegwon Kim characterizes as the problem of "finding a place for the mind in a world that is fundamentally physical"¹—has been puzzled over for centuries, and is unlikely

¹ Quoted in Barbara Montero, "Post-Physicalism," *Journal of Consciousness Studies*, Vol. 8, No. 2 (2001): pp. 61-80.

to be resolved any time soon. The reason is that apparently every possible solution has inadequacies. Anyone familiar with the philosophical literature is aware of all the problems with Cartesian substance dualism, reductive physicalism, eliminative materialism, behaviorism and functionalism, non-reductive physicalism and emergentism. One is tempted to agree with Colin McGinn that the cognitive apparatus of humans is intrinsically inadequate to the problem of explaining the relation between the mind and the brain.¹ How something like consciousness can emerge from something like the brain seems totally inexplicable.

I suspect that *complete* understanding of the mind-body relationship is impossible, just as it is impossible with respect to the hypotheses of quantum mechanics and general relativity. “Formally”—mathematically, conceptually—we may be able to understand the latter theories, but “intuitively” they’re a mystery to us. We can’t visualize the worlds they describe, worlds of eleven dimensions or multiple universes or a finite but unbounded cosmos. Our possible experience is bounded, as Kant argued; we cannot intuitively conceive of indeterministic physical structures or of space in anything but three dimensions. Similarly, understanding the exact causal relationship between the brain and consciousness may, for whatever reason, be beyond our cognitive horizons. However, it might be possible to reproduce the reality in some sort of vague conceptual sense, by means of such concepts as, e.g., emergence, downward causation, and so on. These concepts are somewhat mysterious and will probably remain so, but if we can use them in a “solution” more plausible than any alternative—perhaps by removing their apparent incoherence—then we might be justified in supposing that we have gone some distance towards understanding the mind-brain connection.

In fact, I think that some version of the emergentist approach is the only possible quasi-solution. Nothing else is remotely plausible, as I’ll briefly argue below. Unfortunately, as it stands, emergentism is not yet a polished theory. This will be evident as I look at a couple of recent proposals on how to conceptualize it. I choose Roger Sperry’s version as well as the version put forward by Timothy O’Connor and Hong Yu Wong in their paper “The Metaphysics of Emergence”; I have found their defenses of the theory to be fairly sophisticated.

O’Connor has criticized reductive accounts of consciousness, which propose that consciousness “really is” something else, something physical. He rightly notes that they are deeply counterintuitive. “The claim that ‘token’ mental states—i.e., particular, concrete mental occurrences—just are complex electrochemical events (which just are complex microphysical events) implausibly denies that there is anything distinctive about mental activity in the world.”² Consciousness cannot be something other than *what it is*, namely thoughts, sensations, phenomenal experiences, etc.—not neurons firing. Consciousness is private, while physical, electrochemical events are (at least in principle) publicly observable.

Indeed, any theory that tries either to “eliminate” consciousness or to reduce it to something else—something public, be it physical states, behavior, functional roles, or whatever—flies in the face of incontrovertible intuitions. Despite the efforts of such sophists as Daniel Dennett³ and Richard Rorty⁴ to deny that there are qualitative, phenomenal, private or first-personal aspects to experience, it remains *intuitively* evident that mental experience has to be characterized in mental language, because it is private and qualitative. Phenomenal experience cannot be adequately described in anything but phenomenal language, and the same is true of intentional experience. No other sort of language, such as that of physics, does it justice, or is true to what we perceive.

Consider functionalism. Functionalists define (types of) mental states in terms of their functional roles, thus effectively denying the importance of the state’s private features, be they phenomenal or

¹ See Colin McGinn, “Can We Solve the Mind-Body Problem?,” in *The Nature of Consciousness: Philosophical Debates*, eds. Ned Block, Owen Flanagan and Güven Güzeldere (Cambridge, Mass.: MIT Press, 1997), pp. 529–542.

² Timothy O’Connor and Hong Yu Wong, “The Metaphysics of Emergence,” *Noûs*, Vol. 39, No. 4 (1990): p. 660.

³ See, e.g., his article “Quining Qualia,” in Block et al., *The Nature of Consciousness*, pp. 619–639.

⁴ See his paper “Mind-Body Identity, Privacy, and Categories” (1965). He argues there that sensations don’t exist, and that the only reason we think they do is that to eliminate talk about them from our language would be “impractical.” In other words, when he feels pain he doesn’t feel pain, but it’s useful to talk as if he does.

intentional. In his article “What is Functionalism?”, Ned Block writes that “according to functionalism, the nature of a mental state is just like the nature of an automaton state: constituted by its relations to other states and to inputs and outputs. All there is to....being in pain is that it disposes you to say ‘ouch,’ wonder whether you are ill, it distracts you, etc.” By reducing the mental (the private) to something else, functionalists try to eliminate the mind-body problem. David Lewis, for example, writes that “The definitive characteristic of any (sort of) experience as such is its causal role, its syndrome of most typical causes and effects.”¹ But he is wrong: types of consciousness cannot be defined in a non-circular way, a non-mental way. The definitive characteristic of pain is not that it tends to cause a certain behavior, but simply that it hurts. The definitive characteristic of pleasure is that it feels good. In a deep sense, *consciousness is private*, and one cannot define (or “adequately describe”) the private in terms of the public. This is the essence of the “explanatory gap,” the essence of the mind-body problem—which can also be called (and *should* be called, for clarity’s sake) the private-public problem. Functionalists and behaviorists (and eliminative materialists, reductive physicalists, etc.) try to solve the problem by eliminating the private or reducing it in some way to the public, but they fail because there is manifestly a private realm of experience with its own *sui generis*, “first-personal” properties and features. None of the verbal legerdemain of contemporary philosophers has been able to get past that simple fact.

Frankly, I have never been able to understand how someone can be, say, a functionalist. Or a reductive physicalist. Does this person not have sensations? Is he not conscious? Is he a “philosophical zombie”? Can he not see that only *he* has the ability to perceive “from the inside” what is going on in his own mind, what thoughts and sensations he is having? To say that “*all there is* to being in pain is that it disposes you to say ‘ouch’....,” or that pain is *nothing but* a series of neuronal firings, is to deny that pain is qualitative and private. But this is to deny pain. –In order to recognize the falsity of functionalism (and reductive physicalism), it isn’t necessary to be an expert in analytic philosophy. One needs only a bit of rational common sense.

In short, O’Connor is right that the mind-body problem cannot be solved—cannot even be *formulated*, i.e., recognized as a genuine problem—unless one has first acknowledged that mental life is irreducible to publicly observable properties, be they physical, functional, or behavioral. But by acknowledging this, one has already thrown out the majority of proposed solutions to it. (Of course, they couldn’t be solutions anyway, because they amount to a denial that there is any problem at all. For if consciousness “just is,” e.g., electrochemical activity, then there isn’t a mind-body problem after all! That leaves it a mystery, though, as to why philosophers have thought for four hundred years that there is.) The correct theory has to be non-reductive. That leaves only substance dualism, some form of non-reductive physicalism more sophisticated than functionalism, or emergentism (which can in fact, I think, be considered a version of non-reductive physicalism).

It has long been recognized that substance dualism is problematic. The notion of two fundamentally different kinds of substances, which have nothing in common yet somehow interact, is virtually incomprehensible. Its explanatory advantages, if there are any, are far less compelling than its disadvantages. So it has rightly been discredited.

All that’s left is some sort of physicalism that acknowledges the “non-physical,” and in general the non-publicly observable, properties of consciousness. As I have said, this rules out functionalism. For, while functionalists admit that mental properties (such as painfulness) are not identical to physical properties (such as C-fiber stimulation), they think that the former *are* identical to *functional* properties (such as causal roles). But this cannot be true. Mental properties, like mental particulars, are private, or immediately accessible only to the consciousness that experiences them, whereas the property of fulfilling a causal role can be exhaustively analyzed and understood through public language. In other words, there is nothing it is “like” to be a cause or an effect as such, while there *is* something it is like to be in pain. Pain, then, cannot just be a cause of so-and-so and an effect of so-and-so; there is something more to it than “its syndrome of most typical causes and effects.”

¹ David Lewis, “An Argument for the Identity Theory,” in his *Philosophical Papers Vol. 1* (Oxford: Oxford University Press, 1983).

Another candidate is Donald Davidson's anomalous monism. Insofar as Davidson adopts the Spinozistic position that a mental event is simply a physical event described in mental language, and vice versa, without explaining precisely what that means and how it can be possible—how, that is, a private, mental event can be identical to a public, physical event—his monism is unsatisfactory. It is incomplete. To be plausible, a physicalist theory (such as Davidson's) has to do more than just say that a mental event is “also” a physical event. It has to give a precise account of the relation between physical (public) and mental (private) aspects.

Now, only one theory that I know of has offered such an account. That is, only one theory promises to explain *in what sense* a neural event is also a private mental event. It is the only theory that accommodates our Cartesian intuitions while explaining in what way they are wrong. In fact, if one accepts that consciousness is private (subjective, intentional, qualitative) but also that it somehow arises out of the brain (which is *not* private in the same way, but in principle publicly observable—e.g., during surgery or under the microscope), this theory is all that's left. It has to be accepted; it is the only explanation.

The theory, as I've said, is emergentism. There is more than one version of it, but common to every version, at least implicitly, is the idea that an event in consciousness can be considered from two perspectives. The first is the perspective from which neurologists consider it, namely as consisting of a series of neuronal firings and electrochemical processes. From this neurological viewpoint, what is looked at is the *aggregate*, the “series,” of physical processes that “correspond to” the conscious state. The processes are atomistically “summed up,” so to speak: “first *this* happens, then *this*, then *this*....” A given state of pain or pleasure or whatever is considered as being a particular series of electrochemical events.

The other perspective is *holistic*. The neural events are considered together, as mutually contributing to some “larger” state. This holistic state, the *unity* of all the events in their interactions, is precisely the conscious event.

“Holistic” interactions are ubiquitous in biology. The cell is an obvious example. Each cell is constituted by molecules and molecular processes; in a sense it can be reduced to nothing else but these molecules. And yet it is also its own entity, an entity distinct from its micro-level constituents, possessing its own causal powers. (It can interact with other cells, for example.) Holistically, all the molecular events on which it supervenes interact to produce this new thing, the cell, which has causal powers that are not just the sum of the causal powers of its constituents (considered in themselves, isolated from their cellular environment). And so the cell is *emergent*.

But what exactly does that mean? The relevant definition of “emergence” is a matter of some controversy. There is a consensus, though, that various definitions have to be distinguished from each other. In the weakest possible sense, emergence is virtually ubiquitous: wherever there is a physical structure that has properties not possessed by its “micro-level” constituents in themselves, there is emergence. The mass of an object, for instance, is not an emergent property, even in this weak sense, for it is merely the sum of the masses of its constituents. By adding up the latter, one arrives at the former. The shape of a wheel, on the other hand, is emergent, in that it depends on a specific arrangement (or set of possible arrangements) of the particles that constitute it. In this incredibly weak and uninteresting sense of emergence, everyone is an emergentist. As J.J.C. Smart, a reductionist, puts it, “in saying that a complex thing is nothing but an arrangement of its parts, I do not deny that it can do things that a mere heap or jumble of its parts could not do.” “Smart admits,” writes Tim Crane, “that objects can have properties and powers which their parts do not have. But this doesn't mean that these powers or properties are not reducible to the powers or properties of the parts. The very most it means is that the properties need not be reducible in the ‘additive’ sense.”¹

It is worth noting that even in these cases, there is, or there can be, a kind of downward causation. (The notion of downward causation—i.e., of “causal influence from the macroscopic to the microscopic levels of nature [such that] how things are at a higher level of complexity affects what happens at a lower level”²—is typically thought to be a defining feature of emergence.) Consider Roger Sperry's example of

¹ Tim Crane, “The Significance of Emergence,” p. 8.

² *Ibid.*, p. 15.

a wheel rolling down a hill.¹ The properties of the wheel broadly supervene on the properties of the molecules within the wheel, and yet the former are able to influence the latter. For, while the downward motion of the wheel doesn't cause "reconfiguration" of the wheel's molecules *relative to one another*, it does reconfigure them relative to the rest of the world. At one moment a molecule is at a particular location relative to the grass; at the next moment it is at a different location. Thus, there is a kind of downward causation: certain properties of the macro-structure determine certain ("relational") properties of the micro-structures.

The example of the biological cell is a little different. The cell is a living thing that actively plays a role in its environment, by excreting and "ingesting" molecular structures. Likewise, inside the cell are constantly occurring coordinated chemical processes. These processes are not purely random and accidental, as in the case of a non-living thing; they are tightly controlled, carefully "monitored" by means of unfathomably complex communicative mechanisms between all the molecular structures involved. The mechanisms and all the activities they regulate are ultimately caused by one factor alone: the holistic character of the system, the "web of interactions of the whole system"² itself. They are caused, that is, by the emergent structure (the cell) itself. This isn't efficient causation; it is something that is harder to grasp conceptually. Something like "structural" causation, in the language of the Marxist Althusser. The efficient cause of a given cellular event is, of course, some other cellular event, some micro-level event or series of events. But all these events happen only because their totality constitutes an emergent entity, a holistic system (or structure) that itself makes possible the events, by organizing them in the way they're organized. The properties of the whole, the cell, supervene on what is happening at the level of its constituents, but what is happening there is brought about through the "holistic" influence of the system, the cell.

All this is rather obvious, but it's hard to conceptualize. It reminds one of the "chicken or the egg?" dilemma. You can't have the cell without its constituents and their interactions, but you can't have their interactions without the organizing principle that is the cell. Each factor, in a way, seems to cause the other. No wonder, then, that Jaegwon Kim, in his article "Making Sense of Emergence," doubts the coherence of this reflexive variety of downward causation:

How is it possible for the whole to causally affect its constituent parts on which its very existence and nature depend? If causation or determination is transitive, doesn't this ultimately imply a kind of self-causation, or self-determination—an apparent absurdity? It seems to me that there is reason to worry about the coherence of the whole idea.³

What ensures the logical possibility of this sort of downward causation is that it is not quite the kind of causation Kim has in mind in the quotation. It is not efficient (in Aristotle's sense); it is not even on the same order of causation to which the question of whether it is "transitive" can be applied. Instead, it is "structural": its causal influence is manifested through the micro-level states in (the totality of) which the holistic structure consists. Structural determination is, indeed, manifested in every cellular event. What this means is that the web-like structure of the "web of interactions" is ultimately responsible for the overall pattern of the interactions. To put the point paradoxically: the web-like structure is responsible for itself.

But not even *this* kind of emergence is the kind directly relevant to the mind-body problem. I have discussed it mainly to show that philosophers' attacks on the notion of emergence are misguided. Roger Sperry is right that emergence abounds in nature, and that it in no way contradicts the causal closure of physics or is a totally mysterious property. An emergent structure's downward causal influence occurs through the activity of the micro-constituents themselves. "Microdeterminism," writes Sperry, "is not so

much refuted or falsified as it is supplemented.”¹ That’s why physicists and biologists have rarely felt the need to invoke the concept of emergence to explain an event: physical events can be explained “reductively,” so to speak, even as the reductive explanations would literally have nothing to explain were the phenomena to be explained not embedded in a holistic environment. This environment is what makes the phenomena possible. Holism, or emergence, is a *philosophically* necessary concept, though not, in most cases, a *scientifically* necessary one, inasmuch as scientists can get empirical results simply by focusing on the individual chemical and physical events through which emergence manifests itself.

To explain consciousness, however, it is necessary to invoke a stronger and more mysterious kind of emergence. The type I’ve been describing—the type manifested in the cell—is, I suspect, essentially what Mark Bedau has in mind in his paper “Weak Emergence,” as when he writes “[emergence] involves downward causation only in the weak form created by the activity of the micro-properties that constitute structural macro-properties.”² He contrasts his conception with O’Connor’s stronger version, which he thinks is inexplicable or “magical.” I’ll look at O’Connor’s conceptualization shortly, but first I want to explain what motivates it. That way we’ll be able to understand it better, and also what’s wrong with it.

First let’s recall the intuitive attractiveness of dualism. “The irreducibility of conscious experience and self-determining action already commits one to a kind of dualism, a duality of physical and conscious properties.”³ But this dualism is not of the typical non-reductive physicalist sort, according to which mental features are in some unexplained way “realized in,” while supervening on, physical processes. Rather, “the dualism we must accommodate is ontological.”⁴ We cannot just sidestep our intuitions, which are dualistic in a robustly ontological way. Functionalists and their ilk are inclined to do just that (i.e., to ignore intuitions), but the result is necessarily an unconvincing philosophy. What we have to do is find a middle way that avoids the extremes of substance dualism and reductionism of any sort, the first of which falls victim to logical puzzles and the second of which falls victim to both logical puzzles and irresistible intuitions.

In this age of philosophical shallowness, it is useful to keep in mind exactly why Descartes postulated dualism in the first place. In his *Meditations* he wrote the following:

On the one hand I have a clear and distinct idea of myself, in so far as I am simply a thinking, non-extended thing; and on the other hand I have a distinct idea of my body, in so far as this is simply an extended, non-thinking thing.There is a great difference between the mind and the body, inasmuch as the body is by its very nature always divisible, while the mind is utterly indivisible. For when I consider the mind, or myself in so far as I am merely a thinking thing, I am unable to distinguish any parts within myself; I understand myself to be something quite single and complete. Although the whole mind seems to be united to the whole body, I recognize that if a foot or arm or any other part of the body is cut off, nothing has thereby been taken away from the mind....

He recognized that consciousness is partless or “non-structural,” unextended, unlike the physical objects of our experience. This means that it cannot be composed of physical things, as the cell is. Instead, it has to be emergent in some way. But its “emergence” is very different from the cell’s structural emergence: while the cell is indeed a new “thing” with its own emergent causal powers, it is not a new *kind* of thing. But consciousness is.

I said above that consciousness can be analyzed from two perspectives, viz. the physical and the non-physical. The former is the scientist’s approach when he considers consciousness as a series of neuronal firings and other electrochemical events. His approach is the “additive” one, the atomistic, non-holistic, aggregative one. As far as he is concerned, action potentials and excreted neurotransmitters and so forth are

¹ Quoted in O’Connor, “Emergent Properties,” p. 24.

³ O’Connor, “Groundwork for an Emergentist Account of the Mental,” *PCID* 2.3.1 (October 2003): p. 4.

⁴ *Ibid.*

the building blocks of consciousness. He is not entirely wrong. For, while consciousness is not “made out of” them in the way that a cell is made out of molecules (i.e., structurally), when they interact together in a single holistic state they “produce”—or, from the holistic perspective, they *are*—a given conscious state, like pain. The *neural impulses* are not the mental state, but the holistic, emergent totality of their interactions is. This totality can and should be considered a physical phenomenon and, in a sense, a neural one. However, its privacy, and its intentional and qualitative features, distinguish it from apparently every other physical phenomenon in the universe; and this is the sense in which we are committed to dualism. Not *substance* dualism, though, because it is misleading—indeed, meaningless—to call consciousness a substance. Such terminology serves no purpose; it only propagates misunderstandings. Nevertheless, what we are confronted with is a kind of dualism, involving a phenomenon (consciousness) that can be analyzed from both physical and non-physical viewpoints, or additive and holistic viewpoints. —This is the only plausible way to conceptualize consciousness. Whatever difficulties it gives rise to, the greater difficulties of every conceivable alternative make the emergentist approach the most appealing.

No doubt Colin McGinn is right when he says that, insofar as emergentism doesn’t conceptually explain how the brain can give rise to consciousness, it is unsatisfactory. It leaves the mystery of how the subjective can possibly come from the objective mysterious. No amount of philosophical elaboration on the theses of emergentism can overcome that fact. It does no good, for example, to adopt Roger Sperry’s line:

Instead of following the usual approaches that tried to inject conscious effects into the already established chain of microcausation, the logical impasse was resolved by leaving the microcausation intact but embedding it within higher brain-processes having subjective properties with their own higher-level type of causation, and by which the embedded micro-events are thereafter controlled.

...[E]xcitation of a cortical cell is enjoined into the higher dynamics of passing patterns of cognitive activity. A train of thought with one mental thought evoking another depends throughout on its neurocellular physiology and biochemistry. Nevertheless, like molecules in passing waves in a liquid, the brain cell activity is subject to higher-level dynamics which determine the overall patterns of the neuronal firing, not relative to other events within this particular brain process, but relative to the rest of the organism and its surroundings.¹

However true those ideas may be, they leave the basic mystery of the mind-body problem unsolved. They don’t help to bridge the gap between the private and the public. Nevertheless, it would be wrong to reject emergentism for that reason. For it isn’t as though the emergentist says *nothing*. His theory is not totally uninformative. While it cannot resolve the intuitive paradox of the mind’s emergence from matter, no other theory can either. But its advantage over other theories is that it acknowledges its limitations, unlike, say, functionalism, which in effect—by denying the significance or existence of the “private” dimension of experience—pretends that the basic mystery doesn’t exist.

I have not yet said very much, however, about what the theory entails. Unfortunately this question is not easy to answer—precisely because the relationship between consciousness and the body is difficult to understand. Consciousness is emergent, but does that mean it exerts downwardly causal influence on the electrochemical processes that are responsible for it? The cell’s emergence is characterized by downward causation, but consciousness is not a structural entity. It is partless; it is not composed of molecules but rather of awareness, intentionality and qualia, which, as O’Connor notes throughout his work, are non-structural phenomena. So if it exhibits downward causation, it must do so in a different way than the cell does. But what way is that? And if it doesn’t, is it not then epiphenomenal? How could mental states have causal powers if not by influencing the neural states on which mental states are known to supervene?

¹ Quoted in O’Connor, “Emergent Properties.”

Let's look at this question more carefully. A mental state, I have said, is a neural state—a “radically emergent” one, but a neural state nonetheless. So, when saying that it “supervenes” on neural states, what I am really saying is that it supervenes on neural events considered *additively*, as individual firings of neurons and particular interactions between neurons. In other words, the macro-level holistic state supervenes on the micro-level neural events. (An (imperfect) parallel is the cell's supervenience on molecular processes.) Both “levels” consist of neural events, but one is holistic while the other events are “additive.” Given the causal closure of physics, it is through this series of micro-level events that any causality is manifested. The *holistic* neural event (e.g., a particular sensation of pain) cannot be the direct mechanistic cause of a succeeding event (such as the act of removing one's hand from the fire), because all mechanistic, physical causation operates through individual “micro-level” neural events. There has to be this micro-causation.

Admittedly, it is conceivable that the act of removing the hand from the fire was “overdetermined,” in that it was caused *both* by a chain of neural events *and* by the sensation of pain, but this hypothesis is philosophically unattractive. It is uneconomical and counterintuitive. Kim rightly rejects it in his paper “Making Sense of Emergence.” It's implausible to think that an event has two independent causes that operate at the same exact time. One cause does all the work necessary.

Similarly, it's absurd to say that the mental state somehow directly causes the neural events on which it supervenes. This form of downward causation is incoherent. It is literally senseless, for it entails causal circularity.

So then are mental states epiphenomenal? Are they mere side effects of underlying neural processes, possessing no causal powers of their own? O'Connor tries to avoid that conclusion in “The Metaphysics of Emergence.” He provides the reader with an elaborate diagram meant to show the (probable) relationship between mental states and neurophysiological events, according to which diagram a given mental state is the result of a complex array of neural events and mental states that somehow “work together” to produce the state in question. “As a fundamentally new kind of feature, [an emergent state] will confer causal capacities on the object that go beyond the summation of capacities directly conferred by the object's microstructure. Its effects might include directly determining aspects of the microphysical structure of the object as well as generating other emergent states.”¹ Thus, an emergent state (says O'Connor) can be responsible for another emergent state as well as for the microphysical events on which such states supervene.

In his paper “Emergent Individuals” he describes his position as follows:

Since the....emergent states themselves will help to produce similar subsequent states—possibly resulting in a complex, stratified range of such states—the microphysics alone will *not* determine these later states. Likewise, emergent states will work in tandem with the underlying *micro*-states to determine later micro-states, manifesting a sort of “downward” causation. Hence, the existence of emergent states is contrary to the assumptions of much contemporary metaphysics and philosophy of mind, assumptions which typically include the truth of some fairly strong mental-physical supervenience thesis and the causal closure of the microphysical realm. Neither of these assumptions will hold if there are emergent states as here defined.

This conclusion itself makes O'Connor's position unattractive and implausible. For scientists have accumulated no evidence to suggest that physics, or the microphysical realm, is causally incomplete. But there is another reason to reject O'Connor's ideas: they entail causal overdetermination. If micro-states *and* emergent states determine micro-states, then Kim's old objection is relevant again: the “activity of the emergent property” seems “redundant.”² Consciousness cannot *directly* determine a micro-state, in the way

¹ O'Connor and Wong, “The Metaphysics of Emergence,” p. 665.

² *Ibid.*, p. 670.

that prior microphysical events determine it. Sperry had already rejected such a theory when he rejected the attempt to “inject conscious effects into the already established chain of microcausation.”

Indeed, I find Sperry’s conceptualization more plausible than O’Connor’s. Sperry acknowledges the causal closure of physics: on his version of emergentism, as I said, “microdeterminism is not so much refuted or falsified as it is supplemented.” The way it is supplemented, argues Sperry, is similar to the way it is supplemented in the case of the cell: while the cell’s properties supervene on the properties of its constituent molecules, the latter properties are diachronically determined by the holistic state of the cell. Its overall state in a given moment determines (through molecular processes) the molecular processes in the succeeding moment, on which processes supervenes the cell’s “overall state” in that moment, which determines (through the micro-level events) the molecular processes in the next moment, etc. Similarly, it’s plausible to suppose that “individual nerve impulses and other excitatory components of a cerebral activity pattern are simply carried along or shunted this way and that by the prevailing overall dynamics of the whole active process”¹—dynamics that are integrally related to the emergent neural states that are the mental states supervening on the nerve impulses in question. Precisely what the relation is between these “overall [cerebral] dynamics” and the conscious states is unclear—Sperry himself seemed to identify the two—but it’s likely that as neurophysiology progresses, that question will become less mysterious.

Experiments have shown, for example, that dogs that cannot feel pain willingly stick their snouts into fire and casually withdraw them. In general, a creature that doesn’t feel pain acts differently from one that does. So sensations appear not to be epiphenomenal. It is plausible to suppose, then, that consciousness as a whole is not epiphenomenal. The question is *how* it isn’t. How does it interact with neural events, and how does it determine an individual’s behavior?

Such questions, in fact, bring us to the controversy over “free will” and its meaning. And here we are in a philosophical quagmire from which there is, in all likelihood, no escape. From the perspective of natural science, acts are determined by biological processes; from the perspective of the self, acts are determined by desires and reasons. Can these perspectives be reconciled? One is deterministic, the other not. According to one, there is no place for “self-control”; according to the other, there is. It is hard to see how such opposed viewpoints can be made compatible with each other. Either consciousness and the self have causal power or they don’t. The biological sciences at least implicitly deny that they do (because the sciences reject attempts to “inject conscious effects into the already established chain of microcausation”), whereas our self-experience at least implicitly affirms that they do. And both frameworks for interpreting ourselves seem to have irresistible power. So we appear to be at an impasse. It seems both obvious and impossible that consciousness is epiphenomenal.

It is possible, though I think unlikely, that sometime in the future scientists and philosophers will find a way out of these paradoxes. For now, though, we are compelled to invoke the wisdom of Aristotle: as philosophy begins in wonder, so it ends in wonder.

*

Yes, I know, too ambitious and a little disorganized. But it was a rough draft.

Piccinini suggested I take two extra courses and drop the thesis (which was worth two courses). It’s a good idea. (In his reply he wrote, like, one sentence.)

February 28

Taking a Plato course now—it’s refreshing to get back to basics—and a course on “computer ethics”.

¹ Sperry, quoted in “Making Sense of Emergence,” p. 26.

Gorgias 482d to 486d—Callicles’s speech. Nietzsche could have stolen from there his ideas on masters and slaves. “With dialectics the masses always end up on top”, or however it goes. N.’s defense of the Sophists, his criticisms of Plato and Socrates, etc.—Callicles (i.e., Plato himself) anticipated it all. – And scholars swoon over Nietzsche like he was the most original thinker in history.

His “revaluation of all values” was essentially a return to the common sense of the ancients. That’s all it was. Just a sophisticated defense of what had been the received wisdom for millennia. (Obviously he himself knew that. It’s his fans who lack historical perspective.)

Oh Socrates, what a sophist you were!

What Mozart’s death was to classical music, Tupac’s was to pop culture.

March 1

I doubt that my paper on values will get published, so I’m putting it here. (I wrote it last semester.) The professor gave it an A-, and he ignored my emailed request for comments or criticisms.

[*Years later I posted most of it on my blog, with this prefatory note appended:* Back in my twenties, when I wrote this paper, I was consumed by philosophy, jumping from topic to topic in an effort to answer an implausibly wide range of questions. Unfortunately, my writing wasn't always "polished"; it was intuitive, dense, rough, difficult to read, not nearly as discursive and diffuse as that of most academics. So it was rarely publishable. The excerpts below from a long paper on values are an example. They're in the anti-"objectivist" spirit of [these simpler thoughts](#). I hadn't read J. L. Mackie's classic *Ethics: Inventing Right and Wrong*, but, in retrospect, my arguments were broadly in agreement with his. There are no "objective truths" about values, about which values are right and which wrong, which good and which bad. People can have whatever values they want: they can believe Hitler and Stalin were *good*, and they aren't "wrong"—except in relation to other values, such as being compassionate, not killing millions of people, etc. There is no such thing as (literal) "evil," a remnant of theology: *objectively bad* is as meaningless as *objectively good*. We're dealing with subjective reactions here, subjective orientations toward a given object; the universal mode of experience according to which the value we assign to something *actually inheres objectively in it* is mistaken. Beauty, ugliness, goodness, magnificence, badness, and other such values are things we subjectively project into something; they aren't there independently, even though it may seem when you look at a beautiful face or painting that its beauty is objectively given, so to speak, just as objective as the measurements between features or the various colors that strike the eye. We think of the serial killer Jeffrey Dahmer as somehow *bad in his essence*; but in reality he was just someone who had a taste for killing and eating people, as others have a taste for gardening or growing their own vegetables or playing tennis or whatever. It is we who assign the negative value to Dahmer's activities, as we assign a positive value to, say, a medical doctor's activities. There would be nothing incoherent or objectively wrong about reversing the value-judgments: we're free to value whatever we want. It so happens, fortunately, that the vast majority of people share common intuitions about what is good and what is bad, so we all agree Dahmer was bad. But the only *genuine content* of our judgment is that *we don't like* his behavior. Our judgment has an "objective" form ("*He was...*"), but really we're mostly saying something about ourselves, not him.

[In fact, the fundamentals of how we experience the world are mistaken. One might subsume them all under the category "objectivist fallacies." Our brain constructs our experience on the basis of a wealth of sensory information that it organizes according to innate and acquired schemata, principles/rules of perception, cognition, emotion, aesthetics, and so on. This is the central lesson of the brain sciences and psychology. "In itself" the world is an incomprehensible, colorless mess of elementary particles, electromagnetic waves, atoms and molecules built up into larger structures, sound waves, dark matter and dark energy, infinitely many things zipping around, colliding, attracting, etc. Out of this welter of confusion, the brain constructs our ordered experience. (Evidently all our brains operate in virtually the same ways, since we all have virtually the exact same perceptual experiences. We're genetically almost identical to each

other, with variations around the edges.) Our experience of the world is more immediately our experience of our own minds, the perceptual, cognitive, and emotional architecture of our minds. Thus, when you emotionally or aesthetically react to something—like when you react to a person in some context, your reaction is a function of your mood, your expectations, the impressions you've already formed from previous encounters, whether he or she reminds you of other people you've known, etc. There may be *some* validity to your judgment—for example, insofar as others would agree with you—but ultimately it reflects *you* as much as the other.

[We interpret things as being *out there*, but in a sense they're really "*in here*." Here's a mundane example: sometimes if I'm reading a passage really fast I see a word as such-and-such, like, say, 'cautious.' But then I reread it and I see it's really 'caustic.' I remember having *actually seen* the word 'cautious,' but now that word has suddenly turned into 'caustic.' And I'm made vividly aware of how completely the brain *constructs* everything I experience. I thought the word was *out there*, on the page, but it's really *in here*, in my mind—as, indeed, is the page itself, the page as I perceive it, along with all other objects. The world *as it is in itself* doesn't have a white page with black marks on it; it has only the entities that physics postulates. (As you can see, I'm a scientific realist, a position that strikes me as common sense. See also these reflections.)

[Anyway, in the excerpts below I go into some detail about the nature of values and their lack of objectivity. I also discuss the nature of reason, in part because that topic, too, was obsessing me but also because I thought it bore on the question of values. Specifically, questions about practical reason, as opposed to theoretical reason, bear on values, on action, and on justifying or criticizing courses of action. When and how can we criticize someone for acting irrationally or holding irrational values/desires? What does that mean? In brief, I argue that a person's values can be irrational *only in relation to each other*; for example, it's irrational for me to value Donald Trump's presidency if I also value democracy, compassion, and the well-being of humanity. In that sense, practical irrationality is possible (contrary to what David Hume thought). A person can also demonstrate *theoretical* irrationality by denying a sound chain of reasoning, for instance, or deriving a conclusion through a faulty chain of reasoning. (Actually, I think this is also a type of practical irrationality, inasmuch as everyone fundamentally values, whether they know it or not, logic and the idea of being correct; so they're acting in contradiction to this more basic value by disregarding logic in a particular instance.)

[There's a lot of lengthy, and doubtlessly excessive and repetitive, probing of various issues, such as the falsity of realism about values, the consequent semi-meaninglessness of value-judgments, the notion of "psychological consistency" (as distinguished from strict logical consistency) that I introduce to explicate practical irrationality, the nature of action, Kant's ethics and why they're wrong, and, at the end, certain implications of my arguments.

[Just one more anticipatory note: the reason I say value-judgments are half-meaningless is that their 'objective,' 'representational' linguistic form contradicts their actual content, which is really the statement that the object elicits a certain reaction in the speaker. "The painting is beautiful" isn't a wholly meaningful statement; more meaningful would be to say "I find the painting aesthetically pleasing" or something like that. The latter focuses attention on the main point of the utterance, namely the speaker's subjective response; the former statement pretends that something called "beauty," whatever that may be, is *in the painting*, an essential quality of it. The very word 'beauty,' like 'good,' 'bad,' and all other value words, isn't wholly meaningful, being an illusory reification or hypostatization of a subjective reaction. You can spend hours thinking about the word 'beauty,' reflecting on it, introspecting, intensely contemplating it, trying to get clear on exactly what it means, what it *is*—"because it's so abstract, you see!"—but you won't get very far. The problem isn't its abstractness; the problem is its contradictory fusion of subjectivity and objectivity—a state of mind reified into a supposedly objective thing, a thing whose essence it is to cause that particular 'admiring' state of mind. No such thing exists; the very idea of it is meaningless.

[More generally, platonism is wrong, though a rather psychologically natural philosophy.

[In short, we're all walking around utterly deceived about the true significance of an enormous range of our experiences and judgments. The very phenomenology of our experiences deceives us. The human mind was made to deceive itself. We ourselves are not what we think we are, as I've argued

elsewhere; we are not substantial selves. The Buddhists are right about that. The external, mind-independent world isn't what we think, objectively full of colors and smells and tastes and sounds; it is the exotic world of physics and chemistry, not the world of our brain-constructed experience. It's as if Descartes' famous "demon" is systematically deceiving all of us about almost everything—except the demon is just the human brain, deceiving itself, so to speak.

[I hope you find some of the following at least mildly thought-provoking—not to mention decipherable.]

The Meaning of Norms and Values

The concept of normativity presents a number of philosophical problems. For example, what is the relation between values and norms? Are there objective norms, objective values? What does that mean? *What is* normativity, and *what are* value-judgments? What do they really mean? Is there an important difference between norms of reason and other kinds of norms? What is the difference between practical and theoretical reason? Is it possible to be *motivated* by *reasons*? If so, how? If not, what are the implications? Are moral values part of the “fabric of the universe”, or are they purely subjective? If they are, does that vitiate morality? –The list goes on and on. The sheer number of questions might seem daunting, quite aside from their intrinsic difficulty. Nevertheless, in this paper I'll try to answer many of them.

If that seems over-ambitious, I would respond that the answers to such questions are necessarily interrelated; any thinker, therefore, who wants to answer *one* question—with any thoroughness—must answer many. On the other hand, undertaking such a systematic endeavor in one paper means that the arguments will at times be sketchy.

1. Preliminaries

What kinds of norms are there? *Prima facie*, there are moral norms, aesthetic norms, social norms (including norms of etiquette and the like), norms of contemporary science, epistemic norms, norms of reason, and so on. It's worth noting that scientific and epistemic norms (and norms of social science, of philosophy, of psychology, etc.) are actually norms of reason in disguise. That is, they are supposed to be derivable from the basic rules of reason as applied to distinct states of affairs and types of truth (be they psychological, philosophical, scientific or whatever). It seems, then, that there are but four major normative categories: moral, aesthetic, rational, and social, by which I mean all the myriad rules about how, in light of propriety, it is appropriate to act in certain situations.

Normative judgments are expressed through the words ‘ought’ and ‘should’. They are prescriptions. As such, they are closely related to values. One cannot prescribe something without thereby valuing something. Every prescription is, in fact, either a kind of restatement of a value-judgment¹ or based on the consideration that the prescribed thing is the means to an end (or *constitutive of* an end²). By ‘restatement of a value-judgment’ I mean something like ‘the “flip-side” of a value-judgment’. For instance, “One ought not to lie” is, in a sense, another way of saying “Being honest is better than lying”. By saying the former, you commit yourself to the latter; and by saying the latter, you commit yourself to the former. This is shown by the fact that if someone said “Honesty is better than lying” but followed that up with “Nevertheless, I don't think people should be honest”, you would surely accuse him of inconsistency. You would say he was contradicting himself, in that he expressed disapproval immediately after expressing approval. And you'd wait for an explanation from him. If none was forthcoming, you'd say he was being irrational.

¹ In most contexts in this paper, by ‘value-judgment’ I mean a statement in the form of “So-and-so is bad [or good, etc.]”, not a statement like “I approve of such-and-such”.

² For example, “say that my end is outdoor exercise; here is an opportunity to go hiking, which is outdoor exercise; therefore I have reason to take this opportunity, not strictly speaking as a means to my end, but as a way of realizing it”. See Christine Korsgaard, “The Normativity of Instrumental Reason”, p. 215.

Evidently the reason a particular prescription is associated with a particular value-judgment is that they both express approval (or disapproval) of the same object. In themselves—i.e., without adding a middle premise—they aren't *logically* related, but the middle premise is supplied so automatically by speakers that statements like the two in my example are treated as if they logically entail one another. Hence, someone who asserts one and denies the other is seen as irrational, insensitive to logic. Strictly speaking, though, he is simply denying the premise that one ought to do whatever is good; and if he denies the premise, he is logically free to deny the conclusion (in this case, that people shouldn't lie). It would, therefore, be better to say he is acting in a *psychologically* self-contradictory way, so to speak, rather than in a *logically* self-contradictory way. For he is being inconsistent in his attitude towards honesty: he approves of it and disapproves of it at once.

To take another example, suppose I exclaim, upon seeing Michelangelo's *David*, "This is beautiful!"—but then proceed to smash it into bits with a sledgehammer. You will probably call me irrational, not because I have done anything *logically* 'self-contradictory' but because my mental states are flagrantly inconsistent with each other. In less than a second, after all, I went from extreme approval to extreme disapproval. That this still strikes us as an example of irrationality (even though nothing *logically* inconsistent has been done) shows that practical rationality involves not only respecting logic and induction but also being *psychologically* consistent. If you approve of a given object, such as a sculpture, unless you act according to what are generally thought of as the psychological implications of your attitude of approval, you will justifiably be called irrational.

Perhaps, though, there is a way to assimilate this sort of irrationality to logical inconsistency. Perhaps people implicitly assume that everyone accepts the middle premise in any given case—for example, that one ought to do whatever is good (and so, if one believes that being honest is good, then, on pain of logical inconsistency, one has to believe that people should be honest). This is plausible. Nevertheless, in principle it's possible that someone could deny the middle premise and so deny the conclusion. And yet it still seems to us that he would be acting irrationally. This shows that, at least with respect to *practical* reason, mere logical (and inductive) consistency is not the only relevant factor.

I'll return to these thoughts when I discuss practical reason in depth. For now, my point is, first of all, that particular value-judgments are tied to particular prescriptions (and vice versa) via the relation of psychological consistency. 'Prescriptive (or normative) implications' of a value-judgment are, first and foremost, psychological implications, though they can be made logical *per se* by supplying one or more missing premises. Secondly, one way of being irrational is by violating psychological consistency. Insofar, then, as someone doesn't adhere to the prescriptive implications of his value-judgment, he is being irrational. If I have as an end financial success but don't take the means to achieve my end, I am to that extent being irrational—because I am being psychologically self-contradictory.

It is misleading, and probably incorrect, to say (as some philosophers do) that by having an end, I have a *reason* to take the means to my end. To speak of a 'reason' here is superfluous and wrong. Rather, *just by virtue* of having some end, I implicitly posit 'prescriptions', or 'regulations', on my behavior. Or, to make the point in broader terms: insofar as I value something, I posit corresponding norms (which can be 'psychologically derived'¹ from my value-judgment) to regulate my behavior. These norms are psychologically implicated in my value-judgment. If I flout them, I am being inconsistent with myself and hence irrational.

It seems, then, that we already have a preliminary answer to the question of what explains normative force—i.e., the question of what normativity means, of what 'ought' signifies and where its force comes from. At least with regard to value-judgments that one makes oneself, one ought to respect their prescriptive implications just to the extent that one values *rationality*. Exactly what rationality is will be the subject of a later section, but it's clear that it involves, at the very least, basic self-consistency. One's attitudes, beliefs,

¹ I'll discuss later exactly what that term means.

acts, values and so on cannot be explicitly mutually self-contradictory—in either a logical or a psychological way¹—if one is to be properly called ‘rational’.

2. A digression into the philosophy of language

Before continuing, I should clarify some things about value-judgments. From what I’ve seen, ethical theorists haven’t appropriated the lessons of recent philosophy of language: most of them still speak of value-judgments as if they were not context-sensitive—as if they were a more or less homogeneous mass. ‘Something is either a value-judgment or it isn’t; there is no in-between.’ Such an approach is wrong. Different utterances display different degrees of ‘valorization’ or ‘de-valorization’. For the sake of clarity, we should distinguish between the various classes.

First of all, some statements that seem to be value-judgments are actually pure (non-evaluative) ‘descriptions’ in disguise. They are based on an (implicit or explicit) application of a given set of criteria to an object; and they are true if this object satisfies the criteria. For instance, suppose I say, “Parmigianino’s painting *Madonna with the Long Neck* is a good example of the Mannerist style of art”. Certain criteria define, however vaguely, the school of Mannerism; insofar as Parmigianino’s painting exemplifies these criteria, the statement is true. In fact, while it superficially seems to be a sort of value-judgment, in that the word ‘good’ is central to it, the statement is not really such. It can be rephrased as “*Madonna with the Long Neck* typifies Mannerism”, and this is clearly not a value-judgment. Any such statement, therefore, we can ignore.

As for utterances that include an element of (de-)valuing *per se*—that is, a conceptual element of approval or disapproval—some should be considered value-judgments and others shouldn’t. Some are primarily evaluative and some are primarily descriptive. But there is no clear separation between the categories; there is a ‘merging’ between the class of description and that of full-blown valuing. This may seem counterintuitive, since we’re in the habit of thinking that declarative statements are *either* value-judgments *or* neutral descriptions (depictions of states of affairs). But the fact is that we have to rely simply on our linguistic intuitions in deciding whether a given utterance is ‘primarily’ evaluative or ‘primarily’ descriptive. We have to ask the question, “Is the intention that’s expressed in this utterance mainly to convey approval or disapproval, or is it to convey *information*?”. That is, “Can this utterance be rephrased using entirely non-‘evaluative’ words without suffering a loss in its essential content?”. If the answer is affirmative, then the utterance is not a value-judgment.

I’ll give examples in a moment, but first I want to note that the *context* of utterance is very important. The same sentence uttered in one context may express a value-judgment while in another context it doesn’t. Whether it does depends on the conditions in which the speaker utters the sentence.

It will be useful here, as I said, to borrow some ideas from the philosophy of language. A sentence is said to have an invariant “semantic content”, a linguistic content that does not vary across contexts. What this content is may in any given instance be a matter of controversy, but no one doubts that it exists in some form. Scott Soames has written a paper called “The Gap Between Meaning and Assertion”, in which he argues that semantic content should be understood as “least common denominator”: it’s “what is common to what is asserted by utterances of any given sentence in all normal contexts in which [the sentence] is used literally” (p. 4). What he means by “normal contexts” needn’t concern us here; the point is that what is asserted by a particular utterance of, say, “It’s raining” has something in common with what is asserted by all other possible utterances of that sentence, provided it is uttered literally. This is surely an uncontroversial claim.

So there is a “least common denominator”, an invariant content, to any given sentence understood literally. There are also, however, such things as “conversational implicatures” and “conversational implicatures”,² which embellish the bare-boned, basic linguistic content of an utterance. The notion of

¹ As will be seen (and should be clear already), psychological consistency is the broader category. Logical consistency is merely the most obvious aspect of it.

² See Kent Bach’s paper “Conversational Implicature”.

conversational implicature was analyzed by Paul Grice and J. L. Austin decades ago; an example would be my statement “It’s raining” in response to a friend who says, “Let’s go for a walk”. In a sense, I have said simply that rain is coming down outside. More pertinent, though, is the implication of that basic statement, namely that we shouldn’t go for a walk because it’s raining. This implication is a proposition that is separate from what I have explicitly said (the explicit words), albeit more relevant to the situation than the brute observation “It’s raining”. Many speech acts exhibit implicature.

Conversational *implicature* is somewhat different. It doesn’t involve a separate, implicated proposition, but rather the *completion* or *expansion* of what is explicitly uttered. It is the contextually determined ‘filling in’ of an incomplete proposition.¹ Kent Bach gives some examples, with possible completions given in brackets: “That lamp is cheap [relative to other lamps]”, “Strom is too old [to be a good senator]”, and “The princess is late [for the party]”. Depending on the context, the phrases in brackets are appropriate—and *already implicit*—completions of what is asserted. There wouldn’t be a complete proposition without these ‘insertions’; and the only reason why the speaker/listener thinks that there is a complete proposition even in the absence of the explicit insertions (given in brackets) is that the latter are understood to be implicit. –The phenomenon of implicature is so ubiquitous that we scarcely notice it.

The reason it is relevant to my paper is that certain kinds of value-judgments exhibit features similar to the (particular forms of) conversational implicature that Bach analyzes. That is, whether a given sentence of this type expresses a value-judgment depends on the nature of its contextually determined “pragmatic enrichment”.² But these value-judgments don’t qualify as *implicatures*, since they are not separate propositions implicated by that which is explicitly uttered; instead, they’re *implicatures*, in that they’re implicit in the (saying of) the speaker’s utterance.

I’ll discuss these peculiar value-judgments in a moment. First, though, I want to point out that some sentences don’t exhibit this ambiguity: they’re *always* used to express a value-judgment (provided they’re spoken literally), no matter what the context is. Moral judgments are the best example. “Murder is wrong” always is (or expresses) a value-judgment; the statement cannot be adequately rephrased without articulating an attitude of disapproval, and in every context it articulates such an attitude. “Hitler was evil”, “Honesty is morally good”, “Theft is bad”—they’re always value-judgments. There is no ambiguity about it. Morality is the quintessential sphere of approval and disapproval—*absolute* approval and *absolute* disapproval—and as such is the quintessential sphere of valuing.

The status of (assertions expressed by utterances of) sentences related to aesthetics is more variable. Even here, however, certain words have unambiguous uses. The word ‘beautiful’ is always used to express a value-judgment. That is, the content of any assertion that predicates beauty of an object is essentially related to approval of the object’s appearance. The *point* of the assertion is to express approval. With ‘ugly’, the situation is reversed: the point of the assertion is to communicate disapproval. ‘Ugly’ means ‘not attractive’, ‘not (aesthetically) approved of’; the concept’s essence, therefore, is always evaluative.

But that isn’t so with ‘sublime’. This word can be used in different ways, with correspondingly different definitions implicit in the usage. Usually ‘awe-inspiring’ is understood as a satisfactory synonym for ‘sublime’, but it too has conceptual nuances that vary according to context. Sometimes it is used unambiguously to express a value-judgment, as in “Wow, that symphony was spectacular—magnificent—awe-inspiring!” In this case, the speaker’s intention is simply to articulate approval. But suppose I say, “The destructive power of that hurricane was awe-inspiring”. Is this a value-judgment? Not really. Rather, I am saying that the hurricane had great destructive power, that it caused a lot of damage. No valuing is involved

¹ Bach also describes another type of implicature, which “occurs when the utterance does express a complete proposition....but some other proposition, yielded by what I call the process of *expansion*, is being communicated by the speaker” (ibid., p. 2).

² Pragmatic enrichment involves body language, physical circumstances, the character of immediately past utterances, a background of presuppositions shared by the relevant actors, and other pragmatic (as opposed to semantic) conditions. (See Jason Stanley’s paper “Rigidity and Content” for the meaning of the term ‘background of shared presuppositions’.) Pragmatic enrichment is what makes it obvious that, say, a particular utterance of “It’s raining” is actually being used to communicate the thought that we shouldn’t go for a walk outside.

here. Or suppose I say, “I walked through a dense forest yesterday, a dark, dank place with overgrown vines twisting around the massive trees. And I thought, ‘This place is terrifying and sublime....’”. Here, ‘sublime’ means something like ‘otherworldly’, ‘unreal’. So that statement is not a value-judgment.

Aesthetic concepts can also be used in such ambiguous ways that it’s simply unknown—indeterminate—whether they’re being used to express value-judgments. Imagine that someone who has suffered terrible accidents while climbing Mount Everest says, with a wistful look and a voice that trails off sadly, “The grandeur of the Himalayas is sublime....”. Is this a value-judgment? Is the speaker saying that the Himalayan grandeur has some sort of *value*? He himself might not know. He has terrible memories of the time spent in that region—perhaps he lost a limb, or his friends—and he shudders to think of it, but at the same time he remains overawed by his memories of the Himalayan countryside. Part of him, then, doesn’t mean to express any sort of praise or approval of the Himalayas; he hates them, he hates even their majesty. And yet another part of him is irresistibly attracted to their majesty—loves it, admires it, wants to praise it as one might praise God. In the moment, he commits neither to one side nor to the other. The content of his utterance has a certain indeterminacy, such that any ‘after the fact’ attempt to make it more precise does violence to it.

Perhaps the reader will say that if the statement is in any way indeterminate, it isn’t complete—it isn’t a proposition. It’s just a ‘gesture’ at a proposition. For if its content isn’t completely precise, it can’t have a truth-value, which means it isn’t a proposition. And so philosophers need not take it seriously. –I must agree, however, with Saul Kripke: it may be that “the apparatus of ‘propositions’....break[s] down” in certain areas of philosophy.¹ It has led to apparently insuperable problems in the philosophy of language, of modality, of metaphysics in general; I think that philosophers would do well to experiment with unorthodox positions. In fact, I’m inclined to think that contemporary Anglo-American philosophy is misguided—that its valorization of symbolic logic and analytic methodologies has led it astray. While I can’t argue for all this here, I would suggest, first of all, that the law of excluded middle be discarded. Assertions need not be either true or false; their truth-value can be indeterminate. Indeed, with most assertions it is. What led Aristotle to formulate the law of excluded middle in the first place was his insight that declarative sentences implicitly posit their own truth—that their *form* admits of no possibilities but truth and falsity. In this sense, the law of excluded middle is obviously right. Declarative sentences have the form of positing truth-conditions; hence, they succeed in expressing a proposition when they succeed in positing genuine truth-conditions. But it doesn’t follow that every property predicated of something in fact either does or does not apply to that thing.² There can be truth-conditions without necessarily a truth-value to go along with them. After all, many (perhaps most) properties have an element of vagueness, such that the truth-value of the proposition in which they occur may be indeterminate. Likewise, certain *entities*—actually existing things—are ‘ambiguous’, as quantum mechanics has shown. Humanly understandable concepts do not apply to them. Also, assertions expressed by sentences the subject of which does not refer to anything existent—such as “The king of France in 2006 is bald”—seem to be neither true nor false, despite Bertrand Russell’s paper “On Denoting”.³ –In this paper, however, I am not going to embellish these claims, nor will I explore the implications of the repudiation of Aristotle’s law, because this would take me too far afield.

I want to return now to the issue of conversational implicature and its relation to value-judgments. Above, I mentioned cases in which words associated with aesthetics acquire slightly different meanings depending on the context in which they’re used. ‘Sublime’ and ‘awe-inspiring’ were my examples. In some contexts these words are value-laden, in that the speaker uses them mainly to express approval of the object—i.e., to attribute to the object some kind of value—while in other contexts they are value-neutral. But there is another category of words, a broader category, which comprises words that have firmly fixed meanings but also a conceptual ‘overtone’ of approval or disapproval. Their primary meaning is value-

¹ *Naming and Necessity*, the last paragraph of the preface.

² See John Dewey’s paper “The Sphere of Application of the Excluded Middle”, *The Journal of Philosophy* 26.26 (1929): 701 – 705.

³ For criticisms of it, see P. F. Strawson’s paper “On Referring”.

neutral, but in certain contexts their value-laden overtone has prominence over their value-neutral meaning, in which case the sentence in which they're embedded is being used to express a value-judgment. Examples are 'kind', 'cruel', 'weak', 'stubborn', 'sophisticated', and 'interesting'. These differ from 'sublime' and 'awe-inspiring' in that their (slightly more determinate) meanings are not primarily value-laden. 'Kind' means something like 'respectful of people's feelings', 'interesting' means 'attention-grabbing', etc. In themselves, the meanings aren't necessarily value-related. But over the course of time they have developed a natural association with being-approved-of or being-disapproved-of, such that now this derivative significance can, in an act of assertion, sometimes take precedence over the original meaning. When this happens, (a version of) conversational implicature is coming into play. If the word is, say, 'kind', its semantic content is still 'respectful of people's feelings', but its implicit association with goodness is now the motivation behind the speaker's assertion. The implication that kindness is *good*, and that the object of which it is predicated is therefore good, is the main force behind the assertion, its primary content; the fact that this goodness happens to take the form of respect toward people's feelings is less relevant. In other words, the brute fact that the person is respectful is less relevant than the fact that he is *good* for being respectful.

So, with regard to sentences like "He is kind", "He has a weak personality", "The floor is dirty", and "It's frustrating to talk to her"—i.e., sentences the relevant concepts of which can be understood sometimes as value-neutral and at other times as evaluative—the nature of the pragmatic enrichment in a particular context determines whether or not they are mainly value-judgments. Let's look at a concrete example. If I'm having a conversation with people who are effusively praising a certain person and I say "He's kind, too!", my statement is primarily a value-judgment, in that my intention is not to make the disinterested observation that he treats people with respect but rather to say that he's a good person for doing so. Now, the reader will perhaps say that this latter proposition—the proposition that he's a good person—is not *implicit in*, but rather *implicated by*, the proposition that he's kind, and hence that it's an example of conversational implicature rather than conversational implicature. In other words, he might say that an utterance of "He is kind" or "The floor is dirty" is, in itself, *never* a value-judgment, but instead can, depending on the pragmatic features of the context, *imply a separate* value-judgment. I think this is wrong, though. As I said a moment ago, I think that many words, whose basic semantic content is value-neutral, have nevertheless acquired an implicit association—even outside of any particular context of utterance—with either a positive or a negative value. The value is almost *logically implicit*: no matter in what context the word is used, it will retain its conceptual overtone of either goodness or badness. It seems, therefore, not quite right to say that in the above example, the utterance "He's kind, too!" merely *implicates* that he is good; rather, the proposition that he is good seems *implicit* in the proposition that he is kind. It is *fused* with it, more so than Grice's examples of implicature are 'fused' with the propositions that imply them. The implication, say, that you should close the window is not as intimately related to the utterance "The window is still open!" as the assertion that "He's good (because he's kind)" is related to the assertion that "He's kind!" in my example. —Admittedly, Bach's account of implicature is quite different from what I am calling 'implicature' here. Still, the phenomena he discusses have in common with the ones I'm discussing the fact that they are not examples of *logical* implicature. The relevant entailment-relations are merely '*conversational*'. So I think I'm justified in using the term 'conversational implicature', even if my application of the concept amounts to an *extension* of Bach's.

This paper, however, isn't supposed to be in the philosophy of language. Let's forego a detailed analysis of the linguistic niceties of utterances involving value-judgments. The only reason I've already spent so much time on them is that I'm arguing that, with the exception of moral judgments and propositions involving unambiguous words like 'beautiful' and 'ugly'—i.e., words the semantic content of which is precisely the attribution or denial of value to an object—philosophers cannot rightly speak of entailment-relations between propositions that *apparently* involve reference to value (such as "The painting is sublime") without considering the particular context (with all its pragmatic enrichment) in which the proposition is uttered. "The painting is sublime" might entail that the painting has value or it might not, depending on the context and the way in which it is uttered. Similarly with "John is kind", "James is weak",

and so on. Most of the time, what proposition is implicit in another cannot be ascertained in abstraction from the context of utterance.

This is true of judgments involving norms of rationality, too. When I say, e.g., that something or someone is irrational, am I thereby saying that it/he lacks some kind of value? Or am I merely claiming that, as a (value-neutral) matter of fact, he fails to live up to certain criteria by which we judge rationality? Again, the answer depends on the context and the way in which I make the assertion. Sometimes the answer will not be clear—it will be indeterminate whether I am attributing or denying value to the object—while at other times the answer will be obvious. (That is, the presence or absence of the relevant entailment-relation will be obvious.) Either way, the question is unanswerable in abstraction from a particular context.

—In retrospect, it may not have been necessary for me to write this section. But I think the ideas are interesting in their own right.

3. Value-judgments and reason

Given that a particular assertion attributes or denies value to something, what exactly does such an attribution or denial consist of? In other words, what is a value-judgment? It's useful to note that every value-judgment can be rephrased as "[The object] *has* [the value]". "The mountain is beautiful" = "The mountain has beauty"; "The theory is right" = "The theory has the property of truth". Every value-judgment ascribes a property to an object. "It is wrong to lie" means "Lying exhibits the property of moral wrongness". Value-judgments, therefore, cannot be merely 'disguised' emotive utterances like "Boo lying!" or "Yay for this theory!", as theorists like A. J. Ayer would have it.¹ In fact, any kind of noncognitivism faces the difficulty of having to explain how it is that value-judgments can be so formally similar to scientific propositions while not aspiring to objective truth. *Prima facie*, both kinds of statements exhibit truth-conditions; both, therefore, are implicitly meant to describe truth, reality. They both '*reach out for*' [or *represent*] a fact, a fact independent of the speaker's mere attitude or feeling. Lying *is wrong*, kindness *is good*. These statements can be rephrased using the word 'objectively' without any apparent violation of meaning: lying is (*objectively*) wrong. Noncognitivists may be right, say, that moral judgments involve accepting certain norms, or that they involve an expression of a certain state of mind, but it's counterintuitive to deny that they also aim for objective truth in the way that scientific assertions do.

Perhaps that position is controversial. It's significant, though, that people act as if their value-judgments—especially their moral judgments—are objectively correct. People are as committed to their moral beliefs as they are to their scientific beliefs and their religious beliefs—that is, their beliefs about the way the world objectively is. They're even committed to their *aesthetic* beliefs and values in that way. If you disagree with them that a certain song is beautiful they might well argue with you, try to convince you that you're wrong, as a scientist might try to convince you of a particular hypothesis. In more philosophical moods they might say that judgments of beauty are merely subjective reactions with no claim to objective truth, but they almost invariably *act* as if their aesthetic judgments are objectively true. And as I said, this reaction is even more pronounced in the case of moral judgments.

In his paper "Objectivity and Truth: You'd Better Believe It", Ronald Dworkin argues against moral skeptics who try to differentiate between two spheres of moral discourse, namely our ordinary, first-order, substantive judgments about which acts are right and which wrong, and the philosophical, second-order judgments about the claims to objectivity of the first-order judgments. Such skeptics deny that their arguments apply to the first-order judgments; their position is supposed to be neutral with regard to these. It's only the meta-level philosophical claims they want to contest—claims involving phrases like 'it's really true', 'it's true independently of us', 'it's objectively true'. In short, these theorists profess to be skeptical only about the possibility of objective moral truth, and they maintain that such second-order positions are logically separable from first-order moral discourse (which they want to leave untouched). Dworkin disagrees, though. He thinks that second-order judgments are merely reaffirmations of the first-order ones, and that therefore the skeptics are inadvertently attacking the latter by attacking the former.

¹ See his book *Language, Truth, and Logic*.

The most natural reading [of such claims as “My moral beliefs are really and objectively true”] shows them to be nothing but clarifying or emphatic or metaphorical restatements or elaborations of the proposition that [e.g.] abortion is wrong. If someone thinks abortion morally wrong, he might well say, for example, in a heated moment, “It is just true that abortion is wrong”. But that would be only an impatient restatement of his substantive position....¹

I mention Dworkin’s argument because it supports my own. Implicit in ordinary moral judgments is the positing of their objective truth.

Let’s assume, then, that value-judgments involve a claim to objectivity. To deny that would be to fly in the face of common intuitions as well as some fairly persuasive arguments.² In this respect, then, value-judgments are comparable to scientific hypotheses. So let’s look at the latter. Scientists believe that the most well-established hypotheses are universally valid, that they hold true for everyone because they hold true of reality itself. The truth of Darwinian evolution doesn’t depend on a person’s subjective reactions to it. Given its truth, scientists conclude that everyone *ought* to believe in it. Where does the ‘ought’ come from? Clearly by adding the further premise that people ought to believe true propositions. This premise, in turn, comes, via the mechanism of ‘psychological implication’, from the idea that it is good for one’s beliefs to be true. But at the moment, the relevant idea is that not only a scientist but *everyone* thinks that truth “lays claim to everyone’s assent”³—that it ought to be believed by everyone.

This is somewhat reminiscent of Kant’s idea that judgments of taste are universalizable, in that they make a claim on everyone. “In this respect, [they] are like ordinary statements of fact. Both are either correct or incorrect (‘valid’) independently of who makes the judgment (‘universally’).”⁴ Moreover, as Kenneth Rogerson points out, judgments of taste are, according to Kant, imperatival, just like judgments of morality and, as I noted in the last paragraph, judgments of what is true. In saying that something is true or moral or beautiful, we effectively demand that everyone agree with us. In fact, I think that in *most* cases, the act of ‘judging’ something has an imperatival element, in that we not only expect but ‘demand’ (implicitly) that others agree with us. Admittedly, Kant disagrees. He distinguishes between judgments of taste (and morality) and others:

...Many a thing may be attractive and pleasurable to him; no one cares about that; but if he declares something to be beautiful, he expects the very same pleasure of others, he judges not solely for himself, but for everyone, and then speaks of beauty as if it were a property of things. Hence, he says, the *thing* is beautiful, and does not count on others agreeing with his judgment of pleasure because they did so occasionally in the past; rather he demands this agreement from them. He censures them if they judge differently and denies them taste, which he yet demands they should have.⁵

His distinction, though, between attractiveness and beauty seems spurious. As far as I can tell, the difference between them isn’t of kind but of degree: in saying that an object is attractive I’m saying much the same thing as when I say that it’s beautiful, the only difference being that I’m a little less committed to the former assertion than the latter, because my ‘aesthetic admiration’ is more pronounced with respect to the latter. If my expectation/demand that other people (will) agree with me is less pronounced in the case of attractiveness, it’s simply because I’m less committed to the aesthetic worth of the given object than I am

⁵ Quoted in *ibid.*, p. 304.

if I say that the object is beautiful. I can, after all, intelligibly disagree with and argue against someone who denies that a given object is attractive, as if *demanding* that he agree with me; it's simply not very likely that I will, because the aesthetic worth of the object doesn't strike me with as much force as it would if I said that the object is beautiful.

The reason I harp on this is that I want to say that the imperatival element in certain assertions (in *most* assertions) comes partly from the form of declarative sentences themselves, which posit their truth and their own truth-conditions. Even when the speaker doesn't act as if he expects or demands that people agree with his utterance, I want to say that he has the linguistic 'right' to do so—that, given the necessarily truth-positing form of declarative utterances, it's perfectly natural for a speaker to hope that others will agree with his assertion. For the form of his assertion posits its objectivity—its truth independent of the speaker's attitude—and something that is objectively true is, as I noted a moment ago, thereby supposed by everyone to be a reasonable and virtually obligatory object of belief.

Before proceeding, I ought to return briefly to the point that Kant makes above about pleasure. He says that if I say something is pleasurable, I don't thereby expect or demand the same pleasure from others. My pleasure exists only for me; it isn't universalizable, as judgments of taste are. —First of all, I think he's wrong. If I judge something pleasurable and somebody disagrees with me, I may well get frustrated with him and say "How can you possibly disagree?! You don't think massages are pleasurable?! What's wrong with you?!" But insofar as Kant's point has plausibility, it is because saying that something is pleasurable is to say that it *gives me* pleasure. It is thus different from a statement like "It is attractive" or "It is beautiful", for these statements cannot be rephrased as "It gives me attractiveness" and "It gives me beauty". In short, the subjective, relativistic standpoint is *built into* the assertion that something is pleasurable. And yet even then we often demand that people agree with us that an object is pleasurable! (That is, we often 'universalize' our sentiments about what is pleasurable.) This fact is significant.

Part of its significance is that it supports one of my arguments, namely that implicit in the 'representational' form of assertions is objectivity and, ultimately, 'universalization' (a "lay[ing] claim to everyone's assent"). But there is also a psychological significance, which harmonizes well with the philosophical one. For the example above hints at a broader phenomenon, viz. that a person spends his whole life in essentially the infantile state of mind, according to which "everyone must be like me".¹ His experience is, naturally, the center of his world, which naturally leads him to interpret it—almost unconsciously—as the center of *the* world, at least the human one. People are, quite literally, self-centered; they therefore rarely understand people with experiences and traits substantially different from their own. And they unconsciously project their own attitudes and beliefs onto (into) other people. So it's predictable that they often call people irrational who disagree with them—for anyone who has the same experiences *they* have (e.g., the same experience of what a massage feels like) should apparently draw the conclusions *they* do (that massages are pleasurable). If they don't, it would seem that they are failing to make logical connections, draw logical inferences.

Thus, just as the nature of language commits us to the objective truth of many of our utterances, so the nature of experience implicitly commits us to the objective, 'universal' truth of our beliefs and attitudes. We may not recognize this on a conscious level, but our unconscious or half-conscious commitment to the objective truth and universal validity of our attitudes is revealed in the fact that we tend to get angry at, and treat as irrational, people who disagree with us. We treat it as a kind of imperative that others agree with us—albeit an imperative that is easily forgotten or ignored in social life, since life requires that we get along with people who are different from us. And while in the immediacy of social interaction we may not frown on mutual disagreement—may even encourage it—in the reflectiveness of solitude we may well have disdain for, or be bewildered by, people who don't hold our views on things. We will most likely consider them somewhat irrational.

But what is rationality? Earlier I made a few suggestions about it; but now it's time I addressed the question in more depth. Philosophers usually distinguish between theoretical reason and practical reason:

¹ See "Everybody Must Be Just Like Me", by Elizabeth Lloyd Mayer, in *Female Sexuality: Contemporary Engagements*, edited by Donna Bassin (Northvale, NJ: Jason Aronson, Inc., 1999), pp. 377 – 403.

the former is concerned with standards for seeking truth (about the way the world is), the latter with “rational standards that apply directly to conduct”.¹ Or, as Carl Wellman says, “practical reasoning is using and following practical arguments, arguments that bear fairly directly on practice, on the pursuit of goals and the choice between alternative actions”.² Despite the ambiguity of the words ‘fairly directly’, this formulation may seem clear enough. Theoretical reason relates to what *is the case*, while practical reason relates to what *ought to be done*. Nevertheless, several philosophers have argued that the distinction between the kinds of reason is illusory—or at least, not as important as one might think.³ Before continuing, therefore, we should clarify what we’re talking about.

Consider the question of whether to classify instrumental reason as practical or theoretical. The instrumental principle states that one ought to take the means to one’s ends; instrumental reason relates to the question of what are the best means to achieve a given end. The instrumental principle itself appears to qualify as practical reason, since no amount of word-twisting can reformulate it as an answer to the (theoretical) question of what is the case. Of course, one can say, “It is the case that people ought to take the means to their ends”, thus apparently assimilating the principle to theoretical reason, but this is pure sophistry. Edgley remarks, rightly, that the move fails because “answers of the sort ‘So-and-so ought to be done’ are not answers to the question ‘What is the case?’...”.⁴ But because it strikes us as irrational not to take the means to one’s ends, we are inclined to say that the instrumental principle is a norm of reason; and since it isn’t theoretical reason, it must be practical.

On the other hand, instrumental *reason* is surely a manifestation of theoretical reason, in that it answers the question “What is the case?” In order to bring about a certain state of affairs, logic and induction tell us that so-and-so has to be done. Value-judgments do not come into play here; we are asking only what causes will produce what effects. We are logically and inductively inferring conclusions from premises, and doing nothing else; we are asking what *is*.

Prima facie, then, there are two basic kinds of reason. So what is the connection between them? Let’s look at the instrumental principle more closely, since it is, so far, the only example I have given of practical reason. What is the source of its normativity? How can the principle that one ought to take the means to one’s ends have normative force? For, as Christine Korsgaard points out in her paper “The Normativity of Instrumental Reason”, the principle construed a certain way is an analytic truth. “To will an end just is to will to cause or realize the end, hence to will to take the means to the end. This is the sense in which the principle is analytic.”⁵ In other words, committing yourself to realizing an end logically entails committing yourself to taking the means. But if so, how can it make sense to *prescribe* that people ought to (try to) take the means to their ends? That follows tautologously from their commitment to their end. It’s like saying, “You should do what you are determined to do”, which sounds odd, to say the least. Korsgaard uses some verbal legerdemain to avoid the natural conclusion that the instrumental principle is not really normative, but I think she fails.

An example might highlight the paradox. Suppose I intend to rent a movie tonight but refuse to go to the video store. “I’m going to buy a movie,” I say to my friend, “but I’m not going to go to the store.” “Huh?” my friend says. He won’t think I’m being sincere, or else he’ll think I’m leaving out a piece of information. No matter how much I insist on my two contradictory intentions, he’ll think I’m just joking. The reason is that it’s *psychologically impossible* to commit oneself to an end without committing oneself to the means (the means, that is, that one knows one has to take). People never exhibit this kind of irrationality, unless, perhaps, they’re hopelessly insane.

⁴ *Ibid.*, p. 174.

⁵ Korsgaard, “The Normativity of Instrumental Reason”, in *Ethics and Practical Reason*, edited by Garrett Cullity and Berys Gaut (New York: Oxford University Press/Clarendon), p. 244.

The solution to the paradox is simple, though. The instrumental principle intuitively seems normative because we ordinarily have a loose understanding of the word ‘ends’. We take it to mean something like ‘things that one strongly desires’. On this understanding, it’s actually fairly substantive to say that people should try to bring about their ends, since what is being said is that they should try to bring about what they *strongly desire*. It’s psychologically possible for me to yearn for something while doing nothing to bring it about—but it also seems irrational. Understood in this way, the instrumental principle is both obvious and able-to-be-broken, which is what we intuitively want.

The question now, of course, is why it should be a requirement of reason that one do what one strongly desires. There is, after all, nothing analytic about *this* principle—and since ‘abiding by reason’ is supposed to mean ‘abiding by logic (or induction)’, it would appear that by violating this principle I am not violating reason. So perhaps the instrumental principle, understood in the vague way we usually understand it, shouldn’t be normative after all. –The way out of these difficulties is to acknowledge that practical irrationality is not a matter of violating only logic. As I said in the beginning, there is a kind of psychological inconsistency which is the true intuitive basis for the judgment that someone is being irrational. If I have explicitly conflicting attitudes (or values, beliefs, intentions, etc.), or I act in ways that imply that I have obviously contradictory values or intentions, I will be (justifiably) called irrational.

Clearly the notion of ‘psychological consistency’ is vague. Much vaguer than that of logical consistency. Its vagueness, however, is a strength of my account, because it mirrors the vagueness of our ordinary intuitions about when someone is being irrational. Suppose, for example, I’m sitting at home, bored, and I turn on the television. I start watching *Entertainment Tonight*, a show I’ve always hated. I know there’s nothing intellectually or emotionally redeeming about watching it, and I know I’m wasting time, and I know I should be working, and I’m not even really being entertained—yet I keep watching it, inexplicably. The question is, am I being irrational? There are plenty of reasons for me to turn the TV off and apparently none for me to keep it on—but is it right to say that by keeping it on I’m being irrational? One is tempted to say, “In a sense, obviously you are. After all, you’re not being motivated by reasons that you acknowledge *should* motivate you. But in another sense, you’re being rational. For you clearly don’t want to do work, and there’s nothing you’d *rather* be doing than watching TV, and apparently you just don’t care that you’re wasting time—and perhaps you actually are being a little entertained, despite your refusal to admit that to yourself. So you’re being both unreasonable and reasonable.” In this case, intuition hesitates. I’m being both rational and irrational—consistent with myself and inconsistent with myself. Obviously there is a part of me that does prefer to keep watching, as opposed to getting up and doing work; otherwise, of course, I would get up and do work. So in this sense I’m simply doing what I want to do, which means I’m acting rationally. But there is another part of me, as I said, that’s disgusted and so forth; inasmuch as I am acting contrary to the desires and reasons of *this* part, I am being self-inconsistent and hence irrational.

The same considerations apply to the example Korsgaard gives in her paper “The Normativity of Instrumental Reason” of the man who, because of a disease he has, must get a series of injections in order to live past 50. He wants to have a long life, but he is also terrified of injections. He’s so terrified, in fact, that he refuses to get the treatment, even while knowing that it will mean his early death. “He agrees that a long and happy life is a greater good than avoiding the injections, but he still declines to have them.”¹ Intuition hesitates here in the same way it did in the other case: from one perspective, the man’s fear is clearly causing him to be irrational (to act contrary to what he acknowledges is his greater good); from another perspective, he is being perfectly rational, since *right now* his strongest desire is to avoid the injections rather than have a long life, and he is acting in accord with that desire.

Philosophers discussing the status of reason tend to use as thought-experiments examples, like the foregoing, that involve instrumental reason (or constitutive reasoning). But I think that the normative foundation of the instrumental principle is really the same as that of the ‘principle’ that, say, you shouldn’t destroy the *David* if you think it’s beautiful, or you should be honest if you think being honest is good: by making a value-judgment, you posit certain norms on your behavior (which aren’t *logically* related to your

¹ Korsgaard, op. cit., p. 227.

judgment); if you flout these norms, you're exhibiting irrationality (insofar as you still hold the value in question when you flout the norms). Particular norms are the *psychological* 'flip-side' of particular value-judgments. What establishes the connection between the norm and the value-judgment is, I suspect, the universal properties of intentionality and action, and their relation to value-judgments. I'll return to this question below. My point right now is that philosophers should focus more on value-judgments in general and less on questions about desire and instrumental reason, because desire, after all, is but one kind of value-judgment. (In desiring something—say, financial success—I am valuing the thought of experiencing whatever it is I desire.) And the instrumental principle is but an example of the fact that value-judgments have prescriptive implications. Practical irrationality, then, means violating the prescriptive implications of one's value-judgment.

I agree with Korsgaard that a good way to characterize irrationality, whether practical or theoretical, is as the "fail[ure] to be motivationally responsive to the rational considerations available"¹. I simply think that her idea of what qualifies as a 'rational consideration' is too narrow. A rational consideration isn't necessarily a matter of adhering to logic and induction;—or rather, in the sphere of *theoretical* rationality, it is. But in the sphere of practical rationality it has more to do with what I have called the 'psychological implications of a given value-judgment'²—implications that can be logical² but need not be. What they have in common with *logical* entailments is that, like logic, they are grounded in the principle of non-contradiction. If the injunction to avoid self-contradiction is virtually the guiding law of theoretical reason, so it is with regard to practical reason. The only difference is that what counts as a self-contradiction is somewhat broader in practical than in theoretical reason.

Now is a good time to note that Wellman's statement that 'practical reason is using arguments that bear fairly directly on practice' is fairly worthless.³ Theoretical reason (which relates solely to what is the case) can be, and usually is, inextricably linked to action. For example, suppose I'm angry at my girlfriend because she did something cruel or inconsiderate. So far, I'm being theoretically rational: I have a logical or inductive reason to believe that my girlfriend was intentionally cruel, so I *do* believe that. (My anger, in itself, is neither rational nor irrational. As an emotion, it's 'non-rational'.) In other words, I'm being motivated by logical considerations. But if I learn that she had no choice but to act as she did and yet I remain angry with her, I am being irrational, for I'm ignoring a consideration that absolves her of blame. That is, I'm blaming her for something I know she was not responsible for; I'm being unreasonable. —In this example, pure theoretical reason bears *very* directly on practice. Wellman's criterion, then, for the distinction between practical and theoretical reason is wrong. I have given my own criterion and will elaborate on it periodically in the following.

¹ "Skepticism about Practical Reason", p. 378.

² For instance, sometimes a value-judgment logically entails another one. I'll give examples later.

³ It's also as good a time as any to note that the word 'irrational' has a secondary meaning also (secondary, that is, to the definition by Korsgaard I quoted in the last paragraph): a person who isn't "capable of performing logical and inductive operations" (Korsgaard, *op. cit.*, p. 379) can be said to be irrational. Strictly speaking, though, this usage doesn't seem quite right. Moreover, the quoted phrase is ambiguous. It can mean either that the person has some kind of mental disorder that renders him incapable of performing logical operations, or it can imply a (momentary or sustained) lack of intelligence. In neither case does it seem truly appropriate to say that *irrationality* is being exhibited. But ordinary usage is vague here. For example, in one context it might assimilate the "incapability" to irrationality, while in another context it might assimilate it to unintelligence. An anti-Semite could be considered either irrational or unintelligent: if he is aware of the reasons that militate against anti-Semitism but ignores them (say, because of the overpowering nature of his hatred), he is being unequivocally irrational; if he isn't at all aware of the reasons, he's exhibiting a lack of intelligence (because the ignored rational considerations have to be "*available*", in some sense, if the person is to be called truly irrational). But colloquially we might well say even in this latter case that he's being irrational, despite the fact that, upon reflection, that usage doesn't seem intuitively correct. Still, it's well-established in the language, so we might as well consider it a secondary meaning. —Incidentally, all this is further evidence for what I argued above, that it is sometimes irremediably unclear whether a person is acting contrary to reason.

Now, David Hume looked at all this in a slightly different way than I have.¹ He seemed to think that there is no such thing as practical reason. (I doubt he even thought that *instrumental* reason is practical reason, since he knew that such reasoning is a disguised form of finding out what is the case—i.e., what cause will bring about a desired effect.) Reason, he thought, cannot in itself motivate anyone to act. Only desires can motivate, and desires are neither rational nor irrational per se. “Reason can teach us how to satisfy our desires or passions, but it cannot tell us whether those desires or passions are themselves ‘rational’, that is, there is no sense in which desires or passions are rational or irrational.”² Even outrageous desires cannot be criticized as irrational. To quote Hume:

’Tis not contrary to reason for me to prefer the destruction of the whole world to the scratching of my finger. ’Tis not contrary to reason for me to chuse my total ruin, to prevent the least uneasiness of an Indian or person wholly unknown to me. ’Tis as little contrary to reason to prefer even my own acknowledg’d lesser good to my greater, and have a more ardent affection for the former than the latter.³

I have already explained in what sense I disagree with these ideas. I think that our acts may well conflict with what we value on a reflective level—say, if we are overwhelmed by fear and therefore act contrary to the (prescriptive implications of the) value-judgments we’re reflectively committed to. This, I maintain, should be called a form of irrationality, partly because we intuitively think it is such and partly because it involves blatant self-contradiction: I am acting contrary to what my reflective value-judgments prescribe. If I’m not really committed to them, then perhaps it isn’t quite correct to say that by acting contrary to them I’m being irrational; if I am committed to them, though, then I *am* being (practically) irrational. My irrationality is practical because it isn’t a violation of logic or induction but rather of the rules of ‘psychological entailment’ (which decree, for example, that if I value the thought of not watching *Entertainment Tonight*, I ought to stop watching it)—in other words, because it doesn’t relate to what is *true*, as theoretical irrationality does.

From another perspective, though, Hume is right that practical irrationality is impossible. For every act (and intention) is the expression of a value-judgment. It presupposes, and can indeed be called the ‘actualizing’ of, a value-judgment.⁴ For instance, by writing this paper I am ‘expressing’ or ‘demonstrating’ my (commitment to the) value-judgment that writing this paper is good, i.e., that I ought to be writing this paper. Similarly, insofar as my watching *Entertainment Tonight* can justifiably be called an *act*, it presupposes the (not fully conscious) value-judgment that watching it is good, at least in the circumstances in which I find myself at that moment. In short, as an agent—i.e., as someone with free will, which means that a given act is done because one values it or something it will lead to (or is constitutive of)⁵—one values, in some way or another (whether implicitly or explicitly), acting in whatever way one is acting in a given moment. Hence, one is necessarily always abiding by the prescriptive implications of the value-judgment that overrules all others in that moment. And this means that one is never being practically irrational.

I suspect, however, that Hume didn’t have such considerations in mind when writing the passage above. Instead, he was articulating the implications of the fact that ‘ought’ cannot be derived from ‘is’, that a value-judgment/prescription is not logically inferable from what is the case. He may have been the first person to discover this truth, but he was by no means the last to emphasize its importance. His point harks, for example, to Kierkegaard’s insistence that every decision, every act—even the act of accepting a conclusion validly derived from premises (as well as the act of thus deriving it)—involves an element of

¹ As will be seen, though, I agree with much of what he had to say.

² Korsgaard, op. cit., p. 374.

³ David Hume, *A Treatise of Human Nature*, L. A. Selby-Bigge, ed. (London: Oxford University Press, 1888), p. 415.

⁴ In a more direct sense, of course, it is the actualizing of an *intention*.

⁵ The reason why the idea of self-control entails *that* idea is that it entails that what I do is done because I want to do it, i.e., because I value it or something it is a means to (or constitutive of).

freedom, a “leap of faith”.¹ Hume doesn’t explicitly focus on the element of freedom, but he clearly has it in mind (however obscurely) in denying that ‘ought’ is derivable from ‘is’. He is insisting that there is a gap, a gap of freedom—of non-rationality—between a reason (properly so-called)² and a value-judgment, which is basically equivalent to saying that there is a gap between a reason and the carrying-out of an act, because an act is the actualizing of a value-judgment (or its prescriptive implications). Therefore, acting contrary to theoretical reason (or to what is true) is impossible. Meaningless. Since Hume thought that theoretical reason is the only form of reason, he thought that it’s impossible to act contrary to reason, i.e., truth.³ –To say it one more time, the reason I partially disagree with him about the possibility of practical reason, even though I agree with him that ‘ought’ cannot be derived from ‘is’, is that I recognize a form of reason which is not really assimilable to the category of ‘is’: it consists in the fact that insofar as I value something, I psychologically (or perhaps it’s better to say *phenomenologically*) commit myself to acting a certain way. As Korsgaard might say, *I prescribe a law (or laws) for myself*. If I value Schubert’s piece *Erlkönig*, I implicitly ‘prescribe’ that I will not throw away the CD it’s on, that I will not go around telling people it’s a terrible piece, etc. For any given value-judgment (whether implicit or explicit), there are a number of normative implications. If I violate any of them—and if my violation doesn’t grow out of another value-judgment that has temporarily trumped the earlier one—I’m being to that extent irrational. But this kind of irrationality is not a violation of logic or induction; rather, it stems from my acting contrary to the nature of action itself. In violating the normative implications of my value-judgment, I have ‘negated’ (contradicted) the value-judgment itself—even as I still profess to be committed to it—and since the act of valuing is really the basis, and meaning, of action itself (in that implicit in every act is a valuation, and every act is a realizing, a manifesting, of a particular valuation), I have ‘negated’ or contradicted *action*. My two relevant acts (the valuing and the ignoring of the normative implications of this valuing) are mutually vitiating, as well as—in combination—contradictory to the universal meaning of action itself.

In any case, I noted earlier that it seems almost psychologically impossible to act in this way. It’s scarcely conceivable that a person could contradict himself in the way I imagined him to in the ‘renting a movie’ example above (as well as in the ‘valuing a painting but destroying it’ example⁴). At most, *partial* practical irrationality is possible—as when I keep watching *Entertainment Tonight* despite my belief that my ‘greater good’ would be to get some work done.

As I was saying, though, the element of freedom, of non-rationality, in action, which is also that of value-judgments, entails that ‘ought’ cannot be derived from ‘is’. For instance, one cannot legitimately do what Schopenhauer did in justifying an ethics of compassion through the metaphysical consideration that everyone is part of an undifferentiated thing-in-itself behind appearances (and so by treating people compassionately we’re acting in harmony with our mutual oneness). –Or rather, one can ‘justify’ one’s morality however one likes, but (1) if the justification proceeds directly from what is to what ought to be,

¹ Kierkegaard thus anticipated Lewis Carroll’s argument in his famous paper “What the Tortoise Said to Achilles”, in *Mind* 4, No. 14 (April 1895): 278-280. Carroll pointed out the difference between the *acceptance* of a logical rule (such as *modus ponens*) and the *application* of it. The latter is a second act, different as such from the first act of accepting the logical rule in question. One can accept the logical rule but refuse to apply it, because every act, according to Carroll and Kierkegaard, involves non-rationality, or freedom.

² By ‘reason’ here I mean a conclusion derived from logic or induction.

³ He recognized, of course, the possibility of theoretical irrationality—but, as will become evident three paragraphs later in the text, he didn’t really have the ‘right’ to acknowledge the existence of theoretical irrationality. For this kind of irrationality is just a matter of the motivational force of an end (namely, knowledge) failing to transmit to the means necessary to achieve the end (namely, adhering to logical and inductive rules). In other words, it is a kind of instrumental irrationality, which itself is a manifestation of *practical* irrationality. So theoretical irrationality is a manifestation of practical irrationality. But since Hume rejected the possibility of the latter, he had no right to accept the possibility of the former. (See below.)

⁴ It is of course possible to value something and yet treat it badly, but in doing so, one shows that he values something more than the thing he’s treating badly. He needn’t necessarily *think* he values it more, but inasmuch as a person does what he wants to do, and what he wants to do is what he values at that moment, *this* person (the one who doesn’t think he really values what he is doing, even though he has chosen to do it) is deluding himself.

then there is no logical connection between it and the morality, and the justification fails; or (2) if it deduces the morality from a more basic set of values, then the logical leap (from 'is' to 'ought') occurs in the justification of the more basic set, and so, again, the justification of the morality fails. That is, it's conditional upon the acceptance of the set of values from which it is deduced—and a conditional justification isn't what one wants in a justification of morality. I'll return to this point later, but the relevant conclusion to draw from the gap between 'is' and 'ought' is the one that Hume draws in the passage above: desires, or more generally values, are not criticizable as violating 'truth' (whether logical, scientific, metaphysical or whatever).

But given the gap between 'is' and 'ought', how can theoretically rational considerations motivate? And how is it possible to be theoretically irrational? The answer is that one's responsiveness to theoretical reason must come from another source, albeit a source that decrees that such reasons will be capable of motivating. For example, suppose I value knowledge. I desire to know truth. My value itself, like all values, is neither reasonable nor unreasonable; it's just a brute psychological fact. But since I know that the way to pursue knowledge is to carry out logical and inductive processes of reasoning, I will be motivated by such reasons. In themselves they can't motivate, but given my value, my desire—my 'end', namely knowledge—they can motivate. Actually, I'm basically adhering to the instrumental principle by being motivationally responsive to theoretical reasons: careful reasoning is related to the attainment of knowledge as means to end. And as philosophers know, instrumentally rational considerations are able to motivate because the motivational force of the end gets transmitted to the means necessary to achieve the end. —This shows, incidentally, that theoretical and practical reason are very similar, despite my efforts to differentiate them. For the instrumental principle is a manifestation of practical reason. And so, oddly enough, the motivational force of theoretically rational considerations is grounded in practical rationality (in the imperative—which, as Korsgaard says, is constitutive of action as such¹—to respect the normative implications of one's value-judgments), even as the *meaning* of *practical* irrationality (viz., inconsistency with oneself) is but an extension of the meaning of theoretical irrationality. Both kinds of reason presuppose the other.

Indeed, in daily life people muddle them together. A person is said to be irrational both if he obviously contradicts his own values and if he fails to be motivated by logic or induction. Both types of irrationality, though, are ultimately considered ways of being insensitive to truth, because, as I said earlier, even practical irrationality amounts to self-contradiction, and anything self-contradictory is instinctively felt by everyone to be 'wrong'. The reason, then, why it's considered a harsh criticism to call someone irrational is that everyone, even the most unintelligent guy on the street, is committed to being right (and thus to not being self-contradictory). His commitment is revealed in his actions, for example by his getting frustrated with people who disagree with him and trying to convince them that they're wrong. Indeed, as I mentioned above, the commitment to this value of 'truth' is forced on us by the nature of language: assertions posit their own truth and truth-conditions, so in asserting them we're saying that what we're saying is true. —Thus, any given person wants his beliefs to be true and his reasons for action to be good, and he thinks they are. When you call him irrational, you're saying that reasons are readily available to him for not doing what he's doing—for not valuing what he's valuing—and yet he's ignoring them. He's ignoring either obvious logical and inductive inferences or obvious normative implications of his value-judgments. The reason he *ought not to* is that, in valuing truth/rationality—in wanting his beliefs and his reasons for action to be true, or 'good'—he ought to value good ways of arriving at truth, as means to an end.² In not adhering to rational considerations he's exhibiting something like instrumental irrationality with respect to his end of having true beliefs and good reasons for action. He's ignoring the norms, or the 'laws', he has given himself by valuing rationality (consistency, truth, self-justification).

So, how does one go about justifying a particular act? One cannot appeal solely to what is the case, because there is no logical connection between 'ought' and 'is'. Rather, one has to appeal to what is the case *in combination with* other values that one holds. (More precisely: one's other value(-judgment)s will

¹ See, e.g., "The Normativity of Instrumental Reason", p. 249.

² Alternatively, they can be thought of as constitutive of his end. For, arguably, the desire to be right is basically the desire to act rationally (or to be rationally justified).

themselves be included in the consideration of what is the case, since, after all, they exist.) Much of the time this justification will proceed along instrumental lines. I can justify eating at McDonald's by invoking the facts that I'm hungry, i.e., that I value the thought of eating food right now, that the prescriptive implication of this value is that I find a place to buy food, and that McDonald's is the only place nearby. — Justifications involving the instrumental principle are easy and unproblematic.

Suppose, on the other hand, you want to justify your approval of a particular movie. How should you do this? First you have to note that you have certain other relevant values, such as a complicated plot-structure, rich characterization, thematic significance, and lush cinematography. Then you argue that the movie manifested these qualities. If you're right—if you do a good job of arguing that the movie epitomized your values, such that, perhaps, you convince other people to agree with you—then the value-judgment that you set out to justify is justified. Notice, though, that it's only conditionally justified. It wouldn't necessarily be irrational for someone to reject the values that provided the basis for your approval of the movie. It *would* be irrational if this other person shared with you an even more basic value, from which the values that he has rejected can be easily derived.¹ This circumstance is unlikely, though. It's more likely that he happens to have different values than you, in which case he isn't being irrational because he isn't failing to be motivated by rational considerations. If you don't have a relevant value in common with him, from which the four values I mentioned above can be deduced, it's senseless for you to try to convince him that he's wrong or irrational. For values can be deduced only from other values, not from what is the case.

If the two of you do get into an argument about whether the movie was good, it's likely that you're really trying to convince him that, despite his denial, he actually does have the relevant values that you do (such as lush cinematography). He just doesn't realize it at the moment, so you're trying to coax him out of his momentary confusion or ignorance of his own values.

—I could continue embellishing all these ideas, but the purpose of this paper isn't to clarify rationality. I've been discussing it mainly so as to have firmer ground to stand on in the following. Hence, I won't investigate the relations between the other meanings of 'rational' and 'reasonable', nor will I show to what extent ambiguities in natural language are responsible for confusions about the notion of reason. (It's easily confused with that of intelligence, which is even *more* ambiguous, as well as with intellectual creativity. And 'irrationality' can be confused with a reliance on mistaken premises, or with deficiencies in such non-rational faculties as aesthetic sensibility.) The immediately relevant point is that in criticizing people for exhibiting irrationality, we assume that one of their most fundamental value-judgments is that it's good to have knowledge, it's good to be justified in one's acts and beliefs. Hence, our criticism has nothing to do with "external" reasons² or non-motivating "reasons of rationality"³ or anything like that. We're simply criticizing someone for not adhering to the prescriptive implications of *his own* fundamental value-judgment. We're criticizing him for not wholly abiding by something like the 'principle of constitutive reasoning' (that you do whatever it is that constitutes your ends—even if they're largely unconscious, as in this case). That's why our criticism has force: he recognizes that, if it's true, he's failing to act in accordance with one of his own values, and is thus being irrational.

The circularity of this situation is a little paradoxical. We criticize someone for not being motivated by reason, which he should be because, as a human, he wants to be justified in his acts; and he (perhaps) heeds our criticism just because, in acting contrary to his value (of being justified in his acts), he is being irrational. That is, the reason he doesn't want to be irrational is that it's irrational to be irrational. There is no other reason to adhere to reason than the fact that *not* to adhere to it would be contrary to reason. This fact somehow strikes us as bad enough in itself; no other justification is needed for our acting rationally.

¹ An example of such a value is music that sounds gloomy. Given that minor modes sound gloomier than major modes, it's inferrable from the judgment that 'gloominess is good' that pieces in a minor key are preferable to pieces that aren't. This second value, then, can be derived from the first. If someone holds the first but not the second, he is contradicting himself and is therefore, at least *prima facie*, exhibiting irrationality.

² See Bernard Williams, "Internal and External Reasons", in *Moral Discourse and Practice*.

³ See James Dreier, "Humean Doubts about Categorical Imperatives", in *Varieties of Practical Reasoning*, edited by Elijah Millgram (Cambridge: MIT Press).

We value it for its own sake. This is surely related to the fact that rules of reason are *logically* self-justifying too. As James Dreier says, “there is no sense at all to be made of the question of whether we have any reason to follow the rules of rationality”.¹ These rules (norms) are therefore unlike other rules, such as rules of prudence or morality, in that they are their own justification. One cannot ask for a reason to act rationally without presupposing norms of rationality—just as one, almost of psychological necessity, is committed to the *value* of being rational(ly justified in his acts).

These ideas have implications for morality, but I’ll postpone that discussion until I’ve finished the analysis of values in general which was interrupted by the analysis of reason. I was in the middle of pointing out that we implicitly ‘assume’, in the act of utterance, that the assertion we make is true. We may recant later, but when we utter it we obviously think it’s true and justified. Language forces this fact on us, as does our own unconscious view that “everyone must be like us” (that our own experience is somehow universal), as does our foundational commitment to rationality. Kant’s focusing on beauty, therefore—on our how we universalize judgments of taste—was somewhat misleading: we posit the objectivity of *all* our value-judgments, and we reason (or argue) about them as if there is an objective truth to the matter. Our basic desire to be right, or at least justified, in our acts is the reason for this. The question is, is it right? Are values and their corresponding norms somehow objective? Can they be ‘true’?

Before answering that, I should describe the realist’s position more fully. I’ll quote Korsgaard’s definition: “realism is the view that propositions employing [normative] concepts may have truth values because such concepts describe or refer to normative entities or facts that exist independently of those concepts themselves. We have the concepts in order to describe or refer to those facts.”² I have said that realism is implicit in our ordinary use of language, because propositions, in positing truth-conditions, ‘refer’ to [or represent] an independent reality. Realism, therefore, is the commonsense view. It’s also the view that people find most attractive, because it (potentially) justifies their certainty about their own values. That is, since people like to think they’re right, a position that holds out the possibility that their value-judgments are objectively true is seductive. Is it correct, though?

It should be evident from the foregoing that I answer that question negatively, except with respect to norms of theoretical reason (and mathematics, which is just a special kind of pure reason).³ But that’s because these latter norms, unlike others, are concerned not with what is *good* but with what is *true*. This unique property is manifested also in the fact that they’re categorical: they are their own justification. We can’t question them without presupposing them. This is why Aristotle said that in order to win an argument with someone who doubts the principle of non-contradiction, all you have to do is get him to assert something.⁴ Basic rules of reason, then, are self-justifying, which distinguishes them from all other sets of rules—whether they be ‘derivations’ from the instrumental principle (like prudential maxims) or norms that are the direct flip-side of value-judgments (like “One ought not to murder”, which is the ‘flip-side’ of the judgment “Murder is wrong”). One can coherently argue for or against these other sets of rules, as one *cannot* argue for basic rules of reason. But prescriptions of instrumental reason,⁵ while derivative of basic norms of rationality, have more in common with the latter than they do with norms that are the flip-side of value-judgments, for they are concerned solely with how to cause a given effect, while the others are normative entailments of value-judgments.

It is these norms, and the values they presuppose, that cannot be ‘objective’ or ‘true’ in the way that norms of rationality are, precisely because they are not self-justifying (or—in the case of ‘prescriptions of instrumental reason’—deducible from self-justifying rules in combination with given states of affairs). In other words, it’s because there is a gap of freedom between what is and action (i.e., what ought to be) that these norms/values cannot be a part of reality, for they are nothing but actions in the form of

¹ *Ibid.*, p. 29.

² Korsgaard, “Realism and Constructivism in Twentieth-Century Moral Philosophy”, *Philosophy in America at the Turn of the Century* (2003): 100.

³ The *value* of reason is not somehow ‘objectively true’, but *rules* of reason are.

⁴ See “The Normativity of Instrumental Reason”, p. 248.

⁵ For example: if your goal is to eat food, go to the kitchen and get some food.

‘potentiality’. (Remember I said that implicit in every act is a corresponding value-judgment, and every act is an expression of a value-judgment. Similarly, every value-judgment/norm is an unactualized act. “It’s wrong to murder” is an unactualized refraining-from-murder; “one ought to be honest” is an unactualized being-honest. It is a positing-the-act-of-being-honest.) They are, in fact, posited modifications of reality: after all, they are merely what *ought to be*, as opposed to what *is*. By definition, then, values and norms (except norms of reason) cannot be objectively true. Like actions, they are expressions of freedom; and freedom, as Sartre argued, is essentially a negating of the real. In acting (i.e., being free), I am modifying reality, I am asserting myself. I am changing what is the case at that moment. Since value-judgments, and their normative implications, can be thought of as unactualized acts, and acts, in being expressions of freedom, are negations of what is real, value-judgments are negations of objective reality. By definition, then, value realism and normative realism (excluding realism about norms of rationality) are false.

There are many more arguments one can bring against them. Consider John Mackie’s famous “argument from queerness”:

If there were objective values, then they would be entities or qualities or relations of a very strange sort, utterly different from anything else in the universe. Correspondingly, if we were aware of them, it would have to be by some special faculty of moral perception or intuition, utterly different from our ordinary ways of knowing everything else.[On this view,] an objective good would be sought by anyone who was acquainted with it, not because of any contingent fact that this person, or every person, is so constituted that he desires this end, but just because the end has to-be-pursuedness somehow built into it...¹

Values motivate the person for whom they are values. If they were objective, as $2 + 3 = 5$ is objective, or as “In order to eat food, one must put it into one’s mouth” is objective, they would still have to motivate. But neither of the propositions I just mentioned *motivates* (the second might seem to, but it actually derives its motivational force from the *value* attached to the thought of eating)—and, in general, I can’t conceive what it would be like for an objective truth to motivate. The idea doesn’t make sense. But of course this fact is predictable, given that value-judgments and acts are *negations* of the real, i.e., assertions of freedom. For something real (true) to have to-be-pursuedness built into it would be a negation of its realness, since action is a negation of what is. So Mackie’s argument from queerness is actually an argument from self-contradictoriness.

Or suppose we talked to a classical utilitarian, who would argue that “an agent is obligated to perform an action when there is a rule specifying that actions of that kind are to be performed. [This rule, according to the utilitarian, is] the principle of utility. It is because of the existence of this rule that we characterize actions as obligatory or forbidden.” The problem is that one could intelligibly say, “Why should I care if there’s such a rule? What’s it to me? It’s just some external norm that I reject.” Or, as Korsgaard says, “Are we obligated to obey the rule? If one is obligated to obey the rule, then the notion of obligation exists prior to the existence of the rule. We cannot explain obligation in terms of the rule, as something that arises from it. On the other hand, if we are *not* obligated to obey the rule, then it seems we may permissibly ignore it, and so we have not after all explained why the actions it directs are obligatory.”² This argument works against a great many moral theories. I’ll explain why in a moment.

Another consideration against realism is that human beings currently have no obvious criteria for what would constitute a truth about values or norms. Science and philosophy have criteria for determining truth, but what sort of criteria could we use to decide whether a moral claim is true? Perhaps agreement among everyone? But this fact in itself would have no bearing on moral truth. The implicit premise that the more people agree with a claim, the greater is its likelihood of being true is not necessarily plausible. Moreover, it’s perfectly conceivable that nearly everyone could agree that a certain state of affairs is morally acceptable even though it isn’t. Think of slavery in ancient Greece, or in the American Confederacy. In any

¹ From *Ethics: Inventing Right and Wrong*, in *Moral Discourse and Practice*, pp. 96, 97.

² Korsgaard, op. cit., p. 111.

case, it's a vast logical leap to conclude that murder is wrong from the fact that all cultures *think* it's wrong. But what other criteria are there? –The point is that, if there isn't a way to confirm its truth, it's unclear what is being said in saying that a value-judgment (or a norm) is true.

Notice that no *argument* can establish the truth of a given value-judgment. Suppose I say, “Raphael’s painting ‘The School of Athens’ is beautiful”, and someone asks me why I think so. I might say, “It has a certain symmetry, its use of perspective is realistic, and it shows an incredible amount of detail”. But my interlocutor can simply deny that these factors entail its beauty. He can say, with G. E. Moore, that it’s an open question whether symmetry etc. is beautiful. If he were philosophically sophisticated he might invoke Kant: judgments of taste are not logical per se, i.e., not based on conceptual relations, but are intuitive and subjective. One has to *experience* the object in order to decide whether it’s beautiful; one can’t judge (or defend) its beauty simply by considering its properties in abstraction from the object—i.e., by considering a *list* of them.¹ However, the ‘open question’ argument applies to *all* value-judgments, not only judgments of taste. If someone says that an act was good because it demonstrated sensitivity for a person’s feelings, it’s intelligible to ask whether such sensitivity is itself good. This fact is simply another manifestation of the gap between ‘is’ and ‘ought’. One cannot justifiably conclude from an object’s (or action’s) ‘natural’ properties that it is *good*.

On the other hand, if I justify my value-judgment by invoking other evaluative words—if, for example, I say that Raphael’s painting is magnificent, sublime, awe-inspiring, and hence beautiful—someone can challenge the value-judgments from which I deduced the one I was arguing for. He can say that *those* judgments are problematic, inasmuch as they are made on the basis of the object’s possessing certain natural properties (whether they be colors or shapes or whatever). So, once again, the gap between ‘is’ and ‘ought’ entails that a value-judgment is not logically justified.

To say it differently: evaluative words like ‘good’ and ‘beautiful’ and ‘unjust’ are action-guiding. Which is just to say that a judgment in which they occur is an ‘unactualized act’—or acts—of some sort. (I say ‘acts’ because a value-judgment can have more than one prescriptive, or normative, implication.) Non-evaluative words are not action-guiding. So the difference between the two categories is basically the difference between a [factual] proposition and an act. Clearly *these* categories are radically different; the one is (supposed to be) a replication of reality—a reproduction of it through the medium of language—while the other is a modification of reality, an intruding-of-oneself into reality. To say, then, that one is ‘implied’ by the other—that an act, or a value-judgment, is implied by a truth—is virtually meaningless. What would it be like for an act to be logically entailed by something (aside from another act or a value-judgment)? Acts are essentially free. They can be *causally* necessitated—say, by the firing of particular neurons—but, first of all, this isn’t logical necessity, and second of all, acts are so necessitated only insofar as one abstracts from their *act-ive* character.

But if acts cannot be ‘logically entailed’ by a truth, they cannot be truths themselves. (A truth, after all, entails itself.) This accords with ordinary usage of the word ‘truth’. We don’t say that an act is true, only that a proposition is. But if acts are value-judgments ‘actualized’, then such judgments themselves cannot be true. They aren’t the sort of things to which the property of ‘truth’ applies. It certainly *seems* they are, though. The form in which they are asserted posits their truth. But if this is so, their form contradicts their content. Their content cannot be true—just as the content of an act cannot be true—but their form requires that they be capable of bearing truth-values. This conflict between form and content means that, in a way, they are self-contradictions. Not in the way that “The cat is not a cat” is a self-contradiction, however: *that* statement has a self-contradictory *content*. The content of a value-judgment contradicts not itself but the form in which it is expressed—the ‘referential’ form, the form of referring-beyond-itself-to-an-independent-reality, which is implicit in declarative utterances.

¹ See Frank Sibley’s excellent article “Aesthetic Concepts”, in *The Philosophy of Art: Readings Ancient and Modern*, edited by Alex Neill and Aaron Ridley (New York: McGraw-Hill, 1995), pp. 312 – 331. He argues that aesthetic properties, even non-evaluative ones like ‘graceful’, ‘delicate’, ‘elegant’, and ‘garish’, are not condition-governed or rule-governed. They’re intuitive: we apply them to an object on the basis of how it intuitively strikes us. –Kant was onto something when he contrasted the aesthetic faculty with the cognitive.

What this self-contradiction means is that, just as “The cat is not a cat” is in some sense meaningless, so are “Lying is wrong”, “The painting is beautiful”, and “One ought not to murder”. These statements don’t seem as meaningless as “The cat is not a cat” because their content contradicts not itself but its form, and so they aren’t as blatantly self-contradictory as “The cat is not a cat”. Still, they have an element of self-contradiction; and it is partly this fact that accounts for the common intuition that, when someone says, e.g., “Lying is bad”, or “Hitler was evil”, it isn’t entirely clear what he is saying. The meanings of ‘bad’ and ‘evil’ are....strangely meaningless. For these words too, like the value-judgments in which they’re embedded, implicitly ‘refer’ to something else, in this case to a concept that’s supposed to have some kind of descriptive content;—in other words, to a property of certain things in the world. Hitler had the property of being evil, lying has the property of being bad. Properties are supposed to exist in the world, just like the truth-conditions of propositions. (For example, colors are ‘out there’ in the world, as are shapes. We even implicitly interpret *sensations* as being ‘in’ the objects that cause them: an ice cube *is* cold, fire *has the property* of being hot.) But an object or act cannot *have the property* of badness or goodness, because values are merely the essential components in value-judgments, which are acts in the form of ‘potentiality’—and an act isn’t the sort of thing that can be a ‘part’ of something in the world. It’s inherently a *changing* of the world. Therefore: values, like value-judgments, contradict themselves. Their content contradicts their linguistic form.

But what exactly is the content of a value or a value-judgment? I have said it’s an unactualized act, but this is vague. A better way to say it is that a value-judgment is essentially the speaker’s subjective reaction to the given object projected onto the object—imaginatively made into a property of the object. But the projected thing isn’t precisely the reaction itself; rather, it’s the property of ‘causing this particular reaction’, the reaction that the value-judgment manifests. The speaker effectively reifies his reaction and projects its ‘objective referent’ (so to speak) into whatever it is that he is judging. If he says that lying is bad, he is projecting into the act of lying some such property as ‘inherently causing disapproval’. This, however, is really just the property of ‘inherently not to be done’, which is why my two accounts of the content of value-judgments amount to the same thing. For ‘inherently not to be done’ is a posited action, an unactualized action (or, in this case, *refraining* from action—which is itself, of course, action).

I suppose this second account is a version of projectivism. We project the ‘causal flip-side’ (or ‘objective referent’) of our reaction onto objects, treating it as if it adheres in the object like any other property. The wrongness of murder is (supposed to be) what explains my belief that it’s wrong; the beauty of a painting is what causes [or justifies] my belief that it’s beautiful. In fact, of course, there are features of the object, in combination with my psychological and social conditioning, as well as my biology, that give rise to my value-judgment; however, these features are not what I unthinkingly think they are when I utter my judgment. They aren’t wrongness or beauty or ugliness or goodness or whatever; they’re facts that science can explain, such as the effects that certain visual or auditory stimuli have on my nervous system, etc. Since science and psychology can explain the causal mechanisms through which I make value-judgments, there is no explanatory role for any kind of realism in the sphere of norms and values (excepting norms of rationality). All vestiges of realism are merely redundant and implausible relics of “common sense” and ordinary language use.

What exactly the “reactions” I’ve mentioned consist of has been a matter of debate among philosophers. Are they beliefs, feelings, preferences, attitudes, or inclinations? (I think they can be all five.) Whatever they are, though, the value-judgment/normative statement is in some sense an expression of them. The expressivists, then, are partly right—as are, incidentally, most other schools of ethics. Noncognitivists, cognitivists, realists (but only insofar as they describe the attitude implicit in our ordinary value-judgments), emotivists, intuitionists, “sensibility” theorists (like John McDowell¹), and constructivists. Construed in a certain [limited] way, none of these positions precludes the others. They merely emphasize different aspects of what it means to make value-judgments. After all, no type of act is a simple affair, something that can be adequately explained from only one perspective. There are multifarious intentions involved, behavioral dispositions, intuitions, logical implications and presuppositions, physical movements, perceptions of

¹ See his “Values and Secondary Qualities”, in *Moral Discourse and Practice*.

objects and reactions to them, neural mechanisms. Even the phenomenology of a single act is an extremely complex thing. Especially when you recall what I argued in the first part of this paper—that whether a sentence expresses a value-judgment depends on the context in which it’s spoken, and that utterances can have evaluative features without really expressing value-judgments per se, and that sometimes it’s impossible to tell whether a given utterance expresses a value-judgment or a purely *descriptive* proposition—you’ll realize that the truth cannot be *only* projectivism or *only* constructivism. Maybe one theory does a better job of explaining *this* particular utterance than *that* one, such that a different theory is more appropriate for the latter (because its context differs from that of the former). Open-mindedness should reign in every intellectual field, but especially in philosophy.

I won’t show the precise ways in which all these theories can be reconciled, since this paper is supposed to be only a sketch and it’s already too long. Instead, I’ll argue in more detail about why morality in particular cannot be meaningful, or at least as meaningful as it’s taken to be.

Everyone agrees that something about morality distinguishes it from other spheres of values and norms. Most importantly, it seems as if moral values are somehow more ‘absolute’ and ‘obligatory’ than, say, aesthetic values. This intuition is manifested in the conviction that there is such a thing as moral *rightness* and *wrongness*, as opposed to mere *goodness* and *badness*. Ugliness, for instance, is bad, but few people would call it *wrong*. That word sounds too forceful for aesthetics, too categorical. On the other hand, murder is indeed called ‘bad’, but more often it’s called ‘wrong’. So moral values are supposed to be more binding than aesthetic values. In fact, their obligatoriness differs in kind, not in degree.

Another way to say this is that moral norms are *duties*. They’re *imperative*. This criterion is what we use to distinguish mere social norms of how to treat others from moral norms. For example, kindness isn’t usually considered a moral value, because behaving kindly is merely *good* rather than *right*. It isn’t a duty. Not to lie, however, is considered a duty, so it’s a moral norm. Insofar, then, as a given type of social behavior doesn’t seem intuitively to be *imperative*, or *right*, it doesn’t fall under the heading of ‘morality’. It’s merely a common run-of-the-mill value.

So morality, by definition, consists of duties. This doesn’t, by the way, foreclose any possibilities about the *content* of morality. It doesn’t, for instance, rule out Carol Gilligan’s “ethics of care”, which is supposed to be contrasted with Kant’s deontological system. Care, compassion, empathy: nothing in principle rules them out as maxims of morality. They simply have to be called duties. It has to be a *duty* that people act with compassion and empathy. Otherwise such acts can’t properly be called moral. –This conception of morality isn’t a stipulation; it’s implicit in the way we talk.

The question is, what is a duty? The most obvious way to define it is in terms of other normative words. A duty is something that people are obligated to follow; it’s an imperative. But what does *that* mean? Evidently if we define that in normative terms, we’ll run into the same problem again. Its meaning won’t be clear. –This problem, of course, is just an implication of what I’ve been arguing. Normative and evaluative terms are not fully meaningful, given their [semi-]self-contradictory character. They implicitly pick out some independent reality even as their only real content is their action-guidingness, their positing of an act—which amounts to their reification of an attitude of approval or disapproval (in the person who speaks them). They implicitly project their action-guidingness into the world, which is a contradiction because action is inherently free, i.e., reality-negating. For a posited act (i.e., ‘action-guidingness’) to be *in* the world is a total contradiction, virtually meaningless. Therefore, normative and evaluative words intuitively strike us as somewhat lacking in content, though we have trouble pinpointing exactly *how* or *why*. But I have clarified the matter, at least in outline.

Again, these facts explain why any definition of ‘duty’ in terms of *non*-normative words must fail.¹ Such words, by definition, lack the element of action-guidingness, which means they fail to capture the

¹ E.g., “any act that adheres to the principle of utility is a duty”. There are of course other, unrelated, problems with this utilitarian definition, but the fact that it falls victim to Moore’s argument—which, by the way, basically consists of asking the question “Why?” (“Pleasure is the good.” “Why?” or “The good is what we desire to desire.” “Why?”, etc.)—is itself fatal to it. In any case, this definition doesn’t explain what the word ‘duty’ *means*; it says only which acts are duties. But the task that has to be preliminary to enumerating the various duties is clarification of ‘duty’ itself.

force of normative words. G. E. Moore's 'open question' argument, I have said, consisted of nothing but a muddled intuition of this fact—i.e., of the difference between 'is' and 'ought'. 'Ought' is self-contradictory (except when it's an 'ought' of *reason*), while 'is' is not; hence, the former cannot be defined except in terms of other normative/evaluative words, which capture both its element of self-contradiction and its action-guidingness.

There is, however, one substantive way to define 'ought': namely, the way in which I defined the 'ought' of reason. Reason justifies itself—its basic norms are self-justifying—and any imperative of reason (such as an imperative that grows out of the instrumental principle) is ultimately justified by, or deduced from, rules that are self-justifying [or self-evident]. To say, therefore, that one ought to act in a certain way because reason dictates it is just to say that the act is deducible from fundamental principles of logic in combination with a description of the relevant state of affairs; it is, in other words, to say that *this is the way reality is*. To achieve an end, one *must* act in such-and-such a way; to do this mathematical equation correctly, one *must* add so-and-so together. 'Oughts' of reason are actually 'oughts' of 'is', which is why they are not meaningless. They are deducible from self-justifying rules.

It was Kant's genius to understand all this without understanding it (or, at least, its anti-moralistic implications). This is why he defined duties as principles of reason, as self-justifying maxims of practical reason. One ought to follow a duty just because it's a duty—that is, because it's self-justifying. His answer, then, to what a moral imperative is and why we ought to follow it is that it's a *categorical* imperative, like imperatives of reason, and hence its truth is self-evident. Like logic, it doesn't depend on our subjective desires or our historical circumstances. It's an *a priori* truth, like $2 + 3 = 5$.

Kant's answer to what moral imperatives mean is the only possible substantive one,¹ the only one that neither defines 'duty' circularly (in terms of other problematic normative words) nor falls victim to the 'open question' argument. Indeed, any answer that succumbs to Moore's argument (i.e., the is/ought dichotomy) is flawed not only for that reason but also because it fails to answer the main question, which is how the concept of 'duty' (or 'moral imperative') *itself* should be defined. Theories that succumb to the is/ought distinction consist in saying that such-and-such an act is a duty. Hobbes's social contract theory is an example, as is Bentham's utilitarianism. Rather than giving an intuitive description of the meaning of 'duty', they stipulate that certain acts are duties. In other words, they define the concept extensionally rather than intensionally. The intensional definition, which is what we intuitively want, has to be something like 'a self-justifying maxim of action', 'an intrinsically right rule to live by'. It has to make some reference to reality or objective truth, because, given the referential [or rather, representational] nature of language, our intuitive understanding of normative words involves some reference to 'truth'. Realists like Samuel Clarke and Richard Price² understood this, but Kant gave the definition in question its most sophisticated form.

It isn't necessary to discuss Kant's answer to what the proper formulations of the categorical imperative are, because there are fatal flaws even in his framework. The first arises from the fact that norms of reason, while categorical in themselves, are hypothetical with regard to our explicit *application* of them. A person need not and does not follow them at all times—indeed, this is what makes (theoretical) irrationality possible—because, as I argued earlier, rules of reason are not intrinsically motivating. They can't be: action-guidingness cannot be a part of reality or truth(s of reason). It comes from values. Therefore, we guide ourselves according to (conclusions derived through theoretical) reason only insofar as we value truth.³ The value transmits its motivational force to the rules of reason, such that we are "capable of being motivated by rational considerations". But these considerations *in themselves* are not what motivate us;—or rather, they motivate us only on the basis of our valuing them (i.e., their truth), not somehow

¹ Excepting the theological one, which defines duty as anything that God commands us to do. To abide by a duty, then, is simply to do God's will. This would be a good definition if it weren't for God's nonexistence. (Also, the idea of God is full of contradictions.)

² See, e.g., Martha K. Zebrowski, "Richard Price: British Platonist of the Eighteenth Century", *Journal of the History of Ideas* 55.1 (1994): 17 – 35.

³ For instance, it can be argued that being Christian is theoretically irrational (though not necessarily practically so), as is being anti-Semitic, as is being prejudiced or superstitious in any way.

‘intrinsically’.¹ If we don’t value them, we don’t treat them as categorical. In a sense, then, they’re optional, as it’s optional to ‘take account of’ *any* aspect of reality.² We do so only insofar as we value that aspect, whether as an end, a means to an end, or constitutive of an end.

Thus, even if the categorical imperative were categorical in the sense that the rules of logic are, our use of it would necessarily be hypothetical. Our intrinsic phenomenological freedom is the reason for this. It’s meaningless to say that we *have* to (choose to) follow the categorical imperative, just as it’s meaningless to say that we *have* to (choose to) follow the norms of logic. Whether the norms of logic are somehow innate in our brain [i.e. in our cognitive wiring] is another matter; and it may, in this respect, be true that, descriptively speaking, we ‘have to’ follow the rules of logic, just because they structure how we think. But this isn’t true of the categorical imperative. Its premise—which is morality’s premise—is the existence of free will. Therefore, our ability to choose whether (i.e., to what extent) to follow reason is also our ability to choose whether to follow the categorical imperative.

Another way to say this is that, while the *truth* of the categorical imperative might be self-justifying, or rather self-evident (which it isn’t, by the way)—as is the truth of rational norms—the necessity of its application is not.³ It cannot be, given what ‘application’ means in this context. For it presupposes choice, that is, non-necessity. Thus, to say that the categorical imperative—or, in general, a moral duty—is categorical in the sense required for morality, i.e., categorically applicable, is self-contradictory and basically meaningless. *Nothing* is necessary in this way. Nothing *can* be, because the idea doesn’t make sense. The notion of duty amounts to a conceptual fusion of free will with necessity, which is senseless because the two concepts are negations of each other. –Basically, ‘duty’ is like any other normative/evaluative word, but to an extreme. It involves a reification and projection of *absolute* approval, as contrasted with a form of approval that’s less imperative.

A third way to express the impossibility of moral duties is to return to the point I made above: Kant’s answer to what duty means is the only possible meaningful one. He intuitively understood that the only meaningful form of ‘ought’ is the ought of reason, so he modeled his conception of moral duty on the latter notion. But with regard to reason there is no gap between ‘ought’ and ‘is’, as there is with regard to values. A value is defined by its action-guidingness, which amounts to its negation of what *is*. Since reason is a component in what is—on account of its objective truth—values involve a negation of reason. Insofar as one values something, one is not following pure reason. Since moral duties are also moral values, by their very nature they cannot be imperatives of reason. In short, the only possible substantive answer to what duties are has, ironically, almost nothing in common with what a duty would have to be. Which is why it is, in the end, a virtually meaningless answer.

The failure of Kant’s project is exhibited by the fact that he had to argue extensively for his definition of moral duty. If his definition had really been a self-evident *a priori* truth, like norms of reason, argumentation would have been basically superfluous. (Also, it would have been a mystery why it had taken

¹ In §344 of *The Gay Science*, Nietzsche emphasizes that even the “scientist”—i.e., the person who prides himself on his objectivity, his commitment to truth—has a fundamental non-rational faith, viz. his faith in the value of truth. This is what motivates him, this faith, or value-judgment, which is, as such, comparable to the priest’s faith in God. The section is interesting as revelatory of Nietzsche’s quasi-Humean conception of reason. I think that the speculations on the origin of the commitment to truth (he considers it a manifestation of the commitment to morality) are problematic—at any rate, very imprecise—but the section is thought-provoking.

² Dostoyevsky has his protagonist in *Notes from the Underground* rant against the necessity and so-called value of ‘reason’. Freedom is a higher truth than something as ‘necessary’ as mathematics. “...Two times two is four is a most obnoxious thing. Two times two is four—why, in my opinion, it’s sheer impudence, sirs. Two times two is four has a cocky look; it stands across your path, arms akimbo, and spits. I agree that two times two is four is an excellent thing; but if we’re going to start praising everything, then two times two is five is sometimes also a most charming little thing.” (From the translation by Pevear and Volokhonsky.) Of course, even if we try to reject reason we can’t do it completely. Our thought-processes are saturated with the rules of logic—which is also to say that implicitly we ‘value’ them, even if we try not to.

³ Of course, its truth would consist precisely in the universal necessity of its application, but this is exactly why it’s meaningless.

mankind until the 18th century to articulate the truth.) Moreover, as I've said, his failure was preordained as soon as he had set himself the goal of defending a set of values. No argument that he or anyone else, such as the neo-Kantian Korsgaard, could have put forward would have established his values, or any values, because at some point in any such argument there occurs a leap from what is to what ought to be. Even supposing (what is false) that someone could prove that a particular value logically followed from a truth, we would still have to value truth in order to value that value. So, no matter what, it's always 'permissible' to reject a given value. Nothing can obligate us to follow it, because 'obligation' is meaningless.

One should keep in mind that values and norms (except rational norms) don't have to be genuinely meaningful in order to do their job, which is to facilitate a particular kind of communication. Simon Blackburn has argued that objective-looking normative (or evaluative) predicates, like 'good' and 'ugly', are a necessary prerequisite for "serious, reflective evaluative practice, able to express concern for improvements, clashes, implications, and coherence of attitudes". Without evolving such predicates we would have remained on the level of interjections like "Boo!" and "Yay!", which would have severely hindered complex processes of economic production. Perhaps such production would have been impossible, thus making impossible social evolution. We also could not have articulated 'obligations' between people: rituals like making a promise would have been mute, and thus impossible.¹ To develop them we had to "invent a predicate answering to the attitude [in question], and treat commitments as if they were judgments, and then use all the natural devices for debating truth".² Only comparatively late in human evolution could we start asking misguided questions like "Is lying *truly* bad?"

But where does all this leave us? If value-judgments are ultimately not rationally justified [or justified purely by reason], and if we know this, how can we go on believing them? After all, in believing them we are believing in their truth. Especially with respect to morality, the truth is far more relativistic than we want it to be. Not only is murder not always bad, but, strictly speaking, it isn't *ever* 'bad'. 'Bad' is meaningless. As are 'evil', 'wrong', 'ugly', 'beautiful', and all other evaluative words. (Words that have a primarily descriptive content but evaluative overtones, like 'interesting', are basically meaningless insofar as they have evaluative overtones. They may also, of course, lack a clear *descriptive* meaning—'intelligent' is an example—but this is a separate issue.) They do have *some* content, but to the extent that they're supposed to be objective, they're meaningless. Knowing this, how can we with a good intellectual conscience continue making value-judgments? Are we condemned to self-delusion?

To a large extent, yes. Most people will always believe in the objective justifiability of their value-judgments, thus deluding themselves. Those of us who have intellectual integrity, however, are condemned neither to self-delusion nor to cognitive dissonance: we can navigate these shoals by relying on the fact that certain value-judgments are deducible from others. If we value, say, alleviation of suffering more than life for its own sake, then we're being irrational if we aren't pro-choice with respect to the question of abortion (because abortions are done for the sake of alleviating some kind of suffering). Indeed, one can even argue against pro-lifers if one shares a more basic value with them, such as well-being, from which a pro-choice position can apparently be deduced. Since self-conscious inconsistency is irrational, and people tend to value rationality, by convincing them of their inconsistency one may be able to convince them to change their minds about an issue. Most people do, in fact, share basic values, even apart from rationality; and it is rational to argue with them on the basis of these shared values. One's value-system cannot, strictly speaking, be *correct*, but it may be more consistent and to that degree more rational than one's opponent's.

Suppose I want to argue that Tchaikovsky's fifth symphony is better than Beethoven's second. In the light of this paper, the real content of my claim has to be that the former exemplifies the set of criteria I use to judge musical worth better than the latter. I may not be exactly clear on what my criteria are—perhaps I'm just intuitively more moved by the former than the latter, or its harmonies seem more sophisticated, or maybe I have critically analyzed the scores and decided that Tchaikovsky makes more

¹ See Nietzsche's *Genealogy of Morals* for speculations on the historical and 'moral' importance of the making-promises ritual.

² Simon Blackburn, *Spreading the Word* (Oxford: Oxford University Press/Clarendon, 1984), p. 195.

creative use of the sonata form than Beethoven does—but, whatever they are, if you share them while disagreeing with me then we can have a rational argument. If we don't share all of them then I might try to deduce the criteria we don't share from the ones we do, or from other value-judgments we have in common. Ultimately, though, my judgment is nothing but an expression of subjective approval, and as such doesn't have much force. It has force only to the extent that others agree with my criteria. If, say, Beethoven and Tchaikovsky had substantially the same goals in mind when writing their music—e.g., critical approbation, creative manipulation of the sonata form, and avoidance of bombast or any kind of “florid and superficial” beauty¹—and if their goals are my criteria, then my judgment bears on the question of whether one composer achieved his purpose more fully than the other. These conditions, incidentally, are not unrealistic. Artists, even between genres, tend to measure their work by the same standards; for example, an aversion to sentimentalism is almost universal—across cultures, too. If the common purpose of art is something like connection with as wide and intelligent an audience as possible, then standards can be rationally justified on this basis (i.e., as means to an end). Sentimentalism is bad because it hinders the spectator's identifying with the artist and his work; creative fecundity is good because, among other things, it precludes boredom in the spectator.

Indeed, the presence of common purposes and standards makes possible cross-cultural artistic comparisons. Classical Indian music is inferior to classical Western insofar as it is less creative, less instrumentally rich, less ambitious. It isn't ‘objectively’ inferior, though, unless that term means that Western music exemplifies the common criteria more satisfactorily than Indian music. But nothing necessitates that these be the criteria used; one can adopt any criteria one wants. One's value-judgment, however, will have interpersonal force only to the degree that others share one's standards (because, again, people value rationality; if they think their judgments are mutually inconsistent, they'll change them accordingly). —It certainly seems, by the way, that the human psyche has common aesthetic standards virtually hardwired into it, seeing as particular artworks resonate through the ages.

I agree with Ronald Dworkin that ethical and aesthetic relativism are pernicious, perfidious things. “It is now strenuously argued,” says Dworkin, “that since there is no objective truth about interpretation or art or morality there can be no standard of merit or success in artistic or moral or legal thought beyond the interest a theory arouses and the academic domain it secures.”² Postmodernism is a mendacious creed—a philosophical nihilism that criticizes everything but itself. That there is no objective truth about which values are best does not mean that mankind can have no universal ethical and aesthetic standards. Given that the vast majority of people have common intuitions about what is valuable, we might as well take these intuitions at face-value and adhere to them. Murder is ‘bad’, theft is ‘bad’; excessive sentimentalism is bad, inauthenticity of any sort is an artistic crime. Prejudice is bad not only morally but also with respect to reason: it entails an insensitivity to rational considerations. People across cultures share the intuition that whatever exalts humanity is for that reason good, while whatever degrades or demoralizes it is bad; and they agree, to a large extent, about what it is that thus exalts or debases. “The general principles of taste [and ethics] are uniform in human nature: where men vary in their judgments, some defect or perversion in the faculties may commonly be remarked; proceeding either from prejudice, from want of practice, or want of delicacy....”³ That there is no ‘objective truth’ about these matters can and should be ignored, except insofar as it militates against zealotry.

Indeed, I suspect that the views outlined in this paper have implications vis-à-vis our substantive moral judgments. We should, perhaps, jettison such terms as ‘right’ and ‘wrong’, in that they sound more objective than words like ‘good’ and ‘bad’. Nothing is [absolutely] *right* or *wrong*; it is merely good or bad (relative to something else), and there are gradations in its goodness or badness. Moral absolutism can seem lofty and noble, but it is simpleminded. Objective-sounding norms like ‘justice’ are, as Hume said, artificial; the real substance of morality consists in its prescriptions for well-being and against suffering. These are, by and large, the only ethical norms we ought to take seriously, given the comparative unpretentiousness

¹ Hume, “Of the Standard of Taste”, in *The Philosophy of Art*, p. 262.

² Dworkin, op. cit., p. 89.

³ Hume, op. cit., p. 265.

of their pretensions to objectivity, as well as their immediately concrete implications and their direct relation to universal intuitions. Abstract principles, such as Rawlsian justice and Nozickian liberalism, have an air of ‘objectivity’ about them, as if they are justified by pure reason—which is impossible. Every such justification presupposes values and is merely an elaboration of values. Why not, then, forego the involute philosophizing, the building castles-in-the-air, in favor of alleviating suffering and promoting well-being on a case-by-case basis? Let’s forget about meaningless abstract principles like “Life for its own sake!” or “Marriage is a timeless institution between blah blah blah”: let’s be pro-choice and pro-gay marriage, because these positions are not self-delusively ‘objective’ or ‘abstract’ but instead promote concrete well-being, which is all that matters and is the only real substance to morality. And in any case, let’s abandon the enterprise of grand ethical system-building, which gets us nowhere.

A complete elaboration of the foregoing thoughts would occupy several books, but I hope I have at least sketched a few solutions to some of the perennial problems of moral philosophy. The main point of this paper has been to show that the dichotomy between ‘objectivism’ and ‘relativism’ is false; a third way is available.

*

The paper teems with suggestions each of which the glorified bureaucrats in academia could expand into a long article. And I wrote it in ten days. In a flurry of genius.

It was, indeed, an agonizing process. I *thought* and *thought* and *thought*, for hours and hours at a time, desperately trying to get clear on all the issues—especially in the section on practical and theoretical reason; that was the hardest—and rewrote passages again and again, rethinking them almost endlessly. But I had faith in myself and the power of reason. That’s why I’ve never failed in any intellectual endeavor I’ve seriously undertaken.

One of the reasons the world is worth anything at all is that it produced me. (Cf. Hegel: after rebelling against the world, the virtuous consciousness—or whatever he calls it—finally realizes that society can’t be *all* bad, since it produced the virtuous consciousness itself!)

March 3

Critical note I wrote on Kant:

In the Refutation of Idealism, Kant’s purpose is to argue that “the mere....consciousness of my own existence proves the existence of objects in space outside me”. His argument, however, is unclear, and in any case fails to establish the thesis no matter how it is interpreted. It establishes, at most, only that we are, and have to be, immediately conscious of physical objects as existing independently of us, not that we’re *right* in being so conscious.

“The consciousness of my existence,” writes Kant, “is at the same time an immediate consciousness of other things outside me.” This statement he had in fact proven in the Transcendental Deduction, where it is argued that self-consciousness (apperception) necessarily involves the synthesis of the intuitively given manifold into a unitary ‘objective world’ determined by the categories. The transcendental unity of apperception is ultimately responsible for our being phenomenologically confronted by an objective world (as well as for the unity of this world). The unity of apperception entails, and *is*, the unity of the *object*. Thus, self-consciousness has to be immediately conscious of itself as separate from an object (nature, the objective world); in other words, it has to be conscious that this object exists independently of it. —Notice I haven’t said that this object has to actually *exist*; I have

said only that consciousness must unreflectively perceive it as existing. This conclusion is all that is strictly said by the quotation above.

However, the argument that Kant himself uses to justify the first sentence of the previous paragraph does not work. He states, first of all, that all time-determinations presuppose something permanent in perception. I won't argue with that, though I haven't decided whether I agree with it. But let's assume it's true. The next sentences are as follows: "But this permanent [thing] cannot be an intuition in me. For all grounds of determination of my existence which are to be met with in me are representations; and as representations themselves require a permanent [thing] distinct from them, in relation to which their change, and so my existence in the time wherein they change, may be determined." Kant is not entitled to say that representations require a thing distinct from them, a thing of which they are representations. Admittedly, the *word* 'representation' does presuppose an object represented, but surely this tautology is not what Kant is arguing for. Rather, he is saying that the appearances given to us must be appearances of something outside us; and he has not offered any convincing arguments for that claim. It's conceivable that the appearances given to us are 'spontaneously' produced by consciousness, through some process of which we are unaware. (After all, we need not be explicitly aware of everything 'within' consciousness. In any given moment, for example, we are having sensations of which we are not fully conscious.)

Incidentally, on his own Critical principles Kant cannot justifiably speak of representations as being determined by something outside them—being 'caused' by it, or 'influenced' by it, or 'dependent' on it, or even *of* it at all. For these expressions presuppose causality—i.e., causal interactions between the thing-in-itself and the representation of it—which Kant has argued is nothing but a category in the mind, inapplicable to the noumenon. It would seem, indeed, that Kant is not entitled to the thing-in-itself at all, that it merely mucks up his whole theory. He cannot both speak of objects as existing independently of the mind and at the same time claim that the categories are not valid independently of the mind, for if appearances are representations of something outside them then evidently the categories (causality, etc.) *are* applicable to an external world. —In any event, the thing-in-itself seems unnecessary on Kantian grounds.

To repeat, no arguments offered in the Refutation of Idealism prove the necessity of the thing-in-itself. They don't refute idealism. Kant can claim only to have established (perhaps) that appearances necessarily have an object-ive character. But I see no reason why Descartes or Berkeley would have to deny that.

I'm not sure I agree with the writer that Kant isn't entitled to the noumenon. For one thing, he was obviously *right* about it; there obviously *is* something in the world that we can't intuit, namely the realms of quantum mechanics and general relativity. [Or rather, the world-in-itself.] Our cognitive apparatus is inadequate, or structured so as not to intuitively or conceptually understand these things. By the way, I want to reaffirm my commitment to the idea of a "pre-established harmony", pre-established through evolution and natural selection. The modes of our "understanding" probably do harmonize in some way with aspects of the way the world is in itself. (The universe is almost completely "flat", in the relativistic sense, which is why Euclidean geometry—"flat" geometry—describes it [or at least our region of it] well. At least, that's what I recall thinking after reading books years ago.) I've never encountered a good argument against pre-established harmony. It has to be true. It's the only thing that makes sense. Given that there is synthetic *a priori* knowledge and that we can manipulate the world scientifically, the world's spatial and temporal 'forms', or forms analogous to them, have to be hardwired into us.

In his comments on my paper, the professor remarked that "the 'outside' reality Kant is citing in the Refutation of Idealism is not the thing-in-itself but *material substance*, which is a phenomenal reality". This is what I've never understood about Kant (and Schopenhauer). Phenomena are supposed to be dependent on the mind—they're nothing but appearances, representations; their spatiotemporal form is

imposed by the mind—yet they're also supposed to be outside the mind, independent of it. This book I see, or the organs in my body, or any physical objects, exist in the world even when I (and others) are not perceiving them; yet the form of their existence, says Kant, is imposed on them by the mind. So evidently they *don't* exist independently of the mind! It's a blatant contradiction in his philosophy. To be consistent, his idealism would have to be Berkeleian. Objects exist only insofar as minds posit them. —That idea is ridiculous, of course, but it's surely what Kant, in spite of himself, is committed to.

Obviously objects *as we see them* don't exist outside minds, but *scientific* realism is true. Arthur Eddington was right: the table I see is not the table 'as it really is', independently of how my mind structures experience; the real table is mostly emptiness, consisting of particles (electric charges, protons, neutrons, all the subatomic theoretical entities) flying at each other, hitting each other and so forth. Carl Hempel (in *The Philosophy of Natural Science*) stupidly criticizes Eddington's distinction between the real and the apparent,¹ or the outside world as it is in itself and what I see, but, then again, Hempel was an analytic philosopher, so what do you expect?

Everyone knows that secondary qualities (taste, color, smell) don't belong to objects in themselves. Kant thought that the same is true of primary qualities (shape, extension, etc.), and that space itself is a product of the mind. Eddington and I differ from him in thinking that space and time do exist, in some way or other, outside the mind, and that extension and shape probably do as well—at least up until the subatomic realm—but we agree that the world as unperceived by minds has a radically different 'appearance' than it does when perceived. Of course, to speak of 'appearance' here isn't legitimate, since nothing is being appeared to—but this fact is, ultimately, the source of all the confusion! We want to know how the world appears when no one is perceiving it—i.e., "what it is in itself"—but the very idea of appearance seems inadmissible then. And yet we can't get away from it.

From the perspective according to which well-roundedness is the pinnacle of human existence, it's great to be me. Not necessarily because I'm well-rounded, but because the world forces me, more than it does others, to develop multiple sides of my personality. Innately I'm fairly developed in the artistic and intellectual spheres; my weaknesses are in the practical sphere. But the world forces me, as it does everyone, to acquire skills in this sphere too. Gradually I become more or less as skilled as everyone at socially interacting, at finding my way around cities, at taking care of responsibilities, all of which areas I'm innately deficient in. The result is that I become a much fuller human being than others.

I sometimes fantasize about living in some small town in the Alps, far away from civilization and disgust. Just spending the rest of my life in the Alps.

March 6

The pills I'm taking work well—not the insomnia pills, the other ones—but they prevent me from being melancholy at night. Which means I can't write poetry. I'm too 'contented'. The poem I wrote above was the product of four days without pills, when the nightly melancholy had started coming back (not every night, but occasionally). But since I have two dates this week—Yahoo Personals—I feel like I should keep taking the pills. But damn it I want to write poetry.

My students recently had to write a paper about downsizing in businesses, and Marxism was one of the theories they had to mention. To criticize it or whatever. But they all agreed that Marx was mostly right about capitalism. (Remember, these are *business* students.) —It's a sign of the times. Everyone is disaffected.

¹ Those terms can be misleading. In a sense, the table *really is* the substantial, colored object I see, inasmuch as the appearance *really exists* 'in' (or 'because of') my mind; outside my mind, though, the table is not colored. Its mind-independent 'appearance' is not at all what appears to *me*.

Poems I wrote earlier this year (last year):

My friend

We're friends, and that's how we both want it,
 but I love her like a sister.
 And when I feel like the blue of Picasso's early phase,
 I think of her.
 And when I'm too dead to leave my bed,
 I wish she would appear in my room.
 Her laugh is like the warmth of clothes newly laundered
 when you bury your face in them—
 the comforting warmth, like her laugh.
 She is thoughtful, too.
 She calls me sometimes at night
 just to talk, feeling lonely
 or knowing I am alone too.
 And I tell her I love her like a sister, and we laugh.

Thoughts in December

It's funny: although the December wind shakes
 the window frame and seeps in and the snow
 is monotonous as always and I have been alone
 all my life;
 although the music is no longer as comforting
 as it once was and the ignorant child is building
 his snowman below the window where I have sat
 all my life;
 although I can see his mittens flecked with cold
 white flakes of hope and I do not envy his youth
 for youth is the prelude to a sadness that has lasted
 all my life;
 although the wind rattles the window frame;—
 I am resigned and content, as I have been
 all my life.

A November day.— Sitting here in front of my window as it rains outside, with the dark clouds overshadowing the day and the autumn wind blowing leaves from trees, the warm light in my room softly contrasting with the dark outside as I listen to the first movement of Schubert's piano sonata D. 894 (a piece simple in its beauty)—I feel comfortable and cozy, and I don't remember the last time I was this contented.

Nature's humaneness.— When one has been attached to a girl for a long time but not in a relationship with her, but has held out hopes that she might someday change her mind and perhaps give one a hug or a kiss or something and even slip her hand into one's own as one is walking beside her in the park like one does so often—the shaded spot in the park is a good place to be happy, especially in this spring air—and when one has thought about the feel of that dainty hand in one's own with a certain longing, simply because the

girl is lovely and talks with a voice that sounds like liquid crystal, but suddenly one realizes that she will never, ever consent to a kiss because her every thought is not of this girl whose voice sounds like love, or how love must sound.....one is glad that there is such a thing as sleep, and that someday there will be a longer sleep, a very long and happy sleep without dreams....

Watching hip-hop videos on Youtube—Dr. Dre, Snoop Dogg, Eminem and all the homeys—with all the naked chicks swarming everywhere like flies around shit, it makes you want to fucking vomit, and yet I'd love to be in the position of those money-squandering pimps who live like fucking Roman emperors—at least for a few months, I'd like to experience the life of musical whoredom just so I could move beyond it—and also, yes, for its own sake. Fucking what a world.

People who believe in the dignity etc. of mankind don't take a broad enough perspective on the species. We're like monkeys screaming and running around, male monkeys strutting so they can look dominant and female monkeys taking off their clothes and “presenting” their vaginas to the males—bending over, dancing and swaying, begging to get nailed by the dominant males. Like monkeys hypnotized by the rhythm, the pulsating bass, the primal urges, the deep vibrations arousing them so sex-lubricant oozes from their holes smelling of shit and piss, and the males rubbing up against them all cocky and rough. Monkeys wearing shiny rings and cloths they've found somewhere, mesmerized by the shininess of these stones they carry around, like chimps that collect shells or male birds that decorate their nests to attract females. And the chimps that go on wild rampages around the forest destroying branches and trees to show off their strength—it's just this fucking hedonistic hip-hop culture, this pop culture, this animal world.

And then I read philosophy! What a charade!

March 7

Aaaaaah, how shallow writing is. It can't communicate spontaneity. Which means it can't communicate *me*. I am nothing but spontaneity (except when I'm not).

Here are some random discarded notes I wrote for the book:

....I'd advise the same optimism to writers of fiction and poetry—*serious* fiction, not Dan Brownian crap. But Dan Brown's popularity shows that, despite what I wrote in the Introduction about the demise of narrative, people still enjoy reading books for the plot. And they still like to identify with a protagonist, and have the world interpreted for them by the narrator, and experience a Beginning and an End despite the simplicity of that notion, and in general to escape once in a while from the oppressive spirit of “seriousness”. That is, people like to *play*, to *enjoy* themselves, and they always will, no matter at what age and in what era. To fantasize, to be taken to a different place and time by a narrator manipulating your consciousness into temporary forgetfulness of stress and time and all cynicism, is a delight. There are plenty of novels that are neither purely commercial nor purely intellectual (i.e., on the “cutting edge” of literature) yet borrow elements from both the high and the low—for instance, the beautifully constructed sentences and thematic significance of the high, but the so-called “inauthentic” narrative elements of the low—plenty of novels with these features that become popular, critically acclaimed and commercially successful. There is no need to despair, then, if you're a writer. Fiction is indeed held in more contempt (implicitly) by our culture than by any in centuries, perhaps millennia, but it is still enjoyed. It has to be, and it always will be.

A great writer, a writer on the order of Tolstoy and Dostoyevsky, who is not merely ‘challenging’ but also suspenseful and enjoyable, epic and universal—who writes books with a hero....[etc.]....can craft scenes as beautiful as Ras. & Sophia.... and the ending of B. K....., with its final jubilant “Hurrah for Karamazov!”—as life-affirming as Levin's mowing in the famous scene with peasats.....—he can still exist in this culture. Such a writer would necessarily have contempt for the postmodernist's contempt for narrative; he would reject the self-consciousness of a novel like *The Unbearable Lightness of Being* as

being symptomatic of a societal malaise and as such parochial; he would reject opinions like Richard Gilman's, that narration is "precisely that element of fiction which coerces and degrades it into a mere alternative to life, like life, only better of course, a dream (or a serviceable nightmare), a way out, a recompense, a blueprint, a lesson"¹—or rather accept them but reject their hostile undertone, saying in response, "The conviction of the inauthenticity of narrative and all fiction arises precisely from the inauthenticity of the culture whose conviction it is, from the self-consciousness and universal doubt of a self-hostile age, which doesn't realize that life itself should be an alternative to life, that philistine 'seriousness' is in the spirit of *death*, that life, with all its unhappiness and joy, should be grounded in the spirit of play—of luxury, of superfluity—and not in any sort of mimesis of the dull nihilism of the universe or of life 'as it is in itself', 'as it really is'—'absurd', 'senseless', 'meaningless', 'fragmentary'—and that fiction in the grand old style, from this perspective, is indeed the fulfillment of life!" The fragmented, self-skeptical postmodern novel has its strengths, but it is something that has to be superseded. Its insights have to be taken up and transcended, in the Hegelian fashion. A great writer in this post-postmodern age would make allowances for our self-consciousness, our 'sophistication', giving it its due, but ultimately in the epic sweep of his novel would leave behind its nihilistic implications. He would, that is, abandon postmodern fragmentedness—with its solipsistic wordplay, its indeterminate meanings, its competing and irreconcilable voices, its unstructured structure—in favor of a vast unity (though not necessarily a "univocal" unity) that includes fragmentedness as a "moment" in the whole.

Narrative can never really die, the novel can never die. They're too essential to the good life. They may suffer temporary eclipse in a culture characterized by the eclipse of humanistic confidence, but even then they'll enjoy a sort of underground popularity, as they do now—a popularity outside the main stream of culture. A writer who would reclaim the primeval nobility of his vocation would not be ashamed of his instinct for narrative, nor of his instinct for synthesis. For synthesis is the imperative in all spheres of life. Analysis, yes; rebellion, yes; but ultimately synthesis. Unification, self-unification (one of the manifestations of which, I noted earlier, is self-*diversification*). When reading literature, one doesn't necessarily want to be reminded of one's inauthenticity (the inauthenticity of one's society), i.e., one's lack of self-unification, one's "decenteredness"—one's doubts about selfhood, about the comprehensibility of life, about the existence of truth; one may, instead, want to partake in the imposing of order on life. Order is ultimately the only real 'authenticity', for the alternative to order is doubt—chaotic self-consciousness—which, as Hegel said, "alienates" one from oneself, separates one from one's free nature. Order is true freedom, in the old Goethean formula. This is not just a meaningless humanistic slogan; it expresses a profound truth. For freedom is self-control, self-appropriation, the owning of one's acts and consciousness; it is feeling-at-one-with-oneself, not being coerced by either an external or an internal force. Freedom amounts to mental health, which is just self-integration and self-order—having an intuitive 'core' self that can assimilate experiences and sort them out, relate them to one's sense of self and thus appropriate them, making them one's own and 'explaining' them by reference to the schema that one's psyche (of necessity) imposes on the world. —My point is that, in literature, narrative—i.e., the relating of a succession of events from a perspective that at least partially 'transcends' them, from which they can be interpreted and sorted out, their interrelations remarked on, etc.—is analogous to real authenticity in the self, to freedom and autonomy, self-determination. The ability to enjoy narrative is an indication, though not proof, that one is not divided against oneself—that one can step outside oneself [...]

*

On Women

Lord Byron said once that the company of women always made him feel 'soft' and 'gentle' somehow, semi-purified of his vulgar masculine traits. He could be joking bawdily with his male friends, but a woman enters the room and he suddenly feels civilized. Involuntarily so.

¹ Quoted in Trilling, *op. cit.*, p. 135.

I've always liked John Keats' poem "Woman! when I behold thee flippant, vain". Despite its literary flaws—its mannerism, sentimentalism, exaggerations—and its condescension, I consider it a wonderful and fresh expression of the masculine love for women. It rings true.

How many times have I burned with the sentiment that animates Andrew Marvell's poem "To His Coy Mistress"! *Carpe diem*, woman! But too often I have sat alone with cheeks burning as I thought of my vanishing youth. Damn time and its "wingèd chariot"! [...]

[...]

This sort of lyricism is frowned on in our culture, which no longer trusts such pure feelings—it calls them "sentimental" and laughs at them—and, besides, hates the political incorrectness they can easily fall into. For it is but a small step from them to the idea of the Eternal Feminine, the notion that women are ideally beautiful, pure, innocent beings before whom the conscience-stricken man (tormented by dark, unmentionable Byronic crimes) falls to his knees in worship. No matter that many women are secretly attracted to this vision. It isn't socially acceptable, and in any case is simplistic.

The Eternal Feminine is, no doubt, a Goethean myth, an idealization invented by "beautiful souls" for "beautiful souls". It isn't reality: women aren't eternal and they sometimes aren't even feminine. Like most ideals, though—and stereotypes—it has a kernel of truth.

Is there such thing as a female (and male) 'essence'? Do women—and men—tend to share traits across cultures, biologically determined traits? I think so. It must be emphasized, though, that insofar as they do share qualities, the latter are not 'absolute' but only *relative* to the opposite sex. It would be asinine to say that women are "passive" and men "active"; that's a stupid prejudice. It's even meaningless. But if you qualify that statement by saying that women have *tendencies* to be *relatively* "passive"—in some unspecified sense—in comparison with men, it starts to become less obviously wrong. [One clear example: in sex, the woman is the receptive partner.]

It's unfortunate that the search for commonalities between women is quickly labeled by feminists as symptomatic of the male's desire to dominate. They equate this kind of psychology/social science with the transparent manipulation of power-relations. Even if I point out that I have the same ambition with regard to the male sex (that is, to understand it), they retort, "Well, unconsciously you think that by lumping together women you'll have more leverage for oppressing us". But this is little better than name-calling. Serious, disinterested analyses, like Freud's or D. W. Winnicott's, should be examined on their own terms, refuted or confirmed analytically, not *ad hominemly*. I suspect, in fact, that some radical feminists suffer from something like *ressentiment*, bitterness toward both men and women for the latter's subjection to male power-structures, such that they care more about fighting the tyrannical Other than seeking truth.

Or maybe some feminists will say that, though I may not actually want to *oppress* women, I unconsciously desire the comfort of being reinforced in my prejudices about gender-roles by masking them in the guise of scientific respectability. Therefore I want to believe that women have innate tendencies in relation to men, and my investigations will inevitably lead me to this conclusion. I think this is mistaken, however. I have no love of societal roles. I'm tempted to advocate, say, that only women be allowed to enter politics, in the hope that they would do a better job than men have. And I would happily spend my life fighting the oppression of women if I thought I could have any impact whatever. At the moment, though, I want to take my fight against hypocrisy into the sphere of political correctness itself.

By the way, this feminist suspicion of the quest for sex-knowledge is part of the unfortunate legacy of Foucault and Derrida. "There is no truth! There are only power-relations! Nothing exists outside power-relations!" Not only is Foucauldian and Derridian pseudo-philosophy self-refuting, in that its position can be stated, essentially, as "*The truth is that there is no truth*," but it is dishonest and self-uncritical. At least the ancient Greek skeptics and the early modern skeptics had intellectual integrity; they didn't hide their doctrines in obscure prose. They said what they meant and confronted its implications. Postmodernists look askance at intellectual integrity, for they think that motives are usually selfish and grounded in the pursuit of power.

Let's leave this cynicism behind and confront honestly the question whether women and men are, to an extent, genetically determined in their modes of interaction—and if they are, to what extent. In other words: nature or nurture? [Of course, anyone with a few functioning neurons in their head knows that both

nature and nurture are relevant.]

Before I address that question directly I'll give the reader some sense of what philosophical feminism is, so he knows what we're up against. It is quite different from the old political movements for suffrage and equality. It aims instead to show how gender-relations and -roles are socially constructed, and to illuminate what it means to be a woman in the modern world. A lot of it borrows from Derridian deconstructionism, Foucauldian discourses on power, and Lacanian psychoanalysis—probably because these philosophical currents naturally lend themselves to challenging the Establishment. (Lacan, for instance, reinterpreted Freud in ways that harmonized with Derrida's attempts to subvert the Western philosophical, male-dominated tradition.) Feminism has become so diverse that it's hard to characterize it in general terms; certain feminist currents are in direct opposition to others. For example, some feminists—like Hélène Cixous, Alice Jardine and Luce Irigaray—imply that women are essentially and universally different from men in their behavior, their desires, their self-understandings, and that the masculine order has deceived women about themselves for centuries—although I usually find these feminists' arguments to be unclear and hard to follow. (In this respect they follow in the footsteps of their poststructuralist forebears.) Others argue that there are really no innate differences between men and women, that there seem to be such only because the sexes have been socialized into gender-roles.

In general, though, there tends to be suspicion towards 'masculine' modes of being and writing. Carol Gilligan has argued for an ethic based on the feminine notion of 'care' rather than the masculine one of 'duty'; Cixous admonishes women to oppose masculine forms of writing, with their representationalism and logic, and instead to write "with their bodies", to write "in white ink". Like a good Derridian, she points out that language is saturated with "binary oppositions" such as nature/culture, man/woman, activity/passivity, speaking/writing, cause/effect, mind/body. She thinks that this has helped sustain male privilege. Women ought therefore to reject binary oppositions in their writing, which means writing poetically. Prose is too masculine, too objective and logical.

This hatred of binary oppositions is a common theme in French feminism, as it is in poststructuralism generally. These oppositions are attributed to the Western "phallogocentric" and rational way of being; they're opposed because they are said to conceal value-judgments—in that typically the second term (woman, passivity, effect, body) is valued less than the first (man, activity, cause, mind)—and because this reinforces the marginalization of minorities. In many writers this critique of binary oppositions leads to a critique of logic, of reason, of the notion of truth, etc. These ideas are all masculine, simplistic and Eurocentric.

Now, the ubiquitous presence in language of conceptual dualisms is indeed a striking fact, and one that demands explaining. Not surprisingly, however, few of these thinkers have made an honest attempt to explain it. Nor does it occur to them that in *all* languages—or nearly all—dualisms play an important role. Cause/effect, man/woman, false/true, good/bad, knowledge/ignorance, nature/civilization, space/time, presence/absence: such fundamental oppositions are universal, not just Western. This means that invoking "Western culture" isn't sufficient to explain them. The critiques of logic and truth are similarly superficial, and ultimately self-refuting. Necessarily so. Logic may in some respects be more masculine than feminine, but this is far from being an argument against it or its necessity (if there is to be such a thing as language and thought)—just as it isn't an argument against Gilligan's ethics that they're more feminine than masculine.

You can see already, though, that recent feminists have been confused about what their theoretic ambitions are. Politically, they all agree that women should have an equal status with men, that they should have as much political and economic power as men. Theoretically, however, there is nothing like a consensus about what the agenda should be. Some proudly affirm that women are inherently more emotional, nurturing, bodily oriented, 'non-rational', and empathetic than men; others, especially in America, think that, aside from their physical differences, women are not inherently different from men. They have been *socialized* to be "feminine", i.e., emotional, passive, nurturing, etc. (These theorists fail to explain how the vast differences between gender-roles could have evolved on the basis of substantial biological similarity.) One of the few things most feminists can agree on is that women aren't inherently

passive. ‘Passivity’ has an unpleasant sound, after all; no one wants to be called passive.¹ There is also a general aversion to “essentialist” formulations, because of their association with such horrible things as the Enlightenment, progress, rationality, “totalizing visions”, “meta-narratives” and so on.

I’m putting most of my arguments for the innate differences of men and women later in this chapter, in the disjointed-thoughts section. So I apologize if I end up repeating myself. At the moment I’m going to try to describe, in very broad strokes, the female psyche and its differences from the male. Everything I’ll write is a mere hypothesis, something to which I’ve been led by armchair psychologizing and to which I am by no means wholly committed. I undertake this exploration purely to counteract the superficiality and confusion that reign in writings on sex and women, and especially in all politically correct discourse.

The relative ‘passiveness’ and communal/nurturing tendencies of women (which, again, I think are only *tendencies* true of *women in general, in relation to men in general*)—in both their transhistorical and their culturally specific manifestations—are intimately related to women’s experience of their bodies. Psychoanalysis has insights to offer in this connection,² but, on the whole, I won’t make use of them. For three reasons: I don’t have the expertise; I’m suspicious of the scientific pretensions of psychoanalysis, and in any case am uncertain what criteria to use (apart from intuitive introspection) in weighing one theory against another; and I want to approach the issue from a purely phenomenological perspective. I don’t want to wade into the mire of childhood sexuality. Instead, I want to sympathetically enter into the experience of a woman (as such), to see if I can unravel the myriad puzzles and paradoxes she presents to a typical male. I have no interest whatsoever in “judging” women, only in understanding them.

Where to begin? I can think of no better starting-point than the testimony of a woman. Christine Downing, a respected academic, is noteworthy for her honesty and introspective powers. The following passage, which points to the importance of menstruation for women’s self-conceptions, is from the book *Women’s Mysteries*.

In a female ritual context menstruation means more than the beginning of reproductive capacity; it means initiation into shared sisterhood with all who bleed. I know women who have sought to create menstrual rituals together. They save their blood and pour it onto the earth. They break the taboo against this blood by doing this not alone but in each other’s company. They tell each other their stories of first bleeding. They welcome one another into the circle of women, knowing many were not welcomed when that blood first flowed. They tell one another the stories of the humiliation of the blood...

...From a series of letters written to me over the course of years I have culled these reflections:

“I write today as I bleed. The first day and the heaviest flow. I write feeling my weightedness, the drag of my uterus. Feeling my wound, my incapacity. All the changes in my body—my voice flattened, my belly swollen, my clumsiness, a flood of dreams I cannot bring back to consciousness.

“How difficult it is to stay in the body. I get up, get to the bathroom, reach into my vagina for the menstrual sponge—a bloody mess! Squeeze the blood into a cup. It splatters everywhere.

“Can I write this to you? Am I so crazy I don’t even know it? Today I feel such self-doubt.

¹ Incidentally, I haven’t encountered a single feminist text that distinguishes between *absolute* passiveness and *relative* passiveness. Every writer laughs at the idea of *absolute* passiveness, but none considers the more plausible notion of passive *tendencies relative to men as such*, which is very different. No one, after all, would deny that individual women can be extremely active, dominating, etc.

² See, for example, the anthology *Female Sexuality: Contemporary Engagements*, ed. Donna Bassin (Northvale, NJ: Jason Aronson Inc., 1999).

“The knowledge of taboo returns. The blood is not to be touched, let alone saved.

“Even what we value of menstruation—are our bodies there? We value the rhythmic cycle, the feelings, the dreams, the bond. We talk and interpret. Analyze dreams. Theorize. Baroque elaborations. Virginal fluffy clouds. Ascending out of the blood, the mess, the ache, the wound.

“Even this writing. How difficult for me to stay with my body. My feelings of vulnerability. My tears that I had hoped were past, falling again. Fears and doubts.

“Here I am. The ache in my lower spine is sensual, as is the openness of my vulva, my blood slipping in my vagina.

“A wound not to be healed—but attended to—felt, touched, smelled, seen. Received.”

Merida’s words remind me of how our monthly periods open us to our vulnerability, our tears, our doubts, our fears, to a sense of wounds as not to be fixed but attended to. She encourages us to honor our dreams, the dreams we have that prepare us for our bleeding, the dreams that accompany our bleeding, the dreams that warn us we may cease to bleed...

How ridiculous it is that even in our sex-obsessed culture, such confessions make us blush! Sexuality is *still* thought of as sinful! (Many thanks, Christianity.) This is of course part of the reason for the modern woman’s insecurity: in our prudish, puritan culture, where everyone is “sanitized and deodorized”¹—dehumanized—menstruation will tend to make women a little ambivalent about themselves, consciously or unconsciously. Particularly in their younger years, when they’re still learning about their bodies. The mess itself, in any cultural context, might be enough to induce a little shame and self-ambivalence. But in the context of enforced privacy—in the bathroom, that most sterile of places—as well as the silence, the secrecy (more or less extreme according to the girl’s family and education, but unavoidable due to the societal framework), menstruation becomes even more significant. And given the young girl’s intuitive knowledge that her blood-letting is a momentous event, that it signifies something of profound importance for her sexuality and her self, that it means she has reached a new stage in her life—and that this new stage is centered around her vagina, this mysterious and forbidden little hole—all these positive and negative factors, some culturally conditioned and some transhistorical, will combine to create in her a sense of self-aware that is unlike anything a boy experiences. (The comparable event in a boy’s life, viz. the first time he ejaculates, is less momentous and purely pleasurable.)

It is odd that America, which may be the most prurient nation in history, still suppresses public dialogues on these darker sides of sexuality. Despite all the magazines devoted to sex and sexuality, there is still something like a conspiracy of silence about them. It is more pronounced in certain geographical regions than in others, but, as far as I can tell, it reigns almost everywhere. Sex-education programs are helpful in counteracting it, but they can’t dissipate the atmosphere of conservatism that saturates the culture. This ‘atmosphere’ cannot really be pinpointed; it is more a state of mind and behavior—a state of the collective mind—than anything else. It manifests itself in repressive standards of propriety, in the awkwardness or laughter that results if vaginas or penises, or even breasts, are mentioned, and in the patterns of reporting by America’s mainstream media. Reporters never say ‘penis’ or ‘vagina’ on television, and they try to avoid the subject of sex altogether; nudity, of course, is forbidden. Most important, though, is the girl’s family situation. Downing writes of how her mother treated the onset of Christine’s menstruation as a shameful secret to be kept from her brothers and father. It was too repulsive to be discussed openly. Had the family been more open and easygoing, Christine’s mature attitudes toward herself and her sexuality would have been less conflict-ridden than they were. Her sense of self, in other words, would have had a more secure, proud, self-accepting foundation; she would have been less self-conscious, self-doubtful and “vulnerable” than she was. In being more comfortable with her monthly bleeding, she would have been

¹ Paddy Chayevsky’s words.

more comfortable with her self.

Women, indeed, seem to be more complicit in the silence about sexuality than men: they often take offense far more quickly than men if sexuality is talked about in a social environment. They may giggle at first, but gradually in the course of a conversation they may well become uncomfortable and finally demand a change in topic. For the most part, they simply tend not to like talking about vaginas or anything sexually explicit. It seems to make them self-conscious. And their self-consciousness reinforces itself: modern women in particular are ambivalent about their sexuality—embarrassed by it, insecure about it, but also proud of it and deeply attached to all its facets—so they manifest their ambivalence in public (wearing tight, skin-exposing outfits but pretending to be pure-minded), which itself reinforces and propagates (to young girls) their ambivalence! Their attitude results in behavior that reaffirms their attitude. It's a vicious circle.

The “conspiracy of silence”, though—i.e., the deleterious psychological effect of a young woman's having to sort through her confusing, ‘embarrassing’ sexuality in relative privacy, rather than in a communal atmosphere of understanding and acceptance—is only one aspect of the problem. Equally harmful is pop culture. The magazines, the movies, the television shows, the fashion trends. What is *said* (and shown) is as harmful as what is *not* said. Young women are taught by example, and by the magazines, that sex, youth and beauty are the highest values in life, that womanhood is nothing but pure femininity (i.e., beauty, innocence, passiveness, self-consciousness, sex-objectness), that whatever doubts they have about themselves are probably right—but that they can be fixed, namely by embracing femininity—that cleanliness is godliness, etc. If they show a lot of skin but not *too much* skin, if they're thin but not *too* thin, if they're clean and pretty and sweet and childlike and extremely sexual, they'll find a good man and thereby happiness. All this is calculated to increase self-consciousness and insecurity. Even the “advice columns” in magazines, the ‘sympathy’ that certain television programs and magazines exude for young women's doubts, are ultimately harmful. For they serve indirectly to bolster doubts, namely by focusing attention on perceived weaknesses and emphasizing that if women *really try*—if they (nearly) *obsess* over their flaws—they can conquer them. Pop culture does have a few redeeming aspects, such as its propagation of the idea that female masturbation is normal, but on the whole its influence is pernicious...

To return to the phenomena of repression.—It's easy to blame Christianity (Puritanism, etc.) for the repressive atmosphere that persists in America despite pop culture, but this wouldn't be entirely correct. There is no question that the Puritanism of the early colonists still reverberates, but I think that deeper biological/psychoanalytic factors are responsible for at least a portion of the revulsion we feel for all things sexual and animal-like. Indeed, repressive movements like Puritanism would not conquer so many minds were there nothing in ‘*human nature*’ with which they resonated. They simply accentuate and exacerbate already-existing tendencies that are grounded in the nature of the human psyche. History and anthropology provide support for that hypothesis. Look at the Old Testament. Leviticus, in particular. It says there that “if a woman have an issue, and her issue in her flesh be blood, she shall be put apart seven days: and whosoever toucheth her shall be unclean until the even [etc.]”. Similarly: “if a woman have conceived seed, and borne a man child, then she shall be unclean seven days; according to the days of the separation for her infirmity shall she be unclean”. With regard to men: “if any man's seed of copulation go out from him, then he shall wash all his flesh in water, and be unclean until the even.” Lest you think these proscriptions are a peculiarity of the Judaic tradition, I'll tell you...to read about other societies. You'll find comparable practices.¹ In any case, the facts that even people in archaic societies cover their genitalia and have sex and defecate in private (usually) show that humans are somehow instinctively ‘self-conscious’ vis-à-vis sexuality and defecation. They see these things as ineffably *other* than they themselves.

One wonders why. When did this self-consciousness originate (phylogenetically and ontogenetically)? *How* did (and does) it originate? Is it purely biological? ‘Hardwired’ into us? Or is it a result of inevitable childhood experiences? Maybe both: maybe early experiences call our latent self-knowledge out of its latency. Probably psychoanalysis and biology are both relevant to this question. But whatever the answer is, even young children somehow know that the sexual organs are special. And they

¹ [I wanted to provide a broad survey of societies but didn't have time.]

have a vague idea of their purpose. Before they have been taught anything about sex, they ‘experiment’, or they want to. They find a willing playmate and kiss, fondle, etc. Even at 6 or 7. (This fact in itself refutes traditional empiricism, viz. the theory that all knowledge derives from experience. Sexual knowledge is innate, and is merely ‘triggered’ by experience.)

Especially when one reflects that many studies have established the remarkably early emergence of stereotypical gender-roles—for instance, infant girls playing with dolls, infant boys playing with cars and blocks; infant girls clinging to their mother, infant boys demonstrating greater independence; girls doing more spontaneous smiling and being more attentive to faces—and on the fact that anthropologists have discovered uncanny parallels in gender-roles between cultures—all these considerations give support to the idea that the greater ‘self-consciousness,’ sensitiveness, and timidity of girls as contrasted with boys is not just a reflection of our Christian, capitalist, individualist, repressive culture. It is partly innate. And part of the reason for this is humans’ apparently innate self-consciousness in relation to their “private parts”—their knowledge of the categorical difference between, say, an innocent body-part like a leg and a “dirty” one like the vagina, the penis, or the anus. For, since girls are already imbued with this knowledge, the onset of menstruation (this messy, bloody, ‘animal-like’ thing involving their private parts) will be all the more meaningful for them. Potentially traumatic, but at the very least *meaningful*. More so than puberty is for the boy. It will make the girl more conscious of her body than the boy is of his. Even the growth of his penis doesn’t have comparable significance, for this is a gradual process that is, moreover, inherently prideful, whereas menstruation is a sudden event that can, surely, be as traumatic as it can be prideful. In fact, as I stated above, I think it is necessarily both: it causes satisfaction (if the girl understands its full significance) as well as doubt, or fear, or confusion, or revulsion, on a conscious or half-conscious level. It makes the girl very aware of her body (for she now sees her body as less under her control, more an ‘other’ that has its own will), which feeds into her growing self-consciousness and helps advance it beyond the level of the boy’s.

If I were undertaking a thorough analysis of the female psyche I would discuss Freud’s postulate of “penis-envy”, which, despite its ridicule by the politically correct media, has been taken seriously by psychoanalysts (of both sexes) for a century. A large amount of clinical data lends credence to it. [...]

To continue.— Another factor in the young woman’s self-consciousness is her breasts. The experience of the growth of her breasts, as well as of the breasts themselves once they have grown, is inevitably going to make her more self-conscious than the young man. There are several reasons. First of all, she can see that breasts demarcate her from the opposite sex, thus reaffirming her already-growing sense of community with other women (due to menstruation and other factors). In demarcating her from one group and tying her closely to another, they give her, perhaps, a more defined sense of self than the boy has¹—i.e., they focus her on herself. But her sense of self is not only more ‘defined’ (‘pronounced’, ‘intense’, ‘self-fixated’); it is also more *insecure*. And its insecurity is inseparable from its self-fixatedness. That is, she is fixated on herself because she is insecure about herself; and the more confident she is, the less self-fixated she is. Now, insecurity as such incorporates a value-judgment, namely that one deserves to be criticized (by oneself or by others). So the young woman, consciously or half-consciously, is self-critical. Why? Both nature and nurture come into play. I argued above that menstruation both *naturally* and *culturally*² can cause insecurity or self-criticism; nonetheless, I think that the cultural element is far more important than the natural. Certainly there must be natural causes to explain why young women in so many cultures (*all* of them, apparently) display self-consciousness and passiveness relative to men, but given this minor natural element, the character of the particular culture can exacerbate or mitigate the problem. Western culture happens to exacerbate it; Samoan culture (as described by Margaret Mead) apparently eased it. More on that later.

¹ To quote Spinoza: *determinatio est negatio*. The more differentiation, the more content. In any context. (Cf. Ferdinand de Saussure’s ideas on the meaningfulness of language as being due to the differentiation between concepts.)

² I.e., due solely to the nature of the particular culture.

But the point I'm making¹ is that breasts add to the insecurity—again, for both natural and cultural reasons. They're bound to make the girl more self-aware than the boy (*ceteris paribus*), if only because they're a new body-part. The boy doesn't gain body-parts during puberty; he gains only hair, height and penis-size. If he *did* gain a set of body-parts, you can bet he'd feel pretty aware of himself and fascinated by himself, as the girl is (by *herself*). But self-awareness does not entail, in and of itself, insecurity (though it does raise its likelihood). The latter is caused by several factors: first, breasts probably tend to reduce physical activity, due to their jiggle and the mass they add to the body. I can only imagine how self-conscious a running girl must feel, with her bouncing breasts. And I imagine that this self-consciousness would make physical activity less intrinsically fun than it is for the male. As for why women would therefore be relatively less confident than men: physical activity releases endorphins, which partly account for its pleasure and the self-confidence that goes with it. The less active a person is, the less confident he or she is (*ceteris paribus*). Thus, female biology indirectly causes women to be less self-confident than men.

Related to that is women's physical weakness and smallness. Other things being equal, the weaker someone is, the less he will enjoy being physically active (showing off his prowess). Furthermore, weakness and smallness in themselves lead one to devalue oneself vis-à-vis a strong, large person. The strong one dominates, the weaker is dominated. It doesn't matter that because women know they have no control over their relative lack of strength they shouldn't, 'rationally speaking', criticize themselves. [...] Even so, on an unconscious or half-conscious level, they necessarily see themselves as physically 'dominated' by men, the stronger sex. And this equals—in this regard only—a lack of confidence. Men, on the other hand, are (stupidly) proud of their strength, which equals self-confidence.²

Another advantage of men's is that they don't have to deal with stares. With the constant looks that men aim at women—the surreptitious glances, the snickers, the comments and jokes. Read Sartre's analyses of the look, in *Being and Nothingness*: the look has an enormous power to generate self-consciousness in the looked-at. Women are bombarded with looks, as well as whispers, jokes and so on. Not only in our culture; in *all* cultures (though especially in ours). It's a biological fact: male sexual arousal operates largely by virtue of the look, the look at a beautiful woman, a naked woman, a scantily clad woman. Women are aroused by touch, emotional intimacy and male assertiveness; men are aroused, partly, by sex-objecthood in the woman. So the male look is inevitable in all cultures. Hence, female self-consciousness is to that degree inevitable in any society.

But I haven't yet connected this 'being-looked-at' form of self-consciousness with insecurity. (I noted a moment ago that self-consciousness per se is different from insecurity, because the latter implies a value-judgment, unlike self-consciousness.) The connection is clear: the look is dehumanizing. The look that says "you're a sex-object" ignores the subjectivity, the spontaneous and active selfhood, of women in favor of their body. The objectified woman senses that her personhood is being devalued. When this happens to her as often as it does in modern society, she may begin to internalize the devaluation. She will see herself as the other sees her, namely as a sex-object. She'll lose her self-respect; she'll think she *is* what she is for the other, an object, not a subject (an active self). She is a *thing*, something to be looked at, not something that does the looking. Since this is what she is for others, this is what she becomes for herself. The fact that the other affirms her only insofar as she plays the role of sex-object well will give her an added impetus to play this role—because she desires recognition from the other. So, in the extreme case, she will come to identify herself as a sex-object. Even in this case, though, a resilient core of her humanity will revolt against its dehumanization, and she will develop schizoid tendencies. At times she'll act angrily and aggressively, i.e., spontaneously, in a manner relatively unmediated by awareness of, and concern for, the other; at other times she'll be very calculating and manipulative—and self-dehumanizing/-objectifying—in her efforts for approval. She'll ignore 'good' men who treat her as a human being rather than a sex-object, because her self-conception (as an object) will seek to justify itself and affirm itself by receiving

¹ I keep interrupting myself. Sorry.

² I admit that all these ideas sound silly. Common sense and intuition verify them, though. Their silliness proves only that *homo sapiens* is a silly species.

recognition from ‘bad’ men, i.e., men who reinforce the dehumanized self-conception. –For an analysis of the schizoid personality I suggest you read R. D. Laing’s book *The Divided Self*.

Subjectivity as such resists being labeled, ‘pinned down’, turned into an object, a static thing like a mannikin or a doll; it is inherently alive, flowing, changing from moment to moment. It is active, and it *wants* to be active, because activity is, in most circumstances, pleasurable (self-affirming).¹ This is indeed partly why women vehemently deny the obvious—that, on the whole, they are more ‘receptive’ and even naïve than men. Not only do they think these terms conceal value-judgments, but they intuitively ‘know’ that they (women) are *many* things, not just *this* and *this*. They can be ‘passive’ and they can be ‘active’; they can be weak and they can be strong. “I am whatever I want to be! I am a self-actualizing woman! An empowered modern woman!” Doubtless there is much truth in what they say. Consciousness *does* change from moment to moment; a degree of self-assertiveness *is* part of human nature. Nevertheless, labels can be justified, if qualified. Stereotypes can be defended, as long as one remembers that they are generalizations. But even more paradoxically: people can *enjoy* being ‘objects’. A woman can relish being looked at as an object, even though she may also dislike it.

How is that possible, though? In what sense does she enjoy it? Well, in approximately the same sense that a man may enjoy being seen as a sex-object by women. If a group of women ogled me after I worked out I’d feel pretty good, despite the fact that they were treating me less as a human being than as something pleasant to look at. For I’d like the attention, the recognition—even if it is a somewhat ‘dehumanized’ form of recognition. Similarly, women like being admired for their bodies and their beauty. Hence they dress revealingly. And so they participate in their partial self-degradation, because it yields a form of self-affirmation² (through the covetous looks of men, the appreciative comments from both sexes, etc.).

Well then in what sense do they dislike it? First of all, because female sexuality is not oriented primarily around sight, as the male’s is, men don’t have to live with daily monotonous stares. Stares from women are actually rather rare—though I’m speaking only for myself—so when they do happen they’re ego-boosting. They aren’t common enough to make the man feel as though his active, spontaneous subjecthood is being denied or ignored, so they don’t cause insecure self-consciousness. The female experience is different. Most women grow accustomed to the looks, so they become less satisfying and more annoying (dehumanizing). Their psychological effect persists, though: namely, the woman’s preoccupation with her appearance—her internalization of the other’s attitude—and her consequent insecurity (due partly to the suppression of her free, active, spontaneous selfhood, and partly to the other’s critical look³).

[...]

Incidentally, Andrea Dworkin’s rants against pornography contain an element of truth. “The force depicted in pornography is objective and real because force is so used against women... The idea that pornography is ‘dirty’ originates in the conviction that the sexuality of women is dirty and is actually portrayed in pornography; that women’s bodies (especially women’s genitals) are dirty and lewd in themselves.”⁴ As I have said, there is indeed something about sexuality, about genitals and the mess they cause—and therefore especially about women’s genitals, which are, as a matter of fact, in some ways ‘messier’ than men’s—that makes humans self-conscious, no matter in what culture they live. And obviously sex involves a little force against women. The penis has to be plunged into and out of the vagina (in case you’ve forgotten), and this is a forceful act. Pornography tends to take these facts, together with the importance of sight for male sexuality, and exploit them, magnify them. In so doing, it reduces both female and male sexualities to caricatures of themselves. And, you know, caricatures operate by magnifying

¹ *Free* activity, that is. Chosen, not imposed.

² A degenerate form, though, in comparison with the self-affirmation implicit in *creative activity*.

³ The two causes interact, of course—for instance, the look is the reason for, and reinforces, the woman’s suppression of her active selfhood—but they should be analytically distinguished.

⁴ *Feminisms*, eds. Sandra Kemp and Judith Squires (New York: Oxford University Press, 1997), p. 326.

the *essence* of their object¹ to the exclusion of all else. So, yes: stripped bare of all complicating factors, male sexuality, as such, is relatively active and female sexuality, as such, is more passive, submissive. In certain societies, though, like old Samoa and the Tchambuli people of New Guinea, intersexual relations are organized in such a way that women are not alienated from themselves (and men)—from the active, spontaneous, confident sides of their personalities. Social structures *are* possible that integrate women's passiveness with their activeness, rather than setting the two against each other, as is the case in the modern world.

One of the facets of this passiveness is that men tend to have a more substantial 'otherhood' than women. What this means, in brief, is that men are generally more self-confident and dominating than women, for all the reasons I've been setting forth.² This has been so since the dawn of the species, although social conditions can accentuate the natural differences. [...] Therefore women will seek the more dominating men, whose recognition most validates their sense of self.³

A shy man is not only not much fun to be with, but his approval doesn't intuitively mean much to the approved one (which is, indeed, partly why he isn't much fun to be with). She may think, "This shy guy likes me. So what? That's not very exciting." It doesn't satisfy her, as, say, the approval (or recognition, love) of a charismatic man may. If *he* likes her, she'll feel that her sense of self is being deeply affirmed. Partly because other people too like him, and partly because his self-confidence itself gives him an inherent phenomenological heft, i.e. more of a "self" than the shy man has.

But then, if they date, she may start complaining about his insensitivity to her feelings. She'll say she wants a *sensitive* guy, that he's not sensitive enough, etc. He's fun but he doesn't respect her, communicate with her. These complaints may seem paradoxical, given that she has just rejected the sensitive, respectful guy in favor of the charismatic, cocky guy, but one can intuitively see that she is being perfectly consistent. For her desire throughout is that her sense of self—her self-conception—be affirmed. This is why she prefers the self-confident guy, and this is why she wants him to be sensitive to her feelings—while not losing his self-confidence. If she has to choose, she'll probably pick the self-confidence over the sensitiveness—because, again, recognition from a sensitive weakling is not satisfying, not very 'affirming'—but obviously she'd prefer to have both qualities in the same man.

Incidentally, all these considerations demonstrate that Mother Nature knows her work well. For she has designed the woman in such a way that she desires to be with a self-confident, strong man, i.e., one who will protect her and her child from whatever dangers threaten them in the hunter-gatherer wilderness. In pursuing her own happiness, the woman is simultaneously (unconsciously) furthering the cause of the species.

Speaking of which, I should briefly discuss women's experience of sex. This is important to their self-conception, as the man's experience of it is important to his. In this society, and most others, men are encouraged to think of sex as a test of their masculinity. Their ability to please a woman redounds to their value as men, largely because it is men who have to do much of the exhausting work during the act.

Women, on the other hand, have quite a different experience. Let's consult the Sumerian goddess Inanna:

My vulva, the horn
The Boat of Heaven,
Is full of eagerness like the young moon,
My untilled land lies fallow.

¹ That is, the essence *in relation to* other features. The *relative* essence. This qualification is important.

² To forestall an inevitable objection: particular women may be more self-confident etc. than particular men, but in the minds of both men and women there remains the (natural, "archetypal") idea of the dominant male and the less dominant female.

³ The fact that such men are often the 'bad' (insensitive) ones relates to what I said earlier about the dehumanized self-conception of some women. They want this self-conception to be validated, even though it is in some sense painful, so they seek these dominating "bad boy" types.

As for me, Inanna,
 Who will plow my vulva?
 Who will plow my high field?
 Who will plow my high ground?

[she finds someone to plow her field]

He stroked my pubic hair,
 He watered my womb.
 He laid his hand on my holy vulva,
 He smoothed my black boat with cream,
 He quickened my narrow boat with milk.
 He caressed me on the bed.

Sumerian porn. Not bad for history's first attempt.

Maybe you'll say that "Inanna" was probably some male scribe—maybe history's first transsexual—and so we shouldn't take her words too seriously. Still, I think that many women, if they're honest with themselves, will find the sentiments familiar. And the reader will find them strikingly *passive*—'he did this to me; he did that to me'—as well as self-fixated.

Before continuing, I feel obliged, lest people slander me, to point out again that everything I'm writing is an *observation*, not an *accusation*. I find nothing wrong with self-fixation, especially when one has little control over it. (Self-fixation isn't selfishness.) Men are a certain way and women are a certain way, and I want to understand in what ways they're the same and in what ways they aren't. Both men and women have little control over their characters, so to "blame" either sex for the way it is, or to criticize it, would be senseless. Actually, I respect women more than I do men. Women are, on average, more intelligent in some ways and more humane. I like this quotation from *The Second Sex* [no, I think it's from *All Said and Done*]:

[Ingmar] Bergman's interest in women delights me: for him they are not objects but sensitive, intelligent subjects, and he is very good at drawing the relationships between them: friendship, complicity, hatred. As he sees it, their only weakness is that propensity which urges them towards those pitiful creatures, men.

Hear, hear! Were it not for that propensity, I would have nothing but praise for them. Their susceptibility to manipulation by sleazebags is the only thing that diminishes them in my eyes, though it is in fact a symptom of that which draws me to them: their sensitiveness, their naïveté, their good intentions, their intelligent love of the emotional life.

Despite my good intentions, though, my insistence that there is something like a female essence relative to men (on average) is starting to sound petty. I don't care enough to keep arguing for it. So let's put an end to this discussion.

Before doing so, however, I should address the subject of pregnancy and the mother-child relation, since this is an important part of what it means to be a woman. Let's see what Christine Downing has to say again.

Having wombs reminds us of how much we are part of the ever-ongoing cycle of generations, how much we are used by nature as simply the instrument of her self-continuation. Having wombs reminds us of how much human activity is creative, generative. ...Having wombs reminds us of the womb which gave us birth and also, inevitably, of the womb-tomb to which we will return.

...[Conception] is followed by the mystery of *gestation*—the slow growing within our body of another life. This for me was an even greater mystery, the most powerful experience I've known of my body knowing how to perform a miracle about which "I" didn't have a clue—and the experience of coming to feel that the real "I" was precisely the knowing body. The excitement of feeling the changes month by month. The changes in my body's contours and responses. The experience of feeling the new little creature within grow and move and assert its presence. The strange sense of an intimacy of connection to this other who was also still partly myself. The mystery of knowing that I, too, had begun as a being living within my mother's body.

...Sometimes the child within feels like an invader. Sometimes it feels as though one's body is betraying one, that more radically than ever before it feels "not-me". And sometimes things go radically wrong—and then there can come a terrible feeling of unworthiness and failure. We're "supposed" to know how to do this and to do it easily and well. This sense of failure may then expand and seem to apply to all of our lives, initiating a crisis of depression and self-denigration and despair. How vulnerable our bodies make us.

As Downing hints at, the miracle of pregnancy is yet another factor that causes women to view themselves and their bodies from the perspective of an outsider, i.e., as an object, an other, rather than a subject. It enhances their self-opacity, their fascination with themselves, and thus their self-preoccupation. In feeling as if nature is working its magic through them, they feel closely united with the natural world and all its miracles—and in so doing associate themselves with an *object* (nature), thus placing relatively less stock in their subjective autonomy, their self-determining independence, their subjecthood.

Also, their altered physical appearance—and its inherent *inner feeling*—is bound to make them self-conscious, self-fixated, in a non-*dominating* way. Whether it also makes them generally insecure depends on the particular woman and her body.

[...]

There are still two things I want to mention. First, women's communal tendencies. The close bonding that occurs between them, as well as the frequent reactions against it—the pettiness, back-stabbing, cruelty, mutual hatred. How bizarre this behavior must seem to most men! Totally paradoxical. It isn't, of course. It does, however, grow out of the paradox I've been analyzing, namely that women have a more intimate relationship with their bodies than men do with theirs even as they see their bodies as more of an *other* [of course not a conscious other] than men do. This otherness is indeed *why* they are so preoccupied with their bodies—their appearance, their rhythms, their discharges, their mysteries. Their bodies assert themselves in more ways than men's do, in both pleasant and unpleasant ways; this causes women to be more aware of them, which allows them to be more ambivalent towards them than men are towards theirs. They love them but they can also hate them—and they love and hate *themselves* to a similar degree. The correspondence is especially true in our culture, which emphasizes sex and physical appearance so much that women relate them to their self-conceptions more than they probably did, say, ten thousand years ago in Mesopotamia.

It's only natural, then, that women will bond with one another. They'll seek friends who understand their situations as women, their dilemmas, doubts and insecurities. They'll seek people with whom they can discuss themselves and their bodies without shame, i.e., without having to worry about the value-judgments of the *true* 'other' (namely, males). They want sympathy, in short, and women themselves are in a privileged position to give it.

Downing offers some interesting ideas in connection with this:

Because we are wounded creatures, we tend to fear being further wounded, to fear otherness, to fear dependency, and to misconstrue interdependence as domination. Because the differences between another and myself may seem to be so great as to be well-nigh intolerable, in seeking to establish a relationship I may try to make that other more like

myself. Because we can't tolerate the heterogeneity, we may seek to dominate or destroy the otherness of the other. Thus heterosexual encounters often come to be contaminated by patterns of dominance and submission—even when we may all want something quite different.

Women are infused with self-otherness more than men are; in seeking same-sex friendships or love-affairs they want to escape this self-otherness and insecurity—and thereby the 'gaze' of the true other, males (in the abstract). They want simple, easygoing affection; they want to escape the heterogeneity of the other (and the 'heterogeneous' consciousness he causes in them¹) by immersing themselves in homogeneity, which lets them temporarily forget otherness and the insecurity that sometimes goes with it.

Friendships between men in fact have a similar function. It's nice to be able to relax and have an easy conversation with a couple of guys, not worrying about impressing them. You can talk about whatever you want, whatever vulgar or stupid thought enters your head. With women, however, you have to censor yourself more, because you want to impress them—because they're the true other, the other whose approval you most desire. The difference between men and women in this case is that the 'relief' of same-sex friendships seems to be greater for women than it is for men. Heterogeneity, otherness, isn't usually frightening for us men. [...]

All these considerations help explain why both men and women have always associated men with rationality, objectivity, logic, independence, power, and women with subjectivity, emotionalism, passiveness, interdependence and irrationality. [...]

On sexism.—Feminists are fond of laying the charge of "sexism!" at society. I agree wholeheartedly with them. Society is sexist, intensely so. When a man opens a door for a woman, he is being "sexist". When he compliments a woman on her appearance, he is being sexist. When he looks at a woman, he is being sexist. As soon as he wakes up in the morning, "sexism" is implicit in his consciousness. And the same is true of the woman's.

"Modern women" continued.—It's significant that the notion of romantic love, and poetic tributes to it, have become more widespread as history has progressed. For a long time in India most marriages were arranged; erotic love was relatively unimportant. And as you'd expect if my ideas are right, communities were tightly knit. A person's sense of self was affirmed and bolstered by all his communal ties; he didn't require romantic love in order to be happy and have a secure identity. In fact, arranged marriages are far more frequent in 'primitive' cultures than in 'advanced' ones. Conversely, Western poets began *en masse* to write love poems from the Renaissance on—from Petrarch on to contemporary times. And of course it was during the Renaissance that individualism started to become a European ideology (especially once the Reformation got underway)—suggesting that communities were becoming less tightly knit, and hence that people would turn increasingly to their lovers for 'recognition'—and contemporary society is characterized by extreme atomization, which partly explains the ubiquity of love poems and love songs. People crave togetherness. In short: one can take as a working hypothesis that a culture's emphasis on romantic love is directly proportional to its degree of communal fragmentation.

*

....Anyone who wants to understand this country should read Alexis de Tocqueville's brilliant book *Democracy in America*. It is still basically as relevant as it was in the nineteenth century. Tocqueville understood both the advantages and the dangers of democratic politics, and he knew it was where Europe was

¹ That is, the otherness of consciousness to itself. The otherness of the self to itself.

headed. (He didn't know why, though. For that, it is necessary to supplement him with Marx.) It's where the whole world is headed, in fact. Certain traditions are peculiar to America—for example, the puritanism that still persists and is manifested in such organizations as the Christian Coalition and the Parents Television Council—but, nonetheless, an analysis of the American experience would be valuable to the countries developing in its direction. It would also, of course, be valuable to Americans themselves.

I won't undertake that analysis here. At the age of 25 I don't have the patience for the necessary research. I intend only to ramble awhile, in the hope that I'll stumble across a few insights.

I suggested a moment ago that American arrogance may mask some kind of inferiority complex. That isn't right, though. While an *individual's* arrogance may often have such a function, the situation is more complicated with communities. Sometimes, admittedly, patriotism or nationalism grows out of a community's insecurity vis-à-vis other nations. German nationalism comes to mind. In the nineteenth and early twentieth centuries, Germans had a strong desire to 'catch up' with Western European nations. They longed to surpass the latter's economic, military and political achievements, to be major players on the world stage. Germany, after all, had been politically fragmented until Bismarck united it in the 1860s; it was economically backward—especially in comparison with England—until the end of the nineteenth century; it had been humiliated by Napoleon in his wars. The pride that Germans felt from their cultural superiority (made possible by their many great composers, great philosophers and great poets) made their shame and bitterness in other areas all the more keen. Bismarck was therefore able to fan the flames of German nationalism such that the country eventually became the preeminent militaristic power in Europe, leading indirectly to World War I. And then Hitlerism happened—again, because of the humiliation of the Treaty of Versailles, and the economic depression of the 1920s and '30s. So in this case the hypothesis of an "inferiority complex" is relevant.

Not in the case of America, though. We in this country seem to be genuinely pleased with ourselves. We know we have the most power in the world; we know we have probably the most freedom (in some respects) and one of the better political systems. We grow up being taught that we're the best and luckiest, and we believe it. It's all the more surprising, then—and gets us all the more angry—when someone dares attack us. We flare up in righteous indignation, unite as a population, and seek revenge on the attackers. Our capacity for self-critical, independent thought is submerged in our quasi-emotional state of mind, which sees the attack as a personal affront against us as individuals—against all we stand for, all we believe in. In violating our communal integrity, it infuriates the individual who identifies with the community—because, insofar as he identifies with it, his sense of self is *as* a member of the community. And so his sense of self has been violated too. This is why he takes the attacks personally, and *this* is why he is able to muster such passion for total revenge.

[...]

In a nationwide climate of this intense feeling, rationality and critical thought are forsaken. Conservatism is embraced; instinct, tradition and self-preservation are embraced. Intellectual nuances have no psychological power in comparison with the urges to assert oneself, to affirm oneself and to preserve oneself. In this case, the urges are mediated by one's consciousness of belonging in a community, so the community unites against the evil Other that wants to destroy each individual and hence each individual's sense of self (which is, from the individual's point of view, approximately as terrible a threat as his actual biological destruction). In a really severe case, the community might feel so threatened that it desires the genocide of the Other. The complete destruction of the thing that threatens the self's integrity. Once this thing is destroyed, the community will cease to be united and will revert to its earlier fragmentation, because people's sense of self will again be secure enough for them to compete with one another, etc. That is, they will no longer feel so vulnerable as to desire that their self-conceptions be reinforced through their agreement with the self-conceptions of everyone else in the community. Since the part of them that self-identifies as a member of the community is no longer threatened, they are free to 'take it for granted' and act in individualistic ways that would have been unthinkable earlier, when there was an Other that disrespected their self-conceptions.

(Actually, the phenomenological mechanisms of a person's heightened identification with the community are quite complicated. For example, just as the enemies are melded into an abstract Other,

whom each individual enemy simply *represents*, the people in the community are merged (in a person's mind) into a single vast entity that affirms one's sense of self.)

[...]

But it's this damned atomization I keep talking about, this homegrown American alienation. The country is too atomized for collective action. Nothing is more harmful to democracy than an atomized civil society, because of the apathy that comes with it. Nobody cares about participating, and a democracy can't function properly without mass participation. It deteriorates into an oligarchy, which is what America has become. The few at the top are obsessed with maintaining the status quo because of the power it has given them, and the many at the bottom are too atomized to do anything but go to work and watch TV (or surf the internet). —*What a sick society!* And yet apparently nothing can be done to cure it. The nature of its illness precludes a cure, because a cure would have to be communal in origin. All it can do is keep evolving on its economic foundations and hope that by some miracle it will evolve its way into rejuvenation.

[Blah blah...]

On television and the internet

I'll be the first to admit that TV is addictive. Which is why I never watch it. I could watch *Seinfeld* and *The Family Guy* for hours, and afterwards I'd be disgusted with myself. And yet the next day I might do it again, having learned nothing. There's something about the flickering televised images that grabs your attention and holds it, even if the show you're watching is unimpressive. You turn your head away or walk out of the room, but the sounds pull you back. 'I know it's a waste of time,' you tell yourself, 'but...I just have to see what all that laughter is about! What are the characters saying right now? I have to see how the show is going to end—just *this* show, just five minutes more. *Then* I'll stop!' [...]

What is the explanation of this? Why is television addictive? I've read articles in *Scientific American* that give convincing explanations in terms of neurology. —So, there's your answer: neurology. The addiction has something to do with neurons and brain states. This bunch of synapses over here fires in this way, involving all these neurotransmitters, and those neurons over there are called into action, and the visual cortex is stimulated, and so on. Satisfied? No, of course not. Biological explanations are never satisfying; they always leave you wanting more. You want an *intuitive* explanation, a psychological or phenomenological one. The latter is most intuitively satisfying, because it involves a description of your *consciousness*, which is precisely the thing you don't understand. You don't understand *in what sense* you enjoy watching TV and in what sense you don't. Both your pleasure and your displeasure are inexplicable to you. They're *sui generis*; they're just *there*, somehow, apparently unanalyzable.

You'll get a better idea of what I mean if I discuss a similar paradox, namely the paradox of horror. Which is closely related to that of tragedy. Millions of people enjoy watching horror movies—they enjoy the fear, the adrenaline rush, the violence and gore—despite the fact that fear and terror are generally regarded as painful emotions. In what sense, then, do horror-fans enjoy these emotions? How is that possible? *Where* (in their consciousness) *is* their pleasure, and where their 'pain'? I enjoy thrillers and even some horror movies, but I have no idea what my pleasure consists in. Similarly, tragic plays have been popular ever since Aeschylus, but pity and sadness (the emotions they provoke) are not usually considered pleasant. So why are tragedies popular?

Equally paradoxical is the possibility of enjoying emotions like depression, anger, hatred, and jealousy. It's possible to *wallow* in these feelings, to let them consume you for hours or days at a time. Goethe wrote poems about the ecstasy of despair, and I can attest that sadness is intoxicating. When you're in its throes, you're tempted not to make any effort to overcome it but just to languish in it for weeks, even though you feel miserable.

Philosophers have tried to give psychological solutions to the paradoxes of tragedy and horror. Aristotle attributed tragedy's popularity to its cathartic function—its "purging" the audience of pity—while David Hume attributed it to its engaging plots (its narrative element). In more recent times, Noël Carroll, a famous philosopher of art, tried to explain the phenomenon of horror by invoking the element of fascination:

monsters (and gruesome spectacles) violate our normal conceptual schemes, “transgress our categories of thought”, and hence fascinate us. The suspense in these movies, he thought, is another reason for our enjoyment: we crave the plot’s eventual resolution, as well as the eventual revelation of whatever horrifying being is causing all the mayhem (for movies often delay revealing both the monster and the *explanation* of the monster). So we enjoy horror *in spite* of our disgust and fear. Berys Gaut has argued, on the other hand, that we enjoy it *because* of our disgust and fear. His theory incorporates the idea that emotions are not merely physiological feelings; they’re also intimately tied with evaluations of whatever object of thought one has in mind. To fear something involves evaluating it as threatening, to be envious of someone involves desiring that his situation be yours, etc. The unpleasantness of an emotion is a function of the negative evaluations it includes, rather than of its physiological sensations per se. So people are able to enjoy horror because their evaluations of the movie-situation are not as negative as evaluations of frightening situations in “real life” are. They enjoy the physiological sensations, and psychologically they feel secure because they know it’s just a movie.

All these theories have elements of truth, but they aren’t broad enough to be satisfactory in themselves. They can’t account for the pleasure of *real* sadness, anger and so on. At best they’re special cases of a more general explanation. It seems to me that all these paradoxes are related to the fact of *emotional inertia*. Simply by virtue of experiencing a particular emotion, we want it to continue. This is intuitively verifiable. To *remain* in a feeling, no matter what it is—even if it feels like a *lack* of feeling, as when you’re sitting on the couch doing nothing, just being at rest and letting your mind roam—is comfortable; it is the path of least effort. In enjoying something like sadness, we’re enjoying not the emotion per se but rather our *persisting* in the emotion. All emotions have this inertial element, though ‘painful’ ones like depression also incorporate negative thoughts (and perhaps even intrinsically unpleasant physiological sensations) which account for the sufferer’s partial desire to be in a different mental state.

Obviously I’m not being philosophically rigorous here. (I want readers, after all.) To give a full treatment of these emotional paradoxes I’d have to discuss the elusive phenomenology of consciousness, of pleasure and pain and their interrelations, and how it is that we come to label states *in general* ‘pleasurable’ or ‘painful’, etc. My point is that all these questions and paradoxes are related to the question of television’s addictiveness. Phenomenologically speaking, though, our ‘inertia’ while watching TV is different from emotional inertia: it is more closely related to the *object* than the *feeling*. There doesn’t even seem to be a true, perceptible ‘emotion’ when watching TV, as there is (sometimes) when watching horror or being moved by tragedy. In this respect, TV-watching is similar to social interaction. Rarely do we have a palpable emotion during casual interactions, and yet we find the activity pleasant. Both situations are satisfying and somewhat addictive. If we’re alone and we hear talking in the other room, we’ll want to see what’s going on and join the fun. Or maybe we’ll eavesdrop. Either way, our reaction is similar to our reaction when we hear the TV on.

So, the attraction of television is largely its quasi-social element. Watching characters interact is interesting, as are social interactions themselves. Admittedly, the incessant flicker of the televised images, and their colorfulness, is also relevant, for a field of vision that constantly changes is inherently attention-grabbing, but in itself this cannot fully explain our “addiction”, for it doesn’t explain why when we hear the television in another room we’re curious about whatever show is on and want to go watch it. In the case of this desire, the flicker of the images is irrelevant; we must invoke the social aspect of the experience. — Okay; but whence derives our *displeasure*, our *dissatisfaction*? Well, evidently from TV’s non-social aspects. It isn’t hard to pinpoint these. There is no give-and-take with television; there is no element of ‘recognition’. The characters on the screen are unaware of the viewer’s existence; he just passively absorbs what they say and do. The pleasure of society is (on the phenomenological level) due mainly to its communal function, i.e., to the participant’s implicit recognition of an other who he implicitly knows is recognizing him. Since this recognition is absent when you watch television, you don’t get much “spiritual satisfaction” from it. And you turn it off feeling like you’ve accomplished nothing, because accomplishments in general are satisfying—i.e., have the character precisely of an ‘*accomplishment*’—due to the recognition they make possible for the person who has accomplished them (recognition either from himself—for, as we saw earlier, the individual is, in a sense, his own other—or from another person). Were

there no recognition, there would not be the sense of an accomplishment. Since TV does not give the viewer recognition, he lacks the sense of having accomplished something. Hence he is dissatisfied.

The actual ‘feelings’ or ‘states’ of pleasure and displeasure are utterly mysterious to me in their phenomenological aspect (i.e., the way they *feel*, the way they *are*—their ‘place’ and ‘quality’ in consciousness). They can’t really be analyzed, it seems. But this is a more general puzzle, not specific to TV-watching. Another, similar puzzle applies to the phenomenology of such states as shame, envy and lust: these feelings are both perceptible and not perceptible. We can feel them and yet, in another sense, we can’t, simply because there is really nothing there to be *felt*. –These problems are truly baffling, not least because they’re so hard to get a clear grasp of. But this isn’t the place to discuss them. The point is that at least we have some intuitive idea of the *causes* of the satisfaction and dissatisfaction produced by TV. (I don’t mean the neurological causes, but the phenomenological ones.)

[...]

Scholars, incidentally, have sometimes wondered how it is that the ancient Athenians were able to retain their affirmative attitude toward life despite their acute knowledge of life’s tragic character. Aeschylus, Sophocles, Euripides testify to the Athenian’s preoccupation with fate, with the individual’s impotence vis-à-vis his destiny. And yet Athens was the most *affirming* culture in history. It gave birth to the philosopher, the artist, the statesman, the mathematician, the scientist—to virtually all that is noble. *How?* –First of all, I think this tribute to Athens is a little simple-minded. Be that as it may, Hegel’s answer, which I’ve already mentioned, is insightful: Classical Athens existed between complete homogeneity and extreme individualism. The former would have prevented individual types like ‘the philosopher’ from arising because the individual would not really have existed as such; he would have been only a part of the community—his self-identity would have been as such. The latter, on the other hand, (that is, extreme individualism) would have coexisted with a collective cynicism too great for the community to have *originated* types like ‘the artist’ and ‘the statesman’—to have been enthusiastic enough, naïve enough, to have originated these types and given popular recognition to their exemplars. In Athens of the 5th century B.C., communal integration, and hence the individual’s self-consciousness as an individual, existed in the requisite ‘happy medium’. In the Hellenistic era, on the other hand, which saw the decline of the Greek polis, the individual’s self-consciousness as an individual (his self-fixation) became so extreme that it caused widespread existential anguish, doubt about where the world was heading, confusion, cynicism, a preoccupation with such darker aspects of life as death, disease, old age; art and philosophy, therefore, declined from their ‘affirmative’ heights in the Hellenic period. They reflected the community’s fragmentation and the individual’s consequent sense of living a meaningless existence. (Hence Stoicism, Cynicism, Epicureanism.)

On life

This is the chapter where I’m supposed to sum up everything, arrange it into easily digestible morsels of wisdom. Edifying epigrams. All the lessons I’ve learned from life and want to impart to the reader. I’m supposed to arrive at conclusions—inspiring ones, of course—that can help the reader in his “journey”, like pills he takes in the morning or the coffee he’s addicted to.

But the Age of Naïveté is gone. All saccharine life-lessons will now dissolve upon contact with reality. Nobody knows anything anymore, and I’m not going to pretend I do. There’s no panacea for loneliness or depression or the gnawing feeling that life is meaningless; there will always be boredom, and there will always be despairing thoughts. The best you can do is to wait them out, to be patient and hope they’ll go away. Because you can rarely banish them by sheer force of will.

So I’m not going to end this book with a didactic discussion of the best way to live—as if there is such a thing! [...]

William James wrote in a letter to his wife that “I have often thought that the best way to define a man’s character would be to seek out the particular mental or moral attitude in which, when it came upon

him, he felt himself most deeply and intensely active and alive. At such moments there is a voice inside which speaks and says, “This is the real me!” [...]

In his excellent book *Character Styles*, Stephen Johnson distinguishes between three types of OCD: the most common type is characterized by “an excessive fear of physical harm or danger to one’s self, or others, or property”, which may result, for instance, in constant worry about getting HIV, or an obsession with one’s “hostile impulses”; the second type involves “a vague sense of unease rather than actual danger in the face of normal exposures”; the third type is “distinguished by continual striving for perfection and symmetry”. I belonged to the third type. Johnson describes the symptoms:

Some such patients may need, for example, to have each shoe tied to the same degree of tension or need to walk through a doorway precisely in the middle. Religious or other rituals may have to be done with perfect attention to every detail and sequence, or one’s desk may need to be arranged with complete orderliness and symmetry with every object at its exactly prescribed angle. For the most part, individuals with this diagnosis also find their compulsive behaviors to be irrational, ego-dystonic [i.e., in conflict with one’s ideal self-image], and intrusive, yet they feel compelled to do them. A common exception to this generalization, however, is that their perfectionistic standards are often ego-syntonic [the opposite of ego-dystonic].

That’s virtually a description of me. I had to tie my shoes repeatedly until the tension was equal in both—and if I felt them getting loose later in the day I had to retie them—and everything on my desk had to be symmetrical. Books had to be right-side-up; if their cover was face-down it somehow *bothered* me. I can’t describe the feeling. My facial tics were, I suspect, closely related to my OCD. I hated all my compulsions, but I had to indulge in them. Otherwise I would get an intense feeling of unease. Indulging in the tics and the compulsions made me feel secure again.

[...]

Many adolescents suffer from this kind of self-dissatisfaction. They dislike their apparent self, the one that others see; in wanting to be someone different, they really just want to become what they (probably) see as their *real* self (i.e., their potential self, their ideal self). They have a more or less definite self-ideal, whether it be as a thin person, a beautiful person, an outgoing person, a virtuous person; in trying to become this person, they’re trying to realize their potential self. And in the process to discard their contemptible *apparent* self, who isn’t really—or *necessarily*—them. (They may indeed identify with him, as I did, but they are more committed to their identification with their ideal self.) Their ultimate goal is to recognize their full sense of self in their behavior and in the reactions that others have to them;—to see themselves reflected in the social world, recognized and respected. This will validate their sense of self, will give them self-esteem.

One of the sources of their insecurity, though, as I hinted at in the quotation above, is their doubt about whether their ideal self is in fact who they really are—i.e., a potential self within them. Maybe it isn’t potential. Maybe they’re just deluding themselves: maybe they *really are* the objectionable person that appears to the world. This possibility is terrifying, for it threatens their sense of self, which is intensely attached to the possibility of “becoming who they are” potentially. I myself used to think that I’d rather die than not achieve my self-ideal. Adolescents stake their sense of self-worth on the possibility of achieving the ideal (which they hope and think is the real), and so the nagging doubt that it’s a delusion is destructive of their mental well-being. Nevertheless, they can’t escape this doubt, consciously or half-consciously, which makes their desire to change themselves all the more frantic. For they have to prove to themselves that their sense of self is justified, lest they become even *more* insecure (self-contemptuous).

After all, the reason they have an ideal self in the first place is as a defense-mechanism. When they were younger, before they had this self-ideal, their self-esteem was high enough for them to accept themselves. They didn’t have to try to be someone else. But as they got older they became more aware of themselves, of the differences between themselves and other people, especially the opposite sex. This is true of all adolescents. The difference between the healthy ones and the unhealthy ones is that the self-

consciousness of the latter is compulsive and critical. *Why* this is so has to do with the intersection between genetics and psychology, and isn't well-understood. It doesn't matter for our purposes, anyway. –Now, in being critical of themselves, these adolescents already implicitly recognize a disjunction between who they are and who they want to be. However, they may not yet be *explicitly aware* of their self-ideal. They know only that others ignore them or seem to disapprove of them, and this causes them to disapprove of themselves.

Sooner or later they'll formulate for themselves, and 'flesh out', the implicit self-ideal. It will be a function of such things as what (type of person) they perceive that society rewards, and what values they have been taught, and what their innate aptitudes are, etc. The 'defense mechanism'-aspect exists insofar as they integrate into their sense of self the ideal that they have formulated. This ideal becomes *part* of them, a semi-imaginary part they're determined to realize in practice. They think it is their potentially *real* self, which has for whatever reason been suppressed by circumstances. By deciding that they can become this idealized person, they are protecting their sense of self from disintegration in the face of the other's perceived contempt (which is really their own). –That is, to protect their self-conception they are, seemingly paradoxically, forced to adopt as their own the other's ideal (society's ideal, properly adjusted to fit this particular individual). The paradox is superficial, though, for, after all, self-esteem is largely a function of the other's reaction to one.

The reader may have noticed that Laing's analysis of the schizoid individual in *The Divided Self* is in some respects applicable to the kind of person I'm discussing. Laing distinguishes between the inner, 'true' self and the outer, 'false' self (or selves) and dissects the multifaceted relationship between them. There are indeed certain parallels between the true and false selves, on the one hand, and what I'm calling the ideal and apparent selves, on the other, but the differences are more significant. I'll briefly describe them, in the hope that this will illuminate my own ideas.

According to Laing, the schizoid individual experiences both an inner self, which is the *real* 'me', and an outer self (or selves), which is the persona adopted around other people. This false self is treated virtually as another person, a thing foreign to the true self, which may look on it with detachment, hatred, tenderness, etc. The false self is the one that has interpersonal relationships; the true self cannot, because in the presence of other people it is masked by the false self. So, in the 'ideal' case, it does not have direct contact with people; it simply observes the behavior of the false self. "The imagined advantages [of this system] are safety for the true self, isolation and hence freedom from others, self-sufficiency, and control."¹ The inner self fears relationships as threats to its identity, its integrity; it fears that it will be submerged in them, or that the other's look will turn it into a *thing*, an *object* without subjectivity. Hence it tries to protect itself from people. The main *disadvantage* of this desire, on the other hand, is that the self is haunted by a sense of futility, of deadness and unreality, since it is isolated from the richness and concreteness of interpersonal experience. It doesn't act in reality but only in fantasy, in its imagination and its self-related thoughts, and it is therefore unreal, perpetually frustrated. It may even react against its isolation by seeking relationships with people;—but then, by opening itself up to interpersonal contact, it feels vulnerable and threatened. In short: Scylla and Charybdis. The schizoid person cannot be content with himself.

Laing's analysis is so rich and subtle that any brief summary is inevitably going to be a parody. Nevertheless, the preceding paragraph is enough to show that the main themes of Laing's discussion are different from my ideas. The "apparent self" is not really *false*, at least not necessarily. Most adolescents partly identify with the persona they disapprove of; I certainly did. [...] I just didn't think it was the *necessary* expression of my self. I thought there was a better personality somewhere inside me, waiting to be coaxed out. This better personality was not Laing's "true self" or "inner self"; my inner self was, you could say, caught between my apparent and my ideal self. It was neither one nor the other: it was the arbiter in the dispute. (The biased arbiter.) Yet it overlapped with both, for it identified with both. It (that is, I) knew that its current personality was an expression of itself, but it had a very definite and opposing notion of what its ideal personality was. –The inner self is on a different level than the apparent and ideal selves: while the latter two are basically *personalities*, the former is an *awareness*, an *active thinking* and

¹ *The Divided Self* (New York: Pantheon Books, 1969), p. 78.

evaluating. It is the self (the *I*) in the deep, active sense.

[...] Most self-conscious adolescents are indeed sometimes susceptible to the schizoid experiences of inner deadness, a sense of futility and despair, perhaps unreality and excessive freedom (see below), but these can be simply symptoms of acute loneliness, and need not indicate a truly schizoid personality.

In our civilization, virtually everyone's personality has mildly schizoid characteristics: everyone is self-conscious to the point of slightly altering his personality depending on his company. He is rarely able to be fully spontaneous; either he isn't comfortable enough with himself and others, or his many social roles force him to act differently depending on the circumstances. Around a friend he'll act a certain way, around a coworker he'll act differently, with his family he'll feel less inhibited, and in solitude he'll feel free to act however he wants. He will thus have not only a true, inner self, but also a personality he considers more his own than the others—*traits* he considers the 'truest' expressions of himself. For he feels most comfortable, most natural, acting a certain way. It may be with his family, with his friends or his 'significant other', or with himself and no one else. These traits are associated with his inner self: i.e., just as he has a true *consciousness*, so he has a (more or less) true mode of *behavior*, which is an expression of his true consciousness. For example, my inner self tends to be good-natured, contemplative, ironical, affectionate, forgiving; behavior that reflects this is, therefore, my truest 'personality'.

Modern people are somewhat schizoid in another way, too: they tend to be more or less self-ambivalent, self-confused. Sometimes they can't decide who they 'really' are—i.e., which 'personality' or 'role' is their *true* one. They have too many, or they don't receive sufficient recognition from others to have a secure sense of self.

Rarely, however, do these disorders evolve to the point at which the inner self radically differentiates itself from outer, false selves, and comes to be so attached to its radical freedom that it dreads being 'seen' or 'pinned down', like a thing without subjectivity, by the other—even as it *desires* to be the object of another's attention for the sake of feeling really *alive*. (The schizoid self thinks that, unlike itself, the other is 'full of being', truly alive, and that by being the object of the other's look it will itself participate in this being, which it fervently desires on account of its inner emptiness and deadness. And yet at the same time it fears the other's look.) Not even the adolescents I'm discussing suffer from this *extreme* form of self-consciousness. They can indeed be called more 'self-fragmented' than the healthy person, inasmuch as their inner self partly dissociates itself from their apparent personality (or body) and clings to the vision of an ideal personality (or body) which it identifies with or *wants* to identify with, while in the healthy person the apparent coincides with the ideal. Nonetheless, their partial dissociation is for the sake of approval from the other (the other *in themselves* as well as actual other people)—for the sake of love, affirmation, esteem. They are not conflicted about this desire; they do not love the freedom, the autonomy, of their inner self—because the self *isn't* autonomous. It is attached to a particular self-conception, namely the ideal one, and it wants to realize this in practice. Also, it recognizes that the contemptible apparent self is an outgrowth of the inner self, however much the latter wishes it were not. The schizoid person does not identify with his outer self, and in this respect he's different from the people I'm talking about. He can be considered an extreme version of them: their partial self-dissociation has evolved, in him, to virtually complete self-dissociation. (In the schizophrenic, the self-dissociation is complete.)

In many adolescents, the disjunction between the apparent and the ideal results in eating disorders (anorexia nervosa, etc.), through which they try to remake the apparent in the shape of the ideal. In me, it resulted in obsessive-compulsiveness.¹ More precisely, my obsessive-compulsiveness was my psyche's way of protecting itself (its sense of self) from self-disintegration. Each time I experienced that intuition about what I would do in a particular situation or what I would have done in a situation if I could repeat it, my sense of self was shored up against the encroaching looks of the other. The *critical* looks, which ascribed to me an identity (a 'weak', objectionable identity) that I felt intuitively was not the *real* me, the me I wanted to be and thought I could be. Of course I only imagined them—the critical looks were simply 'the other' *in me* criticizing me—but that made them no less threatening. For they were experienced as

¹ Actually, anorexia, pathological gambling, compulsive self-mutilation and so on should probably be considered forms of OCD, as Johnson suggests (p. 269).

(potential) devaluations from other people. [...] I couldn't change my behavior just by willing to, nor could I say to people that they were wrong, that I was a valuable person. And the mere act of *telling* myself such a thing would have no psychological force. So my psyche manufactured this OCD, this *intuitive* means of asserting my sense of self.

In other words, my irresistible craving to imaginatively enact or reenact my behavior until I reached that intuitive *click* of being satisfied with myself signified my unconscious need for affirmation from the other. By imaginatively behaving as I wanted to in reality, whether in a retroactive or an anticipatory way, I achieved a substitute for the real thing. (It reminds me of Freud's theory that dreams are substitutes for 'real' wish-fulfillments.) I affirmed my sense of self, recognized it in my behavior, in *imagination*—which was the only option for me, since I didn't recognize my sense of self in my *real* behavior.

[...]

As a college freshman, my frequent meditations led me to the conclusion that words, labels, concepts are ultimately half-meaningless. Or at least deceptive. The act of judging people in particular is deluded, based on ignorance of the other's condition. The inner life is fluid; there is no such thing as "arrogance" or "hypocrisy" or "selfishness", much less "badness" and "evil". There is but a continuous movement, a flowing in and out of transient mental states. Static judgments are artificial; language is artificial. Music is the only authentic mode of communication, due to the absence of 'conceptual frozenness', which is unreal. [...]

Arrogance, self-contempt, happiness, unhappiness.... It all ran together in my mind; the quest for certainty was utterly hopeless. I was too mutable. [...]

What a year that was, that freshman year! Had I read Sartre then, I would have sympathized with his belief that humans are absolutely free. Reality didn't feel real to me. The self I presented to others felt 'falsier' than it had in high school; I identified with it less than I had before. But I didn't know what I wanted to put in its place. Sometimes I thought that nothing but my own inertia or cowardice was constraining me from being anyone I wanted to be. And who I wanted to be depended largely on the last book I had read. When I read *Crime and Punishment* I identified with Raskolnikov and wondered whether I ought to kill someone out of intellectual curiosity. When I read about the Dalai Lama I thought *that* was how I wanted to live my life. Usually I read about Marx, though, so his memory dominated my self-musings.

I really ought to have read more about Hegel then. That might have helped me get some self-clarity. I would have seen that one of the reasons (to repeat—for the last time, I promise!) that social interaction is pleasurable and reassuring is that the other's reactions to you, as well as your own natural reactions to the other, reaffirm your reality, your existence, your sense of self. They reaffirm the latter's apparent necessity, its (and your) *concreteness*, by forcing on you the fact of your being. "I am a being among beings, a thing as real, necessary—and hence valuable—as this person I'm talking to." Feeling (on a deep, intuitive level) as if you can *choose* your identity is unnerving, because it implies that your current sense of self is unnecessary, accidental, and hence valueless. Even worse, it implies that *any* sense of self is contingent—that any identity you choose is going to be accidental. So you feel trapped in this prison of freedom. No matter where you turn, you can't escape the doubts, the contingency of it all, because you could always be other than you are. What this means is that your sense of self is inevitably going to be 'up in the air'. Insecure. Nothing is more disturbing than that knowledge.

So, even as I fervidly desired to make a decision about who I was and wanted to be, I hesitated to do so and constantly postponed the decision. Half-consciously I think I knew that it would inevitably mean the embrace of contingency, of a contingent identity; therefore I unconsciously chose to remain in this disturbing postponement of (what I thought was) the inevitable—the inevitable confrontation with myself. I preferred my negative freedom to a decisive embrace of a determinate contingency, because then there would be no turning back. (Or, if I did turn back, I would feel disgusted with myself.) I was living in "bad faith", as Sartre might have said. But I couldn't do otherwise, simply because it wasn't up to me to choose my identity. That's where Sartre was wrong. Humans cannot choose their personality, broadly speaking; at most, they can choose particular actions. But—except in highly stressful, life-and-death situations, such as obtained in Nazi Germany—there is no real necessity to make a choice (like the choice that Raskolnikov made, which resulted in his killing two women). In all healthy individuals and societies, the epic choice of

Either/Or is unnecessary. For the dichotomy is seen as a false one. One can try a little of this, a little of that; no aura of moral heroism hangs around The Decision, for nothing necessitates that a Decision be made. Instead, the person simply follows himself, becomes himself relatively conflict-freely; he unconsciously understands that he is who he is, that he has neither a reason nor the ability to choose what kind of person he is going to be. His character will unfold spontaneously, nourished in its communal environment.

So the emphasis on freedom is a symptom of sickness. A healthy person understands that, while life does have a great deal of contingency, his own identity is largely necessary. It was not a real possibility that he be radically different from what he is. I could not have been a Jon Stewart, nor was there any particular reason for me to *try* to be a Raskolnikov or even a Karl Marx. The best way to live, on the whole, is simply to “become who you are” spontaneously, neither to seek out self-conflict nor to avoid it. Just do whatever feels most natural and sustainable, whatever makes you happiest. The Sartrean morality of freedom is a pathology, appropriate only to the most pathological of times. Most of the time there is nothing particularly heroic about committing oneself irreversibly to a course of action. That sort of commitment strikes me as stupid and unnecessary in this life of “rich ambiguity”; it’s symptomatic of a neurosis.

Part of me understood this, but another part was romantically attracted to the idea of a Decision—and perhaps even believed that ultimately I would *have* to choose, at least if I was to retain my integrity. So I agonized over what belief-system I should have and what personality was best. [...]

I think that half-consciously I often felt dead inside. When I acted spontaneously I felt alive, but the more I scrutinized myself, the emptier I felt. I would realize “There’s nothing there! There’s nothing inside me! I’m just this bare *awareness*; there’s nothing behind it or within it. So how *could* I have an identity? There’s no substance for the identity to inhere in!” If taken seriously, such thoughts are very disturbing.

I used to scoff at Goethe’s idea that profound philosophers are, in a sense, hypochondriacs, thinking he was making an excuse for his own lack of profundity. But, while he surely was, he was also right. If you’re fascinated by your own nothingness, as I was, then—there’s something wrong with you. (Obviously.) That’s okay, though. As long as you can supersede your obsession with attaining knowledge, it can in fact, in the end, be beneficial. For it is appropriate to a certain stage of life, and a certain stage of history. Despairing youth and late capitalism: they’re an odd couple, but in a sense they belong together, for they’re both antitheses in a dialectic. At least, they can be construed as such. First there is naïve pleasure in life, the childhood of simple affirmation and joyful egocentricity; then there is a confrontation with disillusioning reality; and finally there is a sophisticated and rich humanism. This dialectic, in some form, is constantly being played out on microcosmic and macrocosmic levels; and though its manifestations are never identical to one another—there is always some variation or other—its truth is profound and universal. The turbulence of youth is superseded by a self-assured adulthood; the nihilism of late capitalism is superseded by something socialistic. And perhaps, ultimately, by something approximating communism (the adulthood of mankind).

Being a Marxist, I was aware of this dialectic. Being a confused young kid, though, I wasn’t very comforted by it. I was preoccupied with the “antithesis” over the “synthesis”—the absurdity of life over its joyful aspects. Hence my concern with Hegel’s ‘self as self-consciousness’ definition, which implied that I am essentially a nothingness, and thus served as a philosophical justification of my self-floundering. When I discovered that definition, my prior uncertainty about who I was—and my belief that it was impossible *ever* to “be” someone—became even worse. “I am nothing, so how can I ‘be’ something?” No one *is* himself, I thought; he is a nothingness and he has several ‘personalities’, all of which are accidental. They could have been otherwise. Personalities (I thought) are determined by accidental encounters, accidental life-paths, and inertial tendencies within people. Since I wasn’t anyone in particular, my interactions with others necessarily consisted of my putting on a series of masks. Even if they felt sincere at the time, I decided later (in the tortured introspection of solitude) that they had been an act.

[...]

But I saw absurdity and contingency everywhere. I’ve explained in what sense I doubted the authenticity of my self and selves in general, but I had other doubts too. Of course, my whole belief-system was up in the air, but aside from that I doubted the meaningfulness of life. Had I read Milan Kundera, I

would have agreed with him: because of the passage of time, life cannot be meaningful. Nothing matters in a world of transience where everything happens once, and “everything is pardoned in advance and therefore everything cynically permitted”.¹ It’s all over after it’s happened, so it doesn’t matter anymore. Nero’s barbarism, for example, doesn’t matter now; the Thirty Years’ War doesn’t matter; the bombing of Hiroshima is in the past, so it doesn’t matter. All that suffering is gone! Time takes away the meaning from everything.

[...]

—Action, I should point out, always involves at least a slight disregard of reason. It involves a “leap of faith” (to quote Kierkegaard)—an element of *choice*—a gap (of freedom) between the conclusion of the argument in favor of the act and the actual carrying-out of the act. In other words, even when one spends a lot of time debating whether to undertake a certain act before actually undertaking it, action is premised on an element of non-rationality, of a resolute cutting-off of the process of reasoning. After all, with regard to any given act, reasoning *could* go on forever, the debate between arguments and counter-arguments never ending, precisely because of our freedom—i.e., the gap between the conclusion of an argument and the carrying-out of an act.² If we were perfectly, infinitely rational—a condition that is inconceivable (self-contradictory), because then we would never be able to commit the *act* of considering a reason for something—the debate between arguments for and against an act would indeed never end, and nothing would get done. In reality, though, because of the fact of freedom we always act on the basis of an incomplete rationality, an incomplete process of reasoning.³

Anyway, the point is that one manifestation of the incompleteness of our rationality is our generally ignoring reasons pertaining to death, to the vastness of time. Nature was, on the whole, wise to implant in us this unrationality; without it, as I said, we would be obsessed with the meaninglessness of life, and happiness would be impossible. In fact, this obsession can be construed as an antithesis in the sort of dialectic I mentioned above. The ‘thesis’ is the naïve love of life, the childlike immersion in the moment and all its excitement; the antithesis (or the “negation”, in Hegelian language) arises upon the discovery of death and time—*vast* time, with the ultimate futility of human striving that it entails. It arises, that is, with the first stirrings of (idealized) self-consciousness, which, in being a reaction against the previous stage, are negative and life-denying. But then there is the synthesis, or the “negation of the negation”, as Hegel called it: we must accept that in order to live, we cannot constantly think about how futile, in the long run, is everything we humans do. We should self-consciously embrace the conditions of life that nature has hardwired into us, namely (in this case) the spontaneous conviction of our own importance, our own worth. Besides, it’s impossible for us to appreciate the enormousness of time and the universe, and thus our own insignificance. Even if we try, we can’t; time and the universe are beyond our comprehension. So we might as well accept this fact and use it to our advantage: it provides an excellent, honest excuse for doing what *feels* right, namely living life to the fullest. “I can’t comprehend the immensity of time, so why try? I’m bound to fail. Hence, I might as well accept my ignorance and go on living—living well and affirmatively, as nature intended.” In short, the ‘synthesis’ amounts to a return to the attitude of the ‘thesis’ but on a higher, more self-conscious level. It is profounder than the attitude of the antithesis in that it is more reflective: it is justified by deeper processes of reasoning, which don’t take account only of the vast nature of the universe and the inevitability of universal death; instead, they also invoke the necessary conditions of human life, such as our incomplete rationality, our inability to appreciate the magnitude of time’s

¹ From *The Unbearable Lightness of Being*.

² There’s a paradox here. For the process of reasoning is itself a series of acts. As such, it presupposes a setting-aside of reason. That is, when I give a reason for something I am not considering the reasons for and against giving the reason. (That sounds silly, but there are reasons for and against *any* act, be it physical or mental. Insofar as one does not consider the reasons, one is being unrational.)

³ Incidentally, this doesn’t mean that every course of action is as reasonable as every other. Likewise, certain people, while not *completely* rational, are *more* rational than others. (That is, the courses of action they take are more reasonable.) The ideal Marxist is more rational than the ideal Republican, because he has more, and more logical, arguments in favor of his beliefs and acts.

nihilism, and our instinctive intuition of what is the best way to live. These ‘deeper processes of reasoning’ give a good philosophical justification for the act of affirming life, which we all want to do anyway.

[...] In other words, sages and philosophers have throughout history tacitly recognized the truth of the dialectic I’ve been outlining. Human life may, in the long run, be futile, but forget about it! That doesn’t matter to *us*, who are living right now. What matters is our own happiness, our self-growth, our living well. This attitude is not only the sensible one but can also be construed as the *heroic* one: despite our depressing knowledge of the “big picture”—despite the universe’s callousness to us—despite life’s absurdity, we’ll continue to love life, just because we can! Nothing can bring us down! We will assert ourselves no matter what! Man is in fact greater than the universe, for despite knowing that the universe will someday crush him and all his achievements, he continues to love himself and to heap contempt on this vast destructive force.

[...]

Anyway, before that interruption I wanted to point out that, my advice to ‘ignore’ universal death notwithstanding, we should also try to keep it in the back of our minds. For if we do, inhumane excesses will perhaps be avoided. Napoleonic excesses, Hitlerian excesses—excesses of ambition. They will be seen as partly delusive, since, in the end, the best that the conqueror can hope for is a sonnet written three millennia later that’s devoted to the futility of his conquests. Rather than try to create a name for oneself, one should try to alleviate suffering—make the world a better place—since the *here and now* is what matters. Glory is illusory and temporary; suffering is real.

We always dedicate our efforts to the *future*. The present, we think, will pass, but the *future*—the *future* is somehow less transient, more permanent. It matters more than the present. We always justify present misery by appealing to the future. “The current suffering of the Iraqis will make possible a better future.” But how idiotic that is! For the future is as transient as the present! If we’re going to care about *one*, we might as well care about the *other*. We act as if the present doesn’t matter at all; it’s just a means to an end. The future is the end. But this attitude is backward. [...]

As I was saying: I think we should live in the moment more than we do. This is an element of Buddhism I agree with. Rather than immerse ourselves in plans, which we’re constantly doing—(truly: we spend so much of our life preparing for the future that we hardly even notice it)—we should remember that the future matters as little or as much as the present. Most people acknowledge the wisdom of that lesson, but usually the acknowledgement is superficial and abstract instead of *intuitive*. Think about it deeply for a moment. Remember when you were a child in awe of adults? It was like they lived in a different world, like you would be in your own world separate from them forever. But now you’re an adult yourself, and you realize how silly your former attitude was. There is nothing particularly special about adulthood, this present that was once the future. The only thing unique about it right now is its reality. For you feel like the past is just a blur, like you jumped from your first moment to this moment and, in a sense, skipped over everything in between. And yet, the moment before you die you’ll feel, again, like life didn’t really happen, like you just skipped over it all and arrived at this last moment of life, and this is all there ever was. It was always just this moment; this is all that’s ever existed, and everything else was something like a dream. – Future moments, in short, are identical to past moments and present moments, and so the common attitude that treats them as more special or important or permanent is both deluded and harmful. We sacrifice present happiness for the sake of what amounts to future *unhappiness*, because in the future we’ll again be sacrificing present happiness for the sake of the future.

I have to admit that I may be guiltier of this than most people. I’ve always cared less about the present than the future, and I tend to see the present through the prism of the future. I’m never satisfied in the moment; I’m always looking beyond it. To an extent, this ‘looking beyond’ is inherent in the human condition. It’s part of our self-consciousness: it’s a reflective extension of what Edmund Husserl called “protention”, viz. our continuous non-reflective anticipation of the *immediate* future, an anticipation which

is inherent in self-consciousness.¹ Nevertheless, our *reflective* anticipation can be mitigated. And it should. Try not to worry about the transient future: it'll come and it'll pass, and it's as unimportant as the present. –Living for the future does have its time and place, but living for the present is generally better for mental health.

In this respect, Buddhist philosophy is excellent. I disagree with it that we should try to detach ourselves completely from life, from the past and the future, because I think we should have different attitudes toward life at different *times* of life. In childhood: naïve trust and carefree play. In youth: mild hedonism, self-exploration, attachment to worldly things. In middle age: awareness of responsibility, devotion to family. In old age: gradual acceptance of death, detachment from the world. On the whole, we should do what feels most natural rather than exert ourselves at all times to overcome 'attachment' and thus suffering. Save the life-renunciation for old age, when you're already becoming less attached to begin with. –Nevertheless, Buddhist practices, and those of Eastern religions in general, are a good corrective to capitalist ones. Which explains why so many people in Western societies have turned to yoga and the like in recent decades.

[...]

While I'm on this subject I'd like to give some advice to my fellow members of the 'intellectual class'. The future's transience notwithstanding, a writer's fame is good for at least one thing: the longer it lasts, the more valuable, probably, is the work on which it is based. Long-lasting fame indicates that the work resonates with many people across cultures, and therefore that it means something to humanity as such—and *therefore* that it's valuable. So I think it's salutary for writers, when they're writing, to anticipate possible reactions to their work a hundred years in the future. Will it be seen as a mere historical curiosity, or will it be thought to have intrinsic merit? This projection-of-oneself does require imagination, but writers, after all, are supposed to be imaginative. Can they imagine readers in any cultured culture reacting favorably to their work? For example, people like Putnam, Dennett, Searle, Armstrong—not to mention lesser names—will be mostly forgotten in a few decades, which suggests that their works are not very valuable. Likewise with Stephen King, Tom Clancy, John Grisham, Dan Brown. At best, their books will be seen as intriguing relics, superseded by more recent fads. [...]

It's amazing how many different perspectives one can adopt vis-à-vis existential questions about death and time—about their implications for how to live. At certain times it's good to remind yourself of death, at other times it's best to forget about it. In your lifelong quest to make an 'art of living', the lessons of time are invaluable. I find it odd that Nietzsche, who was so concerned with drawing morals about life, rarely discussed issues related to mortality. The only instance I can recall off the top of my head is in *The Gay Science*, in a section in which he remarks how bizarre it is that people generally ignore the fact that they're going to die someday. They spend their whole lives avoiding the thought as much as possible! – Actually, now that I refer to the section (278), it reminds me of what I've been writing. "...Everyone supposes that the heretofore was little or nothing while the near future is everything: and that is the reason for all of this haste, this clamor, this outshouting and overreaching each other! Everyone wants to be the first in this future—and yet death and deathly silence alone are certain and common to all in this future!" "How strange it is that this sole certainty and common element makes almost no impression on people, and that nothing is *further* from their minds than the feeling that they form a brotherhood of death!" It is indeed strange, though quite natural from nature's point of view. In the next sentence he writes: "It makes me happy to see that men do not want at all to think the thought of death!"

In his commentary, Walter Kaufmann notes how different is this attitude from that of the existentialists. They were well-nigh obsessed with death, and found it, understandably, quite depressing. I think, however, that neither Nietzsche nor the existentialists got it quite right. Death need not be depressing. Even in youth. The thought of it can impart an element of lightness to life. For it provides an excuse for the joyous attitude of 'not taking oneself seriously'. It permits one to laugh at oneself. [...]

¹ For instance—to take Husserl's example—when you listen to a melody your consciousness is somehow oriented toward the immediate future, toward the note or phrase that will follow the one that's playing right now. He called this phenomenon "protention" and contrasted it with "retention".

Admittedly, Montaigne and Pascal needed God. But I think that in a culture less atomized than the American—or the French during the Reformation—people wouldn't need religion in order to be content with themselves. The positing of God is a symptom of man's fall from grace. As I've explained, "God" means nothing but the individual's eternal communion with an other. Monotheism is grounded in the human need for community.¹ If we could just get rid of God once and for all and focus our energies on the here and now, we might be able to arrange things so that we no longer could be seduced by prospects of immortality (religious, biological, political or whatever). We might be able to get along with each other—and to laugh at ourselves now and then.

[...]

[...] In any case, we men love women partly for their passive participation in Creation—for the *passivity* of their participation, that is. It's well known that husbands sometimes find their wives more attractive when they're pregnant—not because of any rational considerations about the miracle of life and whatnot, but simply because of the woman's weakness and vulnerability, which the husband (flatters himself that he) is responsible for. "I did that to her. I made her big and happy like that. Look at how vulnerable she is! Because of *me*! And I'm the one who has to protect her now!" Maybe there are pheromones or whatever chemicals the woman's pregnant body emits that attract the man to her more than usually, but the point is that implicit in his *consciousness* is this self-flattery that makes him fond of the impregnated one. –Love in general is a kind of self-flattery, like all other pleasurable states of mind. (Despite his cynicism, La Rochefoucauld was right about most things.)

[...]

Women also, of course, tend to be sensitive, somewhat insecure, fickle, easily heartbroken, but these aren't really flaws. They're simply manifestations of an attachment to life—of a genuine and deep desire for happiness. What's wrong with that? They're a corollary of women's excitable nature: the greater the capacity for joy, the greater the capacity for pain. This is virtually a law of the psyche. Men are usually somewhat dull, capable neither of great heights nor of great depths (though this is less true the more intelligent they are—and the more womanly). This is one of the reasons they're attracted to women: in the presence of the softer sex, they feel themselves rejuvenated. To criticize women, then, for their "drama" is a little disingenuous, for it is effectively a criticism of that which men love about women, namely their childlike immersion in life, their adorable naïveté and 'joi-de-vivre'. Their *spontaneity*. –You can't have the good without the bad.

[...] Matthew Arnold didn't have to look to Goethe and Wordsworth to find his "sweetness and light"; he could have looked to the woman in his life, his wife Fanny. Or to any other pretty young lady. Dostoyevsky is said to have fainted occasionally upon looking at a particularly beautiful woman.... Think of the girl in the mall who falls in love with the pink skirt in the window and has to buy it to show her boyfriend;—or the woman giving birth to a new life;—or the girl ignored by the man she loves but still loyal through all her tears;—or simply a naked young woman looking at herself in the mirror, fascinated:—something strangely inexpressible and beautiful unites these visions. Something that's a cross between the aesthetic sense and human 'fellow-feeling'. Something ideal and pure, which can be partially expressed also in music and nature.

–All things considered, it is of course a little stupid to view women this way. To see a contradiction between them and mundane reality. Women are humans. As ordinary as everything else. Goethean thoughts, like the ones I've been expounding, are always unscientific. Nevertheless, it can be enjoyable to fantasize along these lines. For it adds romance to life. In general, dwelling in the ideal is an essential part of a truly human life—though only a part, for anything taken to extremes is unhealthy. But there's a little bit of the ideal in everything people do, a little bit of illusion. [...]

(By the way, Sartre misinterpreted this side of human behavior. Being a product of his self-

¹ Its historical origins are telling in this respect. The Jews were slaves in Egypt, and Christianity was popular among Roman slaves. That is, people exiled from the community.

conscious times, he thought that people have an *innate* fascination with being an object (of another's gaze), a *real* object like a table—but with the important difference that they also want to remain self-conscious. So he thought that people want to be *self-conscious objects*. They want to be a For-itself-in-itself. An object as such, however, is not self-conscious, which is why Sartre called man a “useless passion”—a self-contradictory passion. But in fact, as I've said repeatedly, the modern fascination with self-conscious objecthood—with fame, respect, sex, love, and so on—arises from the innate desire for community. It arises from the desire for complete accord between your sense of self and the other's reaction to you:—in other words, from the desire for his unreserved, transparent affirmation of your transparent sense of self. In an earlier chapter I outlined the mechanisms by which this primordial desire is transformed into the confusing and contradictory array of modern mass-obsessions.)

How ought one to live? In this world of petty responsibilities, of frustrations and moral doubts, how ought one to live? Should you follow the Taoists in their withdrawal from society or the Confucians in their social activism? Should you live for God or for man? For yourself or for society? Hedonistically or altruistically?

I think that such questions are false dichotomies. Life is long; there is sufficient time to try more than one way of living.

On the self and the community

The nature of the self has been an object of philosophical analysis ever since ancient Greece—and arguably even before then, from the time when the Upanishads were written. It is likely that questions about selfhood will persist as long as there is such a thing as philosophy. This does not mean, though, that progress does not occur, that our understanding of the self must always remain as incomplete as it was in ancient Greece. On the contrary, our understanding has grown exponentially, especially in the last two centuries. Psychology, philosophy, anthropology, neurology have all contributed to it. We are light-years beyond where we were a hundred years ago.

Unfortunately, it has proven difficult to consolidate all the insights into a single theory. It may prove impossible to do so, but no one seems to have tried, so we can't pass a definitive judgment yet. Many people, indeed, think there is no point in trying to come up with a comprehensive theory; they think either that it's hopeless or that the contemporary fragmentation is theoretically healthy. In their book *The Rise and Fall of Soul and Self*, Raymond Martin and John Barresi argue that “before any unifying theory emerges, current occasional expressions of concern about the problem of fragmentation and the still-lingering hope for eventual reintegration will be replaced by the recognition that the multi-faceted threads of debate and theorizing are never going to be woven together completely....”. They also think a “strong case” can be made that “the current state of theoretical and methodological pluralism is healthy”.¹ Many philosophers would agree with them. After all, pluralism presumably encourages freedom and creativity.

To an extent, I agree. I also think that a truly ‘comprehensive’ and detailed theory will never be reached. The task is too difficult; there are too many questions and data to take into account. Nevertheless, the fact that what is being analyzed is a single reality—namely, the ‘self’ and everything that directly pertains to it—implies that a single comprehensive theory is at least *possible*. We cannot rule it out on *a priori* grounds. In fact, such grounds would surely suggest that if people were sufficiently brilliant and determined, a grand synthesis could sum up all that is valuable in current theorizing about the self. Such a synthesis could continue to evolve, of course, and perhaps later we would come up with an even grander synthesis, etc.—but in any case, unified theories seem possible.

I also think they're desirable, as long as they don't stultify further research. Theoretic chaos, such as exists now, is never satisfying to the inquisitive mind. The mind always wants to synthesize, integrate, impose order on experience; it doesn't like the feeling of being lost at sea. One wants to know precisely

¹ *The Rise and Fall of Soul and Self* (New York: Columbia University Press, 2006), pp. 300, 301.

how what is true in psychoanalysis relates to what is true in neurology, and how that relates to what is true in phenomenological psychology. Surely it is possible, at least theoretically, to integrate, or ‘reconcile’, the results of all these approaches!

If it is, I am not, at the moment, the one to carry out the project. My knowledge is too limited. Still, I would like to offer some speculations, if not to pave the way then at least to calm the restlessness of my creative urge. For ten years I have been bothered by a number of questions about selfhood, and I would like to temporarily put them behind me. Questions like: “What is the self? Is there such thing as a self? Does each person have only one self? What is the relation between the present self and the past self? What does it mean to be oneself? Does a person have one identity or many? Is there any substance to the notion of ‘authentic’ selfhood, as opposed to ‘inauthentic’ selfhood?” In a single chapter I cannot give thorough answers to all these questions—and there are many more questions I can’t even touch on—but I’m going to do the best I can. My hope is only that I’ll come across a few insights which will be of use to others.

Ours is an age, obviously, of grave theoretical and practical doubts about selfhood. “Modern man is afflicted with a permanent identity crisis, a condition conducive to considerable nervousness.”¹ The condition is conducive also to the common theoretical doubt that each of us has (or is) a “unified self”. It will be useful to quote again from Kenneth Gergen’s book *The Saturated Self*:

In an important sense, as social saturation proceeds we become pastiches, imitative assemblages of each other. In memory we carry others’ patterns of being with us. If the conditions are favorable, we can place these patterns into action. Each of us becomes the other, a representative, or a replacement. To put it more broadly, as the century has progressed selves have become increasingly populated with the character of others. We are not one, or a few, but like Walt Whitman, we “contain multitudes”. We appear to each other as single identities, unified, of whole cloth. However, with social saturation, each of us comes to harbor a vast population of hidden potentials—to be a blues singer, a gypsy, an aristocrat, a criminal. All the selves lie latent, and under the right conditions may spring to life.The relatively coherent and unified sense of self inherent in a traditional culture gives way to manifold and competing potentials. A multiphrenic condition emerges in which one swims in ever-shifting, concatenating, and contentious currents of being.² One bears the burden of an increasing array of oughts, of self-doubts and irrationalities. The possibility for committed romanticism or strong and single-minded modernism recedes, and the way is opened for a postmodern being.³

And so on and so forth. There is a kind of seductive appeal to the superficial dogmas of postmodernism—as there is to despair of any kind—which we must do our best to oppose. We should do so systematically, starting from the ground up, as it were, until at last we have the conceptual tools with which to expose the one-sidedness of Gergenism, and perhaps to give the self-doubting individual a little therapeutic comfort at the same time.

If the above quotation is too academic for the reader to relate to, maybe I should quote something more personal, to show just how common is the typical ‘postmodern’ disorder and how imperative it is that it be understood. In his book *The Disowned Self*, Nathaniel Branden relates the following anecdote:

One afternoon I was lunching in a small, rather elegant restaurant, when I fell into a conversation with the owner, whom I knew slightly. An attractive man in his late thirties, he projected a restless, buoyant energy, a facile glibness and an aggressively colorful style of dress, all of which seemed clearly intended to fulfill the image of a jet-set playboy. In

¹ Kenneth Gergen, op. cit., p. 73.

² Well done, Kenneth! The reader enjoys nothing more than to swim in the ever-shifting, concatenating and contentious currents of your alliterations.

³ Ibid., pp. 71, 80.

the midst of a long, nonstop monologue about his recent trip to Las Vegas and his problems with his tailor, interspersed with random references to sex, Vietnam, and a new discotheque in Acapulco, he interrupted himself suddenly to say—with desperate earnestness, and with eyes that were dark holes of screaming pain—“Nathaniel, I’ve got to talk to you. Let’s have lunch one day. I can’t stand this hollowness inside of me”—he brought his hand to his chest—“Man, it’s killing me—it’s one big emptiness inside—nothing here—know what I mean?—I don’t know how to describe it—there’s nothing there—*no feeling*—listen, we’ve got to have a talk.”¹

Turns out they didn’t have their talk, since the “jet-set playboy” was immured in his glib lifestyle. But that’s the point. We’ve become prisoners of ourselves. Narcissists, schizoid patients. The first step towards liberation is self-understanding.

Much of this chapter will be rather academic in style, but that’s unavoidable. I want to speak to specialists as well as the general public, so you’ll have to forgive me if the discussion gets a little dry at times. (Likewise, I ask the specialist to be lenient in his criticisms of whatever lack of rigor my arguments show.) Part of the philosophical confusion is that the word ‘self’ is used in a number of different ways: some theorists, for instance, deny its existence, while others say it represents a lifelong *task*—something to be *achieved* over the course of one’s life—while still others think that everyone *obviously* has, or is, a self. These latter theorists use the word to denote the ‘I’, the immediate and indubitable sense of self that a person has, which sense cannot be denied unless we are going to deny consciousness itself, which would be ridiculous. Since this is the most immediate manifestation of the self, I’ll discuss it first.

It might be wise to adopt the method Thomas Aquinas used in his *Summa Theologica*, namely to preface my discussion with brief summaries of theories that I disagree with. David Hume proposed such a theory when he denied the existence of selves. In his *Treatise of Human Nature* he wrote, “For my part, when I enter most intimately into what I call *myself*, I always stumble on some particular perception or other, of heat or cold, light or shade, love or hatred, pain or pleasure. I never can catch *myself* at any time without a perception, and never can observe anything but the perception.” “The soul, so far as we can conceive it, is nothing but a system or train of different perceptions.” I think he was confused, as I’ll argue later; nevertheless, his intuition was, in a sense, right. The Buddha agreed with Hume: he too denied the existence of a substantial, persisting self. He thought there is only consciousness, the body, perceptions, etc., but no *self*, as our intuition says there is. The main difference between them in this respect is that Hume found his conclusion depressing, while the Buddha found it liberating.

Some contemporary philosophers use less plausible reasoning to arrive at a conclusion similar to Hume’s. These philosophers, influenced by Wittgenstein, think that because “the substantial phrase ‘the self’ is very unnatural in most speech contexts in most languages”, the self itself is an illusion—“an illusion that arises from nothing more than an improper use of language”. Galen Strawson, from whose paper “The Self” these quotations are taken, persuasively argues that that position is untenable:

The problem of the self doesn’t arise from an unnatural use of language which arises from nowhere. On the contrary: use of a phrase like ‘the self’ arises from a prior and independent sense that there is such a thing as the self. The phrase may be unusual in ordinary speech; it may have no obvious direct translation in many languages. Nevertheless all languages have words which lend themselves naturally to playing the role that ‘the self’ plays in English, however murky that role may be. The phrase certainly means something to most people.... It is too quick to say that a “grammatical error....is the essence of the theory of the self”, or that “‘the self’ is a piece of philosopher’s nonsense consisting in a misunderstanding of the reflexive pronoun”.²

¹ Branden, *The Disowned Self* (Los Angeles: Nash Publishing, 1971), pp. 1, 2.

² Galen Strawson, “The Self”, *Journal of Consciousness Studies* 5.6 (1997): 405 – 428.

We should take as our starting-point the sense of self that everyone has, the self-intuition. We shouldn't explain it away before even acknowledging its existence.

Daniel Dennett occupies the dubious position of trying to explain away our sense of self without knowing he is doing so. Specifically in his *Consciousness Explained*. Somewhere in that thicket of verbiage he manages to say that he thinks there is a self—indeed, that it's *obvious* there is a self, for, after all, *someone* (namely, the author) is wondering right now whether there is a self—but that it's neither some kind of spiritual substance nor something corporeal: it is one's "center of narrative gravity". It is "an abstraction defined by the myriads of attributions and interpretations (including self-attributions and self-interpretations) that have composed the biography of the living body whose Center of Narrative Gravity it is".¹ The self is an abstraction, an idea, a narrative nucleus. Since Dennett is a clever sophist, he is able to hide the fact that he has effectively defined me—and you—as a metaphor. *I...am nothing but a metaphor, a center of narrative gravity. This person who is writing, who has thoughts. I am not active, as my intuition tells me I am; I'm an abstraction, literally a metaphor. –If you find this idea at all coherent, I commend you.*

As for the popular physicalistic idea that the self is the body or the brain, the fact that I can coherently say, "This is *my* body, *my* brain" is enough to refute it. I must be something over and above my brain if I can refer to it as mine....

....The philosophical method of intuition or introspection, or "phenomenology" (understood broadly), is not popular nowadays. Few theorists have the capacity for it, judging by their writings. Nonetheless, if one's goal is to elucidate the ordinary intuition of the self, introspection is essential. We have to consult our consciousness to see what is 'in' it. Hume took this for granted (as is evident from the above quotation), as did Descartes, Fichte, Hegel, Schopenhauer, Kierkegaard, the young Marx, William James, Franz Brentano, Husserl, George Herbert Mead, Heidegger, Sartre, Merleau-Ponty, Simone de Beauvoir, Paul Federn and countless others. They thought that because one's sense of self is a phenomenon of one's consciousness, if one can 'unpack' what is implicit in consciousness, one will have made progress towards understanding the self. –At any rate, this is the approach I'll adopt; if it gets me nowhere, then my method is wrong.

I had intended to include my ideas on the mind-body problem in this book, but I've had to abandon that idea on account of the book's length. This chapter has the relatively modest aim of defining the self and answering various questions, psychological and philosophical, that arise out of my formulations. I will, however, be more ambitious than Hume (who wrote in the same passage that I quoted above, "If anyone, upon serious and unprejudiced reflection, thinks he has a different notion of *himself*, I must confess I can no longer reason with him. All I can allow him is, that he may be in the right as well as I, and that we are essentially different in this particular. He may, perhaps, perceive something simple and continued, which he calls *himself*; though I am certain there is no such principle in me."²): I'll assume that the conclusions I draw from my own experience (as applying to *me*) are true of the reader as well, whether he knows it or not. Most people have meager introspective powers, however they may delude themselves into thinking otherwise; their disagreement with me is, in itself, by no means proof that I'm wrong. *Homo sapiens* is so constituted that its individuals are essentially similar in the ways I'll discuss. (The self of Paleolithic man, though, may have been slightly different from that of modern man. I'll offer speculations later.)

Before I begin I have to introduce a concept that will be of some importance throughout my investigation. The concept, namely, of 'half-consciousness'. I mean this term to denote a state of mind of which one isn't explicitly conscious, as I am conscious right now of typing on my keyboard (because I am explicitly thinking about it), but which is nonetheless 'implicitly' or 'obscurely' in one's consciousness. For example, five minutes ago I was implicitly, half-consciously aware of my existence; right now I am *explicitly* aware of it, because I'm thinking about it. I'm (aware that I'm) reflecting on it. The idea of half-consciousness may remind you of Sartre's "pre-reflective" consciousness in *Being and Nothingness*. He gives there the example of a man who is counting cigarettes on a table: he has laid out the cigarettes one by

¹ Dennett, *Consciousness Explained* (Boston: Little, Brown and Company, 1991), pp. 426, 427. This book, full of irrelevant cutesiness and empty of ideas, is embarrassing.

² On the other hand, given his wry sense of humor, he was probably being facetious.

one and is counting them. He is wholly absorbed in his activity, not reflecting on himself at all. Nevertheless, if a passerby says, “What are you doing?” he’ll instantly answer, “I’m counting my cigarettes”. The immediateness of his answer, which uses the concept ‘I’, shows that in a sense he was aware of himself even while wholly engaged in counting. He was pre-reflectively self-conscious, ‘half-consciously’ self-conscious. Thus, “in pre-reflective self-awareness I am not confronted with a thematic or explicit awareness of the experience as belonging to myself. Rather, [I am experiencing] a non-observational self-acquaintance.”¹

So why don’t I use Sartre’s term? First of all, I suspect that Sartre intended it to be a modifier primarily of the word ‘self-consciousness’, while I want to say that one can be half-conscious of many things, not just one’s existence. Second of all, there are *degrees* of half-consciousness, whereas Sartre may not have recognized degrees of “pre-reflective” consciousness. (I don’t know if he did.) For instance, consider this example from Wittgenstein:

A doctor asks: “How is he feeling?” The nurse says: “He is groaning.” A report on his behavior. But need there be any question for them whether the groaning is really genuine, is really the expression of anything? Might they not, for example, draw the conclusion “If he groans, we must give him more analgesic”—without suppressing a middle term?

Maybe this example doesn’t make much sense out of context.² At any rate, Wittgenstein wanted to draw a behavioristic implication from it, viz. that the question of whether the patient’s groans signify that he is feeling pain is irrelevant to the situation. Neither the nurse nor the doctor reflects on the “middle term” that the reader naturally supplies, namely that groans imply pain, which calls for analgesic. They just automatically, unthinkingly associate groans with the necessity of giving him analgesic. The association has been ‘conditioned’ into them, as it were. –Wittgenstein is arguing somewhat along those lines, to further his overarching anti-mentalist agenda. I want to draw a different conclusion, though. Wittgenstein may be right that neither the nurse nor the doctor is explicitly thinking about the patient’s pain; still, they are *half-consciously* aware of it. If someone mentioned it to them they would immediately, unthinkingly agree, thus bringing their knowledge (of the patient’s pain) out from its ‘latency’ somewhere in or behind their reflective consciousness to full daylight in the glare of self-aware thought. To call their ‘latent’ knowledge “pre-reflective”, though, would, I think, do violence to the phenomenologist’s conventional use of the term. Ergo: I’m calling their knowledge ‘half-conscious’.

The relevance of the example to my argument is this: the nurse and doctor’s knowledge of the patient’s pain is, I think—in that moment—‘closer’ to their explicit consciousness than, say, their knowledge of their existence. Should someone walk in and say, rather than “That man looks like he’s in a lot of pain!”, “You people are aware that you exist, right?”, they would look at him like he was crazy. Before he said that, they were, in a sense, implicitly aware of their existence, but *less* so than they were aware of the patient’s pain. This is why they’re baffled at the man’s irrelevant comment. –Hence, there are degrees of half-consciousness. That is, the typical phenomenologists’ dichotomy between ‘reflection’ and ‘pre-reflection’ is simplistic. There are *degrees* of reflective awareness, which, if ‘laid out side by side’, would constitute a continuum, from virtually no reflective awareness to an *intense, obsessive* awareness.³

¹ Shaun Gallagher and Dan Zahavi, “Phenomenological Approaches to Self-Consciousness”, *Stanford Encyclopedia of Philosophy* (Fall 2006 Edition), Edward N. Zalta (ed.), URL = <http://plato.stanford.edu/entries/self-consciousness-phenomenological>.

² On the other hand, it doesn’t make much sense *in* context either. See Wittgenstein’s *Philosophical Investigations* (New York: The Macmillan Company, 1958), p. 179.

³ Phenomenologists speak of reflection as being a second-order level of awareness. But there can also be reflection on reflecting. There can be third-order, fourth-order levels of awareness. While these can, from one perspective, be considered merely species of second-order reflection, they are in fact more reflective than, say, awareness of looking at an object, and as such should be differentiated (in some respects) from ‘*immediately* second-order’ awareness. –But the notion of a second order, insofar as it implies some sort of reflective leap between itself and a first order, is itself simplistic.

This phenomenon of half-consciousness (or implicit consciousness) is paradoxical, but it certainly exists. It isn't, by the way, the same thing as a person's 'unconscious' or 'dispositional' beliefs, such as my belief that no lions are forty feet tall, or that there are more than three people in the world. Before I mentioned these two beliefs I had never thought about them; they weren't even somehow implicit in my mind. I wasn't half-consciously aware of them in any way.

Nor is half-consciousness the same thing as Freud's "subconscious" or his "preconscious". (He distinguishes between the two concepts. See his *Ego and the Id*, chapter one.) Repressed memories, for example, are surely *subconscious*, not half-conscious. In any given moment, we aren't even implicitly aware of them.Actually, now that I've refreshed my memory about the (somewhat different) notion of the *preconscious*, I have to admit that it seems pretty similar to what I'm talking about. Freud defines the *preconscious* as comprising thoughts that are latent but can become conscious at any moment, if we focus our attention on them or if they 'pop up' into consciousness. This is essentially what I mean by 'half-conscious thoughts'. Nevertheless, I'll stick to my own terminology, to avoid any Freudian baggage.

Moreover, I want to emphasize the paradox that we are somehow *partly aware* of these thoughts. They are not completely *outside* of consciousness (i.e., *preconscious*); they are on its 'boundary', its 'horizon', as it were. The boundary between consciousness and unconsciousness. In order to understand and appreciate this fact you'll have to introspect a little. So I'll give you one more example. Suppose I say to you, in an angry way, "I resent what you did to me!" What am I saying? What does 'resent' mean?—what do I *think* it means in the moment that I make the utterance? Wittgenstein, who spent many pages in his *Philosophical Investigations* trying to wrap his mind around the paradox I'm discussing, might have said that nothing *in my consciousness* provides my utterance with a meaning. *At that moment* I don't 'think' the statement means *anything* in particular. My consciousness is 'empty'; there is no 'feeling' that imparts an intentional content to the word 'resent'. To paraphrase Wittgenstein, if God looked 'into' my consciousness and examined everything in it, he wouldn't find anything to justify an exclamation like "Aha! *That's* what Chris means by 'resent'!"¹ 'Resent' is just a word I say, a word I am accustomed to and therefore do not find problematic. Wittgenstein's conclusion would be that my utterance is essentially a behavioral fact, not a fact of consciousness; the statement's meaning exists only in the way I *use* it (in my behavior).

I disagree, however. First of all, Wittgenstein's behaviorist conclusion is deeply counterintuitive, which is why he himself grappled with it for so long. It's also why Saul Kripke wrote a book on it.² To use Kripke's language: to think that nothing in my consciousness "justifies" my utterance, in the sense of giving it a meaning, is intuitively appalling. I *must* mean something, something concrete and specific, by what I say, just as there must be a specific reason why I say it. This reason, in fact, must be intimately related to the meaning, the justification, I have in my consciousness. But then what is the meaning (of "I resent what you did to me!")? —The obvious answer, reachable through introspective examination, is that I feel as if the person I'm talking to has slighted me in some way, offended my sense of self-worth, done something that indicates a lack of respect for me. In the moment that I make my exclamation I may not be explicitly thinking about this perception, but I am, nonetheless, 'assuming' it in the back of my consciousness. It *grounds* my statement. I could at any moment call it explicitly to my mind, in which case it would be fully conscious rather than just half-conscious.

As you might imagine, this phenomenon of half-consciously being aware of something—of being neither *totally unaware* of it (as I am right now unaware of certain memories from my childhood) nor fully, self-consciously aware of it—is very common. At any given moment during the day, there are many thoughts we are half-consciously aware of. The phenomenon is also of philosophical importance: for example, I think it plays a central role in resolving the paradox of how it's possible to be—and *what it*

¹ Cf. *ibid.*, p. 217.

² *Wittgenstein on Rules and Private Language*. Kripke's focus was different from mine, but his intuition was basically the "paradoxical" one I'm discussing. You should read my paper "A Refutation of Ontology" in the appendix for an analysis of the paradox from a different perspective, as well as for an argument against the main theses in Kripke's book. See also the section "On 'half-consciousness'" in the appendix.

means to be—subject to self-deception.¹ For the purposes of this chapter, though, its relevance is that some of the analyses I'll propose are in a sense already an object of our awareness. The essence of the self is neither totally hidden from us in our subconscious nor at all times an object of explicit awareness. Indeed, the fact that there is such a thing as half-consciousness is what makes possible the introspective method itself. For the introspecting philosopher is trying to bring half-conscious, implicit thoughts to the light of day. He is trying to 'discursively unpack' what is implicit in consciousness. The test of his theories' truth is whether the intelligent reader can look into himself and say, "Yes! That's exactly what *I* perceive too! That perception has always been implicit in my consciousness; I simply haven't discursively brought it to my attention."

Let's begin: what is the nature of human self-intuition? What is this sense of self that almost everyone seems to have? First of all, it involves *continuity*. We perceive ourselves as being the same person from moment to moment and day to day. In other words, there is a certain stability and permanence in our self-intuition. Secondly, we sense that we're *active*, that we're (usually) in control of what we do. We have free will, we're self-determining. When I read a book, I am *choosing* to do so.

These two facts (our continuity and our apparent self-control) are the most important phenomenological causes of the belief in a substantial, metaphysical self, a "soul". "*I* am something *permanent*," we think, "some kind of spiritual substance, some sort of *entity* or *thing*. This is intuitively obvious! It just *feels* that way." When I introspect, I feel as if I am some kind of ineffably substantial thing, even as I cannot get a clear grasp of whatever it is that 'I' am. This is the sense in which Hume was right: no graspable entity corresponds to our 'substantial' self-intuition. Simply stated, there is *nothing there* (in consciousness), nothing that would qualify as a self. Nevertheless, the irresistible power of our self-intuition has led many people, including philosophers, to assume that each person 'has' or 'is' a *soul*, or a Transcendental Ego, as Kant called it—some sort of self behind appearances. Our self-intuition gives us access only to the *tip*, as it were, of this Transcendental Self. The rest of it is located mysteriously 'within' or 'behind' us. When we die, this thing is supposed either to have an afterlife or to be reincarnated, depending on one's religion.

I, however, am going to follow the Buddha, Hume, William James and Sartre in saying that the notion of a substantial self is a confusion, and a philosophically inelegant one. For it clutters up our conception of man. If we can provide a good explanation of psychic life without invoking a "soul", we should discard the idea as violating the principle of Ockham's razor. So for now I'm going to say that my, and your, self-intuition is deceptive: while it implicitly points to some sort of entity—a concrete *Self*—there is no such thing.

Indirect evidence exists for that conclusion. Consider the pupils of your eyes (or anyone else's). Ordinarily—say, when you look casually at a mirror—they appear ineffably substantial, as if they're a *presence* rather than an *absence*. This makes sense, since we intuitively perceive the eyes as being the gateway to the soul (or the self). When we're having a conversation, for example, we look at the other person's eyes: this is significant because we think of ourselves as communicating with *him*, with his *self*; and so if we naturally look at his eyes, then the obvious conclusion is that we naturally associate his eyes with his self more than we do his other facial features. Literature, of course, bears witness to this conclusion. ("Darling, your eyes are like the sunset! Your smile, your lips, your hair.....but oh! your *eyes*! Your soul sparkles through them!") And yet—the pupil is an *absence*, a hole for light to enter! Our eye-intuition is mistaken! This is indeed horrifying, though most people don't think so. But try this: get so close to the bathroom mirror that your nose is almost touching it, and look intensely into the pupil of your eye for a while. Keep looking until you suddenly get the horrible intuition that your pupils are a *nothingness*. Then back away, and they'll revert to 'substantiality'.

When I conduct that little experiment I always 'see' that there is no substantial self behind my eyes.

¹ For example, a person might be obscurely (half-consciously) aware that, say, his love for a particular woman was tinged with hatred; insofar as he didn't *reflect* on this hatred—i.e., didn't become fully, self-consciously aware of it—he might be said to be deceiving himself.

For a brief moment I see it with irresistible force. And then when I back away I always find it disturbing that I involuntarily return to the old misperception that the pupils are a presence. Evidently our brains are hardwired such that we naturally have this misperception, just as we have the deluded intuition of a substantial self. (Interestingly, we also misinterpret shadows: we see them as a presence when in fact they're an absence (of light).)

So I'm rejecting the strange and probably incoherent notion of a substantial self, something like "a spirit or thinking substance", to quote Bishop Berkeley. But then what is this sense of self that we have? I can see that I exist; but what am *I*? Above, I made light of Dennett's definition of the self as a metaphor, an abstraction, because it neglects the self's *active* nature. It is one-sided. All definitions of the self as some kind of idea suffer from this deficiency. They avoid Berkeley's and Descartes' mistake of attributing to the self a substantiality (which would imply an implausible mind-body dualism), but they sacrifice the insight into the self's essential activity. As Berkeley wrote in the *Third Dialogue Between Hylas and Philonous*, "I my self am not my ideas, but somewhat else, a thinking active principle that perceives, knows, wills, and operates about ideas". This active thing is what we should analyze first. (Later I'll explain in what sense Dennett's ideas have merit. For they are relevant to another aspect of the sense of self—just not its active aspect, i.e., that which sees itself as controlling itself.)

In his *Principles of Psychology*, William James gives a multifaceted definition of the self. The part I want to mention now is what he calls the 'I', as opposed to the 'me'. The I, or the "pure ego", is the "active principle" in oneself, i.e., "that which at any given moment is conscious". But what is this if not "the entire stream of personal consciousness" itself?—or, at any rate, the present segment of it. What else can be conscious but consciousness itself? "The I is a *thought*." "The consciousness of self involves a stream of thought, each part of which as 'I' can remember those which went before, [and] know the things they knew...."¹ James is adhering to the principle of theoretic economy: rather than posing a cumbersome division between thought and thinker, or activity and substance, he is fusing the two. The I is not separate from thoughts; "the thoughts themselves are the thinkers".² If this fusion does the work that we need a philosophical theory of the self to do, then it should be accepted as true.

But what exactly is James saying? The self, the I, is a thought, the present thought in a continuous stream of thoughts. But which thought is it? It can't be the entire stream of consciousness, for the self feels itself as wholly existing in each moment, whereas the stream of consciousness extends over a period of time. Nor can the self be (every thought in) the entire state of consciousness at any given moment, for included in this state is an awareness of things like one's environment, one's body, etc. The self, in its most immediate manifestation, is neither its environment nor its body, nor the *thoughts* it has of its environment and its body. It is just *itself*. But what is this? Well, if the self is a thought rather than a substance, then it can be nothing but the *thought of itself*. In other words, it is *self-thought*, or *self-consciousness*. *I am self-consciousness*.

Now we're in the territory of Fichte, Hegel, Kierkegaard, Sartre and other early phenomenologists. They defined the self as self-consciousness. Kierkegaard, though—at least until Sartre came along—may have been the one who most appreciated the paradoxical character of his definition. It truly is a paradox. For self-consciousness, as such, is a relation—a relation of itself to itself—and a *relating* of itself to itself—and is thus both a self-difference and a 'self-differencing'. As he wrote in the beginning of *The Sickness Unto Death*, "The self is a relation that relates itself to itself or is the relation's relating itself to itself in the relation; the self is not the relation but is the relation's relating itself to itself...." In other words, while the self (i.e., consciousness of being conscious) is, from one perspective, a relation, it is really an activity, and as such it cannot be a mere abstract relation. It has to be a *relating*, a relating itself to itself. Moreover, this is *all* it is. It is just a self-relating—an awareness of awareness, a *thought of thought*.

I have to be careful how I express myself here. For there are many different kinds of self-consciousness. There is consciousness of one's past, one's personality-traits, one's emotions, one's

¹ William James, *Psychology* (New York: The World Publishing Company, 1948), p. 215.

² This statement, of course, is an anticipation of Husserl and Sartre. No wonder, then, that Sartre spoke admiringly of James.

nervousness in social interactions, etc. These are not directly entailed by the kind of self-consciousness I'm referring to. For the moment I'm ignoring them. Instead, I'm talking about the most universal and immediate manifestation of self-consciousness, namely awareness of being aware (of an object). Fully developed and healthy human beings share this awareness at any given moment of the day. Sometimes it is merely half-conscious or 'pre-reflective', while at other times it is explicit and reflective. But in some form it is always present, this self-consciousness or sense of self. Gerald Edelman describes the phenomenon well: "[implicit in] conscious awareness of objects is the *immediate experiential apprehension* of oneself aware of them. Even when our attention is not on ourselves but on what we perceive, conscious perceptual awareness includes awareness of our own perceiving."¹ What I'm saying is that, almost by definition, to the extent that there is this "awareness of our own perceiving", there is a self—i.e., a sense of self.

It's worth noting that this account of the self is virtually, or completely, tautologous. By discarding the idea of a substantial self ('behind appearances'), we have accepted the idea that the self just is the *sense* of self. And what can the sense of self be but self-consciousness? The two terms are synonymous. Since the most immediate and necessary manifestation of self-consciousness is consciousness of consciousness, the self—i.e., the I, that which sees itself, in any given moment, as having self-control or free will—must be consciousness of consciousness. Moreover, this definition is useful in that it explains our perception of free will: self-consciousness, in being *of itself*, necessarily sees itself as existing through itself, as being the cause of itself, as having self-control.² It must see itself as positing itself, just as each person—each I—sees himself as positing himself and his acts, or as having free will. Another advantage of the definition of the self I've given is that it explains Hume's confusion. The reason it didn't occur to Hume is that it's so phenomenologically *obvious*. His probing of his consciousness was too *deep*: he searched all its nooks and crannies (his perceptions, his memories, etc.) for some obscure thing corresponding to a 'self', when in fact it was right there in broad daylight. One cannot 'search carefully' for the self without thereby passing right through it. Self-consciousness attends every thought; it is the human mode of consciousness, such that to look '*within*' consciousness is effectively to look *past* self-consciousness, and hence the self.

Now, many philosophers think that consciousness *as such* must be self-conscious(ness). They think that if it isn't somehow conscious of itself, it's unconscious, and an unconscious consciousness is a contradiction. Sartre was a famous defender of this doctrine, from which he deduced that the Freudian notion of the unconscious is a self-contradiction. One wonders, however, what he would have said about animal consciousness.³ Or the consciousness of someone suffering from Down's syndrome. Such a person is not as self-aware as a normal individual. (One has but to read the first part of *The Sound and the Fury* to get a sense of the mentally retarded person's consciousness. I'll return to this point.) Maybe Sartre would have said that such a person, as well as a higher animal like an ape or a dolphin, is at least a *little* self-conscious. 'Pre-reflectively', perhaps. Indeed, Sartre even thought that when people dream at night their consciousness is conscious of itself as dreaming. As Kathleen Wider summarizes his argument, "my reflective certitude of dreaming is proof that dreaming consciousness is consciousness of dreaming. I can have such reflective certitude, Sartre contends, only if 'my primitive and non-reflective consciousness [of dreaming]....[contained] in itself a sort of latent and non-positional knowledge which reflection then made explicit'"⁴ This "latent and non-positional" self-consciousness might be something like that of dolphins

¹ Quoted in Kathleen Wider's *The Bodily Nature of Consciousness: Sartre and Contemporary Philosophy of Mind* (Ithaca: Cornell University Press, 1997), p. 146. Incidentally, if my book were a work of academic philosophy, I would be constantly quoting many other contemporary studies that support my claims. The only reason I'm not is that that would make the book boring to write and boring to read.

² Cf. Fichte, *Wissenschaftslehre* (New York: Meredith Corporation, 1970), p. 97: "The *self posits itself*, and by virtue of this mere self-assertion it *exists*; and conversely, the self *exists* and *posits* its own existence by virtue of merely existing. It is at once the agent and the product of action; the active, and what the activity brings about; action and deed are one and the same, and hence the 'I am' expresses an Act....".

³ I've always found it odd that he ignored animals in *Being and Nothingness*. After all, an analysis, however crude it would have to be, of their consciousness would probably have some implications for the analysis of human consciousness.

⁴ Wider, *op. cit.*, p. 94.

and chimps, who are able to recognize themselves in the mirror, as well as mentally retarded and autistic people. It might also be vaguely similar to the consciousness of “a long-distance truck driver who, after driving for a long period of time, suddenly ‘comes to’ and realizes that he has been driving for some time apparently without being aware of what he’s been doing”.¹ This example is popular in the phenomenological literature. Was the truck driver pre-reflectively self-conscious before he ‘came to’, or was he unconscious? David Armstrong and others argue that he couldn’t have been completely unconscious, because, after all, during his apparently self-oblivious period he had to steer, use the brakes, use the clutch, etc. He must have had a perceptual consciousness, even if he didn’t have an ‘introspective’ consciousness. Still, it does seem odd to say that he was pre-reflectively self-conscious, since his consciousness was so different from that of our ordinary consciousness at most times of the day.

Such examples—of animals, of the truck driver, of a person with Down’s syndrome, of dreaming-consciousness—further support my abandonment of the rigid dichotomy between reflective and pre-reflective self-consciousness. For instance, it would be misleading to call the non-positional self-consciousness that must characterize the consciousness of a chimpanzee ‘pre-reflective’, because phenomenologists use that term to describe a kind of *human* consciousness. But we can’t call it reflective, either. I think, therefore, that it would be best to make do with my own vague terminology, namely with the claim that a chimp is ‘obscurely’ self-conscious—*half-consciously* aware of its existence. Similarly with the truck driver. Since there must be some sort of a self-giveness to his consciousness—otherwise, as Sartre said, he would necessarily be *unconscious*—we might as well just say that he was half-aware of his existence and be done with the whole debate. He was more self-aware than a dolphin but not as self-aware as a person in the midst of a heated debate. We should acknowledge, then, that self-consciousness is characterized, as it were, by a *continuum* rather than a division between ‘pre-reflective’ and ‘reflective’: both between species of animals and between moments in an individual’s life, the self-giveness of consciousness exhibits many different shades and colorings, many degrees of richness and paucity. A bonobo is more self-conscious than a raccoon,² which is more self-conscious than a dog, which is more self-conscious than a fish. Similarly, it has been established through empirical studies that human infants already have a proprioceptive form of self-consciousness,³ which isn’t properly ‘pre-reflective’, though.

Anyway, the relevant point for this chapter is that, to the degree that there is consciousness of consciousness, there is a (sense of) self. Since humans are the only animal capable of a deep, reflective self-consciousness, they’re the only animal that has a self in the full sense.

There are several respects in which human consciousness is more reflective or self-conscious than that of other animals. (In other words, its self-consciousness manifests itself in several ways.) I’ll distinguish between four main categories of the self’s relation to itself and the world, but the reader should keep in mind that these categories, as such, are simplifications, merely heuristic devices intended to simplify my discussion. There are no mutually differentiated ‘categories’ in concrete consciousness; everything exists in an immediate holistic unity. Indeed, this is the case with regard to any object of analysis, be it in economics, psychology, biology or whatever: the object is always a holistic whole, its analytically differentiated facets thoroughly interrelated and interpenetrating, each empirically presupposing the others. The act of distinguishing them is an act of theoretic violence, which, however, is necessary if we are to understand the object. For understanding consists in placing concepts in such relations to each other that

¹ *Ibid.*, p. 97.

² Bonobos—and apes in general—are amazing animals. They can learn American Sign Language, they can recognize themselves in the mirror, they can apparently empathize with fellow primates, they seem to be capable of envy, love, anger, forgiveness, friendship, and so forth. Any skeptical reader has but to watch one of PBS’s documentaries on the subject or read a book like *Bonobo: The Forgotten Ape* or *Chimpanzee Politics: Power and Sex among Apes*. (I once saw a documentary that described how a captive female bonobo communicated with a female zookeeper. The bonobo had, through ASL, expressed anger when the woman showed up late once for her daily confab with the ape; the woman then signed that she had had a miscarriage that day. So the bonobo expressed sadness, by making the sign for tears. Together they talked awhile about the subject, commiserating over the travails of pregnancy.)

³ Gallagher and Zahavi, *loc. cit.*

they ‘mirror’ the object of analysis in as detailed a way as possible.¹

The four categories I’ll briefly discuss comprise four different kinds of relations between self-consciousness and the world: namely, its relations to *time*, to the *body*, to the *external world* and particular objects in it, and to *itself*. The latter category ultimately includes the others, but it’s useful to distinguish it from them. One of the themes of my discussion will be that in each ‘mode’ or ‘category’ of experience, self-consciousness conflicts with itself—or rather, features of its experience conflict with each other, ultimately because self-consciousness is self-negation. I’ll use my analysis later in the chapter to make some sense of human relationships, including the individual’s relationship with himself.

The first mode of experience I’ll mention is the temporal one. Briefly stated, human consciousness is temporally more extended than, say, a dog’s. That is, the present moment as experienced by a human is more extended, more ‘pre-reflectively temporal’, than is the moment experienced by a dog, which is characterized by a kind of brute immediacy. Likewise, the consciousness of a healthy person is more aware of time *as* time than is the consciousness of someone with Down’s syndrome. William Faulkner portrays this fact well in part one of *The Sound and the Fury*, which is written from the perspective of a mentally retarded thirty-three-year-old named Benjy. Benjy is not capable of reflective self-consciousness; neither is he aware of the immediate past (or the distant past) *as* immediately past (or distantly past). Time does not exist for him, and he does not fully exist for himself. As Faulkner said in an interview, “To that idiot [Benjy], time was not a continuation, it was an instant, there was no yesterday and no tomorrow, it all is this moment, it all is [now] to him. He cannot distinguish between what was last year and what will be tomorrow, he doesn’t know whether he dreamed it or saw it.”² The fully developed person retains the just-past in his consciousness—and is pre-reflectively, or half-consciously, aware of it as just past—even as he anticipates or ‘protends’ the immediate future. This phenomenon can be expressed in Husserlian language: the retentional and protentional structures of consciousness are more prominent in a human than in, e.g., a dog.³ Peter K. McInerney summarizes Husserl’s theory of time-consciousness as follows:

A perceptual act-phase (an instantaneous slice of a perceptual act) has one feature that retains earlier phases of the perceptual act, another feature that perceives whatever is present, and a third feature that protends later phases of the perceptual act.Although retention is actual at one time, its intentional object is at an earlier time. Retention reaches to earlier moments in time and directly intuits earlier moments as *earlier*.protention portrays the future emptily....as indeterminate and open.⁴

Gallagher and Zahavi elaborate:

The retentional structure of experience, that is, the fact that when I am experiencing something, each occurrent moment of consciousness does not simply disappear at the next moment but is kept in an intentional currency, constitutes a coherency that stretches over an experienced temporal duration. Husserl’s favorite example is a melody. When I experience a melody, I don’t simply experience a knife-edge presentation (primal impression) of one note which is then completely washed away and replaced with the next knife-edge presentation of the next note. Rather, consciousness retains the sense of the first note as I hear the second note, a hearing that is also enriched by an anticipation (protention)

¹ Many philosophers would contest this ‘representationalist’, ‘correspondence-theory-ist’ way of describing what it means to theorize, but anyone whose mind hasn’t been warped by philosophy will agree with it. I argue against postmodernists and their ilk in the appendix.

of the next note (or at least, in case I do not know the melody, of the fact that there will be a next note, or some next auditory event).

Perhaps you're wondering what the relation is between all this—this discussion of the temporal structure of consciousness—and self-awareness. Gallagher and Zahavi explain the connection:

The temporal (retentional-impressional-protentional) structure of consciousness not only allows for the experience of temporally extended objects or intentional contents, but also entails the self-manifestation of consciousness, that is, its pre-reflective self-awareness. The retention of past notes of the melody is accomplished, not by a “real” or literal representation of the notes (as if I were hearing them a second time and simultaneously with the current note), but by a retention of my just past experience of the melody. That is, the retentional structure of consciousness captures the just-past qualities of intentional content only by capturing the just-past experience of that intentional consciousness. This means that there is a primary and simultaneous self-awareness (an awareness of my own identity in the ongoing flow of experience) that is implicit in my experience of intentional content. At the same time that I am aware of a melody, for example, I am co-aware of *my ongoing experience* of the melody through the retentional structure of that very experience—and this just is the pre-reflective [i.e., half-conscious] self-awareness of experience.¹

Thus, our advanced temporal awareness is one manifestation of our advanced self-consciousness. For it involves the half-conscious (pre-reflective) perception that our present self is a continuation of the immediately past self, and that the immediately future self will be a continuation of the present self. In being aware of the *moment* as extended, we are aware of *ourselves* as extended. This also makes possible our reflective awareness of our distantly past and distantly future selves as being, in a sense, *us*.

One of the ‘paradoxes’ of the temporality of human consciousness is that the retentional and protentional features of experience exist ‘together’, as it were—indeed, together with the impressional feature. All three are somehow immediately united in consciousness; there is no temporal succession between them. A second paradox (closely related to the first) is that the present moment is both *fleeting* and *extended*. The reader has but to introspect to see how the moment is extended: it is experienced not as a discrete fraction of an instant but as a continuity. This property, I have said, is explained by the presence of retention and protention. At the same time, though, there is the property of *fleetingness*: reflectively we know that any given moment can be divided into tiny instants, which can be measured in milliseconds or less. But even pre-reflectively there is a fleetingness, as indeed there has to be if we are to be pre-reflectively (and reflectively) aware of the temporal structure of every moment. This pre-reflective fleetingness is not obvious when reflection first tries to discern it, because the pre-reflective continuity is more noticeable. But try doing this: say the word ‘now’ many times, four times a second or so. “*Now—now—now—now—now—now....*” Although the perception of temporal continuity remains, there is also a perception of fleetingness, manifested in the fact that you experience each ‘now’ as instantaneously prior to the next (and later than the previous). The continuity and fleetingness exist together on a pre-reflective level, such that there is a sort of temporal contradiction at the heart of self-consciousness. This isn’t just an ‘objective’ contradiction that we don’t subjectively experience until we reflect on it; rather, it exists at the very heart of our subjective, pre-reflective experience. Every waking moment is characterized by it. In every moment, then, self-consciousness exhibits a temporal restlessness: continuity opposes fleetingness and vice versa; retention opposes protention and vice versa. Self-consciousness, or the self, is never at rest under such conditions.

The relations between self-consciousness and the body are similarly paradoxical. There is a pre-reflective awareness of our separation from the body, but there is also an awareness of our union with the body. Both these awarenesses have been analyzed by past philosophers: on the one hand, phenomenologists like Merleau-Ponty have examined the ways in which consciousness is united with the body. (See, e.g., the

¹ Gallagher and Zahavi, loc. cit.

Phenomenology of Perception.) Merleau-Ponty pointed out that there is a kind of bodily self-consciousness, a bodily intentionality “present in motor activity and in perception”—“a form of intentionality that underlies the intentionality of the mental and of language”.¹ And Gareth Evans notes that “perception involves the subject’s awareness of himself as a sensorimotor organism acting in the world. There can be no perceptual consciousness of the world without consciousness of oneself as embodied.”² In general, I am aware of my body not only as *mine* but also as, in a sense, *me*. I am, e.g., thin, muscular, healthy, strong. I look in the mirror and see *myself*. But while the whole body is experienced as me, the face is especially important. For the face most directly manifests states of consciousness. The experience of sadness consists partly in the experience of one’s face as twisted into a frown; the pleasure of laughter is a result partly of the pleasure of smiling. The face is a direct ‘objectification’ of the self, and the inner perception of facial expressions is an essential component in consciousness. (The universal preference of prospective lovers for good-looking people would be inexplicable were the face not half-consciously seen as the person, or the self, himself. When looking at the face and body we are looking at the person himself; the idea of a self ‘behind’ the face doesn’t even enter our thoughts. Therefore, a good-looking face signifies a good, or desirable, person. Unfortunately the correlation is not perfect.)

Moreover, in many modes of experience, the body is experienced almost unambiguously and immediately as the *subject* of consciousness, rather than as an object in the world. For example, when one is engaged in strenuous physical activity, one has effectively become one’s body acting on the world. One’s consciousness has become practically one’s *bodily* consciousness. This example is yet another illustration of the ‘intermixture’ between consciousness and body.

On the other hand, I am not really, strictly speaking, my body. The mere fact that I am reflectively able to distinguish myself from it is significant. Evidently there must be some difference between it and me. Dualists like Descartes have expounded the differences, but even pre-reflectively everyone distinguishes himself from his body. One of the reasons is that consciousness looks out at the world from ‘up above’, from the head and the eyes, while most of the body is located down below. So there is even, to an extent, a physical separation between consciousness and the body.³ The ‘pre-reflective’ duality which this separation supports is what makes possible our reflective awareness of the body as an object, as something in the world which is different from the subject (the I) that is our immediate self-consciousness. But we even half-consciously distinguish ourselves from our *face*: while its contours and expressions, as inwardly experienced by us, are important components of our consciousness, the mere fact that we can’t see it without using a mirror or some sort of reflecting device is enough to support our not completely identifying with it, since we *can* ‘see’ our self at all times—and indeed we *are* seeing it at all times, in that we always have a sense of self. Others, not us, see our face; we, not others, see our (sense of) self.

In short, self-consciousness has a complicated and paradoxical relationship with the body it inheres in, in that it is pre-reflectively aware of both its separation from it and its fusion with it. This relationship, however, does not signify quite the same self-restlessness and self-opposition as is implicit in the self’s temporal relations with itself. The latter are essential to the very notion of self-consciousness, its very activity—the activity that constitutes self-consciousness as such. The former relationship, on the other hand, is between self-consciousness and something external to its self-constituting activity. Even so, this relationship can be the source of much psychological conflict and pain, depending on what a person thinks of his body and on how much he identifies himself with it. If his body is obese, for example, his body-image might be extremely important to his sense of self even as he doesn’t want it to be, with the result that his sense of himself will be ambiguous and conflicted, fickle and insecure.⁴ At times (in moments when he identifies utterly with his body) he may be self-contemptuous, while at other times (when he rebels against

¹ Wider, *op. cit.*, p. 122.

² *Ibid.*, p. 129.

³ I’m not saying that consciousness has a physical location. It doesn’t. It isn’t the sort of thing to which the predicate of ‘location’ applies. Nonetheless, the head is in some sense (perceived by it as) its ‘home’.

⁴ The astute reader will notice that I’m using the term ‘sense of self’ here in a slightly different way than I have hitherto. I’ll clarify the matter later.

such an identification) he may feel self-righteous and angry at the world. One doesn't have to be obese, though, in order for the inherently ambivalent relationship between the self (i.e., oneself) and one's body to cause psychological problems. I myself used to resent the fact that girls seemed not to consider me very desirable on account of my unimposing physique—my skinniness, that is—and their reaction, combined with my knowledge of my skinniness, made inroads on my self-esteem, though I fought against that through the consideration that skinniness isn't who I am. Now that I'm bulkier and women find me desirable, I tend to be a little contemptuous of them, since their desire—like their former lack of desire—is not based on insights into who I really am.

The third main 'category' of the self's experience is made possible by awareness of its separation from the external world. Everything in the world confronts consciousness as an external thing, an other, whether it be as a brute object (like a table or a stone) or as another self. A great deal has to be said about the self's "being-in-the-world"; I'll do so later in the chapter.

The fourth and final universal category of self-consciousness's experience consists of the free will that I mentioned earlier, which, however, is shot through with unfreedom. Let's look at the freedom first.—The I perceives itself as controlling itself, which is to say that a person half-consciously experiences himself as free. He chooses his acts, he even posits his own existence. His existence, as Fichte said, is experienced as an act of his: he 'exists himself'. At any particular moment he is actively 'throwing himself' into existence, into the world, both through his physical activity and through the phenomenological structure of his self-consciousness. Actually, the two aspects are interrelated, since the self partly identifies itself with the body. In immersing myself in some activity or other, like writing or playing soccer or cooking dinner, I am throwing myself into the world, embracing my existence—bringing it to pass, in fact, causing myself to act and to exist. (Obviously I am not literally doing so, but this is how I experience it.) I am 'acting myself', acting my body—which is, to an indefinable extent, *me*—as well as my self-conscious being itself. For self-consciousness, even when it's occupied in acting-on-the-world, always, as such, is acting on itself, simply because it is *of itself*.

At the same time, though, it is passive, precisely because it is 'of itself'. It is its own object; therefore it is unfree, just insofar as it is an object for itself. Inasmuch as it observes itself, it is free and active; inasmuch as it is observed by itself, it is unfree and passive. We can use the terminology of Martin Heidegger (the Hitler-idolizing Nazi¹ who liked to think of himself as a philosopher²) to express the point. Heidegger emphasized man's "thrownness", his "always-already thrownness" into the already-existing world. Man finds himself in the midst of a world he didn't create, embodied in a body he didn't create, possessing a personality he didn't choose, accompanied by a self he didn't create (namely, himself), saturated with an unfree facticity. To quote Magda King:

By "thrownness", Heidegger does not mean that man is cast into the "natural universe" by a blind force or an indifferent fate, which immediately abandons him to his own devices, but means: his own "real" existence is manifest to man in the curious way that he can always and only find himself *already* here, and can never get behind this *already* to let himself come freely into being. But although he can never originate his being, yet he is "delivered over to himself": he *has* to take over his being as his.... Tuned by moods and feelings, man finds himself in his thrown being, in the inexorable facticity "*that* I am and have to be", delivered over to myself to be as I can, dependent upon a world for my own

¹ The jackass even sported a Hitler mustache.

² This isn't the place for a polemic against Heidegger, which would in any case be an unprofitable activity. I'll say only that the fundamental question on which he based his so-called philosophy, and such so-called metaphysical investigations as *Being and Time* and *An Introduction to Metaphysics* (which may be the most sloppy, repetitive, empty book I've ever read), viz. "What is the nature of being?"—and also "Why is there something rather than nothing?"—is a pseudo-question, abortive and unanswerable. Which is why he never answered it. Walter Kaufmann remarked somewhere that Heidegger is always on his way towards a point from which one day it will be possible to ask a question.

existence.¹

Thus, the individual exhibits a certain passiveness in his relationship with the world. He doesn't create it; it is always already there, as he himself is already here. He is therefore not *absolutely* free. This fact is a precondition for the sense of alienation or dehumanization that can afflict people, though, as we shall see, it is not the *cause* of the alienation (much as existentialists might have disagreed). –Be that as it may, there is a kind of dialectic here, between the self's freedom and its thrownness. There is an opposition, a self-opposition. The self feels itself free to do as it pleases; every act and thought feels as if it's chosen, such that in its very existence (i.e., its being conscious) the self seems to choose itself. But at the same time, it doesn't: the self is already here and can't do anything about it. It never makes the choice to exist, nor to exist in the *way* it exists (possessing a certain body and personality), and on some level, in every moment, it obscurely recognizes this fact. The two contradictory terms in this dialectic (the freedom and the unfreedom) always exist in an immediate synthesis; they aren't separated concretely, in consciousness, but only conceptually. They do, however, make for a certain half-conscious restlessness in the self, comparable to the restlessness inherent in the self's experience of time.

The individual's unfreedom and facticity are brought home to him especially forcefully in moments of self-dissatisfaction. Indeed, all unhappiness is first and foremost consciousness of unfreedom. There are, of course, always other conceptual and phenomenological elements in a particular experience of unhappiness, but the unifying thread through all such experiences is awareness of a frustrated desire (i.e., of unfreedom). –This is merely an incidental note, which I'll elaborate on later.

Anyway, the paradox of these self-oppositions is, in a way, not very paradoxical, for, as I have said, self-consciousness itself is a self-opposition, a self-difference. It relates itself to itself; it is both subject and object—its own object—i.e., active and passive, free and unfree. In other words, it is not completely identical to itself, which apparently means it violates the law of identity. Sartre agreed. He embraced this violation of the law of identity and made it the foundation of *Being and Nothingness*, in that it explains the distinction between being-in-itself and being-for-itself. A chair or a tree, for example, is identical to itself; self-consciousness is not. Indeed, there are *two* reasons it isn't: the first, I've said, is that it 'steps back' from itself and observes itself. "The for-itself exists as presence to itself.To be present to something requires separation from that to which one is present. So there must be a separation of consciousness from itself. 'If being is present to itself, it is because it is not wholly itself.'"²

The second reason is more general: consciousness is intentional, which means it is self-transcending. Awareness is never just itself, just pure awareness (of nothing). It is *of* something (as indeed the grammar of the word shows). As such, it transcends itself toward an object. It 'goes beyond' itself. "Consciousness is not a thing, a determinate Dasein; it is always beyond itself; it goes beyond, or transcends, itself."³ Or, as Wider says: "a phenomenological description reveals, for both Sartre and Husserl, that consciousness cannot exist without an object. Consciousness must always be of something.... [Indeed, it] must always be of that which is not itself, even when it takes itself as its own object."⁴ Its content, then—i.e., that of which it is—is, of necessity, not itself. Hence, consciousness is not self-identical.

Many philosophers have objected to that Sartrean (Hegelian, Kierkegaardian) claim. After all, it throws out logic! Or at least it limits its range of applicability. Their objection is misguided, though. For they're objecting to self-consciousness itself, not to a deficiency in the arguments of any philosopher. No one can plausibly deny that consciousness is necessarily of an object, nor that *self*-consciousness, as such, involves a separation from itself. This is just the way it is, the way it logically has to be. In giving his 'paradoxical' formulation in *The Sickness Unto Death* (which I quoted earlier), Kierkegaard was simply articulating what is logically implicit in the notion of self-consciousness. It has to be a self-relation, a self-

¹ Magda King, *Heidegger's Philosophy* (New York: Dell Publishing Company, Inc., 1964), pp. 77, 78.

⁴ Wider, op. cit., p. 42.

difference; and consciousness of whatever kind involves an element of self-difference, because it is of something other than itself. Thus, the law of identity does not apply absolutely to everything.¹

However, Sartre didn't seem to appreciate the sense in which the law does apply to consciousness. For, after all, insofar as we speak of something, it is (identical to) itself. Otherwise we couldn't speak of it. Insofar as some given thing changes in every instant or is necessarily different from itself, it is senseless to speak of *it*.² Self-consciousness is, therefore, tautologously identical to itself: it is ('identical to') this thing that is a separation from itself, a presence to itself. The lack of self-identity is simply a property of this (self-identical) thing. Formally, that is, self-consciousness is just itself; its content, though, is (of) something that differs from itself.

All these ideas will be useful later, when I indulge in a bit of phenomenological psychology. Before I do that, though, I have to at least sketch answers to the questions I posed at the beginning of the chapter, in order to mitigate postmodernist doubts about the nature of the self.

The 'sense of self' I keep referring to—self-consciousness, the I—never exists in its essential purity, as bare consciousness of consciousness. But neither does any thought, as such, really exist. A thought, considered as a single 'determinate' thing (a definite, clearly defined thing), is an abstraction from reality. There is never such a thing as 'a thought', a single thought existing in isolation from others. The 'thought' of, e.g., this table exists in an empirical unity with many other thoughts, which all merge together in the same state of consciousness. Any given state of consciousness comprises a number of thoughts. For example, right now I'm aware of the computer I'm writing on, the music I'm listening to, the feel of the keyboard on my fingertips, the itching in my leg, the desire to be doing something else besides writing, etc. One never experiences a single ('pure') thought of some object, because consciousness is a holistic whole. Hence, while we are always conscious of consciousness, we never experience self-consciousness 'purely' or 'in itself'. It is always merely implicit in our awareness of other objects, as Kant saw.³

In short, the consciousness of which we're conscious in any given moment is never just pure consciousness; rather, it includes many thoughts and many phenomenal states. The latter are produced by our body and its interactions with the environment; the former grow out of our idiosyncratic psyche and its interactions with the environment. Together, in combination with our underlying consciousness of consciousness, they constitute our intuitive sense of self in a particular moment. This sense of self can be only imperfectly described, for it is fundamentally intuitive. It's extremely complicated, too, to the degree that *consciousness* is complicated. For William James was right, in a sense: the self is just the present state of consciousness, because (human) consciousness is self-consciousness. He was wrong, though, or at least imprecise, in that he didn't specify that not *every* thought in consciousness is the self, but only one: viz., the thought of consciousness. Since this thought accompanies all others, we can say, albeit imprecisely, that the self is the entire state of consciousness at a particular moment (or the "*stream* of consciousness", depending on how you look at it).

Included in this state is a perception of psychological and physical continuity over consecutive instants, made possible by protention and retention. I already noted that self-consciousness is (or experiences itself as) temporally extended; now I'm saying that the other aspects of one's being, such as the body and one's personality, are temporally extended as well. The reason is that they are objects of (self-)consciousness, and insofar as consciousness is extended, its objects are too. Including the body and its actions and sensations, as well as emotions and thoughts. These things differ from other objects of consciousness in that they are, crudely speaking, the main features of the world to which self-consciousness

¹ Quantum mechanics provides more evidence for that claim. I think that logical laws in general, while *a priori*, are merely provisional. Whether they are true of some entity 'in itself' is always an open question. (See the appendix.)

² Nietzsche recognized the degree to which language and thought presuppose stasis in (or the self-identity of) what is thought about, and therewith all the other logical laws. See *The Will to Power*, §520—or, indeed, the whole of section 5 in Book Three. For an account of self-consciousness that remedies the one-sidedness of Sartre's, see Hegel's *Encyclopedia*—or Robert R. Williams's book *Hegel's Ethics of Recognition* (Berkeley: University of California Press, 1997), pp. 69–72.

³ See Wider, *op. cit.*, chapter one.

has an immediate ‘affective’ attachment (such that it pre-reflectively sees them as ‘its own’), with the result that they are experienced by (self-)consciousness as the concrete, empirical aspects of the self. Since, via protention and retention, they persist over time, the self in its full concreteness persists over time. (That is, I see myself as the same person right *now* as I am right *now*, and *now*, and *now*.... Across short time-spans like this, protention and retention account for my perception that I remain the same self.)

I fear that I’m being unclear. What I’ve been saying all throughout this chapter is that the essence of the self—the active kernel, as it were; the I in its most essential and immediate manifestation—is pure consciousness of consciousness. When a person reflects on himself (on his sense that he is an I), this self-consciousness is, first and foremost, what he is reflecting on. But pure self-consciousness doesn’t really exist, in the way that an entire state of consciousness (with all its thoughts, phenomenal impressions and so on) exists. It’s an abstraction, albeit an *active* one. It isn’t an abstraction in the way that a concept is, like the concept of 2 or the concept of a tree. These are passive abstractions, as it were. They cannot *act*. Self-consciousness, though—even considered in its abstract purity, in isolation from other thoughts—is active, like the thought I’m having right now of this table, even though in order to consider it as *a single thought* I have to abstract from reality, i.e., from the holistic state of consciousness in which it occurs.

Since self-consciousness is not ‘pure’ but instead interpenetrates and is interpenetrated by every other thought and sensation in a given state of consciousness, such that it is implicit in each of them and each of them is implicit in it, the real (sense of) self that someone has (or *is*) in a particular moment is the entire state of his consciousness.

I’ve already explained, albeit briefly, what accounts for the perception that one is the same self between consecutive instants. Namely, protention and retention. The perception that one remains the same self between longer spans of time is explained in much the same way, namely through memory. In his book *Reasons and Persons*, Derek Parfit distinguishes between “direct memory connections” and “continuity of memory”.¹ It is a useful distinction. There are direct memory connections between my present self and me as a fifteen-year-old if I can remember having experiences that I had then; there is continuity of memory if there has been an “overlapping chain of direct memories” between my past self and my present self. “In the case of most adults, there would be such a chain. In each day...., most of these people remember some of their experiences on the previous day.” Both kinds of memory-experiences are relevant to the perception of self-continuity. The reason I think that the I that I experience now is the same one that I experienced then is both that I remember certain experiences I had when I was fifteen (—would that I didn’t!—²) and that I know there has been an unbroken continuity of memories between then and now. Moreover, I can see from photographs that there was a body then that looks almost identical to mine now, from which I conclude that I ‘inhabited’ (and, to an extent, *was*) that body.

This common way of thinking is confused; I’ll explain why in a moment. First, though, I should answer the inevitable objection that ‘I’ cannot be equivalent to ‘this (self-)consciousness’,³ as I have apparently been saying it is, because it makes sense to say “*my* self-consciousness”, which implies that I must be something over and above self-consciousness. Furthermore, in any ordinary utterance, the words ‘this self-consciousness’ cannot be substituted for ‘I’ without a significant change in sentential meaning. Therefore, they cannot mean the same thing.

¹ *Reasons and Persons* (Oxford: Oxford University Press, 1984), p. 205. This book has been much eulogized in the philosophical literature. It is indeed impressive in some respects, for example in its scope and clarity. But I should limit my praise to the single statement that it’s a masterpiece of discursion. It is verbose, superficial, and boring. Like almost all philosophical texts published in this most unphilosophical of times, it is characterized by a purely discursive method, in that it remains on the level of mere words and shows evidence of no ability to penetrate to the intuitions that alone give, or should give, theories life. —To quote Karl Marx, with some liberties in translation, “On a level plain, simple mounds look like hills; and the insipid flatness of academia is to be measured by the altitude of its ‘great intellects’.” Or, said more succinctly, ‘Mr. Derek is a genius in the way of academic stupidity’. (Cf. *Capital*, pp. 654, 759.)

² Do your job, subconscious! Repress painful memories!

³ Partly included in which consciousness, I noted earlier, is the body. Its sensations, feelings and whatnot are in consciousness, and so the latter experiences the body as ineffably a part of it, though also something external to it.

My answer to this objection is that, partly because the presence of memories establishes a connection between a past self and the present self such that the latter ‘appropriates’ the former to itself, and hence sees itself as persisting across time, consciousness ‘reifies’ itself, sees itself as a sort of substance, an entity, a unifying principle, a thing-like ‘I’ that is both within and without consciousness.¹ Self-consciousness locates itself outside itself and yet inside itself. It projects itself beyond itself into a sort of ‘active concept’, namely the concept of oneself—of “Chris Wright”, in my case—which is constant and unchanging amidst all the shifting determinations of bodily and mental states. I, Chris Wright, am always Chris Wright, the same Chris Wright ten years ago as I’ll be ten years from now. Insofar as I am unchanging in this way, I am really nothing but a concept, albeit an active one, a concept that is free and can act. But this is absurd, of course. No concept can act. The only reason it seems as if the concept that is Chris Wright can act is that self-consciousness is what is doing the acting. Self-consciousness—a fairly reflective self-consciousness²—conflates itself with the concept that is Chris Wright (for example in its assent to the statement “I am Chris Wright”), such that it makes itself into an ‘active concept’, as I said. It reifies itself, turns itself (for itself) into an unchanging thing which functions as the bearer and unifier of physical and mental states and acts across a lifetime.

A moment ago I realized that Sartre anticipated these ideas in *The Transcendence of the Ego*. So I’ll quote him:

The ego is a virtual locus of unity.... Consciousness projects its own spontaneity into the ego-object in order to confer on the ego the creative power which is absolutely necessary to it. But this spontaneity, *represented* and *hypostatized* in an object, becomes a degraded and bastard spontaneity, which magically preserves its creative power even while becoming passive. Whence the profound irrationality of the notion of an ego.³

In other words, when I reflect on myself, implicit in my consciousness is awareness of myself as something ‘over and above’ my immediate consciousness, something that remains the same not only between instants but also between minutes and hours and years, something that Sartre called an ego. This thing—in its active aspect⁴—which I see as being *me*, has free will, temporal awareness, self-awareness, is fused with the body but is not merely the body—in short, has all the properties of self-consciousness and would *be* self-consciousness if it didn’t have the added property that it is self-identical and unchanging. Self-consciousness is not. It exists only in the moment, and to say that *this* self-consciousness (in this moment) is identical to the self-consciousness of ten minutes ago is meaningless. It is either truisitically false or truisitically true: true because self-consciousness as such is *always* the same—it is, after all, just consciousness of consciousness, it is never anything else—and so to say that two instantiations of the concept of ‘self-consciousness’ are the same is tautologously true; false because two instantiations are, in being *two*, not one and the same. In other words, two self-consciousnesses are always *qualitatively* identical but never *numerically* identical. However, the ‘ego’ is both qualitatively and numerically identical to itself across spans of time, no matter how vast. It must, therefore, be a concept, since a concept is always numerically and qualitatively self-identical. (The concept of 2 has never been anything but the concept of 2.) “The ego, being an object [i.e., a concept], is passive.”⁵ But it isn’t *merely* a concept, because I am not merely a concept (much as Dennett would disagree); I am also active. What the ego is, then, is a fusion of

¹ There are many other causes of this self-reification. I’ll note here only that the assigning of a “name” to each person at birth is well-calculated to coax his consciousness eventually into self-reification. He will see himself as something that coheres around his name—“I am Chris. Chris Wright. That is *who I am*, that entity called ‘Chris Wright’.”—and will thus ‘substantialize’ himself, or see himself as a substantial self. I’ll return to this point later in the chapter.

² “The ego [e.g., ‘Chris Wright’] is an object apprehended, but also an object constituted, by reflective consciousness.” Sartre, *The Transcendence of the Ego* (New York: The Noonday Press, 1957), p. 80.

³ *Ibid.*, p. 81.

⁴ See several paragraphs below on the distinction between its active and passive aspects.

⁵ *Ibid.*, p. 79.

passiveness and activeness, of conceptness and self-consciousness. “The ego is an irrational synthesis of activity and passivity.”¹ This is why I said that self-consciousness locates itself both within and without itself. Self-consciousness, which is the self in any given moment, doesn’t see itself as mere self-consciousness; it sees itself as an ego, a fusion of activity and passivity. It sees the ego as the self;² and since it also sees itself as the self, it sees itself as the ego. Which means it sees itself as not-itself, or rather as *more* than itself.

Sartre’s analysis in *The Transcendence of the Ego*, while brilliant, is flawed. My main criticism of it is also one of my criticisms of Anglo-American philosophy: it looks for precision where there is none, or where our concepts are inadequate to the phenomenon. It is too analytical. Sartre postulates absolute distinctions between pre-reflective and reflective consciousness, between the “I” and the “me”—which are aspects of the “ego”—between impersonal and personal consciousness, between spontaneous and active consciousness, etc. etc. What Wittgenstein wrote about William James might apply also to Sartre:

...William James got the idea that the ‘self’ consisted mainly of ‘peculiar motions in the head and between the head and throat’. [But] James’ introspection showed, not the meaning of the word “self” (so far as it means something like “person”, “human being”, “he himself”, “I myself”), nor any analysis of such a thing, but the state of a philosopher’s attention when he says the word “self” to himself and tries to analyse its meaning.³

Granted, Wittgenstein may be the most overrated philosopher in history, with the exception of Heidegger. And he is wrong if he means that intuitive, phenomenological analysis is pointless. Still, I suspect that Sartre read too much into his introspective mental states. Not only is the consciousness of an introspecting philosopher different from ordinary consciousness (such that the philosopher’s conclusions might not be as widely applicable as he thinks), but the entire stream of consciousness is an extremely ‘vague’ ‘continuum’ between varieties of experiences. It is so vague, so hard-to-pin-down, that I think the honest philosopher is forced to make frequent use of such inexact qualifying terms as ‘to an extent...’, ‘in some respects...’, and ‘partly...’, as I have been doing.

With that said, the reader may forgive me for not trying to give an exhaustive analysis of the ego in all its phenomenological permutations. I’ll confine myself to saying that, to the extent that there is self-consciousness, there is awareness of the ego. The two are virtually indistinguishable. Awareness of the ego is in fact implicit in human self-consciousness,⁴ because the latter sees itself not as what it really is, namely a fleeting phenomenon that lasts as long as the ‘moment’ (the “specious present”) lasts, but rather as a continuous, self-identical entity. During certain activities there is virtually no awareness of the ego, as there is little awareness of self; in other activities—for example, when introspecting—the ego is most definitely in some way an object of consciousness, since consciousness itself has become its main object. The reason we have to distinguish between the ego and self-consciousness despite their mutual inextricability is that the first, unlike the second, is a fiction. It is, as Sartre said, an irrational synthesis of activity and passivity, an artificial construct. It is the substantial self that we all unthinkingly think we are, the self that is not only philosophically inelegant and unnecessary, as I wrote earlier, but also completely self-contradictory and impossible. Self-consciousness, on the other hand, while undoubtedly the victim of delusions, is just as real as consciousness itself.

Sartre is right that the ego, or ‘oneself’, can be considered from various angles. There is the

¹ *Ibid.*, p. 83.

² Reflectively, the self takes the form of *oneself*. Which is just to say that it takes the form of the ego. Hence, the sentence “Reflective self-consciousness sees the ego as the self” can be rephrased as “When I explicitly think about myself, I see myself as Chris Wright, an unchanging self (an ego) extended through hours, days, years”.

³ *Philosophical Investigations*, §413.

⁴ Said differently: self-consciousness, for itself, takes the form of an ego.

immediate, active aspect, which is self-consciousness (as it experiences itself, not as it is ‘in itself’¹) or the I; there is the psyche and the body, or the “psycho-physical” aspect, which Sartre calls the me; there is the past ego and the future ego. One has to admit that anything that comprises such diverse things as the present subconscious, the past and future subconscious, the present, past and future body, and all conscious states across a lifetime is quite an artificial construct. Everyone interprets it as himself in his totality, but this self-interpretation is incoherent. There is no such thing as a single entity in this sense; there is only a vast, disorderly collection of states, acts and thoughts, which are all thrown together under the heading of a single ego (“Chris Wright”) largely because the consciousness ‘in’ which they have existed sees itself as a continuous, self-identical thing, on account of such facts as protention and retention and the continuity of memory (as well as “direct memory connections”).

It is also pertinent to note the difference between the concepts of the self and the person. Sartre writes that “the ego is outside, *in the world*; it is a being of the world, like the ego of another”,² but he is surely mistaken (unless I’m misinterpreting him). ‘My’ ego is experienced differently by me than it is by you. It is more ‘intimate’ for me than for you, more personal and private. This can be expressed by saying that, for myself, I am a *self*, while for you I am a *person*. For myself too I am a person, but not in quite the same way as I am for you....

*

Well, there it is. Some of it. All those words, and more, written for no apparent reason.

March 9

Date with April. No chemistry. It was the same with the girl I met in December. In a few days I’ll meet Kim, the librarian. People never ask questions; they always talk about themselves. April is intelligent, but the date consisted mostly of her complaining about her family. It was like a therapy session. (Part of that was my fault. Since I saw that she liked talking about it, I let the conversation stay there. In my defense: she didn’t let me get a word in, except when I interrupted her.)

Took a bus through East St. Louis. It’s a ghost town at night—a God-forsaken industrial desert, desolate as a fresh battlefield.

I can no longer read Goethe without feeling a certain aversion. His arrogance and narcissism, not to mention shallowness, shine through. Nietzsche, on the other hand, was a real man, full of integrity and honesty, determined to understand life.

I’m always amazed that although the odds were infinitesimal that I would be born, I was born anyway.

Reading Huizinga’s brilliant book *Homo Ludens*.

gravel, fucking shards of rock
shoved down my throat,

¹ One of the reasons this subject is extraordinarily difficult, probably the most difficult in all philosophy, is that one has to distinguish between (self-)consciousness’s unthinking self-intuition and what it really is in itself. And when the person doing the analysis is himself, like all selves, really nothing but consciousness, what is going on is that a particular consciousness is probing itself in an effort to distinguish itself from itself, i.e., its truth from its false self-intuition. This is not easy. Incidentally, the distinction between self-consciousness *in* itself and its nature *for* itself, while hard to understand, was essential to Hegel’s project in the *Phenomenology*. See Hyppolite, op. cit., chapter one.

² Sartre, *ibid.*, p. 31.

slicing it into gills.
gurgling bloodily.

The critical burden

fuck the critical faculty
fuck having to write prettily
fuck not writing shittily
fuck the critics' fiddling,
their fucking piddling "poem"-peddling—
middling little shits scribbling, meddling,
belittling your word-whittling—but it's soul-settling, that's all!—
soul-bettering, pain-tempering—
little literary rules are irrelevant, it's self-expression;
you're like Hessian mercenaries you fucks but less,
scribbling critical dribble for a paycheck.

Actually, I pretty much have only two regrets: I haven't loved enough, and I haven't debauched myself enough.

Eminem has influenced my writing a little. I could never rap like him, but, in short bursts, I can sometimes write a little like him. Sort of. (My poems in that style have to be read aloud. Like that long thing I wrote two Novembers ago.)

March 13

I'm 151 pounds. But that's still nine pounds less than I want to be. Whenever I finish working out I look like Brad Pitt in *Fight Club*. (Or so I tell myself.)

"Go melt back in the night; everything inside is made of stone."

Fuck it angers me that all through autumn and winter I was taking those pills and ergo wasn't writing poetry. All that wasted time!

the staring at my calf, the muscle, newly carved, old clay come to life (I am my own Pygmalion), sculpted beneath the skin the pockmarked skin, the staring at new creation ex nihilo ad nihilo, creatine-creation my calf my newborn baby, beautiful as the cut from the cow (dead now) on the dish—or in the dirt so to die as the diet of worms ('From clay, to clay returned.')

I've never had a formal lesson in creative writing, how can I judge the worth of my poems? (I was going to write more above but got sick of it.)

The last survivor of the massacre at the village of El Mozote in El Salvador—the massacre of 1981 carried out by the El Salvadoran army, which had been trained and equipped by the Reagan administration in order to keep the corrupt and murderous government in power (it would have been overthrown by radical guerrillas otherwise)—a woman named Rufina Amaya, who witnessed the whole slaughter behind a tree and told reporters about it—and was subsequently vilified in the U.S. media as a liar, as having made up the story of watching her husband and four children be butchered with bayonets—died today.

Strictly speaking, it isn't *people* I hate—or even *most* people—or even the *people in power*. It's the *complacency, cowardice, stupidity, inhumanity* of most people—or the people in power. That's what I hate.

Almost everyone can be a monster given the right circumstances. The best we can hope for is to prevent those circumstances from arising.

March 14

The more I work out, the more I have a habit of cursing. Probably because of the self-confidence etc. In general I feel like I want to lead a rebellion against the government, or fuck three women at once. Testosterone, I love you.

Philosophizing during youth, or during a period of healthiness, just ain't right. Callicles was right. *Action over reflection.*

Marx would have had a field day with this article in the Times: "Can Your Dog Humanize the Office?" Evidently employees often take their dogs to work, in order to—humanize the place. You know alienation is running rampant when dogs are seen as more human than humans themselves.

By the way, why do you think *everyone* these days has a dog? Because we Americans are starved for affection. There are 300 million of us, and we're all lonely as fuck.

O these halcyon days of youth, these days of *freedom*—I love this shit!!

Here's a short and unsatisfactory paper I wrote for my Kant course:

A summary of Kant's Transcendental Deduction

In this paper I'll give a brief exposition of the ideas that animate the Transcendental Deduction in Kant's *Critique of Pure Reason*. This section is probably the most difficult, but also, I suspect, the most rewarding, in the entire book. Even after two hundred years its insights remain fresh and compelling. So this paper is not a mere academic exercise. The Deduction can teach us a lot about how our minds work and how experience is constructed; its lessons reverberate through a number of disciplines. Cognitive science, for example, has incorporated many Kantian insights about how the mind (or the brain) synthesizes experience. My purpose is but to restate some of these insights, while offering a few pertinent speculations and alterations along the way.

I presuppose a reader acquainted with Kant—with, for instance, his distinction between sensibility and understanding, between phenomena and the thing-in-itself, and with certain other fundamental doctrines that I cannot discuss in detail.

Probably the central idea of Kant's epistemology is that the mind structures experience—that it combines the representations intuitively given to sensibility into the synthetic, unified whole of which we are aware. The Transcendental Deduction is supposed to explain how this happens.

Sensibility is "the capacity (receptivity) for receiving representations through the mode in which we are affected by objects" (p. 65). It is the initial 'filter', so to speak, through which both outer and *inner* experience passes. ('Inner experience' includes bodily sensations, mental states, etc.) I use the word 'filter' for two reasons: first, assuming the soundness of modern science, a great deal of what happens in the physical world—both inside the body and outside—is not perceived by people. Only certain wavelengths of light are processed through the eyes; only sound waves of a certain frequency are sensed through the ears; and people are not conscious of most of the processes occurring in their bodies. Thus, sensibility 'filters out' (or is the result of a neurological filtering-out of) much of what occurs in the world. Secondly, Kant argues that, while sensibility is indeed more passive than the understanding, it imposes the forms of space and time on its representations. So it is not *completely* passive; it is also active.

Of course, on the neurological level, virtually nothing that corresponds to sensation can properly be called 'passive', as Kant says that sensibility is. Sensory neurons are *activated*, so to speak, by a stimulus;

and the brain's processing of the stimulus is at all points fundamentally *active*. This fact is irrelevant, though, to the Kantian thesis. Kant is not talking about biology but psychology, "transcendental psychology". He is trying to explain, on a psychological level, how experience is possible; and, as he sees it, experience manifests both passivity and activity. Psychologically the passive component in experience is constituted by the mind's receptivity to impressions. But since impressions (according to Kant) are received in the modes of space and time—which modes have to be fixed *a priori* in the mind, for reasons that Kant elaborates in the Transcendental Aesthetic—even the passive faculty that is sensibility includes an element of activeness.

On the other hand, we must admit that Kant's account of sensibility, and of its relationship with the understanding, is unclear. Sensibility intuits representations; the understanding *thinks* them. It applies certain "categories" (such as causality, substance, existence, and so forth) to the appearances given to sensibility, and in so doing imposes on them the form of 'objecthood'.¹ In any given instant, prior to the work of the understanding it is not *objects* we are aware of but merely *intuitions*, which as such do not have objective validity. They are merely subjective impressions, with no reference to an objective, external world. The understanding subsumes them under concepts—i.e., it exercises its power of *judgment*—and thereby elevates them to the status of real objects that, as such, are opposed to apperception (self-consciousness). In other words, the understanding creates the world of nature—not, indeed, its *matter*, but only its *form*, its most general laws—by synthesizing and 'conceptualizing' the appearances (or intuitions) that are supplied through sensibility.

The details of this process are extremely complicated, but even its outlines, as provided by Kant, are obscure. Let's try to sort them out.—From much of what Kant says in the *Critique*, it would seem that he considers the intuitions of pure sensation ('prior to' the understanding's activity) to be largely unconscious. And yet he also writes a good deal that would suggest the opposite. For example, in the *Prolegomena* he writes, "When an appearance is given us, we are still quite free as to how we should judge the matter. The appearance depends upon the senses, but the judgment upon the understanding...."² His language here suggests that we are fully conscious of the appearance even before it has been manipulated ("judged") by the understanding (before, that is, the categories have been used to synthesize the appearance into a representation of an objective world). And the activity of the understanding seems to consist in a wholly conscious, free and abstract 'judging' of what is intuitively given to us. On the other hand, in the *Critique* he writes at one point, "Synthesis in general is the mere result of the power of imagination, a blind but indispensable function of the soul, without which we should have no knowledge whatsoever, but of which we are *scarcely ever conscious*."³ Here it seems that the activity of the understanding (which includes that of imagination, as I'll explain later) is either always or almost always unconscious. This means that the appearances we're aware of must have already been worked on by the understanding—and therefore that our sensible intuitions must themselves be unconscious. So Kant's analyses can be unclear, and even apparently mutually inconsistent.

I think the most plausible interpretation of him is that he is discussing phenomena that are mostly unconscious. The "appearances" given immediately to sensibility—as Kant uses the term—have to be unconscious. Our conscious experience has to have been already synthesized imaginatively and conceptually, for it is coherent, structured, and displays all the characteristics that Kant says emerge out of the understanding. But if we are unaware of the 'original' representations given to sensibility⁴ (insofar as they can be called 'representations' at all)—i.e., the representations as they are before they have been synthesized by the understanding—then evidently sensibility cannot be the source of the pure intuitions of space and time. For Kant undoubtedly thinks that these intuitions occur in consciousness, even if we are

¹ Throughout this paper I'll speak mostly of representations of the external world. To speak also of *inner* sense would complicate the discussion.

² *Prolegomena to Any Future Metaphysics* (Indianapolis: Hackett Publishing Company, 2001), p. 31.

³ *Critique of Pure Reason* (New York: Palgrave Macmillan, 2003), p. 112. Italics added.

⁴ The idea that we are unaware of them is contrary to Kant's intentions, at least in some passages. But I'm trying to make certain parts of his doctrine more consistent and defensible than they are in the *Critique*.

not clearly aware of them. Geometry, after all, is based on the *conscious* intuition of space. An unconscious intuition of space would be as good as nothing. It seems, then, that space and time, like the categories, have to grow out of the understanding, inasmuch as it structures consciousness.

However, I suspect that something like our conscious intuition of time—a primitive, unconscious version of it—is necessarily present in sensation. It has to be, for representations, even unconscious ones, must succeed one another. Consider the consciousness of a newborn baby. Its experience is probably analogous to the content of sensibility (in an adult) before it has been synthesized by the understanding—because, after all, a newborn has no “understanding” in the Kantian sense. Its experience consists of what is immediately, unstructuredly given to sensibility. Now, in its consciousness there is surely no intuition of space; there is but a “blooming, buzzing confusion”, something vaguely similar to (though less structured than) an adult’s consciousness as he dreams during sleep. But while the baby has no awareness of space, it must have a confused half-awareness of time, just insofar as its conscious states temporally succeed one another. Not until its understanding develops, though, is its intuition of time (and space) as full and rich as that of an adult.¹

Be that as it may, my point is that sensibility is even more passive and unconscious than Kant thought. Not only the “categories” but also space and time, in the way we are aware of them, originate in the understanding. —Incidentally, one cannot reasonably object that there is no such thing as the “understanding” or “sensibility”, that these concepts are mere fabrications. On the contrary, they are philosophically and psychologically indispensable. They embody a psychological interpretation of what occurs on the biological level, unconsciously. Any neurologist knows that a given state of consciousness has been synthesized by the brain prior to one’s awareness of it. Well, Kant is—or can be understood as—analyzing this process into its passive and active elements. Data are given to the brain; it then structures them according to spatiotemporal, causal principles. It is “sensibility” vs. “understanding”.²

The process works approximately as follows.— The original, unstructured data (e.g., the colors of objects that are not yet conceptualized as objects) are given to sensation. In a particular instant, we are not aware of them in their initial chaotic state. Kant doesn’t explicitly acknowledge such a state, but in the light of modern science it’s necessary. He says that this primordial “appearance”, which contains a manifold of different [soon-to-be] “perceptions”,³ has to be combined into a unity (an “image”) by “imagination”. This act of combination is called apprehension. So, in other words, the imagination, by apprehending the initial sensory manifold, synthesizes it into a unitary image, thus injecting some degree of order into it and preparing it to be acted upon by the understanding.

I differ from Kant in thinking that all this is, so far, unconscious. Certainly the original sensory data have to be combined into an image, or a series of images (such as a house, a plant, a door) in one total ‘image’ that is given to consciousness, but what we are aware of is only the end-result of the process, namely the spatiotemporal, conceptualized whole. Moreover, the combination of the data into an image is surely inseparable from the act of the understanding itself, whereby it imposes the categories on the data given to it. There can be no coherent, unified image outside the spatiotemporal, causal framework created by the understanding.

Also, in general I think that Kant’s use of the language of “faculties” is unnecessary and confusing. While he is right to distinguish between the mind’s passive and active aspects, and he has every right to call them “sensibility” and “understanding” respectively, his concepts start to become a little artificial when he introduces “imagination” as the mediator between the senses and understanding. Such a mediation is

¹ Jean Piaget’s studies attest to the fact that the understanding’s development takes place over many years. At the age of seven, children have spatial intuitions that they lacked at five; at thirteen they can have intuitions they were incapable of at ten.

² Kant also uses ‘sensibility’ in another sense, according to which all representations we’re aware of exist in sensibility. (I.e., our awareness of them is itself a function of sensibility.) While this is a legitimate use of the word, and is related to the other use, the two meanings should be distinguished. Otherwise a great deal of confusion results.

³ “What is first given to us is appearance. When combined with consciousness, it is called perception.” *Ibid.*, p. 143.

unnecessary. Dividing functions into “faculties” is at best a convenient way of talking; when taken too far, or taken too literally, it leads to superfluous conceptual clutter.

However, Kant is right that appearances have to be momentarily retained, or immediately “reproduced”, in consciousness if we are to have experience. This is the second aspect of the “threefold synthesis” he discusses (the first aspect of which is the synthesis of apprehension I mentioned above).

Experience as such [he argues] necessarily presupposes the reproducibility of appearances. When I seek to draw a line in thought, or to think of the time from one noon to another, or even to represent to myself some particular number, obviously the various manifold representations that are involved must be apprehended by me in thought one after the other. But if I were always to drop out of thought the preceding representations (the first parts of the line, the antecedent parts of the time period, or the units in the order represented), and did not reproduce them while advancing to those that follow, a complete representation would never be obtained: none of the above-mentioned thoughts, not even the purest and most elementary representations of space and time, could arise.¹

It’s worth noting that by the concept of “reproduction” he foreshadows Husserl’s notion of “retention”, which denotes exactly the same thing. (Husserl opposes it to “protention”, thus advancing beyond Kant in his analysis of self-consciousness.) Kant claims that imagination—which he defines as “the faculty of representing in intuition an object that is not itself present”²—is responsible for the reproduction of appearances. Accordingly, the synthesis of apprehension and the synthesis of reproduction are inseparable, being carried out by the same faculty at the same time.

Kant argues that these empirical syntheses presuppose a *pure* synthesis—viz., the synthesis of space and time, which the imagination is constantly undertaking. (This synthesis is manifested in pure mathematical intuitions, the intuitions that bear fruit in geometry and arithmetic.) Without such a pure synthesis, a synthesis of spatiotemporal images in consciousness would be impossible. The *pure* intuitions are the basis for the *empirical* intuitions. —This doctrine is surely defensible. The empirical intuitions of space and time are but the intuitions of objects (and mental states) *in* space and time; underlying, or implicit in, the perceptions of these objects are obscure intuitions of the epistemological necessity of spatiotemporality, of causality, of matter and its conservation, etc.³ Such “obscure” (essentially unconscious) intuitions are what Kant calls “pure”.

This is another area where I disagree with Kant. He claims that only space and time are intuitions; all the categories are mere concepts, under which we bring representations so as to form full-fledged “objects” interacting in a spatiotemporal framework. I, on the other hand, think that such “ideas” as causation and the other categories can be intuited no less than space and time. Insofar as space and time are represented to the mind, so is, e.g., causality. Schopenhauer was right that Kant had placed too much emphasis on abstract conceptualization and not enough on the more primitive fact of intuition(s).⁴ After all, sophisticated language-acquisition was a relatively recent event in human evolution, perhaps occurring as late as 50,000 years ago. Are we to believe that before concepts had been ‘invented’, people were unaware of objects? On Kant’s theory, though, this would apparently be the case, since he argues that it is only when the understanding *judges*, by means of “universal” concepts, that a person can be aware of the objective

¹ *Ibid.*, p. 133.

² *Ibid.*, p. 165.

³ On a reflective, intellectual level, one can indeed deny or ignore the necessity of such ‘principles’—as traditional Chinese science, according to some scholars, ignored causality (or didn’t attribute much importance to it)—but on a deeper, unreflective level, these intuitions are innate in humans. One has only to refer to Piaget’s experiments with young children. At a certain age, for example—perhaps six months or so; I forget—infants that see a ball rolling behind a screen expect it to appear momentarily on the other side. They intuitively understand causation, inertia, the conservation of momentum and matter. Kant was right that these “principles of pure natural science”, which Newton brought to our attention, are innate in our mind (i.e., are necessarily imposed on experience).

⁴ See the appendix in volume one of *The World as Will and Representation*.

world as such. –Actually, there are a couple of defenses Kant could use against this Schopenhauerian objection; but before I mention them, I should explain why Kant attributed such importance to concepts, as opposed to intuitions, in the first place.

We have seen that there is, according to Kant, a synthesis of apprehension and a synthesis of reproduction, by which syntheses the imagination unifies, or “holds together”, the manifold given to the senses. The third element in the threefold synthesis is the “synthesis of recognition in a concept”. This is the culminating act of the understanding, the act that makes possible knowledge of objects—and thus experience itself. It involves the recognition of particular representations as being empirical objects in the world—or, alternatively, pure *a priori* objects, like those of geometry (a triangle, a square, etc.)—objects that fall under a concept. The concept is “something universal which serves as a rule”, namely a rule for synthesizing the manifold in a certain way. “The concept of body, for instance, as the unity of the manifold which is thought through it, serves as a rule in our knowledge of outer appearances.”¹ It unites outer appearances as instantiations of the concepts of extension, impenetrability, shape, etc. (which are all implicated by the concept of body). –Thus, the mind creates objects as such, and thereby empirical knowledge, by thinking representations under the appropriate concepts.

The essential point here, and throughout Kant’s discussion, is that there has to be a synthetic unity in our consciousness of the intuitively given manifold. Experience is and has to be united in a single consciousness; all representations have to be mutually related in and by this consciousness. There cannot be simply a diverse and chaotic play of appearances in our minds, as there is for a newborn child; there have to be *rules* synthetically uniting appearances. Concepts are these rules—both *pure* concepts (such as the categories) and *empirical* ones. In particular, the deployment of the categories by the understanding is what gives order to experience in general. It is the necessary and universal condition for experience—the condition that constitutes the objective world, i.e., nature (the postulate of which is presupposed by the unity of appearances).²

The *subjective* side of this unification is the transcendental unity of apperception. Empirically, apperception is always changing and is merely transient; no “abiding self can present itself in the flux of inner appearances”. But such a self is necessary in order for experience to be possible, since experience always belongs to *one self* (namely, me, or you, or whomever). So the unity of apperception has to be *transcendental*—that is, not directly experienced. It is in fact the *basis for* experience, which means it must “precede” experience.

Transcendental apperception, says Kant, is precisely the understanding itself. It is the ‘source’, or (in some sense) the ‘meaning’, of the categories-in-use: insofar as transcendental consciousness is unified, the categories are being used to synthesize *a priori* the manifold of appearances. Their synthetic *a priori* unity is how the unity of apperception manifests itself. That is, it manifests itself in the indeterminate (non-empirical) idea of nature,³ which is constructed by the categories and is what coheres appearances together—ensures that they are appearances *of something*, namely of *objects*, and ultimately of nature itself. The unity of the objective world, or nature, is (constituted by) the unity of apperception. And so the unity of apperception consists essentially in the deployment of a pure *concept* (*viz.*, (the necessary unity of) the objective world), which consists in, and is made possible by, the deployment of the “pure concepts of the understanding” (the categories), which synthesize and structure the sensory manifold (which has already been ‘preliminarily’ synthesized by the imagination, through the syntheses of apprehension and reproduction).

¹ Kant, *op. cit.*, p. 135.

² Nature is the object to which appearances immediately refer [or that they represent], to which they ‘point’, so to speak. They *are* it (or at least that’s how we necessarily unreflectively see them). We are not aware of nature as it is in itself, but its concept is the “transcendental object” that unites representations—that relates them to one another, or provides the spatiotemporal ‘framework’ in which they are so related. The transcendental object that is nature is the ‘place’ in which objects are supposed to exist together; and hence the concept of nature gives objective unity to all the appearances in consciousness.

³ I’m using the word ‘idea’ in Kant’s technical sense, which is not synonymous with ‘concept’.

“Concepts” are, therefore, essential to Kant’s explanation of the possibility of experience. They are no less than the universal and necessary rules that make experience, and knowledge, possible. Insofar as I see a house I judge that it is a house (i.e., I invoke a concept); and presupposed by my judgment are the pure concepts of the understanding.

If the reader would object that one does not always explicitly *judge* a representation to fall under a particular concept—that, on the contrary, one is merely *intuitively* aware that a given representation is in fact (the appearance of) such-and-such an object—Kant would reply that the understanding’s judging-activity is usually “obscure” or unconscious. We need not be *aware* of using concepts. Nevertheless, we are, constantly.

As I said above, this is one of the places where I part company with Kant. At the very least, his presentation of his doctrine is misleading, inasmuch as it suggests that human experience was impossible before words, or concepts, had been invented for kinds of objects. From both a phylogenetic and an ontogenetic perspective, humans were/are aware of objects before acquiring the full conceptual equipment of language. They can distinguish objects from one another; they can intuitively understand causation without recognizing a concept for it.

Kant’s position could be defended, though, from a Chomskyan perspective. The reason we need not have formulated a language in order to have experience (*pace* Kant (at least *prima facie*)) is that there is a “deep structure” of language hardwired into us—a Universal Grammar that is biologically innate. It is this cognitive apparatus, which is deployed step-wise during childhood, that synthesizes experience for us. Natural language is but a putting-into-verbal-use of the “concepts” and syntactical structures (or, more generally, the cognitive structures) that are buried deep within our psyches and make possible experience. It is, so to speak, an ‘articulating’ of them. Hence, we need not explicitly have concepts in order to have distinctively human experiences; the “pure concepts of the understanding” are actually not originally “conceptual” *per se* but biological and intuitive—functions of our innate cognitive equipment.

To return to an earlier point: Kant is doubtless right that intuitions of space and time are on a different ‘order’, as it were, than intuitions of (the necessity of) causality and so on. They are somehow more general and perhaps more concrete. Nevertheless, I would suggest, contrary to Kant, that all such fundamental cognitive intuitions (or functions, concepts, etc.) originate in basically the same “faculty”, the same underlying cognitive apparatus. Our experience of space and time is wholly, inextricably bound up with our experience of causality.

That concludes my short exposition and totally inadequate critique of the fundamental doctrines of the Transcendental Deduction. In a longer paper, of course, I might have been better able to do justice to the richness of Kant’s theories.

*

Curse time for denying me the opportunity to have a conversation with Kant. Such a simple, honest man, who happened to be a genius.

It gives me a perverse satisfaction to think that most twentieth-century philosophy will be increasingly ignored in the future, as the world wrestles with the gigantic problems created by late capitalism. The writings of Quine, Dennett and all those robots will be buried beneath the rubble of civilization. Lost in the conflagration, like the fire that destroyed the ancient library in Alexandria. After it’s all over, not even the “philosophers” will be in the mood anymore for the microscopic logical investigations that once counted as philosophy.

This world is going to hell in a handbasket. There’s no point anymore to anything (to say it again!). I wish people would accept that we’re all primates, that even Plato and Kant were primates. Nothing is worth anything but compassion. If humans were as civilized as bonobos they might understand that.

Most people think of ambitiousness as a virtue. I don't. If I'm ambitious, it's only because I'm unhappy. The unambitious people are the ones I respect—the people who don't thirst for stupid fame or money, or “truth”. They're happy in their own skin, they don't need the illusions that I need. Actually, as I get older I get less ambitious. I get wiser. I'm starting to think I'd be content working anonymously my whole life in some poor third-world country, if only to make conditions a *little* better. It would be good for me too, to get away from America and bureaucracy. –To live Taoism and Confucianism together, the return to nature and the social activism.

To give up the obsession with recognition is not to accept failure. It is to embrace life.

March 16

I called her [some girl], invited her to a Tchaikovsky concert tomorrow night. But she has to work (at a restaurant). On Sunday too.

Fuck I'm lonely.

Imagine if my journal gets destroyed before anyone has had a chance to read it. How absurd that would be! Were it not for my journal, my life would have been utterly pointless so far. (Like everyone else's at my age.)

Ten years of writing—philosophy, psychology, poetry, and almost everything in between—and virtually no feedback from anyone at all. If what I have written is flawed, then I alone bear the blame; if it is worthy, then I alone deserve the credit. [Not true.] –There *is* something new under the sun, Ecclesiastes!

Watched a movie (*Stranger than Fiction*)—good, except it made me fall in love with Maggie Gyllenhaal, which isn't good because I don't know her and she'll never love me back. Also it put me back into that sad mood I'd transcended with the [deleted] poem above, so now again I feel like preparing for death. (Plato is right that philosophizing means preparing for death, but he's wrong about the reasons. See the *Phaedo*. Poetry too is preparation for death, at least nowadays.)

March 17

Quotation from Francis Bacon: *Poesis doctrinae tamquam somnium. Poetry is like a dream of philosophic love.*

It's amazing how much of my life consists in sheer play. All this journal-writing, philosophy-writing (mostly), piano-playing, weight-lifting (?), all my listening to music and singing, everything I do with friends.... It's mostly in the spirit of superfluity, of freedom. Life itself is a luxury and should be treated as such.

Why do you think people sing or whistle while they work? To add an element of play. To make it their own *chosen* activity, as opposed to something compulsive. They thereby thrust themselves into their work, make it truly *their own*. People are always trying to make their environment less foreign, whether by laughing, by singing, by playing games, or by scientifically understanding it. Pleasure is usually just a symptom of having assimilated an object, i.e., of having imposed oneself on it. The need for recognition is obviously another manifestation of this “instinct for play”, or for freedom and self-assertion. It is in fact the same thing.

I met another yahoo girl, to see a movie—with two male friends. It was totally bizarre. She's 24, but she's really 14.

The fact that pride necessarily eludes me is a source of my torment. I will never be pleased, say, that I've lived a rich and full life, even if I succeed in doing so, because I know that chance plays a role in everything and my own little life means nothing in the Grand Scheme. The fact that I've become a real

man, confident and good and willing to stand up for myself and others, doesn't make me proud, because I know it results in part from lifting weights and building body-mass. What absurdity! What a silly thing is man if recognition can come from something as easy as lifting weights!

I read Karl Popper's book *The Poverty of Historicism*. It isn't terrible, but it isn't very interesting. It discusses a wide range of issues somewhat glibly. In any case, now that we're in the 21st century, its interest is purely academic.

I'm facing a distinct problem in my efforts to publicize my book: I'm starting not to care anymore. I've passed the stage of life in which I was fervently committed to that project. I don't need an all-encompassing two-volume work anymore; for some reason it doesn't strike me as important. I'll probably change my mind again in a few months, though.

I'm sure it won't get published, so here it is: (the unfinished rough draft, much of which won't be new to you)

The Humanist's Manifesto Volume 1

Introduction

I remember a time (seems like decades ago) when I still had something like hope. I wanted to write a book that would serve as a wake-up call to the world, a book that would lay bare the absurdities and hypocrisies of our civilization. Sort of in the manner of Nietzsche. Writing it was a delight. All the invective, the glib reflections on human stupidity and conformism, the epigrams on religion and politics and women. Periodically I wrote substantive analyses of society and psychology, delved into philosophy and history, even literature. On the surface the book was a sprawling mess, but in its essence it was to be a "dialectically articulated artistic whole". Basically I was striving for greatness. I wanted to catapult myself into history by resurrecting the spirit of Marx and Nietzsche. These pusillanimous times, I told myself, demanded nothing less.

You see, for a while—when I was still very young—I was preoccupied with the thought of my genius. Or lack of it. I wasn't sure that life was worth living unless I could achieve genius. Mediocrity was the morass I was constantly clawing out of. I *had* to have potential, I just *had* to. I *did* have potential, in fact—I *was* the next [*insert famous name here*]*—no, no, I wasn't, I was just a hack, a talentless impostor—and yet, I was obviously so different from everyone!—surely I had the potential to become a genius, at least in the public eye (for I knew even then on some level that the idea of "genius" or "greatness" is dishonest and empty)—etc. etc. I was neurotic, riddled with doubts and ambitions and self-contradictions, self-conscious to the point of doubting my self-consciousness. I saw myself as postmodernity personified, both in my personality and my beliefs. To quote my former self:*

My life consists of intellectual levitation. I have absorbed the trends of my culture and hover between conflicting worldviews. I recognize the truth in every philosophy from Marxism to psychoanalysis, from Hegelianism to poststructuralism; I recognize the value of every ethical position from Christian morality to nihilism; I have sympathies for every political doctrine from democracy to despotism. I cheer the march of science even as I fear it. I support globalization even as it horrifies me. I am a mess of contradictions.

My faith in the power of reason is totally anachronistic, and even contradictory with myself. I am the bastard child of a union between the Enlightenment and Existentialism—the Masculine and the Feminine.

If I start analyzing myself, though, I'll never stop, so let's just say I had a deep need to be affirmed by myself and others, and I overcompensated by trying to create in my own mind a potential myth of myself.

I knew I was overcompensating even as I did it, and I knew how ridiculous my self-absorption was, but, perversely, I interpreted this knowledge as confirming the truth of my delusions: if my self-awareness was so keen as to see through itself—to diagnose itself—well then, I must indeed be pretty special! I must have some remarkable intuitive abilities! And so the very knowledge that I cherished self-delusions saved me from having to acknowledge their delusional character. I was deluded, but I wasn't.

Anyway, even back then, at the age of 19, I recognized the absurdity, the contingency, of life. Nothing was real, everything was to be doubted (even the injunction to doubt everything), everything was paradoxical, life was wonder. So I didn't take this stuff too seriously—although, of course, on another level I did. —But the point I'm making is that despite all my torments I remained enough of an idealist to think I could have an impact on society by writing a book.

Luckily I came to my senses. Books are dead. Philosophy is dead. The humanities and the social sciences are dead, at least in their purely theoretic aspect. Idealism, high culture, nobility of soul, spiritual ambitions, naïve existential wonder—they're all dead. I'm not saying they'll never live again; in fact, they definitely will, whether in the next fifty or the next five hundred years. As things are now, though, social life is too atomistic, too materialistic for anything esoteric to really matter.

You disagree? Just look at the state of contemporary literature. V. S. Naipaul, surely an authority on the subject, has said that the novel is dead. (T. S. Eliot even said it had ended with Flaubert and James.) Fiction is no longer relevant. The first thing to go was the art of narration, of telling *stories*, in the manner of Balzac, Dickens, Flaubert, Hugo, Tolstoy, James and the like. Modernism and postmodernism abandoned it as hopelessly old-fashioned, since it seemed to presuppose that life is comprehensible—even *simple*, '*linear*'—that there is such a thing as truth and authentic selfhood. "There is something inauthentic for our time", wrote Lionel Trilling in 1969, "about being held spellbound, momentarily forgetful of oneself, concerned with the fate of a person [namely, the main character of the narrative] who is not oneself but who also, by reason of the spell that is being cast, is oneself, his conduct and his destiny bearing upon the reader's own. By what right, we are now inclined to ask, does the narrator exercise authority over that other person, let alone over the reader: by what right does he arrange the confusion between the two and presume to have counsel to give?"¹ In retrospect, the modern contempt for narrative necessarily prefigured a contempt for fiction, given that the essence of fiction throughout most of history has been narrative. Ergo: fiction itself has come to seem inauthentic and somehow frivolous. Which is why serious writers write intentionally frivolous or barely readable things—writers like David Foster Wallace, who, while clearly a genius, writes *clever* books that reek of machinery and dessicated life. Philip Roth and others who still cling to a lofty vision of literature are merely relics of a more idealistic past. People just don't seem to *care* anymore. — And what about poetry? Well, when a man like Charles Bukowski is revered for writing cheap prose and breaking it up into short poetic-looking lines;—when there's no longer a difference between prose and poetry, and most professional poets are barely even on the *fringes* of cultural consciousness:—something's wrong.

Or look at the state of theory. Philosophy, psychology, sociology, economics. Far from being original or ambitious or interesting, they aren't even readable anymore! Philosophy has deteriorated into "research", in the process becoming so technical and tedious that it's a terrible bore to read. (I should know: I'm studying to become a philosopher.) Academia is an incestuous little community whose members live in a perpetual orgy of mutual intellectual masturbation; they promote each other, playfully argue against each other in their endless scholarly journals read only by themselves, and they seem oblivious to the fact that what they do has, on the whole, become irrelevant—even to the search for truth! They tend to treat it all like a game, as Schopenhauer said, a word-game, a sophisticated version of Scrabble. 'Who can use the biggest words? Who is most adept at symbolic logic? Who can cite the most authors?' The whole charade makes me think, for some reason, of the rotten limbs of a leper waiting to fall off his body. Or of decadent,

¹ Lionel Trilling, *Sincerity and Authenticity* (Cambridge: Harvard University Press, 1971), p. 135. I cannot refrain from saying that this little book is remarkable. It is lucid, a pleasure to read, yet challenging—thought-provoking as few books are.

diseased Venice in Thomas Mann's story "Death in Venice"—except that academics are *parodies* of Aschenbach, worshipping not beauty or youth but simply their own complacency.

The only books that seize the popular "imagination" are perfidious things written by the likes of Ann Coulter, Michael Savage, Bill O'Reilly, Byron York. (Or shallow things written by Dan Brown, John Grisham and so on.) But of course even they don't have a significant effect on the public's consciousness, since this is shaped by television—and since people read only the books that confirm them in their own prejudices. (How many Christians are going to read a book by Daniel Dennett explaining to them why they're wrong?) By the way, America has a president who prides himself on not reading newspapers. Need I say more?

In a moment of sadness once I wrote this:

I can't imagine that the overripeness of our culture doesn't make every esoteric project otiose. I can't fathom the relevance anymore of art and intellectual matters. Philosophy, let us admit, is in its yellow leaf; this is uncontroversial, though painful for me, given that philosophy is, was, or would have been my vocation. Psychology and the social sciences don't fare much better, given the imperative of specialization as well as the public's apathy. Literature is passing away, losing its powers to engage society's imagination and tap the vein of rebellion—or (at any rate) discontent. Music died decades ago. Even political activism founders on the rock of the System. My floundering, my depression, itself seems merely comical and narcissistic. When everything is pointless and society has reached the end of time, and whatever one does will not matter in the long run, is it not presumptuous to ascribe *weight* to oneself? Truly, I might as well follow Byron's example and give myself up to masochistic hedonism.

So then why am I writing this book? If I no longer have any illusions about the power of writing in generating social change, what's the point? Well, honestly, I'm just bored. I'm tired of endless reading, endless thinking, endless journal-writing; I'm 25 and I want my fifteen minutes of fame. It would distract me, at least, from "existential nausea" (to quote Sartre). [...]

I wanted to write something that would have theoretic value. I wanted to write a defense and revision of Marxism, and to sift through psychoanalysis for insights into the human condition, and to elaborate a philosophy of language, and to explain why religions are already dead despite what Americans and other fanatics think, and why morality is philosophically meaningless, and what the methodology of the social sciences should be, and so on *ad infinitum*. I'd intended to cull my journal for such worthies as its attack on the mind-body problem and its outline of a refutation of ontology (specifically of the meaningfulness of questions about the existence of "abstract objects", such as numbers, properties, relations and propositions). Unfortunately, it is an iron law that the popularity of a book is inversely proportional to its philosophic value. So if I want to make some money off this investment I have to dumb it down. I've decided, therefore, to divide the work into two volumes, the second of which will be the philosophical and academic one. The first, on the other hand, is semi-autobiographical, in honor of our great American tradition of narcissism. This volume is my answer to Montaigne's *Essays*. [...]

On academia and philosophy

On controversy.— *No being will fly whose feathers have not been ruffled.*

American culture, and increasingly global culture, comprises, arguably, more schisms than any in history. Even societies torn by civil war have not had as many schisms as ours does. Theirs have simply had more dramatic consequences. The "culture wars" that afflict America and the world—between

religions, ideologies, ways of life—are merely one manifestation of late capitalism’s divisive character, and not the most fundamental. Not only has every major empire suffered from culture wars of some sort; more importantly, they’re an utterly predictable reaction to the international hegemony of a single country. After all, a nation’s imposition of its economy and culture on the rest of the world is bound to have repercussions. The American empire is the most powerful and wide-ranging in history, so the ideological conflicts caused by its advance are naturally going to be widespread and recalcitrant. To be surprised by them, or to treat them as signs of the apocalypse, is to be myopic.

Similarly, the so-called culture wars in America, exemplified by the debates over gay marriage, stem-cell research, abortion, and evolution, are not particularly shocking or ominous. They’re just another manifestation of the millennia-old conflict between tradition and progress. Fanatical Muslims fight against capitalism and equality, fanatical Christians fight against science and equality. Religion is usually conservative, like most humans (who remain enmeshed in tradition their whole lives). Progress always triumphs, though; mere bigotry cannot indefinitely dam the flood of technological and scientific advance, nor of the social equality that tends to follow in its wake. Conservatives are always, in the long run, on the wrong side of history.

So, I’m not referring primarily to ideological schisms. I don’t find them particularly disturbing or even suspenseful; I think that wise political leaders could temper their vehemence significantly. And economic evolution will, in the long run, tend to reduce cultural differences anyway.¹ My concern in this chapter is with a more fundamental kind of schism, grounded in the nature of the economy rather than the thoughtless inertia of humanity. Far from being mitigated by economic progress, it is exacerbated. In a word, I mean *atomization*. Atomization between individuals, and between professions, and between facets of the individual’s psyche/personality. Such divisions are closely interrelated and mutually reinforcing, and are grounded ultimately in the economy’s demands on culture (or social life).

Atomization is the real neurosis of the age, the fundamental cause of all the others. The “culture wars” are comparatively transient and unimportant; in fact, one of the unconscious functions of an individual’s immersion in an ideology is precisely to escape atomization. The psyche will construct labyrinthine defenses against the loss of community, elaborate illusions to hide it from view, artificial means to restore interpersonal bonds, but “neuroses”, on an individual or collective level, are always in some way a reaction against communal deprivation.

What do I mean by “atomization”, “loss of community”? I’ll address this question in volume two; for now I’ll let the reader rely on his intuitive understanding. He has but to open his eyes to see examples of the problem. Communities all over the world are deteriorating every year; video games, television, the internet, urbanization are all causal factors. Similarly, schizoid personality disorders are increasingly common, far more so than a hundred years ago. (One has only to compare the psychoanalytic literature of both eras. Freud treated more cases of “hysteria” than schizoid-related disorders; recent psychoanalytic theorists, like R. D. Laing, Heinz Kohut, W. R. D. Fairbairn and D. W. Winnicott, have been more interested in the schizoid/schizophrenic and narcissistic personalities.²) As the community disintegrates, so does the self.

In this chapter, though, I want to focus on the other form of atomization I mentioned, namely professional specialization. Which generally amounts to specialization of the personality. People embark on a career, develop a few skills to machine-like perfection, and let the rest of their potential atrophy. Even in fields that would seem to lend themselves to, or even to require, a breadth of competence in their practitioners, such as political punditry or, indeed, any kind of intellectual endeavor, few people break out of the narrow mold. There is very little mingling between professions. An economist doesn’t write about

¹ This is partly why some Muslims embrace jihad. They resent America’s cultural imperialism, i.e., the erosion of traditional ideologies, and so they fight it. Ultimately they’re impotent, though: nothing they can do (short of nuclear war) can stop globalization. [Needless to say, American foreign policy is the major cause of Islamist terrorism.]

² See also Christopher Lasch, *The Culture of Narcissism* (New York: W. W. Norton & Company, 1979), pp. 34 – 43— or, indeed, the whole of chapter two. Lasch’s book is so insightful that one is left resenting the author for writing a work that relegates one’s own attempts at analysis to comparative sterility.

psychology; a poet doesn't write philosophy; a politician doesn't write at all (except puerile polemics or memoirs). People are becoming more specialized every year, less intellectually and 'spiritually' ambitious, more dehumanized.

Yes, specialization is a form of dehumanization. It is a form of the dehumanization that Karl Marx saw was a product of capitalist economic forces (with the intensification of the division of labor that they entail). For the narrower are one's activities, the less one is exploiting one's human potential, and the less one feels like a human being. A person, after all, has almost limitless potential with respect to intra- and interpersonal modes of activity. This is the glory of being human. One can spend the morning playing sports, the afternoon reading or writing, the evening conversing with one's family and friends about whatever subject is agreeable, and the early night playing the piano or reciting poetry. And the next day one can do something totally different (like, say, go to one's job). The possibilities are endless; and the more you exploit them, the more satisfied you feel with yourself. This is just common sense. It's a shame, then, not to take advantage of living in a society that allows for more leisure time than any other in history, and is constantly allowing for more leisure time as economic productivity increases. It's a shame to conform and fall in line with everyone who lets himself be stunted by the habits of social life.

For the masses of the poor, who have to work all day in a mind-numbing job just to make ends meet, capitalism is a curse. It ruptures the communal support-system that the peasantry traditionally enjoyed and doesn't compensate that loss by permitting an all-round development of the individual. The laborer's life consists of ceaseless drudgery, thankless chores, an unremitting struggle to escape from poverty. One has but to read Barbara Ehrenreich's book *Nickel and Dimed*—or just try washing dishes in a restaurant eight hours a day—to see how appalling are the lower class's working and living conditions in even the most "civilized" of countries. These are the people on whose shoulders rest all the affluence and leisure of the privileged classes; and one cannot expect them to do anything but what they have to do to survive.

But even—or perhaps *especially*—when one's life consists of unending drudgery, a diversity in occupations is infinitely more satisfying than staying chained to a single activity. Consider these observations of a French worker in the 19th century who traveled to San Francisco during the gold rush: "I could never have believed that I was capable of working at all the trades I practiced in California. I was firmly convinced that I was fit for nothing but the printing of books.... Once I was in the midst of this world of adventurers, who change their jobs as often as their shirts, then, upon my faith, I did as the others. As mining did not pay well enough, I left it for the city, and there I became in succession a typographer, a slater, a plumber, etc. As a result of this discovery that I am fit for any sort of work, I feel less of a mollusc and more of a man."¹ No matter what one's station in life, a breadth of experience is almost always more satisfying, and ultimately more human, than narrowness.

Psychoanalysis also upholds that claim. Carl Jung's notion of "individuation" is relevant here. The individual, he thought, must become, as it were, an in-dividual: he must integrate himself, all the unconscious facets of his psyche and his latent capacities, into a coherent whole. He must realize himself, in all his potential breadth. This process is, to an extent, inevitable and involuntary as the person lives more and gets older, but by bringing it under his conscious control he can forestall neuroses and realize himself more completely and happily. Individuation is indeed, in a sense, the meaning of a person's life, of every person's life. It is, on the deepest level and of necessity, his main existential project, though it is never completed. No one ever fully realizes himself; his potential is too great. But some people do a better job than others—people like Goethe and Da Vinci, Thomas Jefferson, Simone de Beauvoir, even Albert Schweitzer. It is they who should be our role-models: we should adopt more or less the attitudes toward life that they adopted. (I say 'more or less' because they too were a little stunted. Athletics, for example, is as important for mental health as—if not more so than—art and thought. Mankind was meant to live mostly outside, not cooped up in a study.)

These thinkers themselves have self-consciously pursued the ideal of self-breadth. From Confucius to Montaigne to J. S. Mill, philosophers have understood its value and preached it—preached the gospel of self-cultivation, self-realization. No one expressed it better than Nietzsche in §290 of *The Gay Science*—

¹ Quoted in Karl Marx, *Capital* (London: Penguin Books, 1976), p. 618.

where he put a slightly different spin on it than I have—but they’ve all had essentially the same idea in mind: the idea, namely, of creating and controlling oneself, of ‘molding’ oneself in as many directions as possible and thereby affirming one’s humanity. Intuitively everyone understands the value of this ideal. It’s sad, then, that few people follow it in practice.

One of the crimes of our social system is that it prevents millions of people from enjoying the freedom without which genuine self-realization is impossible. These unfortunates are like the French worker quoted above before he had come to San Francisco, when he was forced to print books day in and day out. Not only have communal bonds been shredded by the division of labor, but the individual, in being denied means for the development of his personality, has been denied the opportunity to achieve self-respect. However, even the privileged among us—the intellectuals, the successful businessmen, the white-collar workers—succumb to the dehumanizing effects of money-driven routine, thus ensuring that our self-respect is more fragile and fickle than it has to be. In atomizing social relations, economic relations have also divided us from ourselves—from our psyche’s self-imposed imperative to “Become who you are!”—with the result that we don’t *deeply recognize* ourselves in our work or our relationships, or even in most of our leisure-activities. We do things just because we have to, whether to make money or to get momentary release from the daily grind. They aren’t experienced as spontaneous expressions of our sense of self, as intrinsically enjoyable affirmations of who we are, which make us feel “less of a mollusc and more of a man”. –We’re alienated, in short, from ourselves, from our work, from the community.

In order to attain the complete self-respect or -contentment that we’re always half-consciously hankering for amidst our daily frustrations, we have to experience our life-activities as freely chosen by us—as free ‘objectifications’ of our ideal self-perception, which is intuitive and never fully articulated. These objectifications would bolster our concrete sense of self, bringing it closer in line with how we ideally (would like to) see ourselves and our potential. But our potential—not only objectively but also as we subjectively experience it—is broad, branching out into many different spheres of inter- and intrapersonal interaction. The more we ‘diversify’ ourselves, then—the more directions in which we develop ourselves—the more we’ll feel as if we’re integrating our real, concrete self with our ideal self(-perception), and are thus “in-dividuating” ourselves (unifying ourselves). We’ll come to recognize our full sense of self in the world, in our activities and in how people react to them; and the recognition (of who we ideally/concretely are) that others will show us will contribute greatly to our rich self-respect. It will, in fact, be perhaps the *foundation* of our self-respect, and as such will be an important cause of our ever-greater self-diversification (which is not only a cause, but also an effect, of deep self-esteem). More generally, though, individuation is nothing but the process of becoming profoundly well-disposed toward oneself, which, for reasons I’ll go into later, requires that one be well-disposed toward others, which in turn requires that one be recognized or affirmed by them. For all these reasons, individuation can fully occur only in a fairly tightly-knit community, a community not riven by divisions, selfish competition and atomization.

As it is, though, what Marx wrote in 1844 is still true in 2007:

....What, then, constitutes the alienation of labor?

First, in the fact that labor is *external* to the worker [whether blue-collar or white-collar], that is, that it does not belong to his essential being [i.e., his sense of his ideal self]; that in his work, therefore, he does not affirm himself but denies himself, does not feel well but unhappy, does not freely develop his physical and mental energy but mortifies his body and ruins his mind. The worker, therefore, feels himself only outside his work, and feels beside himself in his work. He is at home when he is not working, and when he is working he is not at home. His work therefore is not voluntary, but coerced; it is *forced labor*. It is therefore not the satisfaction of a need, but only a *means* for satisfying needs external to it. Its alien character emerges clearly in the fact that labor is shunned like the plague as soon as there is no physical or other compulsion. External labor, labor in which man is externalized, is labor of self-sacrifice, of mortification. Finally, the external nature of labor for the worker appears in the fact that it is not his own, but someone else’s, that it does not belong to him, that in that labor he does not belong to himself but to someone else [or to

some company]. Just as in religion, the spontaneous activity of human imagination, of the human brain and the human heart, operates independently of the individual, i.e. as an alien divine or diabolical activity, so the worker's activity is not his spontaneous activity. It belongs to another; it is the loss of his self.

The result, therefore, is that man (the worker) feels that he is acting freely only in his animal functions—eating, drinking, procreating, or at most in his shelter and his finery—while in his human functions he feels himself nothing more than an animal. What is animal becomes human and what is human becomes animal.¹

(If anything, this description is more universally true now than it was in Marx's time.) The unfree character of most work, which consists in its not being desired for its own sake—i.e., in its not emerging organically from an individual's "sentiment of [his] being" (in Rousseau's terminology)—causes the individual himself to feel unfree, which means that he does not experience himself as truly himself, which means that he is not individuated. He feels conflicted with himself, because he is conflicted with his activities, his objectifications—which in turn is because social relations have been atomized.

I'll expand on all these thoughts in subsequent chapters, especially in the second volume. As I've said, my purpose right now is to look at a specific form of dehumanization (or atomization), namely the modern stultifying of the individual's potential breadth. This amounts to suppression of the individual himself, suppression of individuation or self-realization or self-affirmation or whatever you want to call it. Whether through direct economic coercion, as in the case of the lower classes, or through the insidious influence of economically conditioned social habits and pressures, the individual is prevented from achieving himself (so to speak). He is practically forced to specialize, both in his job and in his leisure-activities (which usually consist of watching TV or surfing the internet)—the latter because his whole way of being is saturated with a kind of self-laziness and one-sidedness. The type of social conditioning that results from (and *is*) "bureaucracy, the proliferation of images, therapeutic ideologies, the rationalization of the inner life, the cult of consumption",² the hectic pace of modern life, the commercialization of sex and love, the constant forging and breaking of shallow friendships, the deterioration of education, the widespread retreat into video games and television, the degradation of politics into spectacle, and the fact that all these developments (and more) have become common knowledge and are widely deplored but seem impenetrable to understanding and cannot be remedied—indeed, are intensified every year, snowballing according to their internal logic—all this conditioning churns out individuals who suffer from a certain shallowness and discontentedness. They have but a tenuous grasp of themselves, are prone to self-doubt and anxiety. They haven't the self-confidence necessary to explore different, even apparently 'conflicting', facets of their being—propelled to do so from within themselves, as it were—to spread themselves out into the world. For, as I said a moment ago, self-broadening is not only a cause of mental health; it is also an effect. It arises partially from the feeling of freedom, from the intoxication of being (at one with) oneself and one's activities (which is really what the terms 'self-confidence', 'self-esteem', 'self-respect', 'mental health', etc., in their deepest meaning, signify). A person who enjoys such a state will want to assert himself, to be *active*—not in one limited sphere but in several, as if he were 'overflowing' into the world.

If the compulsory nature of work in Marx's day was the main factor that made people feel unfree, in our own day other causes have been added: namely, such developments as those I just listed. We feel buffeted by forces beyond our control; we don't feel at home in the world. And so we don't feel at home in our own skin, since, after all, our being is defined and determined by its situation in the world (as Martin Heidegger saw). We're anxious about how others perceive us, and we're so self-conscious that we constantly worry about how we perceive ourselves. Hence all the self-help books. Our lives are fundamentally divisive; we can't decide who we really are, because our lives are too cluttered. There are too many responsibilities, too many options, too many influences from too many directions. We don't have

¹ *The Portable Karl Marx*, edited by Eugene Kamenka (New York: Penguin Books, 1983), pp. 136, 137. The thoughts in that passage are dramatized in many pop-cultural creations, for example in the popular show "The Office".

² Lasch, *op. cit.*, p. 32.

time, as it were, or stability enough, to lay out an abiding foundation for our identity, on the basis of which we could act in the world in a basically (self-)affirmative way, by aggressively exploiting our potential in ways that might even appear to be (superficially) contradictory. That's the paradox of self-realization: if it is undertaken on the basis of some sort of durable, intuitive sense of self, no amount of apparent conflict between the ways in which we realize ourselves can cause identity-crises. We can be athletes, poets, musicians, activists, parents, lovers, without ever wondering what our 'true' identity consists in. If, on the other hand, our psyche has not had an opportunity during its youth to construct a durable sense of itself—due to constant social conflicts, responsibilities, all the distractions in which contemporary life consists—then sometimes we can't even have a single job and a single child without feeling torn apart by conflicting loyalties and identities. Far from being able to luxuriate in multifarious self-molding, we can barely do what survival dictates without succumbing to neuroses or psychoses. We just go to work, pay the bills and then watch TV, grateful for a respite from ourselves and the dissatisfaction we hide behind our masks.

A certain kind of person has managed to cope by making a virtue of necessity: he embraces the modern person's insecurity, his obsession with how he is perceived by others and his consequent lack of an authentic self (i.e., of a firm sense of himself), by attuning his whole being to "the signals sent out by the consensus of his fellows and by the institutional agencies of the culture, to the extent that he is scarcely a self at all, but, rather, a reiterated impersonation".¹ In *The Lonely Crowd*, David Riesman called this kind of person "other-directed", contrasting him with the "inner-directed" person. "What is common to all the other-directed people is that their contemporaries are the source of direction for the individual.... This source is of course 'internalized' in the sense that dependence on it for guidance in life is implanted early. The goals toward which the other-directed person strives shift with that guidance: it is only the process of striving itself and the process of paying close attention to the signals from others that remain unaltered throughout life."² For whatever reason, this kind of person is able to adapt to the schizophrenic conditions of modern life less painfully than other people are, though he too lacks a secure sense of himself—i.e., a palpable "sentiment of being", of being himself in and through all his activities, of being fundamentally free on account of his sense that his acts are his own. Indeed, "one prime psychological lever of the other-directed person is a diffuse *anxiety*".³ That he is able to make some constructive use of his anxiety does nothing to refute the fact that he has not attained authentic selfhood, which always has an element of inner-direction. Thus, far from being (able to be) well-rounded—which he often seems to be—this person doesn't even know who or what he is, and is therefore fundamentally alienated from himself.

It's time I ended this preliminary discussion, since it is a mere prelude (hardly even *that*) to the sequel of this book. I'll make only one more observation, or rather a response to a possible objection. I can imagine a postmodernist intellectual shouting at me, "You keep talking about self-realization, individuation, authentic selfhood and whatnot, but it doesn't even occur to you that the self is a fiction! There is no entity called the 'self' behind appearances!" This objection is confused, like all postmodernism, but it obscurely grasps a truth. The injunction to "Be true to yourself!" is misguided, for it postulates a dualism: it assumes that there is a specific self to be true to, a self that is somehow buried within each person and just requires a little coaxing to show itself. There is no such thing, no 'already-given' self. Nietzsche's "Become who you are!" is better—as is his statement that "Your true nature lies, not concealed deep within you, but immeasurably high above you, or at least above that which you usually take yourself to be". These maxims, rather than encouraging you to navel-gaze ("Who am I *really*? Am I being true to myself right now? If I could only introspect deeply enough, I would know who I really am!"), encourage you to fix your gaze on something outside you—on the world, on your activities, on your freedom to throw yourself into life. One can realize one's potential in many ways. Authentic selfhood is not a matter of acting in a way that accords with some sort of deeper, truer self; it is, rather, defined by an attitude one takes toward oneself and the world. This attitude isn't chosen; it spontaneously emerges in the course of a healthy life. It is opposed to what Trilling, following Hegel, calls the disintegrated consciousness—the anxiety-ridden, self-doubting,

¹ Trilling, *op. cit.*, p. 66.

² David Riesman, *The Lonely Crowd* (New York: Doubleday Anchor Books, 1953), p. 37.

³ *Ibid.*, p. 41. Riesman's italics.

self-contradictory, overly self-conscious consciousness, the alienated consciousness. The consciousness, in short, of modern man, who is what he is not and is not what he is (to quote Sartre). The “authentic self” is such not by being true to itself but by being well-disposed toward itself, by being one with itself and its objectifications.¹—Questions surrounding the concept of authenticity have fascinated such diverse thinkers as Rousseau, Hegel, Kierkegaard, Marx, Nietzsche, Freud, Heidegger, Sartre, and a number of poets, and I cannot settle them in one paragraph, but suffice it to say, for now, that the truly ‘authentic’ self is integrated with itself and the world, is far along on the path of individuation, recognizes itself in its environment, has the capacity to exploit all its potential, and feels free in everything it does—approaches life in the spirit of play, of spontaneity. The most ‘authentic’ person is he for whom questions about authenticity don’t even exist, being totally superfluous and unconsciously understood as basically meaningless (especially for him).

Having tantalized you with these thoughts on selfhood, I’m going to proceed to the main topic of this chapter, namely ‘Academia as a Case-Study in Stuntedness’. I choose academia as my target for two reasons: I’m intimately acquainted with it, and its framework is such that the people who spend their lives in it have more opportunities than anyone else in society to realize themselves in all their potential. Especially their intellectual potential. And yet they usually don’t: they tend to be somewhat unambitious, intellectually and spiritually stunted. They are über-specialized and complacent. Their attitude toward intellectual matters is not entirely healthy, I think. They are at the same time not serious enough about such matters and too serious: on the one hand, they seem to have lost the desire to really understand the world, choosing instead to write masses of technical papers [*I was thinking of philosophers*] in an effort to build up their curriculum vita; on the other hand, they approach their professions in the spirit of drudgery, as if writing articles is a necessary chore, a necessary part of the academic game. There is no spirit of play² or spontaneity in any of their writings; they just write and write, like automatons, because it’s something they have to do to rise in the academic world. Ironically, they themselves are often the first to admit it is all a meaningless “game”; yet they continue to go along with it. Of course, if they don’t, they might not be promoted, or they might lose their jobs.

The ancient quest for truth has suffered a rather ignominious demise, at least temporarily. Consider any of the postmodernist texts that proliferate in academia. Like Kenneth Gergen’s book *The Saturated Self*, which, when it was published in the 1990s, was heralded as a godsend by philosophical nihilists everywhere.

....Most of the cherished beliefs that undergird the traditional goals of research and teaching are in eclipse. Some consider the demise of the traditional assumptions to be an event little short of catastrophe; to part with the longstanding ideals of truth and understanding is to invite chaos, first in the academic world and then in society more generally. Others feel an innervating sense that history is at a turning point, that a new and exciting era is in the making.

....The crisis in the academy about beliefs in objective knowledge has profound implications for beliefs about the self.... In large measure[,] [traditional beliefs about the self] derive their credibility from the assumption that they are objectively true. But....there is ample reason to doubt such claims in the case of human personality. The present crisis in the academy presses the argument to its radical extreme. We are not dealing here with doubts regarding claims about the truth of human character, but with the full-scale abandonment of the concept of objective truth. The argument is not that our descriptions of the self are objectively shaky, but that the very attempt to render accurate understanding is itself bankrupt. And if objective accounts of human personality are beyond possibility, then why continue the search for human essence? Whatever we are is beyond telling.³

¹ There are in fact several kinds of authentic selfhood, primitive and sophisticated kinds, which I’ll discuss later.

² By that term I’m not referring, e.g., to the undignified cutesiness of a Daniel Dennett.

³ Kenneth Gergen, *The Saturated Self* (New York: Basic Books 1991), p. 82.

Gergen's book is not only among the silliest I've ever read but is "saturated" with self-contradictions. Its continued popularity testifies to widespread intellectual despair. As does the popularity of Jean-François Lyotard's version of postmodernism:

"How do you prove the proof?" or, more generally, "Who decides the conditions of truth?" It is recognized that the conditions of truth, in other words, the rules of the game of science, are immanent in that game, that they can only be established within the bounds of a debate that is already scientific in nature, and that there is no other proof that the rules are good than the consensus extended to them by the experts.¹

Most Anglo-American philosophers recognize that Lyotard's famous book, and postmodernism in general, displays an impressive lack of intellectual integrity. (I explain that remark in the appendix.) Analytic philosophers usually still believe in such quaint notions as truth, intellectual rigor, deductive reasoning and standards of rationality, and recognize logical fallacies when they see them.² Indeed, they are fanatically committed to logical rigor—which is, in a sense, precisely the problem. For their commitment is so obsessive that it manifests itself in an exclusive concern with scholarly minutiae, mind-boggling technicalities, preciseness for the sake of preciseness.³ While their substantive positions are not as idiotic as the postmodernist's....one is hard-pressed to *find* their substantive positions. When they exist, they're often hidden beneath a lot of verbiage. The point is no longer to find the truth about the self, or the mind-body problem, or ontological confusions, or—in the sphere of social science—the causes of a given historical event, or the workings of the economy; the point is to debate endlessly about methodology, or about what past thinkers really thought, or about the proper definition of a concept, and in general to indulge in mere intellectual exercises. Few people are confident enough anymore to attack substantive questions head-on, and few are presumptuous enough to think their work will have lasting influence. Effectively, therefore, even academics⁴ with intellectual integrity don't believe in real 'truth', since they don't act on that belief.

"But the world is so *complicated* these days!" I hear someone shout at me. "There are so many theories, so many things to sort out! To get clear on the kind of 'substantive truth' you're talking about is too hard!" First of all, 'hard' doesn't mean 'impossible'. No doubt it is exceedingly difficult to attain even a passable understanding of something like the self; it is not impossible, though. There *are* truths.⁵ The successes of natural science have demonstrated this, at least beyond a reasonable doubt. How else could scientists act on the world—make correct predictions, etc.—if not by having understood it in some way or other? How else could the application of psychological theories result in the restoration of an individual's self-esteem if it weren't that the theories manifested some insight into the way the psyche *really works*? Or will it be denied there is such a thing as the 'psyche in itself'? It *will*, by many anti-realists. Such people oppose representationalism, or the correspondence theory of truth, with neo-idealist arguments like 'Reality

¹ Jean-François Lyotard, *The Postmodern Condition: A Report on Knowledge* (Minneapolis: University of Minnesota Press, 1979), p. 29. The pernicious influence of Wittgenstein is evident in that quotation.

² For example, the main argument running through Gergen's book can be stated as follows: people are confused nowadays; therefore, there is no such thing as truth.

³ Herbert Marcuse already remarked on that over-preciseness in *One-Dimensional Man* (Boston: Beacon Press, 1964). Criticizing the Austinian style of linguistic analysis, he asks (rhetorically) "Are exactness and clarity ends in themselves, or are they committed to other ends?" (p. 176). But compared to *contemporary* philosophers of language, who can spend dozens of pages writing about nothing, Austin was practically an avatar of ambitiousness. Incidentally, later I'll try to explain the irony that despite the contemporary philosopher's obsessive concern with logical analysis, his positions, such as they are, are frequently muddled and superficial.

⁴ I mean people in the 'soft sciences', not the natural sciences.

⁵ I'm talking about truths beyond facts like 'George Bush is the president of the United States (unless I've simply been having a nightmare for the last seven years)'. Presumably not even postmodernists would deny that fact. (But this already shows that there are 'objective truths' of some elementary kind.)

is socially constructed’—thus, incidentally, confirming (some version of) the correspondence theory of truth. For their own theory is intended to portray ‘reality’ in propositional form, namely the ‘reality’ that there is no world-in-itself, no reality independent of interpretation. Any denial of truth is self-refuting in this way, not to mention contrary to common sense (which upholds the existence of facts, or states of affairs, whose truth doesn’t depend on whether people are aware of them as facts). Philosophical truths are admittedly not as purely ‘representational’ or ‘referential’ as natural-scientific truths, in that they don’t refer to (i.e., portray) physical states of affairs, but they too are explications of the world that can be evaluated on the basis of cross-cultural standards of reason.

I’m not going to delve deeply into questions about the nature of truth right now. My point is only that the goal of understanding truth is implicit in all theorizing, even that which denies truth, and that there is at least potentially a ‘best interpretation’ with regard to any object of analysis. The possibility of one is implicit in the fact that we can rank opinions in terms of rational justifiability. For example, the belief that the global economy is kept in motion by millions of fairies who sprinkle pixie-dust on money is less justified than the belief that international exchange-rates have a lot to do with it. The second interpretation is better than the first, which means that it’s possible for interpretations to be ranked according to their justifiability, which means there is *potentially* a best interpretation of economic functioning. Doubtless we’ll never realize this ideal interpretation, this ‘truth’, in practice, since there are too many variables that come into play, but we can approximate it. And we can approximate it to ever-greater degrees. —Unless, of course, we lack the will to truth.

[...] If academics really cared about truth they would take an interdisciplinary perspective on things, to see how they all fit together. The philosophy of language bears on epistemology; psychology is relevant to sociology; anthropology can contribute to the philosophy of history. Everyone knows this, but almost no one acts on it.

Admittedly, the situation isn’t really anyone’s fault. Ultimately, systemic factors are responsible for it. It’s impossible to untangle all the specific causes—there are too many of them, and social science rarely has recourse to the reliable methods of natural science¹—but their general outlines are intuitively obvious. As scientific technologies and the global economy have grown in complexity, greater specialization between industries and between jobs in a given industry has been necessary. This has led to greater economic productivity,² which has stimulated the growth of industry and thereby intensified the division of labor, in a self-reinforcing cycle. Contemporaneous with these developments has been an intensification in the division of labor between the ideological (academic) professions, for the changing material conditions have led to a correspondingly more intricate and nuanced understanding of the world. —This is just elementary Marxism. As social relations have grown more complex and interdependent, so have relations between ideas. At the same time, there has been a growth in population, a migration to the cities, an extension of university education to more and more people, and thus an expansion of the university. All this has meant more specialization between disciplines and more competition between practitioners of these disciplines (competition for jobs, for prestige, etc.). To ‘get ahead’, academics have to compete, and they have to compete according to the rules of the system, one of which is ever-greater specialization—until the system has finally reached the point where an economist, for example, can lament that

Economics has....become so broad and so complicated that, within the fields, one group of specialists barely speaks the same language as the Ph.D.s across the hall. And so much of

¹ For example, experimentation and the formulation of general laws. The basic reason for this deficiency in social science is that its subject-matter—namely, society and its interactions with the human psyche—is not purely deterministic, as is the subject-matter of the natural sciences (quantum mechanics notwithstanding). The psyche somehow ‘softens’ causality, such that *laws*, testable through experiments, cannot accurately describe it.

² From Adam Smith’s day (and even before then) it has been known that “the division of labor, so far as it can be introduced, occasions, in every art, a proportionable increase of the productive powers of labor [i.e., productivity]”. See *The Wealth of Nations* (New York: Oxford University Press, 1998), p. 13.

what is published seems more to proselytize for an ideology than to make sense of the chaotic world.... It's no wonder that a single economic development can be interpreted as a godsend or a disaster, depending on the interpreter's frame of reference.¹

And yet, from the scholar's perspective, by 'specializing' he is just being intellectually honest and thorough. For each subfield in each discipline is so complicated that he has to be extraordinarily cautious and subtle in his reasoning, and he can't be too ambitious because his colleagues will invariably find a way to contradict him. The more ambitious he is, the more opportunities there are to find weaknesses in his arguments. Unless he is already famous, people will probably treat his ambitiousness as naïve. So the best, and apparently most 'disciplined', thing to do is for him to write narrow papers and gradually build up an extensive CV, at the same time contributing to the evolution of knowledge 'in his own small way', through his relatively unambitious but respectable (closely reasoned) articles.

In light of all this, where is the academy headed? Well, clearly the process I just outlined will continue. No end is in sight. The global economy is growing every year; universities are still expanding, hiring more professors and more *specialized* professors all the time. And scholars, virtually of necessity, continue to do what the system asks of them, so that they can feed their families and hopefully get recognition. It seems like nothing can stop this evolution except some kind of economic or military catastrophe, such as a nuclear war...

There may be other, happier possibilities, but I'm not competent to speculate. What is certain is that the university-system as it exists now in America will straggle on for at least a few more decades, as our society straggles on. Costs will continue to rise, the quality of education will continue to decline, and the 'research' that is pumped out annually will become more and more repetitive, tedious, technical, and 'careful'.

The professional demands of academic life, together with the complexity of the subject-matter, are not the only causes. The cynicism, the discontentedness, that wafts through the cultural milieu, or rather *saturates* it, such that even the inert matter of an office-building or a university's student-center is soaked in it, is also a factor. I mentioned this discontentedness earlier, in a slightly different context. Professors are no more immune to it than the average blue-collar or white-collar worker. All the impersonal vastness of the contemporary social world, which, by means of newspapers, television, constant financial imperatives and so on, confronts the individual as an impenetrable objective force—as a kind of malicious Other that is unaware of his existence but nevertheless bombards him daily with its inhuman demands, its sensory overload, its frenetic movement, its pervasive cruelty and senselessness—all this external compulsion and insensitivity, which makes each of us acutely aware of the littleness of his life and turns him into an insecure yet self-defensively egomaniacal little narcissist, pushes us into a strangely dissatisfied self-complacency. We're so unhappy and dehumanized that we finally settle into our imposed routines without much resistance—resignedly, as it were—content to do what we all but *have* to do, yet at the same time not content with that at all. And so we passively embrace the one-sidedness, the alienation, of modern life, since there seems to be no other option—and since, at any rate, the nature of modern life has sapped our vitality. The result, in much of academia, is disregard for the very goal of all analysis, namely understanding the world. And if people went into academia with the bright attitude of the disinterested truth-seeker, they emerge from it disabused of idealism—including self-idealism. For, far from attaining their intellectual ends, they have had to play the game of petty scholarship. And they have ended up not realizing all their talents, or their desires.

Maybe you'll say that if most academics don't make more of themselves, it's because they don't have much talent to begin with. To some limited extent, you may be right. Hegel was on to something when he said "the inner is the outer". José Ortega y Gasset, that old warrior on behalf of all that is good in man, would have subscribed to this interpretation, judging by the following passage:

¹ Quoted in Gergen, *op. cit.*, p. 83.

For me, then, nobility is synonymous with a life of effort, ever set on excelling oneself, in passing beyond what one is to what one sets up as a duty and an obligation. In this way the noble life stands opposed to the common or inert life, which reclines statically upon itself, condemned to perpetual immobility, unless an external force compels it to come out of itself. Hence we apply the term mass to this kind of man—not so much because of his multitude as because of his inertia.

As one advances in life, one realizes more and more that the majority of men—and of women—are incapable of any other effort than that strictly imposed on them as a reaction to external compulsion. And for that reason, the few individuals we have come across who are capable of a spontaneous and joyous effort stand out isolated, monumentalised, so to speak, in our experience. These are the select men, the nobles, the only ones who are active and not merely reactive, for whom life is a perpetual striving, an incessant course of training...¹

Ortega would say that most academicians live common, inert lives, condemned to immobility. So would Schopenhauer, Kierkegaard, Nietzsche, and many others. These thinkers were contemptuous of the “scholar”—and even more so of the “mass man”—for his apparent lack of talent and existential ambition. They thought it was in his nature to be self-satisfied (in the bad sense), lazy.

I cannot agree with such opinions, fun as they are. They’re unscientific. Too easy. And too self-congratulatory on the part of the person who opposes himself to the academy, and to the masses...

Schopenhauer wasn’t completely justified in all the scorn he heaped on “philosophasters”. Many of them, of course, are extremely intelligent, very dedicated to their craft, dedicated to intellectual integrity and the search for knowledge. They simply go about it in the wrong way, in an overly specialized way. It may be true that the academic system as a whole demands specialization and conformism; still, *individuals* can break out of the mold. Individuals can fight against stuntedness, can work passionately to synthesize disparate spheres of analysis and at the same time facets of their mind. And the more people do it, the more people will follow them, perhaps eventually bringing about a far-reaching change in the decadent world that is academia. [Ha! A remarkably naïve opinion.]

On the other hand, as I said above, anyone who experiments with breadth and ambitiousness in his work will probably be quickly cut down to size by his colleagues. Or he’ll be ignored. Thinkers—at least, the only ones worthy of the name—have become fond of razor-sharp preciseness, such that if a Hegel, a Kant, a Sartre, or a Nietzsche were to exist in this day, his work would be torn to shreds. In that respect, ours isn’t a good age for a thinker. One can’t make much progress without confronting a wall of analytical objections. But does this mean that no one should even *try*?—that no one should try to synthesize, or to be intellectually daring and experimental? I don’t think so. Even if his effort is bound not to be completely successful, it might be illuminating in some respects. It might illuminate hitherto-unnoticed connections between areas of knowledge, thus contributing to the evolution of truth. In any case, the example would be useful as, if nothing else, a corrective to contemporary specialization.

—In the end, though, not much can be done by individuals to remedy the ‘academic epidemic’. The system’s logic is inexorable, and people are currently too complacent anyway. It’s a pity, because these intelligent people have a lot to offer the world. Even apart from the pursuit of knowledge. They could, for instance, contribute also to the pursuit of justice. They could focus their energies on exposing the crimes of the government (à la Noam Chomsky), or they could work together for social change. Chomsky is right that intellectuals, with all their freedom, their financial security, their intelligence and access to resources, have a moral obligation to advance the banner of humanity. One needn’t argue for that claim; it’s pure common sense. Intellectuals can and should be at the vanguard of progress. They should band together and launch assaults on the kind of idiocy that, say, opposes stem-cell research and gay marriage; they should aggressively advocate for renewable energy, for political transparency, for human rights. Above all, they should use their resources to counteract the propaganda of the mainstream media...

¹ Ortega, *The Revolt of the Masses* (New York: W. W. Norton & Company, 1957), p. 65.

Continental philosophers like Sartre and Herbert Marcuse used to deplore the analytic philosopher's lack of social engagement. This analytic, Anglo-American philosopher himself tended to be less politically engaged than his continental counterpart, but even his theorizing was divorced from material conditions and concrete applications. It was, so to speak, a flight from reality, from commitment to any social agenda, from even the attempt to understand philosophy's relation to social conditions. Nothing was more foreign to the spirit of this philosophy than the Hegelian and Marxian sentiment that "the world of immediate experience—the world in which we find ourselves living—must be comprehended, transformed, even subverted in order to become that which it really is".¹ The order of the day was to separate philosophy's domain from that of other disciplines (psychology, sociology, etc.), to reduce its sphere of influence—(Wittgenstein, for example, proclaimed loudly and repeatedly that philosophy "leaves everything as it is", that its purpose is only to "show the fly the way out of the fly-bottle" so that it can go on living its life not vexed by philosophical questions)—to reduce it to a mere sustained analysis of language, in the hope that such an analysis would dissolve all philosophical questions (which were supposed by many to be unanswerable, to be pseudo-questions arising from confusions in language). These analytic thinkers (e.g., in the '40s and '50s) wanted to 'purify' philosophy, to remold it in the image of symbolic logic, or at least of close, careful reasoning about elementary linguistic utterances. The logical positivists of the '30s even went so far as to deny the meaningfulness of statements in metaphysics, ethics and aesthetics, as being "unverifiable". (A statement, they thought, is meaningful if and only if it is verifiable.) In a way, their project was similar to Edmund Husserl's: both programs—the analytic and the phenomenological—were 'foundational', in the sense that they wanted to 'get back to basics' and build philosophy up from the ground (or knock it down, as the case might be).

But Husserl's method was very different from theirs, and in the end, I think, more fruitful. It was (is) in fact similar to the method of all great philosophy as such, namely that of intuition. It is intuition taken to an extreme, raised to the status of a self-conscious method.² Of course, in his attempt to make phenomenology scientific, Husserl formulated many doctrines that were not explicitly held by earlier philosophers; nevertheless, virtually all "great" philosophers would have respected the intuitive core of phenomenology, since their own ideas have been arrived at primarily through intuition (though not necessarily phenomenological *introspection*) and their analyses have tended to proceed along intuitive lines (embellished discursively). Thinkers as diverse as Descartes, Kant, Hegel, Schopenhauer, Kierkegaard, Nietzsche, James, Bergson, Heidegger, Poincaré, Sartre, Merleau-Ponty, and Kripke—and many others—have explicitly relied on intuition in their investigations. Analytic philosophy, however, distrusts intuition, as being too 'private', 'subjective', and 'obscure'.

It's difficult to say what it is about intuition that makes it so fruitful and essential to philosophy—indeed, to all critical thought—but the point is that it somehow seems to permit an approximation of 'direct insights' into a phenomenon. It is sort of a bypassing of logical processes, or rather of such processes on the *conscious* level (for they must occur unconsciously³)—a cutting-through them and getting to the 'thing itself'. The insights that are thus made possible are not always wholly true or adequate—they may be one-sided—but the fact remains that great philosophy is merely a discursive elaboration on, and embellishment of, fruitful intuitions. And these pithy intuitions animate all the great philosophers' writings. One has but to read them to recognize the truth of that claim. (Kant's writings are a good example.) It is odd, then, that analytic philosophers are usually contemptuous of 'intuition'. They treat it as some sort of mystical, unscientific notion that has no place in real philosophy, when in fact it is the very heart and soul of real

¹ Marcuse, *op. cit.*, p. 123.

² "[Phenomenology's] essential way of proceeding is by intuition." Sartre, *The Transcendence of the Ego* (New York: The Noonday Press, 1957), p. 35. The precise definition of intuition has always been controversial, but these remarks will suffice for now: an intuition "is an act of consciousness by which the object of investigation is *confronted*, rather than merely indicated *in absentia*. Thus, it is one thing merely to indicate the Eiffel Tower (merely 'to have it in mind', we say), and another thing to confront the indicated object by an act of imagination or perception. The indicative act is 'empty'; the intuitive act of imagination or perception is 'filled out'." *Ibid.*, p. 110.

³ See chapter three.

philosophy. Ironically, I can use one of their own against them: Saul Kripke, a universally acknowledged genius. In both his *Naming and Necessity* and his *Wittgenstein on Rules and Private Language*, he states more than once that the whole force of his argument is intuitive, and that unless the intuition is grasped the argument will not be understood. Schopenhauer had said the same thing more than a century earlier. Without the preliminary, pithy intuitions, philosophy would be an empty husk, an endless flow of empty discursion.¹

As I said, one of the goals of analytic philosophy used to be the somewhat masochistic one of making philosophy self-contemptuous—that is, of turning it into a mere instrument of “therapy”, which would allow us poor bedeviled intellectuals to calm our roving minds so that we could get on with ordinary life. Philosophy was conceived as (arising out of) sheer confusion. Said Wittgenstein: “A philosophical problem has the form: ‘I don’t know my way about’”. Also: “Philosophy only states what everyone admits”.² It cannot contribute positively to life, it cannot help right wrongs, it has nothing to say about anything that really matters to people. Alternatively, some philosophers imagined that their task, in the modern age, was simply to adjudicate disputes between the disciplines, to clarify which explananda came within the purview of which discipline, and to clarify the epistemological relations between the sciences. Philosophy’s task, then, was primarily methodological. It could perhaps settle, for example, the sociological debate between methodological individualism and holism, and it could set up models of how the sciences work, but it couldn’t say anything about *substantive* questions. —Here again, philosophy was aloof not only from all social activism but even from any substantive question about society and humanity.

To read about the history of philosophy in the twentieth century is like reading about the identity-crises of a schizoid person. In this modern, technical age, philosophy has had a hard time finding its niche. In America it has often debigrated itself vis-à-vis the ‘hard’ sciences, while in Europe it used to ignore the sciences and concern itself with the human condition, the condition of the ‘spirit’. In recent times, its self-skepticism has mutated into a particularly virulent strain, in Rortyan relativism. Academic philosophy is no longer as tormented as it once was about its place relative to other disciplines, but this is largely because it no longer has any sort of a ‘united front’, no clear agenda or direction of progress. It is floundering, flailing its arms about everywhere, perhaps as a signal for help. Everyone is doing his own thing, in his own little area with his own little clique of interested colleagues. Far from philosophy’s having become more self-confident, more ambitious, since the days of logical positivism and Wittgensteinian ordinary-language-analysis, it has become so atomized, technical and isolated from the world (from life) that people outside the academic bubble are hardly even aware there was once something called “philosophy”.

Not only is it specialized, though; it has also become more superficial than it used to be, despite—or because of—its greater logical rigor. This development is the logical conclusion of the discursive methods of analytic philosophy, which have come to dominate the scene. Formalization was always a fetish of thinkers like Bertrand Russell; they wanted to bring formal logic, symbolic logic, or at least obsessive exactitude, into all areas of philosophy, in the hope that this would make them more objective and precise. It may possibly have made them more precise, but I doubt it made them more objective. In any case, the more one emphasizes form, the less one emphasizes content. The result has been that writers pay more attention to the discursive surface of an argument than to its intuitive content. Symbolism is used all the time— x , y , z and so on (“Necessarily, x is part of y at t iff x and y each exist at t , and x ’s temporal part at t is part of y ’s temporal part at t ”³)—because this makes arguments look more mathematically precise; arguments that have already been stated clearly are restated in the jargon of symbolic logic, for no apparent reason other than to exclude non-specialists; unnecessarily abstruse terminology is used, again to prove one’s credentials (to prove that one is ‘part of the gang’); the writer cites a large number of articles in his paper, to show he is aware of the literature; arguments are evaluated on the basis of their *consistency* rather than their plausibility. This last trend is the worst, for it leads to real shallowness. Often the reader loses a

¹ Cf. Kant’s epigram: “Concepts without intuitions are empty, intuitions without concepts are blind.” His understanding of ‘intuition’ was different from mine, but the quotation aptly expresses my own views.

² Wittgenstein, *Philosophical Investigations*, §123 and §599.

³ That’s a simple example, from Ted Sider’s paper “Four Dimensionalism”.

sense of what is being argued about, of what precisely is at stake, because the writer rarely keeps the discussion on the level of easily grasped, intuitive concreteness. I have actually listened to my professors and fellow students debate for hours about metaphysical issues, such as the presentism/eternalism debate or the perdurantism/endurantism debate (see below), even as they obviously had no concrete idea of what was being talked about—precisely because the debates themselves are fairly empty, excessively abstract. Which is because the concepts are not backed up by intuitions. All that matters is consistency, not intuitive plausibility or real *understanding*. The exclusive concern with consistency leads philosophers to take seriously positions that are positively perverse, positions that anyone with a shred of common sense would laugh at.

For example, David Lewis's famous theory of modal realism, proposed decades ago, is still debated, despite its absurdity. For the benefit of those readers who have not had to endure a course in contemporary metaphysics, I'll briefly describe it. It was proposed as a solution to the question of how modal claims can be true or false. For instance, what is it that determines the truth of the statement "It's possible that there is extraterrestrial life", or "A square circle necessarily doesn't exist", or "I will probably not go to class tomorrow"? Given that modal statements (i.e., statements involving the concepts of possibility and necessity) can be true or false, what is it that determines their truth or falsity? *Intuitively* we usually have no problem judging their truth-values, but intuition, in and of itself, is not a very rigorous method. Moreover, *what does it mean* to say that a certain thing is possible (or necessary, or impossible)? What exactly is being said? Various theories have been offered, but David Lewis's is the most famous. Its basic idea is that for every true modal proposition, there is a world somewhere—a *real* world, a concrete world like our own, which is, however, spatiotemporally unconnected to our universe—in which the state of affairs that the proposition posits actually does exist. And that world is exactly like ours except for the one difference posited by the proposition. So if I say, "It was possible for me not to have been born", that proposition is true because there is a world somewhere in which I do not exist. Similarly, the statement "I will possibly become a novelist" is true because in some world I *will* in fact become a novelist. —"But how," you ask, "can *you* become a novelist in *another* world if you're here in *this* world right now?" Good question. Evidently Lewis's theory is also committed to the idea that we have 'counterparts' in other worlds—in fact, an infinite number of them (for there is an infinite number of possible states of affairs, and thus worlds). That is, the only reason why the concept of possibility can be used to describe my situation is that there literally are other Chris Wrights on other planets spatiotemporally unconnected to our universe. Billions of them, trillions of them. And the *meaning* of modal claims about me is related to my counterparts. "I may become a novelist" means (roughly) "I have a counterpart in a possible world who will become a novelist [or who is a novelist]".

You're right that this is all pure fantasy, concocted by nerds. Unfortunately it isn't treated as fantasy by these nerds. They actually take it seriously. The arguments that David Lewis brought against alternative theories of modality were powerful, so his colleagues have felt compelled to come to terms with his own ideas. And they devote *books* to this Lewisian drivel! They cannot see that if they are apparently forced to take his theory seriously as a way to account for modal truths, there must be some gigantic, foundational flaw in their method of philosophizing.

And of course there is: they are too fond of formalization, and of mathematical preciseness. Lewis's theory is useful in various technical ways relating to modal logic and possible-worlds semantics. Even better: it seems internally consistent. Most philosophers don't agree with it, since it's wildly implausible, but they take it seriously. What they *should* do, I think, is to 'explain away' all questions that permit of answers as silly as Lewis's. I'll clarify what I mean by 'explain away' in a minute.

Not only are philosophers preoccupied with formalization at the expense of content and intuitive understanding; they also have a love of classification, of labels of all kinds. Indeed, they have internalized their society's and their profession's atomized structure so completely that they delight in setting up conceptual divisions for their own sake. This has been a characteristic of analytic philosophy almost since its inception. (I say 'almost' because its founder, Gottlob Frege, was a pioneering genius with that rarest of traits among philosophers: intellectual common sense. His thinking was more intuitive than discursive, so it was sensible and fruitful.) One could perhaps argue that this delight in labels has been a characteristic of

philosophy since its inception, and hence is not merely a modern trait. That may be true. Even so, contemporary philosophers have raised it to a new level. Their sophistries, their labyrinths of casuistry, benumb the mind. I said a moment ago that philosophers now are no longer as concerned as they once were to clarify, for example, the differences between philosophy and psychology, and between psychology and sociology, etc. This could be seen as a positive development. Unfortunately, there are many, many other ways in which one can manifest one's love of labeling. In whatever subfield of philosophy you research, you'll find that most writers care more about differentiating opposing positions than actually finding the truth.

For instance, there is currently a debate in metaphysics over the question of how it's possible for an object to persist through time—i.e., to undergo changes while remaining the same object. In what sense does it remain the same and in what sense does it change? A candle melts but it remains the same candle, even as it somehow changes as well. How can this phenomenon be explained? The dominant positions are “perdurantism” and “endurantism”. The perdurantist thinks that the candle is temporally extended: it is actually ‘its’ entire lifespan; it has temporal parts just as it has spatial parts. So the answer to the question is that modifications can occur in its temporal parts, as they can in its spatial parts, while the candle itself persists (or “perdures”). The endurantist, on the other hand, thinks that the candle is wholly present in each moment. It doesn't have temporal parts. It is able to change in that its properties, like the candle itself, exist only *at specific times*. Rather than being, say, red *simpliciter*, the candle is red *relative* to a particular time. In other words, there is no such thing as being red; there is only being *red at* (a particular time).¹—Now, in their preoccupation with drawing distinctions between these positions, writers have failed to see that both perdurantism and endurantism don't really answer the main question. It's unenlightening to say (with the perdurantist) that, “strictly speaking, an object is its past, present and future; each temporal stage is just a part of it—and so, while there can be differences between its temporal stages, it itself remains the same object”. What verbal legerdemain! It says nothing. The real question is what it is that connects the object's instantaneous temporal slivers with each other, such that in their aggregate they form one persisting object. Nobody, as far as I can see, has given an answer. Instead, everyone has focused on how to differentiate the two positions, thereby remaining on the level of sophistry.

This example illustrates something else too: the triviality of the questions that occupy many philosophers. A few of these questions are interesting enough to ponder for short periods of time, perhaps even to write a paper or two on, but to spend years of one's life wondering how the candle can stay the same candle from *t* to *t'* borders on insanity. It strikes me as a kind of masochism. In any case, this sort of philosophy is not an active, passionate search for truth; it is a quibbling, a kind of pettiness. Far from elevating one's outlook on life, which philosophy should always do, it narrows, stultifies the mind, and stunts the personality. —With regard to problems like these, the philosopher should take Nietzsche's advice: “treat them as a cold bath—quick in, quick out”.

My conception of philosophy is quite different from the popular one. I should note, though, that it represents only my personal opinion, and that I don't think it is necessarily the ‘correct’ one. Philosophy is an unusually broad and indefinable discipline, which is why philosophers so often agonize over its proper place in relation to the other sciences and humanities. Of no other discipline could so many irreconcilable definitions be offered; only philosophy is amorphous enough to persist through millennia, changing with the times. Therefore, no definition is ‘absolute’. However, I prefer to look at philosophy in a certain way, because it strikes me as a ‘lofty’ conception that does justice to the richness of the philosophical tradition.

First of all—to repeat—I think the method of *intuition* is essential to real philosophy. I like Heraclitus's advice: “It is wise to listen not to my words but to the Logos”. He understood that words, in themselves, are deceptive, shallow. On the level of words, his own philosophy seems utterly self-contradictory, as does that of Hegel and that of certain Eastern religions. What is important is not the words in which the thoughts happen to be expressed but the thoughts themselves. The intuitions. Words are useful in that they allow the thoughts to be communicated and thus argued for and against, but without the primary,

¹ Cf., e.g., Mark Hinchliff, “The Puzzle of Change”, *Noûs* Vol. 30, Supplement: Philosophical Perspectives, 10, *Metaphysics* (1996): 119 – 136.

non-discursive intuitions, philosophy would just be the series of intellectual exercises it has become. In truth, the process of doing philosophy should consist of a constant interplay between intuition and ratiocination, the intuitions guiding us and the reasoning honing our insights to relative exactitude. An overemphasis on either element vitiates philosophy. Intuition without reasoning gets you mysticism; reasoning without intuition gets you academic philosophy.

Bergson once said that “the essence of philosophy is the spirit of simplicity. [From whatever point of view we look at it,] we always find that its complication is superficial, its constructions mere accessories, its work of synthesis an illusion: to philosophize is a simple act.”¹ I think he may have overstated his case there, but his essential insight is sound: all the complexity of philosophy, of *real* philosophy, is supported by a foundation of utterly simple intuitions—as all intuitions are simple, being nothing but momentary intellectual perceptions. This doesn’t mean it’s easy to understand precisely what an intuition *is*, for, on the contrary, that is extraordinarily difficult. Nevertheless, any thinker who knows what it is to have an intuitive insight into a problem—an imaginative, ‘perceptive’ insight, as opposed to a purely discursive ‘insight’—knows that intuitions, whatever they are, are fairly simple and yet often profound (or fruitful). Much academic philosophy, on the other hand, is extremely complicated yet superficial.

More generally, by “philosophy” I understand something that the intelligent, informed layman can comprehend, something he can be *moved* by. Technicalities, logical symbolism, and so on are at best supplementary tools; philosophy ought not to revolve around them. It ought to be nothing more nor less than an intellectually honest engagement with the perennial questions of life. It ought to *inspire*, as Nietzsche inspires, Marx inspires, Kant inspires; it ought to broaden your vision, impel you to think on your own. As Aristotle said, philosophy arises out of pure wonder. It is man’s original and instinctual attempt to intellectually assimilate the world—his primordial impulse to ask questions, to bring order out of chaos. All the sciences emerged from it. They are extensions of it.

Thus, as I see it, philosophy does not have just one special function, as the old analytic philosophers thought and some still think today. It does not exist just to provide an epistemological ‘grounding’ for the other sciences, or to show how certain questions are merely confusions arising from language, or to oversee methodological issues in other disciplines. It is neither subordinate to the other sciences nor truly ‘superior’ to them. Insofar as it can be distinguished from them at all, its distinction is its breadth. No programme can be imposed on it, in the mode of Wittgenstein, in some *a priori*-ish way; nor is its place ever ‘fixed’ vis-à-vis other sciences. It is fluid; it evolves with the times, going wherever society’s drive to knowledge wills it. It adopts both meta-level and first-order perspectives, depending on what questions are asked.

Moreover, it bleeds into the other sciences. It borrows from psychology and physics while undertaking its own phenomenological and logical investigations. At times it must cede its former territory to newly developed disciplines with their specialized techniques, but it never relinquishes its right to an examination of their results for logical carelessness or for further insights into the human condition. It is the most self-conscious and self-critical of disciplines, for self-consciousness and self-criticism are among its methods. Poetry and fiction and nonfiction can each exemplify philosophy in its own unique way.

For example, Percy Bysshe Shelley was, in a way, a philosopher. Not only in his prose, but also in his poetry. So were Wordsworth, Milton, Shakespeare, Whitman, Dickinson, even Wilfred Owen. And many others. Analytically they weren’t *rigorous* thinkers, but the spirit animating their writings was philosophical. Wonder, awe, despair at universal absurdity, joyfulness in *living*, the drive to understand. The true philosopher has a mind so expansive that he is often dissatisfied with himself; and his dissatisfaction drives him to push the boundaries of thought and life. He may be called a “genius”, but he is really just a thoughtful person who, because he can’t find contentment in ordinary life, spends his time contemplating himself and the world. Indulging his fascination is what makes him happy.

In this broad sense, philosophy is rebellion against the status quo. And philosophers are necessarily rebels. They have to be, because they are *individuals*—individuals who, moreover, have something important to say. Social conditions are never modeled on ‘truth’, so the thinker is bound to come into conflict with them, since he pursues knowledge and criticizes that which is false. Especially in a world

¹ Quoted in H. Stuart Hughes, *Consciousness and Society* (New York: Vintage Books, 1958), p. 200.

where alienation is the norm, where power-structures suppress the individual's development as well as his understanding of truth, philosophy must take on the character of rebellion. It must be socially critical and engaged; but it must also be *lived*—*passionate*, for it requires passion to subvert ossified ways of thinking and being.

In its confrontation with the apologetic character of ideologies and the oppressive character of social structures, philosophy is nothing but the “critical theory” associated with thinkers like Adorno, Horkheimer, Marcuse, and Fromm. [*That's sort of true, but it's much too narrow a conception. “Critical theory” per se was rather silly and masturbatory; what I really meant was all “theory” that is critical of present society.*] Critical social theory is one manifestation of philosophy. Theorists used to debate the epistemological status of critical theory (and Marxism), some arguing it was merely another ideology as ‘uncritical’ as others, while its adherents argued it was different from, say, bourgeois ideologies, in that it was more scientific and signified a union of theory and praxis. I think its adherents were right. While critical theory, like all theory, is indeed guided by particular interests, and to that extent is as partisan as all ideologies, its interests are precisely societal understanding and emancipation. Bourgeois ideologies, by contrast, serve the narrower and less ‘philosophical’ or ‘universal’ interest of maintaining the social order, of defending it against those who have the temerity to point out its flaws. Critical theory—i.e., the enterprise of understanding society—can be more quasi-scientific in its methods than bourgeois ideologizing because its goal is to understand, not to defend the status quo; but given that understanding must criticize and dissect anything that militates against understanding, critical theory necessarily involves criticism of the oppressive and opaque elements of the social order. Which means that its interest coincides with the interest of mankind, its emancipatory interest.¹

Be that as it may, my point is that philosophy, being the broadest, oldest, most ambitious, and arguably the most ‘human’ of disciplines, should reclaim its rightful place at the forefront of human knowledge, life, and progress. We should stop wondering what is and what is not philosophy—how to delimit its sphere of influence, as if it has a clearly defined subject-matter. It doesn't. It isn't even really on the same level as the other sciences. It exists in its own realm of thought, which extends from art to religion to science even as it transcends them all. In this age of money and specialization, we forget philosophy at our peril. We ‘fragment’ it at our peril. If philosophy is in danger of perishing, so is the individual.

I have sometimes heard the term “cutting-edge philosophy” tossed around by my professors. They exhort their graduate students to read up on the most recent scholarship so that they can contribute to cutting-edge philosophy, cutting-edge metaphysics. And every time I hear that word, I feel myself become momentarily hollow, as if a draft of nihilism has passed through me. It's an uncanny feeling, an emotion that makes me hate life, like extreme boredom. “Cutting-edge philosophy” is an oxymoron, a self-vitiation, like “contemporary classical music” or “that mediocre poem the *Bhagavad-Gita*”—a manifest contradiction-in-terms. The more common this attitude towards philosophy becomes—this ‘scientific’, ‘technological’, ‘mathematical’, ‘research-paper-ish’ attitude, which uses words like ‘cutting-edge’—the more I know that philosophy is in danger of dying. And that idealism itself is undergoing something of a crisis. Philosophical scholars may be adept at reasoning, but their technical jargon as much as their actual positions proves that their approach, on the whole, is not quite correct. It's fine to think that the activity of doing philosophy is merely ‘interesting’ and ‘entertaining’, as most professionals think; I don't condemn that attitude. I say only that when it becomes as widespread as it has, it signifies a degradation of philosophy. The motto is no longer Husserl's “*Zu den Sachen selbst!*” (“To the things themselves!”); it's *Zum Wörterbuch!* Discursiveness, analytics! Intuition—be gone with you!

... Without intuition, what you get are mostly the “philosophasters” of whom Schopenhauer spoke, people like Daniel Dennett, David Armstrong, Karl Popper, Hilary Putnam, Derek Parfit. (See the [chapter on genius](#).)

And the specialists. Nietzsche had this to say about “specialists”:

¹ See Julius Sensat, Jr., *Habermas and Marxism* (Beverly Hills: Sage Publications, 1979), chapter two.

Almost always the books of scholars are somehow oppressive, oppressed; the “specialist” emerges somewhere—his zeal, his seriousness, his overestimation of the nook in which he sits and spins, his hunched back; every specialist has his hunched back. Every scholarly book also mirrors a soul that has become crooked; every craft makes crooked.¹

To be sure, a few paragraphs later he rightly qualified that negative assessment. There is much that is good and honorable in the “specialist”, for example his honesty, his intellectual integrity, his dedication to his craft. Nevertheless, at least in his current philosophical manifestation, he cares more about arguing for its own sake than about truth...

Philosophy as I interpret it is unique. It is totally affirmative of our humanity, not only in its depth and spiritual significance but also in its breadth. Its breadth mirrors, more or less, the breadth of the individual’s potential. While a person who occupies himself exclusively in philosophical pursuits is stunted, in the cognitive sphere at least he is not. Or he need not be, because in order to do *good* philosophy—original, interesting philosophy, which, as such, *synthesizes*—he has to be partly educated in the other sciences as well. And the humanities. Synthesis, breadth, is so definitive of philosophy that the latter must draw from all areas of knowledge in order to ‘get the job done’. The narrow thinker is necessarily not a good philosopher. Hence, true philosophy, far from being a victim of academic specialization, should serve as an antidote to it.

In other words, in the academician’s effective disregard for (broad) philosophical truth, he disregards also his human potential—what can be called his *existential* truth, his psychological truth. Conversely, I might go so far as to say that the ideal philosopher is a well-rounded person, simply because philosophical insights can be gained from living life to the fullest. Nietzsche would have been a better thinker had he experienced a woman’s love; he might then have softened the exaggerated elements of his philosophy, and in any case he would have had a more comprehensive outlook on life. Hegel would have been a better philosopher had he been more sympathetic to Newtonian physics, that is, to *science* (as opposed to the pseudo-science that mars the *Phenomenology* and his later works). –In general, the breadth and depth of philosophy, and its universality (across cultures) as well as its life-affirmative character, suggest that philosophers should aim to be the vanguard of humanity, of its potential. They should ‘lead the way’; they are most qualified to, and their vocation demands that they do.

But if, in pursuing this ideal of philosophy, one finds oneself becoming stunted from too much thought, my advice is to temporarily, or even permanently, resist the lure of ‘philosophical truth’ and reform one’s ways. If immersion in analytic philosophy becomes dehumanizing, one should take a break from it. Take up poetry or music or sports, or something else. Self-realization, self-affirmation, is, as I see it, perhaps the foremost imperative in life; not even the search for knowledge trumps it. Should the two ever conflict, the first has priority over the second. For knowledge is not an end in itself. It has value only insofar as it affirms one’s humanity, either directly or indirectly (as in the beneficial practical effects of science). Nietzsche was right that truth is not intrinsically valuable, and that treating it so can be dangerous. What beauty would there be in life if everyone devoted himself at all times to dry *understanding*? How could we *affirm life* in such circumstances? What a desolate thing it would be! To have an appetite for knowledge you have to be willing once in a while to live in ignorance.

But insofar as you remain a philosopher, you should follow the twin imperatives to *subvert* and to *integrate*. Or, in blander language: analyze and synthesize. (I prefer ‘subvert’ and ‘integrate’, though.) Philosophy ought to *engage with society* rather than imprison itself in an ivory tower. It ought to be readable and compelling, not boring and unambitious—and Lewisianly perverse. If you find yourself getting lost in endless technicalities—or getting bored to tears—then you’re probably approaching the question wrong.

Indeed, that’s how I monitor myself and my arguments when doing philosophy. If I’m getting overwhelmed in the complexities of a thought I’m pursuing (or if I find an idea totally uninteresting), then I decide the thought is probably wrong. Ockham’s razor, after all. The simpler, the better. “The essence of philosophy is the spirit of simplicity.” At such times I take a break from thinking about the problem and

¹ *The Gay Science*, translated by Walter Kaufmann, §366.

then return to it later with a fresh mind. But instead of plunging right back into the argument, I revert to *intuition*. I sit back, spend hours *imagining* the problem—trying to ‘picture’ it—non-discursively approaching it from various angles, until suddenly a ‘picture’ of the solution hits me. I can’t really describe the process, but the intuition itself is always very simple. Then I embellish it in arguments. When, again, I lose my way in the arguments, I sit back for a while or pace the room while waiting for a new intuition that will show me the way out of the muddle. At such moments I know I’m doing philosophy—I can *feel* the philosophy. It’s when I get lost in tedious ratiocination that I realize I’ve ceased philosophizing for ‘sophisticizing’ (for lack of a better word).

For example, one of the ways I know that traditional and contemporary approaches to ontology are wrong is that they all lead to casuistry—over-subtleties, debates about such abstruse concepts as “uninstantiated universals” and “Lewisian possible worlds”. The correct approach will *cut through* all the shit, the centuries of verbiage; it won’t argue with it on its own level. (The later Wittgenstein understood this, but the sloppiness of his thinking handicapped him.) It will explain the *deeper sources* of the confusion—therapeutically, as it were. The linguistic or the phenomenological sources. Ontological questions like “Do properties exist, and if so, in what sense?”, or “Do numbers exist? What are they?”, are fundamentally misguided. They are hardly even real questions, as I hope to explain in volume two of this book.

This is the sort of circumstance in which Wittgenstein-esque therapy is valuable. Insofar as one has to separate the substantive questions from the word games, Wittgenstein’s project of “showing the fly the way out of the fly-bottle” is a genuinely philosophical project. His “ordinary language” approach has value, not only as a corrective to academic technicalities but especially because the emphasis on our ordinary use of language is a promising way to illuminate the intuitive conflicts and cognitive dissonance that give rise to many philosophical (particularly metaphysical) questions. Especially in this age, this crisis of philosophy, brutally honest therapy is necessary. We have to reinvigorate philosophy, make it an existential and vital activity again. But this involves not only cutting the dead wood from the live; it also entails making philosophy relevant to society. We have to show how ethics can settle concrete doubts about life, and how the death of religion is not the death of values. We have to engage with politics through Marxism and other theories of history. We have to make *action* philosophical. Philosophy, after all, grows out of social conditions; it’s only natural that it should also contribute to them.

Social activism, if justified philosophically/‘scientifically’, is itself a form of philosophy, for it is emancipation. It is the *real-ization of understanding*. Or, at least, we ought to think of it that way. Plato did. He wanted a Philosopher-King! Like Marx, he wanted to unite theory with praxis. Why do we ignore his vision? If we’re going to call ourselves philosophers, we ought to *do philosophy*. *Actualize* it. We ought to take up arms against ignorance, like Richard Dawkins and Noam Chomsky; we ought to fight all bigotry and conservatism. If we have the talent, we ought to go into politics—subvert the system by means of the system. “To ruthlessly criticize everything existing!”¹ is the philosopher’s creed. Apathy, complacency, is philosophical treason.

In a civilization that has become fragmented into a thousand ideologies and is in danger of perishing someday in a nuclear holocaust, perceptive critical analysis—translated into activism—is imperative. Not only is it not ‘obsolete’, as the postmodernist would have it; it is essential. But we need thinkers with the talent to synthesize—to overcome specialization—and the passion to *act*. Thinkers who aren’t seduced by the academic love of technicalities and discursiveness into thinking that truth is unknowable or that it has to be expressed in a technical and obscure way. In fact, whatever is worth saying can always be said fairly clearly. We need people who can unite the erstwhile ambitiousness of European thought with the analytical carefulness of Anglo-American thought. Otherwise philosophy—and probably the social sciences in general—*will* become obsolete, and the grand tradition will disintegrate in the nihilism of a Kenneth Gergen.

¹ That was the motto of the early Marx.

I'm only sketching a vision here. I can't go into details, since this book is aimed at the public rather than merely the academy. [?!] My purpose in this volume is not to 'explain the world' but only to remind people (including myself), in my inadequate way, of old ideals, ideals that are on the defensive now that capitalism is at its zenith. Truth, creativity, love, poetry, music, community, etc., all of which have been corrupted through commercialism and the culture it has spawned. The only way to bring them back—to overcome the atomization and bureaucratization of life—is to understand the dynamics of society and to manipulate social progress along an enlightened path. Not to *obstruct* it, as conservatives would do, but to push it even harder to realize its potential. Especially its economic potential. Marx was the first to see the possibilities unleashed by capitalism, the productive possibilities, which are (or will be) the basis for amazing cultural opportunities...

[An epigram I was going to put somewhere at the end of all this: *To alienate an alienated world is just to be human.*]

Brief reflections on historical consciousness

The most dangerous kind of amnesia.— The faster that society evolves, the shorter is its collective memory.

Anyone who keeps pace with the march of history knows that, in America, time has stopped. Historical time, that is. And since America is where the rest of the world is headed, time has effectively stopped for the entire world. We have lost the consciousness that we're a part of history. Instead, we're intensely focused on the moment, on what's happening *today*—and tomorrow we forget what happened yesterday. Ironically, it's partially because life proceeds with unprecedented speed that we seem forever stuck in one moment, poised on the edge of time. The incessant bombardment of images, of factoids, of advertisements, of new technologies, of sexual innuendo, of synthesized music and constant noise, all combines to foster a timeless surreality, a suspension of cultural memory and the sense of continuity with the past and future. It doesn't even seem like there *will be* a future: all that will ever exist exists right now, in some sense. Cultural evolution has come to a standstill. In an 'abstract' way we do know that new inventions will arise, that cloning and genetic engineering will be perfected, that wars will always occur and capitalism will spread and pseudo-democracy will follow (eventually), and maybe one day we'll experience something like the *Terminator* scenario, but this knowledge is dry and bloodless, so to speak. It's something we're able to *tell* ourselves simply because, despite the best efforts of the Establishment, human rationality cannot be wiped out. On an intellectual level we know that history won't end until it ends (which it won't for thousands, probably millions, of years), but *intuitively* we don't believe this. We *live* as if history is effectively over. 'How could history go on much longer?! What more can be done?! We've done everything! All that's left is scientific progress, continued globalization, and war.' Just look at our culture's cynicism; look at shows like *The Daily Show*. I remember a clip was played once of Bush saying that Social Security would be bankrupt by 2048 (or whenever); Jon looked incredulous and said, "2048?! That's like, generations from now! Everyone knows the world will be over by then!" (Paraphrase.) The audience laughed because they knew the sentiment was absurd and yet sympathized with it.

More keenly than at any time in the past, we feel as if everything is transient. Nothing lasts, especially in a world of terrorism and nuclear proliferation. Even fame, or any kind of individual immortality, is pointless. Thus arises despair:

Under the present dispensation, human mortality has acquired an entirely new meaning—it is only today that its ultimate horror is brought home to us. To be sure, even previously

no one was exempt from mortality; but everyone regarded himself as mortal within a larger whole, the human world; and while no one ever explicitly ascribed immortality to the latter, the threat of its mortality stared no one in the face either. Only because there was such a “space” within which one died, could there arise that peculiar aspiration to give the lie to one’s mortality through the acquisition of fame.... Today our fear of death is extended to all of mankind; and if mankind were to perish leaving no memory in any being, engulfing all existence in darkness, no empire will have existed, no idea, no struggle, no love, no pain, no hope, no comfort, no sacrifice—everything will have been in vain, and there would be only that which had *been*, and nothing else.¹

While most of us do not think that mankind will become extinct any time soon, the possibility, at least, is real. But our knowledge of this possibility is merely an aggravating factor in our malaise. Perhaps more important is our atomization as such. Christopher Lasch recognizes that this proceeds not so much from the sense of impending catastrophe as from the structure of society itself.

To live for the moment is the prevailing passion—to live for yourself, not for your predecessors or posterity. We are fast losing the sense of historical continuity, the sense of belonging to a succession of generations originating in the past and stretching into the future.The ‘worldview emerging among us’, writes Peter Marin, centers “solely on the self” and has “individual survival as its sole good”. In an attempt to identify the peculiar features of contemporary religiosity, Tom Wolfe notes that “most people, historically, have *not* lived their lives as if thinking, ‘I have only one life to live’. Instead they have lived as if they are living their ancestors’ lives and their offsprings’ lives....”²

The contemporary illness is virtually unique in history (although something like it may have been experienced in Greece during the Hellenistic period and in Italy near the end of the Roman empire).

Remember Francis Fukuyama’s unjustly famous article “The End of History?” (1989)? Liberal democracy, he suggested, is the last ideology. The final form of government. Progress can still occur only in implementing the principles on which it is based, namely liberty and equality. The principles themselves are the endpoint of ideological development. I think this idea is simplistic, and I’ll explain why later, but right now I want to point out how obviously correct it seems to most of us. In this respect, we think cultural evolution has stopped. But there are other respects too. In literature, for example. Insofar as literature is still taken seriously at all, we think that the only thing left is to continue experimenting with old forms—with free verse, occasionally with traditional forms like blank verse or sonnets or whatever, maybe integrating them in new ways; expanding or attenuating the novel and short story, trying new variations (à la D. F. Wallace); perhaps more writing in the vein of Hunter S. Thompson. Or painting and sculpture—what remains in these forms? More minimalism, more graphic design? A return to austere Renaissance techniques as a reaction against technological sophistication? (I have a vision of some guy painting the ceiling of a new city hall, determined to be the next Michelangelo.) And what of music? More Britney Spearsian crap for a while, more hip-hop, probably attempts to unite the musical styles of various cultures (such as already exist in East Asian pop music), probably many resurgences of techno. Classical music will tire of minimalism—though never completely—and composers will, perhaps, seek a return to old styles. (Billy Joel, for instance, has tried this.) But that’ll go nowhere. And what about the wonderful world of *fashion*? More of the same. Maybe we’ll try mass nudity, as the earth heats from global warming. I suspect that cultural confusion—e.g., the coexistence of primitive and sophisticated, of conservative- and liberal-minded, of religious and secular—will keep increasing until finally our problems are temporarily solved in the mass destruction of a nuclear war.

¹ Gunther Anders, “Reflections on the H-Bomb”, in *Man Alone: Alienation in Modern Society*, edited by Eric and Mary Josephson (New York: Dell Publishing Co., 1962), pp. 291, 292.

² Christopher Lasch, op. cit., pp. 5, 6, 7.

My point is that whatever happens will be—so we think—merely an extension of the present. Our ‘collective consciousness’ won’t undergo major changes; it is no longer naïve enough to have much *room* to change. We’ve become too sophisticated for our own good. —So, in short: *this is it!* This is the end of history! We’ve made it to the end! Congratulations!

But that’s ridiculous. If common sense is right that some of us will persevere through whatever suicidal ventures mankind undertakes, our species probably has millions of years to go. Which means we’re still in our prehistory! Thousands of years from now, our descendants will look back on us and shake their heads in nostalgia. “How simple life must have been back then!” But *their* descendants will say the same about *them*. These time-spans are hard to fathom, but, after all, we easily forget that mankind has already existed for hundreds of thousands of years. What we call “history”—the last five thousand years—has been ludicrously short, barely a *blip*.

Most theorists who have noted our lack of historical perspective (i.e., of an awareness of historical continuity) have, like me, attributed it ultimately to technological advances occurring in the social framework of late capitalism. That’s sort of truistic, though. Uninformative. What are the *social mechanisms* that allow technological/economic progress to have this deleterious effect? I think they revolve around the fragmentation of communities caused by economic progress. Such progress has made the individual increasingly autonomous, increasingly house-bound, since he has everything he needs at his fingertips. Television and video games provide him with entertainment; the news provides him with information from the outside world; the internet provides him with a virtual community and an infinite number of commodities. Even if he spends much of his time with people (his coworkers, friends, family), he is still isolated from the “community”—for the relevant community has, in an era of globalization, become the entire world. People know that they live in an intricately interdependent world, that what happens in Asia can immediately affect what happens in America; their perspectives on life are thus ‘broader’ than ever before. The immediate community has lost its primordial importance. Whereas the individual’s consciousness was once closely identified with that of the group—the tribe, the clan, the village—such that he lived *in* and *through* the group, and the group’s past was his past, and there was nothing outside this group except a vast inhuman world, the modern individual really has no ‘groups’ to identify himself with. His desire to so identify himself is evident in the continued popularity of religion despite the fact that economic conditions have superseded it. Nationalism and patriotism are other manifestations of the desire for community. But, as Marx saw, all these movements are at bottom reactions—ultimately futile ones—against a basic fact of life in capitalism, viz. that communal ties are dissolved by the imperative to accrue profits and the constant accumulation of capital. In the long run, all else is subservient to this accumulation.

People still join communities all the time (church groups, neighborhood groups), and fanatics still submerge their identities in collective movements, but nothing any longer provides the psychological security that our Paleolithic ancestors derived from their little groups. This is what we seek, and this is what we will not find. A ‘community’ in the truest sense is something that one wholly belongs to, that circumscribes the boundaries of one’s life and consciousness, such that nothing outside it is considered relevant to oneself. In a real community, one is saturated with all the affection and security one needs. And one identifies with the community so completely that it isn’t seen as having much of a history outside one’s own history. This is the extreme of historical continuity—of the sense of connection with the past and future. One’s horizons are so limited that ‘the past’ and ‘the future’ are effectively just the past and future of oneself and one’s kin. This fact also presupposes the extreme slowness of historical evolution: millennia pass without major changes in the conditions of life. The world is perceived as static; historical knowledge is limited to vague myths and traditions handed down.

The other extreme is what we approximate in late capitalism: social atomization. The “communities” in which people live have more in common with mere aggregates than with communities in the original sense. People live near each other but not *with* each other. Social life is organized around the nuclear family: most things social are filtered through the family. All else is relatively artificial. Apart from the family, people are forced to *act*, to put on social masks and subtly change their personalities depending on who they’re with.

The real picture is of course complicated. Many people feel more comfortable with friends and acquaintances than with their family. Likewise, the individualism of the culture infects the family situation, so that people feel compelled to ‘act’ with their family members, as with their acquaintances. I’ll return to all this in volume two. What matters now is that ultimately the individual is thrown onto his own resources, such that, while the nuclear family is the basic unit of society, the individual is nonetheless atomized even in the family. He may come to feel ‘alienated’ from his parents or siblings—‘different’ from them. Being with them is no longer very rewarding. He seeks solace in video games, television and the internet, which serve to increase his atomization (alienation). Thus ensues a self-reinforcing cycle of communal alienation.

The sense of separation from the immediate community results in disconnectedness from the past and future. For the community’s past does not feel like one’s own past, nor the future like one’s own future. It is a foreign thing, something that one observes or anticipates but does not take part in. One is forever an outsider to the community and its history. Indeed, as I said above, the *real* ‘community’ has become the entire world, i.e., a vast, abstract Other, a gigantic impersonal thing with its own impenetrable internal logic. This is to say that the community is no longer a human one, a transparent organization of particular people full of ‘fellow-feeling’ for each other, but an inhuman one, associated with an intricate global economic logic that governs people’s lives. The past and the future are of *this thing*, this collective abstract thing (which we might call, somewhat misleadingly, ‘mankind’, or ‘society’); they are therefore perceived as detached, impersonal, inhuman. In other words, they are reified, treated as strange external objects—external to the individual. And the future never comes to pass; it is always something beyond the present, beyond experience. Experience is one long present (in a non-truistic sense)—the same thing again and again, an unchanging, monotonous present.

The phenomenon of ‘reification’ is an important, and underappreciated, component in the problem. Karl Marx formulated the idea in *Capital*, in the section on commodity fetishism; it was later taken up and embellished by such thinkers as Georg Lukács (in *History and Class Consciousness*) and I. I. Rubin (in *Essays on Marx’s Theory of Value*), who recognized it as a brilliant and immensely fruitful tool of both social and economic analysis. Right now I’m interested in its sociological aspect.

First, though, I have to describe its economic meaning.— Any economist knows that a commodity has two aspects: its use-value (its utility for the consumer) and its exchange-value (the price it commands). Marx points out that, as a use-value, the commodity is something natural and particular, concrete, while as an exchange-value it is purely the proportion of goods it can be exchanged for. It ‘embodies’ this proportion, so to speak; it is an abstract thing, a quantity, and as such is qualitatively equal to every other commodity. In this sense, commodities are abstract and comparable with each other; as use-values, though, they are just themselves, i.e., their manifold concreteness. They therefore have a dual phenomenology: they can be experienced as themselves, as things that were produced to have a specific *telos* and with whose natural properties one interacts, or they can be experienced as ‘alienated’ from their utility-essence, by being viewed as a mere quantity of value. This second, alienated, aspect is the form they take in the marketplace.

The exchange-values of commodities appear to the consumer to be objective, “socio-natural” properties of the things themselves. Thus, commodities, as exchange-values, seem to take on a life of their own: price-movements are mysterious objective facts, things that just ‘happen’—spontaneously, as it were—determined by forces outside people’s control, by mysterious interactions between the things themselves when they enter the market. Exchange-relations between commodities confront the producer and the capitalist, and the seller and the buyer, as brute facts, impersonal and seemingly inexplicable. In reality, of course, exchange-relations are in no sense properties of the things themselves; they do not exist outside social relations, as appears to be the case, but rather *express* them. Exchange-values are really expressions of relations between individuals—between producers and other producers, capitalists and other capitalists, producers and capitalists, etc. Movements of prices, which are determined by the fluctuations of supply and demand, serve to allocate social labor, by providing economic agents with information they need to make economic decisions. For example, when the demand for a product increases, its price will rise because selling that product has become more profitable. At the same time, the seller will demand more of the product from its manufacturers (so as to sell more of it and make a higher profit), who will therefore move proportionately more labor into its production than into the production of other goods (because they

can make a higher profit by increasing its production). Hence, in the economy as a whole, a change takes place in the allocation of labor. The higher price of the product expresses the higher value of the labor that goes into producing it—that is, the now-greater social necessity of employing labor in production of this particular commodity. So its price is basically a monetary expression of the changed relation between spheres of labor, and between individual laborers, even though it *seems* to express only a relation between things themselves.

Incidentally, most of the time-worn criticisms of Marx's labor theory of value rest on misunderstandings. Marx's purpose was to explain how labor gets allocated in a capitalist society; the "labor theory of value" grows out of the understanding that the price-mechanism is the primary instrument by means of which social labor is apportioned between industries and between areas of a particular industry.

Anyway, the point is that relations between people are, in capitalism, reified into relations between things. And these thing-like relations are seemingly subject to their own laws of movement. The result is that "a man's activity becomes estranged from himself, it turns into a commodity which, subject to the nonhuman objectivity of the natural laws of society, must go its own way independently of man just like any consumer article".¹ Social activity in general develops more and more this alienated character, this appearance of being determined by strange forces outside the individual's control. One can't find a job in a certain sector, so one has to enter another until something happens and one gets laid-off, etc. etc.; relations between friends and family members are conditioned by the impersonal functioning of the economy, and one feels increasingly like a cog. One is compelled to take jobs one doesn't want; one desires, and takes advantage of opportunities for, mindless enjoyment and release from the unpleasant "realm of necessity" (hence the love of video-games, television, the internet); and one's relationships become increasingly dysfunctional. Ultimately, "just as the capitalist system continuously produces and reproduces itself economically on higher levels, the structure of reification progressively sinks more deeply, more fatefully and more definitively into the consciousness of man",² such that life becomes more stressful, more mysterious, more dehumanized and atomistic. It comes to be dominated by the half-conscious perception of a vast impersonal Other which gets associated in one's mind with the faceless strangers he sees, with the company he works for, with his boss, with his dissatisfaction and his unfulfilled desire for recognition (for freedom). One develops an amorphous hostility, sort of an indiscriminate distrust—epitomized in the hard "fuck you" attitude exhibited by New Yorkers in the street—which colors his relationships with people.

Money is the symbol and the *sine qua non* of all this reification and atomization. It gets between people, between social relations; it 'lubricates' them, so to speak, and makes them possible; everything gets translated into monetary terms (e.g., "Time is money"), such that the individual cannot take up his life into himself, as purely *his own*, something that is one with him, but rather treats it more and more as he treats money, namely as something that opposes him, as a *thing* that he doesn't really understand. It *confronts* him; he has to *conquer* it (lest it conquer him), which is to say that he has to struggle to make it his own. And in doing so he tends to adopt the acquisitive attitude, because money is both the threat and the promise, the thing that oppresses him but can liberate him, which symbolizes and is the meaning of life's present otherness from him but can potentially signify his appropriation of (his) life. For by acquiring money, he acquires the power to make things his own, to attain power over the world and force people to 'recognize' him. Unfortunately, he finds that this recognition is not satisfying, for it is not a recognition of him himself but only of his economic power. Therefore, the wealthy person comes to feel alienated from people and himself (i.e., his sense of who he is or wants to be)—perhaps even more so than the poor person, who at least knows that the people who love him love him for himself and not for his power over them or as a means to an end. —Acquisitiveness is the truly alienated and quintessentially capitalist attitude toward life, which fetishizes mere *things* and devalues human relationships, including the self's relationship with itself. The more acquisitive we are, the less human we are; and an acquisitive society is not a human one.

So, in short, just by virtue of the economic laws of motion of capitalism, people develop the perception of being pushed and pulled and harassed by nothing in particular—by some invisible incubus

¹ Georg Lukács, *History and Class Consciousness* (Cambridge, Massachusetts, 1971), p. 87.

² *Ibid.*, p. 93.

pressing down on everyone—although features of life peculiar to late capitalism have aggravated the perception. This fabrication of an abstract ‘Other’, manifested in numerous ways (e.g., in our awareness of mankind as a vast aggregate and our corresponding awareness of the littleness of ourselves), proceeds apace with communal disintegration, such that neither is possible without the other.

Incidentally, a particularly telling manifestation of reification (atomization) is the common use of the word ‘they’ to refer to some mysterious social entity that has power over oneself. For instance, someone might say to his friend, “If you don’t pay your taxes, they’ll catch you and send you to prison”. Who are ‘they’? ‘They’ are the Other, the impersonal system which is associated with politicians and all authority-figures, and which is constantly coming between the individual and himself—his self-expression, his life, his relationships, the fulfillment of his desire for recognition and freedom. ‘They’ will do this, they will do that; they are a constant threat, something breathing down your neck, waiting to punish you, watching you wherever you go and whatever you do, like Foucault’s “Panopticon”—to the extent that they are internalized, such that the individual is incessantly watching himself, feeling separated from himself and his acts. But ‘they’ are not really concrete *people*; they are the structure of society itself, which compels one to act along narrowly conformist paths and is always ready to punish transgressions. ‘They’ are economic imperatives, bureaucratic dictates, ideological and legal institutions, the media, social mores, most of which disrupt spontaneous communal life and propagate anxiety. Consistent with Marx’s analysis, all these things—these concepts and habits and institutions—are “personified”, becoming a ‘*they*’, i.e., something with a will and intelligence and evidently a deep-seated maliciousness, while people themselves are reified into mere numbers, statistics, objects, obstacles that have to be overcome or irrational things that have to be placated.

Capitalism’s laws include not only commodity reification, with everything it directly and indirectly gives rise to, but also incessant *change*, an incredible dynamism that comes to permeate life itself. Of economic necessity, the means of production are constantly being revolutionized, along with the material conditions of life. Contemporary society exhibits this dynamism more completely than any in the past. The result, I have said, which is also the result of reification as such, is an impoverished sense of historical time.¹

It’s ironic, but dialectically predictable, that the phenomenology of the ancient community and the modern anti-community are in this respect similar: life is static, history is static. The present is always just itself, just the same dreary present. And this despite (or rather, (partially) because of) the incredible speed at which modern civilization evolves! Change is so prevalent that it ceases to be change; it is the norm. Life is a blur of scientific change, technological change, political change, cultural change. Every day brings new changes. And so, paradoxically, nothing really changes. *Real* change won’t happen until the incessant change stops—until, that is, some kind of cataclysm grinds the gears of globalization to a halt, or else man seizes the reins of social progress in his own hands and consciously determines the direction of history. (The former event might be a prelude to the latter.)

To sum up: Historical consciousness (in the way I’m using the word) is virtually perfect in the Paleolithic community: the past, present and future are barely distinguished in the mind of the individual, since change (‘history’) is virtually nonexistent. Life is an indiscriminate melding of past, present and future, for there *is* no past in any meaningful sense, nor will there be a meaningful future; there is just *sameness*, universal homogeneity. Homogeneity between oneself and other people, between the community and nature, between man and animal. Man is barely self-conscious [especially not as an *individual*].²

¹ Alexis de Tocqueville already observed (in the mid-1800s) that Americans were disconnected from history. “The woof of time is every instant broken and the track of generations effaced. Those who went before are soon forgotten; of those who will come after, no one has any idea: the interest of man is confined to those in close propinquity to himself.” Quoted in Lasch, *op. cit.*, p. 9. American capitalism then was in some respects more ‘pure’ than even that of England.

² Even as late as Cro-Magnon times (about 40,000 years ago) he was relatively un-self-conscious, at least judging by his art. His cave paintings were of buffalo, deer and other animals rather than of human beings, suggesting that he didn’t clearly differentiate himself from animals. He was focused more on them than on himself, unlike modern man,

Modern man, on the other hand, is exquisitely self-conscious, in two ways: the individual is intensely preoccupied with himself, and an unprecedented number of people are also preoccupied with the situation of the species as a whole. An indirect cause of this self-consciousness, I have suggested—as well as a symptom of it—is the disintegration of the community that has proceeded steadily since the end of feudalism. (Of course, the community in the original, complete sense disintegrated with the onset of agriculture, i.e., the Neolithic age.) In the community's place has arisen the awareness of an abstract Other called 'mankind'; and it is *this thing* that has become the subject of history. History is no longer something that happens to one's immediate community; it happens to something so vast that one is scarcely a part of it. One participates neither in history nor in the community of which it is a history; one is an outsider observing history, looking back on it and looking forward to it.

Between the two extremes (the Paleolithic and the modern) are varying degrees of cultural self-consciousness. Thirty thousand years ago, the collective consciousness (that is, the consciousnesses of individuals insofar as they tended to share thoughts and dispositions) was closer to that of Paleolithic man; two thousand years ago in Greece it was closer to that of modern man. Five hundred years earlier, though, Greek consciousness would have been less easily assimilable to our own. For as Hegel said, Archaic and Classical Greece (up to, say, 400 B.C.) existed in the happy medium between an undifferentiated communal whole, in which the individual is so submerged in the collective that he lacks an independent identity, and the extreme self-consciousness of modernity. Athenian self-consciousness was 'naïve': people were aware of the separation between nature and civilization, between the individual and the community, but they were not nearly as fixated on it as we moderns are. Nevertheless, their state of mind was obviously closer to our own than to that of Cro-Magnon man.

In this context it's interesting to read the essay *On Naïve and Sentimental Poetry*, by Friedrich Schiller, the German poet. He argues there that the ideal life—as well as the ideal *society*—consists in a fusion of 'simplicity' and 'sentimentality', i.e., unreflectiveness and self-consciousness, spontaneity and premeditation, classicism and romanticism. Both individuals and historical epochs are dominated by one or the other of these tendencies. Archaic and Classical Greece, up until (approximately) the time of Sophocles and Euripides,¹ was dominated—so Schiller thinks—by simplicity, 'immediate experience', the unreflective unity of the individual with the community and the community with nature; the Europe of Schiller's time was dominated by self-consciousness, the divisions between the individual and the community as well as the community and nature. I might add that, according to Schiller's schema, 'simple' cultures would probably include India at the time of the Vedas, the society that produced the earlier books of the Old Testament, and the society in which *Beowulf* was written. Self-conscious cultures would include Greece in the age after Alexander, Rome during and after the demise of the Republic, and China during the T'ang dynasty (judging by the sentimental poetry of Li Po).

My reason for mentioning Schiller is that his ideas illustrate my own. While I disagree with their details, as well as his conception of Greece—I think Hegel's was more realistic (namely, that Greece was neither 'simple' nor 'sentimental', but somewhere in between)—his basic intuition was similar to mine. Various cultures, like individuals, exhibit various degrees of self-consciousness. Their literature provides excellent clues about their collective state of mind. I am extending Schiller's argument to illustrate the disjunction between self-consciousness and the sense of historical time. Because the Greeks were more self-conscious than earlier societies, Herodotus was able to become the first self-conscious historian. Like his contemporaries, he was less immersed in historical continuity than, say, the Sumerians had been; he was aware of the immediate past as such, as having led to a different present, and he wanted to understand what the *human-centered* causes of recent historical events were. After him came more scientific historians like Thucydides, who did not invoke gods and myths as valid historical explanations, which Herodotus had still occasionally done, but concentrated exclusively on human agents. These scientific, secular historians

who has posited an unbridgeable gulf between the human and the natural worlds and is decidedly more fixated on the human.

¹ Even with Euripides, though, it was succumbing to sentimentality.

were, like Herodotus before them, made possible by the individual's ever-increasing awareness of his separation from the immediate past—an awareness due to the evolving trade, the increased pace of life, Athens' evolving cosmopolitanism, etc. Indeed, we may make the rough generalization that the more historians (per capita) a society has, the more alien does its collective consciousness feel to its immediate past (measured in years, not centuries), and the more quickly is historical evolution proceeding.¹

The deterioration in the individual's sense of continuity with the past has proceeded, with many interruptions and regressions, from Neolithic times to our own day, in which there is virtually no continuity at all. This isn't to say, though, that our collective consciousness is constantly *changing*—that our national 'mood' changes frequently, from, say, optimism to fear to cynicism. It doesn't. Even 9/11 didn't cause a major change in our consciousness. The brief national unity and anger it caused didn't amount to anything, except ultimately a rise in cynicism. (I remember pundits predicting the "death of irony" and the "death of satire" as a result of the attack. Such myopia has always amazed me.) By 'lack of continuity' I mean only that our collective consciousness is defined by *immediacy*, a focus on the moment, an alienation from the past. It is defined by temporal and interpersonal fragmentation.

There will, of course, always be at least a 'predetermined' minimum of historical continuity in any collective consciousness; otherwise societal functioning would be impossible. Societies will never become totally amnesiac. Indeed, I think that our state of mind in these initial decades of the twenty-first century will be more or less as 'historically disconnected' as is humanly possible. It doesn't seem likely, after all, that any culture will ever evolve much more quickly than ours is evolving. These decades right now are, on a global scale especially, the fastest in history. Different 'social structures' around the world are growing and deteriorating with unprecedented speed.

My year-long visit to South Korea was illuminating in this context. I was 23, that is, too young and stupid to do much research on where I was going. So I ended up in Daegu, the most conservative city in a culturally conservative country. Not a soul spoke English there, but that's another story. (A somewhat bitter one.) The point is that I found Korean culture to be in many ways at the stage of the U.S. in the '50s. I'll quote the relevant journal entry:

....Examples of the '50s-ish culture: the popular phenomenon of obnoxious, insipid slapstick comedies that have characters with whom it's impossible to sympathize; the explicit social ideal of the cute, innocent, childlike woman whose purpose in life is to be an ornament (although this stereotype is changing); the cautiousness and slowness of dating (often it takes two months before a couple will even kiss!); the immaturity of popular music; the ubiquity of cultural optimism. Traits are strikingly consistent across regions and individuals. There is, for example, a broadly 'Korean' sense of humor: slapstick, silliness, good-natured joshing, as opposed to sarcasm. Most Koreans find sarcasm rude. People enjoy more or less the same kinds of music, namely poppish crap like Justin Timberlake and Britney Spears and high-pitched girly singing—though they also like Eminem, probably because they don't know what he's talking about. There are fewer fads in Korea than in America: styles and tastes remain basically the same from year to year. *Subtle* changes only. The cultural homogeneity is remarkable.

It's truly exciting to observe the paths that collective consciousness follows, which in their broad strokes seem preordained because countries developing at different speeds nonetheless experience the same progression from unsophistication to a more nuanced and critical understanding of the world, which may include an increase in forms of activism, and then to cynicism and apathy, which may be punctuated by outbursts of fanaticism that are actually manifestations of lostness and despair. On one side of the Pacific is the

¹ By 'historical evolution' I mean roughly the increase or the decrease in the complexity of a social structure—i.e., in the intricacy of its interrelations, the interdependence of its actors. This definition applies both to Classical Athens, with its creative advances, and to the collapse of the Roman Empire, with its deterioration in the byzantine social structure of Rome.

interaction of a basically primitive collective consciousness with modern conditions and ultramodern consciousness—which (interaction) is of interest in its own right—while on the other side is the future of this society, more or less. The past and the future coexist, united by the similarity in material conditions and the trappings of government but essentially at different historical stages—which makes genuine cultural understanding between them difficult. They have completely different outlooks on the world.

In the coming years, the differences will narrow. There will be a fairly clear thread of Korean cultural evolution—musical, literary, cinematic, political. People’s senses of humor will become more sarcastic as they themselves become more jaded. Women will become more promiscuous and more self-confident. Music will grow in sophistication. Political activism will increase. The reason it’s possible to make such predictions—as it isn’t possible in the United States—is that Korea’s collective consciousness has not yet reached the stage of heterogeneity. Which is a virtually inevitable stage. Every substantial culture (provided it isn’t destroyed by invaders) progresses from homogeneity to heterogeneity, from community to fragmentation. Schiller’s “simplicity” characterizes the former, his “sentimentality” the latter. This explains Korean optimism and naïvete: the community is still relatively intact, so people still receive the recognition, the affection, they desire as human beings. They are less insecure than we Americans, hence less cynical, less bored. As they become Americanized, they can look forward to these feelings.

Why do societies tend to progress in this manner, from homogeneity to heterogeneity? Because of the nature of technological and economic progress. Every society tries to attain power over nature; some are more successful than others. Insofar as they’re successful, communal integration deteriorates (because the division of labor [and marketization, privatization] intensifies), which has a variety of effects. For example, the ideology of individualism tends to be emphasized; the individual becomes increasingly insecure about his place in society and the cosmos; societal evolution proceeds faster; the past and future seem increasingly alien to the society’s collective consciousness. That all these effects are exceptionally predominant in our own culture is consistent with the facts that technological development and communal disintegration are greater than ever.

In the chapters on the self and the community I’ll go into greater detail, making use, for example, of Émile Durkheim’s distinction between mechanical and organic solidarity. I’ll also go into greater depth with respect to the theory of reification, to make it more precise and general. (I don’t think it applies only to capitalism, though its extreme manifestation has been reached in this society.) I want to conclude these brief reflections with remarks on the Fukuyaman belief that we have in some sense reached the end of history—specifically, of ideological development.

Fukuyama’s aforementioned article is in fact an amateurish and crude elaboration of what has been a crude popular opinion since the 19th century, namely that capitalism and liberal democracy are the most “natural” way of organizing society, the best way and the final way, the endpoint of historical development. Marx was already criticizing such ideas in the 1840s. Fukuyama’s position, far from being original, is barely even derivative. It’s just a pseudo-philosophical formulation of our culture’s conventional wisdom. But since most of us implicitly adhere to it, I’d like to explain its absurdity.

Writes Fukuyama (in 1989):

What we may be witnessing is not just the end of the Cold War, or the passing of a particular period of post-war history, but the end of history as such: that is, the end point of mankind’s ideological evolution and the universalization of Western liberal democracy as the final form of human government. This is not to say that there will no longer be events to fill the pages of *Foreign Affairs*’s yearly summaries of international relations, for the victory of liberalism has occurred primarily in the realm of ideas or consciousness and is as yet incomplete in the real or material world. But there are powerful reasons for believing that it is the ideal that will govern the material world in the long run.

It is somewhat embarrassing that, so long after the Marxian critique of bourgeois “rights”, and the Durkheimian critique of “liberty” (as promoting anomie, lostness), and books like Robert Paul Wolff’s essay *The Poverty of Liberalism* (1968), someone like Francis Fukuyama can still make a name for himself defending liberalism without even mentioning its repeatedly criticized contradictions and inadequacies. Evidently academia, like the larger culture of which it is a part, has a very short historical memory.

Ancient Greek intellectuals thought that Athens embodied the highest principles of justice. In his wars, Alexander was, they thought, spreading the final achievements of culture and ideology to the world, namely democracy and freedom—liberating the Persians and Indians from despotism. Romans thought that their empire was the endpoint of historical development, for not only had it united much of the known world, but it was organized around sophisticated (and modern) principles of law and civic order, beyond which no advance was conceivable. Feudal lords and serfs could not even fathom the possibility that their society and ideology were merely a stage of history, something that would pass away, as opposed to the ideal and natural way of organizing civilization. No one in the year 1200 could have imagined capitalism. Florentines during the Renaissance thought of their democracy as the pinnacle of historical evolution, of freedom and culture.

Is it surprising, then, that people have for two centuries thought of capitalism and liberal democracy as natural, permanent and perfectly just? Every culture has thought that its way of life is the best, the “end point of mankind’s ideological evolution”. Material and social conditions circumscribe the boundaries of a society’s consciousness; substantial advances beyond concrete conditions seem inconceivable. People literally have trouble imagining what form a future society would take, and so they think that nothing is possible beyond their own. But history has proven that the possible is not limited by the conceivable.

Liberal democracy is just the old Greek, Roman, German, Florentine, etc. ideals of freedom and democracy adjusted to capitalist conditions. The two animating principles have been around for millennia; they have traveled the world many times over, been reborn and reconceptualized thousands of times, such that evidently they grow out of human nature itself. Humans want to be free, and they want to have some say in how they organize their society. This is just to say that they want to be recognized and respected for who they are. The liberal ideas of “freedom from government intervention”, of “private property” and the “rule of law”, of “inalienable rights”, of the separation between the public and the private spheres, of “tolerance”, are just the ancient principles of freedom and democracy recast in the framework of capitalism—in its atomistic, competitive and individualistic framework.

As long as capitalism exists, liberal democracy will be essentially the best possible organization of society—the ideology that best reconciles the individual’s desires with the desires of other individuals. It represents the best merging of the idealistic and the realistic, which is why it is still respected by Westerners (and increasingly by the rest of the world) a hundred and fifty years after John Stuart Mill. But it can last only as long as capitalism lasts. And capitalism itself will last only as long as the scarcity of essential resources lasts (or, alternatively, until some global catastrophe causes the collapse of civilization). When capitalist dynamism has finally established an abundance of resources—when science and technology have evolved to such a point that humanity can, for example, clone as much food as it wants, genetically engineer its nutrients, satisfy all its energy needs through renewable sources of fuel, etc.—then liberal democracy will, I suspect, become obsolete, because economic processes will take a vastly different form than they do now. One cannot predict what form they will take, since imagination, as I said, is largely limited by material conditions, but economic rationing will probably no longer be necessary (except with regard to luxury goods), which means that money and private property will be, on the whole, superfluous. Again, it is impossible to predict what cultural and political changes will result from this economic evolution, but evidently liberalism—premised as it is on scarcity—will be seen as an absurd philosophy.

In any case, my point is that history is not over. Neither is ideological development. As economic conditions evolve, so will politics and culture. Sooner or later the modern person’s alienation, partially manifested in his disconnectedness from time, will evolve out of existence. How long this will take, I don’t know.

On genius and greatness, and value

The word ‘genius’ has a magical sound. *Genius*. “He is a genius.” It’s redolent of the divine, or at least the über-human. A genius isn’t quite human; there is something mysterious, almost mystical, about him. People speak of him in reverend tones. Einstein is the prototypical example. All his eccentricities, his absentmindedness and childishness, and even his selfishness, are forgiven him, for he was a *genius*. “What is it like to be a genius?” “It must be so hard to tolerate people!” “The genius is immortal.”

In an interview once, David Foster Wallace recalled a day in college when a professor of his had told him he was a genius. It was the happiest day of his life. “I thought I’d never have to go to the bathroom again,” he said. In my younger days, I myself used to take pleasure in basking in thoughts of self-flattery. I would read Schopenhauer’s many passages in which he waxes rhapsodic about the genius, describing him in rich detail and contrasting him with the average dullard. The genius, he says, is like a child, emotional, fickle, prone to alternating bouts of joy and melancholy, absentminded, fascinated by the world, self-absorbed, sensitive, lonely, careless with money, good-natured but easily disappointed in people. I was pleased that every facet of his descriptions was true of me. My absentmindedness, for example, has always been comically severe. Sometimes I accidentally try to brush my teeth with a pen I’ve picked up from the counter, or I try to drink a yoghurt I’ve just taken from the refrigerator, assuming it’s a cup of juice. And I’m incurably lackadaisical about practical things like money, in which I have no interest whatever.

As I grew older (21, 22), I came to understand the silliness of Schopenhauer’s thoughts about the extraordinariness of the genius. For those of you not acquainted with his ideas, I should say that he thought geniuses had some kind of privileged access to the thing-in-itself, the inner essence of the world. In ecstatic moments of artistic contemplation other people can sometimes approximate this, but not to the extent that the genius can. He literally has intuitive “knowledge” of the way the world is in itself. —Pretty fanciful, eh? The funny thing is that our ordinary linguistic usage accords well with what Schopenhauer said. We half-consciously think of the genius as possessing some sort of divine insight into reality—or, if he is an artist, as possessing a half-divine, half-mad sympathy with beauty/creativity. The word itself has these conceptual overtones.

To glance over the concept’s history is enlightening in this regard. The ancient Greeks didn’t have a word for genius, but they understood the difference between a merely talented artist and a supremely gifted one. In his dialogue *Ion*, Plato had this to say about the great poets:

None of the epic poets, if they’re good, are “masters” of their subject; [instead] they are inspired, possessed, and that is how they utter all those beautiful poems. The same goes for lyric poets if they’re good: just as the Corybantes are not in their right minds when they dance, lyric poets, too, are not in their right minds when they make those beautiful lyrics, but as soon as they sail into harmony and rhythm they are possessed by some Bacchic frenzy. ...A poet is an airy thing, winged and holy, and he is not able to make poetry until he becomes inspired and goes out of his mind and his intellect is no longer in him. ...The god himself is the one who speaks [through him].

Thus Plato originated, or at least popularized, the theory that the creative genius is a vessel for some higher force, something over which he has no control—that during his creative episodes he experiences a kind of madness. Many artists have latched onto this conception (no doubt because they find it flattering); Percy Bysshe Shelley, for example, was sympathetic to the Platonic vision, ostensibly because he himself felt as if his poems came from “outside” him, or from an unconscious source. And Nietzsche described his experience of writing *Thus Spoke Zarathustra* in a similar vein:

Has anyone at the end of the nineteenth century a clear idea of what poets of strong ages have called *inspiration*? If not, I will describe it.— If one had the slightest residue of superstition left in one’s system, one could hardly reject altogether the idea that one is

merely incarnation, merely mouthpiece, merely a medium of overpowering forces. The concept of revelation, in the sense that suddenly, with indescribable certainty and subtlety, something becomes *visible*, audible, something that shakes one to the last depths and throws one down, that merely describes the facts. One hears, one does not seek; one accepts, one does not ask who gives; like lightning, a thought flashes up, with necessity, without hesitation regarding its form,—I never had any choice. A rapture whose tremendous tension occasionally discharges itself in a flood of tears, now the pace quickens involuntarily, now it becomes slow; one is altogether beside oneself, with the distinct consciousness of subtle shudders and of one's skin creeping down to one's toes; a depth of happiness in which even what is most painful and gloomy does not seem something opposite but rather conditioned, provoked, a *necessary* color in such a superabundance of light... Everything happens involuntarily in the highest degree but as in a gale of a feeling of freedom, of absoluteness, of power, of divinity... The involuntariness of image and metaphor is strangest of all; one no longer has any notion of what is an image or a metaphor, everything offers itself as the nearest, most obvious, simplest expression. It actually seems, to allude to something Zarathustra says, as if the things themselves approached and offered themselves as metaphors...

Aristotle emphasized the kinship of genius with madness. “No excellent soul is without a tincture of madness.” This brings me to the historical connection between the concepts of genius and the demonic. The latter has a complex history. Even in ancient Greece, the word ‘daimon’ already had multiple connotations. While it *denoted* a semi-divine being who interfered in human affairs, often with destructive ends, its *connotations* were more controversial. Aeschylus, for example, interpreted the daimon as essentially tragic and destructive: in *The Persians*, the Queen attributed Xerxes’ ruinous hubris, his delusions, to a daimon that had taken away his judgment. But even in Aeschylus there are ambiguities, for in the same play a ghost (a daimon itself) says that Xerxes’ daimon *is* his hubris, his hubris that led him to defy the gods. Heraclitus had this same psychological understanding of the demonic element: it arises from man’s own self. “Man’s character is his daimon” (fragment 119). And, like Aeschylus’s daimon, it determines man’s tragic fate. Socrates, on the other hand, conceived of the daimon as a positive power, a supernatural element that keeps man within the fold of rational self-determination. It is an “inner voice” that warns him whenever he is about to do something irrational or harmful. In his paper “The Demonic: From Aeschylus to Tillich” (1969), Wolfgang Zucker summarizes the conflict between Socrates’s benevolent conception and Aeschylus’s tragic one:

For the tragedies, the daimon’s distinctive power is the result of man’s alienation from the objective world order; therefore the demonic appears as an avenging and hostile force. For the rational philosopher in an age of demythologization, the demonic appears as a benevolent helper toward his self-realization, consenting to man’s autonomy as long as he does not lose himself to his passions or contentiousness. The Latin interpreters showed a perfect understanding of what Plato had in mind when they translated the word as “genius.”

We see here that ‘genius’ denotes a benevolent spirit, the guiding or tutelary spirit of a man. In Roman mythology, every man had a genius. Originally, the genius was an ancestor who watched over his descendants, but over time the concept evolved to denote a personal guardian spirit that granted intellect and prowess. The distant origins of the modern word are evident.

In any case, the Socratic understanding didn’t last long. I won’t trace the entire history of the word ‘demon,’ but during Christian times it signified a devilish spirit, a manifestation of evil. This is what it meant throughout the Middle Ages. Finally in the eighteenth century the concept regained some of its original, Greek meaning. I’ll quote the whole passage from Zucker:

...The rediscovery of the demonic as a force that cannot be measured in terms of good and evil was due to the anti-rational cult of genius at the end of the eighteenth century. It was the expression of a fundamental opposition against the Enlightenment, against the utilitarian middle-class concept of order, and against the prevailing moralistic and intellectualistic theology. Such expression needed as its social precondition the breakdown of the old social system and the emergence of a new marginal class of artists who were no longer merely skilled artisans. It is at this time that the designations *artiste* and *Künstler* came in use, designations which did not mean simply specific occupations, but a way of life outside the hierarchy of social and economical values.

At the same time, poets began to see their kinsmen and associates in the visual artists and musicians rather than, as before, in philosophers and scholars. Precisely because secular and clerical princes lost the means for guaranteeing employment and income for the painters and musicians of their households, the practitioners of the various arts became free agents and developed their own ideology of genius.

According to this new viewpoint, the artist was no longer a man who simply had learned the use of brush and chisel or could play different musical instruments, but he now was gifted with some supernatural power; he had genius, or even he himself was “a genius.” A genius is not an ordinary human being; he belongs to a different order and can neither be understood nor judged by society. His acts do not conform to the norms of accepted behavior, but also his work has a superhuman quality that makes it incomparable with the work of other men. Thus the artist can neither share the comforts and rewards of socially useful occupations, nor does he feel compelled to submit to the restrictions and prescriptions of social conventions.

The essential point, however, is that this extraordinary, this marginal position of the artistic genius is not the result of free choice, but the effect of being possessed by a semi-divine power, namely “genius.” The exercising of an artistic endowment is therefore not an achievement, an action of man, but a painful suffering, a passion. Therefore the usual categories of good and evil, of useful and useless, do not apply to the genius. What he does and what he suffers is his fate. He is not a genius because he is an extraordinary artist; rather, he is an artist because he is possessed by a genius. Raphael would be the great artist he was, even if he had been born without hands.

Raphael was possessed by a demon, a genius. Goethe’s famous interpretation of the demonic unequivocally associates it with geniuses (the people, not the spirits). The creativity of great men is demonic; the personalities of men like Napoleon and Byron are demonic; nature itself has elements of the demonic; fate is demonic. Thus the genius is intimately related to fate, to the cosmic order. In his autobiography *Dichtung und Wahrheit*, Goethe describes the demonic as “[representing] a power which is, if not opposed to the moral order of the world, yet at cross-purposes to it; such that one could compare the one to the warp, and the other to the woof. ...[People who exemplify the demonic] are not always men superior in mind or talents, seldom do they recommend themselves by the goodness of their heart. Yet, a tremendous power goes out from them; they possess an incredible force over all other creatures and even over the elements; nobody can say how far their influence will reach...” While the word ‘genius’ isn’t mentioned, clearly Goethe would classify demonic men as, in some sense, geniuses, due to their unconscious, supernatural power. And when discussing demonic men he always refers to people like Mozart, Byron, and Caesar—i.e., “geniuses.” At other times Goethe, like most Romantics, attributes to the genius special rights, exemptions from duties to which the mass of men must adhere. Ordinary morality doesn’t apply to him. Geniuses are “permitted” to be selfish, immoral, cruel, for the sake of realizing themselves, simply because this is what they are *driven* to do. They *have* to do it; they have no choice in the matter. Nietzsche (who ironically was critical of Romanticism) elevated this myth into a philosophic vision, namely that of the *Übermensch*. The *Übermensch* can act immorally in the name of a higher morality, viz. that of the will to power. Realizing one’s will to power is *the* imperative in life; the genius has a qualitatively greater will to

power than the average man, so he has a qualitatively “higher” morality. (See, for instance, the section in the ironically named *Twilight of the Idols* entitled “My conception of the genius.”) –It’s a tribute to the power of all these Romantic writers that their ideologies still captivate us in our unguarded moments, and that, to an extent, their ideas have seeped into the very meaning of certain words.

Such beliefs in the genius’s extra-ordinariness tie into the association of genius with madness. Madness, after all, is not ordinary. This should also remind us of the ancient idea that insane people, or people under the influence of drugs, have insights into the divine, the inner essence of the world. Oracles were in fact susceptible to moments of “insanity,” or at least were “beside themselves” in their oracular moments. Perhaps we moderns are not entirely free from this pagan deification of madness.

Be that as it may, we have to admit that creative “geniuses” (scientific, artistic, and philosophical) have tended to be psychologically unhealthy and unsatisfied. –This brings me to the men of genius themselves, as opposed to the ideology. We have gained some idea, hopefully, of the nature and origin of the myth; now we have to see how well the myth accords with reality. To what extent are so-called geniuses extraordinary? What does it *mean* to call them “great”? If in fact the notion of genius is misguided, where does that leave us who idealize it?

To answer the question of whether geniuses are really “different” from ordinary people, we have to ask how it is that someone is labeled a genius in the first place. And here we encounter the first premise in the debunking of the myth. For the process by which people are labeled geniuses is not at all scientific. Even if we leave aside such secondary uses of the word as “Bill Clinton has a genius for politics” and concentrate on people famous for their *creativity*, there is nothing like a consistent standard in applying to someone the coveted label. The application results from a series of cultural accidents; deserving people are often denied the label while undeserving ones get lucky. For example, in part because of accidental historical circumstances (such as the opposition of the Church), Charles Darwin is called a genius, despite the fact that his main theoretic contribution was the single, simple idea of “natural selection by means of random variation”—which isn’t nearly as impressive as Archimedes’ or Max Planck’s or Ernest Rutherford’s achievements.¹ (Darwin wasn’t the first to propose the theory of evolution.) Yet Rutherford is not commonly called a genius, despite his amazing accomplishments. [...]

It will be objected that this argument shows only that popular recognition is sometimes mistaken, not that the *real* geniuses don’t deserve their title. Besides, there are many examples of public recognition that is both widespread and justified. In literature: Shakespeare, Keats, Shelley, Goethe, Heine, Nietzsche, Faulkner, Joyce, and so on. –But then what are we saying in calling these men geniuses? What do we mean? And what are the criteria?

The ideology of genius that I’ve outlined is premised on the belief in a qualitative, categorical difference between the ingenious and the merely talented. That is, they can’t be differentiated merely by *quantity*, such as the genius’s greater productivity or his somewhat greater creativity—unless, of course, the quantitative differences are so great that they amount to a qualitative difference. I doubt, though, that anyone would want to defend the Romantic ideology anymore. People might say simply, “A genius has extraordinary creativity and great intuitive powers.” But in fact I think that this definition, which does adhere to the word’s ordinary usage, itself implies that there are “qualitatively distinct” attributes of genius. “A genius is a *great human being*, ‘higher’ than the rest of us.” My goal in the following will be to refute this conception—that is, to show that nothing in particular distinguishes “geniuses,” or “great men” in general, from everyone else. Later I’ll suggest why this issue is significant.

Incidentally, I’m using the word ‘genius’ as it was used by the Romantics, and as it’s still used in most contexts. It is now also taken to denote people like Marilyn vos Savant, who have extremely high IQs but are not known for their creativity, or people like Kim Peek, who have astonishing memories. I have no quarrel with this usage, because it’s relatively empty and doesn’t involve the notion of *greatness*. It doesn’t

¹ The biologist Thomas Huxley’s reaction to Darwin’s idea was appropriate: “How extremely stupid not to have thought of that!” It’s just an *obvious* theory, almost a truism. (Essentially it says: those variations that increase the likelihood of an animal’s survival will tend to survive and be passed on.) Incidentally, Alfred Russel Wallace conceived of it around the same time Darwin did, but few people think of him as a genius.

incorporate a value-judgment—“This person is more valuable than the rest of us”—as does the other conception. It’s basically the idea of greatness that I’m arguing against. To do that, I’ll first argue against the meaningfulness of the concept ‘genius,’ and then I’ll extend my critique to the notion of ‘greatness.’

Not only philosophical and scientific, but even artistic geniuses are held to have great powers of intuition. So what is this thing that everyone praises? What is intuition? Briefly stated, it is a non-visual form of seeing. A non-discursive insight. A non-tactile mode of perception. It somehow involves imagination, though not all imagining is called intuiting. Maybe it should be, but both terms are so vague, virtually undefinable, that a demand for perfect consistency in their use would be misplaced. Moreover, I think there are subtle differences in how we use the words. For example, in many contexts, ‘intuition’ seems to connote that its object is *truth*, in some non-verbal form. One can supposedly intuit another’s state of mind or the solution to a problem, intuitions that aim for truth. The contrast with ‘imagination’ is obvious.

Be that as it may, the power of imagination is at least a prerequisite for the power of intuition. Geniuses are said to have both. Because their imaginations are so active, their intuitive powers are remarkable. Mozart, for example, is said to have had a unique musical imagination, as well as an ability to *intuit* his music. In his self-descriptions he says that he could somehow hear an entire piece in a single moment, all jumbled together in his mind. This idea makes (partial) sense only if we interpret it metaphorically: he isn’t hearing all the individual notes together, which would be an intolerable dissonance; he is “imaginatively” understanding the thematic development of the piece, its structure and outline. A parallel would be the philosopher’s intuition of a particular theory—say, Saul Kripke’s intuition of the fact that proper names are “rigid designators.” (See his book *Naming and Necessity*.) Or Hegel’s intuition of the fact that the self is self-consciousness. These two men, in having great philosophical imaginations, can experience potent intuitions.

To give a precise definition of intuition is impossible, because the word itself is very imprecise. Very nebulous; hard to get a grasp on. When I introspect, I experience my own philosophical intuitions as a distinctive manifestation of imagination, an unconceptualizable “seeing” of the truth (or what *seems* to be the truth), unmediated by words. I really can’t say much more about them. A good way to describe them, perhaps, is to call this type of intuition *intentional perception*, as opposed to *phenomenal* perception (such as physical sensations). This definition, vague though it is, at least emphasizes the elements of *depth* and *force* in intuition, as well as the element of mental perception. When I have a quick thought about a person who isn’t present I don’t feel particularly as if I’m experiencing a perception, an *intuition*. I just interpret myself as *thinking* about him, that’s all. When I purposely empathize with someone, on the other hand—when I “place myself in his shoes,” by imagining my reactions if I were in his situation—the intuitive element is present. I’m having an intuition in the full sense, for my empathic insight *strikes* me, with a certain force. There is a “suddenness” to this kind of intuition.

Since there are not clear boundaries between the various types of intuition (insofar as there are such types), my distinguishing a particular class of thought is inevitably going to be somewhat arbitrary. It’s useful, though, and necessary, for when people attribute to the genius intuitive abilities, they’re tacitly doing the same thing. They’re demarcating a class of “full” intuitions from the commonplace thoughts we all have most of the time, which themselves have intuitive features. This fact itself should make us wary of positing a categorical difference between the genius and the ordinary person. But at the moment I want only to emphasize that, even under the restrictive definition I gave in the last paragraph, “ordinary people” commonly have intuitions.

I suspect the reader will grant me this. He may say, though, that geniuses have intuitions more often. However, he has already significantly weakened his defense of the genius by admitting that the average guy on the street can have one of his supposedly defining experiences, namely that of intuition. By claiming that geniuses have intuitions more often than others, he has reduced his case to the belief in a merely *quantitative* difference between the two types of people. And the conclusion has to be that there is no fixed, “essentialist” difference, in this respect at least. There is but an unclear, blurry merging between the two “categories”—which effectively refutes the Romantics’ conception, and thus the implicit significance of our conventional linguistic usage. Even great personifications of genius, like Mozart, Kant,

and Newton, are in this respect merely uncommon examples of ordinary people, in that they have the ordinary experience of intuition relatively often.

Of course it will be objected that, in giving a *phenomenological* analysis of intuition, I've ignored what is really unique in the genius's intuitions. While his *experience* of them may be similar to the ordinary person's experience, their *content* is different. For example, while the philosopher Derek Parfit's intuitions may, for him, feel similar to the way Kant's intuitions felt to him, Kant's were more fruitful, pithy, etc. This is why he is called a genius, while Parfit is not.

This objection is perceptive, in that it links intuition to creativity, which is another criterion in the definition of the genius. A man like Kant has intuitions with more creative potential than a man like Parfit. Consider the following quotation from Henri Poincaré, who was a mathematician of undisputed genius, in which he describes the experience of profound mathematical creation:

...Most striking at first is this appearance of sudden illumination, a manifest sign of long, unconscious prior work. The role of this unconscious work in mathematical invention appears to me incontestable, and traces of it would be found in other cases where it is less evident. Often when one works at a hard question, nothing good is accomplished at the first attack. Then one takes a rest, longer or shorter, and sits down anew to the work. During the first half-hour, as before, nothing is found, and then all of a sudden the decisive idea presents itself to the mind. It might be said that the conscious work has been more fruitful because it has been interrupted and the rest has given back to the mind its force and freshness. But it is more probable that the rest has been filled out with unconscious work and that the result of this work has afterwards revealed itself to the geometer just as in the cases I have cited... These sudden inspirations never happen except after some days of voluntary effort which has appeared absolutely fruitless and whence nothing good seems to have come, where the way taken seems totally astray. These efforts then have not been as sterile as one thinks; they have set agoing the unconscious machine and without them it would not have moved and would have produced nothing...

This is quoted in Hans Eysenck's book *Genius: The Natural History of Creativity* (1995). Eysenck summarizes the passage: "This quotation well describes what countless mathematicians, scientists, writers, artists, and composers have described somewhat less clearly. There is the preliminary labor; the incubation period; the sudden integration, owing its existence to inspiration rather than conscious logical thought, and finally the verification or proof, perfectly conscious..." (Chapter 5.)

It would seem that most people rarely experience this kind of intuition, the kind that results from sustained conscious and unconscious work. Correspondingly, they're called less creative than people like Poincaré. The creativity of the latter is closely related to the content and origin of their intuitions; otherwise they would, supposedly, be merely *talented*. The talented person may be industrious and productive, but his work is less instinctual or unconscious than the genius's, and this results in its relative mediocrity. (The obvious hidden premise is that, for whatever reason, if significant unconscious work—and consequent intuitive illumination—is involved, the product will likely have more value than if the work all takes place on a conscious level.)

But here the question arises: is it the nature of the activity or the worth of the work that determines the genius? If the former, then whether the final product is intrinsically valuable is irrelevant; the point is that it has been arrived at through a process akin to that described by Poincaré. If the latter, on the other hand, then the nature of the creative process is irrelevant; what matters is only the intrinsic value of the work. Neither option seems very satisfying, though. Poincaré might respond, "Both aspects are important: you can't have the intrinsic value without the unconscious, intuitive creative process." But is this right? There seems no way of knowing.

Perhaps it's best just to stipulate—for the sake of definitional clarity—that the class of *true* geniuses includes only those people who are creative in a Poincaréan, intuitive and unconscious way. This appears to capture the essence of our ordinary use of the word 'genius,' since, after all, it isn't a contradiction to say

that a particular man was a genius who unfortunately produced only mediocre work. He had the *potential* for brilliant work, due to the nature of his creativity, but he failed to realize it. Thus, the direct criterion for true genius is not the value of the work but the fecundity of the mind—a fecundity revealed by the nature of its creative process.

Even apart from the further testimony of “countless mathematicians, scientists, writers, artists, and composers,”¹ that claim is justified by the intellectual character of the most uncontroversial geniuses, such as Shakespeare, Byron, Mozart, and Einstein. We’ve already seen what Mozart said about his creative process; Einstein has written somewhere that in the moment of his decisive insight into the theory of relativity, he felt as if something had “snapped” in his mind. He was overcome by elation; his momentary intuition, after countless hours of conscious work, was the most powerful experience of his life. As for Byron and Shakespeare, one has only to read their works to see that their unconscious is responsible for them. (*Don Juan*, for instance, is ridiculously brilliant. It’s a poem unlike any other in the English language—in *any* language—surpassing even Pope’s *Dunciad*. Clearly no merely conscious manipulation of words could have created it.)

In short, we’re back to Plato, Shelley, and Nietzsche, albeit made a little more precise and quasi-scientific. The creative genius is defined as a person whose mind is fertile in such a way that much of its work is done on an unconscious level, and that once the unconscious work is finished, the result intuitively appears to the conscious mind and is then crafted and manipulated. I think that this argument, and this definition, is the strongest one possible in support of the claim that geniuses really are categorically, “*substantively*” different from ordinary people. For it claims that implicit in our ordinary linguistic usage is the notion that there is an *essence* to the genius, an essence that other people lack. This is what the Romantics argued, and it is what I am denying. The definition links intuition and creativity in a plausible way, thus uniting the two main criteria in people’s understanding of what genius is. (Geniuses are, of course, held to have other qualities, various personal idiosyncrasies, but these are not *criteria*.)

So my task is to show why that argument is mistaken. I have to show that our admiration of “true” geniuses is misguided. First I’ll point out that even on the restrictive definition I’ve given, the class of geniuses has a far greater extension than is commonly supposed. There are thousands or hundreds of thousands of so-called geniuses in every generation in the U.S. alone. Many or most poets, novelists, mathematicians, theoretical physicists, and others qualify, because their creative process is essentially the same as Poincaré’s. It’s wrong, then, to think that geniuses are spectacularly unusual, that there are only several in any given generation. This fact in itself serves as an argument against the attribution of semi-divinity implicit in our use of the term.

Similarly, there is nothing particularly remarkable about the behavior of a genius. People tend to associate certain stereotypes with the concept, such as: irritable, impatient, eccentric, absentminded, half-insane, depressive, self-absorbed, socially naïve, or having an unkempt appearance. These stereotypes heighten the concept’s mystique. They do seem to have *some* empirical basis, but, first of all, if we’re assuming approximately the definition I gave above, it may well be that most geniuses do *not* exhibit these traits (any more than the average person). Secondly, even the ones who do—such as Einstein, Van Gogh, Byron, Beethoven, Wittgenstein—don’t exhibit them to the extent that myth suggests they do. In his lifetime, for instance, Byron enjoyed the reputation of being full of passion at all times, a Don Juan pining for love and happiness. His poems were the basis for the myth. And while it flattered him, he had enough intellectual integrity to remark that the myth was absurd: no one is as passionate as he was reputed to be. The vast majority of the time, he said, he was utterly ordinary, as passionless as anyone else; it was only in rare moments that he felt lonely or intensely in love, and it was then that he wrote his poems. Similarly, if you had followed Van Gogh around every day, or Einstein, you would have seen that there was nothing especially sublime about them. Van Gogh, you might think, was kind of a bore, a little too gloomy at times, while Einstein was just a fairly pleasant man with unusual hair. Perhaps moody, perhaps a bit odd in some

¹ See, e.g., Coleridge’s description of the circumstances under which he wrote *Kubla Khan*, and A. E. Housman’s statement to the effect that sometimes, when he goes for a stroll outside, an entire stanza of a new poem suddenly appears before his mind, fully worked out.

respects—but who isn't? Everyone has idiosyncrasies. The main reason it seems as if “geniuses” have more than most people is that people pay more attention to their behavior than to that of others. People write about their experiences with the “great man”; every unusual act of his is recorded, and the consequent impression is of a unique and fascinating person. But if you met him without knowing who he was, the odds are overwhelming that you wouldn't find him particularly memorable. —Napoleon was right that “no man is a hero to his valet.” Familiarity breeds contempt.

It may be true, though, that people called geniuses have tended not to be “well-adjusted.” Many of them have been narcissistic, schizoid, (manic-)depressive, or simply lonely. Some have ended up insane. Others have committed suicide. Artists in particular appear to suffer from erratic mentalities. They're often overly sensitive and unhappy, except, perhaps, in moments of creation. One wonders why. What is it about this kind of creativity that makes the creative person susceptible to mental illness? The most obvious factor is loneliness. When your innate aptitudes are different from most people's and your interests are not theirs, you're going to feel different from them and hence lonely. It will be rare that you find a true companion. Eventually you'll learn that you feel more “fulfilled” and happy when you're being productive than when you're with other people, so you'll spend much of your time creating work in solitude. And while this will, in a sense, make you happy, it will also probably contribute to your unhappiness, since what humans desire more than anything else is “recognition” (love, etc.). No matter how good your work is, as long as you live and work in relative solitude you will be unsatisfied, possibly neurotic and depressed.

So, part of the problem is simply that the highly creative person often doesn't feel comfortable with most people, which means that the part of him that craves validation and affection is frustrated. He may therefore have a fragile sense of self, which depends too much on people's reactions to him and his work, and his self-esteem might be inadequate even as he becomes somewhat egomaniacal due to his isolation, his comparing himself with past great men, and his self-righteous conviction that “despite what they all think, I am a genius, I am ahead of my time!” (which conviction is partly a defense-mechanism against psychological insecurity—i.e., an attempt to give himself the recognition he doesn't receive from others). He will finally come to see the justification of his existence in his work, because his work is the only thing that allows him to recognize his sense of self in the world—to see it objectified and thereby confirmed.

The issue can be approached from a neurological perspective too, namely by asking what are the neural causes of the connection between certain types of creativity and mental illness, but the foregoing suggestions are sufficient to show that the so-called genius's pathological state of mind is thoroughly earth-bound, with fairly ordinary causes. It isn't (only) that he sees so much ugliness in the world that he despairs, having a soul so noble that he pines for Beauty while the cruel world crushes his hopes. There is nothing particularly sublime about his “madness.”

So all the mystique that hovers around the “genius” because of his supposedly eccentric behavior is based on illusions. People misunderstand both themselves and geniuses by attributing to the latter exceptional personal qualities. In general, this idolization is almost as unfounded as the idolization of celebrities: it reflects the peculiar human tendency to pick out a certain person or group of people and look up to them, model oneself after them, praise them and seek their affection, attribute to them supposedly unique qualities many of which are in fact possessed by everyone. This tendency first shows itself in childhood, when one admires one's parents as if they were perfect all-knowing beings; later it takes other forms, such as hero-worship and the idealization of unusually creative people.

Doubtless John Dryden was partly right when he said, in *Absalom and Achitophel*,

Great wits to madness sure are near allied,
And thin partitions do their bounds divide.

This idea is quite interesting, insofar as there is some truth to it. Aside from their both sometimes being absentminded, socially awkward, withdrawn, tormented, and so on, the exceptionally creative and the “insane” can have deeper similarities too. For instance, they both tend to interpret reality differently from how others interpret it, e.g., by perceiving logical and causal connections where others wouldn't. Likewise, obsessive thinking is a common experience in some types of insanity. People suffering from a psychosis

may have compulsive thoughts, delusions of grandeur, hallucinations, severe depressive tendencies, paranoid thoughts—all of which have been associated with genius. Creative people often think compulsively about themselves and are driven compulsively by their creative urge. If they're in the process of creating something, they'll feel strangely "haunted" or "bothered" until it's finished. It will feel like their lives have been put on hold until they're satisfied with their creation, because they just can't stop thinking about it—about getting it *right*, about the absolute necessity of getting past their doubts and moving on with life. (See §93 of Nietzsche's *The Gay Science*: "...But why, then, do you write? –A: Well, my friend, to be quite frank: so far, I have not discovered any other way of getting rid of my thoughts. –B: And why do you want to get rid of them? –A: Why do I want to? Do I want to? I *must*.")

But, of course, whatever seemingly unusual quality one wants to assign some category of people is to a degree possessed by many others as well. Even such meritorious traits as having an impressive work-ethic or a wide-ranging curiosity or great intellectual integrity are dispersed widely through the population. High creativity itself is universal, inasmuch as it is human nature to be astonishingly creative—in the use of language, for example, or in thinking of new ideas, or in interpreting new experiences, or in pursuing whatever talents one has. It may even be misleading to speak of someone's "exceptional creativity"; it seems exceptional to us because it takes a slightly different form than it does in most people, but others are, in their own ways, probably just as creative. We attribute too much creativity to some people and too little to the rest of us—especially given that, in many cases, the difference is simply that the former are more privileged than the latter, having more money or leisure time or a job that allows them to indulge their creative side more than most jobs do.

Anyway, we have to reject the argument that there is an *essence* to genius, because people use the word in too many disparate contexts for it to have a single, coherent definition. Its denotations and connotations are associated through "family resemblances" (to quote Wittgenstein) rather than "necessary and sufficient conditions." That is, its uses merely *resemble* each other; they don't have some clear definition in common, as do, say, the uses of the word 'bachelor.' Even with regard to the *creative* genius, common use of the term doesn't justify defining it in some such essentialist way as the Poincaréan definition I gave above. People disagree on who counts as a genius, and they disagree on what it is about someone that justifies pinning the label on him. The label, in fact, is really little more than an honorific, whose application depends largely on accidental circumstances, the vagaries that determine popular recognition. As we saw earlier, it is merely an *ideological construct*, not a scientific one, and so suffers from a basic meaninglessness at its core.

"Fine!" you say. "I've agreed with your conclusion all along! Now tell me why I should care." First of all, I think that questions about the nature of genius (or lack thereof) are interesting in their own right. But more importantly, I want to extend my critique to the idea of greatness. I think that this idea is even more meaningless than the other one, and for similar reasons. For one thing, we use the word in so many contexts that to extrapolate a satisfactory definition is impossible. A great person is one who, through whatever circumstances—not all of which redound to his credit—has managed to achieve something that impresses society, causes his name to trickle down through the various social classes. The criteria for attributions of greatness differ from person to person; the concept is so vague that nothing really substantive or "definite" determines its use. The person called great isn't somehow "above" the rest of us (whatever that would mean); he isn't "better" than us. The most that can be said in his favor is that certain qualities are, perhaps, more well-developed in him than in most people, while others are probably less so. Often his "greatness" is due to his flaws, whether they be childishness, narcissism, arrogance, or selfishness. Charles de Gaulle is sometimes considered a great man, but he was arrogant, vain, ridiculously conservative, self-deluded—all of which qualities made possible his "strong will" and thus his rise to power. Napoleon was selfish and brutal. Albert Schweitzer, on the other hand, was just an intelligent, good man who understood that humans, as such, have obligations toward each other, and acted on that knowledge.

People called great are often surprised at their reputation. They know they're basically ordinary; they think that all the adulation they receive is silly, though they may play along with it because of vanity. Goethe, for example, insisted he was "extraordinarily ordinary," just as human and flawed as everyone else. But because he wrote and talked well, people thought that he himself must be comparably great. That's the

main confusion: people confuse a person with his objectifications. They confuse Mozart with the *Jupiter* symphony, Byron with his passionate poems, Martin Luther King, Jr. with his powerful speeches. These people are as human as the rest of us, but their distinctive talent makes them seem extraordinary, namely because we look at a few objectifications and think we see the entire person. If certain objectifications seem more impressive than those of most people, we think that the person responsible for them must be that much more impressive as well. But really, the inner, subjective differences, and the biological differences, responsible for the different objectifications are minuscule. And, as I said, they often include traits that are considered weaknesses. —Humans are more or less similar. They're fundamentally equal, however their self-expressions may occasionally suggest otherwise.

Incidentally, everything I'm arguing here is, in a sense, merely an articulation of what has become implicit in societal conditions, in social relations. The structure of late capitalism, with its submersion of the individual in the mass, its commodification of the human personality, its worship of science, and its puerile pop culture, is such that 'greatness' and 'genius' have become empty words, ludicrously romantic and anachronistic, to which people nonetheless continue to pay lip-service. Anyone who still truly believes in the possibility of greatness—the sort of hallowed immortality that people still reflexively attribute to, say, Lincoln, FDR, or Gandhi—is behind the times. People are molded by their circumstances far more than they can ever mold them. Greatness, this strange midpoint between the earthly and the divine, is a myth, just as the divine itself is a myth. The Great Man theory of history is dead; the spirit of Thomas Carlyle is foreign to the spirit of late capitalism.

The history of languages proceeds on the basis of social evolution: new concepts emerge, new modes of communication appear on the basis of new institutions, new modes of life and production. And once particular concepts or ideologies have arisen, they will remain in circulation until *after* concrete social relations have made them obsolete. Only gradually will society slough off ossified ways of thought and communication, namely when it can no longer postpone its "ideological" adaptation to new circumstances. This is why the notions of greatness and genius are still taken as semi-seriously as they are. They're relics of a more romantic, idealistic age than our own, though when they'll effectively die out is impossible to say.

In some respects this state of affairs is desirable, but in others it isn't. Human life has need of *some* illusions, after all. They need not be as patently delusive as, say, Christianity, but they have to function as tonics, as things that make life bearable. Nietzsche, for example, thought of art as such a tonic, a sort of Platonic lie that is, however, believed in by its *creators* more than anyone else. (Nietzsche thought that artists are mostly actors: through their work, they lie to themselves and others, by idealistically pretending to be something they're not.) The belief in great men and geniuses has a similar function—not, admittedly, for most people, who have family, love and, in some cases, religion to make them happy, but for the less well-adjusted, who cling to the illusion of greatness desperately. Nietzsche, ironically, was an example. As are many artists. Their commitment to the illusion is a symptom of the unhappiness I mentioned above—the loneliness, the self-fixation. "If our contemporaries don't recognize us," they think, "well then, posterity will! We'll have the last laugh! (After we're dead, though.)" Such people are frequently more committed to their works than to life itself, or even to the lives of their children. Consider Montaigne's observations:

Now once we consider the fact that we love our children simply because we begot them, calling them our second selves, we can see that we also produce something else from ourselves, no less worthy of commendation: for the things we engender in our soul, the offspring of our mind, of our wisdom and talents, are the products of a part more noble than the body and are more purely our own. In this act of generation we are both mother and father; these 'children' cost us dearer and, if they are any good, bring us more honor. In the case of our other children their good qualities belong much more to them than to us: we have only a very slight share in them; but in the case of these, all their grace, worth and beauty belong to us. For this reason they have a more lively resemblance and correspondence to us. Plato adds that such children are immortal and immortalize their fathers—even deifying them, as in the case of Lycurgus, Solon and Minos.

...Few devotees of poetry would not have been more gratified at fathering the *Aeneid* than the fairest boy in Rome, nor fail to find the loss of one more bearable than the other. For according to Aristotle, of all artists the one who is most in love with his handiwork is the poet.

Such people can be so in love with their works, and the potential immortality that lies in them, that they exhibit total despair upon losing them:

[The enemies of Labienus, a man who “excelled in every kind of literature,”] prosecuted him before the Roman magistrates and obtained a conviction, requiring several of the books he had published to be burnt. This was the very first case of the death penalty being inflicted on books and erudition; it was subsequently applied at Rome in several other cases. ...Labienus could not bear such a loss nor survive such beloved offspring; he had himself borne to the family vault on a litter and shut up alive; there he provided his own death and burial. It is difficult to find any example of fatherly love more vehement than that one...

A similar misfortune happened to Cremutius Cordus, who was accused of having praised Brutus and Cassius in his books. That slavish base and corrupt Senate (worthy of a worse master than Tiberius) condemned his writings to the pyre: it pleased him to keep his books company as they perished in the flames by starving himself to death.¹

It seems that a certain kind of person, blessed with a Protestant ethic, will always see more merit in his “works” than in his “faith”—precisely because his works are what make possible his faith (in himself). He has to creatively “objectify” himself—project himself into the world, see his sense of self reflected and confirmed outside himself. Everyone needs this, but some people evidently need it more, or rather in different ways, than others. Accordingly, they will use their talents, perhaps to the point of obsession, to get the self-confirmation they desire—because knowledge of their talents has become the most essential component in their self-regard.

But what is this identification with “great” objectifications if not identification with greatness itself? The objectifications are what raise the creator (in his own eyes) from the level of the mundane, which he hates, into the level of the semi-immortal. Without them he is just ordinary, and so his sense of self—which is committed to his extraordinariness—is not confirmed or recognized. But *with* them he is this being that can put beauty and profundity into the world. He so invests himself in his objectifications that he is able to live, in a way, *outside* himself; he doesn’t have to face the fact that he is just a human among humans, as mortal and earth-bound as everyone else. He can ignore his obviously animal nature. Schopenhauer and Wagner can be seen as the prototypes—those two brilliant, deluded men. Schopenhauer did more than any other thinker to propagate the myth of genius, the conception of which he basically modeled after how he perceived his own personality: the genius is the man whose intellect is so powerful and energetic that it has been effectively detached from its service to the will (i.e., to the individual’s practical interests, his will-to-live), which in the average person is its sole function.

...The gift of genius is nothing but the most complete *objectivity*, i.e., the objective tendency of the mind, as opposed to the subjective directed to our own person, i.e., to the will. Accordingly, genius is the capacity to remain in a state of pure perception, to lose oneself in perception, to remove from the service of the will the knowledge which originally existed only for this service. In other words, genius is the ability to leave entirely out of sight our own interest, our willing, and our aims, and consequently to discard entirely our own personality for a time, in order to remain *pure knowing subject*, the clear eye of the world... For genius to appear in an individual, it is as if a measure of the power of knowledge must have fallen to his lot far exceeding that required for the service of an

¹ Montaigne, *The Essays: A Selection* (New York: Penguin Books, 1993), 165, 166, 167.

individual will; and this superfluity of knowledge having become free, now becomes the subject purified of will, the clear mirror of the inner nature of the world. This explains the animation, amounting to disquietude, in men of genius, since the present can seldom satisfy them, because it does not fill their consciousness...¹

Such panegyric passages go on for pages in Schopenhauer's books; and while I enjoy reading them, they're obviously fantasies. Wagner didn't think so, though. Like so many other Romantics, he adored Schopenhauer and his philosophy because it flattered him—specifically because of the privileged place that Schopenhauer accorded music. This art, he said, is superior to all others, since it is the most immediate and abstract manifestation of Will, i.e., the essence of reality. This theory gave Wagner the philosophical justification he needed to think of himself as the most monumental and metaphysical of geniuses, a self-conception that comforted him amidst all the suffering and toil that went into his composing. As Nietzsche remarked,² it's likely that Wagner needed his self-idealism, which he enshrined in his philosophical essays, in order to create. But in this respect he was just an ordinary "genius" taken to the extreme.

Self-idealism is ubiquitous, though it isn't usually taken to the excesses that Wagner took it. The very illusion that one is a substantial self—"Chris Wright," "John Smith," "Nancy Jones"—rather than merely a piece of matter with consciousness and memory-fragments is an example of self-idealism; so is love, which ascribes great value to the beloved; so is the attribution of some sort of importance to oneself. Everyone, of necessity, shares these illusions. Human life would not be possible without them. The brain naturally manufactures them, and they're what keep one interested in life. Scientific understanding, as Nietzsche and Max Weber saw, does not itself give rise to values, and indeed tends to show they don't have the "objectively justifiable" status we think they do but are mere projections of our own subjective attitudes. Nevertheless, we need values, we need self-love and self-idealism, and we need to idealize others. The notions of genius and greatness are ultimately senseless, but they can be of inestimable value in stimulating certain people to action, such that it can be very cruel to try to prove to someone that his idolization of a "hero" or so-called genius is a delusion.

The example that comes to mind is that of the young, talented person whose idealization of some hero gives him the inspiration to create. The young Nietzsche is his spokesman:

Your true nature lies, not concealed deep within you, but immeasurably high above you, or at least above that which you usually take yourself to be. Your true educators and formative teachers reveal to you what the true basic material of your being is, something in itself ineducable and in any case difficult of access, bound and paralysed: your educators can be only your liberators.³

This hero-worship is another of the illusions in which human life consists. Without it, a lot of young people would find life boring and pointless. *I* certainly would have. My idolization of particular "great men" gave substance to the (self-)ideals without which I would have found life dull. If I had thought that everyone is basically similar and equal—if, that is, I had truly, intuitively understood humanity—such that I hadn't looked up to anyone as superior to the rest of us, it's doubtful that I could have had my ideals. It would have seemed futile to strive for anything if I weren't basically striving for the approval of past great men. How *boring* it would be to strive for the approval of the average person!—or of someone like me! No satisfaction would come from that kind of recognition. I had to think there were people greater than I, whose judgment I trusted more than my own. Whether I had value as a human being depended on whether they

¹ *The World as Will and Representation* (New York: Dover Publications, Inc., 1969), 185, 186.

² "Let him [i.e., Wagner] have his intellectual tempers and cramps. Let us, in all fairness, ask what strange nourishments and needs an art like [his] may require to be able to live and grow..." *The Gay Science*, §99. (Kaufmann's translation.)

³ Nietzsche, *Untimely Meditations*, Part Three, "Schopenhauer as Educator."

would have thought I had value. —On an *intellectual* level such people may recognize they're the victim of an illusion, but implicitly they still have to believe in it.

Incidentally, if they actually met the person whom they idolize, they would likely be disappointed. Not necessarily because he wouldn't measure up to their expectations, but just because he is as human as they themselves. Similarly, people who meet a celebrity are sometimes taken aback that he is just an ordinary person. "He's easygoing and pleasant. He even goes to the mall! Just like everyone else!" The reason they're surprised is the reason why the hero-worshiper may be disappointed upon meeting his idol: they've come to identify the famous person with his *name*, the *idea* of him. They see him not as something concrete and ordinary but as a sort of abstract concept, a *principle* as it were, just like the abstract Other in consciousness that drives us to seek self-confirmation. This famous person has become (for them) ingrained in the structure of reality, of social reality; he, or his "concept," is a component in the cultural or psychological background against which they live their lives, like a philosophical or aesthetic idea—with the decisive difference, though, that *this* "concept" is also a *self*. Bill Clinton, say, or Barack Obama, or some other famous person, is part-*self* and part-*concept*—part-*other* and part-*object*. His otherness, or selfhood, means that he is the kind of thing from which one wants validation, namely a human being; his "objecthood" (his being a cultural concept) means that he is more permanent than the rest of us, as though he is a part of reality itself.¹ The result is that he is implicitly perceived as more than human. In being recognized by him—or in identifying with him or with some past "great man"—one is recognized by or is identifying with a part of (social) reality itself, which of course is very affirmative of one's sense of self.

These fragmentary reflections, I hope, help explain humans' odd fascination with genius, greatness, and fame. My main concern, though, has been to show that the former two qualities are mere projections of the admiring person's attitude, not substantive, coherent properties in and of themselves. Widespread appreciation of this fact would facilitate a healthy equality among people.

[The above is an edited version. Here's an unedited continuation of the original.] So much for the discussion of genius and greatness. These properties are mere projections of the admiring person's attitude, not substantive, coherent properties in and of themselves. If this fact were widely appreciated it would facilitate a healthy equality among people. People might stop denigrating themselves vis-à-vis famous artists and celebrities.

But 'genius' and 'greatness' are just special cases of a more general phenomenon, namely that of values and valuing. In order to live in a true, and a healthy, equality,² we have to understand that value-judgments as such are not 'objectively valid'. Humans will always praise and condemn each other; this is both necessary and desirable, to an extent. It would be best, though, if we kept it in the back of our minds that the act of judging a person, including oneself, should be approached with a skeptical attitude, in that the judgment cannot be 'correct' or 'objectively true'—whatever that would mean. It is almost meaningless to say that someone is bad or good or stupid or foolish or wonderful; there is no 'objective fact' to which these judgments can correspond, as there is with regard to a descriptive statement like 'He has brown hair' or 'He wants to go to college'. We think we're saying, e.g., 'He objectively has the property of being an idiot'; but, insofar as the word 'idiot' has evaluative overtones, there is no such property. What there is, instead, is an attitude of disapproval towards him. We reify this attitude, so to speak: we attribute to him the intrinsic property of deserving-disapproval (i.e., of '*being-an-idiot*'). But there is no such property. So our judgment is largely deluded.

¹ A better way of saying it may be that he is effectively a concrete version—an especially valued or "impressive" one—of the abstract other from which one is always seeking recognition/validation; hence the excitement of meeting him. His social importance creates the aura around him of a kind of "self-certainty," a particularly powerful kind of substitute self-confidence, a *reality*, recognition from which/whom can prove one's own reality, i.e., the validity of one's implicit self-love.

² There is also an unhealthy kind of equality, such as that which infects pop culture. This is not the place to discuss it, though.

No one, strictly speaking, is ‘better’ or ‘worse’ than others, because the concept of value that is assumed in such evaluations is essentially meaningless.

Nevertheless, we cannot stop making value-judgments altogether. That would be humanly impossible. The best we can do is to adopt, in general, a more skeptical attitude towards them. We should take them a little less seriously than we usually do, since we know that they cannot, strictly speaking, be *true*, given that they’re almost meaningless. Another positive side-effect of our adopting this ‘non-absolutist’, ‘skeptical’, ‘non-judgmental’ attitude would be a lessening of self-righteousness and zealotry.

However, while our value-judgments cannot really have the objective, ‘true-or-false’ character that we think they have, they can be true or false relative to criteria. If our criteria for human worth are, e.g., compassion, empathy, thoughtfulness and tolerance, then, insofar as someone does not exhibit these qualities, we can with justification call him ‘bad’—relative, that is, to the collective standards of goodness. Dick Cheney, then, is, on the whole, ‘bad’, at least as far as these criteria go. Albert Schweitzer, on the other hand, was relatively good.

—Because the topic of values is extremely complicated, I would refer you here to the paper I wrote on morality. This chapter is mainly a supplement to that paper, which itself is merely a sketch for a comprehensive analysis. The following discussion is going to be very brief, non-technical and non-philosophical.

In fact, I’m getting tired of writing in this pseudo-academic style. And I suspect you’re getting tired of reading it. So instead I’m going to copy a few hopefully thought-provoking reflections I’ve written over the years, which are in a more informal style. [See my first book. I’ve deleted some of the reflections here.]

*

“Don’t care what people think of you,” you say to the person who’s sensitive to other people’s opinions. And you’re not saying it only to comfort him; you think you’re right, because you yourself live by your advice. “Those people are wrong. Ignore them. Their opinions don’t matter. Just be yourself.” But when *you* judge people you’re convinced of your judgment, you write off the person as an idiot or a jerk or whatever, and “That’s that!” So what do you mean when you say “Don’t care what people think of you”? *You* care what you think of people. Are you saying that your opinion is the only one that matters, that they should care what you think of them but you shouldn’t care what they think of you? Because, of course, you do want them to care what you think of them. You know you’re right in your judgments of them, so who’s to say they’re not right in their judgments of you? So you’re being inconsistent. Either you admit that your judgments are ignorant, or you admit that you should care what people think of you. It’s one or the other. The option that *I’ve* chosen—the true option—is that interpersonal ‘judgments’ are ignorant; therefore, don’t care what people think of you. But don’t care what you think of them either: i.e., don’t ‘judge’ with the seriousness you usually do. That’s the only way to live honestly.

*

“When John McCain praises Jerry Falwell, is he not being dishonest and hypocritical?” Yes. In that respect we can criticize him. He is not abiding by standards that humans have set up as ‘good’, and to that extent he himself is not ‘good’ (by those standards). But if you could be him for a day, you would understand why he acts contrary to his convictions. He thinks, for example, that, in this case, the ends justify the means; for he wants to be nominated as his party’s candidate for president, and so he has to be accepted by conservatives. You yourself think that in many circumstances, the ends justify the means. And you yourself have done many things you’re not proud of, many things you would condemn if done by someone else. But sometimes circumstances practically compel one to act in a less-than-exemplary way. Politics is replete with such circumstances. No politician, not even Lincoln or Jefferson or Washington, can avoid compromising his integrity constantly. Otherwise nothing would get done, and no politician would be able to effectively pursue his ambitions. It’s a sacrifice one makes for what may, after all, in the end turn out to be the greater good. —My point is that, while it’s good to criticize McCain for his dishonesty (lest he lose

sight of himself and of higher values), it is also not entirely fair, at least not if the criticism is supposed to justify disgust or contempt for him.

*

Wisdom means acknowledging that ideals and values are illusions, that everything and every beautiful thing will die eventually, that life is fundamentally meaningless—and yet continuing to have ideals and values, indeed committing oneself to them *precisely because* life is basically meaningless.

*

(From a later journal entry.) Value characterizes a relation between a subject and an object. It's incoherent to say that an object is valuable in itself, i.e. with no reference to a subject (a subject's purposes, attitudes, etc.), because this contradicts the nature of value. But this is basically what one is doing when one makes a value-judgment. The statement "That painting is beautiful," by virtue of its form, ascribes value (a value-property¹) to an object in itself—without reference to a subject—which is incoherent. The meaningful way of expressing the same sentiment is to say something like "That painting is such as to induce a feeling of aesthetic pleasure in me," or to list the criteria by which one judges aesthetic merit and then say that that painting fulfills the criteria.

But don't forget that all such philosophically problematic statements are unproblematic on the level of common sense. They serve their purpose in that context and are just as meaningful as they have to be given the functions of ordinary communication. (Cf. what I've written about such things as the "external world," the self, free will, linguistic meaning, the mind-body relationship, truth, etc. On the naïve level all this is unproblematic, but when you start to dig you see it all crumble beneath you until you're left with little more than illusions or contradictions or empty 'behavioral' phenomena.)

*

Simplifying somewhat, true statements about humans are (directly or indirectly) a function either of their biology or of the social structures, conventions, ideologies and so on that have molded individuals. But so-called moral truths can be justified by neither. Consider biology: no researcher has ever learned by studying DNA that it's wrong to murder. Likewise, it's ridiculous to say that given our biological constitution, or our patterns of behavior, humans have an inalienable right to freedom. So moral truths are not biological or "natural." But they can't be conventional either—their truth can't result from the fact that society is organized in a particular way. Why? Because that's as absurd as arguing for them on the basis of biology. Moreover, it actually contradicts the essence of moral truths: it means they can't be "absolute" or anything like natural laws, but are relative, changeable, like society itself. —Thus, to talk about moral truths is to not know what one is talking about, since they can be neither 'natural' nor (by definition) merely conventional—but these are the only two options.

In another sense, though, a non-normative sense, moral truths are a function of *both* biology and social organization: our endowment predisposes us to (valorize) compassion, cooperation, respect for others, and the organization of our society results in our belief that particular rules are moral absolutes.

So the proper way to conceptualize ethics is to think of its practitioners as simply trying to find the best way to frame the normative dimension of human relations. Not as trying to find "moral truths."

¹ This property (in the context of a statement) combines ordinary description with evaluation—a 'cognitive' stance with a 'noncognitive' one—which is incoherent. The statement posits its own truth, like any descriptive statement, but it can be neither true nor false because its real content is simply an expression of approval. So it contradicts itself. That is, its form suppresses the subjective perspective—denies its relevance, so to speak, in favor of positing an objective fact that has nothing to do with the subject's attitude—whereas its content is constituted by precisely this subjective perspective, the subject's reaction to what he is seeing.

I should say, however, as I've said repeatedly, that, given certain basic values and assumptions, there *are* moral absolutes. If you reject the former, or somehow qualify your commitment to them, it's perfectly rational to reject the latter.

—Such truths have been known for centuries by humane thinkers. It's time they were accepted by everyone.

March 19

I can't in good conscience live an easy life. I can't live in material comfort without giving back to the oppressed billions on whose backs my comfort rests. Somehow I have to make their lives better. So, while I'm spending the first part of my life making contributions to culture, the second part will be occupied mainly in making the world a better place. (Albert Schweitzer was a simplified version of me. See the book I quoted from a long time ago, the part about the two phases of his life.)

Merely fighting ignorance, Dawkins-style, doesn't really make the world a better place, since people are as rational as Koko the gorilla. Nothing one can say will change their minds about something they don't want to change their minds about. Besides, philosophical activism can't *concretely* benefit anyone. Nor is revolutionary activism appropriate at this stage of history. Capitalism isn't ready to wither away yet. I'm a consistent Marxist, so I'm happy to let society keep evolving naturally on its economic foundations until the time is *really* ripe. The only kind of activism left (apart from the Chomskyan sort, which doesn't interest me right now) is the direct kind—the direct or relatively direct improving of individuals' lives.

I simply cannot spend my life teaching or writing philosophy. First of all, I'm not sure I'd be a great teacher; second of all, philosophy is over. It has ended with me. [!] (At least for a long time.) —How appropriate, then, that with me it has transcended itself! It has understood that it can go only so far as a philosophy of life: in the end it has to rejoin the world—turn its back on itself and return to life. For I have found answers to all the original questions, the ones that occupied Plato and the ancient Indians—regarding death, “the soul”, religion, values, knowledge, virtue, the best way to live, the nature of history, the nature of man, the nature of the universe.¹ In broad outlines, I understand most things. As for the details, they will *never* be understood—but I understand the reasons for that too! So I might as well give back to this world that has permitted me the satisfaction of knowing truth.

I'm instinctively suspicious of anyone who has been successful in this world.
